The MON-50 is a claymore shaped (rectangular, slightly concave), plastic bodied, directional type of anti-personnel mine designed and manufactured in the Soviet Union. It is designed to wound or kill by explosive fragmentation. The mine is similar to the American M18 Claymore with a few differences. It has folding scissor type legs for supporting and aiming, but it also has an attachment point on the bottom for connecting a special clamp/spike which can be attached to wood, metal etc. It has a peep sight centered on the top which is flanked by two detonator cavities. The mine contains 700g of RDX (PVV-5A) to propel approximately 540 or 485 fragments to a lethal range of 50 meters in a 54° arc (spread of 45 meters at 50 meter range). The fragments can be steel balls (540) or short steel rods (485) depending on the variant. The MON-50 is usually command actuated using a PN manual inductor and an EDP-R electric detonator. It can also be actuated by a variety of booby trap (BT) switches including the MUV series pull; the MVE-72 electric brake wire; or the VP13 seismic controller. The MON 50 will usually be mounted above ground level on the surface or up in trees to give the greatest dispersion of fragments. It is waterproof and will function effectively from +50 to -50 °C (it can be buried in snow as long as the pack in front of the mine doesn't exceed 10 cm, any more will greatly reduce the mine effectiveness). The mine can be located visually or with metal detectors under most field conditions. Depending on its actuation method the MON-50 may be resistant to blast overpressure from explosive

breaching systems like the Giant Viper and M58 MICLIC. The MON-50 is currently manufactured in Russia and also manufactured for export in Bulgaria. The MON 50 is widely used in many parts of the world. It comes in a two pouch cloth bandolier which holds all the components for securing and command actuating the mine. It may also come packed in a VKPM-2 set which contains 4 mines complete with miscellaneous fuzes, control panel and wire. The mine has conventional or advanced seismic influence fuzing. It is a hand laid directional fragmentation mine which is normally command actuated (always secure command wires). The MON-50 is known to be used with the VP13 seismic controller which prevents close approach for any clearance operations, or to a variety of BT fuzes. On detonation the mine will normally propel lethal fragmentation to a range between 40 and 60 meters, although the actual hazard range for these types of mines can be as high as 300 metres based on US Army tests of the M18A1 "Claymore" (this is directly in front of the mine, fragmentation range and density drop off to 125 meters to the sides and rear of these mines).

PRB M35 Belgium Anti-Personnel Mine

Tiers:

System

Country of Manufacture: Belgium
# of User Countries: 4+

Comment:

PMN-1 Russian Anti-Personnel Mine

Russian PMN-1 Landmine

Tiers:

System

Height: mm57
Diameter: mm112
Main charge weight: 240 g TNT (initiated by a 9 gram tetryl booster)
Total Weight: g600
Fuze: MD-9 (stab-sensitive)
Operating pressure: 5.8 kg

Notes:

The design of the PMN-1 mine dates from the late 1950s. It is particularly deadly because it contains an unusually large explosive filling when compared to most other anti-personnel landmines. For comparison, most anti-personnel blast mines (e.g. the VS-50) contain around 50 grams of high explosive, which typically destroys all or part of a victim's foot. In marked contrast, a PMN-1 contains 249 grams of explosive which can easily destroy a victim's entire leg (frequently requiring amputation high above the knee) in addition to inflicting severe injuries on the adjacent limb, which may also require some form of amputation due to blast injury. The majority of anti-personnel mine victims (e.g. those who step on an M14 mine containing 29 grams of explosive) have a very high probability of survival, though inevitably they suffer permanent disability regarding their gait. However, the amount of explosive inside a PMN-1 mine is so large that the risk of victims dying is significantly greater and, assuming that they survive their injuries, the degree of disability inflicted is much more severe. These mines are palm sized and cylindrical in shape. The PMN-1 has a bakelite case (brown or black in colour) with a black rubber pressure-plate and contains TNT explosive. The PMN-1 mine is armed by removing a steel ring-pull at the end of the horizontal fuze. When in position, the pin on the end of the ring-pull holds a spring-loaded striker back from the stab-detonator. Pulling out the ring-pull starts an arming delay, which comprises a thin steel wire (held under tension by the spring-loaded striker) which must cut through a small strip of lead before it is freed. The process of cutting through the lead strip takes between 2 and 12 minutes, depending on ambient temperature. After the wire has completely cut through the lead strip, the spring-loaded striker is freed and slides forward a few millimetres before stopping, blocked by the sliding gate of the pressure plate mechanism. At this point the mine is fully armed i.e. the only thing holding back the spring-loaded striker from the stab-detonator is a weak creep-spring on the pressure plate mechanism. Subsequently, any downward pressure on the pressure plate (i.e. when someone steps on the mine) overcomes the upward pressure of the creep-spring and pushes down the sliding gate that holds back the spring-loaded striker. This action frees the striker which flips forward into the stab detonator, firing both it and the adjacent tetryl booster which triggers detonation of the main TNT explosive filling. It is not a blast resistant mine.

M16 American Bounding Anti-Personnel Mine

Tiers:

1 2 3 4

Variants:

- **M16A1:** Redesigned detonator and delay elements
- **M16A2:** Single bounding delay element, reducing the weight
- **KM16A2:** South Korean produced version of the M16A2

System

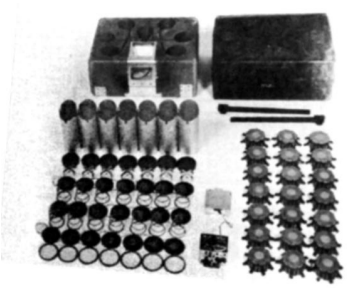
Country of Manufacture: US India
# of User Countries: 6+
Emplacement Method: manual
Diameter: mm103
Height: mm203
Armor Penetration (mm)/ Kill Mechanism: bounding fragmentation
Effective Range: m27 bound height 1
Detectability/ Composition: easy metal
Anti-Handling: possible no 2nd fuze well
Fuze Type/Self Neutralize: tripwire, pressure (2, 5 kg) self-neutralize: no
Explosive Type & Weight/Total Weight (kg): kgTNT: 0.6 Total: 3.67
In Service: 1957-Present
Proliferation: Millions
Detonation Mechansim: Various, including: S.Mi.Z 35 (pressure), Z.Z.35 (pull), Z.U.Z.Z. (tension release), E.S.Mi.Z (pressure and electric)
Comment: not waterproof

Notes:

The M16 mine is a United States-made bounding anti-personnel mine. It was based on captured plans of the World War II era German S-mine and has similar performance. The mine consists of a cast iron body in a thin steel sleeve. A central fuze well on the top of the mine is normally fitted with a pronged M605 pressure and tilt fuze. Sufficient pressure on the prongs or tension on an attached tripwire causes the release of a striker. The freed striker is forced into a percussion cap which ignites a short pyrotechnic delay. The purpose of this delay is to allow the victim to move off the top of the mine, to prevent its upward movement from being blocked. Once the delay has burned through, a 4.5-gram black powder charge is ignited, which launches

the inner iron body of the mine up into the air (leaving behind the steel outer sleeve). The charge also ignites a second pair of pyrotechnic delays. The mine rises to a height of 0.3 to 1.7 meters before one or both of the pyrotechnic delays detonates the main charge of the mine, which sprays high-velocity steel fragments 360° around the point of detonation. These metal fragments have an expected casualty radius of 27 meters for the M16 and M16A1 mines, and out to 30 meters for the M16A2 mine. The M16 and M16A1 mines are similar; the M16A1 has redesigned detonators and boosters but remains largely the same. The M16A2 is considerably different, having an offset fuse well and only a single pyrotechnic delay element. This change reduces the weight of the mine considerably (2.83 kilograms) while allowing it to carry a slightly larger main charge (601 grams) The mines were sold widely and copies were produced in several countries including Greece, India, South Korea and Turkey. They can be found in the 'wild' in Angola, Burma, Cambodia, Chile, Cyprus, Eritrea, Ethiopia, Iran, Iraq, Korea, Lebanon, Laos, Malawi, Mozambique, Myanmar, Oman, Rwanda, Somalia, Thailand, Vietnam, the Western Sahara, and Zambia. The United States retains stocks of M16A2 mines for use in any resumption of war in Korea. When emplaced, most of an M16 mine is buried underground so it can be extremely difficult to spot them visually, particularly in areas of long grass, heavy undergrowth or other debris. The M16 contains large amounts of metal, so is very easy to detect using a mine detector. However, it is important to note that the act of moving the detection head over the ground may strike the prongs and trigger the mine. In any case, other minimum metal mines may have been planted near to an M16 in order to protect it from mine clearance personnel. Additionally, if long tripwires are fitted, the M16 may "see" the deminers before they have chance to find it. When tracking the path of tripwires fitted to any bounding mine, great care must be taken: it is quite possible that additional antipersonnel blast mines (e.g. the M14) may have been buried beneath its path. An extra complicating factor is that some M16 mines may have been fitted with an anti-handling device e.g. placing an M26 grenade underneath it with an M5 pressure-release boobytrap firing device screwed into it.Deliberately triggering the mines from cover, using some form of grappling hook attached to a long rope may be useful in some situations and provide an initial way into the minefield before further clearance work begins.

M131 American Modular Pack Mine System (MOPMS)



Tiers:

Variants:

- **M136:** The M136 is an inert dispenser for training use; it is externally similar to the M131, but has a light to indicate the receipt of a firing signal.

System

Alternative Designation: M131

Type: Modular Pack Mine System (MOPMS)

Manufacturer: Hughes Aircraft Company, Ground Systems Group Aerojet Alliant Techsystems Inc was systems integrator with responsibility for the mines

Crew: The MOPMS modules are taken to the operation site by truck and carried by two men to the required position. If unused they can be retrieved and redeployed. The M71 RCU allows one person to control up to 15 groups of MOPMS modules from a remote location.

Remote: Modules are fired using an M71 coded Remote-Control Unit (RCU), or by a signal sent through a cable connected to a standard US Army blasting device on the dispenser module.

Type of Mines: Each MOPMS unit contains a mixture of Anti-Tank (AT) mines and Anti-Personnel (AP) mines. The mines contain three Large Scale Integrated (LSI) microelectronic chips in the electronics package, which also includes a command destruct/recycle receiver and a sensor circuit.

Batteries: ammonium/lithium batteries

AT Mine: The AT mine, like the BLU-91/B 'GATOR' has a Misznay Schardin (MS) warhead on either side, with a clearing charge to remove debris. The magnetic influence fuze gives the mine a full-width attack capability. The AP mine is activated by one of four tripwires ejected from the top surface. These are automatically deployed on landing and, when disturbed, initiate a fragmentation warhead. The mines are supplied with preset self-destruction devices, or can be detonated by remote control.

Timers: The built-in timers can be reset to extend the life of the minefield and, if the mines have not been dispensed, the sealed dispenser can be moved intact to a new location.

Total Dispensing Tubes: 7

Total Mines: 21 mines total (17 AT, 4 AP)

Self Destruct Time: 4 hour self destruct time(SD), recycle up to three times (16 hours). Mines start to SD at 3 hrs, 12 min (80% of SD time); all mines SD by 4 hrs.

Mine Projectile Maximum Distance: Mines are propelled 35 meters to the front and sidess

Mission Employment: *Close lane *Deliberate protective minefield (cases emplaced, not dispensed) *Nuisance minefield *Ambushes and booby traps *Tactical minefield with Fix or Disrupt intents *In support of MOUT Operations

Emplacement: *Issued as standared Class V munition and drawn from ASP *Site selection, achieving optimum effect *Dispensers are arranged in patterns to achieve necessary frontage, depth, and density *RCU unit can control up to 15 dispensers out to 1 kilometer, can SD all mines on command and recycle the SD time three times *Recycled mines will start to SD 12 hrs, 48 min; all mines will have SD by 16 hrs *Mines must be recycled every 3 hrs and 12 min or some will SD before 4 hrs *Dispensers controlled by blasting machine cannot be recycled mines or command detonated *Establish trigger points for closing lanes

Dimensions

Length: INA

Width: INA

Height: INA

Package: The package fits within 95 cm3

Weight, Combat: kg68

Notes:

M131 Modular Pack Mine System (MOPMS) DESCRIPTION: The MOPMS is a man-portable anti-tank (AT) and anti-personnel (AP) mine system. The M131 module weighs approximately 165 pounds and contains a mix of 17 M78 AT and four M77 AP mines. This module is stored, shipped and emplaced without any modification to the container. The MOPMS module may be initiated by hardwire or radio control. The hardwire capability uses currently available wire and electrical firing devices. The M71 hand-held radio control unit (RCU) allows one individual to control as many as 15 groups of MOPMS modules from a remote location. The AT mine has a magnetic influence fuse and a Miznay-Schardin kill mechanism. The AP mines deploy four tripwires upon ejection which initiate a fragmenting kill mechanism. Both the AP and AT mines contain a radio frequency receiver which allows the mines to be remotely-controlled (recycle self-destruct time and command destruct) with the RCU once the mines are dispensed. The factory set self-destruct time is four hours. STATUS: MOPMS fielding is in progress. The U.S. Army Engineer School was the first unit equipped on 6 MAR 92. EMPLOYMENT CONCEPT: The MOPMS will be employed to close lanes and gaps in minefields, at chokepoints, to reinforce obstacles, to emplace point minefields and for protective mining. Infantry, Armor, Engineer and other units with a protective mining mission will employ MOPMS in support of their tactical missions in all areas of the battlefield. If the mines are not dispensed from the MOPMS module, they may be recovered and reused. A M71 remote control unit (RCU) or an electronic initiating device, such as the M34 hand-blasting machine connected to the container by field wire, dispenses mines on command. Once dispensed, mines cannot be recovered or reused. Operators can disarm and recover the container for later use, if mines are not dispensed. The RCU can recycle the 4-hour self-destruct time of the mines three times, for a total duration of 16 hours (4 hours after initial launch and three 4-hour recycles). This feature makes it possible to keep the minefield in place for longer periods, if necessary. The RC can also self-destruct mines on command. It allows a unit to counterattack or withdraw through the minefield, as necessary, rather than wait until the self-destruct time has expired. The RCU can control up to 15 containers or groups of containers via separate pulse-coded frequencies, out to 300 to 1,000 meters. Coded frequencies defeat threat electronic counter-measures directed against the system. The M34 50-cap blasting machine can detonate one MOPMS at a maximum range of 3,000 meters. (Internal resistance decreases the maximum range by 400 meters for each additional MOPMS connected in series.) When controlled by direct wire, MOPMS dispensers cannot be command-detonated, and the self-destruct time cannot be recycled. BASIS OF ISSUE: MOPMS will be a Class V item of issue and will be issued to those units that are authorized a basic load of mines. It will be substituted for conventional mines currently in a unit's basic load. The M71 RCU will be a TOE item, issued to Engineer Companies (four RCUs each), Armor, Infantry and Cavalry Companies (two RCUs each), and other selected companies with a protective mining mission (one RCU each). TRAINING/PERSONNEL: U.S. Army Combat and Combat Support Schools will provide training during basic and advanced courses of instruction on MOPMS employment. At the unit level, training will be primarily conducted using the M136 Training Dispenser and M71 RCU.

PROM-1 Yugoslavian Anti-Personnel Mine

Tiers:

1 2 3 4

System

Country of Manufacture: Former Yugoslavia
# of User Countries: 5+
Emplacement Method: manual
Diameter: mm75
Height (mm): mmH: w/o fuze 178 H: w/fuze 260
Armor Penetration (mm)/ Kill Mechanism: bounding fragmentation
Effective Range (meter): max: 22 min: 0 bound height .7
Detectability/ Composition: Easy Steel
Anti-Handling: possible
Fuze Type/Self Neutralize: pressure (9 kg) tripwire (3 kg) self-neutralize; no
Explosive Type & Weight/Total Weight (kg): kgTNT: 0.43 Total: 3
Operating Pressure: 9 kg to 16 kg or 3 kg to 5 kg pull
Comment: Delayed ejection and detonation by 1 to 2 seconds to ensure target is clear of the upward path.

Notes:

The PROM-1 is a Yugoslavian manufactured bounding type of anti-personnel mine. It consists of a cylindrical body with a pronged fuze inserted into the top of the mine. It is broadly similar in operation to the German S-mine. The mine is triggered by the tilting of the prongs situated on top of the mine. This is caused by either direct pressure on the prongs or by tension on a tripwire attached to them. Tilting the prongs allows at least one of three striker retaining balls to escape. This releases the spring-loaded striker, which is flipped downwards into the percussion cap and fires the three gram propellant charge. The explosion of the propellant charge forces the upper half of the mine body out of the ground and up into the air, shearing off several brass screws and leaving the base plug of the mine behind in the ground. The mine's body is tethered to its base by a short length of wire, which unwinds behind it as it rises. When the mine reaches a height of approximately 65 centimetres the wire is pulled. This jerks the detonator assembly downwards into the striker. The detonator fires, triggering the main explosive charge, which shatters the internally grooved body into a large number of high-velocity steel fragments, which spray in all directions. Because the time taken from triggering the mine to detonation is so short (typically one second), there is no time to take cover from the blast. As with all bounding mines the PROM-1 is lethal at relatively long distances. It is capable of projecting dangerous fragments to range of 100 metres or more, with a potentially lethal range of around 50 metres. This mine will almost certainly kill or seriously injure anyone caught within 30 metres of the blast. As with any bounding mine, wearing standard kevlar body armour offers no guarantee of safety: the large number of fragments produced by a PROM-1 will wound the unprotected limbs, face and eyes of its victim(s). he PROM-1 can be particularly hard to spot in undergrowth because, apart from the prongs, most of it is buried underground and therefore cannot be seen. Although this mine contains lots of steel

(thereby making it easy to detect with a mine-detector) the act of sweeping the detection head over the ground can easily strike the prongs (or connected tripwire) and detonate the mine. In any case, PROM-1s in a minefield may be surrounded by various types of minimum metal antipersonnel blast mines (e.g. the VS-50) which further hinders the clearance process. The PROM-1 is difficult to render safe because its fuze becomes unstable after being exposed to weather for several years. Most deminers therefore recommend that this mine is destroyed in situ by detonating an explosive charge next to it. Usually (though not always) trip-wires measuring around 20 feet (6 meters) in length are fitted to this mine in order to increase its activation area. When tracking trip-wires back to their source, deminers must keep in mind that other landmines may have been planted along its length. It is all too easy to concentrate on following a trip-wire back to its source, forgetting that there could be PMA-3, PMN or similar blast mines lying buried underneath. The mine has been found in Angola, Bosnia, Chile, Croatia, Eritrea, Iraq, Kosovo, Mozambique and Namibia.

MON-100 Anti-Personnel Mine

Tiers:

Variants:

- **MDH-10:** Vietnam, a copy of the MON-100
- **KN-10:** Cambodia, a simplified version of the MDH-10

System

Country of Manufacture: FSU, Bulgaria
# of User Countries: 27+
Emplacement Method: manual
Diameter: mm220
Height (mm): mm80
Armor Penetration (mm)/ Kill Mechanism: directional fragmentation 400 pieces
Effective Range: m100 width of kill zone @ 100 m = 6.5-9.5
Detectability/ Composition: metal case
Anti-Handling: possible but not likely
Fuze Type/Self Neutralize: electric command, tension release (2 to 5 kg)
Explosive Type & Weight/Total Weight (kg): kgTNT: 2 Total: 5
Fuse 1: Command detonated using PN manual inductor attached by demolition cable to an EDP-R electric detonator
Fuse 2: MUV Series Mechanical Pull or MVE-72 Electric Breakwire (battery powered) or VP13 Seismic Controller (battery powered).
Comment: Effective against lightly armored vehicles. At 100m 50% of frag will strike w/in 5 m of aim.

Notes:

The MON-100 is a circular, sheet metal bodied, directional type of anti-personnel mine designed and manufactured in the early 1960s by the Soviet Union. It is designed to wound or kill by fragmentation and resembles a large bowl. The MON-100 mine body has a smooth, well finished appearance with a webbing handle mounted on the upper edge, it is usually attached to a mounting shackle by wing nuts on either side of the mine body (the shackle is connected to a spike for securing the mine to buildings, trees etc.). The concave face of the mine has a detonator cavity in its center (this is the side aimed at the target). The mine contains 2 kg of explosive to propel 450 steel rod fragments to a lethal range of 100 m, at maximum range the spread of the fragmentation is 9.5 m. The mine alone weighs 5 kg but with the shackle and mounting spike the weight is 7.53 kg. The MON 100 can be command actuated using a PN manual inductor attached by demolition cable to an EDP-R electric detonator. It can also be actuated by a variety of booby trap (BT) switches including: * MUV series pull * MVE-72 electric

breakwire * VP13 seismic controller. The MON-100 will usually be mounted above ground level on the surface or up in trees to give the greatest dispersion of fragments. The mine can be located visually or with metal detectors under most field conditions. Depending on its actuation method the MON-100 may be resistant to blast overpressure from explosive breaching systems like the Giant Viper and M58 MICLIC. The mine is also produced for export to Poland. Because it is a directional type of mine, it should never be approached from the front, always from the rear or side. The MON-90 is known to be used with the VP13 seismic controller which prevents close approach for any clearance operations. If the mine is encountered with any type of electrical wires running from it, secure both ends of the wire before approaching the mine, because it could be linked to another mine or other booby trap device. On detonation the mine will normally propel lethal fragmentation to a range between 75 and 125 meters. The actual hazard range for this mines can be as high as 160 metres (this is directly in front of the mine, fragmentation range and density drop off to 125 meters to the sides and rear of these mines). Always be alert for well concealed blast mines laid along tripwires (don't get tripwire fixation).

POM-2S Russian Scatterable Anti-Personnel Fragmentation Landmine

Tiers:

1 2 **3** 4

System

Country of Manufacture: FSU
# of User Countries: 12+
Emplacement Method: remote-surface (UMZ, helicopter, PKM portable) cylinder:
Length: mm60
Height: INA
Armor Penetration (mm)/ Kill Mechanism: fragmentation
Effective Range: m16
Detectability/ Composition: visual, readily
Anti-Handling: no
Fuze Type/Self Neutralize: tripwires (.2 kg) Self-destruct: 4 to 100 hr
Explosive Type & Weight/Total Weight (kg): kgTNT: .14 Total: 1.6

Notes:

The Russian POM-2S is a scatterable, anti-personnel, fragmentation landmine. It has a cylindrical cast-steel body with tripwire dispensers and a central fuzing system. Surrounding the fuzing system is the main charge of TNT. Once dispensed from the delivery system, the landmine is armed and various components are ejected. After landing six spring-loaded metal fins bring the landmine into an upright position. After a few seconds, the top is blown off allowing the release of 4 spring-loaded spools of plastic tripwire. The tripwires are attached to an arm of the striker release mechanism. Tripping a wire rotates the arm and the spring-loaded striker releases onto the central stab-sensitive detonator assembly. Only 300g of force is required to release the mechanism.

VS-50 Italian Anti-Personnel Blast Mine

Tiers:

Variants:

- **VS-50 EO3:** version fitted with an electronic anti-handling device.
- **SPM-1:** copy produced under licence in Singapore.
- **YM-IB:** copy produced by Iran
- **T/79:** copy produced by Egypt

System

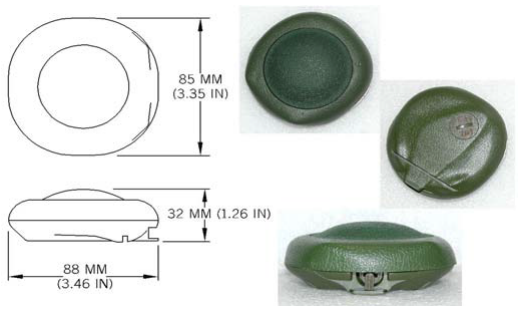
Country of Manufacture: Italy Singapore (SPM-1) Egypt (T/79)
# of User Countries: 14+
Emplacement Method: manual remote surface
Diameter: mm90
Height: mm45
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: mlimited
Detectability/ Composition: Plastic difficult
Anti-Handling: yes, the VS-50AR variant
Fuze Type/Self Neutralize: pressure-10 kg self neutral: no
Explosive Type & Weight/Total Weight (kg): kgTNT: .075 Total: .185
Comment: Designed to be scattered from helicopters. Countermeasure blast (fuel- air-explosive line charge)-resistant. Underwater 1 meter
Operating Pressure: kg10

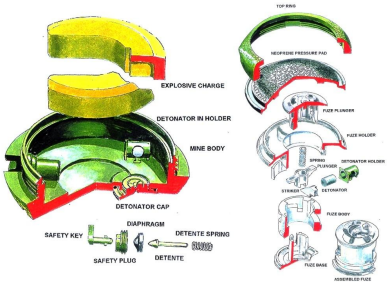
Notes:

The VS-50 is a circular plastic cased anti-personnel blast mine, formerly manufactured by the now-defunct Valsella Meccanotecnica SpA, an Italian high-tech defence industry specialized in area denial systems which was also the manufacturer of the Valmara 69 and one of the first industries in the world to implement plastic construction for landmines. The design is similar to the TS-50 and VS-MK2 mine. It is blast resistant and can be used in a minimum metal configuration. Though unlikely to kill, the explosive charge contained within a VS-50 is quite sufficient to destroy the victim's foot: the blast is capable of penetrating 5 mm of mild steel leaving an 80 mm-diameter hole. The mine consists of three sections, a bottom section containing the main explosive charge, a middle section which contains the fuze and safety/arming mechanism, and the top section which consists of a neoprene pressure pad. The neoprene pressure pad is sometimes reinforced with an 18 gram mild steel plate, which makes the mine detectable by metal detectors. However, the majority of VS-50s were manufactured as

minimal metal mines and are therefore much harder to detect. The case is waterproof and can be used in water up to one metre deep. The mine can be deployed by helicopters or ground vehicles or laid by hand. A sustained downward force of approximately ten kilograms on the pressure plate for a minimum of 0.10 seconds compresses the firing spring and cocks the striker. Continuous downward movement allows the trigger assembly to pivot, slowly forcing the air out of an anti-shock bladder and flips the striker down into the stab sensitive M41 detonator, at which point the mine explodes. The air pressure delay mechanism effectively blocks detonation if the force on the pressure plate is of short duration, because air does not have enough time to leave the small anti-shock bladder. This has two direct applications, it allows the mine to be dropped from helicopter mine scattering systems, and it dramatically increases the mine's resistance to explosive-based mine clearance techniques. It can therefore be regarded as a blast resistant mine.

SB-33 Italian Anti-Personnel Mine





Tiers:

1 2 **3** 4

Variants:

- **EM-20:** a Greek copy of the mine.
- **M/412:** a Portuguese copy of the mine.
- **P-5:** a Spanish copy of the mine produced under license. It is no longer in service with Spain, and all but 4,000 of the mines have been destroyed.

System

Country of Manufacture: Italy, Spain, Greece (EM-20), Portugal (M412)
# of User Countries: 10+
Emplacement Method: manual, scatterable
Length: mm85
Width: mm85
Height: mm30
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: contact
Detectability/ Composition: Plastic difficult w/handheld detectors
Anti-Handling: yes: antihandling SB-33/AR
Fuze Type/Self Neutralize: pressure 10 kg
Explosive Type & Weight/Total Weight (kg): kgRDX: .35 Total: .140
Operating Pressure: kg8
Comment: Countermeasure blast (fuel air/explosive line charge) resistant.

Notes:

The SB-33 is a small Italian minimum metal blast type anti-personnel mine formerly manufactured by Misar, that entered service in 1977. The SB-33 can be emplaced by hand or scattered using the helicopter mounted SY-AT system. The body of the mine is made of two glass reinforced polycarbonate halves, with the top surface having a central neoprene pressure pad. The body has an irregular shape to make the mine harder to distinguish on the ground. To arm an SB-33, a small pin is removed from the side of the mine. After the mine has been armed, gradual pressure on the pressure plate (i.e. when the victim steps on it) rotates a locking collar until the striker is released, which flips into a stab-detonator and the mine explodes. However, sudden pressure (e.g. from a mine-clearing charge) causes the striker to lock the rotating collar in position for the duration of the pressure, preventing the mine from detonating. The combination of low metal content and resistance to overpressure make

the mine extremely difficult to remove. Another version of the SB-33 called the SB-33AR (AR standing for Anti-Rimozione, "Counter-Removal") exists. It looks identical to the standard SB-33 mine. However, the SB-33AR has an integral anti-handling device specifically designed to injure deminers. The anti-handling device in an SB-33AR consists of a mercury tilt switch and battery connected to the detonator. When an SB-33AR is moved a few degrees from the horizontal (i.e. when a deminer lifts it), it detonates, blowing the victim's hand off. Generally, a small number of SB-33AR landmines would be sown inside a minefield containing standard SB-33 mines in order to hinder and deter any attempt to conduct demining operations. Copies of the mine were produced in several countries and the mine was in service with the Netherlands, Spain, Greece and Argentina. This mine is no longer produced and Italy has destroyed all operational stocks and any associated machinery required for its manufacture. However, uncleared minefields containing SB-33 mines do exist e.g. in Afghanistan, Djibouti, the Falkland Islands, Iran, Iraq, Kurdistan, and the Western Sahara.

Mle 1951 (MI AP ID 51) French Anti-Personnel Blast Mine

Tiers:

System

Country of Manufacture: France
# of User Countries: 1
Emplacement Method: manual
Diameter: mm70
Height: mm52
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: mlimited
Detectability/ Composition: very difficult plastic-no metal content
Anti-Handling: possible no 2nd fuze well self-neutralize: no
Fuze Type/Self Neutralize: pressure (14 to 24 kg)
Explosive Type & Weight/Total Weight (kg): kgPETN: .051 Total: .09
Operating Pressure: kg5
Comment: waterproof

Notes:

The Mle 1951 (Model 1951) or MI AP ID 51 is a small circular French brown plastic cased minimum metal mine anti-personnel blast mine. The mine uses a pressure fuze that works by driving a firing pin through a friction sensitive compound (a mixture of Red Phosphorus and glass). The mines safety is a small cap that sits over the pressure fuze and prevents it being pressed. The mine can be used with anti-handling devices. The mines was in service with the French Army and was used in Algeria. It was superseded by the Mle 1955 mine (MI AP DV 59)

OZM-4 Russian Anti-Personnel Mine

Tiers:

1 2 3 **4**

System

Country of Manufacture: FSU
# of User Countries: 19+
Emplacement Method: manual
Diameter: 75
Height: mm120
Weight: kg5.4
Armor Penetration / Kill Mechanism: bounding fragmentation
Casing Material: Cast Iron
Fragmentation Charge (TNT): grams170
Length of the sensor target (one-way): m13
Sensor sensitivity: 1–17 kg
Radius of guaranteed lethal destruction: m13
Temperature usage range: -60 to +60 Degrees Celsius

Notes:

The OZM-3, OZM-4 and OZM-72 are Soviet manufactured bounding type anti-personnel mines. (fragmentation-barrier mine , in the Russian and other post-Soviet armies as informally called "frog mine" or "witch") They are normally painted olive green, and issued with a spool of tripwires and two green painted wooden or metal stakes for affixing the tripwires. Both OZM-3 and OZM-4 have cast iron fragmenting bodies while the OZM-72 also contains preformed steel fragments, and all three are issued with empty fuze wells, so a variety of fuzing options are possible. The mines can be activated by a variety of fuzes, including electronic fuzes or command initiation, although they are most commonly fitted with an MUV booby trap switch which is activated by a tripwire. On firing, a metal base plate remains in the ground, while the mine body is thrown up by a small lifting charge, but remains attached to a strong wire tether. When the end of the tether is reached at a height of approximately 0.5 m, the main charge explodes and scatters fragments of the casing across a wide area. OZM mine may sometimes be laid directly on top of an MS-3 mine. The MS-3 is an anti-handling device which closely resembles a PMN mine, except that it has a "blister" on top and operates purely as a pressure-release boobytrap. Lifting an OZM mine (without rendering safe the MS-3 placed underneath) will trigger detonation.

PMN-4 Russian Anti-Personnel Mine

Tiers:

Variants:

- **PMN-1:** The design of the PMN-1 mine dates from the late 1950s. It is particularly deadly because it contains an unusually large explosive filling when compared to most other anti-personnel landmines. For comparison, most anti-personnel blast mines (e.g. the VS-50) contain around 50 grams of high explosive, which typically destroys all or part of a victim's foot. In marked contrast, a PMN-1 contains 249 grams of explosive which can easily destroy a victim's entire leg (frequently requiring amputation high above the knee) in addition to inflicting severe injuries on the adjacent limb, which may also require some form of amputation due to blast injury. The majority of anti-personnel mine victims (e.g. those who step on an M14 mine containing 29 grams of explosive) have a very high probability of survival, though inevitably they suffer permanent disability regarding their gait. However, the amount of explosive inside a PMN-1 mine is so large that the risk of victims dying is significantly greater and, assuming that they survive their injuries, the degree of disability inflicted is much more severe. These mines are palm sized and cylindrical in shape. The PMN-1 has a bakelite case (brown or black in colour) with a black rubber pressure-plate and contains TNT explosive.
- **PMN-2:** The PMN-2 mine casing is made from injection-molded plastic. In general, the color is leaf-green, but occasionally brown examples may be encountered. The top of the mine has a black rubber X-shaped pressure plate. The filling is an RDX/TNT based explosive that is quite similar to Composition B. As with the PMN-1, the PMN-2 has an unusually large explosive filling when compared to many other anti-personnel landmines.

System

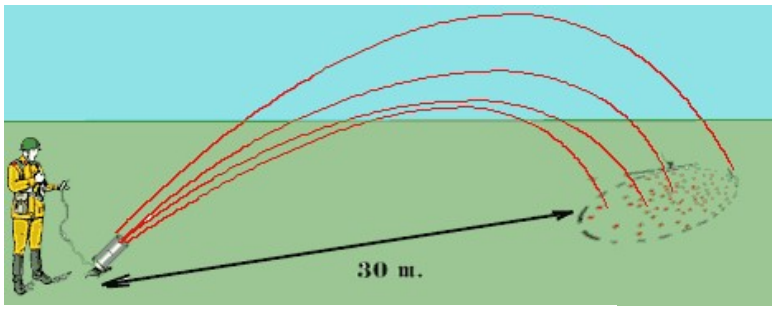
Country of Manufacturer: FSU China Iraq
# of User Countries: 35+
Emplacement Method: manual, chute
Diameter: mm95
Height (mm): mm46
Armor Penetration (mm)/ Kill Mechanism: blast
Explosive Charge Weight: grams55
Total Weight: grams300

Notes:

The PMN (Rus.противопехотная мина нажимная (En: Antipersonnel pressure mine)) series of blast anti-personnel mines were designed and manufactured in the Soviet Union. They are one of the most widely used and commonly found devices during demining operations. The PMN-4 is a delay-armed, pressure-fired blast-mine. The pressure-plate is black and the body is reddish-brown or khaki. The black rubber pressure-plate has a plastic pressure "spider" concealed underneath, shaped like flower-petals. The diameter of the mine is 95mm and the height is 46mm. The explosive charge weight is 55 grams. This comprises 52 grams of 'TG-40' (a 40/60 TNT/RDX mixture) plus a 3 gram pentolite booster. The total weight of the mine is 300 grams. PMN-4 mines contain a significant amount of metal components, so they are readily detectable with a mine detector. Details of the fuze mechanism are scarce, though given that the PMN-4 was designed during the early 1980s, it is logical to

assume that the fuze is more sophisticated and/or reliable than the fuze in the PMN-2 (a mid-1970s design) to compensate for having a smaller explosive filling with significantly reduced destructive power. Similarly, the PMN-4 is almost certainly a blast resistant mine due to the design of the flower-shaped pressure "spider" under the pressure-plate.[2] Cross-sectional diagrams of the PMN-4 showing its components support the view that the PMN-4 is a more sophisticated design then the PMN-2.Examples of the PMN-4 have been encountered in Ukraine and Southern Syria.

PMK-1 Russian Portable Mining Kit



PKM-1 Portable Mining Kit ["Veter-M"

Tiers:

System

Alternate Designation: PKM-1
Date of Introduction: INA
Type: Portable Mining Kit
Manufacturer: INA
Proliferation: INA
In Service: INA
Crew: 1
Kit: The kit is composed of a primitive baseplate, a PM-4 demolitions devce, 2 cable lengths (50 meters each) and a bag.

Dimensions

Length: INA
Diameter: INA
Height: INA
Weight: 2.6 kg

Main Weapon System

↳*Launcher*

Base Plate: The baseplate is a small sheet of metal with a launch base attached to it at 45 degrees and equipped with an electric contact. Attached to this will be containers with anti-tank or AP mines for firing.
Operation: The principle of operation is simple: once the mine casing is attached, the metal contacts are linked

between the baseplate and the casing. Once an electric signal is sent from the demolitions device or other current source, a powder charge is ignited in the casing, and the mines are thrown out to 30-35 meters.

Maximum Range: 35 km

↳ ***Mines***

KSF-1 Case: The KSF-1 case holds 72 PFM-1 mines.

KSF-1S-0.5: The KSF-1S-0.5 holds 36 PFM-1 and 36 PFM-1S mines.

KSF-1S: The KSF-1S hold 64 PFM-1S mines.

KSO-1: The KSO-1 holds 8 POM-1 AP mines

KPOM-1: The KPOM-1 holds 4 POM-2 AP mines

KPTM-3: The KPTM-3 holds 1 PTM-3 AT mine

KPTM-1: The KPTM-1 holds 3 PTM-1 AT mines.

Notes:

The PKM-1 portable mining kit is the simplest remote mining system available to combined arms units. It can be used by infantry and armor personnel to install anti-infantry and anti-tank landmines before their front lines, both ahead of time and in direct combat. This improves the tactical options available to combined arms units. The kit is composed of a primitive baseplate, a PM-4 demolitions devce, 2 cable lengths (50 meters each) and a bag. Total weight is 2.6 kilograms. The baseplate is a small sheet of metal with a launch base attached to it at 45 degrees and equipped with an electric contact. Attached to this will be containers with anti-tank or AP mines for firing. The principle of operation is simple: once the mine casing is attached, the metal contacts are linked between the baseplate and the casing. Once an electric signal is sent from the demolitions device or other current source, a powder charge is ignited in the casing, and the mines are thrown out to 30-35 meters. The different types of cases differ only in their markings. Their size is identical. The KSF-1 case holds 72 PFM-1 mines. The KSF-1S-0.5 holds 36 PFM-1 and 36 PFM-1S mines. The KSF-1S hold 64 PFM-1S mines. The KSO-1 holds 8 POM-1 AP mines The KPOM-1 holds 4 POM-2 AP mines The KPTM-3 holds 1 PTM-3 AT mine The KPTM-1 holds 3 PTM-1 AT mines. The mines are thrown out to form an ellipse. For example a KSF-1 or KSO-1 case form an ellipse 8-10 meters wide and 18-20 meters long. PFM mines fall about 0.6-2 meters from each other, allowing for a 30-50% chance of striking. POM mines fall at 1.5-7 meters from each other, but their cables stretch out to 2 meters and enable a 70% chance of striking. AT mines are thrown out to a distance of 100 meters and form an ellipse of a similar size. Given how AT minefields permit a gap of 9-12 meters between mines, the methods of installing AT minefields and AP minefields are similar. A one-line minefield can be installed by moving along a trench and launching one charge every 8-10 meters, or by simultaneous launch from a row of PKM devices. This can also be done by a centralized control panel linked to any number of devices Multiple-layer minefields can be installed by moving the launch line backwards after every launch. At minimum it must be moved back 30 meters to avoid the minefields overlapping. Density can be improved by firing 2-3 or more casings from a given location. The value of the system is its simplicity. It allows mining from concealment and installing minefields by surprise, at any time and any place.

M14 (Toepopper) American Anti-Personnel Mine

Tiers:

System

Country of Manufacture: US India (M-14) Vietnam (MN-79 & MD 82B)

# of User Countries: 20+

Emplacement Method: manual

Diameter: 56

Height: mm40

Armor Penetration (mm)/ Kill Mechanism: blast

Effective Range (meter): m1 contact

Detectability/ Composition: very difficult with hand-held detector plastic body (only metal is steel striker tip)

Anti-Handling: possible

Fuze Type/Self Neutralize: pressure (9-16 kg)

Explosive Type & Weight/Total Weight (kg): kgTNT: .029 Total: 1

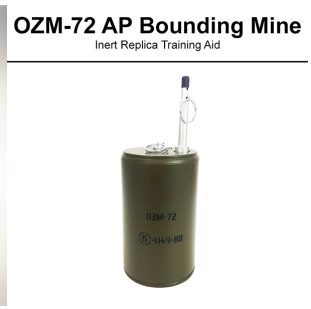
Operating Pressure: 9 to 16 kilograms

Notes:

The M14 mine "Toepopper" is a small (56 mm [2.2 in] diameter) anti-personnel land mine first deployed by the United States circa 1955.[1] The M14 mechanism uses a belleville spring to flip a firing pin downwards into a stab detonator when pressure is applied. Once deployed, the M14 is very difficult to detect because it is a minimum metal mine, i.e. most of its components are plastic. Because of this, the design was later modified to ease mine clearance via the addition of a steel washer, glued onto the base of the mine. In order to activate the M14, the base plug is removed and discarded and an M46 stab detonator is screwed into the base of the mine. Then the mine is placed into a shallow hole in the ground (flush with the surface) and the pressure plate is carefully rotated from its safety position to the armed position using the special arming spanner supplied in each crate of mines. Finally, the U-shaped metal safety clip is removed from the pressure plate by pulling on the attached cord. At this point, the mine is fully armed. When deployed by the USA, M14s are often laid together with other mines in their inventory i.e. the M16, M15 or M19. In a "mixed minefield" the anti-tank mines protect anti-personnel mines and vice versa. Similarly, M14s can be laid among other mine-types manufactured by different nations e.g. alongside the PMA-2, VS-50, Valmara 69 or TM-62. The top of an M14 has a simple arming indicator (an arrow embossed on the pressure plate) which can point to either A(rmed) or S(afe), giving a clear indication of its status. When the arrow points to "A", the M14 will detonate if stepped on. Disarming the M14 requires the arming steps to be performed in reverse. However, due to the possibility of a booby trap or some other type of anti-handling device being fitted underneath, it is often standard demining practice to destroy land mines in situ, without attempting to remove and disarm them. The M14 has not been in active US service since 1974. However, as of 2010 the United States retains a stockpile of 1.5 million mines held in reserve for emergency use on the Korean peninsula, because they are regarded as reliable and effective weapons. This mine has been widely exported and used by various countries, so uncleared minefields containing M14s do exist. The M14 has been found in Angola, Cambodia, Chad, Chile, El Salvador, Eritrea,

Ethiopia, Cyprus, Iran, Iraq, Jordan, Laos, Lebanon, Malawi, Mozambique, Somalia, Vietnam and Zambia. Additionally, copies of the M14 design have been manufactured locally by countries such as India and Vietnam. There are indications that as of 2008, an unlicensed copy of the M14 landmine was being manufactured in Burma by Myanmar Defense Products Industries at Ngyaung Chay Dauk, in Bago Division. The mine is extensively used by the local Burmese Army. Just as with the VS-MK2 (33 gram explosive charge), SB-33 (35 gram charge) or PMA-3 (35 gram charge), the 29 grams of high explosive in an M14 mine is quite small because it is specifically designed to disable victims, not kill them. Although the blast wound from an M14 is unlikely to be fatal (assuming that prompt emergency medical care is provided) it usually destroys a significant part of the victim's foot, thereby leading to some form of permanent disability regarding their gait. The fact that the explosive charge in an M14 is slightly cone shaped (like a shaped charge) focuses most of the blast upwards, increasing its destructive effects. In situations where M14 victims are barefoot or wearing sandals (e.g. in Burma), the wounds are more severe. Due to the relative simplicity of the firing mechanism, the M14 mine is not resistant to blast-clearing methods, unlike more modern antipersonnel mine designs such as the TS-50 mine.

OZM-72 Russian Anti-Personnel Mine



Tiers:

System

Country of Manufacture: FSU
# of User Countries: 19+
Emplacement Method: manual
Diameter: mm108
Height: mm172
Weight: kg5
Armor Penetration / Kill Mechanism: bounding fragmentation
Casing Material: Cast Iron
Fragmentation Charge (TNT): grams660
Sensor Sensitivity: 1–17 kg
Radius of guaranteed lethal destruction: m25
Temperature usage range: -60 to +70 Degrees Celsius
Number of preformed steel fragments: 2400 pcs.

Notes:

The OZM-3, OZM-4 and OZM-72 are Soviet manufactured bounding type anti-personnel mines. (fragmentation-barrier mine , in the Russian and other post-Soviet armies as informally called "frog mine" or "witch") They are normally painted olive green, and issued with a spool of tripwires and two green painted wooden or metal stakes for affixing the tripwires. Both OZM-3 and OZM-4 have cast iron fragmenting bodies while the OZM-72 also contains preformed steel fragments, and all three are issued with empty fuze wells, so a variety of fuzing options are possible. The mines can be activated by a variety of fuzes, including electronic fuzes or command initiation, although they are most commonly fitted with an MUV booby trap switch which is activated by a tripwire. On firing, a metal base plate remains in the ground, while the mine body is thrown up by a small lifting charge, but remains attached to a strong wire tether. When the end of the tether is reached at a height of approximately 0.5 m, the main charge explodes and scatters fragments of the casing across a wide area. OZM mine may sometimes be laid directly on top of an MS-3 mine. The MS-3 is an anti-handling device which closely resembles a PMN mine, except that it has a "blister" on top and operates purely as a pressure-release boobytrap. Lifting an OZM mine (without rendering safe the MS-3 placed underneath) will trigger detonation.

POMZ-2M Russian Anti-Personnel Mine

Tiers:

System

Country of Manufacture: FSU China (Type 59) North Korea Germany
# of User Countries: 33+
Emplacement Method: stake mine manual
Length: mm107
Height: mm60
Armor Penetration (mm)/ Kill Mechanism: fragmentation
Effective Range: mMax: 8 Min: 0
Detectability/ Composition: visual, detection cast iron
Anti-Handling: possible
Fuze Type/Self Neutralize: tripwire (1 kg force) self-neutralize: no
Explosive Type & Weight/Total Weight (kg): kgTNT: 75 Total: 1.7
Comment: Normally emplaced on stake 30 cm above ground. Fuze delay arm Underwater: no

Notes:

The POMZ-2M is a stake-mounted anti-personnel fragmentation mine made in the former Soviet Union. The body of the mine is a cast-iron thick-walled tube with five rows of cast fragmentation "chunks". This is usually mounted on a short wooden stake. Because the mine is easy to copy, dimensions and colour may vary. The body of the mine is usually painted olive green. The wooden stakes may be green, brown or unpainted. The POMZ-2M has a threaded hole in the top into which its fuze is screwed. The mine has been copied in many countries.

M18A1 Claymore American Anti-Personnel Mine

Tiers:

Variants:

- **M68 Inert Training Kit:** The M68 kit is designed to familiarize personnel with the placement and arming of a real M18 directional mine. It comes with all the components of a real Claymore kit packed in an M7 bandoleer. The light blue or black plastic M33 Inert Anti-Personnel Mine is the training and practice version of the M18A1 Claymore. Some inert mines were green with a light blue band. It does not contain an explosive or pyrotechnic filler of any kind. It is packed in a Claymore bag with inert M10 simulated detonator cap wire, an M57 "clacker" firing control, and an M40 circuit test kit.
- **Mini-Multi-Purpose Infantry Munition:** In early 2015, the U.S. Army began testing a smaller version of the Claymore called the Mini-Multi-Purpose Infantry Munition (M-MPIMS). It weighs 2 lb (0.91 kg) and has a 50 m (160 ft) effective range, similar to the full-size Claymore. At its optimized range of 30 m (98 ft), the fragmentation zone is 23 m (75 ft) wide and 2 m (6.6 ft) high, with a minimum of five hits per 1 m2 (11 sq ft). It has the surface space of an average smartphone and includes a Picatinny rail for camera, laser, or other attachments. The M-MPIMS is designed to be more controllable than the Claymore with less collateral damage, using an insensitive munitions explosive that is poured rather than packed for more uniform distribution results in more consistent blast pattern. Rear-safety distance has been decreased to 15 m (49 ft) and shelf life has been increased to 25 years.[

System

Country of Manufacture: US South Korea (K440) Pakistan (P5 Mark I) Iran Chile S. Africa (No.2) FSU (MON-50)
Introduction: 1960
# of User Countries: 22+
Emplacement Method: manual
Length: mm216
Width: mm35
Height: mm83
Armor Penetration (mm)/ Kill Mechanism: directional steel fragments
Effective Range (meter): m50
Maximum Firing Range: m250
Detectability/ Composition: visual plastic case (fiberglass)
Anti-Handling: possible
Fuze Type/Self Neutralize: electric command, tripwire, tension, tension release
Explosive Type & Weight/Total Weight (kg): kgC4: .68 Total: 1.60
Sights: Peep sight on early models, later a knife edge sight

Filling: C-4

Detonation Mechansim: Blasting Cap Assembly M4

Muzzle Velocity: m/s1,218

Notes:

The M18A1 Claymore is a directional anti-personnel mine developed for the United States Armed Forces. Its inventor, Norman MacLeod, named the mine after a large medieval Scottish sword. Unlike a conventional land mine, the Claymore is command-detonated and directional, meaning it is fired by remote-control and shoots a pattern of metal balls into the kill zone like a shotgun. The Claymore can also be victim-activated by booby-trapping it with a tripwire firing system for use in area denial operations. The Claymore fires steel balls, out to about 100 m (110 yd) within a 60° arc in front of the device. It is used primarily in ambushes and as an anti-infiltration device against enemy infantry. It is also used against unarmored vehicles. Many countries have developed and used mines like the Claymore. Examples include former Soviet Union models MON-50, MON-90, MON-100, and MON-200, as well as MRUD (Serbia), MAPED F1 (France), and Mini MS-803 (South Africa). The M18A1 Claymore mine has a horizontally convex gray-green plastic case (inert training versions are light blue or green with a light blue band). The shape was developed through experimentation to deliver the optimum distribution of fragments at 50 m (55 yd) range. The case has the words "FRONT TOWARD ENEMY" embossed on the front of the mine. A simple open sight on the top surface allows for aiming the mine. Two pairs of scissor legs attached to the bottom support the mine and allow it to be aimed vertically. On both sides of the sight are fuse wells set at 45 degrees. Internally the mine contains a layer of C-4 explosive behind a matrix of about seven hundred 1⁄8-inch-diameter (3.2 mm) steel balls set into an epoxy resin. When the M18A1 is detonated, the explosion drives the matrix forward, out of the mine at a velocity of 1,200 m/s (3,937 ft/s),[1] at the same time breaking it into individual fragments. The steel balls are projected in a 60° fan-shaped pattern that is 6.5 feet (2.0 m) high and 50 m (55 yd) wide at a range of 50 m (55 yd). The force of the explosion deforms the relatively soft steel balls into a shape similar to a .22 rimfire projectile.[1] These fragments are moderately effective up to a range of 100 m (110 yd), with a hit probability of around 10% on a prone man-sized 1.3-square-foot (0.12 m2) target. The fragments can travel up to 250 m (270 yd). The optimum effective range is 50 m (55 yd), at which the optimal balance is achieved between lethality and area coverage, with a hit probability of 30% on a man-sized target. The weapon and all its accessories are carried in an M7 bandolier ("Claymore bag"). The mine is detonated as the enemy personnel approaches the killing zone. Controlled detonation may be accomplished by use of either an electrical or non-electrical firing system. When mines are employed in the controlled role, they are treated as individual weapons and are reported in the unit fire plan. They are not reported as mines; however, the emplacing unit must ensure that the mines are removed, detonated, or turned over to a relieving unit. The 100-foot (30 m) M4 electric firing wire on a green plastic spool is provided in each bandoleer. The M57 firing device (colloquially referred to as the "clacker") is included with each mine. An M40 circuit test set is packed in each case of six mines. When the mines are daisy-chained together, one firing device can detonate several mines. The mine can be detonated by any mechanism that activates the blasting cap. There are field-expedient methods of detonating the mine by tripwire, or by a timer, but these are rarely used.

PRB M3/PRB M3A1 Belgian Anti-Tank Blast Mine

Tiers:

System

Country of Manufacture: Belgium
Emplacement Method: manual
Length: mm230
Width: mm230
Height: mm130
Armor Penetration/ Kill Mechanism: blast
Effective Range: m1
Detectability/ Composition: very difficult with hand held detectors plastic
Anti-Handling: yes two secondary fuze wells
Fuze Type/Self Neutralize: pressure (250 kg)
Explosive Type & Weight/Total Weight (kg): RDX/TNT 6.5 Total: 6.8
Comment: aka PRB ATK-M3, waterproof
Operating Pressure: kg250

Notes:

The PRB M3 and PRB M3A1 are plastic cased minimum metal anti-tank blast mine produced by the Belgian company Poudreries Réunies de Belgique in the 1970s and 1980s. The mine is square with an olive drab body[2] constructed from polythene with a webbing carrying handle on the side and an ammonia-free bakelite seating for the pressure plate to be screwed into.The fuze well is in the centre of the seating, with the pressure plate screwed into it after the fuze has been inserted. The cylindrical pressure plate consists of two plastic plates, one of which moves under the weight of a vehicle driving over the mine to transmit the force to the fuze,[2] shearing pins which hold it in place. The PRB M3A1 variant has two secondary fuze wells, and is often deployed with a M30 anti-lift device. The M30 fuze detonates the mine if it is lifted more than 3 cm. It is also a minimum metal mine, with the only metal components being two spring steel wire strikers and two aluminium percussion caps. Both versions of the mine are waterproof when new, and can be laid in shallow water, but the mine casing often splits and warps in hot climates, although small splits do not affect the mine's performance.[3] The mines are prone to sympathetic detonation if laid closer together than 2 m. The mine is found in Angola, Chad, Eritrea, Ethiopia, Iraq, Lebanon, Libya, Mali, Rwanda, Somalia, Sudan, the Western Sahara, and Zambia. In April 2011 it was reported that the rebel forces in the 2011 Libyan civil war were deploying these mines, in contravention of earlier promises not to use land mines. The Libyan National Transitional Council subsequently issued a communique promising to stop using anti-personnel and anti-vehicle landmines, and that their forces will be requested to destroy all stocks of landmines.

PT-Mi-Ba-III Czechoslovakian Anti-Tank Blast Mine

Tiers:

System

Emplacement Method: manual, mechanical, chute
Diameter: mm330
Height: mm101
Armor Penetration (mm)/ Kill Mechanism: blast defeats known belly armor
Effective Range (meter): 1
Detectability/ Composition: plastic/bakelite (metal in fuze only-2.9 gr)
Anti-Handling: yes with RO-4 fuze
Fuze Type/Self Neutralize: pressure (200 kg) self-destruct or neutral: no
Explosive Type & Weight/Total Weight (kg): kgTNT 7.2 Total: 9.9

Notes:

The PT Mi-Ba-III is a large Bakelite cased circular Czechoslovakian anti-tank blast mine. It is no longer produced but it is found in Angola, Kuwait, Mozambique, and Namibia. A Bulgarian copy of the mine, the PMT-BA-III exists.

TMA-3 Yugoslavian Anti-Tank Blast Mine

Tiers:

1 2 3 **4**

System

Country of Manufacture: Former Yugoslavia
Emplacement Method: manual, mechanical
Diameter: mm262
Height: mm140 w/fuze 100 w/o fuze
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range (meter): m1
Detectability/ Composition: very difficult with hand held detectors, plastic coating
Anti-Handling: Yes
Fuze Type/Self Neutralize: pressure (180 kg) self-destruct or neutral: no
Explosive Type & Weight/Total Weight (kg): kgcast TNT 6.5 Total: 7.0
Operating Pressure: kg180

Notes:

The TMA-3 is a circular Yugoslavian minimum metal anti-tank blast mine. It is very similar in appearance to the TMA-4. The mine consists of a cast circular block of explosive cased in resin reinforced fabric. The top of the mine has three fuze wells which each take a UTMA-3 fuze, and a fourth secondary fuze well is provided in the base of the mine to fit an anti-handling device. The fuze wells may also accept a number of other fuzes, including the UPROM-1, and other fuzes, potentially allowing tripwire activation. The small pressure plate area of the UTMA-3 fuzes gives the mine good resistance to minefield clearance techniques which used blast overpressure techniques i.e. explosive charges. The mine is found in Albania, Angola, Bosnia, Croatia, Kosovo, Lebanon, and Namibia.

TMD-B Russian Anti-Tank Blast Mine

Tiers:

1 2 3 4

System

Emplacement Method: manual
Length: mm315
Width: mm290
Height: mm160
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range (meter): 1
Detectability/ Composition: difficult with hand held detectors - wood
Anti-Handling: Possible
Fuze Type/Self Neutralize: pressure (200-500 kg) self-destruct or neutral: no
Explosive Type & Weight/Total Weight (kg): TNT 9.0 kg Total: 9.7

Notes:

The TMD-44 and TMD-B are simple rectangular Soviet wooden box cased anti-tank blast mines, they were both used during the Second World War. Both mines are similar in design, differing only in fuzing mechanism. The wooden construction of both the mines makes them unpredictable as rot and insects can eat away the wooden case, reducing activation pressure to as little as 3 kg. Both mines are found in a number of countries including Afghanistan, Angola, Chad, Cuba, Egypt, Korea, Mozambique, Namibia, Rwanda, Yemen, Zambia, and Zimbabwe. he TMD-B was developed before the start of the Second World War and is simply a wooden box filled with explosives, there are three raised boards on the top of the box, the central one being hinged. The central hinged board is locked into place by a strip of wood inserted into a groove that runs along the edge of all three boards. When enough pressure is applied to the top of the mine the boards collapse onto the plunger of the MV-5 detonator, triggering the mine. A fabric carrying handle is typically fixed to one side of the mine. It was normally painted olive green, gray or white. One problem with the mine was that when it got wet the hinged board would tend to swell making it difficult to disarm the mine, this issue was addressed in the TMD-44 mine. The mine has been copied by a number of other countries, including the Chinese Model 1951, the North Korean ATM-72, and the Yugoslavian TDM-1 and TMD-2.

DM-11 German Anti-Tank Blast Mine

Tiers:

System

Country of Manufacture: Germany Sweden (LI-II)
Emplacement Method: manual

Height: mm34
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: mlimited (typical for contact-fuzed blast-effect mines)
Detectability/ Composition: very difficult plastic
Anti-Handling: possible. no 2nd fuze well
Fuze Type/Self Neutralize: pressure (5 kg)
Explosive Type & Weight/Total Weight (kg): kgTNT: 0.12 Total: 0.23
Comment: waterproof

Notes:

The DM-11 is a German anti-tank mine popular in countries of Africa, not suited to be disarmed or neutralized

PT-Mi-Ba II Czechoslovakian Anti-Tank Blast Mine

Tiers:

1 2 3 4

System

Country of Manufacture: Czech
Emplacement Method: manual
Length: mm397
Width: mm230
Height: mm135
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: m1
Detectability/ Composition: difficult plastic or metal
Anti-Handling: probable-1 or 2 fuzes. Any disturbance detonates the mine after it has been emplaced.
Fuze Type/Self Neutralize: Pressure (200 to 450 kg)
Explosive Type & Weight/Total Weight (kg): kgRO-7-II: 6.44 Total: 10.2
Operating Pressure: 200 to 450 kg

Notes:

The PT Mi-Ba-II is a large Bakerlite cased Czechoslovakian anti-tank blast mine. The mine is unusual in that it has two plunger fuses instead of a pressure plate. The plunger fuses give the mine resistance to overpressure, also the plastic body makes it difficult to detect. The mine is no longer produced, and it is found in Africa.

M15 American Anti-Tank Blast Mine

Tiers:

System

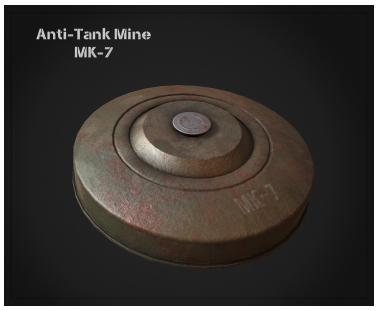
Emplacement Method: manual
Diameter: mm334
Height: mm150
Weight: kg14.3
Armor Penetration / Kill Mechanism: blast
Effective Range: m0, typical with contact mine
Detectability/ Composition: Easy Metal
Anti-Handling: yes 3 fuze wells
Fuze Type/Self Neutralize: pressure (159-340 kg) tilt-rod
Explosive Type & Weight/Total Weight (kg): COMP B 10.3 Total: 14.27
Operating Pressure: 160 to 340 kg (for the M603 pressure fuze)

Notes:

The M15 mine is a large circular United States anti-tank blast mine, first deployed during the Korean War. Essentially, it is a larger version of the M6A2 anti-tank mine, which it replaced. Although the M15 has been superseded by the M19 mine (a plastic-cased minimum metal mine of more modern design), the U.S. retains large stocks of M15s because they are still regarded as reliable and effective weapons. When used against main battle tanks the M15 is primarily a "track-breaker" which creates mobility kills, but has a comparatively small likelihood of causing crew fatalities. However, when used against lighter vehicles such as APCs or unarmored vehicles such as trucks the damage inflicted is much more severe. The mine consists of a large, circular rounded steel case, with a central pressure plate. In the center of the pressure plate is the M4 arming plug, which has an arming lever which can be set to "ARMED" or "SAFE". The pressure plate sits on top of a belleville spring, which in turn rests directly over the M603 fuze. When sufficient downward pressure is applied to the pressure plate (i.e. when a vehicle drives over it) the concertina spring is compressed. This action transfers pressure onto the M603 fuze which fires, triggering detonation. Because this mine has a metallic case, it is very easy to find it using even the most basic mine detector. However, a complicating factor is posed by the two secondary fuze wells. These enable anti-handling devices to be fitted: one on the side of the mine and one underneath. Additionally, a minefield containing M15 mines may also contain a number of minimum metal M19 mines, plus various antipersonnel mines of different types (e.g. the VS-MK2, SB-33, TS-50, PMA-2 or PMA-3), all of which are specifically designed to be difficult to find using metal mine detectors. The M15 mine was originally intended to be fitted with the M600 single-impulse fuze, which contained a glass ampoule of liquid explosive. Unfortunately, the M600 fuze was sensitive to temperature variations and therefore unreliable. For example, freezing temperatures made the mine inert as the liquid froze, whereas temperatures above 50 degrees Celsius could cause the fuze to detonate spontaneously. Just as problematic was the fact that M600 fuzes were inherently unstable, making them dangerous to handle, particularly after having been kept in storage for some time. Because of these shortcomings, the M600 chemical fuze was removed from service around 1953[1] and replaced by the M603 single-impulse fuze, which used a mechanical trigger mechanism i.e. a belleville spring. The

M603 fuze is inherently safe to handle and much more reliable. In addition to the standard M603 fuze, two additional fuzes are available: the M624 tilt-rod fuze (which offers full-width attack capability) and the M608 double-impulse fuze. The M624 fuze requires 3.75 pounds of pressure to move the tilt rod, and once it exceeds 20 degrees of tilt the mine will detonate. The M608 double-impulse fuze will not detonate the mine when the first tank drives over it: instead, it simply arms itself so that the mine detonates when the second vehicle (e.g. an APC or perhaps a truck towing a howitzer) following in the tracks of the first tank drives over it – an event which might occur seconds, hours or even weeks later. The M608 double-impulse fuze is particularly useful when fitted to mines located on the outer edges of minefields, because this gives tanks a false sense of security. The lead tank, for instance, can drive over 30 mines fitted with double-impulse fuzes without detonating any of them. This lures tanks deep into the minefield, where they eventually trigger mines fitted with the M603 or M624 fuze (both of which operate exclusively in single-impulse mode) and become trapped. Attempts to recover the tanks or rescue victims are hindered by the fact that the M608-fitted mines previously driven over are now operating in single-impulse mode, and also because minefields containing M15 mines usually contain various antipersonnel mines as well, for instance the M14 mine and M16 bounding mine. An additional benefit of double-impulse fuzes is that they give mines a degree of protection against clearance techniques which use blast overpressure or mine roller systems.

Mk 7 British Anti-Tank Blast Mine



Tiers:

1 2 3 4

System

Country of Manufacture: United Kingdom
Emplacement Method: manual
Diameter: 325
In Service: The two most modern variants of the mine, the Mk 7/4 (standard) and the Mk 7/7 (waterproof), were taken out of service by the UK by March 2003, after which disposal of existing stockpiles commenced.
Height: mm130
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range (meter): m1
Detectability/ Composition: Easy detect metal
Anti-Handling: Yes
Fuze Type/Self Neutralize: pressure (150 kg), tilt rod available
Explosive Type & Weight/Total Weight (kg): kgTNT 8.9 Total: 13.6
Detonation Mechanism: Double-impulse fuze, tilt-rod fuze (L93A1), anti-handling device

Notes:

The Mk 7 mine was a circular British anti-tank blast mine. It replaced the World War 2-era Mk 5 mine, and has in turn been replaced by the L9 Bar Mine. The Mk 7 can be laid either by hand or from a mechanical mine layer. The mine is conventional in design. It has a steel casing with a central, main fuze well, below which is a tetryl booster charge, both surrounded by the main explosive filling of TNT. The mine can be fitted with a variety of fuzes, including a double-impulse fuze (which gives it some resistance to explosive demining methods) or the L93A1 tilt-rod fuze, which gives it a full width attack capability. The mine has a secondary fuze well for an anti-lifting device and a mechanical anti-handling device was also produced for the mine, although this is reported to have never been used. The mine is currently being phased out of service with the British army. The mine is found in Afghanistan, Angola, Cyprus, Egypt, Eritrea, Ethiopia, Lebanon, Libya, Namibia, Oman, Somalia, and Zambia. The two most modern variants of the mine, the Mk 7/4 (standard) and the Mk 7/7 (waterproof), were taken out of service by the UK by March 2003, after which disposal of existing stockpiles commenced. A Mk 7 was responsible for the deaths of 10 Afghan girls, aged between nine and thirteen years, in December 2012.

TM-62 Russian Anti-Tank Blast Mine

Tiers:

1 2 **3** 4

Variants:

- **TM-62M:** Metallic case
- **TM-62P:** Plastic case
- **TM-62B:** Caseless
- **TM-62D:** Wooden

System

Alternative Designations: none
Date of Introduction: 1960
Proliferation: Over 30 countries
Shape: Circular
Color: Green
Length: mm110
Height: mm101.8
Diameter: mm320
Total Weight: kg8.5
Maximum: 20
Minimum: None
Fuze types (Pressure, seismic, magnetic): Yes
Actuation Force: kg200 /150 to 550
Resistant to Explosive Neutralization: Yes
Operating Pressure: 150 to 550 kg
Explosive Content: 7.5 kg of TNT (although sometimes combinations of RDX/TNT/Aluminium or Amatol mixes are used)

Performance

Armor Penetration: mm27
Effect: Blast

Effective Range: m1

Self-Destruct: No

Underwater Emplacement: Yes

Remotely detonated: Yes

Detonation Height: N/A

Explosive Composition

Type: Pentryt

Weight: 7.5 to 8.3

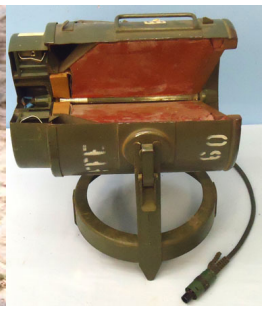
Booster: Yes

Weight-: gr0.75

Notes:

TM-62 is the designation for a series of Soviet anti-tank blast mines. The mines have a central fuze and typically have a 7.5 kg explosive charge, however they vary greatly in detail. The mines can be laid manually or automatically from a mine laying machine including the PMR-1, PMR-2 wheeled towed mine layers, the GMZ tracked mine laying vehicle and the VMR-2 helicopter mine laying system. In a static test, the TM-62M proved capable of penetrating the hull of a Centurion tank, killing the simulated crew of animals inside. The TM-62 series of mines can be fitted with the same fuzes as the TM-72 series of mines, which include MVN-72 and MVN-80 fuzes which are vibration and magnetism sensitive. Variants TM-62M - The TM-62M uses a circular metal case. It is the most widely employed of the TM-62 series of mines. TM-62B - The TM-62B paper or cardboard case and is basically a block of cast explosive with a fuze set into the center. TM-62D - The TM-62D uses a wooden case. TM-62P, TM-62P2, TM-62P3 - all 3 types use plastic cases. However, the TM-62P and TM-62P2 mine cases have ribbed sides, whereas the TM-62P3 has a smooth casing. TM-62T - The TM-62T has a fabric and epoxy casing, with a central fuze. Fuzes MVZ-62 MVCh-62 - The MVCh-62 uses a clockwork arming delay of 30 to 120 seconds. MVN-62 MVN-72 - The MVN-72 fuze uses a combination of electronics and clockwork, after an initial arming delay the magnetic influence fuze is enabled, powered by a 1.5 V battery. MVN-80 - The MVN-80 is an improved version of the MVN-72 fuze. VM-62Z MVP-62 - The MVP-62 uses a pneumatic bellows arming delay of 20 to 300 seconds. The delay mechanism uses a minimum of metal making it difficult to detect when used with one of the minimum metal cases. MVP-62M ZN-97 - magnetic influence fuze (made in Poland). Note: magnetic influence fuzes give full-width attack i.e. any part of the target vehicle passing over the mine will trigger detonation, not just the track or wheels. However, since magnetic fuzes are electronic, their operational life relies on battery power. Ultimately the battery will run down, after which the mine no longer functions. In contrast, a purely mechanical fuze (usually triggered via a belleville spring) gives a much longer operational life e.g. mines planted 50 years previously will still detonate if a target vehicle drives over them.

MIACAH F1 French Anti-Tank Landmine



Tiers:

1 2 **3** 4

System

Country of Manufacture: France UK (L14A1) Netherlands (#29)
# of User Countries: 4+
Emplacement Method: manual
Length: mm260
Diameter: mm200
Height: INA
Armor Penetration (mm)/ Kill Mechanism: 70 RHAE @ 40 m shapedcharge
Effective Range: m80
Detectability/ Composition: visual metal
Anti-Handling: No
Fuze Type/Self Neutralize: Break wire, command, IR influence neutralize: no
Explosive Type & Weight/Total Weight (kg): kgHexolite: 7 Total: 12

Notes:

The MIACAH F1 (L14A1 in British service) is a French off-route anti-tank landmine. It uses a large Misznay Schardin effect warhead to project a powerful self forging fragment capable of penetrating 70 millimetres of armour at a range of 40 metres. The mine consists of a horizontal cylindrical main body with a large inset plate in the front. The detonator protrudes from the centre of the front plate. The main body is supported on two arms which are attached to a circular base with three stakes. The mine can be triggered by a 50-metre breakwire, command or electronically triggered by an external sensor. The mine is no longer in production, and has been withdrawn from service from the French and British armies. The mine has been reported in Iraq.

MPB Polish Anti-Tank Mine

Tiers:

System

Country of Manufacturer: Poland
Emplacement Method: manual
Length: mm450
Width: mm390
Height: mm700
Weight: kg45
Armor Penetration (mm)/ Kill Mechanism: EFP
Effective Range: m50
Detectability/ Composition: visual metal
Anti-Handling: Yes
Fuze Type/Self Neutralize: Acoustic and Infrared Contact (K Model)
Explosive Type & Weight/Total Weight (kg): kgTNT: 22(est.) Total: 45

Notes:

The MPB is a Polish off-route anti-tank mine. It was developed by BELMA (BZE BELMA S.A.) with its partner Military Institute of Engineer Technology. The MPB consists of a metal cylinder filled with explosives, mounted horizontally in an adjustable frame. The mine is intended to be hidden from direct view of the intended target, off to the side of a probable vehicle route, usually a road, to attack the weaker armour on the sides and rear of a vehicle. The mine can be triggered by either a contact fuze (MPB-ZK variant) or an influence fuze (MPB-ZN variant) based on infra-red and acoustic sensors, and is also fitted with an anti-handling device. When used with the passive infrared fuze, an acoustic sensor detects approaching vehicles and activates the infra-red sensor, which triggers the mine at an optimal moment as the target passes. The mine can be programmed to self-destruct after either 1, 10 or 30 days have passed. The mine uses the Misznay–Schardin effect to project an explosively formed projectile to an effective range of roughly 50 meters, where it can penetrate up to 100 millimeters of rolled homogeneous armour (RHA) plate. The energy carried by the projectile is large enough that it can often significantly damage a vehicle that it hits.

TMM-1 Yugoslavian Anti-Tank Blast Mine

Tiers:

System

Country of Manufacture: Yugoslavia
# of User Countries: 2+
Emplacement Method: manual, mechanical
Diameter: mm326
Height (mm): mm90
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: mcontact
Detectability/ Composition: easy to detect metal
Anti-Handling: probable- 2nd fuze well
Fuze Type/Self Neutralize: Pressure (130 w/pressure plate-70 w/o plate) selfdestruct
Explosive Type & Weight/Total Weight (kg): kgTNT 5.6 Total: 8.7
Operating Pressure: 130 to 420 kg
Comment: Commonly surface laid and use extensively in roadblocks. Limited underwater to .25 m

Notes:

The TMM-1 is a circular, metal-cased, Yugoslavian anti-tank blast mine. It is a direct copy of the German Tellermine 43. The mine has a central fuze well that is covered by a screw on pressure plate. Two secondary fuze well are fitted to the side and bottom of the mine allowing the installation of anti-handling devices. The mine is found in Bosnia, Croatia, and Kosovo.

PT-Mi-K Czechoslovakian Anti-Tank Landmine

Tiers:

System

Country of Manufacture: Czechoslovakia	
Emplacement Method: manual, mechanical	
Diameter: mm300	
Height: mm106	
Weight: kg7.2	
Armor Penetration (mm)/ Kill Mechanism: blast	
Effective Range: mcontact	
Detectability/ Composition: easy detect metal	
Anti-Handling: possible	
Fuze Type/Self Neutralize: pressure (200-400KG)	
Explosive Type & Weight/Total Weight (kg): kgTNT: 4.9 Total: 7.6	
Activation Pressure: kg330	

Notes:

The PT Mi-K is a Czechoslovakian metal-cased anti-tank blast landmine. The mine uses a metal grid instead a pressure plate, this gives it resistance to overpressure. The mine is no longer produced, but is found in Afghanistan, Cambodia, Eritrea, Namibia, Nicaragua and the Western Sahara. The mine has a circular metal case inside which is the doughnut shaped main charge, in the centre of which the fuse is inserted. On top of the mine is a metal pressure grid. The grid is held in place by a thin metal wall. Sufficient pressure on the grid causes the wall to collapse sideways, allowing the grid to press down on a plunger triggering a 3.5 oz (0.1 kg) Toul (Tetryl) booster charge, detonating the mine. The mine can be fitted with two main fuzes, the RO-5 and the RO-9 fuse. The RO-5 fuse may be fitted with an RO-3 anti-lifting device, which will trigger the mine if it is raised.

TM-57 Russian Anti-Tank Blast Mine

Tiers:

1 2 3 4

System

Country of Manufacture: Russia
Emplacement Method: manual, mechanical, chute
Diameter: mm316
Height: mm101
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: m1
Detectability/ Composition: easy, sheet metal
Anti-Handling: yes
Fuze Type/Self Neutralize: pressure (200/2.5/.5- 6 kg) delayarmed, tilt rod, pull (booby trap) neutralize:no
Explosive Type & Weight/Total Weight (kg): kgTNT or TGA 60/24/16: 6.3 Total: 8.47
Operating PRessure: 120–400 kg or 21 kg tilt.

Notes:

The TM-57 mine is a large, circular Soviet metal-cased blast anti-tank mine. It can either be triggered by a pressure or a tilt-rod fuze. A development of the TM-46 mine, it is found in Africa, the Middle East, and South East Asia. The TM-57 has a larger main charge and improved fuzing compared to the earlier TM-46. It is circular with a metal case and a central fuze well. A secondary MUV or VPF fuze can be fitted on the side of the mine, which serves as an anti-handling device. The tilt rod fuze gives the mine improved resistance to blast; it is activated when it is forced to a deflection of 25 to 30 degrees. A training version of the mine that produces smoke is designated the TM-60.

Mk 3 British Anti-Tank Mine

Tiers:

System

Country of Manufacture: Great Britain
# of User Countries: 6+
Emplacement Method: manual
Diameter: 150
Height: 133
Weight: kg2.6
Armor Penetration (mm)/ Kill Mechanism: blast
Filling: TNT
Detonation Mechanism: Pressure plate

TM-89 Russian Anti-Tank Mine

Tiers:

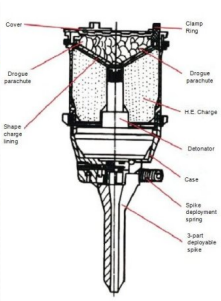
System

Country of Manufacture: FSU
# of User Countries: 15+
Emplacement Method: manual, mechanical
Diameter: mm320
Height: mm132
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: mproximity
Detectability/ Composition: Metal
Anti-Handling: Probable
Fuze Type/Self Neutralize: pressure, magnetic, and electrically
Explosive Type & Weight/Total Weight (kg): kgTG-40 6.7 Total: 11.5

Notes:

The TM-89 is a Russian anti-tank mine first publicly shown in 1993. The mine uses a Misznay Schardin effect warhead capable of producing a 60 mm diameter hole in 100 mm of armour. The mine is fitted with a two-channel magnetic influence fuze, and can be laid from the GMZ-3 mine layer or by the VMR-2 helicopter mine layer.

Type 84 Chinese Anti-Tank Mine



Tiers:

1 **2** 3 4

Variants:

- **Delivered by GLD220 rocket:** Magnetic influence fuse, disarms after 72 hours when the battery becomes discharged.
- **Delivered by GLD220A rocket:** Magnetic influence fuse, self-destructs after a factory pre-set time (4.5, 13.6, 22.8, 36.4, or 72 hours)
- **Delivered by GLD221 rocket:** Tilt-rod fuse

System

Alternate Designation: NA

Type: Rocket Delivered Anti-Tank Mine

Manufacturer: INA

Dimensions

Diameter: mm114

Height: mm160

Weight: kg3.12

Notes:

The Type 84 is a Chinese air-dispersed scatterable anti-tank mine, normally deployed by a rocket. The rockets are launched from a BM-21 Grad or similar multiple rocket launcher system that can hold up to 24 of the rockets. A time fuse on the rocket is set before launch, which activates at a predetermined distance after firing. Upon activation, the rocket head bursts, ejecting the mines, which descend with small green parachutes that slow their fall. The mine consists of a cylindrical body with three prong legs that form a spike, which pierces the ground and arms the mine. If the mine strikes soft ground, the spike is driven into the ground and the mine is held upright. Three variants of the mine exist: one with a magnetic fuse which detonates upon magnetic influence, one with a self-extending tilt rod fuse, and another with a contact baffle. In addition, the magnetic fuse mine has an anti-handling device. The mine's penetrator warhead uses the Misznay-Schardin effect to project an explosively formed penetrator to penetrate up to 110 millimetres of rolled homogeneous armor. The mines also have a self-destruct function which can be set to between 4 and 72 hours, and will disarm itself after 72 hours.

TM-83 Russian Anti-Tank Mine

Tiers:

1 **2** 3 4

System

Alternative Designations: none

Date of Introduction: INA

Proliferation: Over 13 countries

Shape: Cylinder

Color: Green or Yellow

Height: mm440

Diameter: mm250

Total Weight (kg): kg20.4

Maximum: INA

Minimum: INA

Fuze types (Pressure, seismic, magnetic): Yes

Actuation Force: INA

Resistant to Explosive Neutralization: Yes

Performance

Armor Penetration: mm100

Effect: EFP, side-attack

Effective Range: m50

Self-Destruct: 30

Underwater Emplacement: INA

Remotely detonated: Yes

Detonation Height: INA

Explosive Composition

Type: TG40/60

Weight: kg9.6

Booster: INA

Weight (gr): INA

Notes:

The TM-83 is a Soviet off-route anti-tank mine, first shown publicly in 1993. The mine consists of a large Misznay Schardin effect warhead and infra-red and seismic sensors. The mine is positioned 5 metres from the road it is intended to attack and aimed using an integrated sight. The seismic sensor detects an approaching vehicle and activates the infra-red sensor. When the vehicle reaches the optimum target point the warhead is triggered. The mine can also be remotely triggered from up to 100 meters away. The mine can remain operational for up to 30 days. Armour penetration is claimed to be 100–400 mm at a range of 50 meters.

TM-46 Russian Anti-Tank Mine

Tiers:

System

Country of Manufacture: FSU North Korea (ATM-46) Germany Bulgaria Egypt (M/71) Israel (No. 6)
# of User Countries: 28+
Emplacement Method: manual, mechanical
Diameter: mm306
Height (mm): mm94
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range (meter): m1
Detectability/ Composition: easy to detect, sheet metal
Anti-Handling: TMN-46 yes
Fuze Type/Self Neutralize: pressure (180/132 kg), tilt rod neutralize: no
Explosive Type & Weight/Total Weight (kg): kgTNT, amatol 2.9 Total: 5.7
Operating Pressure: 120–400 kg (21 kg tilt pressure)
Comment: The TM-46 and TMN-46 are identical except for the additional fuze well

Notes:

The TM-46 mine is a large, circular, metal-cased Soviet anti-tank mine. It uses either a pressure fuze or tilt-rod, which is screwed into the top. Anti-tank mines with this type of fuze were capable of inflicting much more damage to armored vehicles.[1] The TMN-46 is a variant of the mine fitted with a secondary fuze well on the bottom (where it cannot be seen) which is slightly off-set from the centre of the mine. This secondary fuze well can be fitted with a pull-fuze which functions as an anti-handling device. The mine was used by the North Vietnamese forces during the Vietnam War, and is found in many countries in Africa, the Middle East and South East Asia. Because the TM-46 has a metal casing, it is very easy to detect with a mine-detector. However, mine-fields containing TM-46s may have also been sown with minimum metal mines, e.g. the PMA-2.

M19 American Anti-Tank Blast Mine

Tiers:

1 2 3 4

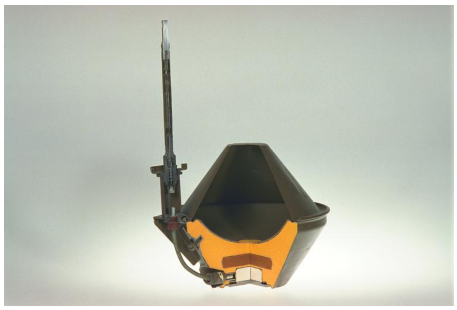
System

Country of Manufacture: US Chile Iran South Korea Turkey
# of User Countries: 13
Emplacement Method: manual
Length: mm332
Width: mm332
Height: mm94
Armor Penetration (mm)/ Kill Mechanism: Blast
Effective Range (meter): m1
Detectability/ Composition: difficult with hand held detectors, plastic
Anti-Handling: Yes
Fuze Type/Self Neutralize: pressure (182 kg)
Explosive Type & Weight/Total Weight (kg): kgCOMP B 9.5 Total: 12.6
Operating Pressure: 118 to 226 kg (although possibly as low as 90 kg)

Notes:

The M19 is a large square plastic cased United States anti-tank blast mine. Intended to replace the M15 mine, the design dates from the mid-1960s and contains only two metal components: the copper detonator capsule and a stainless steel firing pin which weighs 2.86 grams. It is a minimum metal mine, which makes it very difficult to detect after it has been emplaced. This mine is produced under licence in Chile, South Korea and Turkey. A copy is produced in Iran. It is found in Afghanistan, Angola, Chad, Chile, Cyprus, Iran, Iraq, Jordan, South Korea, Lebanon, the Western Sahara, and Zambia. U.S. stocks of the mine were approximately 74,000 before the 1990 Gulf war and had fallen to 63,000 by 2002. An inert version of the mine intended for training purposes (called the M80) is also produced. The plastic casing of the mine is usually dark olive green, and has a large central fuze well. Normally it has a carrying handle on one side. The mine is normally fitted with the M606 fuze which has an arming switch with two settings, S(afe) and A(rmed). These markings are either painted in yellow or embossed into the plastic. When the switch is set to "A" and the safety clip is removed, the mine will detonate if a vehicle drives over it. The firing mechanism is triggered by a belleville spring which flips the firing pin downwards into the stab detonator, setting off the adjacent booster charge and main explosive filling. The mine is also fitted with two secondary fuze wells which allow anti-handling devices to be fitted e.g. the M1 pull fuze or M5 "mouse-trap" anti-lift fuze. Either or both of the secondary fuze wells on an M19 mine may be fitted with an anti handling device. It is worth noting that a minefield containing M19s is usually protected by various anti-personnel mines such as the M14 and M16 bounding mine.

TMK-2 Russian Anti-Tank Mine



Tiers:

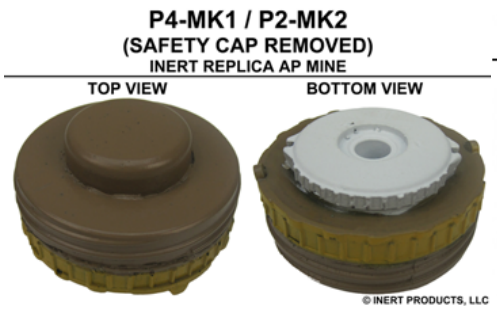
System

Country of Manufacture: FSU
# of User Countries: 13+
Emplacement Method: manual, Tilt-rod
Length: mmD max: 301 D min: 75
Width: mmD max: 301 D min: 75
Height: mm262 w/o
Armor Penetration (mm)/ Kill Mechanism: 250 RHAE belly attack plate charge
Effective Range: m1
Detectability/ Composition: Easy Metal
Anti-Handling: Possible
Fuze Type/Self Neutralize: tilt rod (8-12kg) self-destruct or neutral: no
Explosive Type & Weight/Total Weight (kg): kgTG-50, TNT Total: 12.5
Operating Pressure: 8 to 12 kg tilt

Notes:

The TMK-2 is a Soviet steel cased anti-tank mine. It uses a tilt-rod fuze combined with a shaped charge to attack the belly of vehicles as they pass over the mine. It was originally designed in 1955, but is now obsolete. The mine consists of a case shaped like two truncated cones joined at the base. The MVK-2 tilt rod assembly is held to one side of the mine. The lower truncated cone contains the main charge, and dished metal charge liner. When a vehicle passes over the mine, the tilt rod is bent by 24 to 36 degrees, which allows retaining balls holding the striker to escape, which is driven by a spring into the MD-7M detonator. This then ignites a detonator cord, which carries the detonation wave into the main body of the mine and the DUM-2 detonator, fixed at the bottom of the main charge. The main charge is triggered, and the blast wave travels around a wave shaper, which improves the efficiency of the shaped charge. The resulting blast can penetrate between 60 and 110 millimeters of around depending on if the slightly less powerful TNT, or the more powerful TG-50 explosive is used. It is found in Afghanistan, Angola, Azerbaijan, Eritrea, Ethiopia, Iraq, Mozambique and Namibia.

P2 Mk 2 / P3 Mk 2 Pakistani Anti-Tank Blast Mine



Tiers:

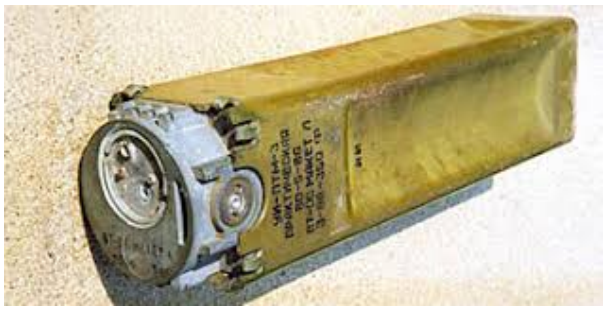
System

Country of Manufacture: Pakistan
# of User Countries: 5+
Emplacement Method: manual
Diameter: mm270
Height: mm130
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: m0, typical with contact mine
Detectability/ Composition: very difficult plastic, only metal is spring, striker tip, and shear wire
Anti-Handling: probable- 2nd fuze well
Fuze Type/Self Neutralize: pressure (180-300 kg)
Explosive Type & Weight/Total Weight (kg): kg6 Total: 6.5
Operating Pressure: 180 to 300 kg when fitted with pressure plate, 10 kg without
Comment: Very difficult to detect w/hand held-detectors. Can also be used as very large AP mine

Notes:

The P2 Mk2 and P3 Mk2 are Pakistani plastic cased minimum metal anti-tank blast mines. The P2 Mk2 has a square case with a central circular ribbed pressure plate, the P3 is circular with a central circular pressure plate. Both mines use anti-personnel mines as the fuse, typically the either the P4 Mk1 or P2 Mk2 anti-personnel mines. The anti-personnel mine sits in a cavity below the pressure plate, when enough pressure is place on the pressure plate of the mine, it collapses onto the anti-personnel mine triggering it and the main charge which sits below it. A yellow canvas carrying strap is normally fitted to the side of the mine. The mines have a secondary fuse well on the bottom which can be used with anti-handling devices. A GLM-2 electronic booby trap can be fitted to the cavity under the pressure plate. The mine is supplied with a steel disc which makes the mine more easily detectable, although this is seldom used. Since 1997 only a detectable version of the mine has been produced, and to comply with the Convention on Conventional Weapons amended protocol II, Pakistani stocks of the mine are being retrofitted with steel detection discs. The mines are found in Afghanistan, Angola, Eritrea, Ethiopia, Pakistan, Somalia, and Tajikistan.

PTM-3 Russian Anti-Tank Mine



Tiers:

1 2 **3** 4

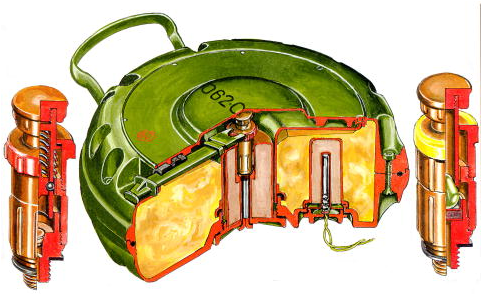
System

Country of Manufacture: FSU
# of User Countries: 12+
Emplacement Method: remote-surface: UMZ, helicopter, PKM portable inf
Length: mm330
Width: mm84
Height: INA
Armor Penetration (mm)/ Kill Mechanism: 70 mm: penetrates tank belly & destroys running gear
Effective Range: m1
Detectability/ Composition: visual mine detectors cause detonation plastic
Anti-Handling: Yees
Fuze Type/Self Neutralize: proximity, magnetic self-destruct: yes-16 to 24 hrs
Explosive Type & Weight/Total Weight (kg): kgTG-40: 1.8 Total: 5
Comment:

Notes:

The PTM-3 is a Soviet scatterable anti-tank mine that can be deployed either by hand, vehicle, artillery, or helicopter. The mine's case is configured to produce a shaped charge effect on five sides. Once deployed the mine arms itself after sixty seconds. The mine uses a magnetic influence fuze that detonates the mine when a vehicle passes over it. It is also reported to have an anti-handling device which is sensitive to movement.

PM-60 (K-1) German Anti-Tank Blast Mine



Tiers:

System

Country of Manufacture: Former E. Germany
# of User Countries: 5+
Emplacement Method: manual
Diameter: mmD (max): 320 D (min): 237
Height: mm125
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: m0, typical with contact mine
Detectability/ Composition: somewhat difficult (only 20 gr metal) plastic
Anti-Handling: probable 2nd fuze well
Fuze Type/Self Neutralize: pressure (200-500 kg)
Explosive Type & Weight/Total Weight (kg): kgTNT 9.9 Total: 11
Activation Pressure: 200 to 500 kg
Comment: waterproof

Notes:

The PM-60 or K-1 is a German round plastic cased minimum metal anti-tank blast mine. The case of the mine consists of two halves joined together by sixteen plastic nuts, giving the mine a distinctive appearance. The top of the mine has a large pressure plate which rests on top of the fuze assembly. Two fuzes are available for the mine, a conventional ball bearing retained striker and a chemical fuze, containing a glass ampule of acid over a flash composition. When the mine is deployed with the chemical fuze it is very difficult to detect because the only metal in the mine is the detonator capsule. There is a secondary fuze well on the bottom of the mine that can accept a fuze allowing remote command detonation of the mine. The mine was originally produced in East Germany by the State factories, but is no longer produced. It is found in Eritrea and Ethiopia.

TM-41 Russian Anti-Tank Mine

Tiers:

1 2 3 **4**

System

Country of Manufacture: FSU China North Korea Cambodia
# of User Countries: 10+
Emplacement Method: manual
Length: mm252
Height: mm145
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: mcontact
Detectability/ Composition: Metal
Anti-Handling: No
Fuze Type/Self Neutralize: pressure (160 kg no)
Explosive Type & Weight/Total Weight (kg): kgTNT: 4 Total: 5.4
Activation Pressure: kg160
Comment: Can be used underwater

Notes:

The TM-41 was a circular, metal-cased Soviet anti-tank landmine used during the Second World War. The mines case consisted of a short cylinder with the entire top surface being used as a pressure plate. The mine has a carrying handle on the side of the mine. It was normally painted olive drab and was broadly similar to the larger, later, TM-44 mine. The mine could be waterproofed with washers and laid underwater, where it can remain operational for two months. Pressure on the pressure plate resulted in lock balls being force out of position, releasing a striker, which triggers a detonator, then a booster and then the mines main charge. The mine was used with anti-handling devices. A Chinese copy of the mine was also produced.

AHM-200 Bulgarian Anti-Helicopter Mine

Tiers:

System

Country of Manufacture: Bulgaria
Emplacement Method: manual
Armor Penetration / Kill Mechanism: 10mm @ 100 m
Effective Range: mmax 200
Detectability/ Composition: visual
Target Velocity: INA
Fuze Type: combined acoustic & Doppler SHF
Warhead Type/Total Weight: Total weight: 90 kg

Notes:

The 4AHM-100, AHM-200, AHM-200-1, AHM-200-2, PMN-150, and PMN-250 are Bulgarian directional fragmentation mines that can be used with proximity fuzes to function as anti-helicopter mines. The systems were developed by the Bulgarian Institute of Metal Science, and are based around electronic fuzes with broadly similar functionality. The fuzes use two sensors. The first, an acoustic sensor, arms the mine as a helicopter approaches. The second sensor is a radar, which locates the target and triggers the mine at the appropriate point. The mines all use a number of large Misznay Schardin effect warheads to project large numbers of fragments to an effective range of around 200 meters. Jane's Mines and Mine Clearance speculates that IFF could be integrated into the fuze circuit to discriminate against friendly aircraft, lowering the chances of friendly fire. The AHM-200 weighs 35 kilograms and contains 12 kilograms of TNT. The mine's warhead has two sections, a large rectangular warhead with a pre-notched fragmentation liner that produces 1,960 fragments, and a secondary warhead with five Misznay Schardin plates that produce large self-forging fragments. The fragments scatter in an arc of 20 degrees to an effective range of 200 meters, and will penetrate 10 millimeters of armour at 100 meters.

Helkir Austrian Anti-Helicopter Mine

Tiers:

1 2 3 4

System

Country of Manufacture: Austria

# of User Countries: 1

Emplacement Method: manual

Armor Penetration (mm)/ Kill Mechanism: 6 @ 50 m 2 @ 150 m

Maximum Effective Range: m500

Detectability/ Composition: visual

Target Velocity: INA

Fuze Type: dual acoustic & IR

Warhead Type/Total Weight (kg): Total weight: 43 kg

Status: in production

Detonation Mechanism: Acoustic & IR sensors

Detectability

Ready: Visual

Explosive Composition

Type: INA

Weight: kg20

Fuze/Sensor

Types: Dual, Acoustic, and IR

Number of Fuze Wells: INA

Resistant to Explosive Neutralization: Yes

Performance

Armor Penetration: mm6 @ 50 m or 2 @ 150 m

Effect: Directed Fragmentation

Effective Range: m150

Target Speed: km/h250

Emplacement Method: Manual

Controllable (remotely detonated): Yes

Antihandling Device: Yes

Self-destruct: INA

Notes:

The Helkir is an anti-helicopter mine developed by the Austrian company Hirtenberger. It uses an IR sensor and an acoustic sensor to detect airborne targets. Once the mine is armed and ready to engage, the acoustic sensor listens for a valid noise input. This enables the IR sensor which is located coaxially to the warhead. When the IR sensor detects a hot signature, the mine blasts off fragments that can penetrate up to 6 mm of armored steel at 50 meters and 2 mm of mild steel at 150 meters. The mine is active for a period of 1 to 120 days, after which it returns to a safe mode. Helkir, as well as other mines developed by Hirtenberger, like the APM-1 and the APM-2 anti-personnel directional mines (discontinued in 1994), do not appear on the company's current website.

→→Other Types of Landmines

UKA-63 Hungarian Multipurpose Landmine

Tiers:

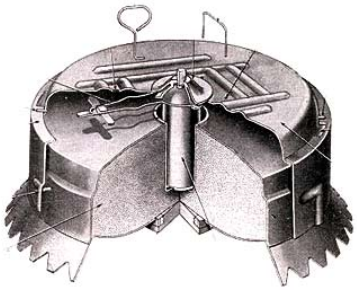
System

Country of Manufacture: Hungary
Emplacement Method: manual mechanical scatterable chute
Diameter: mm300
Height: mm75
Armor Penetration (mm)/ Kill Mechanism: explosively formed fragments
Effective Range: mPlate charge. Trackattack; sideattack effective 0 to 50 meters (see note)
Detectability/ Composition: easy metal
Anti-Handling: Probable
Fuze Type/Self Neutralize: pressure, seismic, magnetic, and electrically fired command detonated, tilt-rod neutralize: no
Explosive Type & Weight/Total Weight (kg): kgTNT 6 Total: 9
Comment: Can operate as a belly-attack, track-attack, or side-attack mine. The plate-charge will probably have only limited success against tank armor in side-attack mode but is successful against lightly armored vehicles.

Notes:

The UKA-63 is a cylindrical mine with a plate-charge lethal mechanism. The UKA-63 is multipurpose in that it can operate as a belly-attack, track-attack, or side-attack mine with effective ranges from 0 to 50 meters. The plate-charge will probably have only limited success against tank armor when used in the side-attack mode but would be very successful against lightly armored vehicles. The size of this mine is consistent with that of other mines manufactured by the former Warsaw Pact countries. The UKA-63 can be emplaced mechanically as well as manually and by means of a chute. Although not expected to be encountered, there is a whole family of other fuzes designed for use in this mine, including a tilt-rod fuze. The UKA-63 is a metallic-cased cylindrical mine which produces its effect by means of explosively formed fragments. Few technical details are known, but comparative analysis of this and other similar mines has yielded some information. It is reported that four fuzing schemes are possible of which only a tilt-rod fuze is known. Other candidate fuzes are pressure, seismic, magnetic, and electrically fired command detonated. The UKA-63 is unique in that it can supposedly operate as a belly-attack, track-attack, or side-attack mine with effective ranges from 0 to 50 meters. Penetration is unknown. The size of this mine is consistent with that of other former Warsaw Pact mines, which can be emplaced mechanically as well as manually and by means of a chute. Counter-countermeasures are reported but only in general terms; counterblast and antidisturbance features are suspected. A training version is available. The mine is OD green.

PMZ-40 Russian Multi-Purpose Landmine



Tiers:

System

Emplacement Method: manual	
Length (mm): D: 280	
Width (mm): INA	
Height (mm): 120	
Armor Penetration (mm)/ Kill Mechanism: blast	
Effective Range (meter): contact	
Detectability/ Composition: Easy, steel	
Anti-Handling: possible no 2nd fuze well or AD features	
Fuze Type/Self Neutralize: pressure (225 AT or 68 AP) self-destruct or neutralize: no	
Explosive Type & Weight/Total Weight (kg): TNT 3.6 Total: 9	
Comment: The AP/AT feature allows a single type mine to be used in a mixed minefield. Preferable in roadblocks. Replaced by the TM- 41 AT mine	

Notes:

The PMZ-40 was a circular metal-cased Soviet multi-purpose landmine used during the Second World War. It was similar in design to the earlier Finnish Panssarimiina m/36 which was used during the Winter War. The mine had a serrated lower edge that allowed it to be deployed on sheet ice. The pressure plate was held over the fuse by four sheer bolts, rotating the pressure plate allows it to rest directly on the fuse, making it sensitive enough to be used as an anti-personnel mine. The mine proved to be too dangerous to use, and was replaced by the TM-41 anti-tank mine.

PARM 2 German Off-Route Mine

Tiers:

Variants:

- **PARM 1 (DM-12):** The PARM 1 is mounted on a small tripod, allowing it to be traversed through 360 degrees and elevated to 90 degrees and depressed to -45 degrees. The mine is manually emplaced, and incorporates an arming delay of five minutes. It can be either command detonated or by a fibre optic trigger cable, which triggers the mine when it is crushed. The mine has an effective range of between 2 and 40 metres. The rocket has a velocity of approximately 120 metres per second, and has a claimed armour penetration of 600 millimeters.

System

Country of Manufacturer: Germany
Emplacement Method: manual
Length: INA
Height: 300 to 700 mm
Warhead Diameter: mm110
Weight: kg20
Warhead Weight: kg1.9
Armor Penetration (mm)/ Kill Mechanism: 600 rocket propelled shaped-charge
Effective Range: 4 to 100 m
Detectability/ Composition: visual metal
Anti-Handling: No
Fuze Type/Self Neutralize: neutralize: 20, 40, 60 days

Notes:

The PARM 1 (DM-12) and PARM 2 are German off-route mines that fire small fin stabilized rockets. The mine was developed in the early 1980s to meet the US MIL-STD-331A and US MIL-STD-810C requirements. Trials of the mine were conducted between March 1983 and March 1988. In June 1988 it was accepted into service with the German army, with the Army receiving the first batch of 25,000 between 1991 and 1994. The PARM 2 was a development of PARM 1 incorporating an infra-red sensor, and an improved rocket. The PARM 2 incorporates an infra-red sensor, the SAPIR, which acts to accurately fire the rocket to ranges up to 100 meters. The warhead of the PARM 2 has been upgraded, with an armour penetration of 750 millimeters and a capability against reactive armour. It can be programmed to be active from between hours and 30 days.

PARM 1 (DM-12) German Off-Route Mine

Tiers:

Variants:

- **PARM 2:** The PARM 2 incorporates an infra-red sensor, the SAPIR, which acts to accurately fire the rocket to ranges up to 100 meters. The warhead of the PARM 2 has been upgraded, with an armour penetration of 750 millimeters and a capability against reactive armour. It can be programmed to be active from between hours and 30 days.

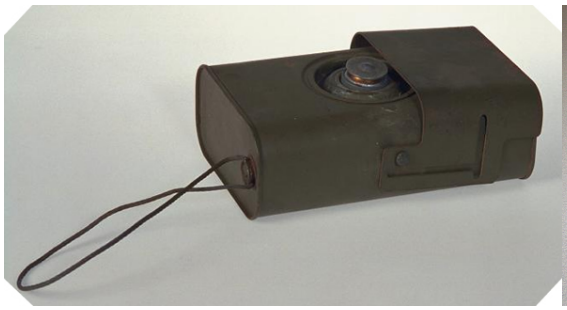
M7A2 American Anti-Vehicle Mine



Tiers:

1 2 3 **4**

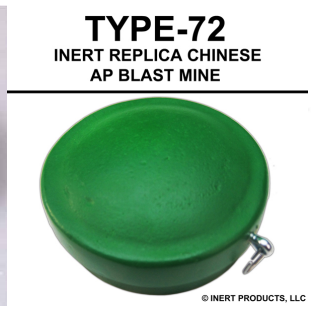
System

Country of Manufacturer: USA
Emplacement Method: manual
Length: mm178
Width: mm114
Height: mm63
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: msee note
Detectability/ Composition: Easy metal
Anti-Handling: Yes Two Fuze wells
Fuze Type/Self Neutralize: pressure (159-340 kg)
Explosive Type & Weight/Total Weight (kg): kgTetryl 1.62 Total: 2.19
Comment: Designed more as anti-vehicle (trucks and LAVs) For tanks 2–5 mines used

Notes:

The American M7A2 is a rectangular, sheet metal bodied, anti-vehicle landmine which is designed to damage or destroy vehicles by its blast effect. The landmine has rounded edges and crimped on end covers with a prominent filling plug in one end. The fuze cavity is open and the M603 pressure fuze is exposed. The pressure plate is slotted and is secured to the sides of the landmine body by two rivets. The landmine has an anti-disturbance fuze cavity which is often used to hold the main firing system. Because of its low explosive content, the landmine is often stacked (two together) for greater effect. The M7A2 can be located using metal detectors under most field conditions as well as visually if set in the tripwire mode.

Type 72 Chinese Landmine



Tiers:

System

Country of Manufacture: China, S. Africa
# of User Countries: 10+ Angola Bosnia Herzegovina Cambodia China Eritrea Ethiopia Iraq Jordan Lebanon Mozambique Rwanda Somalia South Africa Sudan Uganda Zambia
Emplacement Method: manual, mechanical, scatterable
Diameter: mm270
Height: mm100
Armor Penetration (mm)/ Kill Mechanism: blast
Effective Range: mcontact
Detectability/ Composition: very difficult plastic
Anti-Handling: possible
Fuze Type/Self Neutralize: pressure (300 to 800 kg) self-destruct or neutralize : no
Explosive Type & Weight/Total Weight (kg): kgTNT/RDX 5.4 Total: 6.5
Operating Pressure: 300 to 800 kg
Comment: Very difficult to detect with hand held detectors underwater: yes

Notes:

Type 72 Non-Metallic is a Chinese circular, plastic bodied landmine which is designed to damage or destroy a vehicle by blast effect. The mine has a slightly domed pressure plate made from flexible plastic with a raised 6 spoke wagon wheel pattern on top. Type 72 has a telescopic carrying handle molded into the bottom of the mine and a large diameter filler plug on the side just above the handle position. The mine has a crimp around the top edge where the mine body meets the pressure plate. The mine contains 5.4 kg of 50:50 RDX/TNT and is actuated when pressure of 300 kg deforms the flexible plastic pressure plate long enough to release the cocked striker fuze. When the pressure plate is moved approximately 9 mm downwards it exerts pressure on the fuze. If fuzed with the T-72 clear plastic-cased blast resistant fuze, pressure on the top of the fuze will depress the casing which will revolve due to the depression of the spring which is attached to the casing. The revolution is controlled by lugs on the inner fuze assembly which fit in grooves in the fuze casing. When the fuze casing is revolved and depressed sufficiently, the two retaining balls to will fall away in groove in the outer casing, which releases the striker. The striker is driven down by the spring, initiating the detonator, which in turn initiates the booster and the main charge. The mine is blast resistant since rapid depression of the fuze will push the fuze casing straight down without any revolution. The lugs on the inner fuze assembly will then slide into vertical groves instead of the diagonal ones. The striker retaining balls will then be prevented from coming in line with the groves in the outer casing and the striker will not be released. Instead the pressure plate will bounce back into its original position. Two similar plastic bodied AT mines manufactured in China are the Type 69 and the Type 81, although it is entirely possible that there is no difference between the Type 69, Type 72 and Type 81 mines other than their

fuzes. The basic descriptions (dimensions, weights, appearance, colour) for Type 69 and Type 81 mines match the Type 72 very closely. The fuzes are all blast resistant and the mine name may only vary depending on the fuze used. Because of its low metal content, the Type 72 cannot be located using metal detectors under most field conditions. The Type 72 is resistant to shock and overpressure from explosive breaching systems such as the Giant Viper and MICLIC. A copy of the mine, the YM-III (sometimes YM-3), is produced in Iran. It is slightly heavier at 7 kg, with a slightly heavier 5.7 kg Composition B main charge, with a slightly higher activation pressure of 450 to 900 kg. Additionally, a copy is produced in South Africa as "Non-metallic anti-tank mine".

LMG Russian Rocket Propelled Mine

Tiers:

System

Country of Manufacture: FSU
# of User Countries: 13+
Emplacement Method: rocket propelled shaped-charge
Armor Penetration (mm)/ Kill Mechanism: track breaker on contact/blast
Effective Range (meter): m27
Detectability/ Composition: visual metal
Anti-Handling: No
Fuze Type/Self Neutralize: Tension (1 kg), tripwire neutralize: no
Explosive Type & Weight/Total Weight (kg): kgTNT: 3.2 Total: 10

Notes:

The LMG rocket mine consists of a rocket, a rocket launching base, an initiation and propellant charge, an MUV fuze, and a tripwire. As the target vehicle acts on the tension wire, the retaining pin on the MUV fuze is withdrawn. The fuze, in turn, sets off the ignition and propellant charge and launches the rocket. Upon impact, the warhead is detonated by means of a secondary percussion base detonating fuze. Additionally this mine can be initiated by an observer utilizing a wire connected to the MUV retaining pin.

Type 53 Chinese 120mm Mortar

Tiers:

Variants:

- **Type 53:** China version
- **Type 55:** A more robust but heavier version, the Type 55, was developed by Norinco.
- **Helwan Model UK 2.:** Egypt also produced a locally modified variant, the Helwan Model UK 2.

System

Alternate Designation: Type 53
Type: 120mm Mortar
Manufacturer: China; Company: INA
In Service: 1943-Present
Crew: 6

Dimensions

Length: INA
Barrel Length: INA
Weight: 275 kg

Main Weapon System

↳System

Name: Type 55
Type: Mortar
Caliber: 120mm
Breech: muzzle loaded
Elevation: +45° to +80°

Traverse: t could accommodate small-angle shifts of up to 6 degrees without having to shift the baseplate though.

Rate of Fire: 9 rpm maximum, 70 rds/hr sustained

Muzzle Velocity: 272 m/s

Effective Firing Range: 5,700 m (6,200 yd) maximum, 500 m (550 yd) minimum

↳*Ammunition*

Type: Mortar Projectile

Caliber: 120mm

Basic Load: INA

Types of Ammunition: FRAG-HE and HE

Notes:

The Type 53 120mm Mortar is a Chinese version of the Russian M1943 120mm Mortar The M1943 Mortar also known as the SAMOVAR is a Soviet 120 millimeter calibre smoothbore mortar first introduced in 1943 as a modified version of the M1938 mortar. It virtually replaced the M1938 as the standard weapon for mortar batteries in all Soviet infantry battalions by the late 1980s, though the armies of the Warsaw Pact utilised both in their forces. This muzzle-loading mortar can be easily broken down into three parts – barrel, bipod and baseplate – for movement over short distances or towed by a GAZ-66 truck on a two-wheel tubular carriage. The baseplate mounting permits all-azimuth firing, however as with most Soviet mortars it was difficult to turn rapidly over a wide traverse. It could accommodate small-angle shifts of up to 6 degrees without having to shift the baseplate though.

MO-120 RT-61 (MO-120-RT) French 120mm Heavy Mortar

Tiers:

Variants:

- **Turkish copy:** It was copied without license in Turkey and manufactured by MKEK as the HY 12 mortar.
- **Japanese Type 96:** The Japan Ground Self-Defense Force have a self-propelled version of the RT-61 with 50 rounds, the Type 96.
- **2R2M:** The 2R2M is a derivative of the MO-120-RT-61 designed to be carried on light armoured vehicles, with a semi-automatic loading. The system has also been modified by the USMC as the Dragon Fire
- **Expeditionary Fire Support System:** The United States Marine Corps began looking for an Expeditionary Fire Support System (EFSS) in 2001 after the start of operations in Afghanistan exposed their lack of expeditionary artillery lighter than a 155 mm howitzer but heavier than a 60 mm mortar. Early on, the weapon became tied to the development of the MV-22 Osprey, which would contain a Growler ITV jeep that would tow it; both efforts were troubled and experienced delays. The EFSS was first used operationally in Afghanistan in February 2011, firing an M1105 illumination projectile. The full EFSS was introduced in 2009, consisting of two light vehicles, one towing the mortar and the other an ammunition trailer, that fit inside an MV-22 or CH-53E Super Stallion; an EFSS battery is made up of roughly 50 Marines. From 2011 to 2015, the Marines and Raytheon developed the precision extended range munition (PERM) for the EFSS, a GPS-guided round that delivers greater range and better accuracy. The 35 lb (16 kg) round increased range from 8 km (5.0 mi) to 16 km (9.9 mi), falling within 10 meters of the target and as close as two meters, costing $18,000 each, and having 2.5–3 times more lethality. The extra range came from tail fins for stabilization and canards near the nose to make in-flight adjustments and make it glide as it descends, and the greater lethality was a result of this flight path; normal artillery rounds impact at a 45 degree angle, which blows the top half of the round straight up into the air, but descending at a sharp angle places more energy and fragmentation directly on a target. It was even capable of hitting reverse slope positions by shaping its trajectory. Greater accuracy also reduces logistical burdens, as using fewer rounds to destroy one target means a unit can last longer without needing resupply. The PERM was to begin fielding in 2018. Raytheon planned to add semi-active laser (SAL) guidance to PERM rounds to enable them to hit moving targets. By December 2017, the U.S. Marines had divested the EFSS. With the Marines working to extend the range of their artillery arsenal, the EFSS' limited range was not seen as well suited for future missions, so it was chosen for divestment in favor of moving more resources for precision fires.

System

Carriage: wheeled
Elevation: 30–85°
Traverse: ±14° from centreline
Rate of Fire: 6 to 10 rpm
Effective Firing Range: 8,140 m (8,900 yd) with standard projectile 12,850 m (14,050 yd) with rocket projectile

↳*Ammunition*

Type: Mortar Projectile
Caliber: mm120
Shell Weight: 18.7 kg
Basic Load: INA

Notes:

The MO-120 RT-61 (factory designator) or MO-120-RT is a heavy mortar of French origin. The RT in the designator stands for rayé, tracté, which means rifled, towed. The RT-61 is currently used by the French Army (where it is known as RT F1 or Mortier de 120mm Rayé Tracté Modèle F1—"120 mm rifled towed mortar, model F1"), and is produced under licence in various countries. The MO-120 RT-61 is issued to artillery units, where it augments the 155 mm towed artillery. The RT-61 uses standard NATO rounds as well as the specially designed PR-14 (HE) and the PRPA (HERA). The weapon can be fired either by dropping the round down the tube (after aligning of the rifling bands) resulting in an automatic firing once the bomb hits the tube base, or by a controlled firing by dropping the bomb down the tube and pulling on a lanyard that will in turn set off the triggering mechanism in the base of the tube. Rounds fired from the mortar can reach as high as 8,000 ft (2,400 m) and hit the ground with an effective kill radius of nearly 250 ft (76 m). In French service, this weapon is normally towed by the VTM 120 (Véhicule Tracteur Mortier de 120 mm), a wheeled armored vehicle that is a derivative of the VAB 4×4 series of armored personnel carrier. Towing is accomplished by a towing hitch that is screwed onto the muzzle of the weapon. The VTM 120 also carries 70 rounds for the mortar and offers basic ballistic protection from small arms fire and shrapnel for the crew. The RT-61 can also be towed by the AMX-10 TM (Tracteur de Mortier), which is a version of the AMX-10P tracked APC. The mortars, which originally equipped infantry regiments, have now all been transferred to the artillery regiments, where they augment the 155 mm towed artillery.

M252 American 81mm Mortar

Tiers:

System

Alternate Designation: M252

Type: 81mm Mortar

Manufacturer: INA

In Service: 1987-Present

Crew: 5

Dimensions

Length: 1.27 m

Barrel Length: 1.27 m

Weight: 41.3 kg

Armament

↳*System*

Name: M252

Type: Mortar

Caliber: mm81

Elevation: 45°–85.2°

Traverse: 5.6°

Rate of Fire: 8–16 rpm sustained 20–30 rpm in exceptional circumstances and for short periods

Effective Firing Range: HE: 91–5,935 m

Feed System: muzzle-loaded

↳*Ammunition*

Type: Mortar Projectile

Caliber: mm81

Types of Rounds: While the M252 does fire a weapon specific series of ammunition, it can also fire rounds from the M29 Mortar (only at charge 3 or below though). The M252 Mortar can fire the following principal classifications of training and service ammunition: High explosive (HE): Designations M821, M821A1, M889, M889A1, M372-series, and M362. Used against personnel and light materiel targets. Advanced Capability Extended Range Mortar (ACERM): Developmental guided round that adds wings, control fins, GPS navigation, a laser seeker, and an enhanced warhead; increases accuracy to within one meter and can reach a range of 20 km (12 mi) in five minutes. Smoke Cartridge: Designations M819 and M375-series. Used as a screening, signaling, or marking munition. Illumination (ILLUM): Designations M853A1 and M301-series. Used in night missions requiring illumination for assistance in observation. Non-Lethal Indirect Fire Munition: Developmental round based on the M853A1 that disperses flash bang submunitions to temporarily daze people. Training practice (TP): Designations M880, M879, M68, and sabot. Used for training in limited areas. Infrared Illumination (IR): Produces illumination which is only visible through the use of night vision devices.

Fuzes: The M224 rounds have two fuze types: the Multioption Fuze (M734) and the Point-Detonating Fuze (M935). The M734 is used for the M720 HE round and can be set to function as proximity burst, near-surface burst, impact burst, or delay burst.

Note: The range of a mortar is controlled by the number of propellant "C-charges" attached. A charge is a semi-circular donut of nitrocellulose, which resembles a puffy letter "C." A round for the M252 mortar comes with four charges attached. Longer-range shots require more propellant than can fit in the tail of the round, hence the necessity of external charges. When the target is ranged, the first assistant ammunition bearer adjusts the amount of propellant by removing C-charges from the projectile. The mortar squad leader verifies the number of charges; then the assistant gunner drops the round down the muzzle of the tube. The round, pulled by gravity, accelerates down the smooth bore of the mortar until the primer (in the base of the tail boom of the round) strikes the firing pin located in the bottom of the mortar tube. The primer detonates, igniting the charge in the tail fin, which in turn ignites the C-charges on the round. The C-charges detonate, releasing hot, expanding gas which pushes against the obturator band on the projectile, sealing the gas behind the projectile. The pressure from the expanding gas accelerates the projectile until it leaves the end of the tube.

Notes:

The M252 81 mm medium weight mortar is a British designed smooth bore, muzzle-loading, high-angle-of-fire weapon used for long-range indirect fire support to light infantry, air assault, and airborne units across the entire front of a battalion zone of influence. In the U.S. Army and U.S. Marine Corps, it is normally deployed in the mortar platoon of an infantry battalion. The M252 system weighs 91 lb (41 kg) completely assembled and is composed of the M253 Cannon (35 lb, 16 kg), M177 Mount (27 lb, 12 kg), M3A1 Baseplate (29 lb, 13 kg), and the M64A1 Sight Unit (2.5 lb, 1.1 kg). The mount consists of a base plate and a bipod, which is provided with screw type elevating and traversing mechanisms to elevate/traverse the mortar. The M64A1 sight unit (also used on the M224) is attached to the bipod mount. The M252 is a gravity-fired smoothbore system. Attached to the muzzle of the weapon is the Blast Attenuation Device (BAD), used to reduce the blast effects on the mortar crew. To increase cooling efficiency, the breech end is finned; though first-hand accounts attest that the level of cooling is negligible. The cannon also has a crew-removable breech plug and firing pin. High explosive rounds fired by the M252 weigh 10 lb (4.5 kg) and can have an effective kill radius of 35 m (115 ft). In 2017, the Marines revealed they were developing precision guided rounds for the 81 mm mortar, similar to efforts for the 120 mm Expeditionary Fire Support System but in a man-portable system. Crew A crew of five enlisted personnel operate the M252: the squad leader, the gunner, the assistant gunner, the first ammunition bearer, and the second ammunition bearer. The squad leader stands directly behind the mortar where he can command and control his squad. In addition to having general oversight of all squad activities, he also supervises the emplacement, laying, and firing of the weapon. The gunner stands to the left of the mortar where he can manipulate the sight, traversing handwheel, and elevating handwheel. He places firing data on the sight and lays the mortar for deflection and elevation. He makes large deflection shifts by shifting the bipod assembly and keeps the bubbles level during firing. The assistant gunner stands to the right of the mortar, facing the barrel and ready to load. In addition to loading, he swabs the bore after 10 rounds have been fired or after each fire mission. The assistant gunner is the person who actually fires the weapon. The first ammunition bearer stands to the right rear of the mortar. He has the duty of preparing the ammunition (charge settings, fuzes, etc...) and passing it to the assistant gunner. The second ammunition bearer stands to the right rear of the mortar behind the first ammunition bearer. He maintains and keeps a record of the ammunition in addition to the data corresponding to each fire mission. His twofold records include a written table of firing data, type, and number of rounds fired, and the safety pins pulled from each round to provide physical evidence to the accuracy of the table. In addition he provides local security for the mortar position.

Strix Swedish 120mm Terminal-Homing Mortar

Tiers:

System

Alternative Designations: N/A

Producer: Saab Bofors

Range: 1-4km with special expulsion charge 1.7-8km with charge plus attachment of sustainer motor

Guidance System: IR seeker, 12 thruster rockets 16-bit micro- processor retains path data and target identification data

Acquisition Radius: m150

Crew: ea1 additional member in mortar crew to load seeker data

Loading Method: Hand-load or auto-load without sustainer motor Hand-load only with sustainer motor

Equipment / Modifications Required: A computer (e.g., small 2-lb notebook type) is used to load target description data (from target library) into the round Rounds may require less target detail if other hot systems are not in the area

Systems Using This Munition: Any 120mm smoothbore mortar and combination gun can fire the round. The Advanced Mortar System (AMOS) can fit on a variety of vehicle chassis.

Employment Time: 1-5 minutes, depending on system

Rate of Fire: rpmUp to 9, although most point targets will require 1-6 rounds

Counter-Measure Vulnerability: IR absorbing paint, camouflage material, IR suppressing smoke, or tenting can affect the seeker. Target can hide under dense tree canopy, building cover, etc. Decoy targets such as heated plates may deflect the seeker. Any challenge to location accuracy, such as smoke, dust, or target speed, may decrease the possibility that the target is within the seeker footprint. If targets disperse when under attack, some may be able to avoid the footprint.

Dimensions

Weight: kg17.0

Length: m.83

Lethality Mechanism

Type: Shaped-charge (HEAT)

Fuze Type: Point Detonating

Penetration: mm600

Probability of Kill Given a Hit: %90

Number per kill, Moving Target: 4-6 (P-hit 20% est)

Number per kill, Stationary Target: 1-2 (P-hit 75% est)

Target Types

Description: High-value target vehicles include approaching tanks, IFVs, SP artillery, scatterable mine launcher vehicles, ATGM vehicles, etc Vehicles must be hot (sun or recent move). Stationary vehicle targets are preferred

Notes:

The Pansarsprängvinggranat, M94, STRIX is a Swedish end phase-guided projectile fired from a 120mm mortar originally manufactured by Saab Bofors Dynamics. STRIX is fired like a conventional mortar round. The round contains an infrared imaging sensor that it uses to guide itself onto any tank or armored fighting vehicle in the vicinity where it lands. The seeker is designed to ignore targets that are already burning. Launched from any 120mm mortar, STRIX has a normal range of up to 4.5km. With the addition of a special sustainer motor, however, range can be increased to 7.5km. The STRIX mortar round uses twelve midsection lateral thruster rockets to provide terminal course corrections. The tail unit is loaded first with the necessary propelling charges (up to eight increments), then the sustainer motor (if required) and finally, the programmed projectile. A hand-held programming unit is connected to the projectile by cable prior to loading to feed in flight time before seeker activation, and with allowances for terminal phase ballistic conditions. As well as being fired by conventional mortars, STRIX can be fired by the Advanced Mortar System, an automatic dual 120mm mortar mounted in a turret for fitting to armored fighting vehicles. Feasibility and project definition studies began in 1983, as a joint private venture between FFV Ordnance and Saab Missiles. The first fully guided flight took place in 1988.

Type 53 Chinese 82mm Mortar

Tiers:

1 2 3 **4**

System

Alternate Designation: Type 53
Type: Mortar
Caliber: 82mm
Manufacturer: Norinco
Crew: 2
Elevation: +45° to +75°
Traverse: 6° to 15°
Rate of Fire: 25–30 rpm
Muzzle Velocity: 211 m/s
Maximum Firing Range: 3,040 m

Dimensions

Barrel Length: 1.22 m
Weight: 56 kg
Shell Weight: 3.05 kg

Notes:

The Type 53 82mm Mortar is a Chinese version of the Russian M-37 (82-BM-37). The M-37 or 82-BM-37 (батальонный миномёт) is a Soviet 82mm caliber mortar designed by B.I. Szayrin and accepted into service in 1937. The design of the M-37 is based on the earlier French Brandt mle 27/31 mortar with Russian modifications. The main difference between the 82-PM-37 and the earlier 82-PM-36 was the adoption of a round base-plate, revised traverse/elevation controls, simplified sights and spring-loaded shock absorbers on the bi-pod to reduce the amount of relaying needed between shots. The German designation for captured M-37 mortars was 8.2 cm GrW 274/2(r). The M-37M is an improved version with lighter base plate and a device to prevent double loading. It was produced in China by Norinco as the Type 53, in Egypt by the Helwan Machine Tools Company as the Model 69 and in Bulgaria by Arsenal as the M-82 Mod 1937.

Notes:

The K6 entered service with the United States Army in 1991 as the M120 Mortar System. Its mission is to provide heavy weapon, high-angle organic indirect fire support to the unit commander. The M120 is used by both mechanized units and light infantry in certain situations. Another feature of the M120 is the M303 Sub-Caliber insert, which allows the mortar to fire 81 mm ammunition. The M120 is transported on the M1100 Trailer by the M998 Humvee. The version that is mounted on the M1064 and M1129 mortar carriers is known as the M121. The Soltam K6 is a 120 mm (4.75 inch) mortar that was developed by Soltam Systems of Israel. It is the long-range version of the Soltam K5 and has replaced older systems, such as the 107-millimetre (4.2 in) M30, in several armies including the United States Army. It is much lighter than the M30, has a greater range, and can sustain a rate of fire of four rounds per minute, while the M30 could sustain only three. The K6 fires fin-stabilized ammunition from a smoothbore barrel. Unlike its smaller ammunition cousins, the 81 mm and 60 mm mortars, the fin blades of the ammunition fired from the M120 are not canted. Thus, no spin is imparted to the projectile in flight. Although heavy mortars require trucks or tracked mortar carriers to move them, they are still much lighter than field artillery pieces. They outrange light and medium mortars, and their explosive power is much greater. An improved version is known as the K6A3. High explosive rounds fired by the M120 weigh about 31 lb (14 kg) and can have a lethality radius of 225 ft (69 m).

M1943 (120-PM-43) Russian 120mm Mortar

Tiers:

Variants:

- **Type 53:** China version
- **Type 55:** A more robust but heavier version, the Type 55, was developed by Norinco.
- **Helwan Model UK 2.:** Egypt also produced a locally modified variant, the Helwan Model UK 2.

Weight: 275 kg

Main Weapon System

↳*System*

Name: M1943
Type: Mortar
Caliber: 120mm
Breech: muzzle loaded
Elevation: +45° to +80°
Traverse: t could accommodate small-angle shifts of up to 6 degrees without having to shift the baseplate though.
Rate of Fire: 9 rpm maximum, 70 rds/hr sustained
Muzzle Velocity: 272 m/s

Effective Firing Range: 5,700 m (6,200 yd) maximum, 500 m (550 yd) minimum

↳*Ammunition*

Type: Mortar Projectile

Caliber: 120mm

Basic Load: INA

Types of Ammunition: FRAG-HE and HE

Notes:

The M1943 Mortar also known as the SAMOVAR is a Soviet 120 millimeter calibre smoothbore mortar first introduced in 1943 as a modified version of the M1938 mortar. It virtually replaced the M1938 as the standard weapon for mortar batteries in all Soviet infantry battalions by the late 1980s, though the armies of the Warsaw Pact utilised both in their forces. This muzzle-loading mortar can be easily broken down into three parts – barrel, bipod and baseplate – for movement over short distances or towed by a GAZ-66 truck on a two-wheel tubular carriage. The baseplate mounting permits all-azimuth firing, however as with most Soviet mortars it was difficult to turn rapidly over a wide traverse. It could accommodate small-angle shifts of up to 6 degrees without having to shift the baseplate though.

2B25 Russian 82mm Mortar

Tiers:

1 2 3 4

System

Alternate Designation: 2B25

Type: 82mm Mortar

Manufacturer: INA

Crew: 2

Maximum Firing Range: 1,200 m

Minimum Firing Range: 100

Maximum Rate of Fire Without Relaying: 15 RMP

Elevation: 45-85 deg

Traverse, on Bipod: 4 deg

Traverse, by Moving Bipod: 360 deg

Time to Transfer the Morar from Travelling to COmbat Position And Vice Versa: 30 seconds Max

Dimensions

Length: INA

Width: INA

Height: INA

Weight: 13 kg

Note: 2B25 mortar can be transferred from combat to travelling position and vice versa without its disassembling into parts. To short distances it is carried with the help of straps attached to the mortar. To large distances the mortar may be transported in a standard box by any means of transportation or by the crew in a rucksack. Due to its small size and weight, 2B25 mortar can easy be carried by one soldier.

Notes:

2B25 mortar is used to engage the enemy troops situated both in the open and in uncovered field entrenchments and is effective against personnel wearing individual armour. 2B25 can deliver indirect fire against visible and non observable targets from various types of ground both in the day and night time, at ambient temperature -50 to +50 °C. The unique design of 2B25 mortar and its 3VO35 bomb provides the advantage of concealed operation. The mortar fire attack is not expected by the enemy because of the mortar low acoustic signature, absence of flash and smoke. 2B25 mortar can be transferred from combat to travelling position and vice versa without its disassembling into parts. To short distances it is carried with the help of straps

attached to the mortar. To large distances the mortar may be transported in a standard box by any means of transportation or by the crew in a rucksack. Due to its small size and weight, 2B25 mortar can easy be carried by one soldier. All these advantages make the mortar attractive for Special Forces, especially in counter-terrorism operations.

↳Other Munitions

: All standard 120-mm smoothbore mortar projectiles without fold-out fins.

Fire Control System

Collimator: INA

Indirect Fire: INA

Notes:

The RT-61 is a rifled mortar capable of firing pre-engraved spin-stabilized and smoothbore 120mm mortar projectiles with or without rocket assist. However, it is not capable of firing smoothbore mortar projectiles with fold out fins (spring-loaded tail assemblies with straight fins). The RT-61 is a three-piece mortar system consisting of a rifled tube, a baseplate, and a wheeled carriage. Trigger firing is the normal method of firing for this mortar. Drop firing can be accomplished only with smoothbore mortar projectiles.

HY 12 Turkish 120mm Heavy Mortar

Tiers:

Variants:

- **Turkish copy:** It was copied without license in Turkey and manufactured by MKEK as the HY 12 mortar.
- **Japanese Type 96:** The Japan Ground Self-Defense Force have a self-propelled version of the RT-61 with 50 rounds, the Type 96.
- **2R2M:** The 2R2M is a derivative of the MO-120-RT-61 designed to be carried on light armoured vehicles, with a semi-automatic loading. The system has also been modified by the USMC as the Dragon Fire
- **Expeditionary Fire Support System:** The United States Marine Corps began looking for an Expeditionary Fire Support System (EFSS) in 2001 after the start of operations in Afghanistan exposed their lack of expeditionary artillery lighter than a 155 mm howitzer but heavier than a 60 mm mortar. Early on, the weapon became tied to the development of the MV-22 Osprey, which would contain a Growler ITV jeep that would tow it; both efforts were troubled and experienced delays. The EFSS was first used operationally in Afghanistan in February 2011, firing an M1105 illumination projectile. The full EFSS was introduced in 2009, consisting of two light vehicles, one towing the mortar and the other an ammunition trailer, that fit inside an MV-22 or CH-53E Super Stallion; an EFSS battery is made up of roughly 50 Marines. From 2011 to 2015, the Marines and Raytheon developed the precision extended range munition (PERM) for the EFSS, a GPS-guided round that delivers greater range and better accuracy. The 35 lb (16 kg) round increased range from 8 km (5.0 mi) to 16 km (9.9 mi), falling within 10 meters of the target and as close as two meters, costing $18,000 each, and having 2.5–3 times more lethality. The extra range came from tail fins for stabilization and canards near the nose to make in-flight adjustments and make it glide as it descends, and the greater lethality was a result of this flight path; normal artillery rounds impact at a 45 degree angle, which blows the top half of the round straight up into the air, but descending at a sharp angle places more energy and fragmentation directly on a target. It was even capable of hitting reverse slope positions by shaping its trajectory. Greater accuracy also reduces logistical burdens, as using fewer rounds to destroy one target means a unit can last longer without needing resupply. The PERM was to begin fielding in 2018. Raytheon planned to add semi-active laser (SAL) guidance to PERM rounds to enable them to hit moving targets. By December 2017, the U.S. Marines had divested the EFSS. With the Marines working to extend the range of their artillery arsenal, the EFSS' limited range was not seen as well suited for future missions, so it was chosen for divestment in favor of moving more resources for precision fires.

Effective Firing Range: 8,140 m (8,900 yd) with standard projectile 12,850 m (14,050 yd) with rocket projectile

↳*Ammunition*

Type: Mortar Projectile

Caliber: mm120

Shell Weight: 18.7 kg

Basic Load: INA

Notes:

The HY 12 120mm Heavy Mortar is a Turkish version of the French MO-120 RT-61 (MO-120-RT) 120mm Heavy Mortar The MO-120 RT-61 (factory designator) or MO-120-RT is a heavy mortar of French origin. The RT in the designator stands for rayé, tracté, which means rifled, towed. The RT-61 is currently used by the French Army (where it is known as RT F1 or Mortier de 120mm Rayé Tracté Modèle F1—"120 mm rifled towed mortar, model F1"), and is produced under licence in various countries. The MO-120 RT-61 is issued to artillery units, where it augments the 155 mm towed artillery. The RT-61 uses standard NATO rounds as well as the specially designed PR-14 (HE) and the PRPA (HERA). The weapon can be fired either by dropping the round down the tube (after aligning of the rifling bands) resulting in an automatic firing once the bomb hits the tube base, or by a controlled firing by dropping the bomb down the tube and pulling on a lanyard that will in turn set off the triggering mechanism in the base of the tube. Rounds fired from the mortar can reach as high as 8,000 ft (2,400 m) and hit the ground with an effective kill radius of nearly 250 ft (76 m). In French service, this weapon is normally towed by the VTM 120 (Véhicule Tracteur Mortier de 120 mm), a wheeled armored vehicle that is a derivative of the VAB 4×4 series of armored personnel carrier. Towing is accomplished by a towing hitch that is screwed onto the muzzle of the weapon. The VTM 120 also carries 70 rounds for the mortar and offers basic ballistic protection from small arms fire and shrapnel for the crew. The RT-61 can also be towed by the AMX-10 TM (Tracteur de Mortier), which is a version of the AMX-10P tracked APC. The mortars, which originally equipped infantry regiments, have now all been transferred to the artillery regiments, where they augment the 155 mm towed artillery.

M19 American 60mm Mortar

Tiers:

1 2 3 4

System

Alternate Designation: M19

Manufacturer: USA

In Service: Still in Service

Dimensions

Length: 81.9 cm (2 ft 8.2 in)

Barrel Length: 72.6 cm (2 ft 4.6 in)

Weight: 23.4 kilograms (52 lb) (M5 mount) 9.3 kilograms (21 lb) (M1 mount)

Armament

↳*System*

Name: M19

Type: Mortar

Caliber: 60mm

Elevation: +40° to +85° on M5 mount free on M1 mount

Traverse: 14° on M5 mount free on M1 mount

Muzzle Velocity: 89 m/s

Maximum Firing Range: 747 m

Effective Firing Range: 68 m

Feed System: Manual

↳*Ammunition*

Name: INA

Type: Mortar Projectile

Caliber: 60mm

Shell: 1.36 kg

Notes:

The M19 Mortar is a light, smoothbore, muzzle-loading, high-angle-of-fire weapon for light infantry support developed and produced in the United States. It has been replaced in service by the more modern 60 mm M224 Mortar, which has a much longer range and improved ammunition. The original M19 just had a simple spade-like M1 baseplate, leaving the elevation and traverse free for the firer. This of course was found to be too inaccurate, and the infantry initially refused the M19. A new mount, the M5, was developed, which used a conventional baseplate and bipod with elevation and traverse adjustment. This gave the M19 better accuracy, but made it heavier than the M2 Mortar with less range. The M19 fired the same ammunition used in the M2 mortar, which it would replace. The 60 mm mortar is used by the infantry to lob high-explosive and white phosphorus smoke shells at well-protected hostile locations. The weapon can also fire illumination rounds to light up the battlefield at night. The primary difference between the M2 and M19 was that the M2 was drop-fire only while the M19 could be drop-fired or a round loaded and then fired by a lever-like trigger at the base of the tube. M19 development began in 1942 as the T18E6 to replace the M2 Mortar. It was a very simple and light weapon, but was too inaccurate without a mounting. The conventional M5 mount for the M2 mortar was fitted to it. It began to be fielded during the Korean War to replace the M2 and saw limited use in the Vietnam War. Many M19s were scrapped or exported to other countries.

HM 12 Fateh (Hadid) Iranian 60mm Mortar

Tiers:

System

Alternate Designation: HM 12 Feteh; Hadid
Manufacturer: Defense Industries Organization
In Service: Still in Service
Crew: 2

Dimensions

Length: INA
Barrel Length: 677mm
Weight: 6,5 kg

Armament

↳*System*

Name: HM 12
Type: Mortar
Caliber: 60mm
Elevation: 45° to 85°
Traverse: 360°
Rate of Fire: 20 round per minute
Maximum Firing Range: 1050m

↳*Ammunition*

Name: INA
Type: Mortar Projectile
Caliber: 60mm
Shell: INA

Notes:

The HM 12 Fateh (or Hadid) is an Iranian 60mm mortar manufactured by the Ammunition & Metallurgy Industries Group, part of Iran's Defense Industries Organization. It is an unlicensed copy of Israel's Soltam 60 mm mortar. It is generally operated by two people but in urgent cases it can be operated by one as well.

M29 American 81mm Mortar

Tiers:

System

Alternate Designation: M29

Manufacturer: USA

Crew: The weapon was usually serviced by a crew of five. The normal crew consisted of a squad leader, a gunner, an assistant gunner and two ammunition handlers.

Dimensions

Length: INA

Barrel Length: INA

Weight: 23.4 kilograms (52 lb) (M5 mount) 9.3 kilograms (21 lb) (M1 mount)

Armament

↳*System*

Name: M29

Type: Mortar

Caliber: 81mm

Feed System: Manual

Rate of Fire: The maximum rate of fire is 30 rounds for the first minute followed by 4 to 12 rounds per additional minute

Maximum Firing Range: he range is 5,140 yards.

↳*Ammunition*

Name: INA

Type: Mortar Projectile

Caliber: 81mm

Shell: INA

Notes:

The M29 is an American-produced 81 millimeter mortar. It began replacing the M1 mortar in U.S. service in 1952 being lighter and with greater range. It was subsequently replaced by the M252 mortar in 1987. Variants included the M29E1 and M29A1, adopted in 1964. These were produced with a hard chrome-plated bore to prolong barrel life and ease of cleaning. The maximum rate of fire is 30 rounds for the first minute followed by 4 to 12 rounds per additional minute. The range is 5,140 yards. The weapon was usually serviced by a crew of five. The normal crew consisted of a squad leader, a gunner, an assistant gunner and two ammunition handlers.

L16 British 81mm Mortar

Tiers:

Variants:

- **F2 81mm Mortar:** The version produced and used by Australia is named the F2 81mm Mortar, whilst the version used by the U.S. armed forces is known as the M252.

System

Alternate Designation: L16
Type: 81mm Mortar
Date of Introduction: 1956
Proliferation: Widley Proliferated
Manufacturer: Royal Ordnance (barrel and bipod)
In Service: 1956-Present
Crew: 3

Dimensions

Breech: None
Recoil: Baseplate and spring buffered mounting clamp

Rate of Fire: 15 rpm, 1–12 rpm sustained, 20 rpm for short periods

Muzzle Velocity: 225 m/s

Maximum Firing Range: 5,650 m

Effective Firing Range: HE: 100–5,675 m (109–6,206 yd) Smoke: 100–5,675 m (109–6,206 yd) Flare: 400–4,800 m (437–5,249 yd)

Feed System: Manual

Sights: Optical (C2) with Trilux illumination

↳*Ammunition*

Type: Mortar Projectile

Caliber: mm81

Basic Load: INA

Notes:

The United Kingdom's L16 81mm mortar is the standard mortar used by the British armed forces. It originated as a joint design by the UK and Canada. The version produced and used by Australia is named the F2 81mm Mortar, whilst the version used by the U.S. armed forces is known as the M252. It was introduced in 1965–66, replacing the Ordnance ML 3 inch Mortar in UK service, where it is used by the British Army, the Royal Marines and the RAF Regiment. In UK armoured/mechanised infantry battalions, the L16 mortar is mounted in an FV 432 AFV (six per battalion mortar platoon). British army light role infantry battalions and the Royal Marines may transport their mortars in BvS 10 vehicles (the replacement for the Bv 206). Otherwise, it is carried disassembled in three loads, (barrel, baseplate and bipod with sights, each approximately 11 kg), normally carried by a vehicle or helicopter and assembled for firing from the ground. The weapon can be man-packed by the mortar detachment, in which case the ammunition would be carried by other soldiers of the battalion. In addition to their normal equipment, each soldier would carry four bombs in a pair of two-bomb plastic containers (known as greenies in the British Army). The mortar has been used by many countries' armed forces.

2B24 Russian 82mm Mortar

Tiers:

System

Alternative Designation: NA

Date of Introduction: 2018

Proliferation: INA

Crew: 5

Emplacement Time: 30 seconds maximum

Displacement Time: 30 seconds maximum

Maximum Effective Range: m6,000

Minimum Effective Range: m100

Transportation: Is man portable for short distances by the 5 man squad. Can be transported by a single ATV. Can be mounted on combat vehicles to be fired from a mounted position.

Note:: HE Frag Rounds: 3-O-26, O-832 D, O-832 DU and 3-O-12. Other types of mortar rounds can also be used to perform certain tactical and fire tasks: smoke (D-832DU and D-832 A), illuminating (S-832 S) and leaflet (A-832 A) rounds.

Fire Control

Computerized FCS: No

Direct Fire: INA

Indirect Fire: Yes

Collimator: Yes

Notes:

The 82 mm 2B24 mortar is also in Rosoboronexport`s mortars portfolio. The mortar is designed to suppress and destroy enemy`s manpower and weapon systems. It should be noted that 2B24 features enhanced maneuverability and combat effectiveness. The mortar can be installed on various types of wheeled or tracked chassis. According to the specifications, 2B24 has a firing range of 100-6,000 m, a firing rate of 20 rounds per minute, a weight of 45 kg, and a crew of five servicemen.

Type 67 Chinese 82mm Mortar

Tiers:

1 2 3 4

System

Alternate Designation: Type 67
Type: Mortar
Caliber: 82 mm
Manufacturer: INA
In Service: 1967-Present
Crew: 2
Lethal Radius: 26 m

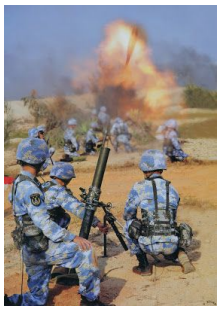
Dimensions

Length: INA
Width: INA
Height: INA
Total Weight: INA
Shrapnel Weight: 3.32 kg
TNT Weight: 0.4 kg

Notes:

The Type 67 82mm Mortar is Chinese infantry support weapon developed in year 1967. It is a modernization of the older Type 53 82mm mortar, which is the Chinese copy of Soviet PM-41 82mm mortar. The mortar was widely used in the Vietnam War by the People's Army of Vietnam (NVA). This mortar can be used in nearly horizontal direction, which means it can be used to destroy pillbox and obstructions. The Type 67 82mm mortar can use different types of shells. The shrapnel of this mortar weights 3.32 kg, with a 0.4 kg TNT, and the lethal radius of this shrapnel is 26m.

Type 71 Chinese 100mm Towed Mortar



Tiers:

System

Manufacturer: NORINCO

Weight of System: 75kg

Weight of Round: 8kg

Muzzle Velocity: 210 m/sec

Range: 4,700m

Ammunition

Types Available: HE, Smoke, and Illum

Notes:

The Type 71, 100mm mortar served with the Chinese People's Liberation Army (PLA). The PLA was the only military in the world to use a 100mm mortar. China used 100mm mortars as the standard regimental level weapon in airborne, highland, jungle and light infantry units that were deployed in the southern part of the country. The Type 71 was basically a larger caliber version of the 82mm Type 67 mortar. The Type 71 consisted of a tube, bi-pod and triangular-shaped base plate. It fired high-explosive (HE), smoke and illuminating (Illum) rounds. The Type 71 was used in the 1979 Sino-Vietnamese border conflicts. The Type 71 is no longer in use.

Type 56 Chinese 160mm Towed Mortar

Tiers:

1 2 3 4

Variants:

- **M-160:** The Soviet 160 mm Mortar M-160 is a smoothbore breech loading heavy mortar which fired a 160 mm bomb. It replaced the 160mm Mortar M1943 in Soviet service after World War II.

System

Alternative Designation: Type 56
Type: 160mm Towed Mortar
In Service: INA
Crew: INA
Carriage: It is mounted on a wheeled carriage, in order to be towed by trucks such as the GAZ-66.

↳*Ammunition*

Type: Mortar Projectile

Caliber: mm160

Shell: 41.5 kg

Basic Load: INA

Fire Control

Name: INA

Computerized FCS: No

Direct Fire: No

Indirect Fire: Yes

Notes:

The Type 56 160mm Towed Mortar is a Chinese variant of the Russian M-160 160mm Towed Mortar. The Soviet 160 mm Mortar M-160 is a smooth-bore breech loading heavy mortar which fired a 160 mm bomb. It replaced the 160mm Mortar M1943 in Soviet service after World War II. It is very similar to the M1943 mortar but has a longer barrel, thus enabling greater range. It is mounted on a wheeled carriage, in order to be towed by trucks such as the GAZ-66. China copied it as the Type 56 mortar. It was introduced in 1953. Originally deployed as a standard mortar for all types of division, it is currently particularly used as mountain or urban artillery. Some countries still use it as field artillery. China originally deployed 12 Type 56 mortars per field division. The M-160 saw service during the Arab–Israeli conflict, including the Lebanese Civil War, and with the Indian Army during the Indo-Pakistani War of 1971. It was also used during the Syrian Civil War by the loyalist forces.

Shell Weight: 40.8 kg

Basic Load: INA

Fire Control

Computerized FCS: No

Direct Fire: No

Indirect Fire: Yes

Notes:

The Soviet 160 mm Mortar M1943 is a smoothbore breech loading heavy mortar which fired a 160 mm bomb. The M1943 (also called the MT-13) was one of the heaviest mortar used by Soviet troops in World War II. Around 535 of these weapons were fielded with Soviet forces during the war. It was replaced in Soviet service after World War II by the M-160 mortar of the same caliber. Originally a simple scaling-up of the 120 mm M1938 mortar, it soon became apparent that drop-loading a 40 kg bomb into a 3 meter high tube would be too difficult for any man to do. It was redesigned into a breech loading weapon, and contains a substantial recoil system to soak up the massive shock of firing a 160 mm bomb and prevent the baseplate from burying itself too deeply. The barrel sits in a cradle which is attached to a baseplate and tripod. To load the weapon, the barrel is hinged forward which exposes the rear end of the tube. The bomb is then loaded, retained in place by a catch, and the barrel is swung back into the cradle, which in effect closes the breech. Because of the weight of the mortar, it is equipped with wheels and is designed to be towed by a motor-driven vehicle.

Rate of Fire: 1st minute: 16 rounds burst, 4 rounds per minute sustained thereafter.

Maximum Firing Range: 6500m

↳*Ammunition*

Name: INA

Type: Mortar Projectile

Caliber: 120mm

Shell: Standard 120mm NATO mortar round

Notes:

The Soltam M-65 is a 120 mm mortar that was developed by Tampella in 1953 via introduction of new baseplate for 120 Krh/40 invented by Hans Otto Donner. In 1960s Soltam Systems of Israel bought a license. The mortar system comes in two versions, a standard mortar and a long-range version. This heavy mortar is light enough to be transported by helicopter sling load, drop by parachute or carried in an APC such as the M113 Armored Personnel Carrier. It can also be towed as a normal artillery piece or even manhandled if necessary. The wheels on the carriage are the same as fitted to the M151 Jeep, and have handling rings to aid in manhandling it. All components are made of chrome-plated or stainless steel to resist wear and corrosion.

Type W86 (W86) Chinese 120mm Towed Mortar

Tiers:

System

Alternative Designation: W86

Carriage: 2 wheeled available

Crew: 7-9

Date of Introduction: 1980s

Prime Mover: Can be towed by any vehicle or beast of burden. Can be carried on the Type 63 or Type 85 APCs and the YW-531H.

Proliferation: Algeria

Dimensions

Height, Overall: m1.08

Length, Chassis Overall Travel: m2.36

Width, Travel: m1.56

Weight, Combat: 206kg (firing), 291kg (traveling)

Armament

↳*Mortar*

Cailber/Length: mm120mm

Elevation: deg+40 to +80

Rate of Fire, Burst: rd/min20

Traverse: 5 deg left and right on bipod, 360 when on baseplate

Range: 400m to 7.7km

Ammunition

Note:: Rounds were developed specifically for this system however, the Type 86 can fire any previously Russian or Chinese developed 120mm mortar rounds with a reduction in range.

Notes:

Developed to replace the Type 55 mortar. The Type 86 (W86) is a 120mm smoothbore that is lighter and more modern than its predecessor. It has a recoil buffer that is wrapped around the barrel. A conventional bi-pod and triangular baseplate are available. During travel a small two wheel carriage is used to transport the Type 86, which is towed by its muzzle. Although the Type 86 can be disassembled into several pieces, it is far too heavy to be considered man-portable. The two wheel carriage allows it to be towed by troops into position and over long distances by light weight vehicles.

Name: INA
Computerized FCS: NO
Direct Fire: No
Indirect Fire: Yes

Notes:

The 2S12 "Sani" ("sleigh") (GRAU index) is a 120 mm heavy mortar system used by the Russian Army and other former Soviet states. First fielded in 1981, the 2S12 is a continued development on the towed mortars first used in World War II. 2S12 is in fact the designator for the combination of the 2B11 "Sani" heavy mortar with its transport vehicle 2F510, a GAZ-66-15 4×4 truck. The 2B11 weighs nearly 500 lb when fully assembled, and thus must be mounted to the 2×1 wheeled chassis 2L81 and towed to the emplacement site by the truck. The GAZ-66 prime mover also transports the ammo load: 24 70-lb crates of 120mm HE mortar bombs, 2 bombs per crate, for a total of 48 available rounds. Once on site, it is unloaded from the transport chassis and manually emplaced by the crew of 5. It is the largest caliber indirect artillery employed at the battalion level. There is also an improved model, the 2B11M, that can fire the laser-guided round "Gran" with a range of 7,500 m. 2S12A and 2S12B improved models are in service now. 2S12A got a new "Ural" family transport vehicle with high power diesel engine and electric hoist for loading the mortar and a new base plate with a hinge that allows for pointing horizontally without turning the heavy support.

Type 87 Chinese 82mm Mortar

Tiers:

System

Manufacturer: NORINCO
Weight of System: 27 kg
Length: 1.4 m
Elevation: 45 degrees to 85 degrees
Traverse: 4 degrees to the left and to the right
Rate of Fire: 20 r/min
Effective Firing Range: Between 120m and 5.6km. 6km could be reached with an assisted round

Ammunition

Types Available: INA

Notes:

The Type 87 82mm Mortar is a Chinese infantry mortar developed by Norinco in 1987. It is a replacement for the older Type 67 82mm mortar used at the battalion level. An 81mm version called the W87 was also developed for export markets.

2B14 Podnos Russian 82mm Mortar

Weight of Round: kg3.14

Note:: Can fire all ammunition designed for earlier model 82mm Soviet / Russian mortars

Fire Control

Computerized FCS: No

Direct Fire: INA

Indirect Fire: Yes

Collimator: Yes

Notes:

The 2B14 Podnos is a Russian 82 mm mortar. The 2B14 was designed in early 1980s as a light, indirect fire weapon for the use of airborne and other light infantry forces. It was developed to replace the older M47 and is lighter and has better range than its predecessor. Despite the intent to field the 2B14 with light infantry units, the 2B14 appears to have been fielded with regular motor rifle units as well at a scale of six per battalion.

Type 63-1 Chinese 60mm Mortar

Tiers:

Variants:

- **Type 31:** The Type 31 is the original Chinese "copy" of the US M2, 60mm mortar which is a copy of the French Modele 1935 60mm mortar. Improvements of the Type 31 became the Type 63.
- **Type 63:** The Type 63 has a rectangular base plate in comparison to the Type 31's oval base plate.

Notes:

The Soltam K6 is a 120 mm (4.75 inch) mortar that was developed by Soltam Systems of Israel. It is the long-range version of the Soltam K5 and has replaced older systems, such as the 107-millimetre (4.2 in) M30, in several armies including the United States Army. It is much lighter than the M30, has a greater range, and can sustain a rate of fire of four rounds per minute, while the M30 could sustain only three. The K6 fires fin-stabilized ammunition from a smoothbore barrel. Unlike its smaller ammunition cousins, the 81 mm and 60 mm mortars, the fin blades of the ammunition fired from the M120 are not canted. Thus, no spin is imparted to the projectile in flight. Although heavy mortars require trucks or tracked mortar carriers to move them, they are still much lighter than field artillery pieces. They outrange light and medium mortars, and their explosive power is much greater. An improved version is known as the K6A3. High explosive rounds fired by the M120 weigh about 31 lb (14 kg) and can have a lethality radius of 225 ft (69 m). The K6 entered service with the United States Army in 1991 as the M120 Mortar System. Its mission is to provide heavy weapon, high-angle organic indirect fire support to the unit commander. The M120 is used by both mechanized units and light infantry in certain situations. Another feature of the M120 is the M303 Sub-Caliber insert, which allows the mortar to fire 81 mm ammunition. The M120 is transported on the M1100 Trailer by the M998 Humvee. The version that is mounted on the M1064 and M1129 mortar carriers is known as the M121. In 2007, the U.S. Army ordered 588 M326 MSS (Mortar Stowage Systems) from BAE Systems. Here, the assembled mortar is mounted on a truck, Humvee or M1101 trailer and can be mounted and dismounted in less than 20 seconds. In November 2016, Elbit Systems announced it was awarded an Indefinite Delivery/Indefinite Quantity (ID/IQ) contract for the production of the M121.

M30 American 106.7mm Heavy Mortar

Tiers:

1 2 3 4

Type: See Type of Rounds

Caliber: 106.7mm

Type of Rounds: *HE M329A1—max range 5,650 m (6,180 yd), weight 12.3 kg (27 lb) *HE M329A2—max range 6,840 m (7,480 yd), weight 10 kg (22 lb) *WP M328A1—max range 5,650 m (6,180 yd) *ILLUM M325A2—max range 5,490 m (6,004 yd), 90-second burn time *ILLUM M335A2—max range 5,290 m (5,785 yd), 70-second burn time ILLUM is

illumination, a parachute flare round with fixed timed detonation. Deployment height above ground is determined by gun elevation angle and propelling charge. HE (high-explosive) and WP (white phosphorus) rounds could be fitted with various fuses before firing, including a proximity fuse set for detonation at about 30 feet above ground to maximize the effected target area and to spray shrapnel down into foxholes. There was also a sub-caliber training device that utilized blank 20-gauge shotgun shells to propel an inert training round a few hundred meters. This training was for the gunnery skill of laying (in a sense, aiming) the guns. This device had originally been developed during WWII for the M2 mortar.

Notes:

The M30 106.7 mm (4.2 inch, or "Four-deuce") heavy mortar is an American rifled, muzzle-loading, high-angle-of-fire weapon used for long-range indirect fire support to infantry units. The M30 system weighs 305 kg including the complete mortar with a welded steel rotator, M24A1 base plate and M53 sight. A point of interest in the design of this mortar is the rifled barrel. A rifled barrel requires the round to be a very tight fit to the bore in order for the rifling to engage the round and impart rotation to it. But, in a muzzle-loading mortar, the round has to be loose enough in the bore to drop in from the front. In order to have it both ways, these rounds have an expandable ring at the base, which expands into the rifling under the pressure of the firing charge that propels the round. Additionally, imparting a spin to a round causes it to drift away from the direction of fire during flight and the longer the flight (greater range to target), the farther the drift, so the computation for setting the direction for firing at a specific target has to account for this drift. American rounds are designed to be drop-safe and bore-safe. As such, the fuzes in the rounds for this rifled mortar did not arm unless the round was spun a certain number of times i.e. the round was not armed until it had exited the barrel spinning and traveled a safe distance from the gun emplacement.

M-160 Russian 160mm Towed Mortar

Tiers:

Caliber: mm160

Shell: 41.5 kg

Basic Load: INA

Fire Control

Name: INA

Computerized FCS: No

Direct Fire: No

Indirect Fire: Yes

Notes:

The Soviet 160 mm Mortar M-160 is a smoothbore breech loading heavy mortar which fired a 160 mm bomb. It replaced the 160mm Mortar M1943 in Soviet service after World War II. It is very similar to the M1943 mortar but has a longer barrel, thus enabling greater range. It is mounted on a wheeled carriage, in order to be towed by trucks such as the GAZ-66. China copied it as the Type 56 mortar. It was introduced in 1953. Originally deployed as a standard mortar for all types of division, it is currently particularly used as mountain or urban artillery. Some countries still use it as field artillery. China originally deployed 12 Type 56 mortars per field division. The M-160 saw service during the Arab–Israeli conflict, including the Lebanese Civil War, and with the Indian Army during the Indo-Pakistani War of 1971. It was also used during the Syrian Civil War by the loyalist forces.

Muzzle Velocity (m/s): INA
Fuze Type: T-1 TSQ

Notes:

The 2B11 is a 120mm mortar of Russian origin. The 2B11 has the nickname Sani and is a much improved version of the World War 2 era M43 120mm mortar. It was developed to provide a longer range and better mobility than the World War 2 era M43. The 2B11 is a muzzle loaded smoothbore mortar of a conventional design. It features a longer and stronger barrel. The 2B11 can be dismantled in a base plate, barrel and tripod, but is normally transported in an assembled state on a two wheel carriage. Some sources state that the 2S12 is the nomenclature for the system which includes one each prime mover, Ural 4x4 truck, and one each mortar, 2B11.

Notes:

The Type 05 / PLL-05 is a Chinese self-propelled gun-mortar in use by Chinese mechanized infantry formations. Conceptually it is similar to the Russian 2S23 "Nona-SVK" (the turret and weapon system of the 2S9 Nona mounted on a BTR-80 chassis) three of which China purchased for evaluation. At one time it was reported that China would purchase 100 of the Russian vehicles however, this failed to occur, nor does it appear that there was a formal transfer of technology to China. The Chinese system features a longer barreled weapon mounted on the Type 92 variant of the WZ551 armored personnel carrier.

Notes:

The 2S34 "Chosta" or "Hosta" is a 120mm self-propelled mortar carrier designed and manufactured in Russia. The 2S34 was first revealed at the TVM-2014 Moscow Defense exhibition, August 2014. The vehicle is an evolution of the soviet-made 2S1 "Gvozdika". While the chassis stays the same as the 2S1, the main evolution is the replacement of 122mm 2A31 series main gun by an upgrade of 120mm 2A80 mortar gun, the 2A80-1. The 2S34 is produced by the Motovilikha Plants Corporation of Perm, in Russia, that also produces, or has produced, the 2S9 and the 2S31. In February 2014, approximately 30 2S34 are in service with the Russian army and could be in service with the 21st Mechanized Brigade, in Totskoye. Accessories: Standard equipment includes infra-red night vision lights (mounted at the commander's hatch) and an NRBC system. 2S34, like 2S1, is fully amphibious, being propelled in the water by its tracks. Before entering the water the bilge pump is switched on, the trim vane is erected at the front of the hull, shrouds are fitted to the hull above the drive sprocket and front road wheels and water deflectors on the rear track covers are lowered. Any water that enters the hull during amphibious operations is removed via the exhaust outlet using the bilge pump. Russian sources state that the 2S1, so probably also the 2S34, takes 20 minutes to be prepared for amphibious operations.

2S9-1M Russian 120mm Self-Propelled Mortar (SPM)

Tiers:

Parent:

2S9 NONA Russian 120mm Self-Propelled Mortar (SPM)

Variants:

- **2S23 NONA-SVK:** A BTR-80 based version is the 2S2
- **NONA-K:** towed 2B16 version
- **2S9:** The 2S9 NONA (Новейшее Орудие Наземной Артилерии - Newest Ordnance of Ground Artillery) is an extremely light-weight self-propelled and air-droppable 120 mm gun-mortar designed in the Soviet Union, which entered service in 1981. The 2S9 chassis is designated the S-120 and based on the aluminium hull of the BTR-D airborne multi-purpose tracked armoured personnel carrier. More generally, the 120 mm mortar is referred to as the Nona, with the 2S9 also known as the Nona-S. A BTR-80 based version is the 2S23 or Nona-SVK and the towed 2B16 version is named the Nona-K. Although no figures have been released, it is estimated that well over 1,000 2S9 were built.
- **SO-120 2S9 Anona:** The 120 mm SO-120 2S9 Anona (Anemone) self-propelled gun/mortar (SPG/M) was first seen in public in May 1985 and is an airborne artillery assault vehicle that was developed to carry out two tactical functions.

System

Alternative Designation: 2S9-1M
Type: 20mm Self-Propelled Mortar (SPM)
Family: 2S9 Family
Crew: ea4

Main Gun

↳*System*

Name: 2A60 120mm gun/mortar

Type: mm120

Breech Type: Combined semi-automatic breechblock with wedge locking mechanism and powder gases plastic obturator

Length, Barrel: 24 calibers

Loader Type: Manual, with ramming being automatic

Max Rate of Fire: rds/min8-10

Rate of Fire, Sustained: rds/min4

Muzzle Brake Type: INA

Max Elevation: deg+80

Min Elevation: deg-4

Traverse Range: deg70

Traverse Left: deg35

Traverse Right: deg35

Maximum Range of Fire (Ordinary Projectiles): km8.85

Maximum Range of Fire (Rocket Assisted Projectiles): km12.8

Maximum Range of Fire (Mines): km7.15

Note: The 2S9-1M can fire the Kitolov-2 guided artillery shell.

↳*Ammunition (Option 1)*

Type: OF-49 HE-FRAG/OF-51 HE-FRAG Projectile

Caliber: mm120

Muzzle Velocity: m/s367

Explosive: A-IX-2 explosive

Basic Load: 25 total, any combination of 120mm Projectiles

Effective Range: km8.85

Projectile Weight: kg17.3

↳*Ammunition (Option 2)*

Type: OF-50 HEAT (Rocket Assisted) Projectile

Caliber: mm120

Muzzle Velocity: m/s560

Fuse Type: INA

Basic Load: 25 total, any combination of 120mm Projectiles

Maximum Effective Range: 12.8

Rocket Motor Start Time: 10-13 seconds after the projectile leaves the barrel

Fin Stabilized: Yes

Pentration: mm650

↳*Ammunition (Option 3)*

Type: OF-843B Mortar Bombs

Caliber: mm120

Muzzle Velocity: m/s119-331

Fuse Type: INA

Basic Load: 25 total, any combination of 120mm Projectiles

Maximum Effective Range: km8.8

Variants: OF-843B, OF-34 and OF-38 high-explosive fragmentation, S-843 and 3S9 illumination, 3Z2 incendiary and 3D5 smoke

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)
Type: mm7.62
Max Rate of Fire: rds/min650
Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces
In Service: 1961-present
Manufacturer: Degtyaryov plant
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length (Overall): mm1,203
Length (Barrel): mm605
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights
Note: The 7.62 PKT can be controlled remotely

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Muzzle Velocity: m/s825
Basic Load: ea1,500
Maximum Effective Range (With Sight Adjustments): m100-1,500

Fire Control

Name: No Name, but it's reported that the 2S9-1M has a updated FCS, INS, and Sensor suite.
Computerized FCS: Yes
Thermal Sight Vehicle Commander: Yes, with three day vision devices
Thermal Sight Gunner: Yes, with panoramic day sight
Main Gun Stabilization: INA
Indirect Fire: Yes
Direct Fire: INA
Land Navigation: Yes

Protection

Hull Armor: Capable of stopping 12.7mm rounds at the front of the vehicle with protection from 7.62mm rounds from the side

Turret Armor: mm16

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: PAZ NBC system

Smoke Equipment: INA

Fire-Extinguishing System.: PPO centralised ethylene-bromide fire-extinguishing system

Notes:

The 2S9-1M is an upgraded variant of the baseline SO-120 2S9 Anona-S. The upgraded vehicle is designed to maintain the battlefield viability of the original SO-120 until a replacement - likely to be the Lotus fire support vehicle based on the BMD-4M - can be developed and introduced into service. It's reported that the 2S9-1M has a updated FCS, INS, and Sensor suite.

2S23 Nona-SVK Russian 120mm Self-Propelled Mortar System (SPMS)

Tiers:

1 2 3 4

System

Alternative Designation: 2S23 Nona-SVK

Type: Wheeled self-propelled mortar carrier.

Family: 2S3 Family

Crew: 4 (commander, gunner, loader and driver)

Chassis: Modified BTR-80 APC

Chassis Configuration: 8x8

Displacement Time: min1

Emplacement Time: min1

Note: These 120 mm rifled weapons combine the features of a howitzer and mortar in one system. In many respects they are unique weapons as there is no similar system in the West.

Coaxial Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: mm7.62

Max Rate of Fire: rds/min650

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×54mmR
Muzzle Velocity: m/s825
Basic Load: 2,400
Maximum Firing Range: m3,800
Effective Range (With Sight Adjustments): m1,500

Fire Control

Name: INA
Computerized FCS: Yes
Thermal Sight Vehicle Commander: Yes
Thermal Sight Gunner: Yes
Main Gun Stabilization: INA
Direct Fire: Yes, DF Telescopic Sight
Indirect Fire: Yes
Collimator: K-1
Note: This mortar system can be used as mortar or howitzer, delivering direct or indirect fire.

Protection

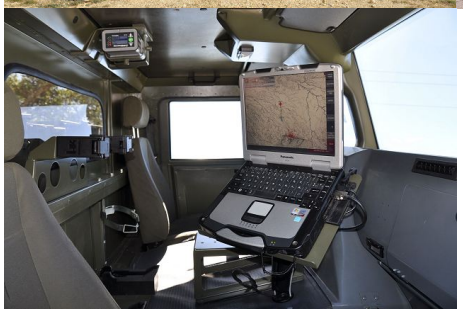
Hull Armor: All-round protection is against 7.62 mm armor-piercing rounds and artillery shell splinters.
Turret Armor: All-round protection is against 7.62 mm armor-piercing rounds and artillery shell splinters.
Applique Armor: INA
Explosive Reactive Armor: INA
Active Protection System: INA
Mine Clearing: No
Self-Entrenching Blade: No
NBC Protection: Yes
Smoke Equipment: Six 81mm smoke grenade launchers
IR Signature: INA
Note: The 2S23 Nova carries two Igla shoulder-launched anti-aircraft missiles and 15 hand grenades.

Notes:

The 2S23 also named Nona-SVK is a Russian made wheeled self-propelled mortar carrier. The 2S23 was first revealed at a defense exhibition in Asia in late 1990 when a complete system was displayed for the first time. According to Russian sources the 2S23 entered service with its land forces in 1990. The 120mm 2S23 Nona-SVK battalion level self-propelled gun (SPG) is designed for use against enemy troops, armament and military equipment. Its armor protection, cross country mobility and maneuverability are identical to the wheeled armored personnel carrier BTR-80. The 2S23 Nona-SVK is capable of applying

aimed fire both from direct and indirect laying positions with mortar bombs and with standard artillery shells. In addition to standard artillery rounds, the gun fires all types of mortar shells designed for use by foreign-made 120mm mortars

EIMOS Spanish 60mm / 81mm Self-Propelled Integrated Mortar System



Tiers:

1 **2** 3 4

Parent:

URO VAMTAC Spanish 4x4 High-Mobility Tactical Vehicle

Variants:

- **VAMTAC I3:** 166-hp Steyr diesel engine
- **VAMTAC S3:** 188-hp Steyr diesel engine, reinforced suspension with greater payload capacity
- **FAMTAC BN3:** Up-armored version with 220-hp Steyer M16TCA-3 6-cylinder engine with a top speed of 135 k/hr

System

Alternative Designations: EIMOS-60; EXPAL EIMOS 60mm Integrated Mortar System
Description: The EXPAL Integrated Mortar System (EIMOS) is a self-propelled system capable of carrying either 60-mm or 81-mm mortars
Manufacturer: EXPAL
In Service: 2009-Present
Crew: 3 (gunner, driver, loader)
Passengers: None

Dimensions

Chassis Length: 5.55 m
Chassis Width: m2.18
Chassis Height: m1.90
Chassis Curb Weight: 3,500 kg

Chassis Payload Weight: 2,500 kg

Chassis Towing Capacity: 3,000 kg

Note: The Chassis is based off of the URO VAMTAC Spanish 4x4 High-Mobility Tactical Vehicle

Automotive

Automotive Performance: 1 x Steyr turbocharged 4-cyl diesel; 166 hp; or 1 x Steyr turbocharged 6-cyl diesel; 188 hp

Engine Type: Turbo-charged 4-cylinder or – cylinder diesel

Engine Powerr: hp166-188

Fuel Capacity: liters110

Transmission: 5 speed automatic

Maximum Range: km600

Speed: 126 km/h to 135 km/h

Gradient: %75

Side Slope: %40

Vertical Step: m0.5

Trench: m0.5

Fording, without Preperation: m0.75

Fording, with Preperation: m1.5

Suspension: 4-wheel independent (double wishbones with coil-springs)

Note: The Chassis is based off of the URO VAMTAC Spanish 4x4 High-Mobility Tactical Vehicle

Communications

Radio: Customer Dependent

Main Weapon System

Note: The EXPAL EIMOS is a autonomous soft-recoil mortar system installed on a turntable mount on the back of a Urovesa VAMTAC 4 x 4 high-mobility utility vehicle

↳*System*

Name: EIMOS-60

Type: High Explosive (HE) Mortar

Caliber: mm60

EIMOS Barrel Length: m1.00

EIMOS Diameter (Base): m0.78

EIMOS Hieght: m1.75

EIMOS Overall Weight: kg800

Length of Recoil: m0.30

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Maximum Effective Range (Using Charge 5): m4,900

Time to Engage Target: Less than 20 seconds

Rate of Fire: 16-18 rounds per minute

Circular Error Probable: 10-15 meters with GT-KIT mortar guidance system

↳*Ammunition*

Name: M720A1

Type: High Explosive (HE) Mortar

Caliber: mm60

Length: mm377

Weight: kg1.7

Ammunition Types: High explosive, White phosphorus (smoke), Hexachloroethane/zinc oxide (smoke) illuminating

Basic Load: INA

Fire Control

FCS Name: INA, a EZPAL Developed Application

Fire Control System: Yes, Laptop-based Fire-Control System. Techfire w/ inertial navigation

Ballistic Software: NATO Standard Agreement (STANAG)-compliant ballistic software

GPS: Yes, differential GPS

Mortar Tube Control: The mortar tube can be rotated and aimed using a joystick located on the mortar unit itself

Guidance System: GT-KIT mortar guidance system

Meteorological Station: Yes, onboard meteorological station

Protection

Armor (turret front): INA

Applique aArmor: No

Explosive Reactive Armor: No

Active Protection System: INA

Self-entrenching Blade: No

NBC Protection System: Available

Smoke Equipment: INA

Notes:

The Spanish Defense Company EXPAL (weapon systems and ammunition) has developed its integrated mortar system EIMOS. EIMOS is a unique system in the market integrating an EXPAL 81 mm or 60 mm mortar, in a 4X4 lightweight vehicle. Automatic aiming and control system facilitates firing procedures and it allows EIMOS to get into firing position rapidly. The system improves precision with minimum effort, requires less instruction and less personnel are required, and improved accuracy saves firepower.

2S9 NONA Russian 120mm Self-Propelled Mortar (SPM)

Tiers:

1 **2** 3 4

Variants:

- **2S23 NONA-SVK:** A BTR-80 based version is the 2S2
- **NONA-K:** Towed 2B16 version
- **2S9-1:** The 2S9-1 is an improved version of the SO-120, it is thought to be reconfigured so that the vehicle can sustain independent fire missions for longer.
- **SO-120 2S9 Anona:** The 120 mm SO-120 2S9 Anona (Anemone) self-propelled gun/mortar (SPG/M) was first seen in public in May 1985 and is an airborne artillery assault vehicle that was developed to carry out two tactical functions.
- **2S9-1M:** The 2S9-1M is an upgraded variant of the baseline SO-120 2S9 Anona-S. The upgraded vehicle is designed to maintain the battlefield viability of the original SO-120 until a replacement - likely to be the Lotus fire support vehicle based on the BMD-4M - can be developed and introduced into service.

Muzzle Velocity: m/s119-331

Fuse Type: INA

Basic Load: 40 total, any combination of 120mm Projectiles

Maximum Effective Range: km8.8

Variants: OF-843B, OF-34 and OF-38 high-explosive fragmentation, S-843 and 3S9 illumination, 3Z2 incendiary and 3D5 smoke

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Max Rate of Fire: rds/min650

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces

In Service: 1961-present

Manufacturer: Degtyaryov plant

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Note: The 7.62 PKT can be controlled remotely

↳***Ammunition***

Type: Rifle

Caliber: mm7.62

Muzzle Velocity: m/s825

Basic Load: ea1,500

Maximum Effective Range (With Sight Adjustments): m100-1,500

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Yes, with three day vision devices

Thermal Sight Gunner: Yes, with panoramic day sight

Main Gun Stabilization: INA

Indirect Fire: Yes

Direct Fire: INA

Land Navigation: Yes

Protection

Hull Armor: Capable of stopping 12.7mm rounds at the front of the vehicle with protection from 7.62mm rounds from the side

Turret Armor: mm16

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: PAZ NBC system

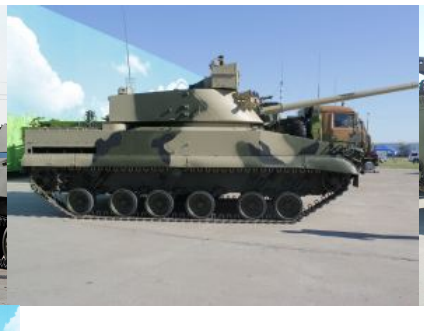
Smoke Equipment: INA

Fire-Extinguishing System.: PPO centralised ethylene-bromide fire-extinguishing system

Notes:

The 2S9-1 is an improved version of the SO-120, it is thought to be reconfigured so that the vehicle can sustain independent fire missions for longer. The 2S9-1 is very similar to the 2S9 NONA Russian 120mm Self-Propelled Mortar (SPM), but it can carry a total of 40 120mm Projectiles instead of the 25 that the 2S9 NONA Russian 120mm Self-Propelled Mortar (SPM) carries.

2S31 Vena Russian Amphibious 120mm Self-Propelled Mortar System



Tiers:

Variants:

- **1B172-2 command vehicle:** The 1B172-2 unified artillery command-observation post/command-and-staff vehicle is based on the same hull as the 2S31. It is fitted with additional communications equipment and a mast-mounted sensor package.
- **120-mm 2S34 Khosta:** This is an upgraded 2S1 self-propelled howitzer fitted with the complete 120-mm 2A80 gun from the 2S31, which is fitted with a muzzle brake. See separate record for more information.

Caliber: mm7.62

Quantity: 1 x PKMT General-Purpose Machine Gun

Length: 1,192 mm

Barrel Length: 605 mm

Weight: 7.5 kg

Action: Gas-operated, open bolt

Rate of Fire: 650 rounds/min

Muzzle Velocity: 825 m/s

Maximum Firing Range: 3,800 m

Effective Firing Range: 1,000 m

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳***Ammunition***

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Basic Load: INA

Armor Penetration: INA

Fire Control System

Name: INA

Computerized FCS: Yes, "Vena" features modern fire control system.

Main Gun Stabilization: INA

Direct Fire: Yes

Indirect Fire: Yes

Laser Detector: Yes, A laser detector is mounted on the low part of the turret front, either side of the 120 mm 2A80 ordnance and on either side of the turret roof at the rear which is used in conjunction with the smoke grenade system.

Protection

Hull Armor: The steel armor protects the crew from small arms fire and shells splinters. Since the mortar is breech loaded the 2S31 is operated from under armor protection. The prototypes were fitted with the Shtora-1 active protection system, but this may not be fitted to all units in service.

Turret Armor: The steel armor protects the crew from small arms fire and shells splinters.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes

Notes:

The 2S31 Vena (Russian: 2C31 Вена) is a Russian amphibious self-propelled 120 mm mortar system. "2S31" is its GRAU designation. The 2S31 Vena is a self-propelled gun/mortar of Russian origin. It was developed as a more capable and more high end alternative to the wheeled 2S23 Nona. The 2S31 was to be more capable in the direct fire role, and more useful as an artillery piece. The 2S31 is based on the chassis of the BMP-3 mechanized infantry combat vehicle. The driver is located at the front, the turret in the center and the engine and drivetrain art located at the rear. The 2S31 features a high level of automation, advanced fire control system and an active protection system. The 120mm 2A80 rifled gun/mortar is the main armament. It is longer than the 120mm gun/mortars found on the tracked 2S9 and wheeled 2S23. Although rifled, it can fire 120mm shells designed for smoothbore and rifled barrels. Laser guided shells can also be fired. A total of 70 shells of 120mm ammunition are carried, about twice as many as carried by 2S9 or 2S23. The effective range is highly dependent on type of ammunition. Regular shells can be fired out to 5 or 9 km. Assisted projectiles can be fired up to 13 or 17 km, depending on type. Maximum rate of fire is quoted as 8 to 10 rpm. The tracked chassis provides the 2S31 with good off road mobility and the ability to keep up with mechanized infantry. The UTD-29 diesel engine provides up to 450 hp. The maximum speed is 70 km/h on roads. The 2S31 is amphibious and propelled in the water via water jet.

Explosive Reactive Armor: Yes, reactive bricks arranged in a row across the front.
Active Protection System: Yes
Mine Clearing: INA
Self-Entrenching Blade: INA
NBC Protection: INA
Smoke Equipment: 12

Notes:

In 2017 a new Infantry Fighting Vehicle (IFV) emerged in China. This armored vehicle is being proposed for export customers as the VN17. It is an entirely new design, rather than clone of Western or Russian designs. The VN17 is based on a VT5 light tank chassis. This new Chinese IFV weights around 30 t. It is fitted with modular add-on armor kit. This new IFV is better protected than ZBD-08, used by the Chinese army. This armored vehicle follows the current trend for better protected IFVs. Most likely that front armor of the VN17 withstands 30 mm armor-piercing rounds.The VN17 is armed with a 30 mm automatic cannon. There are also two HJ-12 anti-tank missile launchers. This armored vehicle has got a coaxial 7.62 mm machine gun.

BMP-1P Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Parent:

BMP-1 Russian Amphibious Infantry Fighting Vehicle (IFV)

Variants:

- **BMP-1:** BMP-1 is the first mass produced, tracked IFV of the erstwhile USSR. It is the first variant of the now obsolete BMP model designed in 1966. Considered to be the world's first true IFV, it is also a radical departure from the armoured vehicle designs of the USSR since the Second World War. With over 55,000 BMP-1s and variants having been produced, it is numerically one of the most significant armoured vehicles produced across the world.
- **BMP-1 Ambulance (Iraq):** Evacuate wounded
- **BMP-1M:** Kliver turret & drop down gate
- **Type 86/WZ-501 (China):** Chinese BMP-1 IFV
- **BMP-1 KShM (Command Vehicle):** Communication equipment similar to BMD KShM variant
- **BMP-1G ICV:** AT-4/AT-5 ATGM & 30-mm AGS-17 AGL
- **BMP-1K (BMP 1974):** Command variant with additional radios, sealed right-side firing ports, & antenna
- **BMP-1 with Soviet modifications in Afghanistan:** Applique armor, AT-4 ATGM mount; some with AGS-17 30-mm AGL
- **BMP-IRM ("Zhuk"-Beetle):** Engineer recon vehicle with front mine claws; 1 MG only
- **BMP-1 with mine plow:** KMT-8 or KMT-10 mine-clearing plows attached
- **MP-31:** Modernized command vehicle
- **BMP-R (BMP M1976):** Recon vehicle with larger rear hatches & 2-man turret
- **BRM-1/BRM-1K Reconnaissance:** BMP-R with a GS-12 Tall Mike radar ILO AT-3 Sagger (see Chapter 1)
- **BREM-2:** Light recovery vehicle w/crane
- **BMP-40:** Larger turret; carries 6 soldiers, prototype model only
- **PRP-3/PRP-4 (Radar):** Artillery recon vehicle with 7.62 MG ILO 73-mm cannon
- **VP-90 (Czech Republic):** Recon with OT-64 turret; 14.5-mm & 7.62-mm MGs
- **SVO Mineclearer (Czech Republic):** Turretless BMP-1 with 24 245-mm explosive rockets
- **BMP-PP0:** Training variant w/o turret
- **Snezka (Czech Republic):** Battlefield surveillance vehicle
- **PRAM-S (Czech Republic):** SP 120-mm mortar carrier
- **BMP-1 Finnish variant:** East German vehicles with autoloaders removed
- **BMP-1 with Poyaud engine (Egypt):** 150 with replaced 10.47-liter Poyaud 6-cylinder engine
- **BMP-1 with applique armor (Iraq):** Armor added to resist 12.7-mm & 14.5-mm armor-piercing shells at 200 m
- **BMP-1A1 Ost:** In 1990, Germany created more space (6 passengers) & removed the automatic loader

- **BMP-1 with CERAWA armor (Poland):** CERAWA ERA on the glacis, hull, & turret front
- **OT-90 (Czech Republic):** OT-64 1-man turret with 14.5-mm & 7.62-mm machine guns
- **BPzV (Czech Republic):** Recon with Tall Mike radar
- **DP-90 (Czech Republic):** Recon with Tall Mike ra0T-90 maintenance variant adar
- **MU-90 (Czech Republic):** Turretless mine-laying OT-90
- **MLI-84 (Romania):** Larger & heavier w/ 12.7-mm machine gun
- **Pansarbandvgn 501 (Pbv 501 (Sweden):** East German vehicles to mechanized Swedish infantry
- **BREM-4 recovery vehicle:** No turret & crane (Czech version is the VPV)
- **BRM-23 (Bulgaria):** Recon with 23-mm cannon
- **82-mm SP Automatic mortar (Hungary):** Vasilyek mortar ILO troop compartment

Smoke Equipment: Yes, a upgraded 81mm 902V "Tucha" smoke grenade launcher

Survivability Equipment: INA

Grenade Launcher: Yes, RPG-7 light grenade launcher with grenades

Scavenger System: Yes

Mine Plough: Yes, KMT-10 plough-type mine-clearing system

Fire-Extinguisher System: Yes

Notes:

The BMP-1P is an upgraded variant of the BMP-1 "A variety of upgrades are available: improved tracks, spall liners, air conditioning, smoke generator launchers, laser warning receivers, & more powerful engines. French SNPE ERA & other kits are available, but are hazardous during dismounted operations. Additional armor may jeopardize amphibious capability. Kornet ATGM launcher can be mounted on other BMP-1 variants. Russian AGS-17 & AG-30 30-mm automatic grenade launchers are also available. Key limitation for BMP-1s is the 1-man turret, but BMP-1S can be upgraded to 2-man turrets."

CV 9035DK Danish Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **CV9030:** Export version with a 30 mm Bushmaster II autocannon. Adopted by Norway, Switzerland and Finland. Within BAE Systems Hägglunds, the original version of the Norwegian CV9030N is known as the CV90 MK I. The Finnish CV9030FIN and Swiss CV9030CH vehicles are known as the CV90 MK II. The CV90 MK II is also available as CV9030 COM – Command & Control Vehicle. The recently upgraded CV9030N infantry fighting, command & control and reconnaissance vehicles for Norway are known as CV90 MkIIIb, and this is the most advanced variant currently in service.
- **CV9035:** Armed with a Bushmaster III 35/50 cannon. Adopted by the Netherlands as CV9035NL and Denmark as CV9035DK. Within BAE Systems Hägglunds, CV9035 is known as the CV90 MK III.
- **CV90105:** Light tank equipped with 105 mm rifled tank gun/turret. Designed by Hägglunds (BAE Systems) and GIAT (Nexter). A newer version features the Cockerill XC-8 turret.
- **CV90120-T:** Light tank equipped with a tank turret equipped with a smoothbore 120 mm gun. (RUAG 120 mm Compact Tank Gun)
- **CV90 CZ:** Export variant designed in collaboration with VOP CZ marketed to the Czech Republic, manned turret variant.[
- **CV90 CZr:** Export variant designed in collaboration with VOP CZ marketed to the Czech Republic featuring a Kongsberg MCT-30 unmanned, remote controlled turret, a slightly raised hull and periscope system.
- **Armadillo:** Armoured personnel carrier version built on a modular CV90 Mk III chassis. The CV90 Armadillo can be modified to become a personnel carrier, an ambulance, a command and control centre, a recovery vehicle and many other non-turreted variants at low cost due up to 80% commonality among variants.[31] Currently, only the APC version has been built, with five delivered to Denmark for trials.
- **CV90 STING:** Combat engineering variant built on CV90 Mk I chassis. This vehicle can be outfitted with either a mine plow or a mine roller, and it also has a robotic arm. 16 have been ordered by the Norwegian Army.
- **CV90RWS Multi BK:** Mortar carrier variant built on a CV90 Mk I chassis. This vehicle is armed with a VingPos Mortar Weapon System outfitted with an 81mm L16A2 mortar. 16 have been ordered by the Norwegian Army.
- **CV90 MkIV:** BAE-developed upgraded variant revealed in January 2018, marketed to the Czech Republic as well as existing customers as an upgrade package. Features include a Scania engine with up to 1000 horsepower, X300 transmission, and an increased payload of 2 tonnes. The system also includes BAE's Fighting computer system, which claims to enhance situational awareness, aid decision making, improve ergonomics, and enable autonomous support and remote operation.
- **CV 9035DK:** This is the Danish variant of the CV 9035. It is armed with an ATK 35/50-mm Bushmaster III cannon and a 7.62-mm machine gun. The vehicle is equipped with a computerized fire-control system with stabilized day and night sights. The gunner is equipped with a third-generation thermal imager. It carries a crew of three and seven troops. The Danish vehicles are all in the infantry fighting vehicle configuration, although a small number were fitted with additional

communications equipment for service as command vehicles. A cupola over the rear troop compartment is provided for the squad leader.

Notes:

CV 9035DK This is the Danish variant of the CV 9035. It is armed with an ATK 35/50-mm Bushmaster III cannon and a 7.62-mm machine gun. The vehicle is equipped with a computerized fire-control system with stabilized day and night sights. The gunner is equipped with a third-generation thermal imager. It carries a crew of three and seven troops. The Danish vehicles are all in the infantry fighting vehicle configuration, although a small number were fitted with additional communications equipment for service as command vehicles. A cupola over the rear troop compartment is provided for the squad leader. The Combat Vehicle 90 (CV90; Sw. Stridsfordon 90, Strf90) is a family of Swedish tracked combat vehicles designed by Sweden's Defense Materiel Administration (Försvarets Materielverk, FMV), Hägglunds and Bofors during the mid-1980s and early 1990s and entered service in Sweden in the mid-90s. The CV90 platform design has continuously evolved in steps from Mk0 to current MkIV with

advances in technology and in response to changing battlefield requirements. The Swedish version of the main infantry fighting vehicle is fitted with a turret from Bofors that is equipped with a 40 mm Bofors autocannon. Export versions are fitted with Hägglunds E-series turrets, armed with either a 30 mm or a 35 mm Bushmaster autocannon. Developed specifically for the Nordic sub-arctic climate, the vehicle has very good mobility in snow and wetlands while carrying and supporting six to eight fully equipped dismount soldiers. Other variants include Forward Observation, Command and control, anti-aircraft, armoured recovery vehicle, electronic warfare and so forth. The CV90 and Hägglunds E-series turrets have been under continuous development with more than 4 million hours invested and are still produced with modern protection, armament and network enabled solutions. Currently, 1,280 vehicles in 15 variants are in service with seven user nations, four of which are NATO members, under BAE Systems Hägglunds AB.

CV 9030 Swedish Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **CV9030:** Export version with a 30 mm Bushmaster II autocannon. Adopted by Norway, Switzerland and Finland. Within BAE Systems Hägglunds, the original version of the Norwegian CV9030N is known as the CV90 MK I. The Finnish CV9030FIN and Swiss CV9030CH vehicles are known as the CV90 MK II. The CV90 MK II is also available as CV9030 COM – Command & Control Vehicle. The recently upgraded CV9030N infantry fighting, command & control and reconnaissance vehicles for Norway are known as CV90 MkIIIb, and this is the most advanced variant currently in service.
- **CV9035:** Armed with a Bushmaster III 35/50 cannon. Adopted by the Netherlands as CV9035NL and Denmark as CV9035DK. Within BAE Systems Hägglunds, CV9035 is known as the CV90 MK III.
- **CV90105:** Light tank equipped with 105 mm rifled tank gun/turret. Designed by Hägglunds (BAE Systems) and GIAT (Nexter). A newer version features the Cockerill XC-8 turret.
- **CV90120-T:** Light tank equipped with a tank turret equipped with a smoothbore 120 mm gun. (RUAG 120 mm Compact Tank Gun)
- **CV90 CZ:** Export variant designed in collaboration with VOP CZ marketed to the Czech Republic, manned turret variant.[
- **CV90 CZr:** Export variant designed in collaboration with VOP CZ marketed to the Czech Republic featuring a Kongsberg MCT-30 unmanned, remote controlled turret, a slightly raised hull and periscope system.
- **Armadillo:** Armoured personnel carrier version built on a modular CV90 Mk III chassis. The CV90 Armadillo can be modified to become a personnel carrier, an ambulance, a command and control centre, a recovery vehicle and many other non-turreted variants at low cost due up to 80% commonality among variants.[31] Currently, only the APC version has been built, with five delivered to Denmark for trials.
- **CV90 STING:** Combat engineering variant built on CV90 Mk I chassis. This vehicle can be outfitted with either a mine plow or a mine roller, and it also has a robotic arm. 16 have been ordered by the Norwegian Army.
- **CV90RWS Multi BK:** Mortar carrier variant built on a CV90 Mk I chassis. This vehicle is armed with a VingPos Mortar Weapon System outfitted with an 81mm L16A2 mortar. 16 have been ordered by the Norwegian Army.
- **CV90 MkIV:** BAE-developed upgraded variant revealed in January 2018, marketed to the Czech Republic as well as existing customers as an upgrade package. Features include a Scania engine with up to 1000 horsepower, X300 transmission, and an increased payload of 2 tonnes. The system also includes BAE's Fighting computer system, which claims to enhance situational awareness, aid decision making, improve ergonomics, and enable autonomous support and remote operation.
- **CV 9035DK:** This is the Danish variant of the CV 9035. It is armed with an ATK 35/50-mm Bushmaster III cannon and a 7.62-mm machine gun. The vehicle is equipped with a computerized fire-control system with stabilized day and night sights. The gunner is equipped with a third-generation thermal imager. It carries a crew of three and seven troops. The Danish vehicles are all in the infantry fighting vehicle configuration, although a small number were fitted with additional communications equipment for service as command vehicles. A cupola over the rear troop compartment is provided for the squad leader.

Marder 1A3 German Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **Marder 1A2:** Since 1983, all the German Marder 1s have been upgraded to the A2 standard. Fitted with thermal imaging sight equipment instead of the image intensifier. New sighting system.
- **Marder 1A3:** new armour kit mounted on the side of the hull. . New stowage boxes are provided along the sides of the upper part of the hull and a new radio installation is provided.
- **Marder 1 A1(−) (1979–1982)::** as A1(+) but without thermal imager. 350 vehicles upgraded to this standard.
- **Marder 1 A1A3::** a Marder A1 with SEM 80/90 cryptographic radios. Marder 1 A1A as 1 A1 but without any passive night vision equipment. 1,112 vehicles upgraded to this standard.
- **Marder 1 A1A4::** a Marder A1A with SEM 80/90 cryptographic radios. Marder 1 A1A2: a converted Marder 1 with A1 turret and A2 chassis
- **Marder 1 A1A5:** a Marder A1A2 with SEM 80/90 cryptographic radios.
- **Marder 1 A2 (1984–1991):** Between 1984 and 1991, all German Marder 1s were upgraded to A2 standard, this included substantial modification of the suspension, fuel tanks, cooling system and water-jet cleaning system. Additionally a new sighting system was installed. The infrared search light equipment was removed, and all vehicles were fitted with thermal imagers except for the 674 A1(+) vehicles, which already had them.
- **Marder 1 A2A1:** a Marder 1A2 with SEM 80/90 cryptographic radios.
- **Marder 1 A3 (1988–1998):**
- **Marder 1 A4:** a Marder 1 A3 with SEM 93 cryptographic radio
- **Marder 1 A5 (2003–2004):** Additional anti-mine armor and completely remodeled interior in order to avoid blast and shock injuries to the crew when hit by a mine. Applied to 74 Marder 1 A3s only.
- **Marder 1 A5A1 (2010–2011:** Equipped with air conditioning system, jammer for IED-protection and multi-spectral camouflage

Notes:

The Marder (German for "marten") is a German infantry fighting vehicle operated by the German Army as the main weapon of the Panzergrenadiere (mechanized infantry) from the 1970s through to the present day. Developed as part of the rebuilding of Germany's armoured fighting vehicle industry, the Marder has proven to be a successful and solid infantry fighting vehicle design. While it used to include a few unique features, such as a fully remote machine gun on the rear deck and gun ports on the sides for infantry to fire through, these features have been deleted or streamlined in later upgrade packages to bring it more in line with modern IFV design (the MG has been moved to be a coaxial, the gun ports entirely welded shut and up armored). It is overall a simple and conventional machine with one large rear exit hatch and three top hatches for mounted infantry to fire from. The Marder is currently being replaced by its successor, the Puma.

FV 510 Warrior British Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **FV510 Infantry Section Vehicle:** This is the principal version operated by the British Army, as described above. 489 were produced (including 105 as platforms for the mobility of ATGW teams, originally equipped with MILAN and later with Javelin).
- **FV511 Infantry Command Vehicle:** 84 of these were produced.
- **FV512 Mechanised Combat Repair Vehicle.:** Operated by REME detachments in Armoured Infantry battalions. It is equipped with a 6.5 tonne crane plus power tools and is able to tow a trailer carrying two Warrior power packs or one Challenger power pack. 105 of these were produced.
- **FV513 Mechanised Recovery Vehicle (Repair):** Also operated by REME detachments in Armoured Infantry battalions. It is equipped with a 20 tonne winch and 6.5 tonne crane plus power tools and (like the FV512) is able to tow a trailer carrying two Warrior power packs or one Challenger power pack. 39 of these were produced.
- **FV514 Mechanised Artillery Observation Vehicle:** This is operated by the Royal Artillery as an Artillery Observation Post Vehicle (OPV) and is fitted with mast-mounted Man-packable Surveillance and Target Acquisition Radar (MSTAR) and Position and Azimuth Determining System (PADS), with Image Intensifying and Infra Red equipment. The only armament is the 7.62 mm machine gun, as the 30 mm Rarden cannon is replaced by a dummy weapon. This allows space for the targeting and surveillance equipment while still keeping largely the same outward appearance of a standard Warrior in order to avoid becoming a priority target. 52 of these were produced.
- **FV515 Battery Command Vehicle:** This is operated by the Royal Artillery. 19 of these were produced. Desert Warrior. This was an export version adapted for operations in hostile desert conditions. It was fitted with the Delco turret as used on the LAV-25 wheeled IFV, mounting a stabilised M242 Bushmaster 25 mm chain gun with coaxial 7.62 mm chain gun and 2 x Hughes TOW ATGM launchers (one mounted on each side). In 1993, Kuwait purchased 254 Desert Warrior vehicles.
- **Warrior 2000.:** This was a new version developed for the Swiss Army. It did not enter production. It featured an all-welded aluminium hull, increased armour, digital fire control system and more powerful engine. It was fitted with the Delco turret, or a Land Systems Hagglunds E30 turret with Alliant Techsystems Bushmaster II Mk 44 30 mm cannon.

Notes:

The Warrior tracked vehicle family is a series of British armored vehicles, originally developed to replace the older FV430 series of armored vehicles. The Warrior started life as the MCV-80, "Mechanised Combat Vehicle for the 1980s". One of the requirements of the new vehicle was a top speed able to keep up with the projected new MBT, the MBT-80 - later canceled and replaced by what became the Challenger 1 - which the then-current FV432 could not. The project was begun in the 1970s. GKN Defence won the production contract in 1980. GKN Defence was purchased by BAE Systems, via Alvis plc. A total of 789 FV510 and variants were manufactured for the British Army, and 254 of a modified version (Desert Warrior) was produced for the Kuwaiti Army. The Warrior incorporates several design features in keeping with the UK's battlefield experience. In particular, there are no firing ports in the hull, in line with British thinking that the role of the armored personnel carrier/infantry fighting vehicle (APC/IFV) is to carry troops under protection to the objective and then give firepower support when they have disembarked. The absence of firing ports also allows additional appliqué armor to be fitted to the sides of the vehicle, which is invariably applied to Warriors involved in active operations. The cage armor used at one stage was replaced in 2007 by "Wrap Two" appliqué armor. The basic armor provides all-around protection against small arms ball ammunition. The crew of a Warrior comprises the driver, seated in the front hull, and the gunner and commander, who are both seated in the turret. The embarked infantry section can number up to seven soldiers, who are seated facing each other in the rear hull compartment. Passenger access is through a single electric ram powered door at the rear of the hull, rather than a drop-down ramp as in the US M113 APC and M2 Bradley IFV. Warrior Section Vehicles are able to carry and support seven fully equipped soldiers together with supplies and weapons, including a number of anti-tank weapons, for a 48-hour battlefield day in nuclear/biological/chemical conditions. The Warrior is driven by a Perkins-Rolls-Royce V8 Condor engine through a four-speed automatic gearbox. It is capable of a road speed of 46 miles per hour (74 km/h). The Warrior has the speed and performance to keep up with a Challenger 2 main battle tank over the most difficult terrain. The vehicle is fitted with a two-man GKN Sankey turret, armed with a non-stabilized L21A1 30 mm RARDEN cannon capable of destroying some APCs at a maximum range of

1,500 meters (1,600 yd), and an L94A1 EX-34 7.62 mm Hughes Helicopters coaxial chain gun. It is fitted with two clusters of four defensive grenade launchers (usually used with Visual and Infrared Screening Smoke – VIRSS). All Warrior Infantry Section Vehicles are now equipped with Bowman radios, which replaced the earlier Clansman radios, for enhanced communications, command and control. When first introduced, the vehicles were fitted with passive Image intensifier night vision sights. These have since been progressively replaced with Thales Optronics Battle Group Thermal Imaging (BGTI) sights to upgrade night fighting capabilities, with 8x magnification. As of 2007, 350 vehicles were fitted with BGTI.

Puma German Infantry Fighting Vehicle (IFV)

Tiers:

1 **2** 3 4

Variants:

- **Command post vehicle:** This variant retains the 30-mm turret. The rear is modified for the command-post role and fitted with additional communications equipment.
- **Driver training vehicle:** Eight of the 350 Pumas ordered by the German army will be in the specialized driver training role. They are not fitted with the 30-mm turret.

System

Alternative Designation: Puma
Type: Infantry Fighting Vehicle (IFV)
Crew: eaInfantry Fighting Vehicle (IFV)
Passengers: 6

Dimensions

Length: 7.6 m
Width: 3.9 m
Height: 3.1 m
Track Width: 0.5 m
Ground Clearance: 450mm
Weight, Maximum Load: 43,000 kg
Weight, Air-Transportable: 31,450 kg
Weight, Ground-Transport: 40,700 kg

Automotive

Engine Name: 1 x MTU 10V 892
Engine Type: 10-cyl high-power density diesel
Engine Power: 1,073 hp (800 kW) at 4,250 rpm
Speed, Forward: 38 mph (70 km/h)
Speed, Reverse: 22 mph (40 km/h)

Range: 310 mi (500 km)

Vertical Obstacle: 2 ft 7 in (0.80 m)

Trench: 8 ft 2 in (2.50 m)

Fording without Preparation: 3 ft 11 in (1.20 m)

Main Gun

↳*System*

Name: Mauser MK30-2

Type: 30 mm Rifled Gun

Quantity: 1 x Mauser MK30-2

Caliber: mm30

Length: mm3780

Weight: kg198

Rate of Fire: 200 rounds per minute

Traverse: 360 deg

Elevation: -10 deg to 45 deg

Range: 9,840 ft (3,000 m)

Notes: dual ammunition feeding allows varied alternate shots

↳*Ammunition*

Type: APFSDS-T and KETF (ABM)

Caliber: mm30

Basic Load: 200 rounds ready to fire, 200 rounds in storage

Coaxial Weapon System

↳*System*

Name: Heckler and Koch MG4 (also known as the HK123)

Type: Light machine gun

Manufacturer: Heckler & Koch

Proliferation: Albania: Standard light support weapon of Albanian Land Forces Brazil: Limited use on the Brazilian Army Estonia: Used by ESTSOF. Germany: Standard platoon-level support weapon of the German Army, adopted in 2005. Malaysia: Used by PASKAL special operations force tactical of the Royal Malaysian Navy, adopted in 2006. Portugal Spain: Ordered 1,800–2,000 MG4E machine guns in 2007 with deliveries expected to continue over the next four years. Standard LMG for the Spanish Army, usually fitted with an ACOG sight. Turkey Air Force MAK SF

In Service: 2005-present

Length: 1,030 mm (40.6 in) stock extended / 830 mm (32.7 in) stock folded (MG4, MG4E) 950 mm (37.4 in) stock extended / 750 mm (29.5 in) stock folded (MG4KE)

Barrel Length: 450 mm (17.7 in) (MG4, MG4E) 370 mm (14.6 in) (MG4KE)

Width: 90 mm (3.5 in)

Height: 250 mm (9.8 in)

Weight: 8.15 kg (17.97 lb) (MG4) 7.90 kg (17.4 lb) (MG4E) 7.70 kg (17.0 lb) (MG4KE)

Action: Gas-operated, rotating bolt

Rate of Fire: 890 (± 60) RPM (MG4) 775 (± 50) RPM (MG4E, MG4K)

Effective Firing Range: Approx. 1,000 m (MG4, MG4E) Approx. 900 m (MG4KE)

Feed System: M27 linked disintegrating belt

Sights: Iron sights; MIL-STD-1913 rail provided for optics, German Army models are equipped with telescopic sights with 3× magnification.

↳*Ammunition*

Type: Rifle

Caliber: mm5.56

Cartridge: 5.56 x 45mm NATO

Basic Load: 1,000 rounds ready to fire, 1,000 rounds in storage

Anti-Tank Guided Missile System

↳*System*

Name: Spike

Type: fire-and-forget anti-tank guided missile and anti-personnel missile

Length: 1,200 mm (3 ft 11 in)

Diameter: 130 mm (5.1 in)

Weight: Spike-ER from helicopter: • Missile in canister: 34 kg (74 lb 15 oz) • Launcher: 55 kg (121 lb 4 oz) • Launcher + 4 missiles: 187 kg (412 lb 4 oz) Spike-MR/LR from ground: • Missile round: 14 kg (30 lb 14 oz) • Command & launch unit (CLU): 5 kg (11 lb 0 oz) • Tripod: 2.8 kg (6 lb 3 oz) • Battery: 1 kg (2 lb 3 oz) • Thermal sight: 4 kg (8 lb 13 oz)

Rate of Fire: Ready to launch in 30 seconds, reload in 15 seconds

Effective Firing Range: 200–2,500 m (220–2,730 yd)

Sights: 10× optical sight

Warhead: Tandem-charge HEAT warhead

Detonation Mechanism: Piezoelectric trigger

Engine: Solid-propellant rocket

Guided System: Infrared homing – Electro Optical (CCD, Imaging Infrared (IIR) or Dual CCD/IIR), Passive CCD or dual CCD/IIR seeker

Fire Control

Name: INA

Computerized FCS: INA

Main Gun Stabilization: INA

Note #1: The Puma offers improvements in situational awareness. The fully stabilized 360° periscope (PERI) with six different zoom stages offers a direct glass optic link to either the commander or the gunner. Since this is an optical line, it had to be placed in the turret center, one of the reasons why the main cannon is mounted off-center on the turret. Via an additional CCD camera the picture from this line can also be fed into the on-board computer network and displayed on all electronic displays within the vehicle. Besides that, the periscope offers an optronic thermal vision mode and a wide-angle camera with three zoom stages to assist the driver, as well as a laser range finder. The whole array is hunter-killer capable; the commander also has 5 vision blocks. The gunner optics, which can be completely protected with a slide hatch, are mounted coaxially to the main gun. The gunner has a thermal vision camera and laser range finder (identical to those on the PERI) and an optronic day sight, rounded off with a vision- and a glass block. The driver has three of them, as well as an image intensifier and one display for optronic image feeds. Even the passenger cabin has a hatch and three vision blocks on the rear right side of the vehicle, one of them in a rotary mount. The rear cabin also has two electronic displays. All in all, the Puma has an additional five external cameras at its rear in swing-mounts for protection while not in use. Apart from the glass optic periscope view directly accessible only by the commander and gunner (but indirectly via the CCD camera), all optronic picture feeds can be displayed on every electronic display within the vehicle. The provisions for the rear cabin enable the passengers to be more active than previously in assisting the vehicle crew either directly through the vision blocks and hatches, or by observing one or more optronic feeds. The whole crew has access to the on board intercom.

Note #2: The gunner's control unit enables him to optimize the type of ammunition for a particular target. Options include tanks, armored infantry fighting vehicle, armored personnel carrier, helicopter, line of skirmishers, soldiers in a covered position and a squad column.

Protection

Hull Armor: The Puma incorporates protection against mines to NATO Standard Agreement (STANAG) 4569 requirements, shaped charges and kinetic energy ammunition as well as nuclear, biological and chemical weapons. The vehicle features passive, reactive and active armor elements. The hull is of all-welded steel armor with applique passive armor for higher levels of ballistic protection. The Puma has two levels of protection. It is air-transportable at protection level A, which includes full mine protection and ballistic protection from machine guns up to 14.5-mm in caliber through 360 degrees. Add-on armor brings the Puma to protection level C. This defends against hand-held anti-tank weapons, medium-caliber weapons, artillery fragments and bomblets. Mine protection is effective against heavy blast mines and explosively formed projectiles (EFP). The belly provides protection against anti-tank mines containing 22 lb (10 kg) of explosive as well as explosively formed penetrators (EFPs).

Turret Armor: The hull and turret roof are protected against bomblets. The rear of the Puma has been strengthened to withstand the impact of another vehicle in case of collision.

Applique Armor: The modular passive armor package allows the vehicle to be rapidly upgraded with new technology or for changing threats.

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Puma is a German infantry fighting vehicle (Schützenpanzer or short SPz) designed to replace the aging Marder IFVs currently in service with the German Army. Production of the first batch of 350 vehicles began in 2010 and is scheduled for completion by August 2020. A second batch of 210 Pumas has received funding. Mass production began on 6 July 2009. The companies responsible for this project are Krauss-Maffei Wegmann and Rheinmetall Landsysteme, who created a joint venture in the form of Projekt System Management GmbH (PSM). The Puma is one of the world's best-protected IFVs, while still having a high power-to-weight ratio. SAIC offered a derivative of the Puma as its contender in the now cancelled American GCV Infantry Fighting Vehicle program. The Puma, while externally not very different from existing IFVs, incorporates a number of advances and state-of-the-art technologies. The most obvious of these is the incorporated ability to flexibly mount different armour (see below for details). Another feature is the compact, one-piece crew cabin that enables direct crew interaction ("face-to-face"; like replacing the driver or gunner in case of a medical emergency) and minimizes the protected volume. The cabin is air conditioned, NBC-proof with internal nuclear and chemical sensors and has a fire suppressing system using non-toxic agents. The engine compartment has its own fire extinguishing system. The only compromise of the otherwise nearly cuboid cabin is

the driver station, located in a protrusion in front of the gunner, in front of the turret. One measure to achieve the one-piece cabin is the use of an unmanned, double-asymmetrical turret (see photo): while slightly off-center turrets are common in IFVs, the Puma's turret is on the left-hand side of the vehicle, while the main cannon is mounted on the right side of the turret and thus on the middle axis of the hull when the turret is in the forward position. The outer hull (minus the turret) is very smooth and low to minimize bullet traps and the general visual signature. The whole combat-ready vehicle in its base configuration will be air transportable in the Airbus A400M tactical airlifter. Its 3+6 persons crew capability is comparable to other vehicles of comparable weight, like the US American M2 Bradley IFV, the same as in the Marder, but smaller than the 3+8 of the CV9030 and CV9035.

CV 9040 Swedish Infantry Fighting Vehicle (IFV)

Tiers:

1 **2** 3 4

Variants:

- **CV9030:** Export version with a 30 mm Bushmaster II autocannon. Adopted by Norway, Switzerland and Finland. Within BAE Systems Hägglunds, the original version of the Norwegian CV9030N is known as the CV90 MK I. The Finnish CV9030FIN and Swiss CV9030CH vehicles are known as the CV90 MK II. The CV90 MK II is also available as CV9030 COM – Command & Control Vehicle. The recently upgraded CV9030N infantry fighting, command & control and reconnaissance vehicles for Norway are known as CV90 MkIIIb, and this is the most advanced variant currently in service.
- **CV9035:** Armed with a Bushmaster III 35/50 cannon. Adopted by the Netherlands as CV9035NL and Denmark as CV9035DK. Within BAE Systems Hägglunds, CV9035 is known as the CV90 MK III.
- **CV90105:** Light tank equipped with 105 mm rifled tank gun/turret. Designed by Hägglunds (BAE Systems) and GIAT (Nexter). A newer version features the Cockerill XC-8 turret.
- **CV90120-T:** Light tank equipped with a tank turret equipped with a smoothbore 120 mm gun. (RUAG 120 mm Compact Tank Gun)
- **CV90 CZ:** Export variant designed in collaboration with VOP CZ marketed to the Czech Republic, manned turret variant.[
- **CV90 CZr:** Export variant designed in collaboration with VOP CZ marketed to the Czech Republic featuring a Kongsberg MCT-30 unmanned, remote controlled turret, a slightly raised hull and periscope system.
- **Armadillo:** Armoured personnel carrier version built on a modular CV90 Mk III chassis. The CV90 Armadillo can be modified to become a personnel carrier, an ambulance, a command and control centre, a recovery vehicle and many other non-turreted variants at low cost due up to 80% commonality among variants.[31] Currently, only the APC version has been built, with five delivered to Denmark for trials.
- **CV90 STING:** Combat engineering variant built on CV90 Mk I chassis. This vehicle can be outfitted with either a mine plow or a mine roller, and it also has a robotic arm. 16 have been ordered by the Norwegian Army.
- **CV90RWS Multi BK:** Mortar carrier variant built on a CV90 Mk I chassis. This vehicle is armed with a VingPos Mortar Weapon System outfitted with an 81mm L16A2 mortar. 16 have been ordered by the Norwegian Army.
- **CV90 MkIV:** BAE-developed upgraded variant revealed in January 2018, marketed to the Czech Republic as well as existing customers as an upgrade package. Features include a Scania engine with up to 1000 horsepower, X300 transmission, and an increased payload of 2 tonnes. The system also includes BAE's Fighting computer system, which claims to enhance situational awareness, aid decision making, improve ergonomics, and enable autonomous support and remote operation.
- **CV 9035DK:** This is the Danish variant of the CV 9035. It is armed with an ATK 35/50-mm Bushmaster III cannon and a 7.62-mm machine gun. The vehicle is equipped with a computerized fire-control system with stabilized day and night sights. The gunner is equipped with a third-generation thermal imager. It carries a crew of three and seven troops. The Danish vehicles are all in the infantry fighting vehicle configuration, although a small number were fitted with additional communications equipment for service as command vehicles. A cupola over the rear troop compartment is provided for the squad leader.

System

Alternative Designation: CV 9040

Type: Infantry Fighting Vehicle

Name: CelsiusTech Electronics UTAAS protected by an armored shutter
Computerized FCS: Yes
Thermal Imager: Yes
Laser Range-Finder: Yes
GPS Receiver: Yes
Compass: KVH Compass

Protection

Hull Armor: Protection against 20- to 30-mm projectiles,may include Kevlar composite materials
Turret Armor: Protection against 20- to 30-mm projectiles,may include Kevlar composite materials
Applique Armor: INA
Explosive Reactive Armor: INA
Active Protection System: INA
Mine Clearing: No
Self-Entrenching Blade: INA
NBC Protection: Yes
Smoke Equipment: INA
Grenades: 2 x Lyran flare grenade launchers on rear turret roof 1 x bank of GALIX grenade launchers on either side of the turret

Notes:

CV 9040 IFV This is the definitive version of the CV 90. It is equipped with 40-mm 40/70 cannon, a 7.62-mm co-axial machine gun and has the UTAAS. The Combat Vehicle 90 (CV90; Sw. Stridsfordon 90, Strf90) is a family of Swedish tracked combat vehicles designed by Sweden's Defense Materiel Administration (Försvarets Materielverk, FMV), Hägglunds and Bofors during the mid-1980s and early 1990s and entered service in Sweden in the mid-90s. The CV90 platform design has continuously evolved in steps from Mk0 to current MkIV with advances in technology and in response to changing battlefield requirements. The Swedish version of the main infantry fighting vehicle is fitted with a turret from Bofors that is equipped with a 40 mm Bofors autocannon. Export versions are fitted with Hägglunds E-series turrets, armed with either a 30 mm or a 35 mm Bushmaster autocannon. Developed specifically for the Nordic sub-arctic climate, the vehicle has very good mobility in snow and wetlands while carrying and supporting six to eight fully equipped dismount soldiers. Other variants include Forward Observation, Command and control, anti-aircraft, armoured recovery vehicle, electronic warfare and so forth. The CV90 and Hägglunds E-series turrets have been under continuous development with more than 4 million hours invested and are still produced with modern protection, armament and network enabled solutions. Currently, 1,280 vehicles in 15 variants are in service with seven user nations, four of which are NATO members, under BAE Systems Hägglunds AB.

K200 KIFV South Korean Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **Vulcan Air Defense Carrier:** KIFV with 20-mm Vulcan AD system & AN/PVS-2 range-only radar
- **Mortar Carrier:** 81-mm (7-man) or 107-mm (5-man) fires through roof; dismount option available
- **Recovery Vehicle:** 3500 kg crane & 20,000 kg winch
- **NBC Recon Vehicle:** No firing ports, single left-opening door, 5 crew members, & NBC equipment
- **Command Post (Malaysia):** Roof-mounted 12.7-mm MG with additional communication equipment
- **Ambulance (Malaysia):** Handles wounded personnel
- **40-mm Turret:** 40-mm gun mounted in turret
- **Smoke Generation:** Creates smoke on the battlefield
- **K200A1:** Upgraded variant to 70 km/hr; quicker dash speed; faster amphibious speed
- **Gun Carriers:** Prototype vehicles with either a 30-mm or 90-mm cannon
- **TOW Carrier:** Proposed variant with turret with 2 TOW missiles in the ready-to-fire position

System

Alternative Designations: None

Description: IFV derived from the FMC YPR 765 with exit ramp in the rear with space for 9 soldiers; firing ports

Manufacturer: Hanwha Defense (originally Daewoo Heavy Industries, later renamed as Doosan DST, follow by Hanwha Defense Systems)

Crew: ea3 (driver, commander, gunner)

Dimensions

Chassis Length Overall (m): 5.49

Width Overall (m): 2.85

Height Overall (m): 1.93 (2.52 with MG shield)

Combat Weight (mt): 12.9

Ground Pressure (kg/cm2): 0.67

Automotive

Engine Name: MAN-Doosan D2848T

Engine Type: V-8 Diesel

Engine Power: 350

Cruising Range: km480
Speed (Max Road): km/h74
Speed (Max Swim) (km/h): km/h6
Fording Depths: Amphibious
Transmission: Allison Transmission X200-5K
Suspension: Torsion bar

Armament

↳*M2*

Caliber/length: 12.7-mm
Type: Machine Gun
Ammo: INA on Rounds carried: AP, API, APIT
Maximum Effective Range: 1800 m
Armor Penetration: 22.2 mm at 91 m; 19 mm at 500 m
Muzzle Velocity: m/s884

↳*Pintle-mounted*

Caliber/length: 7.62-mm
Type: Machine Gun
Ammo: AP, Tracer, Ball
Maximum Effective Range: 1100 m
Armor Penetration: AP: 7 mm at 500 m
Muzzle Velocity (m/s): m/s853

Protection

Armor (turret front): INA
Applique Armor: Welded aluminum armor with applique laminated steel plates
Explosive Reactive Armor: INA
Active Protection System: INA
Self-entrenching Blade: No
NBC Protection System: Yes (Details INA)
Smoke Equipment: 6 Smoke grenade launchers
Survivability Equipment: INA

Notes:

The K200 KIFV (Korea Infantry Fighting Vehicle) is a South Korean armoured personnel carrier, originally produced by Daewoo Heavy Industries as a domestic replacement for older armored personnel carriers, such as the M113, in front line service with the Republic of Korea Armed Forces at the time of the K200's development. Since 2009 the K200 has been supplemented by the K21. A total of 2,383 K200 vehicles of all configurations were produced between 1985 and 2006, among which are 111

K200A1 vehicles exported to Malaysia. The K200 series of vehicles transport mechanized infantry platoon is designed to keep personnel safe from small arms fire. The hull of the KIFV is of all-welded aluminium armour with an additional layer of spaced laminate steel armour bolted to it. This composite armour provides a higher level of protection for less weight. It can protect against 12.7 mm on the side and 7.62 mm on the rear, and against anti-personnel mines. The engine compartment is located at the front right of the vehicle and is separated from the remainder of the vehicle by a bulkhead. The engine compartment is fitted with a fire extinguishing system that can be operated by the driver or from outside the vehicle. The air inlet, air outlet louvres and the exhaust pipe are located on the roof of the vehicle to allow amphibious operations. The K200 has six electrically operated smoke grenade launchers mounted across the front of the hull as countermeasures against electro-optical and infrared targeting. If the KIFV variant features a turret, the smoke grenade launchers mount on the turret (three on each side). K200 can provide infantry firepower support with 12.7 mm and 7.62 mm machine guns. Stronger anti-infantry and anti-material firepower can be brought to bear by equipping a 20 mm Vulcan gun, or 81 mm and 107 mm mortars. Anti-tank capability can be added by equipping the Metis-M anti-tank missile system. The K200 is highly modular, and its variants provide additional combat supports such as air defense and vehicle recovery by outfitting many different equipments. The vehicles accommodate 12 people including one infantry squad, the driver, and gunners. In November 2015, Doosan and CMI Defence revealed they had joined to create the Cockerill Protected Weapon Station (CPWS) to increase the firepower of the K200. The turret can support cannons between 20–30 mm, plus a 7.62 mm coaxial machine gun, including the: CPWS20 20 mm; CPWS 25 mm which can be armed with the M242 Bushmaster, Nexter M811, or Oerlikon KBA; and CPWS30 armed with the M230LF.

BMP-1D Russian Infantry Fighting Vehicle (IFV)

Tiers:

Parent:

BMP-1 Russian Amphibious Infantry Fighting Vehicle (IFV)

Variants:

- **BMP-1:** BMP-1 is the first mass produced, tracked IFV of the erstwhile USSR. It is the first variant of the now obsolete BMP model designed in 1966. Considered to be the world's first true IFV, it is also a radical departure from the armoured vehicle designs of the USSR since the Second World War. With over 55,000 BMP-1s and variants having been produced, it is numerically one of the most significant armoured vehicles produced across the world.
- **BMP-1P:** BMP-1P (Ob'yekt 765 Sp4). The main changes were the replacement of the largely ineffective 9M14M Malyutka ATGM with the more reliable, longer range and more powerful 9P135M or 9P135M-1 ATGM launcher.
- **BMP-1M:** Kliver turret & drop down gate
- **Type 86/WZ-501 (China):** Chinese BMP-1 IFV
- **BMP-1 KShM (Command Vehicle):** Communication equipment similar to BMD KShM variant
- **BMP-1G ICV:** AT-4/AT-5 ATGM & 30-mm AGS-17 AGL
- **BMP-1K (BMP 1974):** Command variant with additional radios, sealed right-side firing ports, & antenna
- **BMP-1 with Soviet modifications in Afghanistan:** Applique armor, AT-4 ATGM mount; some with AGS-17 30-mm AGL
- **BMP-IRM ("Zhuk"-Beetle):** Engineer recon vehicle with front mine claws; 1 MG only
- **BMP-1 with mine plow:** KMT-8 or KMT-10 mine-clearing plows attached
- **MP-31:** Modernized command vehicle
- **BMP-R (BMP M1976):** Recon vehicle with larger rear hatches & 2-man turret
- **BRM-1/BRM-1K Reconnaissance:** BMP-R with a GS-12 Tall Mike radar ILO AT-3 Sagger (see Chapter 1)
- **BREM-2:** Light recovery vehicle w/crane
- **BMP-40:** Larger turret; carries 6 soldiers, prototype model only
- **PRP-3/PRP-4 (Radar):** Artillery recon vehicle with 7.62 MG ILO 73-mm cannon
- **VP-90 (Czech Republic):** Recon with OT-64 turret; 14.5-mm & 7.62-mm MGs
- **SVO Mineclearer (Czech Republic):** Turretless BMP-1 with 24 245-mm explosive rockets
- **BMP-PP0:** Training variant w/o turret
- **Snezka (Czech Republic):** Battlefield surveillance vehicle
- **PRAM-S (Czech Republic):** SP 120-mm mortar carrier
- **BMP-1 Finnish variant:** East German vehicles with autoloaders removed
- **BMP-1 with Poyaud engine (Egypt):** 150 with replaced 10.47-liter Poyaud 6-cylinder engine
- **BMP-1 with applique armor (Iraq):** Armor added to resist 12.7-mm & 14.5-mm armor-piercing shells at 200 m
- **BMP-1A1 Ost:** In 1990, Germany created more space (6 passengers) & removed the automatic loader
- **BMP-1 with CERAWA armor (Poland):** CERAWA ERA on the glacis, hull, & turret front
- **OT-90 (Czech Republic):** OT-64 1-man turret with 14.5-mm & 7.62-mm machine guns
- **BPzV (Czech Republic):** Recon with Tall Mike radar
- **DP-90 (Czech Republic):** Recon with Tall Mike ra0T-90 maintenance variant adar
- **MU-90 (Czech Republic):** Turretless mine-laying OT-90
- **MLI-84 (Romania):** Larger & heavier w/ 12.7-mm machine gun
- **Pansarbandvgn 501 (Pbv 501 (Sweden):** East German vehicles to mechanized Swedish infantry
- **BREM-4 recovery vehicle:** No turret & crane (Czech version is the VPV)

- **BRM-23 (Bulgaria):** Recon with 23-mm cannon
- **82-mm SP Automatic mortar (Hungary):** Vasilyek mortar ILO troop compartment

System

Alternate Designation: BMP-1 'Afghan' (BMP Desantnaya (Assault))

Manufacturer: Kurganmashzavod (Soviet Union)[

Description: IFV with exit doors in the rear with space for 8 soldiers; 4 firing ports on each side; 1 firing port in left rear door

Crew: ea3

Passengers: ea7

Dimensions

Length: m6.74

Width: m2.94

Height: m2.15

Weight, Combat: tons14.5

Automotive

Engine Name: UTD-23 (Upgraded Engine)

Engine Type: Diesel

Engine Power: hp360

Cruising Range: km500

Speed, Maximum Road: km/h65

Speed, Average Cross: 45

Speed, Maximum Swim: km/hNot Amphibious

Gradient: deg60

Side Slope: deg30

Trench: m0.7

Vertical Step: m2.2

Fording Depth: mNot Amphibious

Fuel Capacity: liters462

Ground Pressure: 0.65 kg/cm²

Basic Load: ea40

Wire-Guided Anti-Tank Guided Missile (ATGM)

↳*9M113 Konkurs (AT-5 Spandrel), SACLOS Wire-Guided Anti-Tank Guided Missile (ATGM)*

Type: SACLOS Wire-Guided Anti-Tank Guided Missile (ATGM)

Manufacturer: Tula Machinery Design Bureau (Tula KBP) – Tulsky Oruzheiny Zavod

In Service: 1974-Present

Proliferation: Algeria– used by mechanized infantry units Armenia Azerbaijan Egypt – mounted on Fahd armoured personnel carriers purchased in 1990s Belarus The launcher is been locally produced and upgraded. Bulgaria Croatia

Cuba – not confirmed Czech Republic Eritrea[Finland – known as PstOhj 82M, fired from 9P135M-1 launchers (withdrawn from service) Georgia Guinea Hungary Indonesia – mounted on BVP-2 infantry fighting vehicles operated by the marine corps India – 15,000 Konkurs-M, ordered in 2008 for Rs 1,380-crore. Another 10,000 Konkurs-M ordered for US$250 million in 2012. A new contract was signed in 2019 for USD 110 mln. Iran– produced domestically as Tosan-1 Iraq Ivory Coast (reported) Kazakhstan Kyrgyzstan Morocco[Mongolia Moldova– used on BRDM-2 North Korea – produced domestically Pakistan – Used on Viper infantry fighting vehicle Peru Romania Russia – about 300 Konkurs-M complexes delivered annually in the last years (2014) Slovakia Turkmenistan Turkey Syria Ukraine Houthis – Tosan version

Variants: 9M14M, 9M14P1, Malyutka-2, Malyutka-2F

Weight (Missile): kg14.6

Weight (9P135 Launching Post): kg22.5

Length: mm1,150

Diameter: mm135

Warhead Weight: kg2.7

Detonation Mechanism: Contract

Engine: Solid-fuel rocket

Wingspan: mm468

Maximum Operational Range: km4

Minimum Operational Range: m70

Speed: m/s208

Guidance system: Wire-guided SACLOS

Steering system: Two control surfaces

Launch platform: Individual, vehicle

Penetration: 600mm of RHA

Basic Load: ea4

↳*9K111 Fagot SACLOS Wire-Guided Anti-Tank Missile (ATGM)*

Type: SACLOS Wire-Guided Anti-Tank Missile (ATGM)

Manufacturer: Tula Machinery Design Bureau (Tula KBP)

In Service: 1970-present

Launcher Type: 9P135 launching post

Missile Weight: kg12.5

9P135 Launching Post Weight: kg22.5

Length: mm1,100

Diameter: mm120

Action: 400 mm versus RHA or 200 mm towards armour inclined at 60°

Rate of Fire: rds/min3

Muzzle Velocity (At Launch): m/s80

Muzzle Velocity (In Flight): m/s186

Effective Firing Range: m10-2,500

Warhead Type: HEAT

Warhead Weight: kg1.7

Guidance system: SACLOS wire-guided missile

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Maximum Elevation: deg+20

Minimum Elevation: deg-20

Basic Load: ea4

Grenade Launcher

Name: AGS-17 Plamya, 30mm Automatic Grenade Launcher

Type: Automatic Grenade Launcher

Manufacturer: Molot plant

In Service: 1970-Present

Proliferation: Widely Proliferated

Weight: kg31

Length: mm840

Rate of Fire: rds/min400

Effective Firing Range: m800-1,700

Maximum Effective Range: m1,700

Action: Blowback

Feed system: 29 grenades belt

Sights: Adjustable iron sights, optional mount required for optical sights

Variants: AG-17A helicopter-mounted version

↳*Ammunition*

Name: VOG-17M

Type: 30mm Grenade

Cartridge: 30×29mm grenade

Muzzle Velocity: m/s185

Warhead: high explosive fragmentation warhead.

Effective Firing Range: 800-1,700

Basic Load: ea40

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)
Type: Machine Gun
Caliber: mm7.62
Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
In Service: 1961-present
Manufacturer: Degtyaryov plant
Proliferation: 1 Million +
Max Rate of Fire: rds/min650
Effective Rate of Fire: rds/min250-300
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Action: Gas-operated, open bolt
Length (Overall): mm1,203
Length (Barrel): mm605
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights
Note: The 7.62 PKT can be controlled remotely and is slaved to the main gun,

↳*Ammunition*

Name: 57-N-323S
Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×54mmR km
Muzzle Velocity: m/s855
Basic Load: ea950
Accuracy of fire at 300 meters: mm90

Fire Control

Name: INA
Computerized FCS: Yes
Thermal Vehicle Commander: Yes, TKN-3B day night sight with variable magnification
Thermal Gunner: Yes, TVNE-1PA active IR night vision metascope
Main Gun Stabilization: No
Gyrocompass: Yes, GPK-59 electrical gyrocompass
Firing Ports: ea9+, additional firing ports have been added onto the top hatches of the troop compartment

Day Periscopes: ea4

Search Light: OU-3GK IR search light

Search Light Range: m400

Protection

Armor (turret front): mmProtection from 12.7mm AP rounds

Applique Armor: mmKovriki turret armour, plus 5-6 mm thick appliqué steel armour on the sides of the hull as well as five plates per side covering the suspension and additional armour under the commander's and driver's seats for protection against mines.

Explosive Reactive Armor: mmAvailable

Active Protection System: No

Self-entrenching Blade: No

NBC Protection System: GO-27 radioactive and chemical agent detector

Chemical Decontamination Kits: TDP chemical decontamination kits

Smoke Equipment: Yes, a upgraded 81mm 902V "Tucha" smoke grenade launcher

Survivability Equipment: INA

Grenade Launcher: Yes, RPG-7 light grenade launcher with grenades

Scavenger System: Yes

Mine Plough: Yes, KMT-10 plough-type mine-clearing system

Fire-Extinguisher System: Yes

Notes:

A non-amphibious BMP-1D (the so-called 'Afghan' variant), was built in 1982 for assault units in Afghanistan. It had 5 mm thick appliqué steel armor plates on the hull sides with holes for side firing ports as well as armor plate under the commander's and driver's seats for added protection against mines. It also had large steel armored skirts fitted to the sides of the hull covering the suspension. Firing ports were added into the top hatches of the troop compartment and a stowage box was placed on the roof at the rear of the hull on some vehicles. The 9S428 ATGM launcher was often removed and replaced by an AGS-17 automatic grenade launcher. Due to experience in Afghanistan, a new version with enhanced fighting capabilities, the BMP-2, was introduced in 1980. It had a new two-man turret armed with a 30 mm 2A42 multi-purpose autocannon and a 9P135M-1 ATGM launcher capable of firing SACLOS guided 9M113 Konkurs and 9M113M Konkurs-M as well as 9M111 and 9M111-2 Fagot ATGMs. Later modernization plans included mounting the turret of the BMD-2 IFV on to BMP-1s, but the vehicle never left the design phase. Recent proposals for the modernization of BMP-1s include mounting new turrets armed with a 2A72 30 mm (1.2 in) autocannon, finally approved in 2018, or a TKB-799 Kliver one-man weapons station with a computerized fire control system, armed with a missile pod (which can be armed with either four 9M133 Kornet (AT-14 Spriggan) or 9M133F Kornet ATGMs or 9K38 Igla (SA-18 Grouse) SAMs), a 30 mm 2A72 dual-purpose autocannon and a 7.62 mm (0.300 in) PKTM coaxial machine gun (BMP-1AM ‘Basurmanin’ and BMP-1M respectively).

QN-506 Chinese Infantry Fighting Vehicle (IFV)

Tiers:

1 2 3 4

System

Alternative Designation: QN-506
Manufacturer: Wuhan Gaode Infrared
Type: Fire Support Vehicle
Family: Type 79
Crew: ea3, one driver and two controllers for the vehicle's weapon systems
Chassis: Type 59 tank's chassis
Note: The QN-506 can be used as a urban assault vehicle. It has been called the "new king of ground warfare"

Dimensions

Length (Overall): m9.0
Length (Full): m6.04
Width: m3.27
Height: m2.59
Weight, Combat: kg30,000
Ground Clearance: m0.425
Ground Pressure: 0.8 kg/cm²
Track (Vehicle): m2.85
Track (Normal): mm580
Track Width: mm580
Length of track on ground:: m3.84

Automotive

Engine Name: 12150L
Engine Type: V-12, water cooled, diesel
Engine Power: hp520

Power to Weight Ratio: hgp/ton14.44

Maximum Range (Main Fuel Supply): km720

Maximum Range (Main Fuel Supply with additional fuel tanks)): km600

Speed, Maximum Road: km/h50

Speed, Average Cross: 35

Speed Maximum Swim: km/hNot Amphibious

Fording Depth (Without Preperation): m1.4

Fording Depth (with Preperation): m5.5

Gradient: deg60

Side Slope: deg40

Vertical Obstacle: m0.79

Trench: m2.7

Suspension: torsion bar

Electrical System: v24

Communications

↳*TB-121*

VHF Transceiver: Yes

VHF Range: km1 to 50

Proliferated: Widely

Digital Data: Yes, Full

Control: Self-Adaptive Control (Including Automatic Antenna Tuner)

Frequency Agile: Yes

Wireless Network Capabilities: Yes

Note:: Very similar in capabilities to the US SINCGARS ASIP

Main Gun

↳*System*

Name: Nudelman-Rikhter NR-30

Type: mm30

Max Rate of Fire: rds/min850-1,000

Maximum Effective Range: km5

Range Finder type: Laser range finder

Maximum Elevation: deg+53

Minumum Elevation: deg0

Weight: kg66

Length (Total): mm2,153

Length (Barrel): mm1,600

Width: mm181

Height: mm186

Barrels: ea1

Action: Short Recoil

Variants: Norinco Type 30

Note: The 30mm Chain Gun is similar to the Soviet 2A72.

↳*Ammunition*

Type: Rifle

Caliber: mm30

Cartridge: 30x155mm

Muzzle Velocity: m/s780

Basic Load: ea300

Maximum Effective Range: km5

Armor Penetration: INA

Auxiliary Weapon System

↳*System*

Name: Type 80 Chinese Heavy Machine Gun

Type: mm7.62mm Heavy Machine Gun

Manufacturer: Norinco

Date of Introduction: 1985

Max Rate of Fire: rds/min700-800

Length, Total: mm1,192

Length, Barrel: mm658

Diameter: mmINA

Weight (Gun Only): kg12.6

Weight (With Tripod): kg17.5

Action: Gas-operated, open bolt

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

Variant 1: Type 80 - The copy of the PKM GPMG, chambered in 7.62×54mmR

Variant 2: Type 86 - A machine gun only used for tanks as a secondary weapon.

Variant 3: CF06 - An export-only version of the Type 80, which is chambered for 7.62 NATO ammunition.

Variant 4 (Foreign): BD-14 - A variant of the Type 80 made by Bangladesh Ordnance Factories under license which uses 7.62×51mm NATO instead of 7.62×54mmR

↳*Ammunition*

Type: RIfle

Caliber: 7.62×54mmR

Muzzle Velocity: m/s840

Basic Load: ea2,000

Effective Range: km1.2

Armor Penetration: Available

Anti-Tank Missiles (Option 1)

Name: QN-502C Guided Anti-Tank Missile

Type: Optical-fiber-guided, Anti-Tank Missiles

Muzzle Velocity: INA

Basic Load: ea4

Effective Range: km8

↳*Anti-Tank Missiles (Option 2)*

Name: QN-201 Rockets

Type: Multipurpose missiles

Caliber: mm70

Muzzle Velocity: INA

Basic Load: ea20

Effective Range: km4

↳*Anti-Tank Missiles (Option 3)*

Name: S570 missiles

Type: Small Cruise Missiles

Muzzle Velocity: INA

Basic Load: ea4

Effective Range: km10

Unmanned Aerial Vehicle (UAV)

Type: Chinese Drone. Name: INA

UAV Range: Reports claim the type of drone assigned to the QN-506 can fly at a maximum range of 10km

Note: A UAV is equipped for situational awareness and battlefield information analysis

Fire Control

Fire Control System: Yes, Name: INA

Computerized Fire Control: Yes

Laser Target Desinator: Yes

Day Camera: Yes

Night Camera: Yes

Thermal Imager: Yes

Panoramic Sight: Yes

Protection

Armor: Classified

Applique Armor: No

Active Protection System: Yes, Anti-personnel active protection complex and a "hard-kill" active protection system

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

IR Signature: INA

Counter-Sniper Fighting Devices: Yes

Laser Warning Receivers: Yes

Electro-Optical Sensors: Yes, mounted on the roof

Notes:

QN-506 Fire Support Vehicle was developed by Wuhan Guide Infrared and is designed to suppress enemy forces in urban areas and during counterterrorism operations.The base of the QN-506 is a chassis of Type 59 tank, on which the ZPT99 weapon station is mounted. The crew consists of 3 people - the driver, the commander and the gunner.The combat weight of the vehicle is 30 tons, while the QN-506 has possibility to upgrade in the future. Universal ZPT99 weapon station has the following weapons: 30-mm automatic gun, similar to the Soviet 2A72 (ammunition of 80 armor-piercing tracer and 120 high-explosive fragmentation projectiles) 7.62-mm machine gun (ammunition of 2000 rounds) Two modular launchers with ammunition: 4 QN-502 anti-tank guided missiles with a combined control mode (developed by Wuhan Guide Infrared), which have a range of attack speed and air targets of 6 kilometers, and 20 units of 70-mm QN-201 missiles Four S570 missiles, which are located in slanted launchers in the rear of the ZPT99 weapon station. Anti-personnel active protection complex Integrated drone Counter-sniper fighting devices

Marder 1A5 German Infantry Fighting Vehicle (IFV)

Tiers:

Parent:

Marder 1A3 German Infantry Fighting Vehicle (IFV)

Variants:

- **Marder 1A2:** Since 1983, all the German Marder 1s have been upgraded to the A2 standard. Fitted with thermal imaging sight equipment instead of the image intensifier. New sighting system.
- **Marder 1A3:** new armour kit mounted on the side of the hull. . New stowage boxes are provided along the sides of the upper part of the hull and a new radio installation is provided.
- **Marder 1 A1(−) (1979–1982)::** as A1(+) but without thermal imager. 350 vehicles upgraded to this standard.
- **Marder 1 A1A3::** a Marder A1 with SEM 80/90 cryptographic radios. Marder 1 A1A as 1 A1 but without any passive night vision equipment. 1,112 vehicles upgraded to this standard.
- **Marder 1 A1A4::** a Marder A1A with SEM 80/90 cryptographic radios. Marder 1 A1A2: a converted Marder 1 with A1 turret and A2 chassis
- **Marder 1 A1A5:** a Marder A1A2 with SEM 80/90 cryptographic radios.
- **Marder 1 A2 (1984–1991):** Between 1984 and 1991, all German Marder 1s were upgraded to A2 standard, this included substantial modification of the suspension, fuel tanks, cooling system and water-jet cleaning system. Additionally a new sighting system was installed. The infrared search light equipment was removed, and all vehicles were fitted with thermal imagers except for the 674 A1(+) vehicles, which already had them.
- **Marder 1 A2A1:** a Marder 1A2 with SEM 80/90 cryptographic radios.
- **Marder 1 A3 (1988–1998):**
- **Marder 1 A4:** a Marder 1 A3 with SEM 93 cryptographic radio
- **Marder 1 A5 (2003–2004):** Additional anti-mine armor and completely remodeled interior in order to avoid blast and shock injuries to the crew when hit by a mine. Applied to 74 Marder 1 A3s only.
- **Marder 1 A5A1 (2010–2011:** Equipped with air conditioning system, jammer for IED-protection and multi-spectral camouflage

Traverse Right: deg180

↳***Ammunition***

Type: Rifle

Caliber: mm20

Cartridge: NATO standard 20 × 139 mm cartridge with disintegrating belt

Shell: 20 × 139 mm

Muzzle Velocity (With HEI): m/s1,044

Muzzle Velocity (With AP): m/s1,100

Basic Load: ea1,250

Ammunition Types: HEI-T, TP-T, API-T, and APDS-T.

Coaxial Weapon System

↳***System***

Name: Rheinmetall MG 3

Type: mm7.62

In Service: 1960–present

Manufacturer: Rheinmetall

Proliferation: over 1 million

Max Rate of Fire: rds/min1,000-1,300

Weight (Gun Only): kg11.5

Weight (Mounted on a Tripod): kg27.5

Length (With Stock): mm1,225

Length (With Stock): mm1,097

Barrel Length: mm565

Action: Recoil-operated, roller locked

Effective Firing Range: 200–1,200 m sight adjustments

Maximum Firing Range (Bipod): m600

Maximum Firing Range (Tripod): m1,200

Maximum Firing Range (Gun Carriage): m3,000

Maximum Firing Range (Terminal): m3,750

Feed system: 50-round non-disintegrating DM1 belt (can be combined in a drum); 100-round disintegrating DM6/M13 belt

Sights: Open tangent iron sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO cartridge

Muzzle Velocity: m/s820

Basic Load: ea5,000

Anti-Tank Guided Missile (ATGM)

↳*MILAN Anti-Tank Guided Missile (ATGM)*

Country: France / Germany

Service: 1972-present

Proliferation: thousands deployed by the French, German, Belgian, and Spanish armies, but Italy and soon India were assembling MILANs under license. All in all, the MILAN’s customer list has reached 41 countries and at least several non-state groups.

Range: km2

Basic Load: ea5

Armor Penetration: mm350

Missile Length: mm918

Missile Diameter: mm103

Fin Span: mm267

Missile Weight: kg6.73

Total Weight with Launcher: kg24

Warhead Weight: kg2.7

Warhead Type: High Explosive

Guidance System: Wire-Guided

Note: The iconic MILAN is the most successful Western European anti-tank missile ever made and is only surpassed by the BGM-71 TOW when it comes to international customers.

Fire Control

Name: INA
Computerized FCS: INA
Thermal Sight Vehicle Commander: PERI-Z 11 and PERI Z 11 A1
Thermal Sight Gunner: PERI-Z 11 and Zeiss thermal imager
Main Gun Stabilization: No
Periscopes (Commander): ea8
Periscopes (Gunner): ea3

Protection

Hull Armor: Welded steel, protection up to 20 mm APDS DM43 from 0 m and 25 mm APDS from 200 m
Turret Armor: Welded steel, protection up to 20 mm APDS DM43 from 0 m and 25 mm APDS from 200 m
Front Hull Armor: Protection from 20 mm APDS projectiles
Applique Armor: Yes, Additional RHA shields are also fitted to the sides of the hull.
Passive Armor Package: Yes
Explosive Reactive Armor: No
Active Protection System: Yes
Mine Protection System: Yes, Integrated mine protection system
Self-Entrenching Blade: No
NBC Protection: Yes
Smoke Equipment: Yes, 76 mm smoke grenade launchers
IR Signature: INA
Safety Belts: Automatic crew safety belts
Blast-Attenuating Seats: Yes

Notes:

Marder 1A5 has improved mine protection. Additional anti-mine armor was fitted and interior was completely remodeled in order to improve survivability against mine blasts. A total of 74 Marder 1A3 vehicles were upgraded to the 1A5 standard between 2003 and 2004.The Marder 1A5 can be recognised by the stowage box on the glacis plate and two stowage boxes mounted one either side on the roof at the rear. It also has new armoured side skirts that protect the upper part of the suspension and these have a straight lower part rather than the wavy rubberised reinforced skirt fitted to the standard Marder 1A3.

YPR-765 (AIFV) American Infantry Fighting Vehicle (IFV)

Tiers:

1 2 **3** 4

Variants:

- **EIFV:** Holds only 6 soldiers that can dismount; M242 Bushmaster 25-mm gun with 900 rounds of ammo; BGM-71 TOW AT weapon with 6 rounds; M240 Machine Gun with 4400 rounds
- **Mortar Prime Move (Netherlands: YPR 765 PRMR):** Tows the 120-mm Thomson-Brandt mortar with crew of 7
- **Cargo Carrier (Netherlands: YPR 765 PRVR-A/B):** Crew of 2 can carry cargo into the combat zone
- **TOW Missile Carrier (Netherlands: YPR 765 PRAT):** Similar to the US M901 ITOW variant of the M113 with an Emerson TOW AT system
- **Ambulance (Netherlands: YPR 765 PRGWT):** Unarmed variant with a crew of 4
- **Bn Command (Netherlands: YPR 765 PRCO-C1):** Specialized for infantry battalion commanders
- **Bn Gunnery Center (Netherlands PRCO-C2):** Specialized for use by artillery battalions
- **Mortar Fire-Control Vehicle (Netherlands PRCO-C3):** Specialty vehicle to control indirect mortar fire
- **Anti-Aircraft Control Vehicle (Netherlands PRCO-C4):** Specially designed for air defense command & control
- **YPR 765 PRCO-C5 (Netherlands):** Observation vehicle with only a 4-man crew
- **YPR 765 PRRDR (Netherlands):** Operated the British ZB 298 battlefield surveillance radar
- **YPR PRRDR-C (Netherlands):** Radar/Command Vehicle
- **YPR 765 PRI/I (Netherlands):** Squad vehicle with M113 cupola, M2 HB MG, 9 soldiers, & driver
- **YPR 806 PRBRG (Netherlands):** Recovery vehicle with HIAB crane, crew of 4, & 8 smoke grenade launchers
- **YPR-2000 (Netherlands):** Upgrade included more storage containers
- **Command Vehicle:** Room for 9-man crew with additional communication equipment
- **AIFV-B (Belgium):** 40-caliber MG, NBC protection, & Halon fire-extinguishing system
- **AIFV-B-CP (Belgium):** Pintle-mounted 12.7-mm MG, crew of 7, NBC protection, & Halon fire-extinguishing system
- **Philippine Variant:** Converted to accept 50-caliber MG ILO 25-mm cannon
- **YPR-765 KMAR Military Police Vehicle:** YPR-765 PRI/I modified for use by military police
- **Turkish ACV:** See separate vehicle for the FNSS IFV

System

Alternative Designations: Egyptian Infantry Fighting Vehicle (EIFV); See Variants

Description: IFV modified from the M113 with exit ramp in the rear with space for 7 soldiers; 2 firing ports on each side & 1 firing port in the left of the ramp

Specifications

Crew: 3 (driver, commander, gunner)

Combat Weight (mt): 13.7

Chassis Length Overall (m): 5.26

Height Overall (m): 2.79 (2.01 hull top)

Width Overall (m): 2.82

Ground Pressure (kg/cm2): 0.67

Automotive Performance: 6V-53T

Engine Type: Water-cooled, turbocharged, 2-stroke, V-6 diesel Allison

Cruising Range (km): 490 (483-EIFV)

Speed (Max Road) (km/h): 61 (66-EIFV)

Speed (Max Off-Road) (km/h): INA

Speed (Average Cross-Country) (km/h): INA

Speed (Max Swim) (km/h): 7

Fording Depths (m): Amphibious

Radio: INA

Armament

↳*Oerlikon KBA-B02*

Caliber/length: 25-mm

Type: Cannon

Ammo: 180 Ready rounds; 144 in reserve HEI-T; APDS-T Other types available: SAPHEI-T, TP-T, APP-T, FAPDS

Maximum Effective Range (m): 2000 m

Armor Penetration (m): INA

Muzzle Velocity (m/s): HEI-T: 1360 APDS-T: 1100

↳*Turret Coaxial*

Caliber/length: 7.62-mm

Type: Machine Gun

Ammo: 230 Ready rounds; 1610 in reserve: AP, Tracer, Ball

Maximum Effective Range (m): 1100 m

Armor Penetration (mm): AP: 7 mm at 500 m

Muzzle Velocity (m/s): 853

Protection

Armor (turret front) (mm): INA (sides on EIFV protected against 14.5-mm AP rounds)

Applique Armor (mm): Aluminum hull with spaced laminate steel on front & sides

Explosive Reactive Armor (mm): INA

Active Protection System: No

Self-entrenching Blade: No

NBC Protection System: Yes (Details INA)

Smoke Equipment: 6 Smoke grenade launchers

Survivability Equipment: INA

Notes:

The AIFV (Armored Infantry Fighting Vehicle) is a tracked light armored vehicle that serves as an infantry fighting vehicle (IFV) in the armies of several countries. It is a development of the M113A1 armored personnel carrier. The hull of the vehicle is made of welded aluminum, with spaced steel laminate armor bolted onto the side and front. The voids of the armor are filled with polyurethane foam, which gives the vehicle extra buoyancy when travelling in the water. Original production AIFV's can swim without deploying flotation curtains, using only a large front-mounted trim vane; they are propelled in the water by their tracks. The engine sits on the front right of the hull, behind a hatch that can be used to remove the complete powerpack. The powerpack is similar to the M113A1, except for a larger radiator capacity and turbocharger. The transmission is also fitted with heavy duty components from the M548 tracked cargo carrier. Immediately to the left of the engine is the driver, above whom is a hatch that opens to the right. The driver has four M27 day periscopes. The driver's center periscope can be replaced by a passive infra-red periscope for night driving. The commander sits immediately behind the driver, and has a cupola that can be completely traversed. The cupola has five periscopes, four of which are M17 day periscopes, the fifth has 1x to 6x variable magnification. The turret is fitted on the right side of the hull behind the engine. The turret, which has electro-hydraulic traverse, can elevate from -10 to +50° and can traverse and elevate at a speed of 60°/sec. The turret mounts an Oerlikon Contraves 25 mm KBA-B02 cannon with a dual ammunition feed and 180 rounds of ready use ammo, with another 144 rounds stored in the hull. Mounted to the left of this gun is a 7.62 mm FN MAG machine gun, which has 230 rounds of ready ammo, with a further 1,610 in the hull. There is a six-barrel smoke discharger mounted at the front, just above the large trim vane. The troop compartment is at the rear of the hull; a large power operated ramp allows access through the rear of the vehicle, a door is also provided in the ramp. Additionally a single piece hatch covers the top of the troop compartment. The compartment contains seven troops in the Dutch variant, with six sitting back to back facing outwards and a single passenger sitting between the command and the turret facing backwards. There are two firing ports in each side of the hull and a single firing port in the rear. The side firing ports are provided with M17 periscopes, the rear one is fitted with an M27 periscope.

→→Amphibious Infantry Fighting Vehicle (IFV)

AMX-10 PAC 90 French Tank Destroyer / SP Artillery Piece

Tiers:

Parent:

AMX-10P French Infantry Fighting Vehicle (IFV)

Variants:

- **AMX-10P Marines:** The AMX-10P Marines is a variant of the AMX-10P specifically developed to provide improved amphibious capabilities at sea or in rivers of the original AMX-10P.
- **AMX-10 PAC 90:** The primary role of the AMX-10 PAC 90 is that of anti-tank and fire support on the battlefield at ranges between 1,000 and 2,500 m, but it can also be used as a reconnaissance vehicle or as an APC.
- **AMX-10 ECH:** The AMX-10 ECH is an ARV based on the hull of the AMX-10P. It is designed to support AMX-10P vehicles in combat and maintain readiness by conducting repairs as close to the battlefield as possible.
- **AMX-10 Ambulance:** The AMX-10P is also used to perform as a battlefield ambulance. It is based on the same hull as the AMX-10P to ensure that it can perform alongside other armoured formations.
- **AMX-10PC:** The AMX-10PC is an armoured command post designed to support the operations of armoured formations during combat.
- **AMX-10 HOT:** This was the basic AMX-10P, with the Toucan II turret replaced by a new two-man Lancelot turret based on the TH 20, with four ready-to-launch 4,000 m range MBDA HOT missiles and a further 14 missiles carried in the rear of the hull. The crew of five consisted of the commander and gunner in the turret, two missile loaders, and the driver.
- **AMX-10 VOA:** This was based on the AMX-10PC command vehicle chassis and has been designed for use by artillery observers. Its crew of four consisted of a commander, observer, radio operator, and driver. The turret, which was manned by one or two men, was provided with equipment for day and night observation and local defence.
- **AMX-10 SOA:** The AMX-10 SOA was used for battlefield observation and artillery fire-control. It was essentially an AMX-10P with its Toucan II turret replaced by a new two-man turret armed with an externally-mounted 7.62 mm MG on the right side.
- **AMX-10 SAF:** This was also known as the AMX-10PC SAF and was used with the ATILA artillery FCS. It had a crew of five consisting of the radio operator, driver, two warrant officers, and one commanding officer.
- **AMX-10 TM:** This model towed a 120 mm TDA Model MO-120-RT-61 muzzle loaded rifled mortar, and carried 60 rounds of ammunition, for the mortar. The AMX-10 TM had a crew of six consisting of commander, aimer, artificer, loader, ammunition carrier and driver, and was fitted with a Toucan I turret.
- **AMX-10 SAT:** This was based on the AMX-10 PC command vehicle but had been modified internally to carry a gyrostabilised theodolite, a topographic survey theodolite, distance measuring equipment, and a navigation system.
- **AMX-10P with RATAC radar:** This had no turret and was fitted with a roof-mounted radar for field artillery fire (RATAC) pulse Doppler radar scanner. The vehicle had a crew of five: commander; radar operator; assistant radar operator; radio operator; driver. The radar had four operating modes: ground surveillance; acquisition and identification; angular deviation measurement; automatic tracking.
- **AMX-10P upgrade:** The AMX-10P ICV upgrade included the installation of a new passive armour package to the front, sides, rear, and hull top to provide an enhanced level of survivability. Other enhancements included a modified rear power-operated ramp, new torsion bars, and reinforced transmission. The original AMX-10P was fully amphibious, propelled in the water by two water-jets mounted one either side of the hull at the rear. These and the trim vane installed at the front of the hull were removed to save weight but the vehicle retained its fording capability.

System

Alternative Designation: AMX-10 PAC 90

Date of Introduction: 1979

Proliferation: Indonesia, which placed an order for 34 vehicles, Singapore ordered 44

Manufacturer: Nexter Systems

Function: Fire Support Vehicle

Type: Infantry Fighting Vehicle (IFV)

Family: AMX-10

Crew: ea3

Passenger Capacity: ea4

Dismounts: ea4

Dimensions

Length: m5.87

Width: m2.83

Height: m2.73

Weight, Combat: tons14.5

Ground Pressure: kg/m0.56 kg/cm²

Ground Clearance: m0.45

Track Width: mm425

Track Length (on the ground): m2.93

Automotive

Engine Name: Baudouin 6 F11 SRX

Engine Type: V-8 Diesel

Engine Power: hp300

Cruising Range: km600

Speed, Maximum Road: km/h65

Speed, Average Cross: 40

Speed Maximum Swim: km/h10

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.7

Trench: m1.6

Fording Depth: mAmphibious

Fuel Capacity: liters518

Propellers: 2 each (305mm Diameter)

Emergency Pneumatic Engine Starter: Yes

Water Exchanger: Yes

Communications

Main Gun

↳*System*

Name: GIAT CS-90F-4 90mm High Velocity Rifled Gun

Type: mm90

Barrel Length: 52 Calibers

Maximum Rate of Fire: rds/minINA (32-36 rds/min)

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Electric Traverse: Yes, with two speed modes of 13 deg and 5 deg

Maximum Elevation: deg+15

Minimum Elevation: deg-8

Basic Load (Total): 10 90mm projectiles can be carried onboard with normally a combination of 12 HEAT and 8 HE

Ammo Compatible: 90mm HE, HE long range, HEAT, smoke, and APFSDS Projectiles

↳*Ammunition (Option 1)*

Type: HEAT

Caliber: mm90

Muzzle Velocity: m/sINA

Basic Load: ea12

Maximum Firing Range: km19

↳*Ammunition (Option 2)*

Type: HE

Caliber: mm90

Muzzle Velocity: m/sINA

Basic Load: ea8

Maximum Firing Range: km17.9

Coaxial Weapon System

↳*System*

Name: AA-52, 7.62mm Machine Gun

Type: mm7.62

Manufacturer: Manufacture d'armes de Saint-Étienne (MAS)

Max Rate of Fire: rds/min900

Weight: kg9,970

Length: mm1,080

Barrel Length: mm600

Action: Lever-delayed blowback

Effective Firing Range: m600

Maximum Firing Range: m3,200

Feedd System: Belt

Sights: Iron Removable APX (SOM) telescopic sights IR scope

↳***Ammunition***

Type: Rifle

Caliber: mm7.72

Cartridge: 7.5×54mm French, 7.62×51mm NATO

Muzzle Velocity: m/s830

Basic Load: ea2,000

Anti-Tank Guided Missile (ATGM)

↳***MILAN Anti-Tank Guided Missile (ATGM)***

Country: France / Germany

Service: 1972-present

Prolioferation: thousands deployed by the French, German, Belgian, and Spanish armies, but Italy and soon India were assembling MILANs under license. All in all, the MILAN’s customer list has reached 41 countries and at least several non-state groups.

Range: km2

Basic Load: ea10

Armor Penetration: mm350

Missile Length: mm918

Missile Diameter: mm103

Fin Span: mm267

Missile Weight: kg6.73

Total Weight with Launcher: kg24

Warhead Weight: kg2.7

Warhead Type: High Explosive

Guidance System: Wire-Guided

Note: The iconic MILAN is the most successful Western European anti-tank missile ever made and is only surpassed by the BGM-71 TOW when it comes to international customers.

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Yes, The commander has seven day (three M556 and four M554) periscopes

Thermal Sight Gunner: Yes, the gunner five (three M556 and two M554). Also a M563 telescopic sight

Main Gun Stabilization: Non-stabilized

Periscopes: ea4

Protection

Hull Armor: welded from aluminum armor plates, which protect the vehicle from 14.5mm rounds

Turret Armor: New Dragar Turret.

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Two 80 mm smoke grenade dischargers

IR Signature: INA

Anti-Corrosion Lining: Yes

Notes:

Known as a "Tank Destroyer," The AMX-10 PAC 90 is a dedicated fire support and anti-tank variant of the AMX-10P infantry fighting vehicle. Its production commenced in 1979. This vehicle is in service with France, Brazil and possibly some other countries. This fire support vehicle was designed to operate alongside the main battle tanks and infantry fighting vehicles. At the time of its introduction it was capable of taking anti-tank combat, however by current standards its armament its too week to knock out a modern MBT. It was also intended as a reconnaissance and infantry support vehicle. Aluminum armor of this fire support vehicle provides all-round protection against small arms fire and artillery shell splinters. Front armor withstands 14.5 mm heavy machine gun rounds. Vehicle has an NBC protection system.

BMP-3 Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **BMP-3M:** KBP and Kurganmashzavod have upgraded the vehicle with a new engines and turret with a new ATGM system 9K116-3 Basnya. The upgraded vehicle is called the BMP-3M and the new Bakhcha-U turret which includes a new automatic fire control system with ballistic computer, new SOZH gunner's sight with laser rangefinder and an ATGM guidance channel, thermal imager, TKN-AI commander's vision device with laser illuminator and new ammunition loading system for ATGM.
- **BMP-3M Ataka:** BMP-3M version with a two men turret armed with 30 mm 2A72 autocannon, and 9M120-1 Ataka ATGM
- **BMMP:** Version for naval infantry, fitted with the turret of the BMP-2.
- **BMP-3K:** Tactical command variant, includes additional radio R-173, an intercom for seven users, an AB-R28 independent portable power unit, a navigation device TNA-4-6 and the "Ainet" air burst round detonation system. The BMP-3K lacks the bow machine guns and has its whip antennas mounted on the rear hull. Crew: 3+3
- **BMP-3F:** Armed with the standard 2K23 turret. Specially designed for operations at sea, with improved seaworthiness and buoyancy, capability to move afloat at sea state 3 and fire with the required accuracy at sea state 2. Compared to the basic model, the vehicle design features changes increasing floatability and vehicle stability: the self-entrenching equipment is omitted, a lightweight anti-surge vane and an air intake tube are introduced; the BMP-3F turret is also protected by anti-surge vanes. Water jet propellers develop a speed of 10 km/h when afloat. The BMP-3F design allows the vehicle to come ashore under rough sea conditions and to tow the same-type vehicle. A new main sight, the SOZH, which has an integrated laser range finder and an ATGM guidance channel, is installed. This version can endure continuous amphibious operation for seven hours with the running engine
- **BT-3F:** Amphibious version based on BMP-3F with the original turret replaced by a smaller remote weapon station with either 7.62, 12.7 or 14.5mm machine gun. It can accommodate a crew commander, driver, gunner, and 14 troops, and can use optional ERA armor.
- **BRM-3K "Rys" (Ob.501):** Surveillance and reconnaissance variant with 1PN71 thermal sight (3.7x/11x, 3 km range), 1PN61 active-pulse night vision device (3 km range), 1RL-133-1 ("TALL MIKE") I-band surveillance radar (3 km man, 12 km vehicle), 1V520 computer and a TNA-4-6 navigation system. The armament consists of the stabilized 30 mm autocannon 2A72 (600 rounds) and a coaxial 7.62 mm machine gun (2,000 rounds) or AU-220M Baikal remote weapon station with 57 mm BM-57 autocannon and 7.62mm PKMT machine gun.
- **BMP-3 Dragoon:** New IFV version with an unmanned turret which can be armed with a variety of combat modules, including standard BMP-3's Bakhcha-U turret with a 2A70 100 mm cannon, a 2A72 30 mm autocannon and a PKTM 7.62 mm machine gun, the AU-220M Baikal remote weapon station module with a 57 mm BM-57 gun and a module with a 125 mm 2A82-1M tank gun, the new 816 h.p.
- **BREM-L "Beglianka" (Ob.691):** Armoured recovery vehicle with five-tonne crane and 20/40 metric tonne capacity winch.
- **BMP-3 "Khrizantema-S":** Self-propelled anti-tank version with 9M123 Khrizantema (AT-15) ATGM system with radar and laser guidance. The 9P157-2 carries two 9M123 missiles on launch rails, which are extended from a stowed position; the radar is also stowed during transit. The missiles are re-loaded automatically from an internal magazine with 15 rounds (missiles are stored and transported in sealed canisters) and can also accept munitions manually loaded from outside the vehicle.
- **9P163M-1 "Kornet-T":** Anti-tank version with Kornet (AT-14) missile system. Some sources call it the 9P162. The Kornet is similar in function to the Khrizantema missile system. The 9P163M-1 carries two 9M133 missiles on launch rails, which are extended from a stowed position during transit. Missiles are re-loaded automatically by the tank destroyer from an internal magazine with 16 rounds (missiles are stored and transported in sealed canisters).
- **2S18 "Pat-S" (Ob.697):** Self-propelled version of the 152 mm howitzer 2A61 "Pat-B". This was only a prototype,

further development led to the 2S31 Vena.

- **DZM "Vostorg-2":** Combat engineer vehicle with a dozer blade and excavating bucket. Prototype.
- **UR-07:** Mine clearing system. The UR-07 might replace the UR-77 "Meteorit". It has the same chassis as the BMP-3 but a bigger steel hull with two launch ramps in the rear. The ramps are used to fire rockets towing hose-type mine-clearing line charges to clear mine fields.
- **UNSh (Ob.699):** Basic chassis for specialised variants.
- **Hermes or TKB-841:** Air-defence vehicle with high-velocity missiles and radar system. Prototype.[68] 2S31 Vena – Self-propelled mortar carrier equipped with a 120 mm mortar based on BMP-3 chassis. It entered production in 1996 and service in 2010.
- **2S38 ZAK-57 Derivatsiya-PVO:** Self-propelled air defense vehicle based on BMP-3 chassis fitted with a 57 mm autocannon and passive reconnaissance and target tracking equipment.[72] It is designed to shoot down unmanned aerial vehicles (UAVs), cruise missiles, air-to-surface missiles, aircraft, helicopters, and MLRS rockets.
- **UDAR UGV:** Unmanned ground vehicle based on the tracked chassis of the BMP-3 with the center hull raised to fit the DUBM-30 Epoch armed with 2A42 autocannon, 7.62mm PKMT machine gun, and Kornet-M ATGM.
- **Vikhr UGV:** Unmanned ground vehicle based on BMD-3 equipped with a smaller turret armed with 2A72 autocannon, 7.62mm coaxial machine gun and six anti-tank guided missiles 9M133M Kornet-M, three on each side of the turret.
- **Prokhod-1:** Unmanned mine-clearing vehicle based on the BMP-3 chassis. It is equipped with the anti-mine TMT-C trawl, and a remote weapon station turret with a 12.7mm machine gun.

System

Alternative Designation: BMP-3

Communications

Primary Radio: R-173

Secondary Radio: R-173P

Main Gun

Note: The complete weapon system of the BMP-3 infantry combat vehicle is known as the 2K23 and consists of the 100 mm gun 2A70 with a 30 mm 2A72 automatic cannon (see later in this section) mounted coaxially to the right and a 7.62 mm PKT coaxial machine gun.

↳*System*

Name: 2A70 (100mm) Rifle Gun

Type: mm100

Max Rate of Fire: rds/min8-10

Loader Type: Automatic loader, manual for gun and ATGMs

Maximum Elevation: deg+60

Minimum Elevation: deg-5

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Fire on the Move: Yes

Maximum Aimed Range: m5,000

Maximum Effective Range (Day): m4,000

Maximum Effective Range (Night): mINA

Tactical AA Range: m4,000

Armor Penetration: 25mm of RHA

↳*Ammunition*

Name: 9M117M1 Arkan

Type: Laser beam riding missile

Caliber: mm100

Muzzle Velocity: m/s330

Basic Load: ea40 Total Rounds of any 100mm Russian Projectile

Warhead Type: HEAT

Cartridge: 3UBK23-3 cartridge

Soft Launch: Yes

Motor Type: Rocket

Penetration: 650 mm of rolled homogenous armour (RHA) behind ERA or 750 mm of RHA without ERA and it has a maximum range of 4,000 m

Anti-Tank Guided Missile (ATGM)

↳*System*

Name: 9M117 Bastion (AT-10)

Type: Anti-Tank Guided Missile

Caliber: mm100

In Service: 1983-present

Charge Type: Reduced Explosive Charge

Muzzle Velocity: m/s400-500

Length: mm1,048

Weight: kg27

Basic Load: ea8

Rocket Motor: Ignites 1.6 seconds after firing the missile and it burns for 6 seconds

Guidance System: beam-riding laser guidance.

Steering System: laser sensor to detect the modulation of the light.

Flight Time (4,000 meters): seconds12

Self Destruct Time: seconds26-41

Telescopic Sight: 1K13 day/night telescopic sight (with integral 1K13BZ laser emitter)

Stabilising Fins: ea4

Searchlight: L4 IR searchlight

Effective Firing Range: m100-4,000

Warhead Type: HEAT

Penetration: mm650-750

Note: The 9M117 Bastion (AT-10) is prone to radio or optical jamming

Coaxial Weapon System

↳*System*

Name: 2A72, 30mm Automatic Cannon

Type: mm30

Max Rate of Fire: rds/min330

Maximum Effective Firing Range (Air Targets): km4

Maximum Effective Firing Range (Ground Targets): km2

Maximum Effective Firing Range (Light Armor Vehicles): km1.5

Loader Type: Dual-belt feed

Maximum Elevation: deg-5

Minimum Elevation: deg+60

Fire on the Move: Yes

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

Firing Modes: single shot, 10-round burst, or automatic mode.

↳*Ammunition (Option 1)*

Name: 3UBR8

Type: 195 AP rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,120

Basic Load: INA

Penetrator Type: tungsten alloy sub-calibre penetrator

Penetration: can defeat 28 mm of RHA set at a 60° angle from a range of 1,000 m

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

↳*Ammunition (Option 2)*

Name: 3UOF8

Type: 305 HE-type rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s960

Basic Load: eaINA

Lethal Radius: m25.95

Charge Type: A-IX-2

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

Commander and Driver's Weapons System

Note: The BMP-3 is equipped with a total of two 7.62mm PKT (Kalashnikov's Machine Gun)

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Caliber: mm7.62

Cartridge: mm7.62×54

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

Fire Control

Name: 1K13-2

Computerized FCS: Yes

Thermal Sight Vehicle Commander: optical sight 1PZ-10, a day/night vision device TKN-3MB

Thermal Sight Gunner: 1K13-2 II night channel, 5.5x

Gunner Day Sights: 1K13-2, 8x ; 1P3-10 antiaircraft, 2.6x; PPD-1 stand-by

Main Gun Stabilization: Yes, 2E52 electro-mechanical stabiliser

Stabilizer Modes: The stabiliser has three modes: automatic; semi-automatic; and guidance.

Ballistic Computer: Yes, V539 ballistic computer

Rangfinder: Laser

Infrared Searchlight: Yes, IR searchlight OU-3GA2

Cross-Wind Sensor: Yes

Minutes Of Angle (MOAs): 1.69

Protection

Armor Type: welded of aluminum alloy armor

Hull Armor (Front): protection against 30 mm armor-piercing rounds.

Hull Armor (Sides and Back): protection is against 14.5 mm armor-piercing rounds.

Turret Armor: mm30-35

Applique Armor: On Turret

Explosive Reactive Armor: Available

Active Protection System: Yes, Arena active protection system

Mine Clearing: Yes, KMT-8 mine plow available

Self-Entrenching Blade: Yes

NBC Protection: Yes, Collective

Smoke Equipment: 6 VEESS

Countermeasures System: Shtora countermeasures systems

Automatic Fire Suppression System: Yes

Notes:

The BMP-3 [BMP = Boyevaya Mashina Pyekhota - Infantry Fighting Vehicle], which represents a totally different design concept from BMP-1/2, is a light tank that can hold a squad of infantry. It has a 100mm main gun that fires HE to demolish buildings, can fire long-range ATGMs through its barrel, and a 30mm autocannon and a medium machine gun as a single unit in the turret. The innovative BMP-3 armament suite has been subjected to criticism in the Russian military, which has focused on deficiencies in the barrel-fired ATGM. The performance obtained from the 500 horsepower engine powering this 18 ton of vehicle compares favorably to the American Bradley, which has an engine of similar power for a 33 ton of vehicle. The BMP-3, first seen in public during a parade in Moscow in 1990, was built by Kurganmashzavod, developer and manufacturer of the BMP-2 infantry combat vehicle. The hull of the BMP-3 resembles the BMD Airborne Infantry Fighting Vehicle, with a new turret in the center of the vehicle. The troop compartment at the rear of the hull is accessed via a pair of doors in the hull rear. The BMP-3 is fully amphibious, propelled in water by two water-jets mounted at the rear of the hull.

VN-18 (ZBD-05) Chinese Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

1 2 3 4

Variants:

- **ZTD-05:** The ZTD-05 is a fire support vehicle based on the Type 05 hull. It is designed to have the same mobility and protection as the ZBD-05 however it is armed with a large-calibre direct-fire gun. It is designed to provide overwhelming fire support for ZBD-05 formations against embedded infantry and heavily armoured vehicles.
- **PLZ-07B:** The PLZ-07B is an SPH designed for the Chinese Marine Corps. It is based on the Type 05 hull and uses the weapon system from the PLZ-07, which is based on a different hull. The vehicle is designed to have the same mobility and protection as the ZBD-05, however, it is equipped with a large-calibre howitzer and attendant FCS so that it can provide organic indirect fire support for ZBD-05 formations.
- **Type 001:** The Type 001 is an APC based on the Type 05 hull. It is believed that the Type 001 is more likely to be found in service with the amphibious elements of the PLA rather than the Marine Corps, as it has been shown on exercises with the 74th Army Group. It is designed to perform as an APC and is capable of carrying a section of equipped infantry into combat alongside other Type 005 variants.

System

Alternative Designation: Type 05; ZBD-05, ZTD-05, PLZ-07B

Estimated out of Service Date: 2055

Manufacturer: Norinco

Type: Amphibious Infantry Fighting Vehicle (IFV)

Family: Type 05

Crew: ea3

Troop Compartment Capacity: 11

Maximum Effective Range: km500

Dimensions

Length: m9.5

Width: m3.36

Height: m3.04

Weight, Combat: tons26.5

Ground Pressure: kg/mINA

Automotive

Engine Name: INA

Engine Type: Four-stroke turbocharged water-cooled diesel

Engine Power (Land): hp500

Engine Power (Sea): hp1,577

Transmission: Machanical

Cruising Range (Land): km500

Cruising Range (Sea): kmINA, estimates have it going as far as 2/3 of it's land range.

Speed, Maximum Road: km/h65

Speed, Average Cross: 40

Speed, Maximum Swim: km/h25 (Wow that is fast for a IFV)

Tracks: racks are supported by two return rollers located between the first and last pairs of road wheels.

Suspension: Hydropneumatic

Wheels: 6, unevenly-spaced road wheels per side

Gradient: %60

Vertical Obstacle: m0.6

Trench: m2.9

Fording Depth: mAmphibious

Sea State Capable: Sea State 4

Buoyancy Reserve: Yes

Communications

Blue Force Tracker: Yes

↳***TBR-121***

VHF Transceiver: Yes

VHF Range: km1 to 50

Proliferated: Widely

Digital Data: Yes, Full

Control: Self-Adaptive Control (Including Automatic Antenna Tuner)

Frequency Agile: Yes

Wireless Network Capabilities: Yes

Note:: Very similar in capabilities to the US SINCGARS ASIP

Main Gun

Turret Type: 2 Person

↳*System*

Name: 30 mm ZPT-99 (2A72) cannon

Type: 30mm Auto-cannon

Alternate Designation: Shipunov 2A42

Date of Introduction: 1980

Rate of Fire (Low): rds/min200-300

Rate of Fire (High): rds/min550-800

Barrels: ea1

Feed System: Twin Feed

Action: Gas Operated

Cage Cooling Sleeve: Yes

Traverse: deg360

Weight: kg115

Length, Total: m3.027

Length, Barrel: mm2,416

↳*Ammunition (Option 1)*

Type: Armour Piercing Fin Stabilized Discarding Sabot with Tracer(APFSDS-T)

Caliber: mm30

Muzzle Velocity: m/s1,275

Basic Load: rds125

Maximum Effective Range: m2,800

Min Range: mINA

Armor Penetration: Yes

Round Mass (Nominal): g675

Projectile Mass (Nominal): g220

Round Length: mm280

Tracer: 2.5

Cartridge Case: Steel

Primer: Percussion cap

Penetration at 1,000: >45mm RHA steel at 60° obliquity

Dispersion: Mils0.45

Operational temperature: -32°C to +62°C

↳*Ammunition (Option 2)*

Type: High Explosive Incendiary

USSR Designation: UOF-84

Caliber: 30mm

Description: Shell filled with 48,5g HEI, with A-670M fuze

Muzzle Velocity: m/s960

Basic Load: ea225

Max Range: 5,000

Min Range: INA

Armor Penetration: Yes

Weight, Bullet: kg0.39

Coaxial Weapon System

↳*System*

Name: Type 80 Chinese Heavy Machine Gun

Manufacturer: Norinco

Type: 7.62mm Heavy Machine Gun

Length, Total: mm1,192

Length, Barrel: mm658

Diameter: INA

Action: Gas Operated

Rate of Fire: rds/min700-800

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

↳*Ammunition*

Type: 7.62×54mmR

Caliber: mm7.62x54

Muzzle Velocity: m/s840

Basic Load: Belts in 100/200/250 round boxes

Max Range: m100-1,500

Min Range: m100

Armor Penetration: INA

Anti-Tank Guided Missile (ATGM)

ATGM Type: HJ-73 Red Arrow Anti-Tank Missile System

↳*HJ-73 Red Arrow ATGM (Option 1)*

Name: Red Arrow 73B

Type: Anti-Tank Missile System

Muzzle Velocity: m/s120

Maximum Range: m2,800

Warhead Type: Tandem-HEAT

Hit Probability: %90

Penetration Probability: %80

Penetration: 200 mm of RHA set at 68° and protected by ERA

↳*HJ-73 Red Arrow ATGM (Option 2)*

Name: Red Arrow 73D

Type: Anti-Tank Missile System

Muzzle Velocity: m/s130

Maximum Range: m2,800

Warhead Type: Tandem-Heat

Hit Probability: %90

Penetration Probability: %80

Penetration: 280 mm of RHA set at 68° and protected by ERA

↳*HJ-73 Red Arrow ATGM (Option 3)*

Name: Red Arrow 73E

Type: Anti-Tank Missile System

Muzzle Velocity: m/s135

Maximum Range: m3,000

Warhead Type: Tandem-HEAT

Hit Probability: %90

Penetration Probability: %80

Penetration: 300 mm of RHA set at 68° and protected by ERA

↳*HJ-73 Red Arrow ATGM (Option 4)*

Name: Red Arrow 73F

Type: Anti-Tank Missile System (Bunker Buster)

Muzzle Velocity: m/s130

Maximum Range: m2,800

Warhead Type: Fuel Air Explosive Warhead

Hit Probability: %90

Penetration Probability: %80

Penetration: 300 mm of RHA set at 68° and protected by ERA

Fire Control

Name: BMS System
Computerized FCS: Yes
Thermal Vehicle Commander: Yes
Thermal Gunner: Yes
Main Gun Stabilization: Yes
3D Map of the OE: Yes, Standard
Satellite Navigation System: BeiDou Satellite
Battle Management System: Yes
Navigation System: BeiDou satellite navigation system,

Protection

Hull Armor Type: Hull is of aluminium base armour protected by composite appliqué armour.
Hull Armor: mm30
Sides and Rear Armor: mm14.5
Turret Armor: INA
Applique Armor: Yes
Explosive Reactive Armor: INA
Active Protection System: Yes
Mine Clearing: INA
Self-Entrenching Blade: INA
NBC Protection: Yes
Smoke Equipment: Yes, 8 Total, 4 on each side 76mm
Bow Blade: Yes
Belly Plate: Yes
Self-Sealing Fuel Tank: Yes, capable of stopping a 25 mm APFSDS round at 2,000 m.
Automatic Fire Suppression Device.: Yes

Notes:

VN-18 (ZBD-05) The Type 05 armored fighting vehicle is a family of dedicated designed amphibious infantry fighting vehicle developed by Norinco for People's Liberation Army. The family includes ZBD-05 amphibious infantry fighting vehicle and ZTD-05 amphibious tank (assault gun) as well as several other variants including command vehicle and recovery vehicle. The vehicle could be launched at sea, from an amphibious assault ship over the horizon. It features a hydroplane, and a design concept that has been compared to the US cancelled Expeditionary Fighting Vehicle (EFV) program.

Active Protection System: Optional
Mine Clearing: No
Self-Entrenching Blade: INA
NBC Protection: Yes
Smoke Equipment: Yes
360 degree field of view for crew: Yes

Notes:

In the early 1990s, the BTR-90 was developed as a replacement for the BTR-80 in the Russian Army. While it was a moderate improvement in armament, protection, mobility, and internal space over its predecessor, it all came at the cost of greatly increased unit price. It wasn't accepted into service (except in small numbers) as the modest increase in performance wasn't seen as enough justification for its cost and complexity. Purchases of the BTR-80 stopped in 2010 and the improved BTR-82 was obtained as a stop-gap measure. In mid-2011, the Russian Ministry of Defense issued a requirement for a new modular wheeled family of armored vehicles instead of buying the BTR-90. Development this new wheeled IFV is being done alongside the new and similarly armed and armored but tracked Kurganets-25 infantry fighting vehicle and heavy T-15 Armata IFV. The Boomerang vehicle is based on Armata Universal Combat Platform. It is amphibious and is able to negotiate and overcome water obstacles using two waterjets. In a departure with the previous BTR (Like BTR-70) series of vehicles, the engine will be located in the front instead of the rear. Engine location was a significant drawback of BTR vehicles, where soldiers had to exit the vehicles through cramped side doors. The Boomerang has rear doors and roof hatches for troop entry and exit. It has a crew of three consisting of the driver, gunner, and commander and holds seven troops. Protection comes from ceramic armor and technologies to prevent shell splinters. Like BTRs, the Boomerang is an 8×8 wheeled vehicle, and is equipped with a 750 hp turbocharged diesel engine. Several components and subsystems will be interchangeable between the Boomerang and Kurganets-25 IFV, and it is hoped that both vehicles will be powered by the same engine though that is not the case to date. The K-17 Boomerang infantry fighting vehicle (IFV), is heavily armed with the Boomerang-BM RWS with a 30mm cannon and Kornet-EM anti-tank missiles or AU-220M with 57mm BM-57 autocannon and 7.62mm PKMT machine gun. In November 2011, media reports said the new project had been approved. In February 2012, a high ranking Russian general officer said that the Russian Army would be taking the first deliveries of the Boomerang prototype in 2013. Large-scale deliveries were to began in 2015. At least 2,000 Boomerangs vehicles are to replace the BTR-80 and BTR-82/A in Russian service.

AMX-10P (Marines) French Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Parent:

AMX-10P French Infantry Fighting Vehicle (IFV)

Variants:

- **AMX-10P Marines:** The AMX-10P Marines is a variant of the AMX-10P specifically developed to provide improved amphibious capabilities at sea or in rivers of the original AMX-10P.
- **AMX-10 PAC 90:** The primary role of the AMX-10 PAC 90 is that of anti-tank and fire support on the battlefield at ranges between 1,000 and 2,500 m, but it can also be used as a reconnaissance vehicle or as an APC.
- **AMX-10 ECH:** The AMX-10 ECH is an ARV based on the hull of the AMX-10P. It is designed to support AMX-10P vehicles in combat and maintain readiness by conducting repairs as close to the battlefield as possible.
- **AMX-10 Ambulance:** The AMX-10P is also used to perform as a battlefield ambulance. It is based on the same hull as the AMX-10P to ensure that it can perform alongside other armoured formations.
- **AMX-10PC:** The AMX-10PC is an armoured command post designed to support the operations of armoured formations during combat.
- **AMX-10 HOT:** This was the basic AMX-10P, with the Toucan II turret replaced by a new two-man Lancelot turret based on the TH 20, with four ready-to-launch 4,000 m range MBDA HOT missiles and a further 14 missiles carried in the rear of the hull. The crew of five consisted of the commander and gunner in the turret, two missile loaders, and the driver.
- **AMX-10 VOA:** This was based on the AMX-10PC command vehicle chassis and has been designed for use by artillery observers. Its crew of four consisted of a commander, observer, radio operator, and driver. The turret, which was manned by one or two men, was provided with equipment for day and night observation and local defence.
- **AMX-10 SOA:** The AMX-10 SOA was used for battlefield observation and artillery fire-control. It was essentially an AMX-10P with its Toucan II turret replaced by a new two-man turret armed with an externally-mounted 7.62 mm MG on the right side.
- **AMX-10 SAF:** This was also known as the AMX-10PC SAF and was used with the ATILA artillery FCS. It had a crew of five consisting of the radio operator, driver, two warrant officers, and one commanding officer.
- **AMX-10 TM:** This model towed a 120 mm TDA Model MO-120-RT-61 muzzle loaded rifled mortar, and carried 60 rounds of ammunition, for the mortar. The AMX-10 TM had a crew of six consisting of commander, aimer, artificer, loader, ammunition carrier and driver, and was fitted with a Toucan I turret.
- **AMX-10 SAT:** This was based on the AMX-10 PC command vehicle but had been modified internally to carry a gyrostabilised theodolite, a topographic survey theodolite, distance measuring equipment, and a navigation system.
- **AMX-10P with RATAC radar:** This had no turret and was fitted with a roof-mounted radar for field artillery fire (RATAC) pulse Doppler radar scanner. The vehicle had a crew of five: commander; radar operator; assistant radar operator; radio operator; driver. The radar had four operating modes: ground surveillance; acquisition and identification;

angular deviation measurement; automatic tracking.

- **AMX-10P upgrade:** The AMX-10P ICV upgrade included the installation of a new passive armour package to the front, sides, rear, and hull top to provide an enhanced level of survivability. Other enhancements included a modified rear power-operated ramp, new torsion bars, and reinforced transmission. The original AMX-10P was fully amphibious, propelled in the water by two water-jets mounted one either side of the hull at the rear. These and the trim vane installed at the front of the hull were removed to save weight but the vehicle retained its fording capability.

System

Alternative Designation: AMX-10P Marines

Date of Introduction: 1973

Proliferation: Indonesia, which placed an order for 34 vehicles, Singapore ordered 44

Manufacturer: Nexter Systems

Type: Infantry Fighting Vehicle (IFV)

Main Gun Stabilization: Non-stabilized

Periscopes: ea5

Protection

Hull Armor: welded from aluminum armor plates, which protect the vehicle from 14.5mm rounds

Turret Armor: New Dragar Turret.

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: 4 × turret mounted 80 mm Smoke grenade launcher (2 × 2)

IR Signature: INA

Anti-Corrosion Lining: Yes

Notes:

The AMX-10P Marines was developed as a private venture by Nexter Systems (previously Giat Industries) Roanne facility specifically for the export market for use by marines and other armed forces having an amphibious capability. The first customer was Indonesia, which placed an order for 34 vehicles in two versions, 24 fitted with the Nexter Systems one-man turret armed with a .50 (12.7 mm) M2 HB machine gun and 10 fitted with the Nexter Systems TS 90 two-man turret armed with a 90 mm F4 gun and 7.62 mm coaxial machine gun. This turret is also installed on a number of other armored vehicles including the Panhard ERC Sagaie (6 × 6) and Renault Trucks Defense VBC 90 (6 × 6) armored cars. AMX-10P Marine: AMX-10P with improved amphibious capabilities and a modified propulsion system that allowed for top speeds of up to 10 km/h in water.[4] This variant was developed for the Indonesian Marine Corps

BMP-2M Berezhok Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Parent:

BMP-2 Russian Amphibious Infantry Fighting Vehicle (IFV)

Variants:

- **BMP-2 obr.:** Improved version with "kovriki" armour on turret front
- **BMP-2 obr. 1986:** Late-production model with new BPK-2-42 sight instead of the BPK-1-42.
- **BMP-2D:** Fitted with additional spaced type steel appliqué armour on the hull sides, under the driver's and commander's stations, and 6 mm thick appliqué armour on the turret.
- **BMP-2K:** Command variant fitted with two whip antennas mounted on the rear of the hull, one behind the turret and one on the right-hand side of the rear of the vehicle, one IFF antenna (pin stick) on the left-hand side of the rear of the vehicle and a support for a telescopic mast in the front of the IFF antenna
- **BMP-2M:** This is the general designator for upgraded (modernizirovannyj) versions
- **BMP-2M "Berezhok":** Modernized version from KBP. This version has B05Ya01 Berezhok turret equipped with 2A42 30mm autocannon, PKMT 7.62mm coaxial machine gun, AGS-30 grenade launcher, 2+2 launchers for ATGM 9M133M "Kornet-M" and new day/night sights as found on the BMD-4.
- **BMO-1:** Transport vehicle for a flamethrower squad armed with 30 RPO-A "Shmel" 93 mm napalm rocket launchers.
- **BVP-2V or VR 1p:** Former Czechoslovakia version
- **VPV:** Equipped with a powered crane with 5 tonnes capacity, heavy winch, wider troop compartment etc. Hatches on top of the turret and the troop compartment were removed.
- **BMP-2 "Sarath":** Also known as BMP-II – Indian licence-produced variant of the BMP-2,built by Ordnance Factory Medak. The first vehicle, assembled from components supplied by KBP, was ready in 1987.
- **BMP-2 Light Tank:** India Version, DRDO developed light tank on BMP-2 Chassis DRDO light tank.
- **BMP-2 UGV "Muntra" – unmanned reconnaissance vehicle, "S" version is fitted with equipment used to detect nuclear, biological and:** India Version. unmanned reconnaissance vehicle, "S" version is fitted with equipment used to detect nuclear, biological and chemical contamination while the "M" version is designed to detect mines.
- **BMP-2MD:** Finnish modernisation of the BMP-2, which includes thermal camouflage, thermal sights, anti-aircraft sight and new day/night optics for the gunner and commander, heated cabin and seats, new external storage boxes functioning also as spaced armour and new radio and communications systems

Effective Ground Engagement Range: m1,800

↳*Ammunition (Option 1)*

Name: 3UOF8

Type: HEI

Caliber: mm30

Cartidge: mm30 × 165

Muzzle Velocity: m/s960

Basic Load: 500 total of any combination 30mm projectile

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

↳*Ammunition (Option 2)*

Name: M929

Type: APFSDS-T

Caliber: mm30

Cartridge: mm30 × 165

Muzzle Velocity: m/s1,260

Basic Load: 500 total of any combination 30mm projectile

Note: A sub-caliber fin-stabilized discarding sabot round with tracer from Belgian Mecar, with tungsten alloy penetrator. Penetration: 50 mm RHA steel at 60 degree impact at 1,000 m range

↳*Ammunition (Option 3)*

Name: 3UBR8

Type: APDS

Caliber: mm30

Cartridge: mm30 × 165

Muzzle Velocity: m/s1,120

Basic Load: 500 total of any combination 30mm projectile

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

Note: The 7.62 PKT can be controlled remotely and is slaved to the main gun,

↳*Ammunition*

Name: 57-N-323S

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mm

Muzzle Velocity: m/s855

Basic Load: ea2,000

Accuracy of fire at 300 m: mm90

Anti-Tank Guided Missile (ATGM)

System

Name: 9M133 Kornet
NATO Name: AT-14 Spriggan
Type: Anti-Tank Guided Missile (ATGM)
Manufacfturer: Degtyarev plant
In Service: 1998-present
Proliferation: 35,000 (2009)
Launcher Type: Twin launchers mounted on either side of the turret
Basic Load: ea4
Weight (with Launch Tube): kg29
Weight (with Tripod/Firing Unit): kg63.7
Length: mm1,200
Diameter: mm152
Warhead Weight: kg4.6
Detonation Mechanism: Impact Fuse
Wingspan: mm460
Propellant: Solid-fuel rocket
Operational Range (KORNET): m100-5,000
Operational Range (KORNET-EM): m10,000
Guidance system: SACLOS laser beam riding
Steering system: Two control surfaces
Accuracy: Less than 5 meters
Launch platform: Individual, vehicles, Kornet-T, Kornet-D, Bumerang-BM, Kornet-D1

Fire Control

Name: INA
Computerized FCS: Yes
Commander Periscopes: Two TNPO-170A periscopes, plus a single TKN-3B binocular rear-view prism. Additionally, the Commander has a 1PZ-3 day monocular sight
Thermal Sight Gunner: Sozh panoramic sight
Driver's Central Day Periscope: TNP-350B
Main Gun Stabilization: Yes, digital weapon stabiliser
Effective Ground Engagement Range: m1,800
Searchlight: OU-3GA2 searchlight and the FG-126 searchlight
Digital Battle Management System: Yes
Multi-Channel Optical System: Yes

Advanced Target Detection System: Yes

Laser Range Finder: Yes, PL-1 laser illuminator

Thermal Imaging System: Yes

Ballistic Computer: Yes

Protection

Hull Armor: All-welded steel that is believed to be between 5 and 19 mm thick

Turret Armor: mm23-33

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: KMT-8 mine plow available

Self-Entrenching Blade: INA

NBC Protection: Collective, GO-27 Radioactive and chemical agent detector

Smoke Equipment: 6 smoke grenade launchers, VEESS

Smoke Screen: TDA System using engine

Notes:

The BMP-2M infantry fighting vehicle (IFV) is an upgraded version of the BMP-2 IFV. Designed and developed by Kurganmashzavod JSC, the IFV offers improved mobility and fire power for armed forces. The weapon system for the upgraded vehicle is provided by KBP Instrument Design Bureau. The amphibious vehicle was displayed at an international forum known as Engineering Technologies 2010 held in June 2010 and KADEX-2012, Kazakhstan. The manufacturer also demonstrated the vehicle at Comprehensive Security Exhibition 2015 in Tampere. KBP received an order from Algeria for the modernization of 360 BMP-2 vehicles to BMP-2M standard. A total of 693 BMP-2/2K vehicles of the Indian Army are also being upgraded to BMP-2M standard. The Russian Defense Ministry placed a ten-year contract with KBP for the supply of 540 modernized BMP-2M and BMD-2 airborne vehicles in 2017. The upgraded vehicle is being offered in two different configurations, which include BMP-2M (sb4-2) and BMP-2M (sb4-3). The design of the BMP-2M tracked armored fighting vehicle is based on the BMP-2 IFV, which was commissioned by the Russian Army in 1980. Combat efficiency of the vehicle has been highly improved with advanced armament, while cross-country speed has also been increased. The modernized vehicle can carry three crew members, including a driver, gunner and commander. The troop compartment offers seating for up to seven soldiers. The vehicle retains the design specifications of BMP-2, and measures 6.73m-long, 3.15m-wide and 2.45-high. The combat weight of the vehicle is approximately 16,000kg. The IFV is equipped with a KBM-2 air conditioning system to offer a comfortable environment to the crew when operating in high temperatures. The BMP-2M IFV is equipped with a Berezhok (B05S011) combat module integrating four 9M133 Kornet series anti-tank guided missiles. The missiles are launched from the twin launchers mounted on either side of the turret. The turret is also armed with a 30mm 2A42 automatic gun, a 7.62mm PKT coaxial machine gun and a 30mm AG-17 automatic grenade launcher (AGL). The 30mm cannon has the capability to fire 500 rounds of ammunition a minute, while the 7.62mm gun offers a rate of fire of 2,000 rounds a minute. The AGL can launch 250 grenades a minute for a maximum range of 1,730m. The hull of the IFV is protected by applique armor, which enables the vehicle to withstand 12.7mm B-3232 rounds and high-explosive anti-tank (HEAT) missiles. Observation and fire control The BMP-2M IFV is equipped with a multi-channel optical system for stabilization of view during firing. The vehicle has an advanced target detection system, a laser range-finder and a thermal imaging system to improve the accuracy of target detection and mission efficiency. An armament stabilizer and ballistic computer, as well as a BPK-3-42 gunner’s sight are fitted to the vehicle enable the firing of main armament. The vehicle is also installed with PL-1 laser illuminator. The target detection ranges of the vehicle during the day and night are 5,000m and 3,000m respectively.

AMX-10P French Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **AMX-10P Marines:** The AMX-10P Marines is a variant of the AMX-10P specifically developed to provide improved amphibious capabilities at sea or in rivers of the original AMX-10P.
- **AMX-10 PAC 90:** The primary role of the AMX-10 PAC 90 is that of anti-tank and fire support on the battlefield at ranges between 1,000 and 2,500 m, but it can also be used as a reconnaissance vehicle or as an APC.
- **AMX-10 ECH:** The AMX-10 ECH is an ARV based on the hull of the AMX-10P. It is designed to support AMX-10P vehicles in combat and maintain readiness by conducting repairs as close to the battlefield as possible.
- **AMX-10 Ambulance:** The AMX-10P is also used to perform as a battlefield ambulance. It is based on the same hull as the AMX-10P to ensure that it can perform alongside other armoured formations.
- **AMX-10PC:** The AMX-10PC is an armoured command post designed to support the operations of armoured formations during combat.
- **AMX-10 HOT:** This was the basic AMX-10P, with the Toucan II turret replaced by a new two-man Lancelot turret based on the TH 20, with four ready-to-launch 4,000 m range MBDA HOT missiles and a further 14 missiles carried in the rear of the hull. The crew of five consisted of the commander and gunner in the turret, two missile loaders, and the driver.
- **AMX-10 VOA:** This was based on the AMX-10PC command vehicle chassis and has been designed for use by artillery observers. Its crew of four consisted of a commander, observer, radio operator, and driver. The turret, which was manned by one or two men, was provided with equipment for day and night observation and local defence.
- **AMX-10 SOA:** The AMX-10 SOA was used for battlefield observation and artillery fire-control. It was essentially an AMX-10P with its Toucan II turret replaced by a new two-man turret armed with an externally-mounted 7.62 mm MG on the right side.
- **AMX-10 SAF:** This was also known as the AMX-10PC SAF and was used with the ATILA artillery FCS. It had a crew of five consisting of the radio operator, driver, two warrant officers, and one commanding officer.
- **AMX-10 TM:** This model towed a 120 mm TDA Model MO-120-RT-61 muzzle loaded rifled mortar, and carried 60 rounds of ammunition, for the mortar. The AMX-10 TM had a crew of six consisting of commander, aimer, artificer, loader, ammunition carrier and driver, and was fitted with a Toucan I turret.
- **AMX-10 SAT:** This was based on the AMX-10 PC command vehicle but had been modified internally to carry a gyrostabilised theodolite, a topographic survey theodolite, distance measuring equipment, and a navigation system.
- **AMX-10P with RATAC radar:** This had no turret and was fitted with a roof-mounted radar for field artillery fire (RATAC) pulse Doppler radar scanner. The vehicle had a crew of five: commander; radar operator; assistant radar operator; radio operator; driver. The radar had four operating modes: ground surveillance; acquisition and identification; angular deviation measurement; automatic tracking.
- **AMX-10P upgrade:** The AMX-10P ICV upgrade included the installation of a new passive armour package to the front, sides, rear, and hull top to provide an enhanced level of survivability. Other enhancements included a modified rear power-operated ramp, new torsion bars, and reinforced transmission. The original AMX-10P was fully amphibious, propelled in the water by two water-jets mounted one either side of the hull at the rear. These and the trim vane installed at the front of the hull were removed to save weight but the vehicle retained its fording capability.

Anti-Tank Guided Missile (ATGM)

↳*MILAN Anti-Tank Guided Missile (ATGM)*

Country: France / Germany

Service: 1972-present

Prolferation: thousands deployed by the French, German, Belgian, and Spanish armies, but Italy and soon India were assembling MILANs under license. All in all, the MILAN's customer list has reached 41 countries and at least several non-state groups.

Range: km2

Basic Load: ea10

Armor Penetration: mm350

Missile Length: mm918

Missile Diameter: mm103

Fin Span: mm267

Missile Weight: kg6.73

Total Weight with Launcher: kg24

Warhead Weight: kg2.7

Warhead Type: High Explosive

Guidance System: Wire-Guided

Note: The iconic MILAN is the most successful Western European anti-tank missile ever made and is only surpassed by the BGM-71 TOW when it comes to international customers.

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Yes, M371 day sight with a magnification of ×1 and ×6

Thermal Sight Gunner: Tes, OB-40 day/night periscope

Main Gun Stabilization: Non-stabilized

Protection

Hull Armor: welded from aluminum armor plates, which protect the vehicle from 14.5mm rounds

Turret Armor: welded from aluminum armor plates, which protect the vehicle from 14.5mm rounds

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: 4 × turret mounted 80 mm Smoke grenade launcher (2 × 2)

IR Signature: INA

Notes:

The AMX-10P is a French amphibious infantry fighting vehicle. It was developed after 1965 to replace the AMX-VCI in service with the mechanized regiments of the French Army; the first prototypes were completed in 1968. Production commenced between 1972 and 1973. The AMX-10P is fully amphibious, being propelled through water at speeds of up to 7 km/h by twin waterjets. It is also fitted as standard with a trim vane and bilge pumps to assist with the flotation process. AMX-10Ps were popular with a number of Arab armies and have been operated by Iraq, Qatar, Saudi Arabia, and the United Arab Emirates.[2] Special marine variants were also developed for Singapore and Indonesia, including a fire support model known as the AMX-10 PAC 90, which mated the AMX-10P chassis to the complete turret and 90 mm gun assembly of the Panhard ERC-90 Sagaie. AMX-10Ps share a number of common transmission and chassis components with their armored car counterpart, the AMX-10RC. AMX-10P hulls are fabricated from a welded steel or aluminum alloy[and notable for their parallel incorporation of the driving and engine compartments. The driver is seated at the front of the vehicle and to the left. An AMX-10P's driving compartment is provided with a single hatch cover opening to the rear and three periscopes intended for observation purposes when the hatch is closed. Night vision equipment was not fitted as standard to the base production model; however, one of the three driving periscopes could be replaced with combined day/night intensification sights as needed. The troop compartment is at the rear of the hull and provided with two roof hatches. Passengers embark and debark from a ramp, which is accessed through two doors at the rear. The transmission consists of a hydraulic torque converter coupled to a gearbox with one reverse and four forward driving gears. The AMX-10P utilizes a torsion bar suspension, which supports five road wheels with the drive sprocket at the front and idler near the rear. These can be accessed from inside the hull through maintenance panels. Standard AMX-10P turrets are equipped with a GIAT M693 automatic cannon firing two different types of both high explosive ammunition and armor-piercing ammunition. More than one ammunition type may be loaded at once and fired alternatively. The high explosive rounds have a muzzle velocity of 1,050 m/s, while the latest armor-piercing round has a muzzle velocity of 1,300 m/s and is capable of penetrating 20 mm of rolled homogeneous armor at an incidence of 60°. The autocannon has a cyclic rate of fire of 740 rounds per minute, with the gunner being able to switch between semiautomatic, limited burst, or fully automatic fire as necessary.

BMP-3M Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Parent:

BMP-3 Russian Amphibious Infantry Fighting Vehicle (IFV)

Variants:

- **BMP-3M:** KBP and Kurganmashzavod have upgraded the vehicle with a new engines and turret with a new ATGM system 9K116-3 Basnya. The upgraded vehicle is called the BMP-3M and the new Bakhcha-U turret which includes a new automatic fire control system with ballistic computer, new SOZH gunner's sight with laser rangefinder and an ATGM guidance channel, thermal imager, TKN-AI commander's vision device with laser illuminator and new ammunition loading system for ATGM.
- **BMP-3 UAE:** The BMP-3 with a upgraded cooling system, which allows the vehicle to operate in the hot desert
- **BMMP:** Version for naval infantry, fitted with the turret of the BMP-2.
- **BMP-3K:** Tactical command variant, includes additional radio R-173, an intercom for seven users, an AB-R28 independent portable power unit, a navigation device TNA-4-6 and the "Ainet" air burst round detonation system. The BMP-3K lacks the bow machine guns and has its whip antennas mounted on the rear hull. Crew: 3+3
- **BMP-3F:** Armed with the standard 2K23 turret. Specially designed for operations at sea, with improved seaworthiness and buoyancy, capability to move afloat at sea state 3 and fire with the required accuracy at sea state 2. Compared to the basic model, the vehicle design features changes increasing floatability and vehicle stability: the self-entrenching equipment is omitted, a lightweight anti-surge vane and an air intake tube are introduced; the BMP-3F turret is also protected by anti-surge vanes. Water jet propellers develop a speed of 10 km/h when afloat. The BMP-3F design allows the vehicle to come ashore under rough sea conditions and to tow the same-type vehicle. A new main sight, the SOZH, which has an integrated laser range finder and an ATGM guidance channel, is installed. This version can endure continuous amphibious operation for seven hours with the running engine
- **BT-3F:** Amphibious version based on BMP-3F with the original turret replaced by a smaller remote weapon station with either 7.62, 12.7 or 14.5mm machine gun. It can accommodate a crew commander, driver, gunner, and 14 troops, and can use optional ERA armor.
- **BRM-3K "Rys" (Ob.501):** Surveillance and reconnaissance variant with 1PN71 thermal sight (3.7x/11x, 3 km range), 1PN61 active-pulse night vision device (3 km range), 1RL-133-1 ("TALL MIKE") I-band surveillance radar (3 km man, 12 km vehicle), 1V520 computer and a TNA-4-6 navigation system. The armament consists of the stabilized 30 mm autocannon 2A72 (600 rounds) and a coaxial 7.62 mm machine gun (2,000 rounds) or AU-220M Baikal remote weapon station with 57 mm BM-57 autocannon and 7.62mm PKMT machine gun.
- **BMP-3 Dragoon:** New IFV version with an unmanned turret which can be armed with a variety of combat modules, including standard BMP-3's Bakhcha-U turret with a 2A70 100 mm cannon, a 2A72 30 mm autocannon and a PKTM 7.62 mm machine gun, the AU-220M Baikal remote weapon station module with a 57 mm BM-57 gun and a module with a 125 mm 2A82-1M tank gun, the new 816 h.p.
- **BREM-L "Beglianka" (Ob.691):** Armoured recovery vehicle with five-tonne crane and 20/40 metric tonne capacity winch.
- **BMP-3 "Khrizantema-S":** Self-propelled anti-tank version with 9M123 Khrizantema (AT-15) ATGM system with radar and laser guidance. The 9P157-2 carries two 9M123 missiles on launch rails, which are extended from a stowed position; the radar is also stowed during transit. The missiles are re-loaded automatically from an internal magazine with 15 rounds (missiles are stored and transported in sealed canisters) and can also accept munitions manually loaded from outside the vehicle.
- **9P163M-1 "Kornet-T":** Anti-tank version with Kornet (AT-14) missile system. Some sources call it the 9P162. The

Kornet is similar in function to the Khrizantema missile system. The 9P163M-1 carries two 9M133 missiles on launch rails, which are extended from a stowed position during transit. Missiles are re-loaded automatically by the tank destroyer from an internal magazine with 16 rounds (missiles are stored and transported in sealed canisters).

- **2S18 "Pat-S" (Ob.697):** Self-propelled version of the 152 mm howitzer 2A61 "Pat-B". This was only a prototype, further development led to the 2S31 Vena.
- **DZM "Vostorg-2":** Combat engineer vehicle with a dozer blade and excavating bucket. Prototype.
- **UR-07:** Mine clearing system. The UR-07 might replace the UR-77 "Meteorit". It has the same chassis as the BMP-3 but a bigger steel hull with two launch ramps in the rear. The ramps are used to fire rockets towing hose-type mine-clearing line charges to clear mine fields.
- **UNSh (Ob.699):** Basic chassis for specialised variants.
- **Hermes or TKB-841:** Air-defence vehicle with high-velocity missiles and radar system. Prototype.[68] 2S31 Vena – Self-propelled mortar carrier equipped with a 120 mm mortar based on BMP-3 chassis. It entered production in 1996 and service in 2010.
- **2S38 ZAK-57 Derivatsiya-PVO:** Self-propelled air defense vehicle based on BMP-3 chassis fitted with a 57 mm autocannon and passive reconnaissance and target tracking equipment.[72] It is designed to shoot down unmanned aerial vehicles (UAVs), cruise missiles, air-to-surface missiles, aircraft, helicopters, and MLRS rockets.
- **UDAR UGV:** Unmanned ground vehicle based on the tracked chassis of the BMP-3 with the center hull raised to fit the DUBM-30 Epoch armed with 2A42 autocannon, 7.62mm PKMT machine gun, and Kornet-M ATGM.
- **Vikhr UGV:** Unmanned ground vehicle based on BMD-3 equipped with a smaller turret armed with 2A72 autocannon, 7.62mm coaxial machine gun and six anti-tank guided missiles 9M133M Kornet-M, three on each side of the turret.
- **Prokhod-1:** Unmanned mine-clearing vehicle based on the BMP-3 chassis. It is equipped with the anti-mine TMT-C trawl, and a remote weapon station turret with a 12.7mm machine gun.

Basic Load: eaINA

Lethal Radius: m25.95

Charge Type: A-IX-2

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

Commander and Driver's Weapons System

Note: The BMP-3 is equipped with a total of two 7.62mm PKT (Kalashnikov's Machine Gun)

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Caliber: mm7.62

Cartridge: mm7.62×54

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

Fire Control

Name: 1K13-2

Computerized FCS: Yes, a new improved FCS over what the BMP-3 is equipped with. The new FCS allows the BMP-3M to extend the range of the Arkan gun-launched missiles to 5,500 m

Thermal Sight Vehicle Commander: optical sight 1PZ-10, a day/night vision device TKN-3MB

Thermal Sight Gunner: SOZh Sight System

Gunner Day Sights: SOZh Sight System

SOZh Sight System Max Range (MBT Size Vehciles): m7,000

Main Gun Stabilization: Yes, 2E52 electro-mechanical stabiliser

Stabilizer Modes: The stabiliser has three modes: automatic; semi-automatic; and guidance.

Ballistic Computer: Yes, V539 ballistic computer

Rangfinder: Laser

Infrared Searchlight: Yes, IR searchlight OU-3GA2

Cross-Wind Sensor: Yes

Minutes Of Angle (MOAs): 1.69

Battle Management System: Yes, the Automated Battlefield Management Equipment Set (ABMES)

Vesna-K System: Yes, the VESNA-K provides automatic target tracking and thermal image capable optics

Vesna-K System Maximum Range (MBT Size Vechiles): m4,500

Protection

Armor Type: welded of aluminum alloy armor

Hull Armor (Front): protection against 30 mm armor-piercing rounds.

Hull Armor (Sides and Back): protection is against 14.5 mm armor-piercing rounds.

Turret Armor: mm30-35

Applique Armor: On Turret

Explosive Reactive Armor: Available

Active Protection System: Yes, Arena active protection system

Mine Clearing: Yes, KMT-8 mine plow available

Self-Entrenching Blade: Yes

NBC Protection: Yes, Collective

Smoke Equipment: 6 × turret mounted 81 mm smoke grenade launcher

Countermeasures System: Shtora countermeasures systems

Automatic Fire Suppression System: Yes

Notes:

The BMP-3M has an upgraded new engine and turret with a new ATGM system 9K116-3 Basnya. The upgraded vehicle is called the BMP-3M and the new Bakhcha-U turret which includes a new automatic fire control system with ballistic computer, new SOZH gunner's sight with a laser rangefinder and an ATGM guidance channel, thermal imager, TKN-AI commander's vision device with laser illuminator and new ammunition loading system for ATGM. The BMP-3M is also able to fire various ammunition types, including new 100 mm laser-guided projectiles, new 100 mm HE-FRAG (high explosive fragmentation) rounds and new 30 mm APDS (armor-piercing discarding sabot) rounds. Its additional auxiliary armor shields are effective against 12.7 mm armor-piercing rounds from a range of 50 m. Explosive reactive armor is available as an option. The new uprated engine is the UTD-32, which is rated at 660 hp. There are actually several different M models, some fitted with additional armor, "Arena-E" or "Shtora-1" active protection systems, air conditioner etc. BMP-3M – KBP and Kurganmashzavod have upgraded the vehicle with a new engine and turret with a new ATGM system 9K116-3 Basnya. The upgraded vehicle is called the BMP-3M and the new Bakhcha-U turret which includes a new automatic fire control system with ballistic computer, new SOZH gunner's sight with a laser rangefinder and an ATGM guidance channel, thermal imager, TKN-AI commander's vision device with laser illuminator and new ammunition loading system for ATGM. The BMP-3M is also able to fire various ammunition types, including new 100 mm laser-guided projectiles, new 100 mm HE-FRAG (high explosive fragmentation) rounds and new 30 mm APDS (armor-piercing discarding sabot) rounds. Its additional auxiliary armor shields are effective against 12.7 mm armor-piercing rounds from a range of 50 m. Explosive reactive armor is available as an option. The new uprated engine is the UTD-32, which is rated at 660

hp. There are actually several different M models, some fitted with additional armor, "Arena-E" or "Shtora-1" active protection systems, air conditioner etc.

ZBD-04A (Type 4) Chinese Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Parent:

ZBD-04 (Type 4) Chinese Infantry Fighting Vehicle (IFV)

Variants:

- **ZBD-97:** Designation for ZBD-04 prototype.
- **ZBD-04:** Standard variant.
- **ZBD-04 HJ-8:** Based on original ZBD-04 with four additional HJ-8 anti-tank missile mounted on the turret.
- **ZBD-04A:** The ZBD-04A (industrial designation WZ502G, sometimes referred to as ZBD-08) is an improved variant that sacrifices amphibious performance for better armor protection; add-on armor can be fitted, and the frontal arc can withstand 30 mm rounds along with side skirts added. Although the vehicle is still amphibious, able to propel itself by its tracks to ford lakes and rivers, it lacks waterjets and can no longer operate in open sea.
- **ZBD-04A AT (AFT-10 Anti-Tank Missile Carrier):** ZBD-04A's chassis works as the mobile launching platform for AFT-10 (HJ-10) anti-tank missile. Noted the AFT-10 is a specific version of HJ-10 missile that designed for firing from vehicle launching platform such as ZBD-04A.
- **ZBD-04A Command Vehicle:** Modified from original ZBD-04A, featuring a crew cabin with higher ceiling.
- **ZBD-04A Combat Reconnaissance Vehicle:** Equipped with radars and electric-optic sights for battlefield surveillance, the chassis of the Combat Reconnaissance Vehicle is modified from standard ZBD-04A. The recon equipment is mounted on a retractable mast.
- **ZBD-04A Armored Recovery Vehicle:** Equipped with a crane for emergency vehicle service.
- **VN12:** Export variant based on ZBD-04A.

System

Alternative Designation: ZBD-04, Type 04, WZ502 (Industrial Designation), VN11

Type: Amphibious APC/IFV

Crew: ea3

Troop Compartment Capacity: ea7

Maximum Effective Range: km400

Amphibious: Yes

Note: It is the primary vehicle of China's mechanised infantry brigades

Dimensions

Length: m7.52

Width: m3.4

Height: m2.53

Weight,.Combat: tons24

Ground Clearance: m0.45

Max Speed: km/h70

Range (On Road): km400

Automotive

Engine Name: 404 kW (541 bhp) six-cylinder, water-cooled turbo-diesel

Engine Type: Turbo-diesel

Engine Power: hp590

Engine Location: Front Right

Cruising Range: km600

Speed, Maximum Road: km/h75

Speed, Average Cross: 50

Speed, Maximum Swim: km/h6

Gradient: %60

Side Slope: %30

Vertical Step: m0.7

Trench: m2.7

Fording Depth: m1.4

Suspension: Traditional torsion bar configuration, with each side having six dual rubber-tyred road wheels and a driver sprocket at the front, idler at the rear and track return rollers. Only the upper part of the suspension is covered.

Note: Due to increased Armor, the Maximum Swim speed of the ZBD-04A is reduced to only 6 km/h

Communications

Digital Transmission Capable: Yes

Data Bus Technology: Yes

Digital Radios: Yes, Standard

Wireless Internet Connection Capable: Yes

↳*TBR-121*

VHF Transceiver: Yes

VHF Range: km1 to 50

Proliferated: Widely

Digital Data: Yes, Full

Control: Self-Adaptive Control (Including Automatic Antenna Tuner)

Frequency Agile: Yes

Wireless Network Capabilities: Yes

Note:: Very similar in capabilities to the US SINCGARS ASIP

Main Gun

↳*System*

Name: 100 mm 2A70 rifled gun/missile launcher,

Type: rifled gun/missile launcher,

Manufacturer: KBP Instrument Design Bureau

Max Rate of Fire: rds/min8-10

Weight, Combat: kg332

Automatic Loader: Yes

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Maximum Elevation: deg+60

Minimum Elevation: deg-6

Note: The 100 mm gun is capable of firing two natures of conventional ammunition as well as a guided missile.

↳*Ammunition (Option 1)*

Name: PFHE BTE3

Type: 100mm Projectile

Maximum Effective Range: m7,000

Splinters: ea2,400

Basic Load: 41 (Inclusive of guided missiles)

↳*Ammunition (Option 2)*

Name: HE BTE1

Type: 100mm Projectile

Maximum Effective Range: m4,000

Basic Load: ea41 (Inclusive of guided missiles)

Auxiliary Weapon System

↳*System*

Name: 30 mm 2A72 (Shipunov 2A42)

Type: 30mm Auto-cannon

Alternate Designation: Shipunov 2A42

Manufacurer: Tulamashzavod

Date of Introduction: 1980

Rate of Fire (Low): rds/min200-300

Rate of Fire (High): rds/min550-800

Barrels: ea1

Feed System: Twin Feed

Action: Gas Operated

Traverse: deg360

Weight: kg115

Length, Total: m3.027

Length, Barrel: mm2,416

↳*Ammunition*

Type: Auto-cannon

Caliber: mm30x165

Muzzle Velocity: m/s960

Basic Load: rdsINA

Effective Firing Range: m2,000

Maximum Firing Range: m4,000

Armor Penetration: Yes

Coaxial Weapon System

↳*System*

Name: PK 7.62mm Machine Gun (Pulemyot Kalashnikova)

Type: 7.62mm Coaxial Machine Gun

Manufacturer: Degtyaryov plant

In Service: 1961-Present

Proliferation: +100 Million

Weight: kg9

Length, Total: mm1,203

Length, Barrel: mm605

Rate of Fire: rds/min650

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes.

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Varients: PK PKS PKT PKM PKMS

↳*Ammunition*

Type: 7.62mm Coaxial Machine Gun

Caliber: 7.62mmx54mmR

Muzzle Velocity: m/s825

Basic Load: INA

Effective Firing Range (Normal): m1,000

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Armor Penetration: Available

Fire Control

Name: A advanced FCS, Name: INA

Computerized FCS: Yes

Thermal Vehicle Commander: Yes, panoramic sight

Thermal Gunner: Yes, panoramic sight

Gunner Sight: a laser guidance system for the 100 mm laser-guided missile.

Main Gun Stabilization: Yes

Meteorological Sensor: Yes

Fire on the Move: the FCS enables the vehicle to engage stationary and moving targets under all weather conditions, even when firing on the move.

Protection

Armor Material: Welded steel and modular armour panels

Hull Armor (Front): Protection against 30mm projectiles from a distance of 1,000 meters

Hull Armor (Side): Protection against 14.5mm projectiles at a distance of 200 meters

Hull Armor (Rear and Roof): Protection from 7.62mm AP projectiles and artillery fragments

Under the Hull Armor: The ZBD-04A withstands mine blasts equivalent to 10 kg of TNT anywhere under the hull.

Applique Armor: Yes, added to the front and sides of the hull

Explosive Reactive Armor: Yes

Active Protection System: Yes, A bank of three electrically operated grenade launchers is mounted either side of the turret.

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes

Automatic Fire Suppression Systems: Yes

Battle Management System: Yes

Navigation Suite: Yes, Beidou satellite navigation system

Firing Port: The vehicle's final 'weapon system' is a firing port and viewing aid on each side toward the rear of the hull.Dismounts can also fire out of rear hatches, using the hatch covers locked vertically as shields.

Notes:

The ZBD-04A is an upgraded version of the ZBD-04. It forms the base platform for several other vehicles and carries improved armor but reduced mobility over the ZBD-04. It is the primary vehicle of China's mechanized infantry brigades, and provides sufficient firepower and protection to transport a section of fully-equipped infantry into a high-intensity battle. It is designed to operate alongside the Type 99A MBT and conduct mobile operations as part of a combined arms formation. The ZBD-04A was displayed in public for the first time during the 2015 Victory Day parade through Beijing, although development was competed the year before.

Kurganets-25 Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **Armored Recovery Vehicle:** Equipped with a crane, a winch, and armed with a 12.7mm heavy machine gun
- **Armored Ambulance:** Proposed addition to the Russian army
- **82mm Vasilek Mortar Carrier:** Proposed addition to the Russian army
- **Anti-tank Vehicle:** Proposed addition to the Russian army
- **Reconnaissance Vehicle:** Proposed addition to the Russian army
- **Command Vehicle:** Proposed addition to the Russian army
- **Armored Engineering Vehicle:** Proposed addition to the Russian army
- **Self Propelled Anti-Aircraft Gun (SPAAG):** Proposed addition to the Russian army
- **Self Propelled Gun (125mm):** Proposed addition to the Russian army

Applique Armor: Optional
Explosive Reactive Armor: Optional
Active Protection System: Yes, Drozd-2 or Afghanit or modified Shtora
Self-Entrenching Blade: Yes
NBC Protection: Yes
Smoke Equipment: INA

Notes:

The Kurganets-25 is a tracked, 25-ton modular vehicle that can be used as either an infantry fighting vehicle or an armored personnel carrier depending upon the turret that is mounted to the hull. As part of the Russian army’s efforts to modularize their combat systems, the Kurganets-25 will evolve into various models, gradually replacing BMP, BMD, MT-LB and other types of tracked Soviet armored platforms. The Kurganets-25 will have modular armor that can be upgraded for specific threats. The Kurganets-25 IFV and APC variants were first seen in public during rehearsals for the 2015 Moscow Victory Day Parade. The Kurganets-25 is designed to bring the Russian tracked troop carrier fleet up to standard with Western designs like the American M2 Bradley and British Warrior, which outclassed their Soviet Cold War BMP-series counterparts. Kurganets-25 is based on Armata Universal Combat Platform while being lighter than the T-15 Armata "heavy IFV" based on the same and similar to wheeled VPK-7829 Bumerang. The heavily armed infantry fighting vehicle carries 6-7 troops and a lightly armed APC carries 8 troops. Other variants proposed for the Kurganets include an armored ambulance, an 82 mm Vasilek mortar carrier, anti-tank vehicle, armored recovery vehicle, a reconnaissance vehicle, a command vehicle, and an armored engineering vehicle. The vehicle represents a departure from traditional Russian low profile designs, having a higher floor more suited for mounted combat rather than troop carrying, which also provides better IED and mine protection. While the T-15 is expected to be deployed with T-14 tanks in armored formations, Kurganets-25 platforms will equip mechanized units.

ZBD-05 (ZBD-2000) Chinese Amphibious Infantry Fighting Vehicle

Tiers:

1 2 3 4

System

Alternative Designation: VN-18

Manufacturer: Norinco

Family: Type 05

Crew: ea3

Capacity for Infantryment: ea10

Dimensions

Length: m9.5

Width: m3.36

Height: m3.04

Weight, Combat: tons28.5

Ground Pressure: INA

Automotive

Engine Name: INA

Engine Type: Four-stroke turbocharged water-cooled diesel

Engine Power (Land): hp500

Engine Power (Sea): hp1,577

Transmission: Machanical

Cruising Range (Land): km500

Cruising Range (Sea): INA, estimates have it going as far as 2/3 of it's land range.

Speed, Maximum Road: km/h65

Speed, Average Cross: km/h40

Speed, Maximum Swim: INA

Maximum Distance at Sea: km90

Tracks: Tracks are supported by two return rollers located between the first and last pairs of road wheels.

Suspension: Hydropneumatic

Wheels: 6, unevenly-spaced road wheels per side

Gradient: %60

Side Slope: %30

Vertical Obstacle: m0.6

Trench: m2.9

Fording Depth: Amphibious

Sea State Capable: Sea State 4

Buoyancy Reserve: Yes

Communications

↳*TBR-121*

VHF Transceiver: Yes

VHF Range: km1 to 50

Digital Data: Yes, Full

Control: Self-Adaptive Control (Including Automatic Antenna Tuner)

Frequency Agile: Yes

Wireless Network Capabilities: Yes

Note:: Very similar in capabilities to the US SINCGARS ASIP

Main Gun

↳*System*

Type: mm30

Rate of Fire: rds/min1,000

Maximum Firing Range: m5,000

Traverse Range: deg360

Maximum Elevation: deg+53

Minimum Elevation: deg0

Action: Short Recoil

↳*Ammunition*

Basic Load: 300

Penetration: INA

Caliber: 30x155mm

Muzzle Velocity: m/s780

Anti-Tank Guided Missile (ATGM)

ATGM Type: Hong Jian-73C

↳*Hong Jian-73C*

Type: Anti-Tank Missile System
Maximum Range: m5,000
Basic Load: 2; one each on either side of the turret

Coaxial Weapon System

↳*System*

Name: Type 80 Chinese Heavy Machine Gun
Manufacturer: Norinco
Type: 7.62mm Heavy Machine Gun
Length, Total: mm1,192
Length, Barrel: mm658
Diameter: INA
Action: Gas Operated
Rate of Fire: rds/min700-800
Feed System: Belts in 100/200/250 round boxes
Sights: Open sights. Optical/Night vision scope can be outfitted.

↳*Ammunition*

Type: 7.62×54mmR
Caliber: mm7.62x54
Muzzle Velocity: m/s840
Basic Load: Belts in 100/200/250 round boxes
Max Range: m100-1,500
Min Range: m100
Armor Penetration: INA

Commander's Weapon System

↳*System*

Name: QJZ-89 or Type 89
Type: 12.7mm Heavy Machine Gun
Manufacturer: NORINCO
Length, Total: mm2,119

Length, Barrel: mm1,003

Weight (Gun Only): kg17.5

Weight, (Tripod Only): kg8.5

Max Rate of Fire: rds/min600

Sustain Rate of Fire: rds/min400-600

Action: Gas/Recoil

Feed System: Belt

Sights: Iron/Optical

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: mm12.7x108

Basic Load: ea1,200

Max Effective Range: m1,600

Fire Control

Name: BMS System

Computerized FCS: Yes

Thermal Vehicle Commander: Yes

Thermal Gunner: Yes

Main Gun Stabilization: Yes

3D Map of the OE: Yes, Standard

Satellite Navigation System: BeiDou Satellite

Battle Management System: Yes

Navigation System: BeiDou satellite navigation system,

Protection

Hull Armor Type: Hull is of aluminium base armour protected by composite appliqué armour.

Hull Armor: mm30

Sides and Rear Armor: mm14.5

Turret Armor: INA

Applique Armor: Yes

Explosive Reactive Armor: INA

Active Protection System: Yes

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes, 8 Total, 4 on each side 76mm

Bow Blade: Yes

Belly Plate: Yes

Self-Sealing Fuel Tank: Yes, capable of stopping a 25 mm APFSDS round at 2,000 m.

Automatic Fire Suppression Device.: Yes

Notes:

The ZBD-05 also called VN-18 is an amphibious Infantry Fighting Vehicle (IFV) based on tracked armored using the chassis of the ZBD2000 family of tracked armored. The ZBD-05 uses the same chassis as the ZTD-05. The ZBD-05 has a crew of three, with the driver seated at front and the commander and gunner situated inside the 30mm cannon turret. The layout of the ZBD-05 or VN-18 consists of three main parts with the powerpack at the front, turret in the centre of the hull and troop's compartment at the rear. It has a crew of three including driver, commander and gunner and can accommodate up to ten fully equipped soldiers. The driver is seated on the left side at the front of the hull with the engine on its right. Commander and gunner are positioned inside in the turret. The troops can enter and leave the vehicle via a single door mounted at the rear of the hull that opens to the right. The hull and the turret of the ZTD-05 are of all-welded steel armour construction, which give protection against fire of small arms and shell splinters. The ZBD-05 or VN-18 is propelled by a strong-powered engine and can navigate at a high speed in water. The powerpack is mounted to the front of the vehicle. The vehicle can run at a maximum road speed of 65 km/h and 45km/h in the water. It has a maximum cruising range of 500 km and can negotiate a gradient of 60% and side slope of 30%. It can cross a vertical obstacle of 0.7 m and trench of 2 m. The ZTD-05 features a large flat, boat-like hull, with six double road wheels and three return rollers. The upper part of the suspension is can be protected with armor plates. The ZBD-05 or VN-18 is fully amphibious, in the water the vehicle is propelled by two large water jets mounted to the rear side of the hull. According to Chinese sources standard equipment includes satellite navigation systems, night vision, NRBC (Nuclear, Radiological, Biological and Chemical) protection system, fire control computer and laser range finder, all of these devices so that vehicles equipped with the sort of "ultra-horizon" environment daytime / night-time amphibious capability. The ZBD-2000 is a family of Chinese tracked amphibious assault vehicles. They are designed for beach assault missions and to accompany infantry as ground forces move inland. The vehicle resembles the (now cancelled) U.S. Expeditionary Fighting Vehicle (EFV).

Type 86 Chinese Amphibious Infantry Fighting Vehicle

Tiers:

Variants:

- **WZ-501:** Converted into an NBC reconnaissance vehicle with a raised troop compartment. Also converted into a battlefield surveillance vehicle.
- **YW-501:** Export variant of WZ-501.
- **NFV-1:** (N stands for NORINCO, F stands for FMC and V-1 stands for Vehicle 1) – An export variant which was the product of a co-operative project between the Chinese NORINCO and US FMC companies in the 1980s. Its goal was to fit a FMC large vertical slab-sided turret with a chamfered front called "Sharpshooter", onto a modified Type 86 hull. It was to be armed with a 25 mm M242 Bushmaster autocannon with a two plane stabilization system and a 7.62 mm M240 coaxial machine gun (on the left hand side of the main gun). The vehicle carries 344 rounds for the main gun, 200 rounds are for 'ready use' while 144 are kept in storage. 2,300 rounds are carried for the machine gun. The gun is moved in the horizontal and vertical planes by an electromechanical system, it can also be moved manually. The gun can be depressed or elevated between −7° and +44°. The gunner has the M36E3 dual mode day/night sight and 4 periscope vision blocks which are located in the front and on the sides of the turret. Also an additional periscope vision block can be fitted to the back of the turret. The tracks have been slightly modified. As the result of all these changes the weight of the vehicle increased to 13.6 tonnes and the maximum range was reduced to 460 km. The vehicle is also wider (2.97 m) and higher (2,248 m). The prototype was shown to the public for the first time in November 1986. It never left the prototype stage because the US government prohibited any further collaboration with China.
- **Type 86-I:** Improved variant of the Type 86 designed by the Chinese together with the US FMC company at the end of the 1980s. It is fitted with a one-man overhead mount turret armed with a licensed copy of the 25 mm M242 Bushmaster autocannon and a coaxial 7.62 mm Type 59 machine gun. The overhead mount turret is the same as the one on the ZSL92 wheeled IFV. The vehicle carries 400 rounds for the main gun and 2000 rounds for the machine gun. It is powered by a new 6V150F 29.41-litre diesel engine which is a powered-up version of the 6V150. It develops 400 hp (298 kW). Maximum road speed has increased to 70 km/h. The tracks have been slightly modified. The weight of the vehicle has increased to 13.6 tonnes. 350 were produced. Its industrial designation is WZ-501A. It is also called Type 86-1.
- **Type 86A:** Modernization fitted with a new turret armed with a 30 mm autocanon although the ATGM launcher for the HJ-73 ATGMs was retained and is positioned on the right hand side of the roof of the turret. The turret was equipped with two clusters of three smoke grenade launchers (one on each side of the turret). It is sometimes called the Type 86Gai, G stands for Gai – improved.
- **Type 86B:** Variant developed by NORINCO for Chinese naval infantry. It features a slightly higher hull, an amphibious kit, an exhaust extension, a bow extension, a larger trim vane, a mount for an outboard motor on the rear of the hull to improve its swimming performance, a raised engine air intake on the right hand side of the front of the hull, detachable pontoons in the front and rear of the hull, a high snorkel and large side screens for better streamlining. Also the turret was improved by adding two clusters of three smoke grenade launchers (one on each side of the turret). Its industrial

designation is WZ-501C.

- **WZ-502:** WZ-501 equipped with a mortar.
- **WZ-503:** WZ-501 converted into an APC. It lacks the turret and has a taller troop compartment. The number of passengers was increased from 8 to 13. The vehicle's armament consists of one centrally mounted 12.7 mm heavy machine gun operated by the commander/gunner. It did not leave the prototype stage.[3][23][29] WZ-506 – WZ-503 converted into an armored command post for the divisional or regimental commanders of armored formations. The personnel compartment can accommodate six staff members, four radios and an auxiliary electricity generator. It can be recognized by its four whip antennas.
- **WZ-504 (Type 504):** The troop compartment was replaced by a weapons compartment which incorporates an elevatable weapon station armed with four HJ-73 "Red Arrow 73" cable-guided ATGM rail launchers mounted under the roof of the weapons station and equipped with optical sights. The launcher can be retracted into the compartment when not in use. The vehicle carries 16 ATGMs. It never left the prototype stage.
- **WZ-505:** WZ-501 converted into an armored ambulance with raised troop compartment and armed with one machine gun.
- **Type 86G:** This variant is equipped with a 30-mm cannon turret and a HJ-73 ATGM launcher.
- **The Boragh:** In service with Iran

A Chinese copy of the BMP-1 (Ob'yekt 765Sp3). It is armed with an ATGM launcher for the HJ-73 "Red Arrow 73" ATGM which is a copy of the Soviet 9M14 "Malyutka". It is powered by the Type 6V150 diesel engine which is a copy of the Soviet UTD-20. Equipment includes the A-220A radio (a copy of the Soviet R-123M), A-221A intercom (a copy of the Soviet R-124), two 7.62 mm machine guns, a 40 mm rocket propelled grenade (RPG) launcher and a HN-5 or QW-1 MANPADS. Its industrial designation is WZ-501

BMP-1 Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **BMP-1P:** The BMP-1P is an upgraded variant of the BMP-1 and weighed 13.4 tonnes. Protection capabilities in the BMP-1P and its sub variant BMP-1PG ('Granatomyot' - grenade launcher) were improved by fitting them with the 81 mm 902V "Tucha" smoke grenade launcher and an AGS-17 "Plamya" AGL respectively.
- **BMP-1 Ambulance (Iraq):** Evacuate wounded
- **BMP-1M:** Kliver turret & drop down gate
- **Type 86/WZ-501 (China):** Chinese BMP-1 IFV
- **BMP-1G ICV:** AT-4/AT-5 ATGM & 30-mm AGS-17 AGL
- **BMP-1 with Soviet modifications in Afghanistan:** Applique armor, AT-4 ATGM mount; some with AGS-17 30-mm AGL
- **BMP-IRM ("Zhuk"-Beetle):** Engineer recon vehicle with front mine claws; 1 MG only
- **BMP-1 with mine plow:** KMT-8 or KMT-10 mine-clearing plows attached
- **MP-31:** Modernized command vehicle
- **BMP-R (BMP M1976):** Recon vehicle with larger rear hatches & 2-man turret
- **BRM-1/BRM-1K Reconnaissance:** BMP-R with a GS-12 Tall Mike radar ILO AT-3 Sagger (see Chapter 1)
- **BREM-2:** Light recovery vehicle w/crane
- **BMP-40:** Larger turret; carries 6 soldiers, prototype model only
- **PRP-3/PRP-4 (Radar):** Artillery recon vehicle with 7.62 MG ILO 73-mm cannon
- **VP-90 (Czech Republic):** Recon with OT-64 turret; 14.5-mm & 7.62-mm MGs
- **SVO Mineclearer (Czech Republic):** Turretless BMP-1 with 24 245-mm explosive rockets
- **BMP-PP0:** Training variant w/o turret
- **Snezka (Czech Republic):** Battlefield surveillance vehicle
- **PRAM-S (Czech Republic):** SP 120-mm mortar carrier
- **BMP-1 Finnish variant:** East German vehicles with autoloaders removed
- **BMP-1 with Poyaud engine (Egypt):** 150 with replaced 10.47-liter Poyaud 6-cylinder engine
- **BMP-1 with applique armor (Iraq):** Armor added to resist 12.7-mm & 14.5-mm armor-piercing shells at 200 m
- **BMP-1A1 Ost:** In 1990, Germany created more space (6 passengers) & removed the automatic loader
- **BMP-1 with CERAWA armor (Poland):** CERAWA ERA on the glacis, hull, & turret front
- **OT-90 (Czech Republic):** OT-64 1-man turret with 14.5-mm & 7.62-mm machine guns
- **BPzV (Czech Republic):** Recon with Tall Mike radar
- **DP-90 (Czech Republic):** Recon with Tall Mike ra0T-90 maintenance variant adar
- **MU-90 (Czech Republic):** Turretless mine-laying OT-90
- **MLI-84 (Romania):** Larger & heavier w/ 12.7-mm machine gun
- **Pansarbandvgn 501 (Pbv 501 (Sweden):** East German vehicles to mechanized Swedish infantry

- **BREM-4 recovery vehicle:** No turret & crane (Czech version is the VPV)
- **BRM-23 (Bulgaria):** Recon with 23-mm cannon
- **82-mm SP Automatic mortar (Hungary):** Vasilyek mortar ILO troop compartment
- **BMP-1K / BMP-1KSh / BMP M1974 Command Vehicle:** This is the company command version of the BMP-1. It has additional communications equipment, an additional radio aerial on the right rear of the hull, a redesigned troop compartment to incorporate tables and a map board. The firing ports were eliminated. The BMP-1K has two roof hatches, each equipped with a roof-mounted TNPO-170A aiming device. The 73-mm gun is provided with 20 rounds of ready use ammunition, which is loaded manually. Two man-portable surface-to-air missiles are carried. The BMP-1K1 and K2 are equipped with two R-123M radios and a semi-telescopic antenna. The K3 features an R123M radio, R130M and a 33-ft (10-m) telescopic antenna. Another variant, the BMP-1KSh (not to be confused with the KShM) was a regimental and divisional command post vehicle. It was similar to the BMP-1K, except that it was unarmed, has a larger Hawk Eye radio antenna and carries more radio equipment (R-137, R-140M or R-145BM, each with four or five radios). A TNA-3 navigation system is fitted. The crew is provided with a portable 7.62-mm PK machine gun for self-defense. Ref: Military Periscope, April 2016

System

Alternative Designations: BMP Model 1970, Korshun

Manufacturer: Kurganmashzavod (Soviet Union)[

Description: IFV with exit doors in the rear with space for 8 soldiers; 4 firing ports on each side; 1 firing port in left rear door

Crew: ea3

Passengers: ea8

Driver's Station: The driver sits in the front on the left side of the hull. He has three TNPO-170 periscope vision-blocks to provide vision when his hatch is closed. The driver's center vision block can be replaced with a TVNO-2 active night binocular vision device for use in night and poor visibility conditions or with a TNPO-350B extended periscope when swimming with the trim vane erected. The BMP was the first Soviet armored vehicle to use a simple yoke steering system.

Commander's Station: The commander's station is located behind the driver's station and is provided with a removable OU-3GA2 or OU-3GK infrared searchlight with an effective range of about 400 metres (440 yd). A dual mode (day/night) TKN-3B 5x/4.2x magnification binocular vision device is coupled to the infrared searchlight. Two periscope vision blocks are also fitted with a heating and cleaning system. The commander's station is equipped with an R-123M radio set.

Turret: The BMP-1 has a conical turret equipped with a fume extraction system and an electric traverse drive with a manual backup system.[14] The main gun has a dead-zone over the commander's hatch (between the 10:00 and 11:00 o'clock positions), where the gun must be elevated over the infra-red searchlight to avoid crushing it. When the gun is facing backwards, it prevents hatches on top of the troop compartment from opening. The low profile of the turret makes it a difficult target. The same turret is used in the BMD-1.

Gunner's Station: The gunner's station is located to the left of the main gun. The gunner has a dual mode (day/night) 1PN22M1 6x/6.7x magnification image intensifying monocular periscope sight, four day-use periscope vision blocks, and an OU-3GK removable infrared or white-light searchlight. The 1PN22M1 sight has a maximum range of 400 metres (440 yd) at night, 900 metres (980 yd) with the use of the infra-red searchlight. The sight is marked stadiametric with the apparent size of a 2.7 metres (8.9 ft) tall tank at various ranges. The original sight was replaced with the 1PN22M2, which has an additional scale for the OG-15V HE-Frag rounds used by the Ob'yekt 765Sp3, produced from July 1974. The new sight has two day scales for the two projectiles – one from 200 to 1,600 metres (220 to 1,750 yd) and the other from 400 to 1,300 metres (440 to 1,420 yd).

Notes:

The BMP-1 is a Soviet amphibious tracked infantry fighting vehicle. BMP stands for Boyevaya Mashina Pekhoty 1 (Russian: Боевая Машина Пехоты 1; БМП-1), meaning "infantry fighting vehicle". The BMP-1 was the first mass-produced infantry fighting vehicle (IFV) of the Soviet Union. It was called the M-1967, BMP and BMP-76PB by NATO before its correct designation was known. The Soviet military leadership saw any future wars as being conducted with nuclear, chemical and biological weapons and a new design, like the BMP, combining the properties of an armored personnel carrier (APC) and a light tank would allow infantry to operate from the relative safety of its armored, radiation-shielded interior in contaminated areas and to fight alongside it in uncontaminated areas. It would increase infantry squad mobility, provide fire support to them, and also be able to fight alongside main battle tanks. The BMP-1 was first tested in combat in the 1973 Yom Kippur War, where it was used by Egyptian and Syrian forces. Based on lessons learned from this conflict, and early experiences in the Soviet–Afghan War, a version with improved fighting qualities was developed, called the BMP-2. It was accepted into service in August 1980. In 1987, the BMP-3, a radically redesigned vehicle with a completely new weapon system, entered service in limited numbers with the Soviet Army. The BMP-1 is a fully amphibious tracked vehicle, with a front-engined chassis developed especially for it, a welded steel hull with a sharp, sloping front with a conspicuously ridged surface, a centrally located, flat, truncated cone turret and a troop compartment at the rear. The driver sits in the front on the left side of the hull. He has three TNPO-170 periscope vision-blocks to provide vision when his hatch is closed. The driver's center vision block can be replaced with a TVNO-2 active night binocular vision device for use in night and poor visibility conditions or with a TNPO-350B extended periscope when swimming with the trim vane erected. The BMP was the first Soviet armored vehicle to use a simple yoke steering system. The commander's station is located behind the driver's station and is provided with a removable OU-3GA2 or OU-3GK infrared searchlight with an effective range of about 400 metres (440 yd). A dual mode (day/night) TKN-3B 5x/4.2x magnification binocular vision device is coupled to the infrared searchlight. Two periscope vision blocks are also fitted with a heating and cleaning system. The commander's station is equipped with an R-123M radio set. The BMP-1 has a conical turret equipped with a fume extraction system and an electric traverse drive with a manual backup system. The main gun has a dead-zone over the commander's hatch (between the 10:00 and 11:00 o'clock positions), where the gun must be elevated over the infra-red

searchlight to avoid crushing it. When the gun is facing backwards, it prevents hatches on top of the troop compartment from opening. The low profile of the turret makes it a difficult target. The same turret is used in the BMD-1. The gunner's station is located to the left of the main gun. The gunner has a dual mode (day/night) 1PN22M1 6x/6.7x magnification image intensifying monocular periscope sight, four day-use periscope vision blocks, and an OU-3GK removable infrared or white-light searchlight. The 1PN22M1 sight has a maximum range of 400 metres (440 yd) at night, 900 metres (980 yd) with the use of the infra-red searchlight. The sight is marked stadiametric with the apparent size of a 2.7 metres (8.9 ft) tall tank at various ranges. The original sight was replaced with the 1PN22M2, which has an additional scale for the OG-15V HE-Frag rounds used by the Ob'yekt 765Sp3, produced from July 1974. The new sight has two day scales for the two projectiles – one from 200 to 1,600 metres (220 to 1,750 yd) and the other from 400 to 1,300 metres (440 to 1,420 yd).

ZBD-08 (WZ502G) Chinese Infantry Fighting Vehicle (IFV)

Tiers:

1 **2** 3 4

Variants:

- **Note:** There are several variants. One is fitted with a similar turret to the ZBD-04 with a new external design. An armored personnel carrier fitted with a cupola-mounted 12.7-mm machine gun has also been identified. Another variant features a turret-mounted 120-mm mortar with direct- and indirect-fire modes. That turret appears to be the same as that fitted to the PLL-05 6 x 6 self-propelled mortar already in Chinese service. There are said to be command, missile carrier, short-range air defense, artillery radar carrier and cargo vehicle variants. A shortened version with five road wheels has also been reported.

Types of Ammunition: HEI, AP, TP, Chaff dispensers

Basic Load: 500

Anti-Tank Guided Missile (ATGM)

Note: This gun can fire both ordinary projectiles and anti-tank guided missiles. It is compatible with Chinese indigenously designed ATGMs, derived from the Soviet AT-10 Stabber, are capable of penetrating up to 600 mm of armor behind ERA blocks and pose serious threat to main battle tanks. It is claimed that hit probability of the missile is at least 80%.

Basic Load: 8

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Yes

Thermal Sight Gunner: Yes

Main Gun Stabilization: Yes

Protection

Hull Armor: Welded steel armor hull. It is claimed that front arc withstands 30 mm armor-piercing rounds. Sides withstand 14.5 mm rounds.

Turret Armor: Welded steel armor hull. Turret roof and rear end provide protection from 7.62 mm armor-piercing rounds.

Applique Armor: Yes, Add-on modular armor can be fitted for a higher level of protection.

Explosive Reactive Armor: INA

Active Protection System: Yes

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: 6 x Smoke Grenades

Notes:

The ZBD-08 is a new Chinese infantry fighting vehicle. Its industrial designation is the WZ502G. It is a revised and improved version of the previous ZBD-04, which is already in service with the PLA. The new improved vehicle appeared in 2007. It seems that the ZBD-08 IFV, together with its numerous variants, is being produced in large numbers for the Chinese army. It is replaces the Type 86 IFV, which is a copy of the Soviet BMP-1. The new ZBD-08 has a number of improvements. Its hull was

slightly redesigned in order to improve armor protection at a cost of reduced amphibious capabilities. The previous ZBD-04 IFV has great amphibious capability and can operate at Sea State 2-3. However this feature is not required by typical army units. Overall height of the vehicle was reduced. Also the new vehicle is heavier due to increased armor. The ZBD-08 infantry fighting vehicle has a welded steel armor hull. Baseline armor is thicker and presumably offers better protection. Add-on modular armor can be fitted for a higher level of protection. It is claimed that front arc withstands 30 mm armor-piercing rounds. Sides withstand 14.5 mm rounds. Turret roof and rear end provide protection from 7.62 mm armor-piercing rounds. Side skirts were added for improved protection. Also it may be fitted with indigenous active laser protection system.

BMP-2 Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

1 2 **3** 4

Variants:

- **BMP-2 obr.:** Improved version with "kovriki" armour on turret front
- **BMP-2 obr. 1986:** Late-production model with new BPK-2-42 sight instead of the BPK-1-42.
- **BMP-2D:** Fitted with additional spaced type steel appliqué armour on the hull sides, under the driver's and commander's stations, and 6 mm thick appliqué armour on the turret.
- **BMP-2K:** Command variant fitted with two whip antennas mounted on the rear of the hull, one behind the turret and one on the right-hand side of the rear of the vehicle, one IFF antenna (pin stick) on the left-hand side of the rear of the vehicle and a support for a telescopic mast in the front of the IFF antenna
- **BMP-2M:** This is the general designator for upgraded (modernizirovannyj) versions
- **BMP-2M "Berezhok":** Modernized version from KBP. This version has B05Ya01 Berezhok turret equipped with 2A42 30mm autocannon, PKMT 7.62mm coaxial machine gun, AGS-30 grenade launcher, 2+2 launchers for ATGM 9M133M "Kornet-M" and new day/night sights as found on the BMD-4.
- **BMO-1:** Transport vehicle for a flamethrower squad armed with 30 RPO-A "Shmel" 93 mm napalm rocket launchers.
- **BVP-2V or VR 1p:** Former Czechoslovakia version
- **VPV:** equipped with a powered crane with 5 tonnes capacity, heavy winch, wider troop compartment etc. Hatches on top of the turret and the troop compartment were removed.
- **BMP-2 "Sarath":** also known as BMP-II – Indian licence-produced variant of the BMP-2,built by Ordnance Factory Medak. The first vehicle, assembled from components supplied by KBP, was ready in 1987.
- **BMP-2 Light Tank:** India Version, DRDO developed light tank on BMP-2 Chassis DRDO light tank.
- **BMP-2 UGV "Muntra" – unmanned reconnaissance vehicle, "S" version is fitted with equipment used to detect nuclear, biological and:** India Version. unmanned reconnaissance vehicle, "S" version is fitted with equipment used to detect nuclear, biological and chemical contamination while the "M" version is designed to detect mines.
- **BMP-2MD:** Finnish modernisation of the BMP-2, which includes thermal camouflage, thermal sights, anti-aircraft sight and new day/night optics for the gunner and commander, heated cabin and seats, new external storage boxes functioning also as spaced armour and new radio and communications systems

System

Alternative Designation: BMP-2
Type: Amphibious Infantry Fighting Vehicle (IFV)
Family: BMP-2

Manufacturer: mKurganmashzavod

Crew: ea3

Passenger Capacity: ea7

Dimensions

Length: m6.72

Width: m3.15

Height: m2.45

Weight, Combat: tons14.3

Ground Pressure: kg/m0.63

Automotive

Engine Name: UTD-20S1

Engine Type: Diesel

Engine Power: hp300

Cruising Range: km600

Speed, Maximum Road: km/h65

Speed, Off Road: km/h45

Speed, Average Cross: 35

Speed Maximum Swim: km/h7

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.7

Trench: m2.5

Fording Depth: mAmphibious

Note: initial production BMP-2 is partially amphibious, and propelled in water by its tracks

Communications

Primary: R-123M transceiver

Secondary: R-173

Main Gun

↳*System*

Name: Shipunov 2A42, 30mm Autocannon

Type: mm30

Max Rate of Fire (Low): rds/min200-300

Max Rate of Fire (High): rds/min550-800

Weight: kg115

Length (Total): m3.027

Barrel Length: mm2,416

Barrels: ea1

Action: Gas-operated

Effective Firing Range: m2,000

Maximum Firing Range: m4,000

Feed System: Twin Feed

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Maximum Elevation: deg+75

Minumum Elevation: deg-5

Firing Modes: automatic and semi-automatic

↳*Ammunition (Option 1)*

Name: 3UOF8

Type: HEI

Caliber: mm30

Cartidge: mm30 × 165

Muzzle Velocity: m/s960

Basic Load: ea500 total of any combination 30mm projectile

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

↳*Ammunition (Option 2)*

Name: M929

Type: APFSDS-T

Caliber: mm30

Cartridge: mm30 × 165

Muzzle Velocity: m/s1,260

Basic Load: 500 total of any combination 30mm projectile

Note: A sub-caliber fin-stabilized discarding sabot round with tracer from Belgian Mecar, with tungsten alloy penetrator. Penetration: 50 mm RHA steel at 60 degree impact at 1,000 m range

↳*Ammunition (Option 3)*

Name: 3UBR8

Type: APDS

Caliber: mm30

Cartridge: mm30 × 165

Muzzle Velocity: m/s1,120

Basic Load: 500 total of any combination 30mm projectile

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

Note: The 7.62 PKT can be controlled remotely and is slaved to the main gun,

↳*Ammunition*

Name: 57-N-323S

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,000

Accuracy of fire at 300 m: mm90

Anti-Tank Guided Missile (ATGM)

↳*System*

Name: 9M113 Konkurs (AT-5 Spandrel)
Type: Soviet SACLOS wire-guided anti-tank missile.
Manufacturer: Tula Machinery Design Bureau (Tula KBP) – Tulsky Oruzheiny Zavod
In Service: 1974-Present
Proliferation: Algeria– used by mechanized infantry units Armenia Azerbaijan Egypt – mounted on Fahd armoured personnel carriers purchased in 1990s Belarus The launcher is been locally produced and upgraded. Bulgaria Croatia Cuba – not confirmed Czech Republic Eritrea[Finland – known as PstOhj 82M, fired from 9P135M-1 launchers (withdrawn from service) Georgia Guinea Hungary Indonesia – mounted on BVP-2 infantry fighting vehicles operated by the marine corps India – 15,000 Konkurs-M, ordered in 2008 for Rs 1,380-crore. Another 10,000 Konkurs-M ordered for US$250 million in 2012. A new contract was signed in 2019 for USD 110 mln. Iran– produced domestically as Tosan-1 Iraq Ivory Coast (reported) Kazakhstan Kyrgyzstan Morocco[Mongolia Moldova– used on BRDM-2 North Korea – produced domestically Pakistan – Used on Viper infantry fighting vehicle Peru Romania Russia – about 300 Konkurs-M complexes delivered annually in the last years (2014) Slovakia Turkmenistan Turkey Syria Ukraine Houthis – Tosan version
Variants: 9M113M,Towsan-1, Tosan, Towsan, or M113, 9N131M1, 9N131M2-1
Basic Load: ea4
Weight (Missile): kg14.6
Weight (9P135 Launching Post): kg22.5
Length: mm1,150
Diameter: mm135
Warhead Weight: kg2.7
Detonation Mechanism: Contact
Engine: Solid-fuel rocket
Wingspan: mm468
Maximum Operational Range: km4
Minimum Operational Range: m70
Speed: m/s208
Guidance System: Wire-guided SACLOS
Steering system: Two control surfaces
Launch platform: Individual, vehicle
Penetration: 600mm of RHA

Fire Control

Name: INA
Computerized FCS: Yes
Commander Periscopes: two TNPO-170A periscopes, plus a single TKN-3B binocular rear-view prism. Additionally, the Commander has a 1PZ-3 day monocular sight
Thermal Sight Gunner: BPK-1-42 Sight

Driver's Central Day Periscope: TNP-350B

Main Gun Stabilization: Yes, two-plane stabilisation system designated as 2E36-1

Searchlight: OU-3GA2 searchlight and the FG-126 searchlight

Protection

Hull Armor: All-welded steel that is believed to be between 5 and 19 mm thick

Turret Armor: mm23-33

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: KMT-8 mine plow available

Self-Entrenching Blade: INA

NBC Protection: Collective, GO-27 Radioactive and chemical agent detector

Smoke Equipment: 6 smoke grenade launchers, VEESS

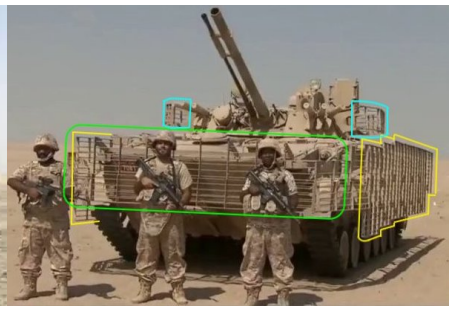
Smoke Screen: TDA System using engine

Notes:

The BMP-2 [BMP = Boyevaya Mashina Pyekhota - Infantry Fighting Vehicle] infantry combat vehicle, fielded in the early 1980's [initially designated BMP 1981], is an improved version of the BMP-1 incorporating major armament changes. The new two-man turret mounts a 30-mm automatic gun with a long thin tube and double-baffle muzzle brake that can be used against aircraft and helicopters. The ATGM launcher on top of the turret can employ either AT-4 SPIGOT or AT-5 SPANDREL missiles, though the AT-5 Spandrel canister is normally mounted. Given the enlarged turret, there are two roof hatches in the rear fighting compartment, rather than the four of the BMP-1, and the the BMP-2 accommodates one less passenger. Each side of the troop compartment has three firing ports with associated roof-mounted periscopes.The BMP-2 is the base IFV of the family, it is designed to support MBTs during an assault and is expected to engage vehicles that are in a similar category to itself. In the centre of the vehicle is the welded steel turret, which seats the commander and gunner, both of whom have hatches. The commander sits to the right and has three day-vision periscopes, a 1PZ-3 day-sight designed for anti-aircraft use with 1×, 2× and 4× magnification, an OU-3GA2 infra-red searchlight, a TNP-165A designator and a TKN-3B binocular sight with 4.75× day magnification and 4× night-sight magnification. The gunner sits to the commander's left and has a smaller rectangular hatch with a rearward-facing day periscope, additionally, there are three other day periscopes facing forward and left. The gunner has a BPK-1-42 binocular sight with a moon/starlight vision range of 650 metres, or 350 metres using the infra-red searchlight, and a TNPT-1 designator. An FG-126 infra-red searchlight is mounted coaxially to the 30 mm cannon. The driver sits in the front left of the vehicle, with the engine in a separate compartment to his right. The driver has his own entry hatch above him, with three day-periscopes. The centre TNPO-170A periscope can be replaced with either a TNPO-350B extended periscope for amphibious operation or a TVNE-1PA night vision scope. An infantryman sits immediately behind the driver, and has a firing port and vision block. TNPO-170A periscopes are used throughout the vehicle and are electrically heated. In the BMP-1 and BMP-2 ammunition is stored near or even inside the compartment, which can lead to a catastrophic failure in case of a hull breach. The BMP-1 and BMP-2 share the same chassis and have almost identical road performance. The BMP-2 is heavier, but also has a more powerful engine to compensate. The BMP-2 is amphibious with little preparation, using hydrodynamic fairings to convert track momentum into water jets. Peacetime regulations require that any BMPs entering water must have a working radio set, since its bearings are not airtight and it can be carried away by currents in case of loss of engine power (the vehicle lacks an anchor). The main armament is a turret with a stabilized 30 mm 2A42 autocannon with dual ammunition feeds, which provide a choice of 3UBR6 AP-T and 3UOR6 HE-T / 3UOF8 HE-I ammunition and 9M113 Konkurs ATGM. The gun has a selectable rate of fire, either slow at 200 to 300 rounds per minute or fast at 550 rounds per minute. The original stabilization provides reasonable accuracy up to a speed of about 35 kilometres per hour. The AP-T ammunition can penetrate 15 millimetres of armour at sixty degrees at 1,500 metres, while a new APDS-T tungsten round can penetrate 25 millimetres at the same distance. A typical ammunition load is 160 rounds of AP ammunition and 340 rounds of HE ammunition. The ammunition sits in two trays located on the turret floor rear. The gun can be fired from either the commander's or the gunner's station. The commander's 1PZ-3 sight is specifically designed for anti-aircraft operation and combined with the high maximum elevation of 74 degrees, it allows the 30 mm cannon to be used effectively against helicopters and slow flying aircraft. The turret traverse and elevation are powered and it can traverse 360 degrees in 10.28 seconds and elevate through 74 degrees in 12.33 seconds. Reloading the BMP-2's 30 mm cannon can be somewhat problematic and can take up to two hours, even if the ammunition is prepared.

Additionally, the cannon is normally only used on the slow rate of fire, otherwise, fumes from the weapon would build up in the turret faster than the extractor fan can remove them. The effective range of the 30 mm cannon is up to 1,500 metres against armour, 4,000 metres against ground targets, and 2,500 metres against air targets. A coaxial 7.62 mm PKT machine gun is mounted to the left of the 30 mm cannon, and 2,000 rounds of ammunition are carried for it. On the roof of the turret is an ATGM launcher, on Russian vehicles this fires AT-5 Spandrel missiles, but on export models, it normally fires AT-4 Spigot missiles. A ground-mount for the missile is also carried, allowing it to be used away from the vehicle. The missiles are a substantial improvement on the AT-3 Sagger missiles used on the BMP-1, in both range and accuracy. Behind the turret is the troop compartment that holds six troops, the seventh sits just behind the driver. The troops sit back to back, along the centre of the vehicle. Down each side of the compartment are three firing ports with periscopes. Access to the compartment is by the two rear doors, which also hold fuel tanks, both doors have integral periscopes and the left door has a firing port. In addition to the main weapons, it can carry a man-portable surface-to-air missile launcher and two missiles, and an RPG launcher and five rounds. The vehicle is fitted with a PAZ overpressure NBC system and fire suppression system, and carries a GPK-59 gyrocompass.

BMP-3 UAE Amphibious Infantry Fighting Vehicle (IFV)



Tiers:

Variants:

- **BMP-3M:** KBP and Kurganmashzavod have upgraded the vehicle with a new engines and turret with a new ATGM system 9K116-3 Basnya. The upgraded vehicle is called the BMP-3M and the new Bakhcha-U turret which includes a new automatic fire control system with ballistic computer, new SOZH gunner's sight with laser rangefinder and an ATGM guidance channel, thermal imager, TKN-AI commander's vision device with laser illuminator and new ammunition loading system for ATGM.
- **BMP-3M Ataka:** BMP-3M version with a two men turret armed with 30 mm 2A72 autocannon, and 9M120-1 Ataka ATGM
- **BMMP:** Version for naval infantry, fitted with the turret of the BMP-2.
- **BMP-3K:** Tactical command variant, includes additional radio R-173, an intercom for seven users, an AB-R28 independent portable power unit, a navigation device TNA-4-6 and the "Ainet" air burst round detonation system. The BMP-3K lacks the bow machine guns and has its whip antennas mounted on the rear hull. Crew: 3+3
- **BMP-3F:** Armed with the standard 2K23 turret. Specially designed for operations at sea, with improved seaworthiness and buoyancy, capability to move afloat at sea state 3 and fire with the required accuracy at sea state 2. Compared to the basic model, the vehicle design features changes increasing floatability and vehicle stability: the self-entrenching equipment is omitted, a lightweight anti-surge vane and an air intake tube are introduced; the BMP-3F turret is also protected by anti-surge vanes. Water jet propellers develop a speed of 10 km/h when afloat. The BMP-3F design allows the vehicle to come ashore under rough sea conditions and to tow the same-type vehicle. A new main sight, the SOZH, which has an integrated laser range finder and an ATGM guidance channel, is installed. This version can endure continuous amphibious operation for seven hours with the running engine
- **BT-3F:** Amphibious version based on BMP-3F with the original turret replaced by a smaller remote weapon station with either 7.62, 12.7 or 14.5mm machine gun. It can accommodate a crew commander, driver, gunner, and 14 troops, and can use optional ERA armor.
- **BRM-3K "Rys" (Ob.501):** Surveillance and reconnaissance variant with 1PN71 thermal sight (3.7x/11x, 3 km range), 1PN61 active-pulse night vision device (3 km range), 1RL-133-1 ("TALL MIKE") I-band surveillance radar (3 km man, 12 km vehicle), 1V520 computer and a TNA-4-6 navigation system. The armament consists of the stabilized 30 mm autocannon 2A72 (600 rounds) and a coaxial 7.62 mm machine gun (2,000 rounds) or AU-220M Baikal remote weapon station with 57 mm BM-57 autocannon and 7.62mm PKMT machine gun.
- **BMP-3 Dragoon:** New IFV version with an unmanned turret which can be armed with a variety of combat modules, including standard BMP-3's Bakhcha-U turret with a 2A70 100 mm cannon, a 2A72 30 mm autocannon and a PKTM 7.62 mm machine gun, the AU-220M Baikal remote weapon station module with a 57 mm BM-57 gun and a module with a 125 mm 2A82-1M tank gun, the new 816 h.p.
- **BREM-L "Beglianka" (Ob.691):** Armoured recovery vehicle with five-tonne crane and 20/40 metric tonne capacity winch.
- **BMP-3 "Khrizantema-S":** Self-propelled anti-tank version with 9M123 Khrizantema (AT-15) ATGM system with radar and laser guidance. The 9P157-2 carries two 9M123 missiles on launch rails, which are extended from a stowed position; the radar is also stowed during transit. The missiles are re-loaded automatically from an internal magazine with 15 rounds (missiles are stored and transported in sealed canisters) and can also accept munitions manually loaded from outside the vehicle.
- **9P163M-1 "Kornet-T":** Anti-tank version with Kornet (AT-14) missile system. Some sources call it the 9P162. The Kornet is similar in function to the Khrizantema missile system. The 9P163M-1 carries two 9M133 missiles on launch rails, which are extended from a stowed position during transit. Missiles are re-loaded automatically by the tank destroyer from an internal magazine with 16 rounds (missiles are stored and transported in sealed canisters).
- **2S18 "Pat-S" (Ob.697):** Self-propelled version of the 152 mm howitzer 2A61 "Pat-B". This was only a prototype,

further development led to the 2S31 Vena.

- **DZM "Vostorg-2":** Combat engineer vehicle with a dozer blade and excavating bucket. Prototype.
- **UR-07:** Mine clearing system. The UR-07 might replace the UR-77 "Meteorit". It has the same chassis as the BMP-3 but a bigger steel hull with two launch ramps in the rear. The ramps are used to fire rockets towing hose-type mine-clearing line charges to clear mine fields.
- **UNSh (Ob.699):** Basic chassis for specialised variants.
- **Hermes or TKB-841:** Air-defence vehicle with high-velocity missiles and radar system. Prototype.[68] 2S31 Vena – Self-propelled mortar carrier equipped with a 120 mm mortar based on BMP-3 chassis. It entered production in 1996 and service in 2010.
- **2S38 ZAK-57 Derivatsiya-PVO:** Self-propelled air defense vehicle based on BMP-3 chassis fitted with a 57 mm autocannon and passive reconnaissance and target tracking equipment.[72] It is designed to shoot down unmanned aerial vehicles (UAVs), cruise missiles, air-to-surface missiles, aircraft, helicopters, and MLRS rockets.
- **UDAR UGV:** Unmanned ground vehicle based on the tracked chassis of the BMP-3 with the center hull raised to fit the DUBM-30 Epoch armed with 2A42 autocannon, 7.62mm PKMT machine gun, and Kornet-M ATGM.
- **Vikhr UGV:** Unmanned ground vehicle based on BMD-3 equipped with a smaller turret armed with 2A72 autocannon, 7.62mm coaxial machine gun and six anti-tank guided missiles 9M133M Kornet-M, three on each side of the turret.
- **Prokhod-1:** Unmanned mine-clearing vehicle based on the BMP-3 chassis. It is equipped with the anti-mine TMT-C trawl, and a remote weapon station turret with a 12.7mm machine gun.

System

Alternative Designation: BMP-3 UAE Version

Manufacturer: Kurganmashzavod

Type: Amphibious Infantry Fighting Vehicle (IFV)

Family: BMP-3

Crew: ea3

Passenger Capacity: ea7

Fighting Module: 2K23 Fighting Module

Note: KBM-3M2 air-conditioning system, which allows the BMP-3 UAE to operate in the desert

Dimensions

Length (Hull): m7.2

Width: m3.23

Height: m2.45

Weight, Combat: tons18.7

Ground Pressure: 0.63 kg/cm2

Automotive

Engine Name: UTD-29

Engine Type: 10 cylinder, 4 stroke, v-shaped, water colled diesel

Engine Power: hp500

Cruising Range: km600

Speed, Maximum Road: km/h70

Speed, Average Cross: 45

Speed Maximum Swim: km/h10

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.8

Trench: m2.5

Fording Depth: mAmphibious

Communications

Primary Radio: R-173

Secondary Radio: R-173P

Main Gun

Note: The complete weapon system of the BMP-3 infantry combat vehicle is known as the 2K23 and consists of the 100 mm gun 2A70 with a 30 mm 2A72 automatic cannon (see later in this section) mounted coaxially to the right and a 7.62 mm PKT coaxial machine gun.

↳*System*

Name: 2A70 (100mm) Rifle Gun

Type: mm100

Max Rate of Fire: rds/min8-10

Loader Type: Automatic loader, manual for gun and ATGMs

Maximum Elevation: deg+60

Minimum Elevation: deg-5

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Fire on the Move: Yes

Maximum Aimed Range: m5,000

Maximum Effective Range (Day): m4,000

Maximum Effective Range (Night): mINA

Tactical AA Range: m4,000

Armor Penetration: 25mm of RHA

↳*Ammunition*

Name: 9M117M1 Arkan

Type: Laser beam riding missile

Caliber: mm100

Muzzle Velocity: m/s330

Basic Load: ea40 Total Rounds of any 100mm Russian Projectile

Warhead Type: HEAT

Cartridge: 3UBK23-3 cartridge

Soft Launch: Yes

Motor Type: Rocket

Penetration: 650 mm of rolled homogenous armour (RHA) behind ERA or 750 mm of RHA without ERA and it has a maximum range of 4,000 m

Anti-Tank Guided Missile (ATGM)

↳*System*

Name: 9M117 Bastion (AT-10)

Type: Anti-Tank Guided Missile

Caliber: mm100

In Service: 1983-present

Charge Type: Reduced Explosive Charge

Muzzle Velocity: m/s400-500

Length: mm1,048

Weight: kg27

Basic Load: ea8

Rocket Motor: Ignites 1.6 seconds after firing the missile and it burns for 6 seconds

Guidance System: beam-riding laser guidance.

Steering System: laser sensor to detect the modulation of the light.

Flight Time (4,000 meters): seconds12

Self Destruct Time: seconds26-41

Telescopic Sight: 1K13 day/night telescopic sight (with integral 1K13BZ laser emitter)

Stabilising Fins: ea4

Searchlight: L4 IR searchlight

Effective Firing Range: m100-4,000

Warhead Type: HEAT

Penetration: mm650-750

Note: The 9M117 Bastion (AT-10) is prone to radio or optical jamming

Coaxial Weapon System

↳*System*

Name: 2A72 (ZPT99)

Type: 30mm Automatic Cannon

Caliber: 30mm

Proliferation: Widely Proliferated

In Service: 1980s-Present

Max Rate of Fire: rds/min330

Maximum Effective Firing Range (Air Targets): km4

Maximum Effective Firing Range (Ground Targets): km2

Maximum Effective Firing Range (Light Armor Vehicles): km1.5

Loader Type: Dual-belt feed

Maximum Elevation: deg-5

Minimum Elevation: deg+60

Fire on the Move: Yes

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

Firing Modes: single shot, 10-round burst, or automatic mode.

↳*Ammunition (Option 1)*

Name: 3UBR8

Type: 195 AP rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,120

Basic Load: INA

Penetrator Type: tungsten alloy sub-calibre penetrator

Penetration: can defeat 28 mm of RHA set at a 60° angle from a range of 1,000 m

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

↳*Ammunition (Option 2)*

Name: 3UOF8

Type: 305 HE-type rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s960

Basic Load: eaINA

Lethal Radius: m25.95

Charge Type: A-IX-2

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

Commander and Driver's Weapons System

Note: The BMP-3 is equipped with a total of two 7.62mm PKT (Kalashnikov's Machine Gun)

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Caliber: mm7.62

Cartridge: mm7.62×54

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

Fire Control

Name: 1K13-2

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Athos thermal optic Sight

Thermal Sight Gunner: Athos thermal optic Sight

Gunner Day Sights: 1K13-2, 8x ; 1P3-10 antiaircraft, 2.6x; PPD-1 stand-by

Main Gun Stabilization: Yes, 2E52 electro-mechanical stabiliser

Stabilizer Modes: The stabiliser has three modes: automatic; semi-automatic; and guidance.

Ballistic Computer: Yes, V539 ballistic computer

Rangfinder: Laser

Infrared Searchlight: Yes, IR searchlight OU-3GA2

Cross-Wind Sensor: Yes

Minutes Of Angle (MOAs): 1.69

Sighting System: Namut sighting system

CCIR TV: standard 625-line CCIR TV output

Protection

Armor Type: welded of aluminum alloy armor

Hull Armor (Front): protection against 30 mm armor-piercing rounds.

Hull Armor (Sides and Back): protection is against 14.5 mm armor-piercing rounds.

Turret Armor: mm30-35

Applique Armor: On Turret

Explosive Reactive Armor: Available

Active Protection System: Yes, Arena active protection system

Mine Clearing: Yes, KMT-8 mine plow available

Self-Entrenching Blade: Yes, a dozer blade

NBC Protection: Yes, Collective

Smoke Equipment: 6 VEESS

Countermeasures System: Shtora countermeasures systems

Automatic Fire Suppression System: Yes

Air-Conditioning System: KBM-3M2 Air-Conditioning System

Air-Conditioning System operating timeline: hours8

Air-Conditioning System Temperature Sets: maintains temperatures inside the vehicle between 25°C and 29°C.

Unditching Beam: Yes

Notes:

The BMP-3s deployed by the UAE are fitted with improved cooling systems that allow the vehicles to operate in the country's harsh climate. The standard BMP-3 is incapable of operating in any weather that is warmer than the average European heat wave (35-40°C). Despite this, the vehicle competed against the M2 Bradley and Warrior IFV during the UAE tender, and was successful nonetheless. The BMP-3 is a Soviet and Russian infantry fighting vehicle, successor to the BMP-1 and BMP-2. The abbreviation BMP stands for boevaya mashina pehoty (боевая машина пехоты, literally "infantry combat vehicle"). The BMP-3 is one of the most heavily armed infantry combat vehicles in service, original version of BMP-3 has a turret fitted with a low-velocity 2A70 100 mm rifled gun, which can fire conventional shells or 9M117 Bastion ATGMs (AT-10 Stabber). 40 100mm-rounds and 8 ATGMs are carried. A 2A72 30 mm dual feed autocannon with 500 (300 HEI and 200 APT) rounds and a rate of fire of 350 to 400 RPM, and a 7.62mm PKT machine gun with 2,000 rounds, all mounted coaxially in the turret. The main gun elevates from −5° to +60°. There are also two 7.62mm PKT bow machine guns, again with 2,000 rounds each. The BMP-3 is capable of engaging targets out to 5,000–6,000 meters with its ATGM weapon system 9K116-3 "Basnya". With conventional ammunition, such as the HE-Frag shell 3OF32, the 2A70 gun has a range of 4,000 meters. According to the manufacturer's web-site, all weapons can be fired from the halt, on the move, and afloat with the same effectiveness. The ability to hit targets

on the move with missiles was successfully demonstrated during competitive evaluations in the UAE in 1991. The turret is fitted with the 2K23 system, which consists of an autoloader with 22 rounds (the remaining 18 rounds are stored in the hull), a 1V539 ballistic computer, a cross-wind sensor, a 2E52-2 stabilising system, a 1D16-3 laser range finder, a 1K13-2 gunner's sight/guidance device, a PPB-1 gunner's sight and an OU-5-1 IR searchlight. Optional autoloader for ATGM missiles is also available. The commander has a combined optical sight 1PZ-10, a day/night vision device TKN-3MB and an IR searchlight OU-3GA2.[6] Since 2005, the BMP-3 can be fitted with a new fire control system from the "Peleng" Joint Stock Company from Belarus. This consists of a SOZH-M gunner's main sight with an integrated laser range-finder and missile-guidance channel, a Vesna-K targeting system with thermal imaging camera and automatic target tracker AST-B, an armament stabilisation system, a ballistic computer with data input sensors and a PL-1 IR laser projector.Since 2017, the BMP-3 is fitted with a new fire control system from the "Vologda Optical-Mechanical Plant" from Russia. This consists of a Sodema two-plane stabilized gunner's main sight with an integrated laser range-finder and missile-guidance channel plus a SOZH-M thermal imaging camera. Standard equipment includes five firing ports with associated vision blocks, an R-173 transceiver, an R-173P receiver, a GO-27 radiation and chemical agent detector, an FVU filtration system, an automatic fire extinguisher and six 902V "Tucha-2" 81 mm smoke grenade launchers. BMP-3M is equipped with Bakhcha-U turret, which has similar weapons to the original BMP-3 turret but with a new dual-channel FLIR gunner's sight, commander's panoramic thermal imaging device, vertical-storage conveyor, new autoloader, and a new sighting system. It also has a stronger armor on the turret, and two-axis stabilisation. The turret of the BMP-3 has been fitted to the Patria Armoured Modular Vehicle and on the Turkish-UAE RABDAN 8x8 IFV. In August 2017, a BMP-3M was presented with a new ATGM remote weapon station fitted on the standard turret carrying two 9M120 Ataka (AT-9 Spiral-2) missiles. In June 2018, the Russian Defense Ministry announced that BMP-3s would be fitted with the AU-220M combat module equipped with a 57 mm cannon. The module can carry 80 rounds and fire 80 rounds per minute including air burst, high-explosive, fragmentation, armor-piercing and guided munitions with a maximum range of 14.5 km (9.0 mi), and can even punch through side armor of main battle tanks.

BMP-3K Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Parent:

BMP-3 Russian Amphibious Infantry Fighting Vehicle (IFV)

Variants:

- **BMP-3M:** KBP and Kurganmashzavod have upgraded the vehicle with a new engines and turret with a new ATGM system 9K116-3 Basnya. The upgraded vehicle is called the BMP-3M and the new Bakhcha-U turret which includes a new automatic fire control system with ballistic computer, new SOZH gunner's sight with laser rangefinder and an ATGM guidance channel, thermal imager, TKN-AI commander's vision device with laser illuminator and new ammunition loading system for ATGM.
- **BMP-3M Ataka:** BMP-3M version with a two men turret armed with 30 mm 2A72 autocannon, and 9M120-1 Ataka ATGM
- **BMMP:** Version for naval infantry, fitted with the turret of the BMP-2.
- **BMP-3F:** Armed with the standard 2K23 turret. Specially designed for operations at sea, with improved seaworthiness and buoyancy, capability to move afloat at sea state 3 and fire with the required accuracy at sea state 2. Compared to the basic model, the vehicle design features changes increasing floatability and vehicle stability: the self-entrenching equipment is omitted, a lightweight anti-surge vane and an air intake tube are introduced; the BMP-3F turret is also protected by anti-surge vanes. Water jet propellers develop a speed of 10 km/h when afloat. The BMP-3F design allows the vehicle to come ashore under rough sea conditions and to tow the same-type vehicle. A new main sight, the SOZH, which has an integrated laser range finder and an ATGM guidance channel, is installed. This version can endure continuous amphibious operation for seven hours with the running engine
- **BT-3F:** Amphibious version based on BMP-3F with the original turret replaced by a smaller remote weapon station with either 7.62, 12.7 or 14.5mm machine gun. It can accommodate a crew commander, driver, gunner, and 14 troops, and can use optional ERA armor.
- **BRM-3K "Rys" (Ob.501):** Surveillance and reconnaissance variant with 1PN71 thermal sight (3.7x/11x, 3 km range), 1PN61 active-pulse night vision device (3 km range), 1RL-133-1 ("TALL MIKE") I-band surveillance radar (3 km man, 12 km vehicle), 1V520 computer and a TNA-4-6 navigation system. The armament consists of the stabilized 30 mm autocannon 2A72 (600 rounds) and a coaxial 7.62 mm machine gun (2,000 rounds) or AU-220M Baikal remote weapon station with 57 mm BM-57 autocannon and 7.62mm PKMT machine gun.
- **BMP-3 Dragoon:** New IFV version with an unmanned turret which can be armed with a variety of combat modules, including standard BMP-3's Bakhcha-U turret with a 2A70 100 mm cannon, a 2A72 30 mm autocannon and a PKTM 7.62 mm machine gun, the AU-220M Baikal remote weapon station module with a 57 mm BM-57 gun and a module with a 125 mm 2A82-1M tank gun, the new 816 h.p.
- **BREM-L "Beglianka" (Ob.691):** Armoured recovery vehicle with five-tonne crane and 20/40 metric tonne capacity winch.
- **BMP-3 "Khrizantema-S":** Self-propelled anti-tank version with 9M123 Khrizantema (AT-15) ATGM system with radar and laser guidance. The 9P157-2 carries two 9M123 missiles on launch rails, which are extended from a stowed position; the radar is also stowed during transit. The missiles are re-loaded automatically from an internal magazine with 15 rounds (missiles are stored and transported in sealed canisters) and can also accept munitions manually loaded from outside the vehicle.
- **9P163M-1 "Kornet-T":** Anti-tank version with Kornet (AT-14) missile system. Some sources call it the 9P162. The Kornet is similar in function to the Khrizantema missile system. The 9P163M-1 carries two 9M133 missiles on launch rails, which are extended from a stowed position during transit. Missiles are re-loaded automatically by the tank

destroyer from an internal magazine with 16 rounds (missiles are stored and transported in sealed canisters).

- **2S18 "Pat-S" (Ob.697):** Self-propelled version of the 152 mm howitzer 2A61 "Pat-B". This was only a prototype, further development led to the 2S31 Vena.
- **DZM "Vostorg-2":** Combat engineer vehicle with a dozer blade and excavating bucket. Prototype.
- **UR-07:** Mine clearing system. The UR-07 might replace the UR-77 "Meteorit". It has the same chassis as the BMP-3 but a bigger steel hull with two launch ramps in the rear. The ramps are used to fire rockets towing hose-type mine-clearing line charges to clear mine fields.
- **UNSh (Ob.699):** Basic chassis for specialised variants.
- **Hermes or TKB-841:** Air-defence vehicle with high-velocity missiles and radar system. Prototype.[68] 2S31 Vena – Self-propelled mortar carrier equipped with a 120 mm mortar based on BMP-3 chassis. It entered production in 1996 and service in 2010.
- **2S38 ZAK-57 Derivatsiya-PVO:** Self-propelled air defense vehicle based on BMP-3 chassis fitted with a 57 mm autocannon and passive reconnaissance and target tracking equipment.[72] It is designed to shoot down unmanned aerial vehicles (UAVs), cruise missiles, air-to-surface missiles, aircraft, helicopters, and MLRS rockets.
- **UDAR UGV:** Unmanned ground vehicle based on the tracked chassis of the BMP-3 with the center hull raised to fit the DUBM-30 Epoch armed with 2A42 autocannon, 7.62mm PKMT machine gun, and Kornet-M ATGM.
- **Vikhr UGV:** Unmanned ground vehicle based on BMD-3 equipped with a smaller turret armed with 2A72 autocannon, 7.62mm coaxial machine gun and six anti-tank guided missiles 9M133M Kornet-M, three on each side of the turret.
- **Prokhod-1:** Unmanned mine-clearing vehicle based on the BMP-3 chassis. It is equipped with the anti-mine TMT-C trawl, and a remote weapon station turret with a 12.7mm machine gun.

System

Alternative Designation: NA

Manufacturer: Kurganmashzavod

Type: Amphibious Infantry Fighting Vehicle (IFV)

Family: BMP-3

Crew: ea3

Passenger Capacity: ea3

Fighting Module: 2K23 Fighting Module

Navigation Unit: TNA-4-6 Navigation Unit

Dimensions

Length (Hull): m7.2

Width: m3.23

Height: m2.45

Weight, Combat: tons18.7

Ground Pressure: 0.63 kg/cm2

Automotive

Engine Name: UTD-29

Engine Type: 10 cylinder, 4 stroke, v-shaped, water colled diesel

Engine Power: hp500

Cruising Range: km600

Speed, Maximum Road: km/h70

Speed, Average Cross: 45

Speed Maximum Swim: km/h10

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.8

Trench: m2.5

Fording Depth: mAmphibious

Portable Power Unit: Yes, the AB-R28

Communications

Primary Radio: R-173

Secondary Radio: R-173P

R-173P Radio Effective Range: km20-40

Intercom: Yes

Main Gun

Note: The complete weapon system of the BMP-3 infantry combat vehicle is known as the 2K23 and consists of the 100 mm gun 2A70 with a 30 mm 2A72 automatic cannon (see later in this section) mounted coaxially to the right and a 7.62 mm PKT coaxial machine gun.

↳*System*

Name: 2A70 (100mm) Rifle Gun

Type: mm100

Max Rate of Fire: rds/min8-10

Loader Type: Automatic loader, manual for gun and ATGMs

Maximum Elevation: deg+60

Minimum Elevation: deg-5

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Fire on the Move: Yes

Maximum Aimed Range: m5,000

Maximum Effective Range (Day): m4,000

Maximum Effective Range (Night): mINA

Tactical AA Range: m4,000

Armor Penetration: 25mm of RHA

Air Burst Round Detonation System: Yes, the "AINET"Air Burst Round Detonation System

↳*Ammunition*

Name: 9M117M1 Arkan

Type: Laser beam riding missile

Caliber: mm100

Muzzle Velocity: m/s330

Basic Load: ea40 Total Rounds of any 100mm Russian Projectile

Warhead Type: HEAT

Cartridge: 3UBK23-3 cartridge

Soft Launch: Yes

Motor Type: Rocket

Penetration: 650 mm of rolled homogenous armour (RHA) behind ERA or 750 mm of RHA without ERA and it has a maximum range of 4,000 m

Anti-Tank Guided Missile (ATGM)

↳*System*

Name: 9M117 Bastion (AT-10)

Type: Anti-Tank Guided Missile

Caliber: mm100

In Service: 1983-present

Charge Type: Reduced Explosive Charge

Muzzle Velocity: m/s400-500

Length: mm1,048

Weight: kg27

Basic Load: ea3 (the BMP-3K can only carry 3 ATGM's compared to the BMP-3,which can carry 8 ATGMs due to the C2 equipment.

Rocket Motor: Ignites 1.6 seconds after firing the missile and it burns for 6 seconds

Guidance System: beam-riding laser guidance.

Steering System: laser sensor to detect the modulation of the light.

Flight Time (4,000 meters): seconds12

Self Destruct Time: seconds26-41

Telescopic Sight: 1K13 day/night telescopic sight (with integral 1K13BZ laser emitter)

Stabilising Fins: ea4

Searchlight: L4 IR searchlight

Effective Firing Range: m100-4,000

Warhead Type: HEAT

Penetration: mm650-750

Note: The 9M117 Bastion (AT-10) is prone to radio or optical jamming

Coaxial Weapon System

↳*System*

Name: 2A72, 30mm Automatic Cannon

Type: mm30

Max Rate of Fire: rds/min330

Maximum Effective Firing Range (Air Targets): km4

Maximum Effective Firing Range (Ground Targets): km2

Maximum Effective Firing Range (Light Armor Vehicles): km1.5

Loader Type: Dual-belt feed

Maximum Elevation: deg-5

Minimum Elevation: deg+60

Fire on the Move: Yes

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

Firing Modes: single shot, 10-round burst, or automatic mode.

↳*Ammunition (Option 1)*

Name: 3UBR8

Type: 195 AP rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,120

Basic Load: INA

Penetrator Type: tungsten alloy sub-calibre penetrator

Penetration: can defeat 28 mm of RHA set at a 60° angle from a range of 1,000 m

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

↳*Ammunition (Option 2)*

Name: 3UOF8

Type: 305 HE-type rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s960

Basic Load: eaINA

Lethal Radius: m25.95

Charge Type: A-IX-2

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact,

and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

Commander and Driver's Weapons System

Note: The BMP-3 is equipped with a total of two 7.62mm PKT (Kalashnikov's Machine Gun)

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Caliber: mm7.62

Cartridge: mm7.62×54

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

Fire Control

Name: 1K13-2

Computerized FCS: Yes

Thermal Sight Vehicle Commander: optical sight 1PZ-10, a day/night vision device TKN-3MB

Thermal Sight Gunner: 1K13-2 II night channel, 5.5x

Gunner Day Sights: 1K13-2, 8x ; 1P3-10 antiaircraft, 2.6x; PPD-1 stand-by

Main Gun Stabilization: Yes, 2E52 electro-mechanical stabiliser

Stabilizer Modes: The stabiliser has three modes: automatic; semi-automatic; and guidance.

Ballistic Computer: Yes, V539 ballistic computer

Rangfinder: Laser

Infrared Searchlight: Yes, IR searchlight OU-3GA2

Cross-Wind Sensor: Yes

Minutes Of Angle (MOAs): 1.69

PAB-2M Magnetic Aiming Circle: Equipped

Protection

Armor Type: welded of aluminum alloy armor

Hull Armor (Front): protection against 30 mm armor-piercing rounds.

Hull Armor (Sides and Back): protection is against 14.5 mm armor-piercing rounds.

Turret Armor: mm30-35

Applique Armor: On Turret

Explosive Reactive Armor: Available

Active Protection System: Yes, Arena active protection system

Mine Clearing: Yes, KMT-8 mine plow available

Self-Entrenching Blade: Yes

NBC Protection: Yes, Collective

Smoke Equipment: 6 VEESS

Countermeasures System: Shtora countermeasures systems

Automatic Fire Suppression System: Yes

Notes:

Command vehicle BMP-3K is a BMP-3 based one intended to control a subunit, to communicate with the major unit commander and to carry on combined tactical operations with the subunit as well. BMP-3K is equipped with navigation devices, two radio sets, receiver, intercom for seven users, portable power unit, At customer's request the BMP-3K armament system may be additionally equipped with SAT thermal imager sight. Tactical command variant, includes additional radio R-173, an intercom for seven users, an AB-R28 independent portable power unit, a navigation device TNA-4-6 and the "Ainet" air burst round detonation system. The BMP-3K lacks the bow machine guns and has its whip antennas mounted on the rear hull. Crew: 3+3

BMP-2K Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Parent:

BMP-2 Russian Amphibious Infantry Fighting Vehicle (IFV)

Variants:

- **BMP-2 obr.:** Improved version with "kovriki" armour on turret front
- **BMP-2 obr. 1986:** Late-production model with new BPK-2-42 sight instead of the BPK-1-42.
- **BMP-2D:** Fitted with additional spaced type steel appliqué armour on the hull sides, under the driver's and commander's stations, and 6 mm thick appliqué armour on the turret.
- **BMP-2K:** Command variant fitted with two whip antennas mounted on the rear of the hull, one behind the turret and one on the right-hand side of the rear of the vehicle, one IFF antenna (pin stick) on the left-hand side of the rear of the vehicle and a support for a telescopic mast in the front of the IFF antenna
- **BMP-2M:** This is the general designator for upgraded (modernizirovannyj) versions
- **BMP-2M "Berezhok":** Modernized version from KBP. This version has B05Ya01 Berezhok turret equipped with 2A42 30mm autocannon, PKMT 7.62mm coaxial machine gun, AGS-30 grenade launcher, 2+2 launchers for ATGM 9M133M "Kornet-M" and new day/night sights as found on the BMD-4.
- **BMO-1:** Transport vehicle for a flamethrower squad armed with 30 RPO-A "Shmel" 93 mm napalm rocket launchers.
- **BVP-2V or VR 1p:** Former Czechoslovakia version
- **VPV:** equipped with a powered crane with 5 tonnes capacity, heavy winch, wider troop compartment etc. Hatches on top of the turret and the troop compartment were removed.
- **BMP-2 "Sarath":** also known as BMP-II – Indian licence-produced variant of the BMP-2,built by Ordnance Factory Medak. The first vehicle, assembled from components supplied by KBP, was ready in 1987.
- **BMP-2 Light Tank:** India Version, DRDO developed light tank on BMP-2 Chassis DRDO light tank.
- **BMP-2 UGV "Muntra" – unmanned reconnaissance vehicle, "S" version is fitted with equipment used to detect nuclear, biological and:** India Version. unmanned reconnaissance vehicle, "S" version is fitted with equipment used to detect nuclear, biological and chemical contamination while the "M" version is designed to detect mines.
- **BMP-2MD:** Finnish modernisation of the BMP-2, which includes thermal camouflage, thermal sights, anti-aircraft sight and new day/night optics for the gunner and commander, heated cabin and seats, new external storage boxes functioning also as spaced armour and new radio and communications systems

System

Muzzle Velocity: m/s855

Basic Load: ea2,000

Accuracy of fire at 300 m: mm90

Anti-Tank Guided Missile (ATGM)

↳*System*

Name: 9M113 Konkurs (AT-5 Spandrel)

Type: Soviet SACLOS wire-guided anti-tank missile.

Manufacturer: Tula Machinery Design Bureau (Tula KBP) – Tulsky Oruzheiny Zavod

In Service: 1974-Present

Proliferation: Algeria– used by mechanized infantry units Armenia Azerbaijan Egypt – mounted on Fahd armoured personnel carriers purchased in 1990s Belarus The launcher is been locally produced and upgraded. Bulgaria Croatia Cuba – not confirmed Czech Republic Eritrea[Finland – known as PstOhj 82M, fired from 9P135M-1 launchers (withdrawn from service) Georgia Guinea Hungary Indonesia – mounted on BVP-2 infantry fighting vehicles operated by the marine corps India – 15,000 Konkurs-M, ordered in 2008 for Rs 1,380-crore. Another 10,000 Konkurs-M ordered for US$250 million in 2012. A new contract was signed in 2019 for USD 110 mln. Iran– produced domestically as Tosan-1 Iraq Ivory Coast (reported) Kazakhstan Kyrgyzstan Morocco[Mongolia Moldova– used on BRDM-2 North Korea – produced domestically Pakistan – Used on Viper infantry fighting vehicle Peru Romania Russia – about 300 Konkurs-M complexes delivered annually in the last years (2014) Slovakia Turkmenistan Turkey Syria Ukraine Houthis – Tosan version

Variants: 9M113M,Towsan-1, Tosan, Towsan, or M113, 9N131M1, 9N131M2-1

Basic Load: ea4

Weight (Missile): kg14.6

Weight (9P135 Launching Post): kg22.5

Length: mm1,150

Diameter: mm135

Warhead Weight: kg2.7

Detonation Mechanism: Contact

Engine: Solid-fuel rocket

Wingspan: mm468

Maximum Operational Range: km4

Minimum Operational Range: m70

Speed: m/s208

Guidance System: Wire-guided SACLOS

Steering system: Two control surfaces

Launch platform: Individual, vehicle

Penetration: 600mm of RHA

Fire Control

Name: INA
Computerized FCS: Yes
Commander Periscopes: two TNPO-170A periscopes, plus a single TKN-3B binocular rear-view prism. Additionally, the Commander has a 1PZ-3 day monocular sight
Thermal Sight Gunner: BPK-1-42 Sight
Driver's Central Day Periscope: TNP-350B
Main Gun Stabilization: Yes, two-plane stabilisation system designated as 2E36-1
Searchlight: OU-3GA2 searchlight and the FG-126 searchlight

Protection

Hull Armor: All-welded steel that is believed to be between 5 and 19 mm thick
Turret Armor: mm23-33
Applique Armor: Available
Explosive Reactive Armor: Available
Active Protection System: INA
Mine Clearing: KMT-8 mine plow available
Self-Entrenching Blade: INA
NBC Protection: Collective, GO-27 Radioactive and chemical agent detector
Smoke Equipment: 6 smoke grenade launchers, VEESS
Smoke Screen: TDA System using engine
Note: Unlike the BMP-2,which has firing ports, the BMP-2K has no firing ports and is a C2 BMP version

Notes:

BMP-2K: command variant with two antennas mounted on the rear of the hull, one behind the turret and one on the right-hand side of the rear of the vehicle, one IFF antenna on the left-hand side of the rear of the vehicle and a support for a telescopic mast in the front of the IFF antenna. The firing port equipped with the periscope was removed from either side of the vehicle.

VN-11 Chinese Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

1 2 3 4

Parent:

ZBD-04 (Type 4) Chinese Amphibious Infantry Fighting Vehicle (IFV)

Variants:

- **ZBD-97:** Designation for ZBD-04 prototype.
- **ZBD-04:** Standard variant.
- **ZBD-04 HJ-8:** Based on original ZBD-04 with four additional HJ-8 anti-tank missile mounted on the turret.
- **ZBD-04A:** The ZBD-04A (industrial designation WZ502G, sometimes referred to as ZBD-08) is an improved variant that sacrifices amphibious performance for better armor protection; add-on armor can be fitted, and the frontal arc can withstand 30 mm rounds along with side skirts added. Although the vehicle is still amphibious, able to propel itself by its tracks to ford lakes and rivers, it lacks waterjets and can no longer operate in open sea.
- **ZBD-04A AT (AFT-10 Anti-Tank Missile Carrier):** ZBD-04A's chassis works as the mobile launching platform for AFT-10 (HJ-10) anti-tank missile. Noted the AFT-10 is a specific version of HJ-10 missile that designed for firing from vehicle launching platform such as ZBD-04A.
- **ZBD-04A Command Vehicle:** Modified from original ZBD-04A, featuring a crew cabin with higher ceiling.
- **ZBD-04A Combat Reconnaissance Vehicle:** Equipped with radars and electric-optic sights for battlefield surveillance, the chassis of the Combat Reconnaissance Vehicle is modified from standard ZBD-04A. The recon equipment is mounted on a retractable mast.
- **ZBD-04A Armored Recovery Vehicle:** Equipped with a crane for emergency vehicle service.
- **VN12:** Export variant based on ZBD-04A.

System

Alternative Designation: VN-11 is the export version of the ZBD-04
Type: Amphibious APC/IFV
Crew: ea3
Troop Compartment Capacity: ea7
Maximum Effective Range: km400

Name: PK 7.62mm Machine Gun (Pulemyot Kalashnikova)

Type: 7.62mm Coaxial Machine Gun

Manufacturer: Degtyaryov plant

In Service: 1961-Present

Proliferation: +100 Million

Weight: kg9

Length, Total: mm1,203

Length, Barrel: mm605

Rate of Fire: rds/min650

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes.

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Varients: PK PKS PKT PKM PKMS

↳*Ammunition*

Type: 7.62mm Coaxial Machine Gun

Caliber: 7.62mmx54mmR

Muzzle Velocity: m/s825

Basic Load: INA

Effective Firing Range (Normal): m1,000

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Armor Penetration: Available

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Vehicle Commander: Yes

Thermal Gunner: Yes

Gunner Sight: a laser guidance system for the 100 mm laser-guided missile.

Main Gun Stabilization: Yes

Range, Day Sight: mINA

Range, Thermal Sight: mINA

Fire on the Move: the FCS enables the vehicle to engage stationary and moving targets under all weather conditions, even when firing on the move.

Protection

Hull Armor: mm90

Turret Armor: No Profile

Front Armor: the front arc provides protection from 90 mm armor-piercing projectiles.

Side Armor: Sides can withstand hits from rocket launchers, such as RPG-7, and some anti-tank guided missiles.

Under the Hull Armor: The VN11 withstands mine blasts equivalent to 10 kg of TNT anywhere under the hull.

Applique Armor: INA

Explosive Reactive Armor: Yes

Active Protection System: Yes, A bank of three electrically operated grenade launchers is mounted either side of the turret.

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes

Automatic Fire Suppression Systems: Yes

Battle Management System: Yes

Navigation Suite: Yes

Firing Port: The vehicle's final 'weapon system' is a firing port and viewing aid on each side toward the rear of the hull.Dismounts can also fire out of rear hatches, using the hatch covers locked vertically as shields.

Notes:

The VN11 is a new Chinese heavy armored personnel carrier. It was converted from obsolete Type 59 medium tank. The VN11 was first publicly revealed in 2017. This armored vehicle is mainly aimed at export customers. In concept the VN11 is similar to Ukrainian BMP-55 heavy APC. During conversion the Type 59 medium tank was refurbished and its powerpack and running gear were upgraded. Tank's turret was removed and replaced with a superstructure in order to create a troop compartment. Additional armor was fitted for a higher level of protection. China and numerous other countries operate or keep in storage thousands of out-dated Chinese Type 59 or similar Soviet T-55 tanks that offer little value on modern battlefield. These old tanks are vulnerable to most modern anti-tank weapons. Instead these surplus tanks could be converted to VN11 troop carriers in order to extend their operational lives. On the other hand Israel is so far the only country to use heavy APCs, converted from similar medium tanks. Other similar vehicles, such as Russian BTR-T, Ukrainian BMP-55, or Indian Tarmour, never reached production. Only Israeli Achzarit was produced in quantity. The VN11 offers much better protection for the crew and troops than most modern armored personnel carriers and infantry fighting vehicles. Front mounted engine provides additional protection. The main role of the VN11 is to carry troops on the battlefield under enemy fire. Sometimes these machines are referred as battlefield taxi. The VN11 is invulnerable to heavy machine gun fire. It seems that the front arc provides protection from 90 mm armor-piercing projectiles. Sides can withstand hits from rocket launchers, such as RPG-7, and some anti-tank guided missiles. The VN11 withstands mine blasts equivalent to 10 kg of TNT anywhere under the hull. Vehicle also withstands nearby explosions of artillery shells. The VN11 is fitted with NBC protection and automatic fire suppression systems. The VN11 has a low-profile turret, armed with a 30 mm cannon. Similar turret was used on Type 86G infantry fighting vehicle, which is widely used by the Chinese Army in large numbers. The cannon can engage armored targets at a range of 1 500 m, ground targets at a range of 4 000 m and helicopters at a range of up to 2 500 m. It looks like there is a launching rail for HJ-73 anti-tank guided missile. This missile has a range of 3 000 m. This armored vehicle has got no coaxial machine gun. The VN11 has a crew of 3, including commander, gunner and driver. This heavy APC accommodates around 6 dismounts. Troops enter and leave the vehicle via rear doors. Troop compartment is located at the rear part of the vehicle. Rear powerpack arrangement of the Type 59 tank became an issue in attempt to make the troop compartment in the rear part of the vehicle. Designers of the VN11 found a simple solution and swapped front end of the vehicle with the rear. So the VN11 is driving backwards comparing with the original Type 59 tank. The Type 59 tank is powered by a diesel engine, developing 520 hp. Most likely that the VN11 heavy APC received new engine and transmission.

ZBD-04 (Type 04) Chinese Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **ZBD-04A:** The ZBD-04A (industrial designation WZ502G, sometimes referred to as ZBD-08) is an improved variant that sacrifices amphibious performance for better armor protection; add-on armor can be fitted, and the frontal arc can withstand 30 mm rounds along with side skirts added. Although the vehicle is still amphibious, able to propel itself by its tracks to ford lakes and rivers, it lacks waterjets and can no longer operate in open sea.

Notes:

The ZBD-04 (VN11) is the tracked infantry fighting vehicle (IFV) based on the ZBD-97 IFV. The ZBD-04 is developed for the PLA in the late 1990s. The vehicle was designed to provide protected transport for an infantry squad on the battlefield; to provide fire support for dismounted infantry, and to engage enemy tanks and armored vehicles. The ZBD-04 is currently equipped by the amphibious mechanized divisions in South Military Region. The ZBD-04 was designed as the successor to the Type 86 and has been in service with the PLA ground forces since 2006, in the armored units of the Guangzhou and Nanjing military regions. Besides the infantry fighting vehicle (IFV) variant, an armored recovery vehicle (ARV) variant is also available. A further improved variant is known as the ZBD-04A. The ZBD-04 has a crew of three (a commander, a driver, and a gunner) and is able to carry seven troops. The commander and gunner are seated in the two-man turret located in the middle, and the driver with one passenger is located in tandem to the left of the power compartment, located at the front right. Six infantrymen are located in the troop compartment at the rear. There are firing ports in the left, right, and exit door that allow infantrymen to fire assault rifles or light machine guns from inside the vehicle, even on the move. The vehicle has amphibious capability, designed to swim to shore from a ship. For high-speed swimming, it has two large water jet ports.

Boragh Iranian Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Boragh:** Reverse engineered BMP-1 or Type 86 (WZ-501) converted into an APC. It is very similar to Chinese WZ-503 APC. It has V-8 turbocharged diesel engine which delivers 330 hp (246 kW). It also has road wheels from the US M113 APC. Combat weight was reduced to 13 tonnes. The other upgrades include a higher road speed and stronger armor. Number of passengers was increased from 8 to 12. The 12.7 mm DShK 1938/46 heavy machine gun (1,000 rounds) serves as a main weapon of the vehicle.
- **Raad-1 (Thunder-1):** Boragh converted into a self-propelled howitzer fitted with a turret from the 2S1 Gvozdika
- **Raad-2 (Thunder-2):** Boragh converted into a self-propelled howitzer fitted with a turret that has a similar layout to the M109A1 155mm/39-cal self-propelled howitzer fitted with 155 mm HM44 howitzer manufactured by the Hadid facility of the Iranian Defence Industries Organisation. The gun looks exactly like 155mm/39-cal M185 gun from M109A1 and is fitted with a double baffle muzzle brake, fume extractor, screw breech mechanism, hydro-pneumatic recuperator and a hydraulic recoil brake
- **Cobra:** Concept vehicle for the Boragh armed with 23 mm anti-aircraft gun for use as a fire support vehicle.
- **Khatim 1:** Sudanese designation for Boragh

Notes:

boragh or Boraq (Persian: نفربر براق) is an Iranian-made armored personnel carrier. Boragh is believed to be a reverse engineered and upgraded model of the Chinese Type 86 (BMP-1). The upgrades include a reduction in weight, a higher road speed, and stronger armor. The vehicle is fully amphibious and is fitted with an NBC protection system and infra-red night vision equipment. It was reported in May 2002 that three additional variants are produced by the Vehicle and Equipment Group (VEIG) of the Iranian Defense Industries Organisation (DIO). These are a 120 mm mortar carrier, an ammunition resupply vehicle, and an armored personnel carrier (APC) fitted with improved armaments. Boragh is a tracked APC. Rubber elements on the track are added to prevent damage on paved surfaces. It has a crew of three (driver, commander and gunner). It can transport up to 8 infantry soldiers. Boragh's main armament consists of the DShK 1938/46 12.7 mm heavy machine gun on a rotatable mount. Some vehicles have the machine gun mount protected all around by an armored shield. The vehicle is equipped with an NBC protection system and is capable of laying down a defensive smoke screen by injecting diesel fuel into the exhaust outlet. The vehicle is named after the Buraq, a winged steed from Islamic mythology.

→→Airborne Infantry Fighting Vehicle (IFV)

ZBD-03 (WZ-506) Chinese Airborne Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **ZLC-2000:** The ZLC-2000 has been in service with the People's Liberation Army Air Force (PLAAF) Airborne Corps since 2003. China decided to develop the ZLC-2000 in the late 1990s after a failure to reach agreement with Russia over the purchase or licensed-production of BMD-series vehicles. The first prototype is thought to have been delivered in 2003. Development of the K/STW-17 vehicle air dropping system was completed in 2004. The ZLC-2000 was first seen in operational service in 2005 and was noted as a participant in the Peace Mission 2005 exercise with Russia. The vehicle was first displayed publicly as part of the Oct. 1, 2010, parade celebrating the 60th anniversary of the founding of the People's Republic of China.
- **ZBD-03 Command Post:** The command and control version features a higher rear hull to accommodate staffs.
- **ZBD-03 ATGM Carrier:** Armed with the HJ-8 ATGM anti-tank guided missile.

Round Mass (Nominal): g675

Projectile Mass (Nominal): g220

Round Length: mm280

Tracer: sec2.5

Cartridge Case: Steel

Primer: Percussion cap

Penetration at 1,000: >45mm RHA steel at 60° obliquity

Dispersion: Mills0.45

Operational temperature: -32°C to +62°C

↳*Ammunition (Option 2)*

Type: High Explosive Incendiary

USSR Designation: UOF-84

Caliber: mm30mm

Description: Shell filled with 48,5g HEI, with A-670M fuze

Muzzle Velocity: m/s960

Basic Load: ea225

Max Range: m5,000

Min Range: INA

Armor Penetration: Yes

Weight, Bullet: kg0.39

Coaxial Weapon System

↳*System*

Name: Type 80 Chinese Heavy Machine Gun

Manufacturer: Norinco

Type: 7.62mm Heavy Machine Gun

Length, Total: mm1,192

Length, Barrel: mm658

Diameter: INA

Action: Gas Operated

Rate of Fire: rds/min700-800

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

↳*Ammunition*

Type: 7.62×54mmR

Caliber: mm7.62x54

Muzzle Velocity: m/s840

Basic Load: Belts in 100/200/250 round boxes

Effective Firing Range: m100-1,500

Min Range: m100

Armor Penetration: INA

Anti-Tank Guided Missile (ATGM)

↳*System*

Name: HJ-73 Red Arrow Anti-Tank Missile System

Type: Anti-Tank Missile System

Length, Total: mm1,005

Length, Barrel: mm860

Rate of Fire: rds/min4

Sights: Integrated Optics

↳*Ammunition (ATGM)*

Name: HJ-73 Arrow-73 (Base Series Name; Manual Command-to-Line-Of-Sight. MCLOS)

Type: Anti-Tank Missile System

Date of Introduction: 1979

Caliber: 125mm

Muzzle Velocity: m/s130

Basic Load: INA

Max Effective Range: m3,001

Min Range: INA

Armor Penetration: Yes

Guidance System: SACLOS

TV Goniometer: Yes

Variant 1: Red Arrow 73B: Armed with a tandem-HEAT warhead, this missile has a maximum range of 2,800 m, a hit probability of 90%, and a penetration probability of 80%. At maximum range the 73B takes around 20 seconds to reach the target at a speed of 120 m/s, and if a hit is achieved is capable of penetrating 200 mm of RHA set at 68° and protected by ERA.

Variant 2: Red Arrow 73D: This missile is much the same as the 73B, however it is slightly longer and capable of penetrating 280 mm of RHA set at 68° and protected by ERA. The flight speed of the missile is increased to 130 m/s.

Variant 3: Red Arrow 73E: The 73E is a further improvement of the above systems. The range is extended to 3,000 m and the RHA penetration increased to 300 mm.

Variant 4: Red Arrow 73F: The 73F is described as a bunker buster. It has a maximum range of 2,800 m and has the same accuracy statistics of the 73B. It is fitted with a fuel air explosive warhead, designed to defeat bunkers and fortifications through overpressure effects.

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Vehicle Commander: Yes

Thermal Gunner: Yes, dual-channel sight

Driver Periscopes: ea3

Main Gun Stabilization: Yes

Range, Day Sight: mINA

Range, Night Sight: mINA

Navigation System: Yes, BeiDou Satellite Navigation system

Accuracy: to within several meters

Blue Force Tracking: Yes

Protection

Armor Type: Welded steel protects against small arms and shell splinters.

Hull Armor: 12.7mm Projectiles

Side Armor: mm7.62mm Projectiles

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection Armor: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: yes

Smoke Equipment: Yes, The vehicle also carries six smoke grenade launchers that can be used to launch aerosol grenades to obscure the vehicle from targeting lasers, or fragmentation projectiles for close range defense from infantry.

Note: The protection is limited by the need for the ZBD-03 to be deployed by parachute; as such it is thought to be focused on countering small arms fire and shell fragments.

Notes:

The ZBD-03 or Type 03 (industrial designation WZ506) is a Chinese airborne infantry fighting vehicle. It features a light-weight chassis and hydropneumatic suspension for airborne operations. The ZBD-03 bears some external resemblance to the BMD-3, particularly with regards to its main armament. However, the chassis and internal subsystems possess a different layout. The ZBD-03 retains the Russian parachute system for landing from an Il-76 transport aircraft. The ZBD-03 has a crew of three (a commander, a driver, and a gunner) and is able to carry five infantry passengers in a troop compartment. The ZBD-03 bears some external resemblance to the BMD-3, particularly with regards to its main armament. However, the chassis and internal subsystems possess a different layout. The ZBD-03 retains the Russian parachute system for landing from an Il-76 transport aircraft. The ZBD-03 has a crew of three (a commander, a driver, and a gunner) and is able to carry five infantry passengers in a troop compartment. The gunner is seated in the single-man turret located in the middle of the chassis. The driver and commander are located in tandem to the left of the power compartment in the front right of the chassis. The troop compartment is located in the rear with two overhead hatches and a rear exit. The suspension system of ZBD-03 consists of five lightweight road wheels and three return rollers with a front-mounted drive sprocket. The hydropneumatic suspension has variable ground clearance, minimum exhibited in the commission of landing the plane in order to reduce the force of impact on the ground. The ZBD-03 is equipped with a single-man turret with a 30mm gun capable of firing armor-piercing round. A missile rail launcher at the top of the turret is included as part of the HJ-73C anti-tank guided missile (ATGM). Secondary weaponry includes a coaxial 7.62mm machine gun and three smoke grenade dischargers mounted to each side of the turret. The ZBD-03 armor protection is limited by its weight restrictions necessary for airdropping. With a combat weight of 8 tonnes, the vehicle’s armor is thin and sloped to maximize resistance to small caliber weapons. The gunner has a day/night thermal scope and an emergency back-up day sight. The gun system is fully stabilized. The driver and commander has their own observation instruments installed on the hatch.

BMD-1 Russian Airborne Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **BMD:** First production model.
- **BMD-1K:** (K stands for komandirskaya – command) – Command variant fitted with R-126 and R-107 transceivers, two Clothes Rail antennas and a generator box. It's sometimes called BMD-K
- **BMD-1P:** BMD-1 modernization with its 9S428 ATGM launcher replaced by pintle-mounted 9P135M-1 ATGM launcher capable of firing 9M113 "Konkurs" (AT-5 Spandrel), 9M113M "Konkurs-M" (AT-5B Spandrel B), 9M111 "Fagot" (AT-4 Spigot) and 9M111-2 "Fagot" (AT-4B Spigot B) ATGMs. Entered service in 1977.
- **2S9 NONA Russian 120mm Self-Propelled Mortar (SPM):** The 120 mm SO-120 2S9 Anona (Anemone) self-propelled gun/mortar (SPG/M) was first seen in public in May 1985 and is an airborne artillery assault vehicle that was developed to carry out two tactical functions.
- **2S9-1 Russian 120mm Self-Propelled Mortar (SPM):**
- **2S9-1M:** The 2S9-1M is an upgraded variant of the baseline SO-120 2S9 Anona-S. The upgraded vehicle is designed to maintain the battlefield viability of the original SO-120 until a replacement - likely to be the Lotus fire support vehicle based on the BMD-4M - can be developed and introduced into service.
- **BMD-1PK:** (K stands for komandirskaya – command) – Command variant of BMD-1P. It is fitted with an additional R-123M radio set, a generator, the GPK-59 gyroscopic compass, the PRKhR radiation and chemical reconnaissance unit and two attachable tables. The machine gun mounted in the left corner of the bow of the hull has been eliminated as well as one of the seats. The crew consists of 6 men. The ammo load was reduced by one 9M113 "Konkurs" (AT-5 Spandrel) ATGM and 250 7.62 mm machine gun rounds
- **BMD-1M:** BMD-1 with smoke grenade launchers on the rear of the turret, improved ventilation and road wheels
- **BMD-2 (Ob'yekt 916):** BMD-1 variant with a new one-man turret armed with stabilized 30 mm 2A42 multi-purpose autocannon and 7.62 mm PKT coaxial tank machine gun (mounted on the right hand side of the main gun). The vehicle carries 300 rounds for the main gun (180 AP and 120 HE) and 2,940 rounds for the machine gun. The gun has a maximum elevation of 75° and can be used to fire at air targets. The turret is also armed with pintle-mounted 9P135M launcher, on the right hand side of the roof of the turret, with semi-automatic control capable of firing SACLOS guided 9M113 "Konkurs" (AT-5 Spandrel) and 9M113M "Konkurs-M" (AT-5B Spandrel B) ATGMs. The new turret seats the gunner on the left hand side of the main gun. On top of the turret there's one single piece circular hatch opening to the front. Located in front of the said hatch is the gunner's sight which is the same one as the one used in BMP-2. Another gunner's sight is located on the left hand side of the main gun and moves in vertical planes along with it. It is a high angle of fire sight used when the gunner is aiming at air targets. The vehicle also has additional periscopes that provide it with vision on the sides. A white searchlight is mounted in front of the turret. The amount of bow mounted tank machine guns decreased from two to one. The right hand side bow mounted machine gun was preserved. NATO gave it the designation BMD M1981/1
- **BTR-D (Ob'yekt 925):** Lengthened variant (with 6 rather than 5 road wheels), slightly up-armoured at the front. The

BTR-D has no turret, but is armed with two bow-mounted machine guns PKB and can be fitted with pintle-mounted automatic grenade launchers (AGS-17, AGS-30 or AGS-57) and/or machine guns (PKM, 6P41, "Utyos" or "Kord"). Entered service in 1974 and can carry 10 passengers. Combat weight: 8.5 tons.

System

Alternative Designation: BMD-1 Russian Airborne Amphibious Infantry Fighting Vehicle (IFV)

Manufacturer: Volgograd Tractor Plant

Type: Airborne Amphibious Infantry Fighting Vehicle (IFV)

Family: 2S923

Crew: ea2 (driver, gunner)

Passengers: 6 troopers (including commander and machine gunner seated next to the driver and 3 men in the troop compartment)

Chassis: S-120 and based on the aluminium hull of the BTR-D airborne multi-purpose tracked armoured personnel carrier

Displacement Time: min30

Emplacement Time: min30

Airborne Capable: Yes

Parachute System: PRSM-916 parachute system, or the PRSM-925 for combat deployments

Airdrop Height: m500-1,500

Note: The BMD-1 can be distinguished from all other BMD variants firstly by the large gun that is its main armament, and secondly by its road wheels that have a star-shaped centre and dual rims.

Main Gun Stabilization: INA
Indirect Fire: Yes
Direct Fire: INA
Land Navigation: Yes
Searchlight: IR searchlight

Protection

Armor Type: Welded aluminium alloy
Gun Mantlet: mm33
Turret Armor: 23 mm at 42° turret front 19 mm at 36° turret side 13 mm at 30° turret rear 6 mm turret top
Hull Armor: 15 mm at 50° lower hull front, 10 mm rest of the hull
Applique Armor: INA
Explosive Reactive Armor: No
Active Protection System: INA
Mine Clearing: No
Self-Entrenching Blade: Available
NBC Protection: PAZ NBC system
Smoke Equipment: INA
Fire-Extinguishing System.: PPO centralised ethylene-bromide fire-extinguishing system

Notes:

The BMD-1 is an airborne infantry tracked armoured vehicle, which entered in the service to the Russian army airborne units in 1969 and was first show to the public during a parade held in Moscow in November 1973. The vehicle was called the M1970 before its Russian designation became known. Development started in 1965 and limited production began in 1968 and ended in 1969. After operational trials it was deployed in limited numbers by 1969 and the serial production started in 1970, although the vehicle weight 500 kg more than what the requirements stated (7.5 tonnes and 13.3 tonnes when loaded with equipment).

In late 1970s a new modernized vehicle received a designation BMD-1P following adoption of the new 9P135M-1 ATGM launcher instead of 9S428 ATGM launcher, firing the 9M113 "Konkurs" (AT-5 Spandrel). In 1983, based on the combat experience in Afghanistan a decision was made to produce a new variant of the BMD with a weapon capable of engaging targets such as those faced by the airborne troops in that conflict. This resulted in "Ob'yekt 916" which later became BMD-2. A lengthened chassis of BMD-1 served as a basis for the BTR-D airborne multi-purpose tracked APC which itself served as a basis for many specialized airborne vehicles. The BMD-1 is always currently used by the Russian airborne troops. BMD-1 and BMD-1PK IFVs are used by Russian airborne units of KFOR. BMD-1 IFVs were used by Russian airborne units of SFOR.

VN-10 (ZBD-03) Chinese Airborne Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **ZLC-2000:** Designation for ZBD-03 prototype.
- **ZBD-03:** Standard variant.
- **ZBD-03 Command Post:** The command and control version features a higher rear hull to accommodate staffs.
- **ZBD-03 ATGM Carrier:** Armed with the HJ-8 ATGM anti-tank guided missile.

System

Alternative Designation: VN-10 (ZBD-03) , ZBD-2000; ZLC-2000; VN10 (export designation)
Type: Airborne Infantry Fighting Vehicle (IFV)
Crew: ea3

- **BMD-1M:** BMD-1 with smoke grenade launchers on the rear of the turret, improved ventilation and road wheels
- **BMD-2 (Ob'yekt 916):** BMD-1 variant with a new one-man turret armed with stabilized 30 mm 2A42 multi-purpose autocannon and 7.62 mm PKT coaxial tank machine gun (mounted on the right hand side of the main gun). The vehicle carries 300 rounds for the main gun (180 AP and 120 HE) and 2,940 rounds for the machine gun. The gun has a maximum elevation of 75° and can be used to fire at air targets. The turret is also armed with pintle-mounted 9P135M launcher, on the right hand side of the roof of the turret, with semi-automatic control capable of firing SACLOS guided 9M113 "Konkurs" (AT-5 Spandrel) and 9M113M "Konkurs-M" (AT-5B Spandrel B) ATGMs. The new turret seats the gunner on the left hand side of the main gun. On top of the turret there's one single piece circular hatch opening to the front. Located in front of the said hatch is the gunner's sight which is the same one as the one used in BMP-2. Another gunner's sight is located on the left hand side of the main gun and moves in vertical planes along with it. It is a high angle of fire sight used when the gunner is aiming at air targets. The vehicle also has additional periscopes that provide it with vision on the sides. A white searchlight is mounted in front of the turret. The amount of bow mounted tank machine guns decreased from two to one. The right hand side bow mounted machine gun was preserved. NATO gave it the designation BMD M1981/1
- **BTR-D (Ob'yekt 925):** Lengthened variant (with 6 rather than 5 road wheels), slightly up-armoured at the front. The BTR-D has no turret, but is armed with two bow-mounted machine guns PKB and can be fitted with pintle-mounted automatic grenade launchers (AGS-17, AGS-30 or AGS-57) and/or machine guns (PKM, 6P41, "Utyos" or "Kord"). Entered service in 1974 and can carry 10 passengers. Combat weight: 8.5 tons.

System

Alternative Designation: BMD-1P Russian Airborne Amphibious Infantry Fighting Vehicle (IFV)

Date of Introduction: 1969

Proliferation: Angola –INA Armenia – 10 Azerbaijan – 41 Belarus – 124 in 1995, 154 in 2000, 2003 and 2005. Iran – 200 in service as of 1998. India - INA Moldova – 44 BMD-1 9 BTR-D and also 9 2S9. Russia – About 105 in active service and more than 2,400 in storage. Ukraine – 61 in 1995, 2000 and 2005. Uzbekistan – 110 in 1995, 120 in 2000 and 2005

In Service: 1969-Present

Manufacturer: Volgograd Tractor Plant

Type: Airborne Amphibious Infantry Fighting Vehicle (IFV)

Family: 2S923

Crew: ea2 (driver, gunner)

Passengers: six personnel including a section commander, and the vehicle is crewed by a driver and gunner.

Chassis: S-120 and based on the aluminium hull of the BTR-D airborne multi-purpose tracked armoured personnel carrier

Displacement Time: min30

Emplacement Time: min30

Airborne Capable: Yes

Parachute System: PRSM-916 parachute system, or the PRSM-925 for combat deployments

Airdrop Height: m500-1,500

Note: The BMD-1 can be distinguished from all other BMD variants firstly by the large gun that is its main armament, and secondly by its road wheels that have a star-shaped centre and dual rims.

Dimensions

Length: m5.1

Width: m2.53

Height: m1.97

Type: R-173

Main Gun

↳*System*

Name: 2A28 Grom 73mm smooth bore semi-automatic gun

Type: mm73

Manufacturer: KBP

Length, Barrel: mm1,195

Height: mm322

Weight: kg115

Width: mm218

Electric Motor: Yes, with a manual mechanical backup

Magazine Type: forty-round mechanized conveyor double-row magazine

Max Rate of Fire: rds/min8-10

Loader Type: M3 electromechanical autoloader with ammunition conveyor

Max Elevation: deg+33

Min Elevation: deg-4

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Note: The BMD-1 can also fire ATGM launcher (three 9M14M or 9M113 or 9M111M ATGMs)[4][9]

↳*Ammunition (Option 1)*

Type: OG-15V HE-Frag

Caliber: mm73

Muzzle Velocity: m/s290

Basic Load: 50 Total of any 72mm combination projectiles

Weight: kg4.57

Shell: kgOG-9 shell with a 0.73 kg (1 lb 10 oz) TNT bursting charge

↳*Ammunition (Option 2)*

Type: PG-15V (HEAT)

Caliber: mm73

Muzzle Velocity: m/s400

Stabilizer Type: fixed fin-stabilized rocket-assisted round.

Basic Load: 50 Total of any 72mm combination projectiles

Weight: kg3.47

Shell: kg2.6

Explosive Type: mmRDX explosive charge in the warhead

Explosive Weight: kg0.322

Penetration: mm280-350

Note: Once the projectile has travelled 10–20 m (33–66 ft), the rocket motor starts and accelerates it to 700 m/s (2,300 ft/s).

Anti-Tank Guided Weapons (ATGW)

Name: 9M111 Fagot missile

Type: SACLOS wire-guided missile

Minimum Range: m70

Maximum Range: m2,000

Time for Missile to Reach an altitude of 2,000 meters: sec10.8

Rate of Fire: rds/min3

Warhead Type: HEAT

Penetration: mm400

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Max Rate of Fire: rds/min650

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces

In Service: 1961-present

Manufacturer: Degtyaryov plant

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Note: The 7.62 PKT can be controlled remotely

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Muzzle Velocity: m/s825

Basic Load: ea1,500

Maximum Effective Range (With Sight Adjustments): m100-1,500

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Yes, with three day vision devices

Thermal Sight Gunner: Yes, dual-mode 1PN22M1 monocular periscopic sight mounted on the left side of the turret roof.

Driver Sight: TNPO-170 periscope

Main Gun Stabilization: INA

Indirect Fire: Yes

Direct Fire: INA

Land Navigation: Yes

Searchlight: IR searchlight

Protection

Armor Type: Welded aluminium alloy

Gun Mantlet: mm33

Turret Armor: 23 mm at 42° turret front 19 mm at 36° turret side 13 mm at 30° turret rear 6 mm turret top

Hull Armor: 15 mm at 50° lower hull front, 10 mm rest of the hull

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: Available

NBC Protection: PAZ NBC system

Smoke Equipment: INA

Fire-Extinguishing System.: PPO centralised ethylene-bromide fire-extinguishing system

Notes:

The BMD-1P is a variant of the BMD-1 designed for combat-heavy operations. It is armed very similarly to the BMD-1 but carries additional ammunition and an improved missile. The BMD-1P is a tier 4 Armored Fighting Vehicle originating from the Soviet Union and is sold by Marat Shishkin. It can be unlocked from the BMD-1, and leads to the BMD-2.

BMD-3 Russian Airborne Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **BMD-3K:** The commander variant of the BMD-3 adopted by the Russian Army in 1996. Mass production of this vehicle was never initiated.
- **2S25 Sprut-SD (Object 952):** A self-propelled anti-tank gun that entered service in 2005. This vehicle has the chassis of the BMD-3 and is operated by a crew of three. The main armament is the 125 mm 2A75 smoothbore gun which is a variant of the 2A46 smoothbore gun series used by Soviet main battle tanks since the T-64. It can fire the ammunition of the 2A46 including the 9M119 Svir. The chassis has seven road wheels on each side instead of five and the engine is now the 2V-06-2S with a power of 510 hp.
- **BTR-MD “Rakushka” (Object 955):** A multi-role transport vehicle with bigger hull and no turret. This type can be used to transport troops, fuel, ammunition and wounded personnel. It also serves as the basis for a new range of specialised vehicles for the Russian airborne forces, including a mortar platform and an ambulance.
- **BTR-MDM:** A modernized version with the same improvements as the BMD-4M.
- **RKhM-5 (Object 958):** A chemical reconnaissance vehicle introduced in 2011 and is fitted with the same specialized equipment as the BTR-80 version known as the RKhM-4. The turret has been removed; the RKhM-5 has a fixed superstructure with a machine gun turret. The hull is larger allowing it to transport troops, fuel, ammunition and wounded personnel
- **BMD-4 (Object 960):** Originally designated as the BMD-3M, this vehicle has a modified chassis with new turret known as the "Bakhcha-U". The weaponry bears greater similarity to the BMP-3. This new armament consists of: a 100 mm 2A70 rifled main gun, a 30mm 2A72 autocannon, a 7.62 mm coaxial machine gun, and new "Ramka" fire control system. The bow-mounted AGS-17 has been removed and is replaced with an AGS-30. BMD-4s are newly built or upgraded BMD-3s. The BMD-4 is no longer being purchased for the Russian troops, in favor of the BMD-4M.
- **BMD-4M:** The upgraded variant with a new chassis and the 500 hp UTD-29 engine of the BMP-3. This version will be produced by Kurganmashzavod (KTZ) instead of VgTZ. The vehicle was presented to the VDV in March 2008. According to KTZ, series production could have started in 2009. The BMD-4M was evaluated by the VDV
- **BMM-D:** A command post vehicle and a recovery vehicle. Some variants will have a longer chassis with seven road wheels and probably the same 510 hp engine as the 2S25.

System

Alternative Designation: BMD-3
Manufacturer: Volgograd tractor factory
Type: Airborne Infantry Fighting Vehicle

Family: BMD-3

Crew: ea2

Passenger Capacity: ea8

Amphibious: Yes, The BMD-3 is amphibious and propelled in the water by two water-jets mounted on both sides at the rear of the vehicle

Buoyancy Reserve: More than 30% of its own displacement

↳*Ammunition (Option 1)*

Name: 3UOF8

Type: HEI

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s960

Basic Load:

Projectile Weight: g389

Bursting Charge: g49

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

↳*Ammunition (Option 2)*

Name: M929

Type: APFSDS-T

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,260

Basic Load: ea

Projectile Weight: g235

Bursting Charge: None

Note: A sub-caliber fin-stabilized discarding sabot round with tracer from Belgian Mecar, with tungsten alloy penetrator.

Penetration: 50 mm RHA steel at 60 degree impact at 1,000 m range

↳*Ammunition (Option 3)*

Name: 3UBR8

Type: APDS

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,120

Projectile Weight: g304

Bursting Charge: None

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

Grenade Launcher

↳*System*

Name: AGS-17 Plamya, 30mm Automatic Grenade Launcher

Type: Automatic Grenade Launcher

Manufacturer: Molot plant

In Service: 1970-Present

Proliferation: Widely Proliferated

Weight: kg31

Length: mm840

Rate of Fire: rds/min400

Effective Firing Range: m8,00 - 1,700

Maximum Effective Range: m1,700

Action: Blowback

Feed system: 29 grenades belt

Sights: Adjustable iron sights, optional mount required for optical sights

Variants: AG-17A helicopter-mounted version

↳*Ammunition (Option 1)*

Name: VOG-17M

Type: 30mm Grenade

Cartridge: 30×29mm grenade

Muzzle velocity: m/s185

Warhead: High explosive fragmentation warhead.

Effective Firing Range: 8,00 - 1,700

Basic Load: ea40

↳*Ammunition (Option 2)*

Name: VOG-30

Type: 30mm Grenade

Cartidge: 30×29mm grenade

Muzzle velocity: m/s185

Effective Firing Range: 8,00 - 1,700

Basic Load: ea40

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: 7.62mm

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Anti-Tank Guided Weapon (ATGW)

Name: 9M113 Konkurs (AT-5 Spandrel)

Type: Soviet SACLOS wire-guided anti-tank missile.

Manufacturer: Tula Machinery Design Bureau (Tula KBP) – Tulsky Oruzheiny Zavod

In Service: 1974-Present

Proliferation: Algeria– used by mechanized infantry units Armenia Azerbaijan Egypt – mounted on Fahd armoured personnel carriers purchased in 1990s Belarus The launcher is been locally produced and upgraded. Bulgaria Croatia Cuba – not confirmed Czech Republic Eritrea[Finland – known as PstOhj 82M, fired from 9P135M-1 launchers (withdrawn from service) Georgia Guinea Hungary Indonesia – mounted on BVP-2 infantry fighting vehicles operated by the marine corps India – 15,000 Konkurs-M, ordered in 2008 for Rs 1,380-crore. Another 10,000 Konkurs-M ordered for US$250 million in 2012. A new contract was signed in 2019 for USD 110 mln. Iran– produced domestically as Tosan-1 Iraq Ivory Coast (reported) Kazakhstan Kyrgyzstan Morocco[Mongolia Moldova– used on BRDM-2 North Korea – produced domestically Pakistan – Used on Viper infantry fighting vehicle Peru Romania Russia – about 300 Konkurs-M complexes delivered annually in the last years (2014) Slovakia Turkmenistan Turkey Syria Ukraine Houthis – Tosan version

Varaints: 9M113M,Towsan-1, Tosan, Towsan, or M113, 9N131M1, 9N131M2-1

Weight (Missile): kg14.6

Weight (9P135 Launching Post): kg22.5

Length: mm1,150

Diameter: mm135

Warhead Weight: kg2.7

Detonation Mechanism: Contact

Engine: Solid-fuel rocket

Wingspan: mm468

Maximum Operational Range: km4

Minimum Operational Range: m70

Speed: m/s208

Guidance system: Wire-guided SACLOS

Steering system: Two control surfaces

Launch platform: Individual, vehicle

Penetration: 600mm of RHA

Basic Load: INA

Fire Control

Name: INA

Computerized FCS: INA

Thermal Sight Vehicle Commander: Yes, 1PZ-3 with a TNP-165A designator

Thermal Sight Gunner: Yes, BPK-1-42 with a TNPT-1 designator and a TKN-3B binocular sight

Main Gun Stabilization: Yes, 2E36-5

Periscopes: TNPO-170A periscopes and the TNPO-350B night vision periscope.

Protection

Hull Armor: Protection to stop up to 12.7mm rounds fired at the hull and 7.72mm rounds fired at the sides

Turret Armor: INA

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes, three 81 mm electrically-operated smoke grenade dischargers firing forwards,

IR Signature: INA

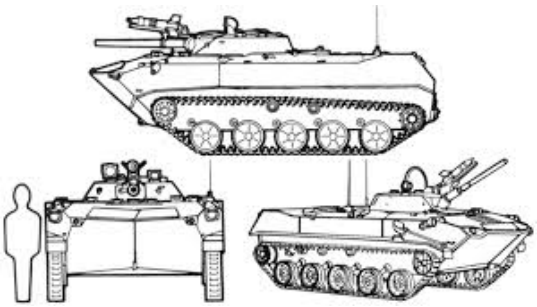
Fire Suppression System: Yes

Notes:

The BMD-3 (Boyevaya Mashina Desanta, Russian "Боевая Машина Десанта", literally "Combat Vehicle of the Airborne") is an infantry fighting vehicle (IFV) originating from the former Soviet Union. This armored fighting vehicle is one of the lightest in its class and is intended to be a fire support platform for use by airborne and air assault units. The primary armament is a 30 mm 2A42 autocannon capable of firing different types of ammunition which include high-explosive and armor-piecing. The BMD-3 possesses multiple secondary weapons such as the 9M113 Konkurs missile and the AGS-17 grenade launcher to defeat a wide range of targets from enemy infantry to other armored fighting vehicles. The development of this 3rd generation airborne combat vehicle was initiated during the same time frame of the development of the BMP-3. However, the results of the development showed that the mass of the BMP-3 with landing facilities will significantly exceed 20 tonnes limiting an Il-76 to transporting one vehicle. In the early 1980s, the creation of an airborne combat vehicle was initiated. During the design, two options were considered for the BMD-3. The first one included a chassis weighing over 18 tonnes with a 100 mm 2A70 rifled gun and a coaxial 30 mm 2A72 autocannon. The second option was to use the combat module with a 30 mm 2A42 autocannon. Thus, an IL-76 could be loaded either with two airborne combat vehicles weighing 18 tonnes, or three airborne combat vehicles weighing 12.5 tonnes. Research showed that the latter version of the new BMD-3 ran much more efficiently. On the basis of the experience gained and the results of the research, the Council of Ministers of the USSR and the CPSU number 451-159 officially opened the ROC under the code "Bakhcha" on 20 May 1983. Work included the development of an airborne combat vehicle weighing 12.5 tonnes with the Volgograd tractor factory appointed as the head developer. One month later, an agreement was made for the tactical and technical requirements for the new BMD as well as a complete technical design stage. When developing the new BMD, the experience gained in the course of work on the BMD-1 and "Object 934" light tank was used. By 1985, the acceptance testing of three new BMD prototypes was completed. The test results revealed that all the samples exceeded the permissible mass by 190–290 kg and that the running vehicle gave numerous failures. The design bureau VgTZ fixed most of the shortcomings and were eliminated. By May 1986, the refined BMD prototypes completed preliminary tests with three more prototypes developed by the Volgograd tractor factory. These were sent to the state test for another evaluation. New samples exceeded the permissible mass by 400 kg, as they were made subject to measures of improving the reliability of the running transmission gears. The BMD state tests took place between 27 October 1986 and 27 October 1987.

According to test results, two to three vehicles were completed and sent to the control tests in different climatic zones conducted from 10 July to 19 November 1988. The conclusion for the "Bakhcha" was assessed as positive with the vehicle fulfilling the tactical and technical requirements set by the airborne troops. On 10 February 1990, the USSR adopted the "Object 950" IFV into service under the designation BMD-3. The serial production of the BMD-3 was then initiated and continued until 1997. Excluding six prototypes produced before 1990, 137 BMD-3s were produced from the year of its adoption to the end of its serial production.

BMD-1K Russian Airborne Amphibious Infantry Fighting Vehicle (IFV)



Tiers:

Variants:

- **BMD:** First production model.
- **BMD-1:** Final production model. It has a dome-shaped NBC filter intake on the right hand side of the center of the hull roof.
- **BMD-1P:** BMD-1 modernization with its 9S428 ATGM launcher replaced by pintle-mounted 9P135M-1 ATGM launcher capable of firing 9M113 "Konkurs" (AT-5 Spandrel), 9M113M "Konkurs-M" (AT-5B Spandrel B), 9M111 "Fagot" (AT-4 Spigot) and 9M111-2 "Fagot" (AT-4B Spigot B) ATGMs. Entered service in 1977.
- **2S9 NONA Russian 120mm Self-Propelled Mortar (SPM):** The 120 mm SO-120 2S9 Anona (Anemone) self-propelled gun/mortar (SPG/M) was first seen in public in May 1985 and is an airborne artillery assault vehicle that was developed to carry out two tactical functions.
- **2S9-1 Russian 120mm Self-Propelled Mortar (SPM):**
- **2S9-1M:** The 2S9-1M is an upgraded variant of the baseline SO-120 2S9 Anona-S. The upgraded vehicle is designed to maintain the battlefield viability of the original SO-120 until a replacement - likely to be the Lotus fire support vehicle based on the BMD-4M - can be developed and introduced into service.
- **BMD-1PK:** (K stands for komandirskaya – command) – Command variant of BMD-1P. It is fitted with an additional R-123M radio set, a generator, the GPK-59 gyroscopic compass, the PRKhR radiation and chemical reconnaissance unit and two attachable tables. The machine gun mounted in the left corner of the bow of the hull has been eliminated as well as one of the seats. The crew consists of 6 men. The ammo load was reduced by one 9M113 "Konkurs" (AT-5 Spandrel) ATGM and 250 7.62 mm machine gun rounds
- **BMD-1M:** BMD-1 with smoke grenade launchers on the rear of the turret, improved ventilation and road wheels
- **BMD-2 (Ob'yekt 916):** BMD-1 variant with a new one-man turret armed with stabilized 30 mm 2A42 multi-purpose autocannon and 7.62 mm PKT coaxial tank machine gun (mounted on the right hand side of the main gun). The vehicle carries 300 rounds for the main gun (180 AP and 120 HE) and 2,940 rounds for the machine gun. The gun has a maximum elevation of 75° and can be used to fire at air targets. The turret is also armed with pintle-mounted 9P135M launcher, on the right hand side of the roof of the turret, with semi-automatic control capable of firing SACLOS guided 9M113 "Konkurs" (AT-5 Spandrel) and 9M113M "Konkurs-M" (AT-5B Spandrel B) ATGMs. The new turret seats the gunner on the left hand side of the main gun. On top of the turret there's one single piece circular hatch opening to the front. Located in front of the said hatch is the gunner's sight which is the same one as the one used in BMP-2. Another gunner's sight is located on the left hand side of the main gun and moves in vertical planes along with it. It is a high angle of fire sight used when the gunner is aiming at air targets. The vehicle also has additional periscopes that provide it with vision on the sides. A white searchlight is mounted in front of the turret. The amount of bow mounted tank machine guns decreased from two to one. The right hand side bow mounted machine gun was preserved. NATO gave it the designation BMD M1981/1
- **BTR-D (Ob'yekt 925):** Lengthened variant (with 6 rather than 5 road wheels), slightly up-armoured at the front. The BTR-D has no turret, but is armed with two bow-mounted machine guns PKB and can be fitted with pintle-mounted automatic grenade launchers (AGS-17, AGS-30 or AGS-57) and/or machine guns (PKM, 6P41, "Utyos" or "Kord"). Entered service in 1974 and can carry 10 passengers. Combat weight: 8.5 tons.

System

Alternative Designation: BMD-1K Russian Airborne Amphibious Infantry Fighting Vehicle (IFV), Sometimes called the BMD-K

Date of Introduction: 1971

Proliferation: Angola –INA Armenia – 10 Azerbaijan – 41 Belarus – 124 in 1995, 154 in 2000, 2003 and 2005. Iran – 200 in service as of 1998. India - INA Moldova – 44 BMD-1 9 BTR-D and also 9 2S9. Russia – About 105 in active service and more than 2,400 in storage. Ukraine – 61 in 1995, 2000 and 2005. Uzbekistan – 110 in 1995, 120 in 2000 and 2005

In Service: 1969-Present

Manufacturer: Volgograd Tractor Plant

Type: Airborne Amphibious Infantry Fighting Vehicle (IFV)

Family: 2S923

Crew: eaThe total crew is thought to be six personnel, including the driver and gunner.

Passengers: INA. Radio Equipment Installed

Chassis: S-120 and based on the aluminium hull of the BTR-D airborne multi-purpose tracked armoured personnel carrier

Displacement Time: min30

Emplacement Time: min30

Airborne Capable: Yes

Parachute System: PRSM-916 parachute system, or the PRSM-925 for combat deployments

Airdrop Height: m500-1,500

Note: The BMD-1K can be recognized from the BMD-1 by the two clothes rail antennas and a generator box located at the read of the vehicle

Dimensions

Length: m5.1

Width: m2.53

Height: m1.97

Weight, Combat: tons7.5

Ground Pressure: kg/mINS

Automotive

Engine Name: 5D20

Engine Type: V-6, water cooled, Diesel Engine

Engine Power: hp240

Cruising Range: km320

Speed, Maximum Road: km/h70

Speed, Average Cross: 40

Speed Maximum Swim: km/h10

Graident: deg60

Side Slope: deg30

Vertical Step: m0.8

Trench: m1.6

Fording Depth: mAmphibious

Communications

Primary Radio: R-126

Secondary Radio: R-107

Addiitiona Radios: R-173 and/or R-168

Note: This is a C2 vehicle for platoon and company level Commanders

Main Gun

↳*System*

Name: 2A28 Grom 73mm smooth bore semi-automatic gun

Type: mm73

Manufacturer: KBP

Length, Barrel: mm1,195

Height: mm322

Weight: kg115

Width: mm218

Electric Motor: Yes, with a manual mechanical backup

Magazine Type: forty-round mechanized conveyor double-row magazine

Max Rate of Fire: rds/min8-10

Loader Type: M3 electromechanical autoloader with ammunition conveyor

Max Elevation: deg+33

Min Elevation: deg-4

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Note: The BMD-1 can also fire ATGM launcher (three 9M14M or 9M113 or 9M111M ATGMs)[4][9]

↳*Ammunition (Option 1)*

Type: OG-15V HE-Frag

Caliber: mm73

Muzzle Velocity: m/s290

Basic Load: 16 Total OG-15V HE-Frag Projectiles

Weight: kg4.57

Shell: kgOG-9 shell with a 0.73 kg (1 lb 10 oz) TNT bursting charge

↳*Ammunition (Option 2)*

Type: PG-15V (HEAT)

Caliber: mm73

Muzzle Velocity: m/s400

Stabilizer Type: fixed fin-stabilized rocket-assisted round.

Basic Load: 24 Total PG-15V Projectiles

Weight: kg3.47

Shell: kg2.6

Explosive Type: mmRDX explosive charge in the warhead

Explosive Weight: kg0.322

Penetration: mm280-350

Note: Once the projectile has travelled 10–20 m (33–66 ft), the rocket motor starts and accelerates it to 700 m/s (2,300 ft/s).

Anti-Tank Guided Weapons (ATGW)

Name: Kolomna Malyutka (Baby) 9M14

Type: wire-guided ATGW

Minimum Range: m500

Maximum Range: m3,000

Maximum Speed (throughout the Flight): m/s130

Flight Time: sec25

Warhead Type: HEAT Warhead

Penetration: mm400

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Max Rate of Fire: rds/min650

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces

In Service: 1961-present

Manufacturer: Degtyaryov plant

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Note: The 7.62 PKT can be controlled remotely

↳***Ammunition***

Type: Rifle

Caliber: mm7.62

Muzzle Velocity: m/s825

Basic Load: ea1,500

Maximum Effective Range (With Sight Adjustments): m100-1,500

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Yes, with three day vision devices

Thermal Sight Gunner: Yes, dual-mode 1PN22M1 monocular periscopic sight mounted on the left side of the turret roof.

Driver Sight: TNPO-170 periscope

Main Gun Stabilization: INA

Indirect Fire: Yes

Direct Fire: INA

Land Navigation: Yes

Searchlight: IR searchlight

Protection

Armor Type: Welded aluminium alloy

Gun Mantlet: mm33

Turret Armor: 23 mm at 42° turret front 19 mm at 36° turret side 13 mm at 30° turret rear 6 mm turret top

Hull Armor: 15 mm at 50° lower hull front, 10 mm rest of the hull

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: Available

NBC Protection: PAZ NBC system

Smoke Equipment: INA

Fire-Extinguishing System.: PPO centralised ethylene-bromide fire-extinguishing system

Notes:

BMD-1K (K stands for komandirskaya – command) – Command variant fitted with R-126 and R-107 transceivers, two Clothes

Rail antennas and a generator box. It's sometimes called BMD-K. The BMD-1 is a Soviet airborne amphibious tracked infantry fighting vehicle, which was introduced in 1969 and first seen by the West in 1970. BMD stands for Boyevaya Mashina Desanta (Боевая Машина Десанта, which literally translates to "Combat Vehicle of the Airborne"). It can be dropped by parachute and although it resembles the BMP-1 it is in fact much smaller. The BMD-1 was used as an IFV by the Soviet Army's airborne divisions. An improved variant of the BMD-1 was developed, the BMD-2. The BMD-1 also provided a basis for the BTR-D airborne multi-purpose tracked APC.

BMD-4 Russian Airborne Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **BMD-4K:** The commander variant featuring an additional radio station.
- **BMD-4M:** A variant with a modular unification with the BMP-3.
- **BMD-4M Sinitsa:** A variant with further modular unification with the BMP-3 and Sinitsa turret.
- **BTR-MDM Rakushka:** A armored personnel carrier based on BMD-4M. It can carry 3 crews and 12 troops.
- **2S25 Sprut-SD-:** A new order for 2S25 replacement 125 mm tracked self-propelled guns were made in 2013. These tank destroyers are planned to be made using the chassis of the BMD-4 with the turret being replaced by the 2A46M-5 125 mm gun; the same smoothbore gun used on the T-90
- **2S42 Lotus:** A self-propelled 120 mm mortar based on BMD-4M
- **Ptitselov:** A self-propelled airdroppable SAM system with twelve 9M337 missiles based on BMD-4M
- **BMD-4M:** The BMD-4M was unveiled by Kurganmashzavod in 2008. This vehicle retains the Bakhcha-U turret with a number of other innovations. Overall bulletproof crew protection is ensured. Special lightweight and durable alloys make this possible without the vehicle losing its ability to swim or be airdropped. The more powerful and compact engine of the BMP-3 is integrated into the BMD-4M; providing 500 hp.In general, the unification of units, plants, and systems of the modernized BMD-4 chassis with the same units, plants and systems of BMP-3 is 80%. This decreases the expenses of the airborne assault vehicle servicing in the army allowing a significant reduction of service maintenance of airborne combat vehicles in the army.
- **BMD-4M Sinitsa:** The BMD-4M Sinitsa was unveiled in 2017. This vehicle has the Sinitsa turret combat module fitted with a top-mounted panoramic sight with a thermal imaging channel and housing a 100 mm 2A70 tank gun/ATGM launcher, 30 mm 2A72 autocannon and a 7.62mm PKMS medium machine gun. The original power unit and transmission system are changed to the parts used in the BMP-3 to standardise production and spare parts supply.
- **Kornet-D1:** In January 2019, the Russian MoD announced it would begin state trials of the 9P163 Kornet-D1 anti-tank missile system, a version of the BMD-4M chassis modified to fire Kornet ATGMs.

System

Alternative Designation: BMD-4; BMD-4M
Manufacturer: Volgograd tractor factory
Estimated Service Life: years40
Type: Airborne Infantry Fighting Vehicle
Family: BMD-4
Crew: ea2
Passenger Capacity: ea6
Amphibious: Yes, The BMD-4 is amphibious and propelled in the water by two water-jets mounted on both sides at the rear of the vehicle
Note: It is reported that the BMD-4 can cause mission system damage to a MBT sized target at 1,500 meters while afloat.

Note: The engine remains effective in elevations up to 3,000 m above sea level.

Communications

Primary Radio: R-168-25UE-2 (Digital Radio)

R-168-25UE-2 Freauency: 30-107,975 MHz range

R-168-25UE-2 Range: km17-35

Data Transmit: 1, 2 or 16 Kbits/s

Antenna: either the R-168TWBA or R-168BBMA antenna

Main Gun Weapon System # 1

Note: The Turret System includes: Bakhcha-U turret with 100 mm 2A70 rifled tank gun, 30 mm 2A72 autocannon, and 7.62 mm PKT coaxial machine gun

↳*System*

Name: 2A70 (100mm) Rifle Gun

Type: mm100

Max Rate of Fire: rds/min10

Loader Type: Automatic loader, manual for gun and ATGMs

Maximum Elevation: deg+60

Minimum Elevation: deg-5

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Fire on the Move: Yes

Maximum Aimed Range: m5,000

Maximum Effective Range (Day): m4,000

Tactical AA Range: m4,000

Armor Penetration: 25mm of RHA

↳*Ammunition (Option 1)*

Name: 9M117M1 Arkan

Type: Laser beam riding missile

Caliber: mm100

Cartridge: 3UBK23-3 cartridge

Muzzle Velocity: m/s330

Basic Load: ea34 total rounds of any Russian 100mm Projectiles

Soft Launch: Yes

Warhead Type: HEAT

Motor Type: Rocket

Penetration: 650 mm of rolled homogenous armour (RHA) behind ERA or 750 mm of RHA without ERA and it has a maximum range of 4,000 m

Penetration: 650 mm of rolled homogenous armour (RHA) behind ERA or 700 mm of RHA without ERA

Maximum Effective Range: m4,000

Note: The gunner can issue corrections whilst the missile is in flight.

↳*Ammunition (Option 2)*

Name: 3OUF19-1

Type: mm100

Muzzle Velocity: m/sINA

Basic Load: ea34 total rounds of any Russian 100mm Projectiles

Penetration: INA

Fuze Type: proximity fuse, designed to detonate the shell 3 meters above ground

Lethal Area: 600 m2 against soft targets.

Note: This type of projectile is used against entrenched infantry and aircraft, but not heavly protected vehicles.

↳*Ammunition (Option 3)*

Name: 3UOF19 Vishnia HE
Type: mm100
Muzzle Velocity: m/s340
Basic Load: ea34 total rounds of any Russian 100mm Projectiles
Penetration: INA
Fragments: The projectile produces over 3,000 fragments in a butterfly pattern
Lethal Area: 360 m2 lethal area.

Main Gun Weapon System # 2

↳*System*

Name: Shipunov 2A72, 30mm Autocannon
Type: mm30mm
Manufacturer: Tulamashzavod
Max Rate of Fire (Low): rds/min200-300
Max Rate of Fire (High): rds/min550-800
Weight: kg115
Length (Total): m3.027
Barrel Length: mm2,416
Barrels: ea1
Action: Gas-operated
Effective Firing Range: m2,000
Maximum Firing Range: m4,000
Feed System: Twin Feed
Traverse Range: deg360
Traverse Left: deg180
Traverse Right: deg180
Maximum Elevation: deg+75
Minumum Elevation: deg-5

↳*Ammunition (Option 1)*

Name: 3UOF8
Type: HEI
Caliber: mm30
Cartridge: 30 × 165
Muzzle Velocity: m/s960

Basic Load: ea

Projectile Weight: g389

Bursting Charge: g49

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

↳*Ammunition (Option 2)*

Name: M929

Type: APFSDS-T

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,260

Basic Load: ea

Projectile Weight: g235

Bursting Charge: None

Note: A sub-caliber fin-stabilized discarding sabot round with tracer from Belgian Mecar, with tungsten alloy penetrator. Penetration: 50 mm RHA steel at 60 degree impact at 1,000 m range

↳*Ammunition (Option 3)*

Name: 3UBR8

Type: APDS

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,120

Basic Load: ea

Projectile Weight: g304

Bursting Charge: None

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62mm

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

Note: The 7.62 PKT can be controlled remotely and is slaved to the main gun,

↳*Ammunition (Option 1)*

Name: 57-N-323S

Type: Rifle

Caliber: mm7.62

Cartridge: km7.62×54mmR

Muzzle Velocity: m/s855

Muzzle Energy: J3,509

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

↳*Ammunition (Option 2)*

Name: 7N13 (AP)

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s855

Muzzle Energy: J3,436

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

↳*Ammunition (Option 3)*

Name: 7BZ3 (API)

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s834

Muzzle Energy: J3,613

Basic Load: ea2,500

Accuracy of fire at 300 m: mm150

Anti-Tank Guided Weapon (ATGW)

Name: 9M113 Konkurs (AT-5 Spandrel)

Type: Soviet SACLOS wire-guided anti-tank missile.

Manufacturer: Tula Machinery Design Bureau (Tula KBP) – Tulsky Oruzheiny Zavod

In Service: 1974-Present

Proliferation: Algeria– used by mechanized infantry units Armenia Azerbaijan Egypt – mounted on Fahd armoured personnel carriers purchased in 1990s Belarus The launcher is been locally produced and upgraded. Bulgaria Croatia Cuba – not confirmed Czech Republic Eritrea[Finland – known as PstOhj 82M, fired from 9P135M-1 launchers (withdrawn from service) Georgia Guinea Hungary Indonesia – mounted on BVP-2 infantry fighting vehicles operated by the marine corps India – 15,000 Konkurs-M, ordered in 2008 for Rs 1,380-crore. Another 10,000 Konkurs-M ordered for US$250 million in 2012. A new contract was signed in 2019 for USD 110 mln. Iran– produced domestically as Tosan-1 Iraq Ivory Coast (reported) Kazakhstan Kyrgyzstan Morocco[Mongolia Moldova– used on BRDM-2 North Korea – produced domestically Pakistan – Used on Viper infantry fighting vehicle Peru Romania Russia – about 300 Konkurs-M complexes delivered annually in the last years (2014) Slovakia Turkmenistan Turkey Syria Ukraine Houthis – Tosan version

Varaints: 9M113M,Towsan-1, Tosan, Towsan, or M113, 9N131M1, 9N131M2-1

Weight (Missile): kg14.6

Weight (9P135 Launching Post): kg22.5

Length: mm1,150

Diameter: mm135

Warhead Weight: kg2.7

Detonation Mechanism: Contract

Engine: Solid-fuel rocket

Wingspan: mm468

Maximum Operational Range: km4

Minimum Operational Range: m70

Speed: m/s208

Guidance system: Wire-guided SACLOS

Steering system: Two control surfaces

Launch platform: Individual, vehicle

Penetration: 600mm of RHA

Basic Load: INA

Fire Control

Name: 1V539M FCS

Computerized FCS: Yes

Battle Management System: Yes

Thermal Sight Vehicle Commander: Yes, 1PZ-3 with a TNP-165A designator

Thermal Sight Gunner: Yes, BPK-1-42 with a TNPT-1 designator and a TKN-3B binocular sight

Driver Sight: TVNE-1B periscope for night driving

Main Gun Stabilization: 2E52 electro-mechanical stabiliser.

Main Gun Stabilization Modes: Three modes of operation: utomatic; semi-automatic; and guidance.

Periscopes: TNPO-170A periscopes and the TNPO-350B night vision periscope.

Laser Rangfinder: 1D16-3 LRF

GLONASS System: Yes

Gyrocompass: GPK-59 gyrocompass

Note: The 1V539M FCS can process five ballistic setterings and calculate fire solutions at a mazimum distance of 5,000 meters.

Protection

Hull Armor: Hull: Welded Aluminum Alloy with Ceramic plates. Protection to stop up to 12.7mm rounds fired at the hull and 7.72mm rounds fired at the sides

Turret Armor: Turret: welded aluminium Protection to stop up to 12.7mm rounds fired at the hull and 7.72mm rounds fired at the sides

Applique Armor: INA

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes, 902 toucha smoke grenade launchers

IR Signature: INA

Fire Suppression System: Yes

Notes:

The BMD-4 (Russian: "Боевая Машина Десанта-4"; Boyevaya Mashina Desanta-4 literally "Combat Vehicle of the Airborne") is an amphibious infantry fighting vehicle (IFV) originating from post-Cold War Russia. Originally designated as the BMD-3M, the chassis of the BMD-4 is the same as that of the BMD-3, because it was developed on the same basis. This armored fighting vehicle is one of the lightest and one of the most heavily armed in its class, possessing a substantial amount of firepower in comparison to its counterparts. The vehicle was designed to transport Russian Airborne Troops (VDV); increasing its mobility, armament, and protection on the battlefield. Many components of the vehicle, such as the ergonomics and positioning of the passengers, remain relatively unchanged. Primary differences between the BMD-4 and its predecessors lie in its armament. The vehicle is fitted with the Bakhcha-U turret, which consists of: a 100 mm 2A70 low-pressure rifled gun, a 30 mm 2A72 coaxial autocannon, and a 7.62 mm PKT coaxial machine gun. The 2A70 rifled cannon is capable of firing high explosive fragmentation rounds and laser guided anti-tank missiles. It also features secondary weapons designed to engage and destroy enemy infantry and armored fighting vehicles. The automated fire control system of the vehicle is advanced with new features that simplify the

use of the vehicle's armament by the gunner and commander. The vehicle is designed by the Volgograd tractor factory and the armament was developed by the KBP Instrument Design Bureau unitary enterprise located in Tula. Kurganmashzavod is the official manufacturer of the vehicle. The only operator of the BMD-4 is Russia, where it entered service in late 2004 and has been produced ever since then. In 2008, a modernized version, designated as the BMD-4M, was introduced with significant contributions from Kurganmashzavod; the designer of the BMP.

Smoke Equipment: INA

Notes:

Rakhsh is a lightweight Iranian 4x4 cross-country APC developed and produced by DIO's Shahid Kolah Dooz Industrial Complex and named after Rakhsh, the mythical horse of Rostam in Shahnama. It is probably based on a proven 4 × 4 cross-country chassis present in Iran before and is in service of Iranian Police, Iranian Army, IRGC and Sudan. Characterized by high speed on road and excellent off-road mobility, the Rakhsh can transport 10 men. The vehicle is fitted with a 12.7 mm Automatic Gun and can be fitted with different cupolas for various types of armaments, Such as 7.62 mm machine gun and water spraying gun for civil defense. The crew can see and fire through 10 vision blocks and firing ports and can be quickly embarked or deployed through one rear door and two side doors. The Rakhsh 4x4 light armored personnel carrier is intended more for law enforcement forces than for full-fledged combat operations. It is in service with the Iranian police and the Islamic Revolution Guard Corps (IRGC). This armored personnel carrier is extremely similar to the North Korean BTR M-1992 The Rakhsh BTR comes in two versions: the first experimental model, which, apparently, is still being manufactured, and a later export version, which, due to the sanctions imposed on Iran, is also produced for local police and military. First display in 2006, Rakhsh was probably developed by the Iranian Defense Industries Organization (DIO) Shahid Kolah Dooz Industrial Complex. Rakhsh is based on a proven 4 × 4 cross-country chassis, produced in Iran for a variety of civil and military applications. In 2003 the Russian company Kamaz started cooperation with the company Rakhsh Khodro Diesel by the instrumentality of the RT Ministry of Trade. In addition to being used by Iran, a quantity of these vehicles have been supplied to Sudan. Production of the Rakhsh is undertaken by the DIO on an as required basis and may have been followed in development by a more advanced 4 × 4 or 6 × 6 APC. The Rakhsh hull is of all-welded steel armor providing protection from 7.62 mm small arms fire. The commander and driver are seated at the front of the vehicle being provided with front and side bulletproof windows. In addition to its crew of two, Rakhsh can carry eight fully equipped troops seated in the rear troop compartment. These occupants also have small bulletproof windows and 10 associated firing ports that allow them to fire their weapons from within the vehicle with some level of protection. The crew can rapidly enter and leave the vehicle via a door in either side of the hull and twin doors in the hull rear. The baseline version of the Rakhsh APC is fitted with a roof-mounted protective mount armed with a locally manufactured 12.7 mm Machine Gun (MG). This mount appears to be almost identical to that installed on the locally developed Boraq full-tracked APC that is already in service with Iran. This is very similar to 12.7 mm MG cupolas installed on Chinese tracked APCs. This manually operated mount provides side and rear protection to the gunner. Most often, the first option is a 14.5-mm machine gun in the turret, while a later version can only be seen with a 12.7-mm machine gun in the turret. Although there are no obvious reasons why you can not install other weapons. Although some models installed anti-aircraft installation ZU-23-2. In the early models, the side doors were hinged, while the later model had single door side doors. Other differences between the two options are minor, mostly “aesthetic”, most likely reflecting changes in production technology than any significant improvements. These include the alignment of the roof of the engine compartment, the elimination of certain angles and the movement of air intakes. The hull is welded from sheets of armor steel and has very characteristic massive angular contours. With spaced armor, it provides protection against 7.62-mm bullets. It can also be bolted to fasten armor plates, designed for other combat vehicles. Other features of the machine include a centralized pumping system for wheels, wheels with armor resistant inserts, a winch, an air conditioning system, optional smoke grenade launchers, and a system of protection against weapons of mass destruction. Standard equipment for the Rakhsh includes a central tyre inflation system that allows the driver to adjust the tire pressure to suit the terrain being crossed, tires fitted with run-flats, differential locks and a powered winch. As it will be deployed in high ambient temperatures an air conditioning system is fitted as standard. Rakhsh BTR cannot overcome too complex obstacles, destroy other armored vehicles, or protect the crew and troops from large-caliber ammunition, but it is worth recalling that it is not intended for such things and does not intend to replace Boragh or BMP-2. It is well suited to work as a police car or light armored personnel carrier, but no more.

Hafeet Emirate (UAE) 6x6 Armored Personnel Carrier (APC)

Tiers:

Variants:

- **HAFEET 620:**
- **HAFEET 620A:** Logistics and Utility Vehicle
- **HAFEET 640A:** Artillery Support Vehicle (Observation and Command & Control configurations)

Protection

Armor: The Hafeet Class features variants with a high degree of protection to enhance survivability of the crew to attack from roadside IEDs, under-vehicle mines and ballistic threats. The Hafeet Class vehicles can be armored with different level of ballistic and blast protection depending on the variant and customer needs. The vehicles can receive standard ballistic protection up to STANAG level IV and standard blast protection up to STANAG level III (a,b).

Applique Armor: Available, There are numerous versions of the Nimr Hafeet. Due to its modular nature the vehicle can be configured to suit various battlefield roles.

Explosive Reactive Armor: No

Active Protection System: INA

NBC Protection: Optional

Smoke Equipment: Available, smoke grenade dischargers

Fire Suppression System: Yes

Protective Net: Protective net against anti-tank rocket launchers

Battle Field Management System: Available

Heat Signature System: Available

RPF Protection System: Available

Notes:

The Hafeet is a family of 6 x 6 armored vehicles developed by Nimr Automotive in the United Arab Emirates to meet a variety of military requirements. The vehicles have a capacity of 28,660 lb (13,000 kg) and can perform missions from utility and transport to armored patrol, according to the manufacturer. Each variant uses the same 6 x 6 chassis to minimize logistics, training and spare-parts management. All Hafeet vehicles can be fitted with armor. The base platform is powered by six-cylinder, in-line diesel engine producing 300 hp. A more powerful 360-hp engine is available as an option. A fully automatic power shift transmission is connected to a two-speed dropbox and provides drive to the vehicle's fully independent double-wishbone portal axles with coil springs and hydraulic dampers. The suspension provides high ground clearance and, coupled with full differential locking and a central tire-inflation system, ensures excellent tactical mobility. The Hafeet is equipped with a generic vehicle compliant electronic architecture that supports intelligent power management; battlefield management systems; and capacity for integration with a variety of communication, battlefield and weapon systems. The vehicle can be fully integrated with a customer's preferred command, control, communications, computers, intelligence, surveillance, target acquisition and reconnaissance (C4ISTAR) systems and advanced weapon systems. Standard equipment includes a power-management system; run-flat tires; central tire-inflation system; and a winch. The Hafeet is powered by a Cummins ISBe 360 6.7-liter diesel engine developing from 286 to 360 hp coupled to an Allison 3200SP six-speed automatic transmission. All variants are equipped with air over hydraulic actuated disc brakes and hydraulic power-assisted steering. Option systems include various levels of ballistic (NATO Standard Agreement Level 1 to Level 4) and blast (Level 1 to Level 3a/b) protection; infrared-signature management; rocket-propelled grenade protection system; and nuclear, biological and chemical (NBC) warfare protection. A variety of camera systems can be equipped, including day and night cameras; a situational awareness system; and a display monitor. A GPS and/or inertial navigation system may also be fitted. A range of armament can be fitted, including 5.56-mm and 7.62-mm machine guns; 12.7-mm heavy machine guns; 40-mm automatic grenade launcher; and 20-mm to 30-mm cannons.

XA-188 Danish 6x6 Armored Personnel Carrier (APC)

Tiers:

Variants:

- **XA-180:** Original six wheeler, carries crew of 2 and 16 troops. Empty weight ca 12 tonnes.
- **XA-185:** Upgraded version, carries crew of 2 and 18 troops. Has a more powerful engine and improved power transmission. Used as an ambulance in the Norwegian Army.
- **XA-186:** Upgraded armour. Armoured and equipped with machine-assisted gun turret (.50 BMG). Cannot swim because of the heavy armour. Empty weight ca 19 tonnes. Engine and transmission same as XA-185.
- **XA-188:** Used by the Netherlands Army.
- **XA-200:** The 200 series looks a little different from older variants due to increased armour. It lacks amphibious capabilities but can wade through water that is up to 1.5 m deep. The improved armour protects the passengers against up to 14.5 mm small arms fire. It is also equipped with modern optical aids like periscopes and night vision. The armor upgrade was initiated after the realisation that the previous armor was inadequate, even modern armor-piercing 7.62 mm ammunition could pierce the older XA-180 and XA-185 models in certain areas. The XA-202 was originally developed for Communications and Command. The XA-203 was made as a temporary replacement for XA-185, and is intended to be replaced by Patria AMVs in Finnish service. The Patria AMV (Armored Modular Vehicle) is an 8×8 multi-role military vehicle produced by the Finnish defence company Patria.

System

Alternative Designation: XA-188
Type: 6x6 Armored Personnel Carrier (APC)
Manufacturer: Patria Vehicles Oy, Hameenlinna, Finland
Family: XA Series
Crew: 2 (commander, driver)
Passenger Capacity: 10 Troops
Note: This is the Dutch/Danish version that has been developed for peacekeeping operations.

Dimensions

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: INA

Protection

Hull Armor: All-welded steel hull provides splinter protection. The basic armor is 0.5-in (12-mm) thick. The hull bottom offers improved mine protection.

Applique Armor: Available, Add-on armor is available as an option, which can protect against threats up to 14.5-mm armor-piercing rounds.

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: Yes

Smoke Equipment: Yes, five smoke dischargers on each side

Fire Suppression System: Yes

Notes:

XA-188 This is the Dutch/Danish version that has been developed for peacekeeping operations. It can be armed with a 7.62-mm or 12.7-mm machine gun mounted on the roof of the vehicle. The basic armor is 0.5-in (12-mm) thick. The hull bottom offers improved mine protection. Add-on armor is available as an option, which can protect against threats up to 14.5-mm armor-piercing rounds. The Patria Pasi (earlier known as the Sisu Pasi) is a Finnish-made six-wheeled armoured personnel carrier (APC) originally designed for Finnish Defence Forces. The first version was produced in 1983 and serial production began in 1984. It was designed to operate with ease of use, simple structure and low-cost maintenance. The basic appearance and configuration of Patria Pasi is similar to most wheeled APCs. The XA-180 and XA-185 versions are fully amphibious while the XA-203 is not. In 1980, Sisu produced an XA-180 prototype for Finnish Army tests. It competed against two other prototypes, but was declared the winner of the trials in 1983. On 22 December 1983 the Finnish Army ordered a first batch of fifty XA-180s, of which nine were reserved for UN duties. The vehicle proved quite successful and more orders were soon to follow. The XA-180 was originally manufactured and marketed by the Finnish company Sisu Auto but later variants were marketed by the Finnish defence company Patria and are known as Patria XA series.[1] The Vehicle's widely known nickname "Pasi" (also a common given name of Finnish men) stems from the Finnish name "panssari-Sisu" (English: armoured Sisu). The main superstructure is mainly manufactured from 6 to 12 mm of armour steel and the bottom is mine-strengthened, and the front windows are bullet-resistant and equipped with protective hatches. The vehicle has continuous six wheel drive and good capabilities for off-road driving. It can take inclines up to a maximum of 60°. The XA series has no standard armament, but is equipped with a rotating turret structure for installation of light/heavy machine guns or autocannons. It also has 8 BMP style firing ports on the sides and rear. Therefore, passengers, usually a squad of infantry, can fire their weapons from the cover of the armor. The XA series is popular in peacekeeping missions due to its mobility, non-aggressive appearance, and good protection against mines and improvised explosive devices (IED). The vehicle also offers a good combination of armament, comfort, mine protection, protection against shrapnel and small calibre fire, road speed, short time of learning how to drive, and an acceptable terrain mobility. It also offers more internal space compared to other similar vehicles like the Fuchs or BTR-80.

Shorland S55 British 4x4 Armored Personnel Carrier (APC)

NBC Protection: Yes

Smoke Equipment: Available

Windscreens: All windscreens and side windows were bullet resistant while the six occupants in the rear were provided with small vision blocks and firing ports.

Firing Ports: Yes

Notes:

The Shorland is an armoured patrol car that was designed specifically for the Royal Ulster Constabulary by Frederick Butler. The first design meeting took place in November 1961. The third and final prototype was completed in 1964 and the first RUC Shorlands were delivered in 1966. They were reallocated to the Ulster Defence Regiment in 1970. The Royal Ulster Constabulary soon replaced the Shorland with an armoured Land Rover with more conventional profile and no machine gun turret. The vehicles were built by Short Brothers and Harland of Belfast using the chassis from the Series IIA Land Rover. By the nineties, the Land Rover Tangi, designed and built by the Royal Ulster Constabulary's own vehicle engineering team, was by far the most common model of armoured Land Rover. Shorts and Harland continued to develop the original Shorland from an

armoured patrol car with a crew of three to an armoured personnel vehicle, capable of carrying two up front and six in the rear; a small number of these were used on the streets in Northern Ireland as late as 1998.

BTR-152 Russian 6x6 Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BTR-152:** Basic version with open top & no winch that has been converted to other uses such as fire support vehicles, gun trucks, ambulances, or engineer vehicles
- **BTR-152A:** Anti-aircraft variant with twin 14.5-mm MGs mounted in a turret
- **BTR-152D/BTR-152E:** Anti-aircraft version with 4 14.45-mm machine guns
- **BTR-152I:** BTR-152V converted to use as an artillery command vehicle
- **BTR-152 (Model D):** Similar to the BTR-152V3, but with an overhead armor & 2 roof hatches
- **BTR-152V:** Open top with central tire-pressure regulation system (CTPRS)
- **BTR-152V1 (Model B):** BTR-152V with 5000 KG front winch
- **BTR-152V2:** BTR-152V without the winch
- **BTR-152V3 (Model C):** BTR-152V with winch, internal CTPRS air lines & infrared driving lights
- **BTR-152U:** Command vehicle features a high rear structure & CTPRS
- **BTR-152 with ZU-23 Mount (Lebanon):** 2 23-mm anti-aircraft machine guns mounted in troop compartment
- **BTR-152 with Czech M53 (Egypt):** 4 12.7-mm DShKM anti-aircraft MGs mounted in troop compartment
- **Type 56 (China):** Chinese BTR-152 with a different engine

System

Notes:

The BTR-152 (also known as BTR-140) was a six-wheeled Soviet armored personnel carrier built on the chassis and drive train of a ZiS-151 utility truck. It entered service with a number of Warsaw Pact member states beginning in 1950, and formed the mainstay of Soviet motor rifle battalions until the advent of the amphibious BTR-60 series during the 1960s. BTR-152s were available in several marks, and were manufactured in large numbers for the Soviet military and export. Late production models utilized automotive components from the more reliable ZIL-157 truck. Three primary variants of the BTR-152 appeared between 1950 and 1959: the base armored personnel carrier with a single pintle-mounted 7.62mm or 12.7mm machine gun, an unarmed command vehicle with a higher roofline, and an anti-aircraft variant armed with a ZPU-2 mount. BTR-152s could carry a single infantry squad each, or specialist weapons teams along with their mortars and anti-tank equipment. In Soviet service, a number were also deployed as artillery tractors. The BTR-152 is a modified truck chassis with an armored hull and an open-topped troop compartment. The sides and rear of the troop compartment are vertical, with corners sloping inwards to deflect shell fragments. There are firing ports on each side of the troop compartment and two rear doors for rapid debarking. Infantrymen can fire their individual weapons from the relative protection of the vehicle, and exit through these doors or by jumping over the sides. The crew consists of a driver and a single passenger, who operates the radios. Two types of seating arrangements were available: the first consists of wooden benches on either side of the troop compartment facing inwards; the second consisted of three rows of seats facing forward. Both the driver and the radio operator seated to his right are provided with individual windscreens and, when in combat, these are covered by twin armored shutters with integral vision blocks. Crew members exit the vehicle through side doors, the tops of which are hinged and fold down for observation purposes. The BTR-152's armor plate is fabricated of welded steel and ranges from 4 mm (0.16 in) to 13.5 mm (0.53 in) in thickness. This protects the crew and passengers from small arms fire, shell fragments, grenades, and anti-personnel mines, but is ineffective against larger shell fragments or even heavy machine gun fire. Late production hulls may have been manufactured from steel plate with a thickness of up to 15 mm (0.59 in). The vehicle is sometimes fitted with a winch that has a maximum capacity of 5 tonnes and a 70m cable. Depending on the variant, BTR-152s can tow field artillery, transport 1.9 tonnes of cargo, or carry a half platoon of infantry. Most Soviet BTR-152s were powered by a six-cylinder ZiL-123 in-line water-cooled petrol engine developing 110 hp at 2,900 rpm. Those based on the chassis and components of the ZiL-157 utility truck utilized a slightly different ZiL-137K engine. There are several engine louvers on the front of the hull to prevent overheating; these could be safely closed for short intervals during combat, as long as the driver reduced speed and avoided overtaxing the vehicle. A BTR-152's gearbox comprised five forward gears and one reverse gear with a two-speed transfer box. Fifth gear had an overdrive. The suspension consisted of conventional leaf springs with hydraulic shock absorbers. In the late 1950s, a little over 200 BTR-152s were produced with enclosed hulls, as opposed to the traditionally open-topped design; these were designated

BTR-152K and BTR-152K1. They were also known unofficially as "BTR-152 Model D" or "BTR-152 M1961" by some Warsaw Pact armies. The enclosed hull reduced situational awareness but allowed for the installation of central heating and an NBC overpressure system. Two hatches opening to the right were installed on the new roofline. The BTR-152 was originally armed with a single pintle-mounted 7.62mm SG-43 Goryunov (SGMB) medium machine gun, fed by 1,250 rounds of stored on-board ammunition. This was mounted behind the driving position. Additional 7.62mm general-purpose machine guns could be mounted on either side of the hull top as needed. The SGMB machine gun could traverse 45 degrees and elevate between -6 and +24 degrees. Some of the BTRs were fitted with single 12.7mm DShK or 14.5mm KPV heavy machine guns in place of the SGMB. Vehicles designated BTR-152A were ground support vehicles with limited air defense capability. BTR-152As carried twin KPVs in a ZPU-2 anti-aircraft mount. Variations included an Egyptian model with a Czechoslovak M53 Quad mounting for four DShKs, which were normally towed on a two-wheeled trailer, and some modified by the Palestine Liberation Organization to accept 23mm ZU-23-2 anti-aircraft guns. Because the original BTR-152 utilized the chassis and engine of the ZiS-151, it shared that truck's maintenance problems and poor cross-country mobility. Later variants, using ZiL-157 components, had more power and larger, single tires that reduced the vehicle's shortcomings but did not entirely eliminate them. Serviceability and reliability remained low.

XA-200 Finish Armored Personnel Carrier (APC)

Tiers:

Variants:

- **XA-202/XA-202S:** This is a command vehicle based on the XA-200 chassis. The hull is divided into four sections: auxiliary power unit (APU) room, engine room, driver/commander compartment and operator room. A ring mount for a 12.7-mm machine gun is fitted above the commander.
- **XA-203/XA-203S:** This is an armored personnel carrier variant with a combat weight of 23 tons, including a payload of 7 tons.
- **XA-220:** This is the latest variant, which was revealed by Patria in mid-2016. The vehicle offers more comfort, mine protection, armor protection, speed, all-terrain mobility and internal space compared to similar platforms, according to the manufacturer.

System

Alternative Designation: XA-200

Type: Armored Personnel Carrier (APC)

Manufacturer: Patria Vehicles, Hameenlinna, Finland

Family: XA Series

Crew: ea2

Passenger Capacity: ea10

Dimensions

Length: 7.45 m

Width: 2.95 m

Height: 2.60 m

Ground Clearance: 0.40 m

Weight, Combat: 22,000 kg

Automotive

Engine Name: Valmet 612DWIBIC (Euro 2)

Engine Type: turbocharged intercooled six-cylinder inline Diesel

Engine Power: 295 hp at 2,000 rpm

Power-to-Weight Ratio: 13.4 hp/ton

Fuel Capacity: 300 liters

Transmission: Allison MD 3560PR automatic w/torque converter(6 forward gears, 1 reverse in high range)

Axles: Sisu

Steering: hydraulic, power steering, first two axles

Brakes: dual circuit pneumatic

Suspensions: parabolic leaf springs with hydraulic shock absorbers

Maximum Speed on Road: 95 kph

Range: 600 km

Gradient: 60 percent

Side Slope: 60 percent

Fording: 1.5 m

Main Gun

Note: 7.62-mm machine gun; or 20-mm AKAN m47D cannon (12 rounds)

Hull Armor: High hardness welded armored steel

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: Available

Smoke Equipment: INA

Notes:

The XA-200 series armoured 6×6 wheeled vehicle is an updated production version of the XA series, of which over 700 vehicles have been produced. The series is manufactured by Patria Vehicles of Hameenlinna, Finland, formerly Sisu Vehicles. The vehicle is in service with the Finnish Army (104 XA-200 armoured personnel carriers), the Swedish Army (86 XA-203S basic vehicles and 18 XA-202S command vehicles) and the Norwegian Army (32 XA-200 armoured personnel carriers). The AMOS advanced mortar system has been integrated on the XA-200 chassis and trialled and evaluated by the Finnish Army. 24 AMOS systems (developed by Patria Hagglunds) were ordered by Finland for integration on the Patria 8×8 armoured modular vehicle.

Supacat 400 British 4x4 Armored Personnel Carrier (APC)

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Supacat Protected Vehicle 400 (SPV 400) is a further evolution of Supacat's long pedigree of developing relevant and effective military vehicles. Giving soldiers what they need for 21st century operations: superior mobility and protection. Building on previous experience and integrating direct feedback from the operational use of our existing fleet, the SPV 400 takes the performance levels of lightweight protected mobility platforms beyond that currently on offer around the globe. "Fully integrated protection" is the key to the SPV formula which, combined with a cutting edge bespoke automotive solution, offers exceedingly high levels of protection yet remains sufficiently packaged to access the tightest of terrain. The SPV 400 mirrors the "go anywhere" ethos of other Supacat products and provides supreme cross-country performance as well as providing the protection required to operate in an urban environment. The operator's needs and the integration of modern battlefield systems have been considered from the outset so the SPV 400 is a highly attractive and 'useable' solution for 21st Century operations. The SPV 400 patrol variant can be adapted for use by fitting alternative and interchangeable mission pods that include ambulance, logistic, command and open top weapon mounted variants.

FV103 Spartan British Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Scorpion (FV101):** Original variant with 3-man crew
- **Spartan (FV103):** Artillery & engineer vehicle with 3-man crew & 4 dismountable troops; 80 k/hr; 483 km range; 1 7.62-mm MG
- **Striker (FV102):** AT vehicle with 5 Swingfire CLOS ATGMS (5 reloads) & 1 7.62-mm L37A1 MG
- **Scorpion 90:** 3-man crew; 73 k/hr; Cockerill Mk IIIK 90-mm gun & 1 7.62-mm MG
- **Samaritan (FV104):** Ambulance for 4 litter patients, 5 seated patients, or 2 litter/3 seated patients; 2-man crew; 483 km range
- **Sultan (FV105):** Command vehicle with at least 2 radios; total 5-6 personnel; 483 km range
- **Samson (FV106):** 483 km range, ARV with internal main winch, tow bars, & tow cables
- **Scimitar (FV107):** Scorpion with 1 30-mm Rarden L21 rifled gun (165 rounds) & 1 7.62-mm coax MG; 80 k/hr; 644 km range;
- **Scorpion 2:** Description of late production Scorpions with Perkins engine & other upgrades with 2-man turret with 30-mm, 76-mm, or 90-mm main armament options
- **Saber:** Reconditioned recon vehicle with 30-mm Rarden cannon & Hughes 7.62-mm coaxial chain gun
- **Scorpion (Jordan):** Upgraded original Scorpion with Perkins engine & other upgrades
- **Spartan with MILAN ATGM:** 2-round turret must be reloaded from outside the vehicle (11 reloads)
- **Scorpion 90 (Venzeula):** Scorpion 90 with Belgain CMI Defence 90-mm Mk II gun & Perkins engine
- **Sturgeon:** OPFOR vehicle used in Suffield, Canada based on the Spartan
- **Salamander:** OPFOR vehicle used in Suffield, Canada based on the 76-mm Scorpion
- **Scorpion (Malaysia):** Scorpion 90 with 76-mm AGL & Perkins engine
- **Omani Scorpion:** Increased protection package & some received a Cummins diesel engine
- **Scorpion vehicle-mounted automatic mortar FCS:** Fires Denel's 60-mm or BAE Systems' 81-mm L16 mortars
- **CVR(T) Life-Extension Program (LEP):** LEP with diesel engine, better optics & communication

Note #1: The rear door has an integral vision block

Note #2: There are no firing ports

Notes:

FV103 Spartan is a tracked armoured personnel carrier of the British Army. It was developed as the APC variant of the Combat Vehicle Reconnaissance (Tracked) family. The vehicle can carry up to seven personnel, including three crew members. Armed with a single machine gun, it is almost indistinguishable from the FV102 Striker in external appearance. Rather than a general personnel carrier for infantry, the Spartan has been used for moving specialist teams, such as anti-aircraft missile teams. An anti-tank variant of the Spartan has been produced, named FV120 Spartan MCT; this is armed with MILAN anti-tank missiles. Nearly 500 Spartans have served with the British armed forces since entering service in 1978; they are now being replaced by newer vehicles. The FV103 Spartan was developed during the 1970s as the Armoured Personnel Carrier (APC) version of the British Army's Combat Vehicle Reconnaissance (Tracked) (CVR(T)) family of armoured fighting vehicles, designed by Alvis plc. The vehicle entered service with the British military in 1978. The Spartan is similar in appearance to the FV102 Striker, except for the missile launcher on the Striker. The Spartan was powered by a 4.2 xk jaguar petrol engine. The vehicle is 5.16 metres (16.9 ft) in length and 2.48 metres (8 ft 2 in) in width. With a ground clearance of 0.33 metres (1 ft 1 in), it has a height of 2.63 metres (8 ft 8 in). As the APC variant of the CVR(T) family, the FV103 has been used by small specialized groups such as mortar fire controller teams, anti aircraft teams and also reconnaissance teams. The vehicle can carry seven personnel, in a combination of three crew members and four passengers or two crew members and five passengers.[6] It is armed with one 7.62 mm L37A1 machine gun, and can have four smoke dischargers on each side. In addition to the APC role, it has also been used as a resupply vehicle for the FV102 Striker, carrying extra Swingfire missiles. The FV103 has combat weight of 10,670 kilograms (23,520 lb). It can achieve a maximum speed of 96 kilometres per hour (60 mph) and has a range of 510 kilometres (320 mi). It is capable of negotiating up to 60% gradients

M113 American Armored Personnel Carrier (APC)

Tiers:

Variants:

- **M113:** Original gasoline version
- **M113A1:** Diesel production model
- **M113A1 Armored Cavalry Assault Vehicle (ACAV):** Armor around the commander's position & 2 extra M-60 MGs
- **M113A2:** Improved engine cooling, better rear fuel cells, & new suspension system
- **M113A2 ARV:** Armored Recovery Vehicle with a 1361 kg auxiliary crane
- **Stretched M113A2:** Prototype with an extra road wheel
- **M113A3:** Bigger engine, yoke steering, Kevlar spall liner, applique liner, external fuel cells
- **M113A3 M/R:** Maintenance/Recovery vehicle with 9000 kg winch & 1360 kg crane
- **M58 Wolf Smoker Generator Carrier:** Vehicle dedicated to produce smoke
- **M106:** M113 with M30 (107-mm) mortar in back with 88-93 rounds
- **M125:** M113 with M29 (81-mm) mortar in back with 114 rounds
- **M163:** M113A1 with turret with M61A1 Vulcan 20-mm 6-barrel Gatling cannon
- **M548:** Unarmored cargo carrier
- **M577:** Command post carrier with built-up rear area & telescopic antenna
- **M577A3:** M113A3 engine with extended hull & 6 road wheels
- **M901:** Improved TOW Vehicle with an Emerson ITV turret with 2 TOW tubes with an additional 10 missiles
- **M981:** Fire Support Vehicle (FSV) with laser designator & improved commo gear
- **M1059 Lynx:** M113A2 with M157 smoke generator system
- **M1064A3:** M113A3 with Soltan (120-mm) mortar with 60 rounds
- **M1068A3:** Modified M113 into the Standard Integrated Command Post (SICP)
- **M113 Ambulance:** Various versions available
- **M113 with Dozer Blade:** M113s with trim vane removed to be fitted with a bulldozer kit
- **M113 HAZMAT:** Stretched M113A3 for spills

System

Alternative Designations: M113 APC. This APC has many different Variants

Description: Tracked APC with rear ramp (door also) for 11 soldiers to dismount. Soldiers must expose themselves through the roof of the vehicle to fire their weapons. No firing ports.

Manufacturer: INA

Crew: ea2 (driver, commander)

Passengers: ea11

Note #1: The M113 and variants are the most widely produced and utilized APC of the Western World.

Note #2: There were 4,947 M113 APC's produced for the U.S. Army and 9,839 under the Foreign Military Sales (FMS) program

Fire Control

FCS Name: INA

Computerized FCS: No

Protection

Armor (turret front): Protection of the M113 was rather limited. All-round protection is against 7.62 mm ball rounds and artillery shell splinters. At close range the M113 would be penetrated by 12.7 mm heavy machine gun rounds

Applique Armor: Yes, on the bottom of the APC

Explosive Reactive Armor: Available

Active Protection System: No

Self-entrenching Blade: Available

NBC Protection System: Yes

Smoke Equipment: No

Survivability Equipment: Anti-mine armor on bottom

Note: Up to 40% of vehicle components are manufactured from light alloys

Notes:

The M113 armoured personnel carrier was developed by the FMC (Food Machinery Corp.) based on M59 and M75 armoured personnel carriers from the 1950s. The first prototype of M113 was produced in 1957. The US Army adopted the vehicle in 1960. Kaiser Aluminum and Chemical produced the aluminium required for the development of M113. FMC transferred the production of M113 vehicles to its new subsidiary, the United Defense in 1994. United Defense was acquired by BAE in 2005. As of November 2011, more than 80,000 M113 vehicles were produced in different variants. The vehicle is operational in more than 44 countries. The M113 is a fully tracked armored personnel carrier (APC) that was developed and produced by the Food Machinery Corp (FMC). The M113 was sent to USAREUR to replace the mechanized infantry's M59 APCs in the 1961/62 time frame. The M113 was first tried out in combat in April 1962 after the United States provided the South Vietnamese Army (ARVN) with heavy weaponry such as the M113, under the Military Assistance Command, Vietnam (MACV) program. Eventually, the M113 was the most widely used armored vehicle of the U.S. Army in the Vietnam War, earning the nickname 'Green Dragon'[dubious – discuss][citation needed] by the Viet Cong as it was used to break through heavy thickets in the midst of the

jungle to attack and overrun enemy positions. It was largely known as an "APC" or an "ACAV" (armored cavalry assault vehicle) by the allied forces. The M113 was the first aluminum hull combat vehicle to be put into mass production, it introduced new aluminum armor that made the vehicle much lighter than earlier vehicles; it was thick enough to protect the crew and passengers against small arms fire but light enough that the vehicle was air transportable and moderately amphibious. In the U.S. Army, the M113 series have long been replaced as front-line combat vehicles by the M2 and M3 Bradleys, but large numbers are still used in support roles such as armored ambulance, mortar carrier, engineer vehicle, and command vehicle. The U.S. Army's heavy brigade combat teams are equipped with approximately 6,000 M113s and 4,000 Bradleys. The M113's versatility spawned a wide variety of adaptations that live on worldwide, and in U.S. service. These variants together currently represent about half of U.S. Army armored vehicles. To date, it is estimated that over 80,000 M113s of all types have been produced and used by over 50 countries worldwide, making it one of the most widely used armored fighting vehicles of all time. The Military Channel's Top Ten series named the M113 the most significant infantry vehicle in history. The U.S. Army planned to retire the M113 family of vehicles by 2018, seeking replacement with the GCV Infantry Fighting Vehicle program, but now replacement of the M113 has fallen to the Armored Multi-Purpose Vehicle (AMPV) program. Thousands of M113s continue to see combat service in the Israel Defense Forces, although as of 2014 the IDF was seeking to gradually replace many of its 6,000 M113s, with Namer APCs.

SBA-60K2 Bulat Russian Armored Personnel Carrier (APC)

Name: INA

Computerized FCS: No

Protection

Hull Armor: The armour on the Bulat can withstand direct hits from 7.62 mm calibre weapons.[4] The vehicle features prominent, high-angled plated armour meant to deflect small-arms' rounds and artillery shell shrapnel, and features a V-shaped hull to increase protection against mine and IED blasts, with the bottom of the hull being resistant to explosions equivalent to 1 kg of TNT. The Bulat is also fitted with mine-resistant seats.

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The SBA-60K2 Bulat armored personnel carrier (APC) was developed jointly by Kamaz and Zaschita corporation as a private venture. Development of this vehicle commenced in 2010 and was completed by 2013. It is a further development of the earlier BPM-97 6x6 wheeled mine-resistant, ambush protected (MRAP) vehicle. Russia currently employs 15 Bulat vehicles received in late 2014, and ordered a new batch of further 50 vehicles from the Russian manufacturer Zashcita. The layout of the Bulat SBA-60-K2 is very similar to the old Soviet-built BTR-152, with the engine being placed at the front, the commander and driver are seated behind the engine, and the troop compartment placed at the rear. The Bulat APC consists on a KamAZ-5350 6x6 wheeled utility truck chassis fitted with a fully enclosed armored hull, and can be employed in many roles, including: transportation of soldiers and equipment, patrol and convoy escort duties, and Mine & IED clearance. The troop compartment has room for 8 fully equipped soldiers plus 2 crew members. The soldiers enter and exit the vehicle through the twin doors placed at the rear of the hull which open outwards, and each door is fitted with one single bulletproof glass window and one firing port. The roof of the crew compartment is fitted with 6 hatches, and both sides of the hull can be fitted with three to four bulletproof glass windows with a single firing port beneath each window. The Bulat APC is powered by a KamAZ-740.31-240 turbocharged diesel engine developing 240 hp, which is mated with a 10-speed manual transmission. Although built on a wheeled 6x6 configuration, it has a limited cross-country capability, being fitted with a central tyre inflation system and a self-recovery winch. Standard equipment includes air conditioning, an engine fire suppression system, and special racks for rifles and other personal weapons. There are a number of other available options, including a satellite-based land navigation system, cameras for 360-degree situational awareness, and additional heating. The armour on the Bulat can withstand direct hits from 7.62 mm calibre weapons. The vehicle features prominent, high-angled plated armour meant to deflect small-arms' rounds and artillery shell shrapnel, and features a V-shaped hull to increase protection against mine and IED blasts, with the bottom of the hull being resistant to explosions equivalent to 1 kg of TNT. The Bulat is also fitted with mine-resistant seats.

Basic Load: 2,000 ea

Fire Control

FCS Name: INA

Computerized FCS: No

Protection

Armor (turret front): Protection of the M113A1 was rather limited. All-round protection is against 7.62 mm ball rounds and artillery shell splinters. At close range the M113 would be penetrated by 12.7 mm heavy machine gun rounds

Applique Armor: Yes, on the bottom of the APC

Explosive Reactive Armor: Available

Active Protection System: No

Self-entrenching Blade: Available

NBC Protection System: Yes

Smoke Equipment: No

Survivability Equipment: Anti-mine armor on bottom

Note: Up to 40% of vehicle components are manufactured from light alloys

Notes:

The M113A1, informally known as the Gavin, is a lightly armoured full tracked air transportable personnel carrier designed to carry personnel and certain types of cargo. The M113-family was developed from M59 and M75 by Ford and Kaiser Aluminium and Chemical Co. in the late 1950´s. The vehicle is capable of: amphibious operations in streams and lakes; extended cross country travel over rough terrain; and high speed operation on improved roads and highways. The M113 Family includes approximately 12 variants of light armored tracked vehicles used in a variety of combat and combat support roles. Total density exceeds 28,000. Today's M113 Family of Vehicles is composed of a mix of derivative systems consisting of the A1, A2, and A3 configurations. The current fleet includes: M113A2; M113A3; M106A2; M1064; M1064A3; M548A1; M548A3; M577A2; M577A3; M730A2; M901A1; M981; M1068; M1068A3; M1059; and M1059A3. Over the next 10-15 years, the majority of these systems will be converted to the A3 configuration. Since their initial introduction in 1960, M113-based systems have entered service in more than 50 countries. The systems have been modified into more than 40 identified specific variants, with many times that number of minor field modifications. Many of these modifications have been developed by foreign governments to meet their specific national requirements. While some older M113 derivatives are being retired and removed from selected inventories, other FOV members are being upgraded, reconfigured, and introduced as entirely new systems. More than 80,000 M113 Family of Vehicle (FOV) systems have been produced. New M113 FOV systems are being built while existing chassis are being upgraded to modern configurations. The M113 APC was the first modern "battle taxi"; developed to transport infantry forces on the mechanized battlefield. It is fitted with a 2 stroke six cylinder Detroit diesel providing power through a 3 speed automatic gearbox and steering differential. The main armament is a single .50 Cal heavy barrel machine gun, and the secondary armament is a single .30 Cal machine gun. The M113 is built of aircraft quality aluminum which allows it to possess some of the same strengths as steel at a much lighter weight. This distinct weight advantage allows the M113 to utilize a relatively small engine to power the vehicle, as well as carry a large payload cross-country. The vehicle is capable of "swimming" bodies of water. The vehicle is not mission capable if any one track shoe is damaged. If the M113 loses a track, breaks a track shoe or the vehicle throws a track, extreme caution must be exercised in maintaining control. The driver must immediately release the accelerator and let the vehicle coast to a stop. Applying braking action, i.e. brake pedal, laterals, pivot or any type of steering controls causes the vehicle to pull to the active or good track and could result in a roll-over. If it is absolutely necessary, the driver may apply braking action only, and only if the vehicle is approaching a ravine, a cliff, or if other catastrophic outcome, probably resulting in fatalities. When roll-over is imminent; it is safer to stay in the vehicle than to try to get out while the vehicle is still moving. Crew members may receive slight injuries from being thrown against metal parts, but if they try to leave the vehicle, it may roll over and crush them. Once the vehicle stops moving, the crew should get out as fast as possible because spilled fuel and oil may catch on fire. The first thing the driver should do in such an emergency is shut off the engine and turn off the master switch to minimize the fire hazard.

M113A3 American Armored Personnel Carrier (APC)

Tiers:

1 2 **3** 4

Variants:

- **M113:** Original gasoline version
- **M113A1:** Diesel production model
- **M113A1 Armored Cavalry Assault Vehicle (ACAV):** Armor around the commander's position & 2 extra M-60 MGs
- **M113A2:** Improved engine cooling, better rear fuel cells, & new suspension system
- **M113A2 ARV:** Armored Recovery Vehicle with a 1361 kg auxiliary crane
- **Stretched M113A2:** Prototype with an extra road wheel
- **M113A3:** Bigger engine, yoke steering, Kevlar spall liner, applique liner, external fuel cells
- **M113A3 M/R:** Maintenance/Recovery vehicle with 9000 kg winch & 1360 kg crane
- **M58 Wolf Smoker Generator Carrier:** Vehicle dedicated to produce smoke
- **M106:** M113 with M30 (107-mm) mortar in back with 88-93 rounds
- **M125:** M113 with M29 (81-mm) mortar in back with 114 rounds
- **M163:** M113A1 with turret with M61A1 Vulcan 20-mm 6-barrel Gatling cannon
- **M548:** Unarmored cargo carrier
- **M577:** Command post carrier with built-up rear area & telescopic antenna
- **M577A3:** M113A3 engine with extended hull & 6 road wheels
- **M901:** Improved TOW Vehicle with an Emerson ITV turret with 2 TOW tubes with an additional 10 missiles
- **M981:** Fire Support Vehicle (FSV) with laser designator & improved commo gear
- **M1059 Lynx:** M113A2 with M157 smoke generator system
- **M1064A3:** M113A3 with Soltan (120-mm) mortar with 60 rounds
- **M1068A3:** Modified M113 into the Standard Integrated Command Post (SICP)
- **M113 Ambulance:** Various versions available
- **M113 with Dozer Blade:** M113s with trim vane removed to be fitted with a bulldozer kit
- **M113 HAZMAT:** Stretched M113A3 for spills

Notes:

The A3 generation of the M113 family of vehicles is a major, comprehensive upgrade for the entire range of M113 variants. The intent of this upgrade was to increase the overall performance of the US Army's M113 fleet, which was the workhorse of its armored forces in the 1980s (over 20 000 M113s and its variants were in US service then). While previous M113 models were considered to have adequate firepower for an Armored Personnel Carrier (APC), their protection was considered lacking, and their mobility attributes outdated. With 209 hp and a top speed of 64 km/h, the earlier M113A2 would lag behind the 72 km/h M1 Abrams MBT and M2 Bradley IFV. Fully replacing the M113 family of vehicles with Bradley variants had already proven technically, logistically, and fiscally impossible, which necessitated upgrading the M113s instead of replacing them. The decision to proceed with this upgrade was made in 1984. Collectively known as the RISE upgrade (Reliability Improvements for Selected Equipment), the vehicle that would become the M113A3 was planned to be fitted with spall liners, a more powerful engine and transmission, new controls in the driver's station, external fuel cells, shock-absorbent seats, new brakes, and provisions for appliqué armor. Starting in 1987, all new-built M113s were made to 'A3 standard, and all upgrades have been to 'A3 since 1989.

Type 63 (YW531) Chinese Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Type 531 (1963):** Basic version with Type 56 7.62 mm machine gun, not mass-produced
- **ype A531 or Type 63 (1968):** Production variant with 12.7 mm machine gun Type 54, uprated engine and different transmission. Also known as Type 531A.
- **VTT-323:** North Korean version of the Type A531
- **Type B531 or Type 63-I (1981:** Improved version with stronger suspension, additional firing ports and two additional roof hatches.
- **Type 63C:** PLA version of the YW531C
- **Type 63CA:** PLA version of the YW531E
- **Type WZ701:** Command version of the Type A531 with higher troop compartment and fitted with up to five radios (Type 889, Type 892, Type 70-2B) and a generator. Armament consists of a Type 56-1 machine gun of 7.62 mm.
- **Type WZ721:** Communications relay vehicle with higher roof line and ZZT1 set.
- **Type WZ750:** Armoured ambulance with higher roof line, unarmed.
- **Type WZ302 or Type 54-1/Type 63-1 SPH:** Self-propelled artillery version of the Type B531 mounting a 122 mm Type 54-I howitzer. An improved version, the Type 70 [zh], has a longer chassis. Both vehicles also mount a Type 67 machine gun.
- **Type WZ303 or Type 70 MRL:** Rocket artillery version of the Type A531 with 19-tube 130 mm multiple rocket launcher (similar to the BM-14 MRL)
- **Type YD801:** Fire fighting vehicle
- **ZZM88:** Cryptography vehicle. Program begun in July 1984 and entered service in August 1992. Used to provide cryptographic codes for other vehicles.
- **Type WZ534:** (Type 89)
- **Type YW531C (1982):** Export version of the 531 series with German Deutz engine KHD BF8L of 320 hp (240 kW). The machine gunner's position front right was deleted
- **Type YW531D:** Modified version with only 1 instead of 2 firing ports on the left side
- **Type YW531E:** As per YW531D but with one additional radio Type 892
- **Type YW701:** Export version of the Type WZ701 command post vehicle. Based on the Type YW531C and equipped with a commander's cupola with Type 54 machine gun. Improved version Type YW701A
- **Type YW750:** Export version of the Type WZ750 armoured ambulance. Based on the Type YW531C and equipped with a commander's cupola with Type 54 machine gun.
- **Type YW304:** Self-propelled 82 mm mortar with 120 rounds, based on the Type YW531C/Type 531H.
- **Type YW381:** Self-propelled 120 mm mortar with 50 rounds, based on the Type YW531C
- **Type YW531H:** (Type 85)

Notes:

The Type 63 (industrial designation YW531) is a Chinese armoured personnel carrier that entered service in the late 1960s. It was the first armoured vehicle designed in China without Soviet assistance. The design is simple and is comparable to other APCs of its time such as the M113. Approximately 8,000 all types and variants were produced by Norinco. It also equips several armies around the world and has seen action in different conflicts including the Vietnam War, the Sino-Vietnamese War, the Iran–Iraq War, and the Gulf War. The hull is made of welded steel, and provides protection against small arms fire. The vehicle carries a maximum of 15 including crew, which depending on the particular configuration may be two or four, the rest of the passengers are infantry who sit in a compartment at the rear of the vehicle. The driver sits in the front left of the hull, and has a single piece hatch, which opens to the left. The driver is provided with two day periscopes which cover the front and right of the vehicle. One of the drivers periscopes can be replaced by a night vision device. The commander sits on the front right of the hull, and has a single piece hatch which opens to the right. The commander hatch has a periscope on the top surface that may be rotated through 360 degrees. Export variants of the vehicle with BF8L engine did away with the commander's position in the front right of the hull. Behind the driver, on the left side of the hull is a third crew position, which is provided with a hatch that opens to the left, and like the commander's position has a 360-degree rotating periscope. The engine sits to the right rear of the driver. It has a large intake located in the top of the hull, with an exhaust on the right hand side. The engine is either a Type 6150L 260 hp diesel engine or, on export versions, an 8-cylinder air-cooled, turbocharged diesel engine KHD BF8L 413F which develops 320 horsepower at 2,500 rpm. The engine feeds a manual transmission with five forward gears and one reverse gear. Track is driven at the front by a drive sprocket, and passes over four rubber-typed road wheels, then loops over an idler at the rear, before returning to the front again. No return rollers are fitted, the track rests on the top of the road wheels. Suspension is of the torsion bar type. The vehicle has a fuel capacity of 450 litres, which gives it a road range of around 500 kilometers. A 12.7 millimetre calibre machine gun is located in an open mount at the front of a small hatch in the center of the hull which opens into the troop compartment. The gun can traverse through 360 degrees and can be elevated to an angle of 90 degrees. Two roof hatches and a large rear door provide access to the troop compartment. The vehicle is amphibious, a folding trim board stowed at the front of the hull needs to be raised, and the vehicle can then propel itself in the water using its tracks.

M113A2 American Armored Personnel Carrier (APC)

Tiers:

Variants:

- **M113:** Original gasoline version
- **M113A1:** Diesel production model
- **M113A1 Armored Cavalry Assault Vehicle (ACAV):** Armor around the commander's position & 2 extra M-60 MGs
- **M113A2:** Improved engine cooling, better rear fuel cells, & new suspension system
- **M113A2 ARV:** Armored Recovery Vehicle with a 1361 kg auxiliary crane
- **Stretched M113A2:** Prototype with an extra road wheel
- **M113A3:** Bigger engine, yoke steering, Kevlar spall liner, applique liner, external fuel cells
- **M113A3 M/R:** Maintenance/Recovery vehicle with 9000 kg winch & 1360 kg crane
- **M58 Wolf Smoker Generator Carrier:** Vehicle dedicated to produce smoke
- **M106:** M113 with M30 (107-mm) mortar in back with 88-93 rounds
- **M125:** M113 with M29 (81-mm) mortar in back with 114 rounds
- **M163:** M113A1 with turret with M61A1 Vulcan 20-mm 6-barrel Gatling cannon
- **M548:** Unarmored cargo carrier
- **M577:** Command post carrier with built-up rear area & telescopic antenna
- **M577A3:** M113A3 engine with extended hull & 6 road wheels
- **M901:** Improved TOW Vehicle with an Emerson ITV turret with 2 TOW tubes with an additional 10 missiles
- **M981:** Fire Support Vehicle (FSV) with laser designator & improved commo gear
- **M1059 Lynx:** M113A2 with M157 smoke generator system
- **M1064A3:** M113A3 with Soltan (120-mm) mortar with 60 rounds
- **M1068A3:** Modified M113 into the Standard Integrated Command Post (SICP)
- **M113 Ambulance:** Various versions available
- **M113 with Dozer Blade:** M113s with trim vane removed to be fitted with a bulldozer kit
- **M113 HAZMAT:** Stretched M113A3 for spills

System

Alternative Designations: M113A2 APC. This APC has many different Variants
Description: Tracked APC with rear ramp (door also) for 11 soldiers to dismount. Soldiers must expose themselves through the roof of the vehicle to fire their weapons. No firing ports.
Manufacturer: INA
Crew: ea2 (driver, commander)
Passengers: ea11
Note #1: The M113 and its variants are the most widely produced and utilized APC of the Western World.
Note #2: Additionally, there is a M113A2 Armored Recovery Vehicle and a Stretched M113A2

Dimesions

Length: 5.3

Speed (Average cross-country): INA

Speed (Max Swim): km/h5.8

Ground pressure (kg/cm2): 0.55

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.6

Trench: m1.7

Fording Depths (m): Amphibious

Gearbox: Automatic gearbox.

Suspension: Reinforced suspension

Torsion Bars: Higher-strength torsion bars increased ground clearance

Shock Absorbers: Yes, reducing the effects of ground strikes

Fuel Capacity: 360 Liters

Note: On water it is propelled by spinning its tracks

Communications

Primary: Varies depending on model and country

Main Weapon System

Note: 12.7 mm machine gun mounted over commander's hatch

↳*System*

Name: M2 HB Anti-Aircraft Machine Gun

Type: 12.7mm

In Service: 1933-Present

Proliferation: Over 3 Million

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight, Gun Only: 38 kg

Weight, Gun with Tripod: 58 kg

Max Rate of Fire (M2HB Version): 450-600 rds/min

Max Rate of Fire (AN/M2 Version): 750-850 rds/min

Max Rate of Fire (AN/M3 Version): 1,200-1,300 rds/min

Action: Short recoil-operated

Effective Range: 1,800-2,000 m

↳*Ammunition*

Name: INA

Type: Rifle

Caliber: 12.7mm

Cartridge: 0.50 BMG (12.7×99mm NATO)

Muzzle Velocity: 450-1,300 m/s

Basic Load: 2,000 ea

Fire Control

FCS Name: INA

Computerized FCS: No

Protection

Armor (turret front): Protection of the M113A1 was rather limited. All-round protection is against 7.62 mm ball rounds and artillery shell splinters. At close range the M113 would be penetrated by 12.7 mm heavy machine gun rounds

Applique Armor: Yes, on the bottom of the APC

Explosive Reactive Armor: Available

Active Protection System: No

Self-entrenching Blade: Available

NBC Protection System: Yes

Smoke Equipment: No

Survivability Equipment: Anti-mine armor on bottom

Armored Fuel Tank: Yes

Note: Up to 40% of vehicle components are manufactured from light alloys

Notes:

The U.S. M113 armored personnel carrier (APC) and its variants are the most widely used of all non-Russian APCs. The M113A2 replaced the M113A1 in production since 1979. It has improved engine cooling equipment and reinforced suspension. A total of

5 300 M113 and 12 700 M113A1 APCs were upgraded to the A2 standard in the USA. In 1979, further upgrades were introduced. Engine cooling was improved by switching the locations of the fan and radiator. Higher-strength torsion bars increased ground clearance, and shock absorbers reduced the effects of ground strikes. Armored fuel tanks were added externally on both sides of the rear ramp, freeing up 0.45 cubic metres (16 cu ft) of internal space. The weight of the M113A2 was increased to 11,740 kilograms (25,880 lb). Because the added weight affected its freeboard when afloat, it was no longer required to be amphibious. Four-tube smoke grenade launchers were also added. The suffix A2 is used on all variants to denote upgrade to A2 standard.

M113AS4 Australian Armored Personnel Carrier (APC)

Tiers:

1 **2** 3 4

Variants:

- **M113AS4 AF:** armored fitted, fitted with a Hiab crane. A total of 38 of these vehicles will be delivered.
- **M113AS4 ARVL:** armored recovery vehicle, fitted with a 13 t capacity winch. A total of 12 of these vehicles will be delivered.
- **M113AS4 AA:** armored ambulance. A total of 15 of these vehicles will be delivered.
- **M113AS4 ACV:** armored command vehicle. A total of 43 of these vehicles will be delivered.
- **M113AS4 ALV:** armored logistics vehicle. It can take all types of combat supplies and carry them under armor. A total of 50 of these vehicles will be delivered.

Applique Armor: Protection of the upgraded APC was enhanced by add-on ceramic armor tiles. Hull was reinforced for additional protection against landmines and IED blasts. Interior was fitted with spall liner.

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M113AS4 is an Australian-made upgrade of the old M113AS1 and M113AS3 which are based on the American M113A1 tracked armoured personnel carrier (APC), one of the most popular light tracked APC in the world. The project of Australian M113 upgrade was leaded by BAE Systems. The decade long project to upgrade 433 M113 vehicles began in 2002, with the first completed vehicle delivered to the customer in January 2007. While the upgraded Australian M113s look similar to how they would have in the 1970’s, they are ‘a generational leap ahead’ with improved firepower, protection and habitability from the original M113 A1 vehicle. The finished vehicles are also more reliable and faster following the upgrade. The Australian Army operates a fleet of some 800 members of the M113 series of full-tracked armoured personnel carriers in different variants including ambulance, fire support, command post, mortar carrier, recovery and load carrier vehicles. The M113AS4 is currently the standard tracked APC of Australian armed forces. The M113 Armoured Personnel Carrier (APC) is an all-terrain vehicle designed to protect and transport its crew and up to ten Infantry personnel. In September 1996, the Australian Department of Defence selected the now Tenix Defence Systems Pty Ltd, Australia to upgrade 364 of the Australian Army's fleet of M113A1 series of full-tracked Armoured Personnel Carriers (APCs) to extend their operational life through to the year 2010.

BOV-M Slovenian 4x4 Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BOV-M (Slovenia):** Some built with 12.7-mm MGs
- **BOV-VP:** Security version with swing out gates to direct crowds
- **BOV-1/Polo M-83:** Sans troop compartment with 2 ATGM launcher pods with 3 AT-3 launchers each with machine gun mounted before the two AT-3s
- **BOV-3:** 3 turret-mounted 20-mm cannons for air defense
- **BOV-30:** 2 turret-mounted 30-mm cannons for air defense
- **LOV (Croatia):** No raised compartment, increased hull protection, but with a 12.7-mm machine gun
- **BOV-SN:** Ambulance
- **Yugo import BOV variants:** Serbia has a variants that include SP AA vehicles with the Igla or Stinger missiles or the ZU-23; AT vehicles with the AT-5 Spandrel; or an armored reconnaissance vehicle with a 20-mm M55 cannon, 7.62-mm PKT machine gun with twin AT-3 Sagger AT launchers or a single Spandrel system

Notes:

The Pandur I is an APC developed and produced by the Austrian company Steyr-Daimler-Puch Spezialfahrzeuge (SSF). It was developed during the 1980s as a private venture, based on the Pegaso BMR-600 design.[1] In 2003, General Dynamics took over Steyr-Daimler-Puch which is now part of General Dynamics European Land Systems (GD ELS), which is also the parent company of MOWAG, Santa Bárbara Sistemas and GD ELS – Germany. The baseline vehicle is armed with a 12.7 mm (.50 cal) heavy machine gun. Its modular design allows it to be fitted with a variety of weapon systems, including a 20 mm autocannon

and an armored two-man 90 mm gun turret.

BTR-40 Russian 4x4 Armored Personnel Carrier (APC)

Tiers:

1 2 3 4

Variants:

- **BTR-40A:** 5 person crew fires 2 14.5-mm KPV heavy MGs (2400 rounds) from a ZPTU-2 turret
- **BTR-40B:** Only 6 dismounted soldiers can fit into this vehicle with overhead armor with 4 roof hatches
- **BTR-40Kh:** NBC decontamination vehicle with poles to mark cleared lanes
- **BTR-40 with AT-3 Sagger:** East Germany converted some BTR-40s to ATGM vehicles with a triple launcher under overhead cover
- **BTR-40zhd:** This vehicle uses a metal wheel suspension to travel on railroad lines on scouting missions
- **Type 55 (China):** Chinese BTR-40 with different engine
- **Walid (Egypt):** Variants besides the APC include a smoke rocket launcher or a minelayer vehicle

System

Alternative Designations: Type 55 (China)
Description: 4 X 4 wheeled APC based on the GAZ-63 truck with an open top & a single rear exit door; passenger space for 8 soldiers; 3 firing ports on each side & 2 in the rear door

Notes:

The BTR-40 is a Soviet non-amphibious, wheeled armoured personnel carrier and reconnaissance vehicle. It is often referred to as the Sorokovka in Soviet service. It is also the first mass-produced Soviet APC. It was eventually replaced in the APC role by the BTR-152 and in the scout car role by the BRDM-1. The BTR-40's design was based on the GAZ-63 four wheel drive truck which went into production in 1946. The design featured a self-bearing body which was a new feature in Soviet vehicles. The hull has two side doors for the commander and driver and a back door. The vehicle can transport up to eight fully equipped soldiers or 1 tonne of cargo. The BTR-40's development began in early 1947 at the design bureau of the Gorkovsky Avtomobilny Zavod (Gorkovsky Automobile Factory) under the leadership of V. A. Dedkov. The concept was a successor to the BA-64B armoured car which went out of production in 1946. The design team also included L. W. Kostikin and P.I. Muziukin. Two prototypes designated BTR-141 were completed in 1947. The first was armed with two coaxial 14.5 mm KPVT heavy machine guns on a rotatable mount which was protected by armour plate at the front and sides. The second had no fixed armament. Neither one was accepted for service. In 1950 two new prototypes were produced. Those had a different shape of armour including an upright rear armour. Again one prototype had no fixed armament and the second was armed with two coaxial 14.5 mm KPVT heavy machine guns. These were accepted into service as BTR-40 and BTR-40A respectively. The vehicle's drawbacks, such as its poor cross-country performance and problems with crossing water obstacles, compelled the design team to produce, in late 1954, what was planned to be an amphibious variant of the BTR-40. It received the designation BTR-40P (with the 'P' standing for plavayushchiy – "floating"). During the design process, the vehicle moved away from the APC concept and became an amphibious armoured scout car. It received a new designation, BRDM. The BTR-40's design was based on the GAZ-63 four wheel drive truck which went into production in 1946. The design featured a self-bearing body which was a new feature in Soviet vehicles. The hull has two side doors for the commander and driver and a back door. The vehicle can transport up to eight fully equipped soldiers or 1 tonne of cargo. The BTR-40's armour is from 6 mm to 8 mm thick which gives it protection from small arms fire and the shell splinters of its time, but does not protect it against modern artillery fragments and .50-calibre machine gun fire. The BTR-40-series tyres are not protected by armour. They are particularly vulnerable to puncture from fire of all kinds. The vehicle has no roof and is normally covered with a tarpaulin to protect the crew, transported cargo or troops from rain and snow. However this makes it unable to mount any of the SGMB machine guns. The APC variant has no permanent armament but it has pintle mounts for three 7.62 mm SGMB medium machine guns, one at the front of the troop compartment and the other two at the sides. The vehicle also has two firing ports on both sides of the hull which allow up to four soldiers to use their weapons while being protected by the APC's armour. Like the GAZ-63 truck on which it is based on,

the BTR-40 has a four-wheel drive. The chassis, however, is shorter compared to the GAZ-63. The only other thing that distinguishes the chassis of the BTR-40 from that of the GAZ-63 are additional shock absorbers. The BTR-40 also has a more powerful engine. The turning angle is 7.5 m. The vehicle has the 10RT-12 receiving and airing radio which has a range of 20–25 km and a winch at the front, with a maximum capacity of 4.5 tonnes and 70 m of cable. It has no protection against nuclear, biological and chemical (NBC) weapons. It also has no night vision equipment.

Mine Clearing: Yes, with additional anti-mine protection plates
Self-Entrenching Blade: INA
NBC Protection: Yes
Smoke Equipment: Yes, smoke grenade dischargers placed in the rear part of the hull
IR Signature: INA
Automatic Fire Suppression Equipment: Yes

Notes:

The BTR-T ‘Armoured Transporter–Heavy’) is a Russian heavy infantry combat vehicle, designed by the Design Bureau of Transport Machine-Building (Omsk Transmash) state-run production association. It is based on the hull of the T-55 tank and answers the need for a heavy, well protected and well armed vehicle adapted to urban combat. The need for a heavy IFV appeared after the First Chechen War during which APCs such as the BTR-80 and BMP-2 suffered heavy losses in urban areas at the hands of Chechen rebels using RPG shoulder-launched anti-tank weapons. As a result, the design incorporates thicker armour, with built-in reactive armour. It also has heavier armament with sufficient elevation to engage targets in multi-story buildings. The choice of the T-55 hull rather than that of a more modern tank was decided as a cost-cutting measure and also probably in order to validate a conversion solution for the many T-55s in use around the world. It was influenced by Israel's IDF Achzarit that created virtually the same modifications in the 1980s. However, no export contracts have been signed.

XA-186 Finish 6x6 Armored Personnel Carrier (APC)

Tiers:

Variants:

- **XA-180:** Original six wheeler, carries crew of 2 and 16 troops. Empty weight ca 12 tonnes.
- **XA-185:** Upgraded version, carries crew of 2 and 18 troops. Has a more powerful engine and improved power transmission. Used as an ambulance in the Norwegian Army.
- **XA-186:** Upgraded armour. Armoured and equipped with machine-assisted gun turret (.50 BMG). Cannot swim because of the heavy armour. Empty weight ca 19 tonnes. Engine and transmission same as XA-185.
- **XA-188:** Used by the Netherlands Army.
- **XA-200:** The 200 series looks a little different from older variants due to increased armour. It lacks amphibious capabilities but can wade through water that is up to 1.5 m deep. The improved armour protects the passengers against up to 14.5 mm small arms fire. It is also equipped with modern optical aids like periscopes and night vision. The armor upgrade was initiated after the realisation that the previous armor was inadequate, even modern armor-piercing 7.62 mm ammunition could pierce the older XA-180 and XA-185 models in certain areas. The XA-202 was originally developed for Communications and Command. The XA-203 was made as a temporary replacement for XA-185, and is intended to be replaced by Patria AMVs in Finnish service. The Patria AMV (Armored Modular Vehicle) is an 8×8 multi-role military vehicle produced by the Finnish defence company Patria.

System

Alternative Designation: XA-186
Type: 6x6 Armored Personnel Carrier (APC)
Manufacturer: Patria Vehicles Oy, Hameenlinna, Finland
Family: XA Series
Crew: 2 (commander, driver)
Passenger Capacity: 10 Troops

Dimensions

Length: 7.35 m

Width: 2.90 m

Height: 2.30 m

Distance between a Axles, 1st to 2nd: 1.90 m

Distance between a Axles, 2nd to 3rd: 1.90 m

Tire Size: 356 x 508 mm

Ground Clearance: 0.40 m

Combat Weight: 15,000 kg

Unloaded Weight: 12,000 kg

Payload Weight, Road: 6,500 kg

Payload Weight, Cross-Country or Swimming: 3,000 kg

Automotive

Engine Name: 1 x Valmet 612 DWI

Engine Type: 451-cu in (7.4-l) liquid-cooled, turbocharged, 4-stroke, 6-cyl inline diesel

Engine Power: 271 hp (202 kW) at 2,500 rpm

Power-to-Weight Ratio: 16.0 hp/metric ton

Transmission: Allison automatic MD 3560P

Suspension: 6 x 6 (6 wheels driving, 4 wheels steering); beam axles, leaf springs and shock absorbers on each wheel station

Maximum Road Speed: 100 kph

Range: 800 km

Main Gun

Turret: A one-man turret

↳*System*

Name: M2 Browning

Type: Heavy Machine Gun

Caliber: 12.7

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective FIring Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

↳*Ammunition*

Type: Rifle
Caliber: 12.7mm
Cartridge: .50 BMG (12.7×99mm NATO)
Basic Load: INA

Protection

Hull Armor: All-welded steel hull provides splinter protection
Applique Armor: Available
Explosive Reactive Armor: No
Active Protection System: No
Mine Clearing: No
NBC Protection: Yes
Smoke Equipment: Yes, five smoke dischargers on each side
Fire Suppression System: Yes

Notes:

XA-186 This is an up-armored variant of the XA-185 developed for U.N. peacekeeping missions. The vehicle is fitted with additional passive armor; a one-man turret mounting an M-2HB .50-caliber machine gun with a bank of five smoke dischargers on each side; wire-cutting device on the front of the hull; and additional roof-mounted periscopes. The Patria Pasi (earlier known as the Sisu Pasi) is a Finnish-made six-wheeled armoured personnel carrier (APC) originally designed for Finnish Defence Forces. The first version was produced in 1983 and serial production began in 1984. It was designed to operate with ease of use, simple structure and low-cost maintenance. The basic appearance and configuration of Patria Pasi is similar to most wheeled APCs. The XA-180 and XA-185 versions are fully amphibious while the XA-203 is not. In 1980, Sisu produced an XA-180 prototype for Finnish Army tests. It competed against two other prototypes, but was declared the winner of the trials in 1983. On 22 December 1983 the Finnish Army ordered a first batch of fifty XA-180s, of which nine were reserved for UN duties. The vehicle proved quite successful and more orders were soon to follow. The XA-180 was originally manufactured and marketed by the Finnish company Sisu Auto but later variants were marketed by the Finnish defence company Patria and are known as Patria XA series.[1] The Vehicle's widely known nickname "Pasi" (also a common given name of Finnish men) stems from the Finnish name "panssari-Sisu" (English: armoured Sisu). The main superstructure is mainly manufactured from 6 to 12 mm of armour steel and the bottom is mine-strengthened, and the front windows are bullet-resistant and equipped with protective hatches. The vehicle has continuous six wheel drive and good capabilities for off-road driving. It can take inclines up to a maximum of 60°. The XA series has no standard armament, but is equipped with a rotating turret structure for installation of light/heavy machine guns or autocannons. It also has 8 BMP style firing ports on the sides and rear. Therefore, passengers, usually a squad of infantry, can fire their weapons from the cover of the armor. The XA series is popular in peacekeeping missions due to its mobility, non-aggressive appearance, and good protection against mines and improvised explosive devices (IED). The vehicle also offers a good combination of armament, comfort, mine protection, protection against shrapnel and small calibre fire, road speed, short time of learning how to drive, and an acceptable terrain mobility. It also offers more internal space compared to other similar vehicles like the Fuchs or BTR-80.

→→Amphibious Armored Personnel Carrier (APC)

BTR-80A Russian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BTR-80 (GAZ-5903):** Original w/ 3 firing ports on each side & smoke grenade launchers
- **BTR-80A (GAZ-59034:** Stabilized turret w/ 2A72 gun, 7.62-mm coax MG, & new right side firing port
- **BTR-80AK:** BTR-80A CP variant with 1 firing port on right side and 2 whip antennas at rear corners
- **BTR-80K (GAZ-59031):** Command Post for 6; different turret w/ MGs & 3 radios (R-173, R-173P & R-159)
- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment
- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle
- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun

- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control
- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RPM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle
- **R-439-BK (Legenda 2BK):** Satellite communications vehicle
- **R-165B:** Short-wave signal/ communications vehicle
- **R-149BM4A:** Command and Signal Vehicle
- **R-149BMR:** Signal/Communications vehicle
- **PU-12M7 (9S482MU):** Improved PU-12M6 FA battery command vehicle
- **PU-12M6 (9S482M6):** Field Artillery (FA) battery command vehicle
- **P-240BTZ:** Switchboard platform
- **K1Sh1 (GAZ-59032) (UNSH):** Command Post with enlarged hull w/o turret armament
- **E-351BrM:** Mobile power station with diesel/electric generator
- **BREM-K (GAZ-59033) ARV:** Armored recovery vehicle with A-frame, tow bars, & stabilizers
- **BMM-80 (GAZ-59039 or Simfoniya):** Battlefield ambulance for 9 sitting or 2 litter patients
- **BMM-3:** Battlefield ambulance used as a mobile field hospital
- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)
- **2S23 (Nona-SVK) SP GunMortar System (Fire Support Vehicle):** Breach-loaded 2A60 120-mm rifled mortar/gun system similar to the 2S9
- **BTR-80 R-975:** Forward air control vehicle
- **BTR-80 1V152:** Artillery C2 & forward observation vehicle w/ range finding, navigation & new optics

System

Alternative Designation: BTR-80A

Description: 8 X 8 wheeled APC as an upgrade to the BTR-70; 7 soldiers exit through 2 side doors; 4 firing ports on the right & 3 firing ports on the left

Crew: ea3

Personnel: ea7

Note: Vehicle has a crew of 3 and can carry 7 dismounts. Soldiers enter and leave the vehicle through side doors or roof hatches. Passengers can fire their individual weapons from inside the armored hull. Each passenger is provided with firing port and periscope for aiming.

Dimensions

Length: m7.7

Width: m2.9

Height: m2.41

Weight, Combat: tons14.5

Automotive

Engine Name: YaMZ-238M2

Engine Type: Water-cooled, V8 Diesel

Automotive Performance: hp240

Range, Cruising: km600

Speed, Maximum Road: km/h90

Speed, Maximum Off-Road: km/h60

Speed, Maximum Swim: km/h10

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.5

Trench: m2.0

Fording Depth: mAmphibious

Note: Vehicle can be fitted with run-flat tyres. Once fitted with these tyres this APC can travel several thousand kilometers with multiple tyre shots and absence of pressure in the tyres. Furthermore this APC can travel with any two if its wheels missing. Mobility of this armored vehicle allows to operate alongside tanks, though it looses in terms of off-road performance to tracked armored personnel carriers.

Accuracy of fire at 300 m: mm90

Fire Control

Name: INA

Computerized FCS: INA

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Gunner Day Sights: 1P3-6, 1.2x/4x

Main Gun Stabilization: No

Infrared Searchlight: OU-3GA2M

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Turret Armor: Protection against 12.7mm and shrapnel

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, Collective

Smoke Equipment: Six 81 mm smoke grenade dischargers are fitted to the turret.

Notes:

The BTR-80 has evolved into the BTR-80A. In 1993, the Tula design bureau finished development of a new turret similar to that on the German Marder APC, mounting a 30-mm 2A42 (BMP-2) automatic gun, coax 7.62-mm MG, and TNP-3 day/night sights. This vehicle is in prototype and offered for export. The drop-in gun/turret package (Modular Weapon System) is offered for export, to upgrade a wide variety of vehicles to BTR-80A standard. BTR-80A can mount K1-126 bullet-resistant tires. On the BTR-80A and BTR-80S, the standard BTR-80 turret is replaced with a modular armaments system. The BTR-80A is fitted with a 30 mm 2A72 automatic gun and 7.62 mm PKT coaxial machine gun.

BTR-82 Russian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Effective Range (Day): m2,000

Effective Range (Night): INA

Tactical Range: m1,500-2,000

Armor Penetration: 20 at 1,000 m/ 30 at 500 m

Note: Additional Ammo includes: API, I-T

Auxiliary Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Caliber: mm7.62

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Effective Rate of Fire: rds.min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length, Total: mm1,203

Length, Barrel: mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

↳*Ammunition*

Name: 57-N-323S

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

Fire Control

Automatic Fire Suppression System:

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Turret Armor: Protection against 12.7mm and shrapnel

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, Collective

Smoke Equipment: 6 x 81-mm smoke grenade launchers

Note #1: Interior of this armored vehicle is lined with spall liner.

Note #2: This APC has a double hull floor for improved protection against landmines and improvised explosive devices.

Notes:

The BTR-82 armored personnel carrier is a latest version of the BTR-80 family. It is an improved version of the BTR-80A/S, which entered service back in 1994. It was developed largely as a complement (and a stop-gap) for a BTR-90, whose development has been long, troubled and expensive. The BTR-82 is similar to the BTR-80A/S but has some minor improvements. It was publicly revealed in 2009. In 2010 it successfully passed trials and production commenced during the same year. The original BTR-82 entered service with the Russian Army in 2011. However the original BTR-82 was not produced in large numbers as production soon switched to upgunned BTR-82A, which is used by the Russian military in large numbers. Since 2010 Russian Army stopped purchasing the older BTR-80 APCs. Currently the BTR-82 is being obtained as a temporarily measure, until a new-generation Bumerang armored personnel carrier is available. The BTR-82 and its variants has been exported to Azerbaijan, Kazakhstan, Syria, Turkmenistan, and possibly, some other countries.

WZ551 (Type 92) Chinese 6x6 Wheeled Armored Personnel Carrier (APC)

Tiers:

Variants:

- **WZ 551A/ZSL-92:** This variant is fitted with a one-man turret equipped with a 25-mm cannon with ammunition carried in a large upended drum to the left of the weapon and a coaxial 7.62-mm machine gun with 1,000 rounds. The cannon fires armor-piercing incendiary (API) and high-explosive (HE) rounds at a selectable rate of 100, 300 or 500 rounds per minute. There are 200 ready-use 25-mm rounds plus another 200 carried in reserve. The turret can traverse through 360 degrees. The 25-mm cannon has an elevation of -8 degrees to 55 degrees. Smoke grenade launchers are mounted on each side of the turret. The gunner is equipped with a single-piece hatch cover, two day periscopes and a day/low-light level night sight, which is mounted on the forward part of the turret. The vehicle has a crew of two. An improved diesel engine is equipped. The infantry fighting vehicle variant has been in Chinese army service since 1995. The ZSL-92A armored personnel carrier version entered service in 1997. It has also reportedly been exported to Pakistan and Sri Lanka. The WZ 551A has also been referred to as the Type 82, Type 90 and Type 92. Type 92A
- **Type 92B (WZ-551B):** This was an upgraded amphibious armored personnel carrier with improved firepower, maneuverability, and reliability.
- **Type 90:** Original Prototype
- **NVG-1:** Original prototype with a French GIAT 25-mm autocannon equipped.
- **WZ-550:** 4x4 mass production version.
- **WZ-550 AT:** Four HJ-9 launchers, laser designator and thermal-tracking sight are mounted on top of the WZ-550.
- **PTL-02 / Type 02 / WMA 301 Assaulter 105-mm tank destroyer:** This is a WZ 551B chassis armed with a three-man turret fitted with a 105-mm low-recoil gun. The gun a slotted muzzle brake, fume extractor and thermal sleeve. A total of 30 105-mm rounds are carried. A 7.62-mm machine gun is mounted coaxially and a 12.7-mm machine gun on top of the turret. In addition to NATO-standard tank ammunition, it can fire NORINCO GP2 gun-launched guided projectiles with a range of 5,500 yd (5,000 m). The munition has a tandem HEAT warhead that is said to be able to penetrate 26 in (650 mm) of rolled homogenous armor protected by explosive reactive armor. The WMA 301 has a gross vehicle weight of 41,900 lb (19,00 kg). The weight prevents the vehicle from being amphibious. This variant is in service with the Chinese army, where it is designated the PTL-02. It is armed with a smaller 100-mm gun. The PTL-02 was first shown publicly in late 2009. The WMA 301 Assaulter is NORINCO's export designation for the vehicle. Ref: Military Periscope October 2017
- **PLL-05:** Debut in 2001. PLL-05 is a self-propelled 120mm gun-mortar based on the WZ-551
- **Type 92 Yitian:** Air defense upgrade with TY-90 anti-air missile launchers. Equipped with radar and thermal-tracking sight. Chinese equivalent of American AN/TWQ-1 Avenger.
- **VN2:** EXPORT VERSION. Upgraded export variant with 30mm cannon. The VN2C is a mine-resistant variant equipped with an UW4 30 mm remote weapons station
- **CS/VN9:** EXPORT VERSION. 6x6 armored personnel carrier with a remotely-operated 30 mm autocannon.
- **WMA301 Assaulter:** EXPORT VERSION. derivative of the PTL-02 with a 105 mm NATO-compatible gun

Notes:

The WZ551 is an amphibious 6x6 armored personnel carrier (APC) capable of transporting up to 11 passengers. Produced in multiple variants, the WZ551 has served as a basis for several specialized vehicles, including mortar carriers, self-propelled artillery and tank destroyers such as the WMA301 Assaulter. Known as the Type 92 in Chinese Service, the WZ551 has also been exported to numerous foreign militaries, particularly in Africa and Asia, where the WZ551 represents a cost-effective solution to requirements for APCs.

VAB French 4x4 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **VCAC Milan:** Trial 4 X 4 with 2 Milan ATGMs
- **VAB Echelon Repair Vehicle:** 4 X 4 or 6 X 6 variants for battlefield repairs with a 7.5- mm or 7.62-mm machine gun
- **VAB PC Command Vehicle:** Crew of 6 with additional radios & mapboards; FDC & FO versions also available
- **VAB Bromure Electronic Warfare Vehicle:** Crew of 3 operate Thomson- CSF VHF tactical jammer
- **VAB ATILA:** Artillery fire & command
- **VAB Reco:** NBC reconnaissance vehicle
- **VAB Genie Engineer Vehicle:** Crew of 9 with roof-mounted raft
- **VTM 120-mm Mortar Towing Vehicle:** Tows Thompson Brandt 120- mm Mortar with 70 rounds
- **VPM 81:** 81-mm mortar fires through roof opening
- **VAB TOW:** Basic VAB with TOW ATGM launcher with 16 reloads
- **VAB TOW-ALT:** Thune-Eureka 2-tube TOW turret with 16 reload missiles
- **VAB VDAA Albi SAM System:** Prototype 4 X 4 or 6 X 6 with turret with 2 MATRA SAM launchers & 6 extra missiles
- **VAB with UTM 800 Anti-Tank Launcher:** 4 non-retractable HOT tube launchers with 8 reloads
- **VCAC HOT Mephisto Anti-Tank Vehicle:** 4 retractable HOT tube launchers with SACLOS missiles & 8 additional rounds
- **VMO:** Internal Security Vehicle
- **VMO with TOI:** Standard VMO with cupola, 7.62-mm MG & AGL
- **VAB AZURE:** Urban warfare with bulldozer blade & panoramic periscopes
- **VAB Atlas:** Improved ATILA Artillery C2
- **VAB Mark III:** Latest upgrade from 2014; 6 X 6 with advanced protection & mobility
- **VAB New Generation/Improved VAB:** 1996 Upgrade with most variants available
- **VCI:** More heavily armed than the basic VAB with many variants
- **VAB RASIT:** Recon vehicle with radar
- **VAB RATAC:** Artillery target acquisition
- **VAB Sanitaire Ambulance:** Carries 4 litter, 10 sitting, or 2 litter/5 seated patients
- **VAB VDAA Santal SAM System:** 6 X 6 VAB with 2-man turret with 6 MATRA Mistral SAMs with 6 extra rounds in vehicle
- **VAB with ESD:** TA-20 turret mounted anti- aircraft system

Smoke Equipment: 4 Smoke grenade launchers
Survivability Equipment: V-shaped hull

Notes:

The Véhicule de l'avant blindé or VAB ("Armoured vanguard vehicle" in French) is an armoured personnel carrier and support vehicle designed by Renault of France. It entered service in 1976; around 5,000 were produced. As of 2019, it is the standard APC of the French Army and has also been exported to more than 15 countries. It saw combat in various conflicts in Africa, Asia and Europe. VAB means “Véhicule de l’Avant Blindé”, literally “Vanguard Armoured Vehicle” which does not tells that it was an armored personnel carrier and the most prolific of the French Army by far. 5000+ indeed has been built since its introduction in 1976, both in 4×4 and 6×6 configuration, declined into 35 variants and exported to 15 countries over time. With 3,900 vehicles the French Army is the largest operator of the type, and now most vehicles are modernized while there is a second generation VAB (called Mk.II) currently developed for escort.

This variant is fitted with a one-man turret equipped with a 25-mm cannon with ammunition carried in a large upended drum to the left of the weapon and a coaxial 7.62-mm machine gun with 1,000 rounds. The cannon fires armor-piercing incendiary (API) and high-explosive (HE) rounds at a selectable rate of 100, 300 or 500 rounds per minute. There are 200 ready-use 25-mm rounds plus another 200 carried in reserve. The turret can traverse through 360 degrees. The 25-mm cannon has an elevation of -8 degrees to 55 degrees. Smoke grenade launchers are mounted on each side of the turret. The gunner is equipped with a single-piece hatch cover, two day periscopes and a day/low-light level night sight, which is mounted on the forward part of the turret. The vehicle has a crew of two. An improved diesel engine is equipped. The infantry fighting vehicle variant has been in Chinese army service since 1995. The ZSL-92A armored personnel carrier version entered service in 1997. It has also reportedly been exported to Pakistan and Sri Lanka. The WZ 551A has also been referred to as the Type 82, Type 90 and Type 92

ZBL-09 (Type 09) Chinese 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **PLL-09 (Type 09) Modular Self-propelled Howitzer system:** Based on IFV variant. Can be armed with either a 122mm or 155mm howitzer, to provide indirect fire support for infantry.
- **ZTL-11:** The ZTL-11 is the direct fire support version of the Type 09 family. It is equipped with a 105 mm direct fire gun and is capable of defeating heavily armoured targets if engaged from opportune ranges or in an ambush. The vehicle is designed to provide a combined arms brigade with enough organic firepower to defeat the majority of opposition encountered. The ZTL designation stands for armoured (Z), assault gun (T) and wheeled (L).
- **ZZH-09 C2:** This variant of the Type 09 family is equipped with the equipment required to conduct C2 at a brigade level. Like many of the support platforms based on this family it is designed to have matching mobility and protection so that it can work with the formation on the battlefield. The platform is known to be in service and may have the designation ZZH-09, which stands for Armoured, Combat Service Support, and Command respectively.
- **ZBL-09 ARV:** The ARV of the Type 09 family is designed to support, repair, and recover damaged or incapacitated Type 09 vehicles in combat. It is armoured to the same level so that it can accompany a mechanised formation wherever it is required.
- **ZBL-09 bridging platform:**
- **ZBL-09 combat engineering platform:**
- **ZBL-09 SHORAD:**
- **VN1 anti-tank missile carrier:**
- **ZBL-09 35mm air-defense platform:**
- **ZBL-09 ambulance:**
- **ZBL-09 EW platform:**
- **ZBL-09 reconnaissance platform:**
- **VN1C, Armor Day, 2017:**
- **Type 09, assault gun:** It was revealed in 2009 that the PLA was fielding a new assault gun equipped with a 105-mm cannon. The first unit equipped was the 162nd Light Mechanized Infantry Division, 54th Group Army in the Jinan Military Region. The vehicle features a new all-welded steel hull that is believed to share some components with the ZBD-09. The ZBL-09 can fire the GP2 105-mm laser-guided projectile.
- **ZTL-09 105-mm gun variant:** This variant of the VN-1 is fitted with the 105-mm gun turret first seen on the ZTD-05 tracked amphibious combat vehicle.
- **VN1A APC:** This is a development of the baseline VN1. A raised roof line begins behind the driver and commander positions, and above the second road wheel station, for additional volume. The raised roof allows the vehicle to be used for other roles, such as ambulance and command post. The all-welded steel hull is fitted with applique passive armor, with firing ports and associated vision devices provided in the sides and rear of the troop compartment. The VN1A typically has a crew of three (commander, driver, gunner) and can accommodate up to 12 troops. The latter are seated six down each side facing inward on seats that are attached to the sides of the hull for improved survivability. The seats can be folded upward to make room for cargo. The vehicle is armed with a protected weapon station equipped with a 12.7-mm machine gun that can be traversed through 360 degrees, with an elevation of -2 degrees to 65 degrees. A total of 1,000 rounds of 12.7-mm ammunition is carried. Alternative weapon stations might also be fitted. The VN1A has a gross vehicle weight of 20 metric tons and a power-to-weight ratio of 22.15 hp/metric ton. An independent suspension is fitted for improved cross-country mobility. Steering is power-assisted on the front four wheels. A central tire-inflation system and run-flat tires are fitted. Standard equipment includes an air-conditioning system, nuclear, biological and chemical warfare system and a fire-detection and fire-suppression system. The vehicle is fully amphibious with two propellers mounted on either side at the rear. May be referred to as the Type 09A

Protection

Hull and Turret Armor: High hardness armor steel, which provide a protection against 12.7mm armour-piercing incendiary (API) strikes frontally at 100m,

Side Armor: 7.62mm API on the sides at 100m

Rear Armor: 7.62mm ball at the rear.

Applizue Armor: Available, he ZBD-09 can also be fitted with add-on armour package enables the vehicle to survive 25 mm API frontally at 1,000m and 12.7mm API on the sides at 100m.

Explosive Reactive Armor: INA

Active Protection System: yes

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes, 12 Smoke Grenade Launchers (6 on each side)

Central Tire Inflation System: Yes, The tires are fitted with a CTIS and RFIs, which means that the tyres will continue to support the vehicle once punctured for 100 km at a speed of 40 km/h.

Automatic Fire Extinguishing System: Yes

Air Conditionning System,: Yes

Notes:

The Type 09 family (commonly referred to as ZBL-09) is the latest wheeled platform series to enter service with the People's Liberation Army (PLA) of China. The family was designed by China North Industries Corporation (NORINCO) and is expected to replace obsolete wheeled vehicles in service with the PLA. The family bears some resemblance to the US Stryker Brigade Combat Team concept, and may reflect recent shifts in China's doctrine to mimic the rapidly deployable and mobile formations used by the US and Russia. The ZBL-09 is the most numerous variant of the Type 09 family, which as a result it is often the designation used to describe the entire genus of Type 09 variants. It is designed as an IFV, armed and protected to provide an equipped infantry section with the necessary fire support and shelter needed to effectively influence a battle.

BTR-70 Russian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Pandur 1:** Basic version as in the description
- **Belgian Pandur:** Belgian SMAS radio, NBC protection, armed with 12.7-mm & 7.62-mm machine guns
- **Amphibious Pandur:** Electric bilge pumps, closed air intakes-capable of 11 km/h in water
- **Pandur Ambulance:** 3-man crew for 4 stretcher, 2 seated & 2 stretcher, or 2 seated patients
- **Pandur Anti-Aircraft:** Twin 20-mm cannon or SANTAL SAM in turret
- **Pandur ATGM Carrier:** HOT AT missile in a Euromissile UTM 800 launcher or a TOW AT missile in a Kvaerner-Eurkea turret; additional missiles stored in the hull
- **Pandur Armored Recon/Fire Support Vehicle (FSV):** 2-man LCTS turret with a Cockerill 90-mm Mk 8 gun or a Giat TS-90 turret with a 90-mm CN90F4 gun or Cockerill CSE90 turret with an Mk III 90-mm gun
- **Pandur Mechanized Infantry Combat Vehicle (MICV):** MGTS with a choice of armaments: 12.7-mm M2 & 7.62-mm MGs; 30-mm M230 chain gun & 7.62-mm MG; or 40-mm AGL & 12.7-mm MG
- **Pandur Mortar Carrier:** In the passenger compartment, there is an 81-mm or 120-mm mortar mounted on a turnatable
- **Command & Control Vehicle:** For C2 operations
- **Armored Recovery/Repair Vehicle:** For vehicle recovery operations

Self-Recovery Winch: Yes, standard

Notes:

The BTR-70 is a Russian-made 8x8 armoured vehicle personnel carrier which was shown for the first time to the public in November 1980 during a military parade in Moscow. The vehicle was originally developed during the late 1960s under the industrial designator GAZ-4905. The BTR-70 enters in service with the Russian army in August 1972. The BTR-70 was widely used during the Soviet war in Afghanistan and many smaller conflicts in Eastern Europe. After the Cold War these AFV saw service with the UN in the Balkans with high success.

Smoke Equipment: Yes
360 degree field of view for crew: Yes

Notes:

In the early 1990s, the BTR-90 was developed as a replacement for the BTR-80 in the Russian Army. While it was a moderate improvement in armament, protection, mobility, and internal space over its predecessor, it all came at the cost of greatly increased unit price. It wasn't accepted into service (except in small numbers) as the modest increase in performance wasn't seen as enough justification for its cost and complexity. Purchases of the BTR-80 stopped in 2010 and the improved BTR-82 was obtained as a stop-gap measure. In mid-2011, the Russian Ministry of Defense issued a requirement for a new modular wheeled family of armored vehicles instead of buying the BTR-90. Development of a new wheeled APC is being done alongside the new and similarly armed and armored but tracked Kurganets-25 infantry fighting vehicle, the Kurganets-25 armored personnel carrier, and heavy T-15 Armata IFV. The Boomerang vehicle is based on Armata Universal Combat Platform. It is amphibious and is able to negotiate and overcome water obstacles using two waterjets. In a departure with the previous BTR (Like BTR-70) series of vehicles, the engine will be located in the front instead of the rear. Engine location was a significant drawback of BTR vehicles, where soldiers had to exit the vehicles through cramped side doors. The Boomerang has rear doors and roof hatches for troop entry and exit. It has a crew of three consisting of the driver, gunner, and commander and holds eight troops. Protection comes from ceramic armor and technologies to prevent shell splinters. Like BTRs, the Boomerang is an 8×8 wheeled vehicle, and is equipped with a 750 hp turbocharged diesel engine. Several components and subsystems will be interchangeable between the Boomerang and Kurganets-25 APC, and it is hoped that both vehicles will be powered by the same engine though that is not the case to date. The K-16 Boomerang armored personnel carrier (APC), is lightly armed with a remote controlled turret and a 12.7mm heavy machine gun. In November 2011, media reports said the new project had been approved. In February 2012, a high ranking Russian general officer said that the Russian Army would be taking the first deliveries of the Boomerang prototype in 2013. Large-scale deliveries were to begun in 2015. At least 2,000 Boomerang vehicles are to replace the BTR-80 and BTR-82/A in Russian service.

MT-LB Russian Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **MT-LBM (izdeliye 6M):** MT-LB modernization developed by Muromteplovoz in the 1990s. It can be fitted with several different turrets.
- **MT-LBM (izdeliye 6MA):** MT-LBM fitted with a turret from BTR-80, with a KPVT 14.5mm machine gun and co-axial PKT 7.62mm machine gun.
- **MT-LBM (izdeliye 6MA1):** MA armed with additional AGS-17 30 mm automatic grenade launcher.
- **MT-LBM (izdeliye 6MA4):** MA1 armed with KPVB 23x115 mm instead of KPVT 14.5 mm heavy machine gun.
- **MT-LBM (izdeliye 6MA2):** MA armed with KPVB 23x115 mm instead of KPVT 14.5 mm heavy machine gun.
- **MT-LBM (izdeliye 6MA3):** MT-LBM armed with four 9M133 Kornet ATGM launchers, 7.62 mm PKTM tank machine gun and an AGS-30 30 mm automatic grenade launcher.
- **MT-LBM (izdeliye 6 MB):** MT-LBM fitted with a turret from BTR-80A, using a 2A72 30 mm autocannon and co-axial PKT 7.62mm machine gun.
- **MT-LBM (izdeliye 6MB2):** MB armed with AGS-17 30 mm.
- **MT-LBM (izdeliye 6MB3):** MT-LBM armed with GSh-23V 23 mm, AGS-30 30 mm and "Kord" 12.7 mm.
- **MT-LBM (izdeliye 6MB4):** MT-LBM armed with GSh-30K 30 mm, AGS-30 30 mm and "Kord" 12.7 mm.
- **MT-LBM (izdeliye 6MB5):** MT-LBM armed with twin gun 23 or 30 mm, "Igla" SAM and equipped with improved sights.
- **MT-LBM1 (izdeliye 6M1):** MT-LBM fitted with 300-310 hp engine.
- **MT-LBM2:** MT-LBM upgrade package developed by Kurganmashzavod with new engine and transmission, improved suspension, BMP style side skirts etc. Prototype.
- **2S24:** Mortar carrier with 2B24 (or 2B14 "Podnos") 82 mm mortar and 83 rounds. The system designator for the carrier vehicle, mortar, and ammunition is 2K32 "Deva". The 2S24 was designed by TsNII "Burevestnik" and has a crew of five. In service with RF Interior Ministry.
- **MT-LBVMK:** A modification of MT-LBVM with "Kord" 12.7 mm machine gun instead of NSVT 12.7 mm.
- **Toros:** Arctic adapted vehicle developed by Muromteplovoz based on the MT-LB chassis armed with a 30mm autocannon 2A42, PKMT 7.62mm machine gun, and 30mm AGS-17D grenade launcher, and equipped with a snowplow. Toros is able to operate in -45°C.
- **Note::** There are more than 50 additional variants to the MT-LB. The variants above were chosen because they are linked to the Russian Federation and will likely be the most modern / upgraded.

System

Alternative Designation: See Variants

Date of Introduction: 1964

Proliferation: Current Operators: Armenia, Azerbaijan – 336, Angola – 8, Bangladesh – 134, Bulgaria – 100, Belarus – 70, Congo, Kinshasa – 6, Eritrea – 10, Finland – 389 MT-LB/v, 50 MT-LBU, Georgia – 66 in Service, Iraq – About 400 in Service, Kazakhstan – 150, Lithuanian army MT-LB on exhibition, Lithuania – 10, Macedonia – 10, Moldova – 60, Myanmar – 26, Nigeria – 67, Poland – 15, Russia – 3,300 in active service. Currently being modernized in the version MLBSh for the Marines with more powerful engines KAMAZ-740.50 of 360 hp, new tracks and new weaponry. Ukraine – 2,090, Uruguay – 5, United States – used by military in OPFOR missions. Former operators: Czechoslovak Socialist Republic Czechoslovak Socialist Republic – Passed on to the Czech Republic. East Germany – 721 Bulgarian-made MT-LBs, 32 SNAR-10 and 36 Strela-10M. It is assessed that after unification, all MT-LBs were taken from the GDR’s Army, scrapped, or sold. Hungary – Strela-10 and SNAR-10. Soviet Union – Passed on to successor states. Sweden – 460 (Called Pbv 401, former East German, bought 1993;

reduced by 147 before the end of 2011, sold to Finland, Croatia, and Yugoslavia.)

Notes:

The MT-LB (Russian: Многоцелевой Тягач Легкий Бронированный, Mnogotselevoy Tyagach Legky Bronirovanny / Multi-Purpose Towing Vehicle Light Armoured) is a Soviet multi-purpose fully amphibious auxiliary armored tracked vehicle, which was first introduced in the 1950s. It is also produced in Poland, where (starting mid-1990s) its YaMZ engine was replaced by a Polish one. In the 1950s, the Soviet Central Auto and Tractor Directorate began a development program to replace the AT-P series of artillery tractors (which were based on the ASU-57 airborne self-propelled gun) with a new generation of vehicles. The MT-L was developed to meet this requirement based on the PT-76 amphibious light tank chassis. The MT-LB is the armored variant of the MT-L. Entering production in the early 1970s, it was cheap to build, being based on many existing components, e.g. the engine, which was originally developed for trucks. It is built at the Kharkiv Tractor Plant and under license in Poland by Huta Stalowa Wola and Bulgaria. The crew, a driver and a commander/gunner sit in a compartment at the front of the vehicle, with the engine behind them. A compartment at the rear enables up to 11 infantry to be carried or a cargo of up to 2,000 kg. A load of 6,500 kg can be towed. The vehicle is fully amphibious, being propelled by its tracks in the water. A small turret at the front of the vehicle fits a 7.62 mm PKT machine gun with 360-degree manual traverse and an elevation of −5 to +30 degrees. The vehicle is lightly armored against small arms and shell splinters with a thickness of 3 to 10 mm of steel with a maximum of 14 mm for the turret front. The infantry compartment has two hatches over the top, which open forwards. There are four firing ports—one on either side of the hull, the other two in the rear twin doors of the infantry compartment. The driver is provided with a TVN-2 infra-red periscope, which in combination with the OU-3GK infra-red/white light searchlight provides a range of about 40 m. All vehicles include an NBC system.

WZ-523 (Type 93) Chinese 6x6 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Type 91 (ZFB-91):** This internal security vehicle variant was developed in 1991. It is fitted with a one-man turret, 35-mm automatic grenade launcher with tear gas grenades, coaxial 7.62-mm machine gun, flash lights, searchlight and siren. An obstacle-clearing blade is mounted at the front of the hull.
- **Type 93 (ZSL-93):** This was a finalized version of the WZ 523 proposed for the PLA. It was not accepted into service.
- **Type 05P:** This is an upgraded variant being marketed by Beijing-headquartered PolyTechnologies. It has been shown armed with a one-man turret equipped with a 12.7-mm machine gun.

Notes:

The WZ-523 (NATO reporting name M1984) is a six-wheeled Chinese armored personnel carrier designed to be amphibious. Built on the chassis of the Hanyang HY472 truck, it can carry a crew of three and seat up to eight additional passengers. Two primary models were produced—one with a roof-mounted 12.7mm heavy machine gun, and the other with a small turret armed with a 35mm grenade launcher and a 7.62mm co-axial general purpose machine gun. An export model that entered service in 2008 as a fire support vehicle was also marketed successfully to the Namibian Army; this is armed with a 73mm 2A28 Grom smoothbore cannon in exactly the same turret as used on the Soviet BMP-1 infantry fighting vehicle. The WZ-523 was unveiled at a military parade in Beijing in October 1984, gaining the NATO designation M1984, although it was destined for export and did not enter large scale service with the People's Liberation Army (PLA). An internal security vehicle based on the WZ-523, the ZFB-91, which has a turret armed with a 35 mm grenade launcher and a 7.62 mm machine gun replacing the roof mounted 12.7 mm anti-aircraft machine gun of the WZ-523, is in service with PLA units in Hong Kong and Macau. When the WZ-523 was first exhibited publicly, there were many observations by international defence analysts regarding its design origins. Although the hull design resembled that of the South African Sandock-Austral Ratel infantry fighting vehicle, subsequent studies have found that while there may have been some South African influence the WZ-523 has many unique characteristics in overall dimensions and technical features. For example, its driving compartment is somewhat reminiscent of the BTR-60, with a single passenger seated next to the driver.The location of the turret ring is also similar that of the BTR-60 series rather than the Ratel, being located near the hull center. The People's Liberation Army has deployed the WZ-523 primarily for reconnaissance purposes, and for specialized tasks involving artillery and combat support units. Despite being designed as an armored personnel carrier, it was not adopted by Chinese mechanized or motorized infantry forces. Outside of China, Sudan's Military Industry Corporation also produces the WZ-523 under license.

Cobra II Turkish 4x4 Amphibious Armored Personnel Carrier (APC)

Tiers:

1 2 3 4

Parent:

Cobra Turkish 4x4 Amphibious Armored Personnel Carrier (APC)

Variants:

- **APC:** Basic variant; carries 8-12 troops & 12.7-mm MG; open or turret-mounted 40-mm AGL, 25-mm cannon, or 30-mm cannon.
- **Armored Reconnaissance Vehicle:** Crew of 4 in vehicle with a 25mm cannon and FLIR.
- **Armored C2 Vehicle:** Command and control vehicle with a crew of 6 armed 7.62mm machine guns.
- **Armored Ambulance:** Evacuates 4 litter or 6 ambulatory patients and medical gear.
- **TOW Missile Carrier:** Crew of 5 with a TOW ATGM with a range of 3750m or Rafael overhead weapons system with Spike AT missiles.
- **Cobra EOD Vehicle:** Designed for explosive ordnance disposal with controlled blade on front of vehicle operated by driver.
- **Cobra Reconnaissance / Surveillance Vehicle:** Target acquisition for higher unit commands.
- **Cobra Twin-Turret:** Rotating turret with 40mm AGL and 12.7mm machine gun.
- **Cobra Amphibious Vehicle:** Allows vehicle to enter water without any preparation.
- **NBC Reconnaissance Vehicle:** Equipped with NBC sensors.
- **Cobra II:** First unveiled at IDEF 2013, the Cobra II is a more heavily armoured successor to the Cobra. The Cobra II has a combat weight that is roughly double that of its predecessor and is slightly wider, longer and taller.
- **Cobra II amphibious:** There is an amphibious and slightly larger variant of the Cobra II with a more powerful 6.7 L, 360Hp, V6 turbocharged engine that is capable of crossing lakes and smaller bodies of water

System

Alternative Designation: Cobra II; Otokar Cobra II
Description: 4x4 light; 10 troops besides the crew; 4 side doors, rear door, and 2 roof hatches; 3 firing ports on each side of vehicle and 1 in rear door.
Function: Its various functions are security and peacekeeping operations and border protection
Manufacturer: Otokar
Crew: ea2
Passengers: ea7
Rear View Camera: Yes
Therma Front Camera: Yes
Air Conditioning System: Yes

Black Out Lighting System: Yes

Protection

Armor Type: All-welded steel hull

Armor, Applique: mmAvailable

Armor, Turret Front: mmThe armoured hull of Cobra II offers protection against 7.62mm rounds and artillery shell splinters

Armor, Explosive Reactive: mmAvailable

Active Protection System: No

NBC Protection: A CBRN defense filtration kit is optional

Self-Entrenching Blade: No

Smoke Equipment: Yes

Survivability Equipment: Electrical self-recovery winch; fire suppression system.

Automation Fire Extinguishing System: Yes

Note: The bottom of the crew compartment is fitted with a removable parabolic-shaped plate for deflection of blast

Notes:

First unveiled at IDEF 2013, the Cobra II is a more heavily armoured successor to the Cobra. The Cobra II has a combat weight that is roughly double that of its predecessor and is slightly wider, longer and taller. Standard equipment includes rear view camera, thermal front camera, air conditioning system, blackout lighting system, multi-point seat belts, radio provisions, and a towing eye. It can be optionally equipped with a self-recovery winch, nuclear, biological and chemical filtration kit, automation fire extinguishing system, intercom system, navigation system and an auxiliary power unit. In an APC configuration, the vehicle can carry nine personnel and can be armed with a number of different weapons, including crew-operated machine guns and remote weapon stations armed with short-range surface-to-air missiles and grenade launchers. Powered by a 6.7 L, six-cylinder, water cooled, turbo charged, common rail diesel engine that produces 281 hp, its maximum road speed is 110 km/h on roads and has a maximum cruising range of 700 km with an operating temperature from -10 up to 45 degree C. Otokar has received orders for the Cobra II both from an undisclosed customer and from the Turkish Armed Forces. In late 2015, the Turkish Armed Forces ordered 82 Cobra II vehicles plus related systems, maintenance and support worth $52 million. In June 2016, the Turkish Armed Forces ordered an undisclosed number of Cobra II vehicles plus related systems, maintenance and support worth $120.8 million. Assuming the same value to vehicle ratio as the 2015 order, this would imply an order of about 180 vehicles. Cobra II amphibious There is an amphibious and slightly larger variant of the Cobra II with a more powerful 6.7 L, 360Hp, V6 turbocharged engine that is capable of crossing lakes and smaller bodies of water

BTR-60 Russian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BTR-60P:** Initial model with open top, pintle-mounted 7.62-mm machine gun
- **BTR-60PA/BTR-60PK (12 passengers only):** Covered top, NBC protection, pintle-mounted 7.62-mm MG, still exit over top
- **BTR-60PB (space for 8 soldiers for dismounted operations).:** Most common variant with BRDM-2 MG turret with a 14.5-mm MG & coaxial 7.62-mm; troops exit over top
- **Modernized BTR-60PB:** BM2 Turret with 30-mm 2A42 Cannon & 7.62-mm PKTM MG; 30-mm AGS-17 AGL on left side
- **BTR-60U:** Command vehicle with additional radios
- **BTR-60 PU-12/12M:** Anti-Aircraft units' command vehicle
- **BTR-60 MS:** Radio vehicle with High Ball antenna
- **BTR-60 VVS:** Sans turret with additional radios
- **BTR-60 PBK:** BTR-60PB with 3 radios
- **BTR-60 1V18:** Artillery observation vehicle
- **BTR-60 1V19:** BTR-60 1V18 for FDC operations
- **BTR-60 R-145BM:** Communications vehicle with 5 radios
- **BTR-60 R-975:** Forward air-control vehicle with turret
- **BTR-60-Z-351BR:** Power production vehicle with generator
- **BTR-60-P-238BT:** Switchboard vehicle for communications
- **BTR-60-P-240BT:** Integrates radio & wire communications- R-123M radio & R-241 switchboard
- **BTR-60-P241BT:** Equipped with P-241 telephone system
- **BTR-60-R-137B:** Communications vehicle with turret
- **BTR-60 ACRV:** Artillery Battery C2 & recon vehicle
- **BTR-60-R-145:** Additional radio, but no turret
- **BTR-60-R-156BTR:** C2 vehicle with additional radios
- **BTR-60-R-409BM:** Relay vehicle-R-409 & R-123M radios
- **BTR-60PAU (Bulgaria):** Artillery command vehicle
- **BTR-60PB-MD (Bulgaria):** Upgraded engine, radios, & NBC equipment
- **BTR-60P Maintenance Assistance (MTR-2):** Maintenance vehicle with tarp over troop compartment
- **BTR-60 SPAAG (Cuba):** Twin 30-mm anti-aircraft cannons
- **BTR-60 Djibouti (Djibouti):** AML-90 turret on BTR-60
- **BTR-60BD:** Speed increased to 100 km/h & range to 800 km
- **MTP-2:** Armored Recovery Vehicle
- **BTR-60PZ:** Final production model with 1PZ-2 roof-mounted periscope
- **BTR-60-R-140BM:** C2 vehicle with turret
- **MEP:** Infantry command post
- **BTR-60PB FAC:** Turreted FAC vehicle without the gun

Notes:

The BTR-60 is the first vehicle in a series of Soviet eight-wheeled armoured personnel carriers (APCs). It was developed in the late 1950s as a replacement for the BTR-152 and was seen in public for the first time in 1961. BTR stands for Bronetransporter (БТР, Бронетранспортер, literally "armoured transporter") BTR-60 was a revolutionary design for its time. It had a non-standard layout for an APC; the crew compartment was in the front, the troop compartment in the middle and the engine compartment in the rear. This meant that, while the BTR-60 did not share some of the weaknesses that other APCs had, it had several disadvantages of its own. In the BTR-60, the crew compartment is located in the front of the vehicle and had a roof - unlike the troop compartment, which first received one with the introduction of the BTR-60PA. In the BTR-60P and BTR-60PA, the crew consists of a driver and a commander. The driver's seat is on the left and commander's seat is on the right. In the BTR-60PAI, BTR-60PB and BTR-60PZ, the crew consists of a driver, a commander and a gunner. The position of the driver and commander stations remained unchanged in later models. The gunner operates the BPU-1 turret, using the PP-61A optical sight. In the BTR-60P, both the driver and commander manned their positions by entering the vehicle through the sides. The BTR-60PA introduced two hatches over their stations and crew members had to climb on top of the vehicle to use them. The entry method did not change in later production models. The BTR-60B introduced a side door for the gunner on the right side, and firing ports for both the driver and commander, and two for the gunner, one on each side. (For more information on the BTR-60's firing port see the troop compartment section). Both the driver and the commander have forward views through bulletproof windshields, onto which steel covers can be lowered. In the BTR-60P and BTR-60PA, the covers had vision slots, and additional slots on both sides of the crew compartment. These were removed in the BTR-60PB in favor of two periscopes on each side.[clarification needed] In early models of the BTR-60P and BTR-60PA, only the driver had a periscope, while the commander had a removable OU-3 infrared searchlight. In the BTR-60PB, both the driver and the commander have three periscopes in the front (the commander's center periscope can be hard to see as it's just below the OU-3 infrared light). The vehicle was usually equipped with an R-113 radio; however, some models used the R-123. The initial BTR-60P production model lacked night-vision and had only four headlights (two infrared, two white, one of each kind per side, these remained in all BTR-60 models). Late BTR-60P models were fitted with night-vision; the TKN-1 connected with the OU-3 infrared searchlight for the commander and the TWN-2 for the driver. This remained unchanged in later models. The troop compartment is behind the crew compartment and in front of the engine compartment. The BTR-60P can transport up to 16 fully equipped soldiers. This number reduced to 14 in BTR-60PB. As the BTR-60P didn't have a roof, it was covered with a tarpaulin when traveling in bad weather conditions. It was also covered with bows and canvas. Also, all BTR-60 models had three firing ports on each upper side of the hull through which the infantry being transported could fire at the enemy with their personal weapons. The difference between models was in the position of these three firing ports. The BTR-60P and BTR-60PA had the firing ports positioned in a row between the middle and the front part of the troop compartment. In the BTR-60PB, the firing ports were relocated; one was next to the driver and commander, one next to the gunner and one in the side of the troop compartment. Because of the engine placement (in the rear of the vehicle), transported infantry must mount and dismount through the sides in the BTR-60P or through the roof hatches in the roofed BTR-60PA, BTR-60PB, and BTR-60PZ variants. To help the infantry to mount and dismount the vehicle, the BTR-60P had two steps on each side of the hull, one between the first and second pair of road wheels and the other between the third and fourth pair of wheels. It also had two vertical hand rails on each side of the troop compartment, as well as an angled horizontal one on the left-hand side of the hull next to the engine compartment. The BTR-60PA introduced yet another step on each side of the hull between the second and third pair of wheels, as well as six horizontal hand rails on each side of the vehicle, three on the lower side and three on the upper side. The vertical ones were removed, while yet another angled horizontal one was added on the right-hand side of the hull next to the engine compartment. In the BTR-60PB, the number of hand rails decreased from six to five on each side of the hull; the rear upper hand rail was removed from he right side, whereas the center upper one was removed from the left side. The BTR-60P has two doors on each side of the troop compartment (one in the front and one in the rear), but infantry still had to dismount through the sides. The side doors were removed in the BTR-60PA. They were used mostly as emergency exits and as auxiliary firing ports. In the BTR-60PB, a side door was added on the front left of the troop compartment.

ZZH-09 (Type 09) Chinese 8x8 Amphibious Armor Personnel Carrier (APC)

Tiers:

Parent:

ZBL-09 (Type 09) Chinese 8x8 Armor Personnel Carrier (APC)

Variants:

- **PLL-09 (Type 09) Modular Self-propelled Howitzer system:** Based on IFV variant. Can be armed with either a 122mm or 155mm howitzer, to provide indirect fire support for infantry.
- **ZTL-11:** The ZTL-11 is the direct fire support version of the Type 09 family. It is equipped with a 105 mm direct fire gun and is capable of defeating heavily armoured targets if engaged from opportune ranges or in an ambush. The vehicle is designed to provide a combined arms brigade with enough organic firepower to defeat the majority of opposition encountered. The ZTL designation stands for armoured (Z), assault gun (T) and wheeled (L).
- **ZZH-09 C2:** This variant of the Type 09 family is equipped with the equipment required to conduct C2 at a brigade level. Like many of the support platforms based on this family it is designed to have matching mobility and protection so that it can work with the formation on the battlefield. The platform is known to be in service and may have the designation ZZH-09, which stands for Armoured, Combat Service Support, and Command respectively.
- **ZBL-09 ARV:** The ARV of the Type 09 family is designed to support, repair, and recover damaged or incapacitated Type 09 vehicles in combat. It is armoured to the same level so that it can accompany a mechanised formation wherever it is required.
- **ZBL-09 bridging platform:**
- **ZBL-09 combat engineering platform:**
- **ZBL-09 SHORAD:**
- **VN1 anti-tank missile carrier:**
- **ZBL-09 35 mm air-defence platform:**
- **ZBL-09 ambulance:**
- **ZBL-09 EW platform:**
- **ZBL-09 reconnaissance platform:**
- **VN1C, Armour Day, 2017:**
- **Type 09, assault gun:**

Name: Type 80 Chinese Heavy Machine Gun

Manufacturer: Norinco

Type: 7.62mm Heavy Machine Gun

Length, Total: mm1,192

Length, Barrel: mm658

Diameter: INA

Action: Gas Operated

Rate of Fire: rds/min700-800

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

↳*Ammunition*

Type: 7.62×54mmR

Caliber: mm7.62x54

Muzzle Velocity: m/s840

Basic Load: Belts in 100/200/250 round boxes

Effective Firing Range: m100-1,500

Min Range: m100

Armor Penetration: INA

Fire Control

Name: BDS System

Computerized FCS: Yes

Thermal Tank Commander: Yes

Thermal Gunner: Yes

Main Gun Stabilization: INA

Firing Ports: Yes

IFF: INA

GPS: Yes

Winch: Available

Satellite Navigation System: BeiDou System

IR Thermal Optic: Installed

IR Thermal Optic Detection Maximum Range: m8,000

IR Thermal Optic Identification Maximum Range: m3,500

High Definition Color Video Camera: Yes

High Definition Color Video Camera Detection Maximum Range: m12,000

High Definition Color Video Camera Detection Maximum Range: 77,000

Range Finder (Laser) Maximum Range: km10

Radar Type: Ku-band battlefield radar

Radar Maximum Target Detection Range: km12

Radar Minumum Target Detection Range: m200

Protection

Hull and Turret Armor: High hardness armor steel, which provide a protection against 12.7mm armour-piercing incendiary (API) strikes frontally at 100m,

Side Armor: 7.62mm API on the sides at 100m

Rear Armor: 7.62mm ball at the rear.

Applizue Armor: Available, he ZBD-09 can also be fitted with add-on armour package enables the vehicle to survive 25 mm API frontally at 1,000m and 12.7mm API on the sides at 100m.

Explosive Reactive Armor: INA

Active Protection System: yes

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes, 12 Smoke Grenade Launchers (6 on each side)

Central Tire Inflation System: Yes, The tires are fitted with a CTIS and RFIs, which means that the tyres will continue to support the vehicle once punctured for 100 km at a speed of 40 km/h.

Automatic Fire Extinguishing System: Yes

Air Conditionning System,: Yes

Notes:

This variant of the Type 09 family is equipped with the equipment required to conduct C2 at a brigade level. Like many of the support platforms based on this family it is designed to have matching mobility and protection so that it can work with the formation on the battlefield. The platform is known to be in service and may have the designation ZZH-09, which stands for Armoured, Combat Service Support, and Command respectively.

VTT-323 (M1973 Sinhung) North Korean Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Type 85/YW 531H:** Domestic/export base model
- **YW703H:** Command variant
- **Type 85 Armored Command Vehicle:** 2-man crew, 6 staff, additional communications equipment, & fewer ammunition rounds; used at regimental or division level
- **Type 85 Recovery Vehicle:** 1000 KG crane with 5-man crew
- **Type 85 Maintenance Engineering Vehicle:** Similar to the WZ 751 (ambulance), but for support
- **Type 85 Mortar Carriers:** 82-mm & 120-mm variants similar to the YW 531
- **WZ 751 Armored Ambulance:** 2-man crew with space for 4 litter or 8 seat patients; 12.7-mm MG
- **Type 85 SP Howitzer (Type 70-1/YW 302):** Type 54-1 122-mm howitzer on Type 85 chassis
- **Type 85 ATGM Launcher Vehicle:** Railed hull with 4-rail Red Arrow-8 SACLOS wire-guided ATGM
- **YW 307 IFV:** Type 89 with a 25-mm cannon similar to the Bushmaster & the 7.62-mm coaxial MG
- **YW 309 Infantry Combat Vehicle (ICV):** 3-man crew, 73-mm low pressure main gun, 7.62-mm coaxial MG & Red Arrow 3 ATGM
- **HJ-8 Anti-Tank Vehicle:** AT traversable launcher with 4 HJ-8 ATGMs & 4 loads in storage in the hull
- **NVH-1:** Joint Chinese/British variant with 25-mm gun
- **Type 90:** Updated design with reduced height, improved hull shape, & better transmission
- **Thai versions:** Similar to the Chinese variants, but armed with a M-2HB MG
- **Artillery Command Post Vehicle:** YW 531H modified with a raised rear superstructure
- **YW 306:** 130-mm MRL platform
- **Type 89 (YW 534/WZ 534):** Improved power pack & night vision equipment for domestic use & export with longer & wider chassis, improved engine, & mobility

Smoke Equipment: No

Notes:

The Sinhung VTT-323 armored personnel carrier (APC) is a North Korean license-built version of the Chinese Type 63 APC (see separate record). However, it has several alterations from its original that effectively make it a different vehicle. It is designated the M1973 by the U.S. Army and nicknamed the "Vet." It uses the same chassis found in the PT-85 light tank and several other vehicles in North Korean service. The welded steel hull is boxy in shape, with the turret placed behind the center-line of the vehicle. The driver sits in the front left of the vehicle, a single-piece hatch opening to the left above him, fitted with two day periscopes to the front. The commander sits to the driver's right with a single 360-degree view periscope and a single-piece hatch opening to the right. The engine compartment is behind the commander, with the third crew member, the loader, seated behind the driver. The engine has air inlets and outlets on the roof and exhausts to the right side of the roof. A one-man turret holds the gunner and mounts either a 14.5-mm machine gun and a 7.62-mm MG, or twin 14.5-mm guns. Another version carries a Susong-Po anti-tank guided-missile (ATGM) launcher (a variant of the Russian AT-3 Sagger ATGM) and SA-7/SA-16 man-portable surface-to-air missiles (SAMs). The turret is probably manually operated. The vehicle can carry 10 fully equipped infantry and is the standard APC in North Korean service, organic to the motorized infantry battalions of tank and motorized infantry brigades. Infantry enter and exit the vehicle through a two-hinged door on the back of the hull. There are at least two

firing ports provided on each side of the hull. Fully amphibious, the vehicle must have a trim board affixed to the front of the hull, though this can be accomplished by the driver without leaving his seat. It is propelled through the water by its tracks.

BTR-80 Russian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BTR-80 (GAZ-5903):** Original w/ 3 firing ports on each side & smoke grenade launchers.
- **BTR-80A (GAZ-59034:** Stabilized turret w/ 2A72 gun, 7.62-mm coax MG, & new right side firing port.
- **BTR-80AK:** BTR-80A CP variant with 1 firing port on right side and 2 whip antennas at rear corners
- **BTR-80K (GAZ-59031):** Command Post for 6; different turret w/ MGs & 3 radios (R-173, R-173P & R-159)
- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment

- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle
- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun
- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control
- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RPM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle
- **R-439-BK (Legenda 2BK):** Satellite communications vehicle
- **R-165B:** Short-wave signal/ communications vehicle
- **R-149BM4A:** Command and Signal Vehicle
- **R-149BMR:** Signal/Communications vehicle
- **PU-12M7 (9S482MU):** Improved PU-12M6 FA battery command vehicle
- **PU-12M6 (9S482M6):** Field Artillery (FA) battery command vehicle
- **P-240BTZ:** Switchboard platform
- **K1Sh1 (GAZ-59032) (UNSH):** Command Post with enlarged hull w/o turret armament
- **E-351BrM:** Mobile power station with diesel/electric generator
- **BREM-K (GAZ-59033) ARV:** Armored recovery vehicle with A-frame, tow bars, & stabilizers
- **BMM-80 (GAZ-59039 or Simfoniya):** Battlefield ambulance for 9 sitting or 2 litter patients
- **BMM-3:** Battlefield ambulance used as a mobile field hospital
- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)
- **2S23 (Nona-SVK) SP GunMortar System (Fire Support Vehicle):** Breach-loaded 2A60 120-mm rifled mortar/gun system similar to the 2S9
- **BTR-80 R-975:** Forward air control vehicle
- **BTR-80 1V152:** Artillery C2 & forward observation vehicle w/ range finding, navigation & new optics

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Turret Armor: Protection against 12.7mm and shrapnel

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, Collective

Smoke Equipment: 6 x 81-mm smoke grenade launchers

Notes:

The BTR-80 is an 8×8 wheeled amphibious armoured personnel carrier (APC) designed in the USSR. The BTR-80 is a modern, lightly armored vehicle with a diesel power plant. It is manufactured at the Gorkiy Automobile Factory in Nizhniy Novgorod and has been in service since the early 1980s. The BTR-80 is a lightly armored amphibious vehicle with a collective chemical-biological-radiological (CBR) protective system. Operated by a crew of three, the vehicle can carry a squad of seven infantry troops. The BTR-80 8 x 8 armored personnel carrier is intended to carry personnel on the battlefield and provide close fire

support. It can also carry out reconnaissance, combat support and patrol missions. It entered service with the Russian army in the late 1980's and has since been used in a number of military conflicts, including UN peacekeeping operations. The vehicle is in production and in service with the Russian army and with a number of other countries.The BTR-80 is superior to BTR-60/70 with a larger chassis, high-angle-of- fire turret, and single more powerful diesel engine (vs gasoline). Although the armament is same as BTR-60 and BTR-70, except for added smoke grenade dispensers on the back of the turret, the conical turret has been improved and the gun can elevate higher. The Soviets-based the BTR-80 on the BTR-70 APC. It has a single 260-hp, V-8 turbocharged, water-cooled, diesel engine, an improvement over the twin gasoline engines installed in the BTR-60 and BTR-70 vehicles. The reconfigured rear portion of the hull accommodates the new, single engine. The Soviets removed the roof chamfers of the modified BTR-70, raised the rear, and squared off the rearward-sloping engine compartment. Standard equipment includes TNPO vision blocks, TNP-B and TKN-3 optical devices for the driver and commander, an OU-3GA2M infrared search light, six 81 mm smoke grenade launchers 902V "Tucha", a radioset (R-173 or R-163-50U), an intercom, and hydrojets for amphibious propulsion. The Soviets modified the truncated cone turret used on the BTR-70 for the BTR-80 by redesigning the mantlet. This allows the 14.5 mm (0.57 in) KPVT and coaxial 7.62 mm (0.3 in) PKT machine guns to be elevated to a maximum of 60 degrees. This high angle of fire is useful in engaging targets on steep slopes, in urban fighting, and for engaging low slow flying air targets.[5] The Soviets had also modified the design and positioning of the firing ports; the ports are now round, rather than tear-shaped, and have ball mounts similar to those used on the BMP-1. The forward firing ports now sit in angled recesses, which allows infantry to fire to the front of the vehicle. The redesigned side doors are split horizontally. The upper portion opens forward; this gives dismounting troops some protection against small arms fire from the front of the vehicle. The lower portion opens down, forming a step. Six smoke grenade projectors are mounted on the rear of the turret. The BTR-80 can climb a slope with up to 60% gradient and climb a vertical step of 0.5 m.

Protection

Hull Armor: 6-10mm

Notes:

The Type 77 armored personnel carrier (APC) is a development of the former Soviet BTR-50PK and the Chinese Type 63 amphibious tank (see separate records). The vehicle is very similar in appearance to the BTR-50PK, although the Type 77 is heavier and has a more powerful engine. An all-welded steel hull surrounded the troop compartment. The commander is located at the front right side in what resembles an armored conning tower that has three small vision blocks. The driver sits at the front left side and the 12.7-mm anti-aircraft gun is located at the commander's station. As is the case with the BTR-50PK, troops enter and exit through two rectangular roof hatches in the built-up superstructure. Unlike that onetime Soviet vehicle, the Type 77 has an additional forward opening door in the right-hand side. The Type 77 has reportedly been fitted with a new more powerful and more efficient diesel engine. There are no details available on the engine type or its characteristics. At least 200 are in service with the Chinese People's Liberation Army Navy (PLAN) for use in amphibious warfare, used mainly by Chinese marines for front-line transport. Development of the APC began in April 1965, though the design certificate was not awarded until 1977. Initial production took place in the mid-1970s; it was first observed by the West in 1974. Total production has been estimated at 900 units. One report has suggested that Albania may have obtained a small number of Type 77 APCs from China; that report has not been confirmed as of this update. The Type 77-II is a basic APC used to transport marines from a landing ship to the beach and to evacuate casualties. It can be modified to serve as an ambulance, command post or fuel resupply 4 x 4 vehicle.

Piranha III Swiss 6x6 Amphibious Armored Personnel Carrier (APC)

Tiers:

Smoke Equipment: INA

Notes:

The Piranha 6 x 6 armored personnel carrier (APC) is one of four models in the Piranha family (the others being the 4 x 4 and 8 x 8 versions), all of which share similar components such as hull sections and wheels, as well as door and hatch configurations.

Type 85 (Type YW-531H) Chinese Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Type 85/YW 531H:** Domestic/export base model
- **YW703H:** Command variant
- **Type 85 Armored Command Vehicle:** 2-man crew, 6 staff, additional communications equipment, & fewer ammunition rounds; used at regimental or division level
- **Type 85 Recovery Vehicle:** 1000 KG crane with 5-man crew
- **Type 85 Maintenance Engineering Vehicle:** Similar to the WZ 751 (ambulance), but for support
- **Type 85 Mortar Carriers:** 82-mm & 120-mm variants similar to the YW 531
- **WZ 751 Armored Ambulance:** 2-man crew with space for 4 litter or 8 seat patients; 12.7-mm MG
- **Type 85 SP Howitzer (Type 70-1/YW 302):** Type 54-1 122-mm howitzer on Type 85 chassis
- **Type 85 ATGM Launcher Vehicle:** Railed hull with 4-rail Red Arrow-8 SACLOS wire-guided ATGM
- **YW 307 IFV:** Type 89 with a 25-mm cannon similar to the Bushmaster & the 7.62-mm coaxial MG
- **YW 309 Infantry Combat Vehicle (ICV):** 3-man crew, 73-mm low pressure main gun, 7.62-mm coaxial MG & Red Arrow 3 ATGM
- **HJ-8 Anti-Tank Vehicle:** AT traversable launcher with 4 HJ-8 ATGMs & 4 loads in storage in the hull
- **NVH-1:** Joint Chinese/British variant with 25-mm gun
- **Type 90:** Updated design with reduced height, improved hull shape, & better transmission
- **Thai versions:** Similar to the Chinese variants, but armed with a M-2HB MG
- **Artillery Command Post Vehicle:** YW 531H modified with a raised rear superstructure
- **YW 306:** 130-mm MRL platform
- **Type 89 (YW 534/WZ 534):** Improved power pack & night vision equipment for domestic use & export with longer & wider chassis, improved engine, & mobility

Notes:

According to Military Periscope, dated: April 2013, the Type 85 armored personnel carrier (APC) is an enlarged successor to the Type 69 that has spawned a family of variants including infantry fighting, command, mortar carriers, weapons carriers and ambulance vehicles. It was developed in parallel with the 6 x 6 Type 86 and shares the engine and most of the armament options. The Type 85 is also designated the YW 531H. Another version, designated the Type 89 by China, but called the YW 534 in the People's Liberation Army (PLA), is very similar, but is 74mm wider and has 150 mm more length of track on ground. All vehicles in the line share a common hull. The hull has a shallow glacis, angular sides and top, track skirts over the three return rollers per side and five wheel stations per side versus the four of the earlier Type 69. The driver sits in the left front of the hull with the compartment for the license-built Deutz diesel engine to his right. Behind him is the commander. Some variants have turrets, which are located over the troop compartment. The basic APCs have a shielded 12.7mm machine gun. Other main guns include 25- and 73mm cannon. Troops enter and leave by a rear door that opens to the right; emergency roof hatches are also

provided. The number of vision blocks and firing ports varies, having three to four periscopes and firing ports on the right-hand side, two to three on the left side. (Thai YWH 534s have three on each side and one in the rear door.)

ASLAV-PC Australian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **ASLAV Type I:** The ASLAV Type I is the most numerous type; it is a turreted vehicle derived from the LAV-25 and comes in only one variant.[
- **ASLAV-25 (Reconnaissance):** ASLAV-25 (Reconnaissance) – is an Armored Car with a crew of three (commander, gunner & driver). The two man turret has day, thermal and infrared imaging weapon systems, a stabilized M242 25mm dual-feed chain gun and two FN MAG 58 7.62 mm machine guns. The ASLAV-25 conducts troop-level tactical reconnaissance and can carry up to six dismounts in the rear.
- **ASLAV Type II:** The ASLAV Type II has no turret and greater internal capacity and is derived from the Canadian Bison Armored Personnel Carrier. The ASLAV Type II has a crew of two (commander and driver) and is armed with a pintle mounted M2 12.7 mm machine gun. In a number of vehicles, the standard machine gun pintle mount was replaced by a Kongsberg Protector remote weapon station (RWS), which can accommodate either a 12.7 mm machine gun or a Mk 19 40mm automatic grenade launcher. Using a common hull design installed with interchangeable Mission Role Installation Kits (MRIKs), it can be converted into any one of four variants.
- **ASLAV-PC (Personnel Carrier):** Is an Armored Personnel Carrier capable of carrying seven fully equipped troops in support of troop level tactical reconnaissance
- **ASLAV-C (Command):** Is an Armored Command Vehicle, it is equipped with an enhanced radio installation and radio masts, map boards, stowage compartments, specialized seating and an stowable annex. In addition to the crew, the ASLAV-C can accommodate three staff officers and provides command and control at the Squadron and Regimental Headquarter level.
- **ASLAV-S (Surveillance):** Is a specialized surveillance vehicle equipped with a hydraulically raised mast mounted thermal imager, laser range finder, day television camera and battlefield surveillance radar RASIT or AMSTAR. The ASLAV-S supports tactical reconnaissance with ground surveillance and observation and can carry four crew and two occasional troops.
- **ASLAV-A (Ambulance):** Is an Armored Ambulance and is fitted with specialist medical equipment and in addition to the crew can accommodate a medic and three lying patients or six sitting patients.
- **ASLAV Type III:** The ASLAV Type III has no turret and is used by members of the Royal Australian Electrical and Mechanical Engineers for repair and recovery. The ASLAV Type III has a crew of two (commander and driver) and usually carries a third mechanic, it is armed with a pintle mounted FN MAG 58 7.62 mm machine gun, although some have been fitted with the Kongsberg Protector RWS. The ASLAV Type III comes in two variants utilizing two specialist MRIKs.
- **ASLAV-F (Fitter):** Is a maintenance support vehicle that provides a protected mobile workshop for field repair personnel, including vehicle parts and tools, and is fitted with a HIAB 650 crane.
- **ASLAV-R (Recovery):** Is an Armored Recovery Vehicle that is equipped with a heavy winch to recover disabled vehicles to a more accessible location or tow them to a repair facility

System

Alternative Designation: ASLAV-PC

Type: Armored Reconnaissance Vehicle

Family: ASLAV

In Service: In the Australian Army, the ASLAV equips the Cavalry Squadrons of the Royal Australian Armoured Corps. A Cavalry Squadron comprises a headquarters element, an echelon and three sabre troops of six ASLAVs, each troop is further broken down into two patrols each comprising two ASLAV-25s and one ASLAV-PC. The ASLAV equips two squadrons from each of the Australian Army's Armoured Cavalry Regiments, the 1st Armoured Regiment in Adelaide, the 2nd Cavalry Regiment in Townsville, and the 2nd/14th Light Horse Regiment (Queensland Mounted Infantry) in Brisbane, as well as the School of Armour at Puckapunyal.

Crew: ea2

Fording Depth: mAmphibious

Note: The ASLAV-PC is fully amphibious with 3 minute preparation. It is propelled on water by two water jets mounted at the rear of the hull.

Main Gun

Note #1: Vehicle has no turret, but a raised superstructure over the troops compartment.

Note #2: The main armament is a pintle-mounted 12.7 mm machine gun. Currently most of the vehicles are retrofitted with remotely controlled weapon stations fitted with either a 12.7 mm machine gun, 7.62 mm machine gun or 40 mm automatic grenade launcher. It can be operated remotely from behind armor protection.

↳*System*

Name: M242 25mm Bushranger Chain Gun
Type: 25mm Chain Gun
Caliber: 25mm
Manufacturer: Hughes Helicopters (1981–1985) McDonnell Douglas Helicopters (1985–2002) Alliant Techsystems (2002–2015) Orbital ATK (2015–2018) Northrop Grumman Innovation Systems (2018–present)
In Service: 1981-Present
Proliferation: >11,000
Length: 2,672mm
Barrel Length: 2,175mm
Width: 318mm
Height: 373mm
Weight: 119 kg
Barrels: Single barrel (progressive RH parabolic twist)
Action: Open bolt
Rate of Fire: • Cyclic: 200rpm with 1hp or 500rpm with 8hp
Muzzle Velocity: 1,100 metres per second (3,600 ft/s)
Maximum Firing Range: 6,800 m
Effective Firing Range: 3,000 m
Sights: INA

↳*Ammunition*

Type: Rifle
Caliber: mm25
Shell: 25×137 mm
Basic Load: 720
Notes: A wide range of ammunition has been developed for this weapon, providing it with the capability to defeat the majority of armored vehicles it is likely to encounter, up to and including some light tanks. The ammunition used in the M242 may also be used in a variety of weapons such as the GAU-12 Equalizer, the French Giat M811, or the Swiss Oerlikon KBA weapon system. It has the capability to fire U.S. manufactured ammunition as well as the NATO equivalents thereof. Primarily though, it fires six types of rounds: the M791, M792, M793, M910, MK210, and M919.

Auxiliary Weapon System

↳*System*

Name: Mk 48 Machine Gun
Alternative Designation: Mark 48, or Mk 48, or Maximi
Type: Light Machine Gun
Caliber: 7.62mm

Proliferation: Widely Proliferated

Manufacturer: FN Herstal

In Service: 2003-Present

Length: 1,000 mm

Barrel Length: 502 mm

Weight: 8.2 kg (22.006 lb) empty 11.2 kg (24.7 lb) w/ 100 rounds

Action: Gas-operated, open bolt

Rate of Fire: 710 (± 50) rounds/min

Maximum FIring Range: 3,600 m

Effective Firing Range: 800 m

Feed System: Disintegrating belt (M13 link)

Sights: INA

↳***Ammunition***

Type: Rifle

Caliber: mm7.62

Computerized FCS: No

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: INA

Automatic Fire Suppression: Yes

Protection

Hull Armor: Armor of the ASLAV-PC provides protection against small-arms fire, mine-blasts and artillery fragments.

Applique Armor: Protection of the ASLAV-PC can be increased by fitting add-on ceramic armor tiles. Vehicle can be also fitted with slat armor, which improves protection against RPG rounds.

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

ASLAV-PC (Personnel Carrier) – is an Armored Personnel Carrier capable of carrying seven fully equipped troops in support of troop level tactical reconnaissance. The Australian Light Armored Vehicle (ASLAV) is an eight-wheeled amphibious armored reconnaissance vehicle used by the Australian Army. It was built by General Dynamics Land Systems Canada, and developed from the Canadian Army's LAV-25 and Bison armored fighting vehicles. The ASLAV is a highly mobile, eight-wheel drive, amphibious armored fighting vehicle that can be deployed by land, sea or air (in Royal Australian Air Force C-130s or C-17s). It is fitted with GPS, an intra-vehicular navigation system and a radio harness capable of supporting HF, VHF, UHF and digital radios. The ASLAV is capable of speeds of 100 km/h (62 mph) and has a maximum range in excess of 660 km (410 mi). The eight-wheel drive provides excellent cross-country mobility and redundancy, the vehicle is capable of operation with only four working wheels, and can continue to operate with eight punctured tires through the use of solid-core run-flat tires. It is fully amphibious and is driven in the water by permanent shrouded propellers located at the rear of the hull at speeds of up to 10 km/h (6.2 mph)

VN-1 (ZBD-09) Chinese 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **PLL-09 (Type 09) Modular Self-propelled Howitzer system:** Based on IFV variant. Can be armed with either a 122mm or 155mm howitzer, to provide indirect fire support for infantry.
- **ZTL-11:** The ZTL-11 is the direct fire support version of the Type 09 family. It is equipped with a 105 mm direct fire gun and is capable of defeating heavily armoured targets if engaged from opportune ranges or in an ambush. The vehicle is designed to provide a combined arms brigade with enough organic firepower to defeat the majority of opposition encountered. The ZTL designation stands for armoured (Z), assault gun (T) and wheeled (L).
- **ZZH-09 C2:** This variant of the Type 09 family is equipped with the equipment required to conduct C2 at a brigade level. Like many of the support platforms based on this family it is designed to have matching mobility and protection so that it can work with the formation on the battlefield. The platform is known to be in service and may have the designation ZZH-09, which stands for Armoured, Combat Service Support, and Command respectively.
- **ZBL-09 ARV:** The ARV of the Type 09 family is designed to support, repair, and recover damaged or incapacitated Type 09 vehicles in combat. It is armoured to the same level so that it can accompany a mechanised formation wherever it is required.
- **ZBL-09 bridging platform:**
- **ZBL-09 combat engineering platform:**
- **ZBL-09 SHORAD:**
- **VN1 anti-tank missile carrier:**
- **ZBL-09 35 mm air-defence platform:**
- **ZBL-09 ambulance:**
- **ZBL-09 EW platform:**
- **ZBL-09 reconnaissance platform:**
- **VN1C, Armour Day, 2017:**
- **Type 09, assault gun:**

Protection

Hull and Turret Armor: High hardness armor steel, which provide a protection against 12.7mm armour-piercing incendiary (API) strikes frontally at 100m,

Side Armor: 7.62mm API on the sides at 100m

Rear Armor: 7.62mm ball at the rear.

Applizue Armor: Available, he ZBD-09 can also be fitted with add-on armour package enables the vehicle to survive 25 mm API frontally at 1,000m and 12.7mm API on the sides at 100m.

Explosive Reactive Armor: INA

Active Protection System: yes

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes, 12 Smoke Grenade Launchers (6 on each side)

Central Tire Inflation System: Yes, The tires are fitted with a CTIS and RFIs, which means that the tyres will continue to support the vehicle once punctured for 100 km at a speed of 40 km/h.

Automatic Fire Extinguishing System: Yes

Air Conditionning System,: Yes

Notes:

The VN-1 is part of the Type 09 family (commonly referred to as ZBL-09) is the latest wheeled platform series to enter service

with the People's Liberation Army (PLA) of China. The family was designed by China North Industries Corporation (NORINCO) and is expected to replace obsolete wheeled vehicles in service with the PLA. The family bears some resemblance to the US Stryker Brigade Combat Team concept, and may reflect recent shifts in China's doctrine to mimic the rapidly deployable and mobile formations used by the US and Russia. The ZBL-09 is the most numerous variant of the Type 09 family, which as a result it is often the designation used to describe the entire genus of Type 09 variants. It is designed as an IFV, armed and protected to provide an equipped infantry section with the necessary fire support and shelter needed to effectively influence a battle.

BTR-60PB Russian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BTR-60P:** Initial model with open top, pintle-mounted 7.62-mm machine gun
- **BTR-60PA/BTR-60PK (12 passengers only):** Covered top, NBC protection, pintle-mounted 7.62-mm MG, still exit over top
- **BTR-60PB (space for 8 soldiers for dismounted operations).:** Most common variant with BRDM-2 MG turret with a 14.5-mm MG & coaxial 7.62-mm; troops exit over top
- **Modernized BTR-60PB:** BM2 Turret with 30-mm 2A42 Cannon & 7.62-mm PKTM MG; 30-mm AGS-17 AGL on left side
- **BTR-60U:** Command vehicle with additional radios
- **BTR-60 PU-12/12M:** Anti-Aircraft units' command vehicle
- **BTR-60 MS:** Radio vehicle with High Ball antenna
- **BTR-60 VVS:** Sans turret with additional radios
- **BTR-60 PBK:** BTR-60PB with 3 radios
- **BTR-60 1V18:** Artillery observation vehicle
- **BTR-60 1V19:** BTR-60 1V18 for FDC operations
- **BTR-60 R-145BM:** Communications vehicle with 5 radios
- **BTR-60 R-975:** Forward air-control vehicle with turret
- **BTR-60-Z-351BR:** Power production vehicle with generator
- **BTR-60-P-238BT:** Switchboard vehicle for communications
- **BTR-60-P-240BT:** Integrates radio & wire communications- R-123M radio & R-241 switchboard
- **BTR-60-P241BT:** Equipped with P-241 telephone system
- **BTR-60-R-137B:** Communications vehicle with turret
- **BTR-60 ACRV:** Artillery Battery C2 & recon vehicle
- **BTR-60-R-145:** Additional radio, but no turret
- **BTR-60-R-156BTR:** C2 vehicle with additional radios
- **BTR-60-R-409BM:** Relay vehicle-R-409 & R-123M radios
- **BTR-60PAU (Bulgaria):** Artillery command vehicle
- **BTR-60PB-MD (Bulgaria):** Upgraded engine, radios, & NBC equipment
- **BTR-60P Maintenance Assistance (MTR-2):** Maintenance vehicle with tarp over troop compartment
- **BTR-60 SPAAG (Cuba):** Twin 30-mm anti-aircraft cannons
- **BTR-60 Djibouti (Djibouti):** AML-90 turret on BTR-60
- **BTR-60BD:** Speed increased to 100 km/h & range to 800 km
- **MTP-2:** Armored Recovery Vehicle
- **BTR-60PZ:** Final production model with 1PZ-2 roof-mounted periscope
- **BTR-60-R-140BM:** C2 vehicle with turret

- **MEP:** Infantry command post
- **BTR-60PB FAC:** Turreted FAC vehicle without the gun

Notes:

The BTR-60PB armored personnel carrier is a further development of the previous BTR-60PA. This APC was produced in large numbers. Its production commenced in 1966 and ceased in 1976. For a long period of time the BTR-60PB was used to transport Soviet motorized infantry troops. It has also been exported to a number of countries. Despite its age, the BTR-60PB is still in service with at least 30 operators worldwide. The BTR-60 PB has a main entry that differs from the PA in the adoption of the BRDM-2's machine-gun turret holding machine guns of two different calibers, a 14.5-mm machine gun, with a 7.62-mm machine gun mounted co-axially. Some later variants have similar sighting equipment to the BTR-70; there i s a small periscopic sight on the turret roof. It has well-sloped armor on the sides and overhead armor cover. The hull is of all-welded steel construction, with the driver and commander seated at the front, a personnel compartment in the mid-section, on top of which is a one-man turret, with the engine compartment at the rear of the hull. Troops enter from a top hatch. The BTR-60PB performs well going cross-country in conditions that favor wheels. On land or water, the vehicle is steered by the front two sets of wheels, which have power steering. The boat-shaped hull with sloped sides provides good swimming capability and helps deflect hostile fire. The BTR-60PB has a searchlight and IR equipment, allowing it conduct night operations. The Kharkiv Morozov Machine Building Design Bureau (KMDB) offers a version of the BTR-60PB with a new powerpack. The upgrade replaces the original Russian-made GAZ-49B carburetor-type engines with a Ukrainian-made UTD-20 diesel engine. The new engine provides a 20 percent decrease in fuel consumption; an increase in cruising range from 310 mi (500 km) to 373 mi (600 km); and a better power-to-weight ratio.

Piranha III Swiss 4x4 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Piranha (6 x 6):** INA
- **Piranha III (8 x 8):** INA
- **Piranha IV:** This variant ioncludes an upgraded MTU 544-hp powerplant with an increased power-to-weight ratio and maximum speed of 62 mph (100 km/hr) and 465.7-mi (750-km) road range.

Self-entrenching Blade: No

NBC Protection System: Available

Smoke Equipment: 6 Smoke grenade launchers

Survivability Equipment: No

Notes:

The Pandur I is an APC developed and produced by the Austrian company Steyr-Daimler-Puch Spezialfahrzeuge (SSF). It was developed during the 1980s as a private venture, based on the Pegaso BMR-600 design. In 2003, General Dynamics took over Steyr-Daimler-Puch which is now part of General Dynamics European Land Systems (GD ELS), which is also the parent company of MOWAG, Santa Bárbara Sistemas and GD ELS – Germany. The baseline vehicle is armed with a 12.7 mm (.50 cal) heavy machine gun. Its modular design allows it to be fitted with a variety of weapon systems, including a 20 mm autocannon and an armored two-man 90 mm gun turret. The amphibious conversion is available for all other variants. It adds electric bilge pumps, water-to-water cooling and closed air intakes. An integrated waterjet is mounted on either side of the rear hull. The driver pushes a button to activate the amphibious systems, including the deployment of a hydraulic front trim vane. The amphibious Pandur has the same characteristics as the base model, above, except as follows:

XA-180 Finish 6x6 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **XA-180:** Original six wheeler, carries crew of 2 and 16 troops. Empty weight ca 12 tonnes.
- **XA-185:** Upgraded version, carries crew of 2 and 18 troops. Has a more powerful engine and improved power transmission. Used as an ambulance in the Norwegian Army.
- **XA-186:** Upgraded armour. Armoured and equipped with machine-assisted gun turret (.50 BMG). Cannot swim because of the heavy armour. Empty weight ca 19 tonnes. Engine and transmission same as XA-185.
- **XA-188:** Used by the Netherlands Army.
- **XA-200:** The 200 series looks a little different from older variants due to increased armour. It lacks amphibious capabilities but can wade through water that is up to 1.5 m deep. The improved armour protects the passengers against up to 14.5 mm small arms fire. It is also equipped with modern optical aids like periscopes and night vision. The armor upgrade was initiated after the realisation that the previous armor was inadequate, even modern armor-piercing 7.62 mm ammunition could pierce the older XA-180 and XA-185 models in certain areas. The XA-202 was originally developed for Communications and Command. The XA-203 was made as a temporary replacement for XA-185, and is intended to be replaced by Patria AMVs in Finnish service. The Patria AMV (Armored Modular Vehicle) is an 8×8 multi-role military vehicle produced by the Finnish defence company Patria.

System

Alternative Designation: XA-180
Type: 6x6 Amphibious Armored Personnel Carrier (APC)
Manufacturer: Patria Vehicles Oy, Hameenlinna, Finland
Family: XA Series

Note: Basic vehicle is unarmed except for 3 firing ports and vision blocks in each hull side

Protection

Hull Armor: All-welded steel hull provides splinter protection

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: Yes

Smoke Equipment: INA

Fire Suppression System: Yes

Notes:

XA-180 The Patria Pasi (earlier known as the Sisu Pasi) is a Finnish-made six-wheeled armoured personnel carrier (APC) originally designed for Finnish Defence Forces. The first version was produced in 1983 and serial production began in 1984. It was designed to operate with ease of use, simple structure and low-cost maintenance. The basic appearance and configuration of Patria Pasi is similar to most wheeled APCs. The XA-180 and XA-185 versions are fully amphibious while the XA-203 is not. In 1980, Sisu produced an XA-180 prototype for Finnish Army tests. It competed against two other prototypes, but was declared the winner of the trials in 1983. On 22 December 1983 the Finnish Army ordered a first batch of fifty XA-180s, of which nine were reserved for UN duties. The vehicle proved quite successful and more orders were soon to follow. The XA-180 was originally manufactured and marketed by the Finnish company Sisu Auto but later variants were marketed by the Finnish defence company Patria and are known as Patria XA series.[1] The Vehicle's widely known nickname "Pasi" (also a common given name of Finnish men) stems from the Finnish name "panssari-Sisu" (English: armoured Sisu). The main superstructure is mainly manufactured from 6 to 12 mm of armour steel and the bottom is mine-strengthened, and the front windows are bullet-resistant and equipped with protective hatches. The vehicle has continuous six wheel drive and good capabilities for off-road

driving. It can take inclines up to a maximum of 60°. The XA series has no standard armament, but is equipped with a rotating turret structure for installation of light/heavy machine guns or autocannons. It also has 8 BMP style firing ports on the sides and rear. Therefore, passengers, usually a squad of infantry, can fire their weapons from the cover of the armor. The XA series is popular in peacekeeping missions due to its mobility, non-aggressive appearance, and good protection against mines and improvised explosive devices (IED). The vehicle also offers a good combination of armament, comfort, mine protection, protection against shrapnel and small calibre fire, road speed, short time of learning how to drive, and an acceptable terrain mobility. It also offers more internal space compared to other similar vehicles like the Fuchs or BTR-80.

Notes:

BTR-60PA (1963) – This version has an armoured roof over the troop compartment. It is fitted with improved 'closed-down' vision devices for the crew. Behind the commander's and driver's hatches is a single rear-opening rectangular hatch in front of which is a single mount for the DShK 1938/46 12.7 mm heavy machine gun between the two circular crew hatches at the front of the personnel compartment and two optional mounts for 7.62 mm machine guns (either the PKT, the SGMB or the PKB tank/medium/general-purpose machine guns) on each side of the roof of the personnel compartment. Early production BTR-60PAs only had a single mount for the 7.62 mm machine gun between the two circular crew hatches at the front of the personnel compartment. The small doors on each side of the hull that were present in the BTR-60P were removed. The BTR-60PA introduced collective NBC protection system to the series. It has six handrails on the each side, in rows of three. The personnel compartment has two rectangular hatches. The fact that the roof has been added makes passengers more vulnerable to enemy fire while they're exiting the vehicle through the top hatches. Also, the gunner must be at least shoulder high out of the vehicle to operate the weapons. The vehicle carries 500 rounds for the DShK 1938/46 12.7 mm heavy machine gun and 3,000 rounds for 7.62 mm machine guns. The weight of the vehicle increased from 9.8 tonnes to 10.2 tonnes. It was also known under the designation BTR-60PK, where K stands for krisha – "roof" and GAZ-49A.

Bv206S Swedish Amphibious Tracked Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Bv 206A:** Ambulance version, which is capable of carrying stretchers in the rear compartment.
- **Bv 206F:** Firefighting vehicle
- **RaBv 2061:** Swedish Army communications/command version, fitted with radio equipment and workplaces for staff members.
- **PvBv 2062:** Swedish Army anti-tank vehicle, an open top version of the Bv 206 armed with a 90 mm Pvpj 1110 recoilless anti-tank gun.
- **PvBv 2063:** Swedish Army anti-tank vehicle, similar to PvBv 2062, but fitted with the launch system for an ATGM, either the TOW (Rbs 55) or the Bofors BILL (Rbs 56).
- **Bv 206S:** The Bv206S is an armored personnel carrier variant of the Bv 206, which provides protection from small arms fire for the occupants. It is in service with the armed forces of France, Germany (379 Bv 206D/S ordered), Spain, Netherlands, Italy (189 units), Sweden (50 units), Greece (Bv 208) and Singapore (300 units), which has replaced it with the Bronco All Terrain Tracked Carrier. Using a Steyr M1-"Monoblock" engine (6-cylinder, 130 kW), the vehicle can carry the driver and 12 combat-equipped troops — four in the front compartment and eight in the rear. The Bv 206S can be slingloaded by Boeing CH-47 Chinook and Sikorsky CH-53E Super Stallion helicopters or carried in the C130 Hercules.

System

Alternative Designation: Small Unit Support Vehicle (SUSV)
Description: Amphibious Armored Personnel Carrier
Bodies: Fiberglass reinforced with PVC foam insulation
Crew: ea1
Passengers: ea11
Forward Car: The forward car accommodates the driver and three combat troops.
Rear Car: The rear car carries eight fully equipped troops.
Airlift Capable: Yes, The unladen Bv206S can be underslung and air lifted by a Boeing Chinook CH-47 and a Sikorsky Super Stallion CH-53 helicopters. The vehicle is air transportable in the C-5A Galaxy (ten vehicles), C-17A Globemaster (six vehicles), C-130 Hercules (one or two vehicles), C-160 Transall (one vehicle), A400M (two vehicles), CH-47 helicopter (one vehicle) and CH-53 helicopter (one vehicle).
Note: The vehicle provides high mobility and ballistic protection and is available as an armoured personnel carrier, cargo carrier, battlefield ambulance, mortar carrier, command post vehicle and recovery vehicle.

Automated Fire Detection and Extinguishing System.: Yes

Notes:

The Bv206S is an armored personnel carrier version of the tracked articulated all-terrain vehicle, Bv206, of which 11,000 have been produced and are operational in over 40 countries worldwide. The vehicle can carry 12 combat-equipped soldiers through difficult terrain and extreme weather conditions. The vehicle operates in temperatures from -32°C to +46°C, from Arctic to desert and jungle conditions. The vehicle provides high mobility and ballistic protection and is available as an armored personnel carrier, cargo carrier, battlefield ambulance, mortar carrier, command post vehicle and recovery vehicle. The Bv206S vehicle was developed jointly by Alvis Hagglunds (now BAE Systems Land Systems Hagglunds) and the Swedish Army Materiel Command, initially for use by the Swedish armed forces. It is in service with the armed forces of France, Germany, Spain, Italy and Sweden. The Bv206S is also under evaluation by other armies. Orders have been received for 479 Bv206S vehicles.

Smoke Equipment: INA

Notes:

The Kurganets-25 APC is a lightly armed armored personnel carrier that can move 8 infantrymen to the battle with the support of one 12.7mm machine gun. The machine gun is in a remotely controlled turret. As part of the Russian army’s efforts to modularize their combat systems, the Kurganets-25 IFV and APC will evolve into various models, gradually replacing BMP, BMD, MT-LB and other types of tracked Soviet armored platforms. The Kurganets-25 will have modular armor that can be upgraded for specific threats. The Kurganets-25 IFV and APC variants were first seen in public during rehearsals for the 2015 Moscow Victory Day Parade. The Kurganets-25 is designed to bring the Russian tracked troop carrier fleet up to standard with Western designs like the American M2 Bradley and British Warrior, which outclassed their Soviet Cold War BMP-series counterparts. Kurganets-25 is based on Armata Universal Combat Platform while being lighter than the T-15 Armata "heavy IFV" based on the same and similar to wheeled VPK-7829 Bumerang. The APC carries 8 troops. Other variants proposed for the Kurganets include an armored ambulance, an 82 mm Vasilek mortar carrier, anti-tank vehicle, armored recovery vehicle, a reconnaissance vehicle, a command vehicle, and an armored engineering vehicle. The vehicle represents a departure from traditional Russian low profile designs, having a higher floor more suited for mounted combat rather than troop carrying, which also provides better IED and mine protection. While the T-15 is expected to be deployed with T-14 tanks in armored formations, Kurganets-25 platforms will equip mechanized units.

BTR-50 Russian Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BTR-50P:** Original with open troop compartment without NBC protection; 57-mm or 85-mm anti-tank (AT) gun could be mounted on the rear deck
- **Belgian Pandur:** Belgian SMAS radio, NBC protection, armed with 12.7-mm & 7.62-mm machine guns
- **BTR-50PA:** No AT gun ramp mount; sometimes featured a 14.5-mm KPVT heavy MG
- **BTR-50PK:** Primary model with covered troop compartment, 4 firing ports & NBC protection system
- **BTR-50PU:** Command vehicle with additional radios, 4 antennae, & auxiliary power supply
- **Pandur ATGM Carrier:** HOT AT missile in a Euromissile UTM 800 launcher or a TOW AT missile in a Kvaerner-Eurkea turret; additional missiles stored in the hull
- **BTR-50PK(B):** Amphibious armored recovery vehicle designed for river crossings
- **MTP:** BTR-50PK converted into a rolling workshop with 15000 crane, 8000 tow bar, & block/tackle system to raise capacity
- **MTK (UR-67):** Mine-clearing rocket launcher system
- **MTR-1:** BTR-50 designed for repairing equipment
- **OT-62 (Slovakia & Poland):** Originally the Czech produced BTR-50
- **Type 77 (China):** Chinese produced BTR-50P
- **Nimda BTR-50PK (Israel):** Improved engine, electrical system, & fuel system
- **Schuetzenpanzer 50PK (North Vietnam):** BTR-50PK produced by North Vietnam
- **Upgraded BTR-50 (Ukraine):** Improved performance vehicle with 60 km/hr speed on land, 10 km/hr in water, & with a heavier payload
- **Civilian BTR-50:** BTR-50P converted for civilian use such as topographic reconnaissance

System

Alternative Designations: BTR-50, BTR-50P
Description: The only BTR APC that uses tracks instead of wheels. There are no exit doors forcing the 18 soldiers to dismount over the sides; 2 firing ports on each side of the vehicle

Automatic Engine Fire-Extinguisher: Yes

Notes:

The BTR-50 (BTR stands for Bronetransporter (БТР, Бронетранспортер), literally "armored transporter") is a Soviet amphibious

armored personnel carrier (APC) based on the PT-76 light tank. The BTR-50 is tracked, unlike most in the BTR series, which are wheeled. The BTR-50 shares many similarities with two other APCs, the OT-62 TOPAS and the Type 77. While the OT-62 is an improved copy of the BTR-50 developed jointly by Czechoslovakia and Poland, the Type 77, based on the Type 63 amphibious light tank developed by the People's Republic of China (PRC), is not a copy of the BTR-50. Like the PT-76, the BTR-50 has a flat, boat-shaped hull. Unlike the PT-76, it has a new superstructure added to the front of the vehicle. The hull of the BTR-50 is made of all-welded steel with the crew compartment in the front, the troop compartment in the center and the engine compartment at the rear. It has the ability to transport up to 20 fully equipped infantrymen, who sit on benches that run across the full width of the troop compartment. They mount and dismount the APC by climbing over the sides of the hull. The driver sits in the center of the front of the hull and has three vision blocks and periscopes located at the top of the sloping glacis plate. During night operations, the center periscope can be swapped for the TVN-28 night vision device, which gives the driver clear vision up to 60 meters. The driver also has a small hatch that opens upwards—while it cannot be used to leave the vehicle, it can be opened in relatively safe areas for extra vision. In combat, the hatch is closed and the driver can use a vision block. There is an emergency hatch under the driver's seat. The commander, who sits on the left side of the vehicle at the front, has three vision blocks and periscopes in a projecting bay. On top of this bay is a cupola that opens forward and can be locked vertically; it has a vision block facing forward. The vehicle can operate in temperatures from −40 °C to +40 °C. The torsion bar suspension consists of six evenly spaced large rubber-tired road wheels with a drive sprocket at the rear and an idler at the front. The road wheels are hollow to assist its amphibious capabilities. These wheels increase the APC's buoyancy by 30%. There are no track-return rollers. The first and last road wheels have a hydraulic shock absorber, the steel tracks have a single pin and 96 links each when new. There is a small, thin, horizontal skirt over each track. The BTR-50 is powered by a V-6 6-cylinder 4-stroke in line water-cooled diesel engine developing 240 hp (179 kW) at 1800 rpm. This gives it a road speed of 44 km/h with a cruising range of 400 km. The vehicle can negotiate 30° side slopes, ascend 60° gradients, cross 1.1 m high vertical obstacles and 2.8 m wide trenches. The engine has a cooling system and a pre-heater (intended for ignition when the air temperature is −20 °C or below). The APC has a five gear manual shaft-type transmission system similar to that in the T-34/85 medium tank. The gearbox has four forward and one reverse gear. The vehicle has a side clutch that enables it to make turns, mechanical transmission and a bandbrake. The vehicle has three fuel tanks, two on the right at the front of the engine compartment and one at the rear. The total fuel capacity is 400 liters. The vehicle has four mounts for additional external fuel tanks located on the rear of the hull; the two on the hull corners are for a flat external tanks, whereas the two in the center are for a drum-type of tank. The BTR-50 is amphibious thanks to its flat, boat-shaped hull, which is hermetically sealed and ensures minimal resistance when the APC is afloat. It can swim after switching on the two electric bilge pumps; erecting the trim vane which improves the stability and displacement of the vehicle in the water and prevents water from flooding over the bow of the APC. Swapping the driver's periscope for a swimming periscope enables the driver to see over the trim vane. There is also a manual bilge pump for emergency use. In the water, it is propelled by two hydrojets, one on each side of the hull, the inlets are under the hull, the outlets are at the rear. There are also additional assistant water-jet inlets on both sides of the hull over the last road wheels. The rear outlets have lids that can be fully or partially closed, redirecting the water stream to the forward-directed outlets at the sides of the hull, thus enabling the vehicle to turn. This system was designed by N. Konowalow. It is the same system as the one used in the PT-76. The vehicle's low freeboard of 15 to 20 cm and lack of a snorkel means that it can only swim in the calmest waters. Its armor is composed of homogeneous, cold rolled, welded steel—it is very thin by modern standards, 13 mm at the front, 10 mm on the sides and top and 7 mm at the rear. While its maximum armor protects it fully against small arms fire and small artillery shell fragments, it cannot protect it against large shell fragments and .50-caliber machine gun bullets. Although its front armor might protect it against 7.62 mm small arms fire, that same fire can sometimes penetrate the sides. The vehicle is equipped with an IR driving light and an IR searchlight. It lags behind other Soviet armored fighting vehicles as it has no fire protection systems and, with the exception of the BTR-50PK variant, it has no nuclear, biological or chemical (NBC) protection systems, which significantly reduces its effectiveness.

Cobra Turkish 4x4 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **APC:** Basic variant; carries 8-12 troops & 12.7-mm MG; open or turret-mounted 40-mm AGL, 25-mm cannon, or 30-mm cannon.
- **Armored Reconnaissance Vehicle:** Crew of 4 in vehicle with a 25mm cannon and FLIR.
- **Armored C2 Vehicle:** Command and control vehicle with a crew of 6 armed 7.62mm machine guns.
- **Armored Ambulance:** Evacuates 4 litter or 6 ambulatory patients and medical gear.
- **TOW Missile Carrier:** Crew of 5 with a TOW ATGM with a range of 3750m or Rafael overhead weapons system with Spike AT missiles.
- **Cobra EOD Vehicle:** Designed for explosive ordnance disposal with controlled blade on front of vehicle operated by driver.
- **Cobra Reconnaissance / Surveillance Vehicle:** Target acquisition for higher unit commands.
- **Cobra Twin-Turret:** Rotating turret with 40mm AGL and 12.7mm machine gun.
- **Cobra Amphibious Vehicle:** Allows vehicle to enter water without any preparation.
- **NBC Reconnaissance Vehicle:** Equipped with NBC sensors.
- **Cobra II:** First unveiled at IDEF 2013, the Cobra II is a more heavily armoured successor to the Cobra. The Cobra II has a combat weight that is roughly double that of its predecessor and is slightly wider, longer and taller.
- **Cobra II amphibious:** There is an amphibious and slightly larger variant of the Cobra II with a more powerful 6.7 L, 360Hp, V6 turbocharged engine that is capable of crossing lakes and smaller bodies of water

System

Smoke Equipment: Yes

Survivability Equipment: Electrical self-recovery winch; fire suppression system.

Notes:

The Cobra Wheeled Armored Vehicle has been developed by Otokar's research and development team to provide the best solution for the need of the armed forced for wheeled armored vehicles. Cobra attracts interest with its superior maneuvering capability and its high level of ballistic protection as well as its feature of adjustability of the same platform for diverse functions. It provides great facilities in maintenance and service as it is designed on the same framework and infrastructure and it can be manufactured in many models and types. The fact that the infrastructure remains the same even in diverse Cobras manufactured for different realms, which, in turn, saves from maintenance and repair works and spare parts, makes Cobra an armored vehicle preferred by many armies. Rubber tire-wheeled 4 x 4 Cobra Armored Vehicle capable of carrying 1+8 personnel is manufactured with the following types. Moreover, it has an amphibious version as well. The Cobra vehicle forms a common platform which can be adapted for various roles and mission requirements including: armoured personnel carrier, anti-

tank vehicle, reconnaissance vehicle, ground surveillance radar vehicle, forward observation vehicle, armoured ambulance, armoured command post, turreted vehicle for 12.7mm machine gun (turret produced by the Israeli firm Rafael), 20mm cannon, anti-tank missiles such as the TOW missile and Spike missiles or surface-to-air missiles.

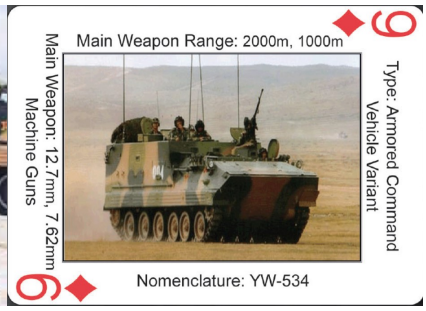
Notes:

The BTR-82A is one of Russia’s latest 8x8 wheeled infantry fighting vehicles; its silhouette is the reminder of its predecessor, the BTR-80A. The development and production of BTR-82A is engaged in "military-industrial company", which also produces a new generation of armored vehicles, "Boomerang". Hailed by defense specialists as a full-fledged combat vehicle, the BTR-82A created a big stir in late-2010 with its 2A72 30 mm chain gun, coaxial 7.62mm MG and advanced observation gear, making it ideal for regular combat and counterterrorism operations alike. The BTR-82A is an upgraded version of the BTR-80 wheeled armored vehicles that were put into service in 1980. BTR-82A has a high survivability, equipped with a unified fighting module, air conditioning, modern communication and orientation systems. Designers modernized more than 1,000 elements in the BTR-82A.Thanks to its advanced characteristics, the BTR-82A’s firing effectiveness increased two-fold as compared to its previous version. Securing the machine is increased by the use of a new armored personnel carrier Ballistic protection of multilayer synthetic material such as Kevlar on the inner surfaces of the body. To reduce the negative effects of explosions under the wheels or body carpeted floor mats in mine, is a multilayer rubber coating, which layers have different properties. Such mats partially dampen the impact of the blast wave. In addition, the seat of the crew and landing are made at the special

suspension, which reduces the impact of the explosion energy.

Type 89 (YW-534) Chinese Amphibious Armored Personnel Carrier (APC)



Tiers:

Variants:

- **Type WZ534 - Type 89 Tracked Armoured Personnel Carrier.:** Basic version, as described. Military designator: ZSD-89.
- **Type YW307 - Type 89 Infantry Fighting Vehicle:** Fitted with a one-man turret with 25 mm automatic gun (400 rounds) and 7.62 mm coaxial machine gun (1,000 rounds). Crew: 3+7. Military designator: ZSD-89-II.
- **Type 89 Armoured Command Vehicle:** Fitted with a higher roofline and with a longer chassis with 6 double road wheels either side. Armament consists of a 12.7 mm HMG on the commander's station behind the driver.
- **Type WZ752 - Type 89 Tracked Armoured Ambulance:** Unarmed ambulance with a higher roofline and with a longer chassis with 6 double road wheels either side.
- **Type 89 Refuelling Vehicle:** Transport vehicle for fuel and lubricants, fitted with a higher troop compartment. Offered for export as the Amphibious Armoured Refuelling Vehicle.
- **ZJX-93 - Type 89 Recovery Vehicle:** Maintenance and recovery variant, fitted with a light crane on the left side of the hull roof, and a machine gun cupola in the roof center.
- **ZHB-94 - Type 89 Supply Vehicle:** Similar to the recovery variant and also equipped with a light crane, but the commander's cupola with HMG is located behind the driver's position.
- **Type WZ731 - Type 89 Reconnaissance Vehicle:** Variant for artillery forward observers, equipped with an unarmed turret with observation devices. Military designator: ZZC-01.
- **Type 89 Recce Radar Carrier:** Equipped with a battlefield surveillance radar on a telescopic arm. Military designator: ZZC-02.
- **Type 89 Tank Destroyer (missile):** ATGM carrier vehicle with double launch system for wire-guided HJ-8 missiles. A total of 12 missiles is carried on board. Military designator: ZDF-1.
- **Type 89 Mine-Laying Vehicle:** Has a modified rear hull that mounts a scatterable mine system, consisting of 6 launchers. Each launcher has 36 tubes of 122 mm with each tube containing 5 SATM mines, 15 SAPM mines, 45 SAPEM mines or a mix of SAPM and SAPEM mines.
- **Type 89 Obstacle-Removing Vehicle:** Crowd-control variant for the PAP, equipped with an obstacle clearing blade.
- **Type 90 AFV or Type YW535:** No Information
- **YW306:** 30-tube 130mm self-propelled multiple rocket launcher (MRL) for export market
- **YW309:** infantry fighting vehicle, with a BMP-1-style 73mm low-pressure smoothbore gun and a HJ-73 anti-tank guided missile launcher. Prototype only.
- **YW323:** D30 122mm self-propelled howitzer. Prototype only
- **YW382:** 120mm self-propelled mortar for export market
- **YW383:** 82mm self-propelled mortar for export market
- **YW534:** HJ-8 anti-tank guided missile launch vehicle
- **YW703H:** Armoured command vehicle for export market

Notes:

The Type 89, also known as ZSD 89 or YW 534, is a tracked armored personnel carrier. It is a successor of the Type 63 armored personnel carrier. The Type 89 has many design details in common with the Type 63, however the it is slightly larger overall. It was manufactured by NORINCO and powered by a German Deutz diesel. The Type 89 is in service with the Chinese Army. The base model of the Type 89 is fully amphibious with propulsion once in the water being provided by the tracks. Troops enter the vehicle via a single door in the hull rear. Once inside there are several ball-and-socket firing ports for the occupants, one being in the entry door, and periscopes are provided to allow observation of the battlefield for the occupants.

VP-10 Chinese 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **VP10 8x8 APC with Remotely-Controlled Weapon Station (12.7mm Machine Gune):** Armored personnel carrier is fitted with a remotely-controlled weapon station, armed with a 12.7 mm machine gun.
- **VP10 8x8 APC with UW4A Remotely-Controlled Weapon Station (30mm Cannon):** Armored personnel carrier, fitted with a UW4A remotely-controlled weapon station, armed with a 30 mm dual-feed cannon and coaxial 7.62 mm machine gun. It can effectively engage lightly armored vehicles. It can also target low-flying helicopters.
- **VP10 8x8 APC with Fire Support (105mm Rifled Gun):** Fire support vehicle, armed with a 105 mm rifled gun. It was first publicly revealed in 2016. This combat vehicle was designed to provide direct fire against hostile armored vehicles, buildings and field fortifications. It also has a coaxial 7.62 mm machine gun. It looks that this armored vehicle can carry some dismounts in its troop compartment, as there were some firing ports with associated vision blocks at the rear part of the hull. Despite heavier turret it looks like this armored vehicle retains its amphibious capability.

Hull Armor (Side and Back): mm7.62 (Round)

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: INA

NBC Protection: INA

Smoke Equipment: INA

Note: The VP10 is very lightly armored. Compared to other APC's the VP10 has poor protection.

Notes:

The VP10 is a Chinese armored personnel carrier with 8x8 configuration. It was developed mainly for export. Externally it resembles a successful Finnish Patria AMV armored personnel carrier, however it is a different design. It was first observed in 2014. Development of this armored vehicle was completed in around 2015. The VP10 is being proposed for various export customers. China's army uses a broadly similar ZBL-09 armored personnel carrier, which is proposed for export as the VN1.

BTR-87 Russian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

System

Alternative Designation: BTR-87

Date of Introduction: 2017

Proliferation: Not Widely Proliferated

Description: Armored Personnel Carrier with front mounted engine.

Manufacturer: Russia`s Military-Industrial Company (VPK)

In Service: 2017-Present

Crew: ea2

Passengers: ea8

Note: Troops enter and leave the vehicle via rear entry doors rather than awkward side doors of the BTR-80 series vehicles

Dimensions

Length: m7.56

Width: m2.99

Height: m3.02

Weight: 16 - 16.5 t (depending on the turret)

Automotive

Anti-Tank Guided Missile (ATGM)

Name: 9M133 Kornet (AT-14 Spriggan)

Type: man-portable anti-tank guided missile (ATGM)

Manufacturer: Degtyarev plant

In Service: 1994-Present

Proliferation: +35,000

Length: mm1,200

Diameter: mm152

Wingspan: mm460

Weight, with Launch Tube: kg27

Weight, with Tripod and Firing Unit: kg63.7

Warhead: 1,000–1,200 (9K135), 1,200 (E), 1,300 (D) mm RHA penetration after ERA with Tandem HEAT, Thermobaric

Warhead Type: HEAT

Warhead Weight: kg4.6

Detonation Mechanism: Impact Fuze

Propellant: Solid-fuel rocket

Operational Range, Kornet: m100-5,500

Operational Range, Kornet-EM: 8,000 m (anti-tank), 10,000 m (thermobaric)

Guidance System: SACLOS laser beam riding

Steering System: Two control surfaces

Accuracy: <5 m

Basic Load: ea4

Fire Control

Protection

Active Protection System: Hard Kill

Armor, Front Arc: Withstands hits from 23 mm cannon
Armor, Sides: Withstand 12.7 mm rounds
Armor, All Around: protection is likely to be against 7.62 mm bullets and artillery shell splinters
Applique Armor: Yes
Armor, Explosive Reactive: Yes
NBC Protection: Yes
Smoke Equipment: Yes
Firing Ports: Yes
Self-Recovery Winch: Yes
Central Tire Pressure System: Yes

Notes:

BTR-87 is designed by VPK with assemblies and units of BTR-82A APC. The vehicle was developed in 2015, and for the first time it was publicly demonstrated at the International Military-Technical Forum "Army-2017". The specifications of the BTR-87 is full analog of the BTR-82A. The differences is in the rear doors or ramp, which simplifies the landing of troops. To enable placement of the rear exit, the vehicle layout has changed - the engine is placed in front of the hull. Vehicles ballistic armour protects the crew against small arms and shell splinters. The BTR-87 is additionally equipped with NBC protection system.

Pandur II Austrian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Pandur 1:** Basic version as in the description
- **Belgian Pandur:** Belgian SMAS radio, NBC protection, armed with 12.7-mm & 7.62-mm machine guns
- **Amphibious Pandur:** Electric bilge pumps, closed air intakes-capable of 11 km/h in water
- **Pandur II:** Pandur II
- **Pandur Anti-Aircraft:** Twin 20-mm cannon or SANTAL SAM in turret
- **Pandur ATGM Carrier:** HOT AT missile in a Euromissile UTM 800 launcher or a TOW AT missile in a Kvaerner-Eurkea turret; additional missiles stored in the hull
- **Pandur Armored Recon/Fire Support Vehicle (FSV):** 2-man LCTS turret with a Cockerill 90-mm Mk 8 gun or a Giat TS-90 turret with a 90-mm CN90F4 gun or Cockerill CSE90 turret with an Mk III 90-mm gun
- **Pandur Mechanized Infantry Combat Vehicle (MICV):** MGTS with a choice of armaments: 12.7-mm M2 & 7.62-mm MGs; 30-mm M230 chain gun & 7.62-mm MG; or 40-mm AGL & 12.7-mm MG
- **Pandur Mortar Carrier:** In the passenger compartment, there is an 81-mm or 120-mm mortar mounted on a turnatable
- **Command & Control Vehicle:** For C2 operations
- **Armored Recovery/Repair Vehicle:** For vehicle recovery operations

System

Alternative Designations: Pandur II

Type: Armored Personnel Carrier

Manufacturer: Steyr-Daimler-Puch

Crew: ea2 (driver, commander)

Passengers: ea12

Note: Possible vehicle configurations for the Pandur II will include an anti-tank guided-weapon carrier, battlefield ambulance, company or battalion command vehicle, driver training vehicle, forward observer vehicle, fully amphibious armored vehicle and a platoon command vehicle

Dimensions

Length: m6.58

Width: m2.67

Anti-Tank Guided Missile (ATGM) System

Name: Spike ER

Type: Israeli fire-and-forget anti-tank guided missile

Manufacturer: Rafael Advanced Defense Systems Diehl Defence (Now part of Rheinmetall Defence Electronics)

In Service: 1997-Present

Length: mm1.670

Diameter: mm170

Weight, Missile in Canister: kg34

Weight, Launcher: kg55

Weight, Launcher and 4 Missiles: kg187

Rate of Fire: Ready to launch in 30 seconds, reload in 15 seconds

Effective Firing Range: 50–1,500 metres

Sights: 10× optical sight

Warhead: Tandem-charge HEAT

Detonation Mechansim: Piezoelectric trigger

Engine: Solid-propellant rocket

Guidance System: Infrared homing – Electro Optical (CCD, Imaging Infrared (IIR) or Dual CCD/IIR), Passive CCD or dual CCD/IIR seeker

Fire Control

Fire Control System: No

FCS Name: INA

Night Vision: Optional

Navigation: Optional

Main Gun Stabilized: Yes

Protection

Armor (turret front): Protects against 7.62-mm AP rounds at 30 m

Applique Armor: Available, An optional level of protection can increase the protection level to shield against 14.5-mm AP projectiles fired from a distance of 100 meters

Spall Liners: Avaialble on the inside of the vehicle

Mine-Protection Mats: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Self-entrenching Blade: No

NBC Protection System: Available

Smoke Equipment: 6 Smoke grenade launchers

Survivability Equipment: No

Notes:

The Pandur II 8x8 is an improved modular all-wheel-drive version of the Pandur 6x6 APC wheeled armoured vehicle. It was developed as a private venture by the Austrian company Steyr-Daimler-Puch Spezialfahrzeuge and is currently in production for the Portuguese Armed Forces. Steyr-Daimler-Puch Spezialfahrzeuge is part of General Dynamics European Land Combat Systems, which is also the parent company of MOWAG of Switzerland and Santa Bárbara Sistemas of Spain. The most significant change is the introduction of an 8x8 configuration with more interior space. The construction is an all-welded steel hull with optional armour upgrades. The basic armour package is designed to protect against 7.62 to 14.5 mm (0.300 to 0.571 in) armour-piercing rounds (customers may select a choice of armour thickness). The vehicle is designed to be transportable in a Lockheed Martin C-130 Hercules transport aircraft. The driver is seated on the left at the front and the engine is to the right. The driver is provided with a single piece hatch cover as well as three day periscopes, one of which can be replaced by a passive periscope for night missions. The vehicle is fitted with a two-stage synchronized distribution gear box for both road and cross country use. Improved suspension will be fitted for optimum cross country mobility. The vehicle is designed to take a number of turret systems (such as the SP 30 turret also mounted on the ASCOD AFV of the Spanish and Austrian Armies), or it can be used as a standard APC with a mounted machine gun. With the turret the vehicle can carry 6 infantry. Without the turret, it can carry 12. The Pandur 8x8 APC is manufactured in Austria while export versions are also built in the Czech Republic and licensed versions in Barreiro, Portugal. The Czech company Excalibur Army has offered their Pandur 8x8 wheeled armored vehicle for the Philippine Army's Wheeled APC acquisition project under the Horizon 2 phase. EA mentioned that the PA has requested for options of either a manned or unmanned 25mm or 30mm turret, or an RCWS with 50cal. heavy machine gun. EA is also participating in the Philippine Army's M113 Firepower Upgrade project, offering either 25mm or 30mm manned turret with co-axial 7.62mm machine gun, or RCWS system depending on PA requirements. Apparently for this project the PA prefer a manned turret solution.

BTR-90 (GAZ-5923) Russian 8x8 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BTR-90M/BTR-90 Rostock:** BMP-3 turret with 100-mm 2A70 gun, 30-mm 2A72 cannon, & 7.6-2mm PKT machine gun
- **Arzamas Upgrade:** 30-mm automatic gun, 7.-62-mm coaxial MG, 30-mm AGL, & ATGM range to 4000 m
- **Krymsk Hybrid-Electric APC:** Prototype operates on a battery-driven electric motor & can be controlled remotely with a top speed of 97 km/h

System

Alternative Designations: NA
Description: 8 X 8 wheeled APC as an upgrade to the BTR-80 with side exit doors; 4 firing ports on the right side & 3 firing ports on the left
Manufacturer: Arzamas Machine Building Plant (AMZ), a subsidiary of the Military Industrial Company.
Crew: ea3 (driver, commander, gunner)
Passengers: ea7

Type: Grenade

Caliber: mm30

Cartridge: 30×29mm grenade

Muzzle Velocity: m/s185

Basic Load: ea400

Coaxial Weapon System

Note: The BTR-90 also has a Coaxial 7.62 mm PKT machine gun

Basic Load: ea2,000

Anti-Tank Guided Missile (ATGM)

Name: 9M113 Konkurs (AT-5 Spandrel)

Type: SACLOS wire-guided anti-tank missile

Manufacturer: Tula Machinery Design Bureau (Tula KBP) – Tulsky Oruzheiny Zavod

In Service: 1974-Present

Proliferation: Widely Proliferated

Launcher Type: 9P135 launching post

Length, With Gas Generator: mm1,150

Length, Without Gas Generator: mm875

Diameter: mm135

Wingspan: mm468

Missile Weight: kg14.6

Launcher Weight: kg22.5

Warhead Type: 9N131 HEAT

Warhead Weight: kg2.7

Detonation Mechanism: Contact

Engine: Solid-fuel rocket

Operational Range: 70 m - 40 km

Speed: m/s208

Guidance System: Wire-guided SACLOS

Steering System: Two control surfaces

Launch Platforms: Individual, vehicle

Basic Load: ea4

Fire Control

Protection

Armor (turret front): mmINA (defeat 12.7 to 20-mm rounds with applique armor)

Applique Armor: mmAvailable

Explosive Reactive Armor: mmAvailable, Special Tifon explosive reactive armor was developed for this APC

Active Protection System: Available

Self-entrenching Blade: No

NBC Protection System: Collective

Smoke Equipment: 6 81-mm smoke grenade launchers

Survivability Equipment: Mine protected hull

Automatic Fire Suppression Systems: Yes

Firing Ports: There are a some firing ports in the vehicle hull

Notes:

BTR-90 (GAZ-5923) (Russian: бронетранспортер, romanized: Bronetransporter, lit. 'Armoured Transporter') is an 8×8 wheeled armored personnel carrier developed in Russia, designed in 1993 and first shown publicly in 1994. It is a larger version of the BTR-80 vehicle, fitted with a BMP-2 turret. Armour protection is improved compared with the BTR-80, giving protection from 14.5 mm projectiles over the frontal arc. It is armed with a 2A42 30 mm auto cannon, a coaxial 7.62 mm PKT machine gun, an AT-5 Spandrel ATGM, as well as an AGS-17D 30 mm automatic grenade launcher. Limited numbers have been produced and are in service with Russian Internal Troops. In October 2011, the Ministry of Defence refused to buy the BTR-90 and did not include them in the list of the state program of armament until 2020, and waived exports for the BTR-90. The BTR-90 has a pointed nose, somewhat similar to that of the LAV-25. The hull is made of welded steel armour plate, and is slightly larger and higher than the BTR-80, from which it is developed. A turbo charged, liquid cooled, multi-fuel diesel engine is used, which can develop 510 bhp. The vehicle has eight-wheel drive and has an automatic reversible hydro mechanical transmission, which is capable of providing different speeds to each side of the vehicle. Duplicated electrical and compressed air engine start systems are also used. The wheels are utilized with independent torsion-bar suspension and the traverse arms have high capacity telescopic hydraulic shock absorbers. Communication equipment installed in the BTR-90 include an R-163-50U radio set for external communications, an R-163UP receiver, and an R-174 intercom device for communication between the crew members. The layout and positioning of equipment and parts in the BTR-90 is similar to those of the BTR-80 and BTR-80A. The commander and gunner are accommodated in a fighting compartment in the turret. This compartment also houses a BPK-3-42 gunner's day/night sight and a 1P-13 commander's optical sight.Optionally, a BPK-M thermal imaging sight can be fitted in this compartment as the gunner's sight. The driver is located somewhat to the middle of the hull, just in front of the turret. The troop compartment is located behind the driver's position and the turret. The engine compartment is at the rear of the hull. Hatches are provided on the top of the turret and hull, and side doors are available on the middle of the vehicle. These are designed to allow quick dismounting and boarding of troops even while the vehicle is on the move. The eight wheels are located as two sets, with two pairs at the front of the hull and two pairs at the rear. Split side doors are located between these two sets of wheels. The two forward pairs of wheels are utilized with power steering. The BTR-90 is capable of achieving a maximum speed of 100 km/h, and has cross-country driving ability comparable to that of tracked vehicles, with an average speed of 50 km/h. The vehicle is fully amphibious and can negotiate water obstacles without any preparation. Two water jet propellers power the vehicle in water, and it can achieve a maximum speed of 9 km/h. It can enter and be deployed from amphibious assault ships from the water. The BTR-90 can be deployed by truck, rail and also by water and air transportation means. Its hydro mechanical transmission helps to increase its maneuverability by providing different speeds to each side of the vehicle. This allows the BTR-90 to have a low turning radius of 6 m. When turning with only the front four wheels, it has a

turning radius of 14 m. It can cross up to 2.1 m wide trenches and can negotiate 60% gradients, 30% side slopes and 0.8 m vertical steps. The vehicle has an inner capacity of 12 cubic meters, and can carry a load of 7,000 kg. An air conditioning system can be added optionally. The commander has the ability to carry out all-round surveillance and can take full control of the weapons from the gunner. An onboard information control system (OICS) enables automatic control over the transmission, engine and other important parts of the BTR-90, and it is the first armoured personnel carrier to have such a system. A centralized tire pressure control system is also available, and allows the vehicle to move even if four of its wheels are destroyed.

XA-185 Finish 6x6 Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **XA-180:** Original six wheeler, carries crew of 2 and 16 troops. Empty weight ca 12 tonnes.
- **XA-185:** Upgraded version, carries crew of 2 and 18 troops. Has a more powerful engine and improved power transmission. Used as an ambulance in the Norwegian Army.
- **XA-186:** Upgraded armour. Armoured and equipped with machine-assisted gun turret (.50 BMG). Cannot swim because of the heavy armour. Empty weight ca 19 tonnes. Engine and transmission same as XA-185.
- **XA-188:** Used by the Netherlands Army.
- **XA-200:** The 200 series looks a little different from older variants due to increased armour. It lacks amphibious capabilities but can wade through water that is up to 1.5 m deep. The improved armour protects the passengers against up to 14.5 mm small arms fire. It is also equipped with modern optical aids like periscopes and night vision. The armor upgrade was initiated after the realisation that the previous armor was inadequate, even modern armor-piercing 7.62 mm ammunition could pierce the older XA-180 and XA-185 models in certain areas. The XA-202 was originally developed for Communications and Command. The XA-203 was made as a temporary replacement for XA-185, and is intended to be replaced by Patria AMVs in Finnish service. The Patria AMV (Armored Modular Vehicle) is an 8×8 multi-role military vehicle produced by the Finnish defence company Patria.

System

Alternative Designation: XA-185
Type: 6x6 Amphibious Armored Personnel Carrier (APC)
Manufacturer: Patria Vehicles Oy, Hameenlinna, Finland
Family: XA Series
Crew: 2 (commander, driver)
Passenger Capacity: 10 Troops

Dimensions

Length: 7.35 m
Width: 2.90 m
Height: 2.30 m
Distance between a Axles, 1st to 2nd: 1.90 m
Distance between a Axles, 2nd to 3rd: 1.90 m
Tire Size: 356 x 508 mm
Ground Clearance: 0.40 m

Combat Weight: 15,000 kg

Unloaded Weight: 12,000 kg

Payload Weight, Road: 6,500 kg

Payload Weight, Cross-Country or Swimming: 3,000 kg

Automotive

Engine Name: 1 x Valmet 612 DWI

Engine Type: 451-cu in (7.4-l) liquid-cooled, turbocharged, 4-stroke, 6-cyl inline diesel

Engine Power: 271 hp (202 kW) at 2,500 rpm

Power-to-Weight Ratio: 16.0 hp/metric ton

Transmission: Allison automatic MD 3560P

Suspension: 6 x 6 (6 wheels driving, 4 wheels steering); beam axles, leaf springs and shock absorbers on each wheel station

Maximum Road Speed: 100 kph

Maximum Swim Speed: 10 kph w/2 shrouded propellers

Range: 800 km

Fording: Amphibious

Main Gun

Note: Basic vehicle is unarmed except for 3 firing ports and vision blocks in each hull side

Protection

Hull Armor: All-welded steel hull provides splinter protection

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: Yes

Smoke Equipment: INA

Fire Suppression System: Yes

Notes:

XA-185 This is an improved version of the XA-180 fitted with a more powerful diesel engine and stronger axles. The Patria Pasi (earlier known as the Sisu Pasi) is a Finnish-made six-wheeled armoured personnel carrier (APC) originally designed for Finnish Defence Forces. The first version was produced in 1983 and serial production began in 1984. It was designed to operate with ease of use, simple structure and low-cost maintenance. The basic appearance and configuration of Patria Pasi is similar to most wheeled APCs. The XA-180 and XA-185 versions are fully amphibious while the XA-203 is not. In 1980, Sisu produced an XA-180 prototype for Finnish Army tests. It competed against two other prototypes, but was declared the winner of the trials in 1983. On 22 December 1983 the Finnish Army ordered a first batch of fifty XA-180s, of which nine were reserved for UN duties. The vehicle proved quite successful and more orders were soon to follow. The XA-180 was originally manufactured and marketed by the Finnish company Sisu Auto but later variants were marketed by the Finnish defence company Patria and are known as Patria XA series.[1] The Vehicle's widely known nickname "Pasi" (also a common given name of Finnish men) stems from the Finnish name "panssari-Sisu" (English: armoured Sisu). The main superstructure is mainly manufactured from 6 to 12

mm of armour steel and the bottom is mine-strengthened, and the front windows are bullet-resistant and equipped with protective hatches. The vehicle has continuous six wheel drive and good capabilities for off-road driving. It can take inclines up to a maximum of 60°. The XA series has no standard armament, but is equipped with a rotating turret structure for installation of light/heavy machine guns or autocannons. It also has 8 BMP style firing ports on the sides and rear. Therefore, passengers, usually a squad of infantry, can fire their weapons from the cover of the armor. The XA series is popular in peacekeeping missions due to its mobility, non-aggressive appearance, and good protection against mines and improvised explosive devices (IED). The vehicle also offers a good combination of armament, comfort, mine protection, protection against shrapnel and small calibre fire, road speed, short time of learning how to drive, and an acceptable terrain mobility. It also offers more internal space compared to other similar vehicles like the Fuchs or BTR-80.

→→Airborne Armored Personnel Carrier (APC)

BvS 10 (Viking) Swedish Amphibious Armored Personnel Carrier (APC)

Tiers:

Variants:

- **UK Variants:** The UK currently operates four variants of the vehicle: The Troop Carrying Variant (TCV) capable of carrying 2 crew plus 10 passengers; the Command Variant (CV), which carries 2 crew plus up to 8 passengers with the rear cab being designed as an enhanced digital communications platform, the Repair and Recovery Variant (RRV), carrying 4 specialist maintenance vehicle mechanic crewmen and the Ambulance Variant (AV). The rear cab of the RRV carries a HIAB crane, a fully mobile workshop, an air compressor and a 9 tonne capacity capstan winch, together with hydraulic anchors. All three variants are fully air-portable under a CH-47 Chinook helicopter, either complete or in two separate front and rear component parts and are also fully amphibious; being capable of swimming in varying sea-states with a full load of passengers and stores. UK Viking vehicle variants are used as amphibious armoured all-terrain vehicles for troop transport and as vehicle repair recovery vehicles.

System

Alternative Designation: BvS 10; Viking
Description: Armored Personnel Carrier (APC)
Manufacturer: BAE Systems Land Systems Hägglunds of Sweden and under license by FNSS of Turkey.
Crew: ea2
Passengers: 10
Airportable: Yes, by the C-130 Hercules and C-17 Globemaster III. It can be carried underslung by the CH-47 Chinook or split in two sections and carried by the Merlin helicopter.

Fording, with Preparation: mAmphibious

Fully Amphibious Time: less than 2 min

Operating Temperatures: - 46°C to + 49°C.

Main Weapon System

Note: The BvS 10 Vehicle can be armed with 12.7 mm or 7.62 mm machine gun, mounted on top of the forward unit. The rear unit can be configured to carry various weapon systems. However in its normal deployment this vehicle remains out of contact with hostile troops.

Protection

Armor: The BvS 10 provides all-round protection against 7.62 mm ball rounds.

Armor, Applique: mmAvailable, Optional add-on armor makes it invulnerable to the 7.62 mm armor-piercing rounds.

Armor, Explosive Reactive: mmNo

Active Protection System: INA

NBC Protection: Yes

Smoke Equipment: smoke grenade launchers (front), mortars (back)

Notes:

The BvS 10 is an All Terrain Armoured Vehicle produced by BAE Systems Land Systems Hägglunds of Sweden and under license by FNSS of Turkey. This vehicle, referred to as the All Terrain Vehicle (protected) - ATV(P) or Viking by the UK forces, was originally developed as a collaboration between industry - Hägglunds Vehicle AB - and the UK Ministry of Defence (MoD) on behalf of the Royal Marines. The BvS 10 is similar to, but distinct from, the Bv 206 or Bv 206S. It is a much larger and fully amphibious armoured vehicle based upon the characteristic twin-cab, articulated steering system typical of Hägglunds all-terrain vehicles. The main differences from the older Bv206s are a more powerful Cummins 5.9 litre diesel engine, improved ground clearance, and newly developed chassis, power train and steering units that give the vehicle considerably enhanced speed (from previous 51.5 km/h on road) and comfort on road and in terrain, as well as greater load-carrying capability (up to 5 tons), and the ability to add various modular sub-systems such as add-on armour, weapon mounts, a load-changer and cargo platforms. French Order On 18 December 2009, the French Armed Forces placed an initial order for 53 BvS 10 Vikings, with the total order for 129 of the vehicles. Including servicing, the contract is estimated to be worth £220 million, and the vehicles will

be assembled at the BAE factory in Sweden. This is a historic order, as it is the first French order for military equipment from the United Kingdom in decades. In placing the order, France broke with their tradition of supporting domestic products, in this case the Bronco All Terrain Tracked Carrier, built jointly by ST Kinetics and Thales. Swedish Order On 5 January 2012, it was announced that the Swedish Armed Forces decided to procure 48 units of the model BvS10 MkIIB, to be delivered starting in the autumn of 2012, and deployed to the Swedish contingent in Afghanistan in the spring of 2013. The contract is worth approximately 700 million SEK, and also includes support and training equipment. There are also options to order an additional 127 vehicles divided in three different batches in the future. On 25 September 2013, Sweden agreed to buy 100 additional BvS10 vehicles for over $160 million, as part of the options agreed upon in the first order. On 19 December 2013, Sweden officially ordered 102 BvS10 vehicles for $120 million. The vehicles include troop carrier, command, ambulance, and logistic carrier variants and will be delivered from 2014 to 2015. Austrian Order On 30 June 2016, it was announced on Baesystems homepage that the Austrian Army decided to procure 32 units of the model BvS10, to be delivered from 2017 to 2018. The BvS10 will also play a role in Austria's mission in the European Union Mountain Training Warfare Initiative (EU MTI). According to the Austrian military magazine "Truppendienst", the Austrian Army will receive the first build BvS10's MkIIB with CBRN protection and all vehicles equipped with WS4 PANTHER remote controlled weapon station. A possible additional BvS10 MkIIB order could be signed after 2018 delivery. The Austrians received the first of BvS10 vehicles in February 2019.

BTR-MD Rakushka Russian Amphibious/Airborne Armored Personnel Carrier (APC)

Tiers:

Variants:

- **Note:** A whole host of BTR-MD variants is currently planned or under development. These include signals vehicle, anti-tank missile carrier with Kornet missiles, MRU-D air defense radar carrier, Poliot-K unmanned aerial vehicle control vehicle, Poliot-K UAV command post vehicle, Obzhimka reconnaissance and fire control post. Other versions, such as Lastochka-2 special signals vehicle and BMM-D Travmatizm armored ambulance were trialed by the Russian airborne forces.

System

Alternative Designation: BTR-MD Rakushka
Type: Airborne/Amphibious Armored Personnel Carrier
Family: BTR Series
Crew: ea2
Passenger Capacity: 13
Payload Capacity: 2,000 kg
Paradropped: The BTR-MD can be carried by and paradropped from most medium cargo aircraft with the crew of three inside. The Il-76 can carry two of these airborne APCs. A single vehicle can be carried underslung by the Mi-26 heavy cargo helicopter.
Note: This APC can also carry at least three stretchers, ammunition or fuel in stead of the troops.

Dimensions

Length: 6.1 m
Width: 3.1 m
Height: 2.5 m

Protection

Hull Armor: Protection of this vehicle is very light due to weight limitations. Hull of the BTR-MD is welded from aluminum armor. It provides protection only from small arms fire and artillery shell splinters. Vehicle is fitted with NBC protection and

automatic fire suppression systems.

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: INA

Smoke Equipment: INA

Notes:

Russia’s airborne forces, whose numbers will be doubled by 2020, are set to take possession of two new vehicles: the BMD-4M airborne combat vehicle and the BTR-MD Rakushka (“shell”) universal armored personnel carrier. The vehicles will be ready to enter service with the armed forces by spring 2015, when dozens of them will drive through Red Square for the Victory Day parade on May 9, 2015. In the next 10 years the army will buy 1,500 units of the former and 2,500 units of the latter. The Rakushka will become the workhorse of the Russian Airborne Forces, replacing the BTR-Ds that were acquired 40 years ago. The paratroopers have been waiting a long time for the vehicle. BTR-MD "Rakushka" (Ob'yekt 955) is a multi-role transport vehicle variant of the the BMD-3 "Bakhcha" with a bigger hull and no turret. This type can be used to transport troops, fuel, ammunition and wounded personnel. It also serves as the basis for a new range of specialised vehicles for the Russian airborne forces, including a mortar platform, an ambulance BMM-D, a command post vehicle and a recovery vehicle. Some of the variants will have a longer chassis with 7 road wheels and probably the same 510hp engine as the 2S25.

BTR-D Russian Airborne Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BTR-DG (Ob'yekt 925G):** Cargo variant without bow machine guns, firing ports and periscopes. The troop compartment was modified to serve as a cargo compartment.
- **BTR-DG:** converted into an airborne SPAAG fitted with a specially built three-legged ZU-23-2 twin anti-aircraft autocannon mount over the roof of the cargo compartment.
- **BTR-D San:** BTR-D converted into an airborne armoured ambulance.
- **BREM-D:** (BREM-D stands for bronirovannaya remonto-evakuatsionnaya mashina desanta – armoured maintenance-recovery vehicle of the airborne) (Ob'yekt 932) – BTR-D converted into an airborne ARV. It carries specialized equipment for the repair and recovery of BMD-1 type vehicles. This equipment includes a light collapsible crane stored on the roof of the personnel compartment, which can be traversed through 180°, a recovery winch, a combination spade and dozer blade, a generator, towing equipment, electric welding system, tools and ready use spares. One of the 7.62 mm bow PKT tank machine guns was eliminated. This entered service in 1989 in very small numbers
- **BTR-RD "Robot":** BTR-D converted into an airborne ATGM team carrier with two 9P135M-1 ATGM launchers capable of firing 9M113 "Konkurs" (AT-5 Spandrel), 9M113M "Konkurs-M" (AT-5B Spandrel B), 9M111 "Fagot" (AT-4 Spigot) and 9M111-2 "Fagot" (AT-4B Spigot B) ATGMs. They can be used by the dismounted ATGM squad or fitted on a pintle mount on the right side of the hull. This is basically a BTR-D with a pintle mount added and with missile racks inside the troop compartment
- **BTR-ZD "Skrezhet":** (ZD stands for zenitnaya ustanovka) – BTR-D converted into an airborne air defense vehicle for carrying two MANPAD teams. The vehicle is fitted with racks for spare MANPAD missiles. It also is fitted with external stowage rails for a MANPAD on the right hand side of the roof of the troop compartment. It can also carry a complete ZU-23-2 twin anti-aircraft autocannon mount on the roof of the troop compartment.
- **NPDU "Sterkh":** (NPDU stands for nazemnyj punkt distantsionnogo upravleniya) – BTR-D converted into an airborne unmanned aerial vehicle carrier and launch vehicle of the "Stroy-P" set. It is used to launch Yak-061 "Pchela-1T" UAV for reconnaissance or jamming at ranges up to 60 km. The single-rail launcher is mounted on left hand side of the roof of the hull. It has large three-piece tube on forward right hand side of the roof of the hull. It entered service in 1990
- **BMD-1KSh "Soroka" (Ob'yekt 926):** (KSh stands for komandno-shtabnaya – command and staff) – airborne command post equipped with the R-123M, R-111 and R-130M or R-134 radio sets, as well as an AB1 portable 1 kW generator, the TNA-3 navigation system, folding CLOTHES HORSE type antennae around the superstructure and two slim antenna masts. Bow mounted machine guns and firing ports were removed. The commander's hatch is offset to the left and does not project forward. It's sometimes called BMD-KSh or KShM-D
- **BMD-1R "Sinitsa":** (R stands for radiostantsiya – signals vehicle) – Division-level command and signals vehicle equipped with R-161A2M radio set, one heavy telescopic antenna mast stowed along the left hand side of the roof of the hull and one slim elevatable antenna mast on the rear right hand side of the roof of the personnel compartment. Only a small number was delivered.

- **R-440-ODB "Kristall-BDS":** BTR-D converted into an airborne satellite communications vehicle with R-440 system with a range of 15,000 km. The vehicle has a roof-mounted satellite dish AK-12 that is covered with a cage-like structure during transport.
- **R-440-ODB "Kristall-BDS":** BTR-D converted into an airborne satellite communications vehicle with R-440 system with a range of 15,000 km. The vehicle has a roof-mounted satellite dish AK-12 that is covered with a cage-like structure during transport.
- **1V119 "Reostat":** BTR-D converted into an airborne artillery battalion fire direction vehicle. The vehicle is fitted with a turret equipped with NNP-21 and V-7 observation devices, three R-173 and R-159 radiosets, PAB-2AM aiming circle, three antennae mounts, DSP-30 and DAK-2 rangefinders. The turret was also equipped with PSNR-5K (1RL-133-1) "Tall Mike" ground surveillance radar mounted on the roof of the turret. Located over the turret front sights were the visors hinged in the center
- **2S9 Nona-S (Ob'yekt 925S) –:** Airborne self-propelled mortar, armed with a 120 mm 2A60 mortar. Entered service 1981.

Notes:

The BTR-D is a amphibious and airborne APC. The BTR-D is a Soviet airborne multi-purpose tracked armoured personnel carrier which was introduced in 1974 and first seen by the West in 1979 during the Soviet–Afghan War. BTR-D stands for Bronetransportyor Desanta (БТР, Бронетранспортер Десанта, literally "armoured transporter of the Airborne"). It is based on the BMD-1 airborne IFV. NATO gave it the designation BMD M1979. While the BTR-D is based on the BMD-1, it is 60 mm longer and lacks a turret; instead, it has a small flat superstructure with a hatch on top. Crew The crew consists of the driver, the commander and the left bow mounted machine gun gunner, all of whom are in the same positions and have the same equipment as in the BMD-1. Armament Although the turret with all of the main armament was removed, the two bow mounted machine guns have been retained. However, the original PKT tank machine guns have been replaced by PKB general purpose machine guns. The vehicle can also be fitted with pintle-mounted automatic grenade launchers (AGS-17, AGS-30 or AGS-57) and/or machine guns (PKM, 6P41, "Utyos" or "Kord"). Maneuverability The BTR-D is powered by the same engine as the BMD-1, however, its suspension is longer because the entire vehicle has been lengthened by 60 mm. Because of this, the vehicle has six road wheels on each side instead of five. It also has five return rollers on each side unlike the BMD-1, which has four. Armour protection The armour protection is slightly better on the BTR-D than on the BMD-1. That's because the upper front armour has a dual slanted angle. Troop compartment Because the turret has been removed, the troop compartment has been enlarged and can carry up to ten fully equipped soldiers. It's also linked with the crew compartment in the front. Also, there are two firing ports in the sides and one in the rear, two of which are for RPK-74 light machine guns. Equipment The BTR-D has all the same equipment as the BMD-1, but also has towing equipment for ZU-23-2 twin AA autocannon.

VP-3 (CS/VP3) Chinese 4x4 Mine-Resistant Ambush Protected (MRAP)

Tiers:

System

Alternative Designation: BIGFOOT

Expected Out of Service Date: 2034

Status: In service with various police and military forces, production as required

Manufacturer: China Poly Group

Type: 4x4 MRAP APC

Crew: 2

Troop Compartment Capacity: 10

Payload Capacity: kg2,000

Firing Ports: There are a total of nine firing ports on the vehicle, one in each of the four windows that are fitted to the side of the vehicle and one in the window at the rear of the vehicle.

Mazimum Effective Range: m800

Dimesions

Length: m7.58

Width: m2.45

Height: m3.25

Weight, Standard: kg13,000

Weight, Combat: kg15,000

Ground Clearance: m0.38

Automotive

Engine Name: Unspecified

Engine Type: Diesel Engine

Engine Power: hp315

Maximum Torgue: Nm1,100

Crusiing Range: km800

Speed, Maximum Road: km/h110

Speed, Average Cross: km/h

Amphibious: No

Fording (Without Preparation): m1.2

Towing equipment: Optional, 2 towing points at rear, pintle at rear

Self Recovery Winch: Optional, Hydraulic winch on the rear and front side of the vehicle or electric winch on the front as an option

Mounting Provisions for Air-Drop: Lift points at the top of the hull

Personnel Emergency Exits: Three side doors and a rear mounted ramp (with an emergency door in it)

Run Flat Tires: Standard

Bullet Proof Tires: Available

Climbing Gradient: %60

Side Slope: %30

Vertical Obstacle: m0.6

Air-Conditioning: Yes

Turning Radius: m9.5

Tires: 14.00R2

Communications

↳*TBR-121 VHF Radio*

VHF Transceiver: Yes

VHF Range: km1 to 50

Proliferated: Widelty

Digital Data: Yes, Full

Control: Self-Adaptive Control (Including Automatic Antenna Tuner)

Frequency Agile: Yes

Wireless Network Capabilities: Yes

Note:: Very similar in capabilities to the US SINCGARS ASIP

Main Gun (Turret #1)

Number of Turrets: 2 (One in the front and one in the rear)

Options: Each Turret can be mounted with two 7.62mm Machine Guns, two 12.7mm Machine Guns, or one 7.62mm and one 12.7mm Machine Gun

Note: For this example we will mount one 12.7mm machine gun on turret 1 and one 7.62mm machine gun on turret 2.

↳***System***

Name: QJG89
Manufacturer: INA
Type: Heavy Machine Gun
Length: mm2,119
Barrel Length: mm1,003
Diameter: mmINA
Weight (Gun Only): kg18.5
Weight (Tripod): kg17.5
Action: Gas
Rate of Fire: rpm450-600
Feed System: Belt
Sights: Iron/Optical
Fire Selector: 0-F
Stock: Fixed

↳***Ammunition***

Type: Ball
Caliber: mm12.7x108mm
Muzzle Velocity: m/s825
Basic Load: INA

Protection

Hull Armor: Yes, Passive armour protection (ballistic still and ballistic glasses).

Turret Armor: Armor Platting

Window Armor: The windows are believed to be protected to the same level as the armoured hull

Applique Armor: Yes

Ballistic Protection Level: BR-3 to BR-7 upon request, for windows and steel structure

Mine Protection Level: Optional, add on anti-personnel mine protection and explosive up to 4 kg mine under belly and 7 kg under wheel

Exhaust Gas Signature Reduction: Exhaust pipes are protected to limit IR signature

Countermeasure Systems:: Smoke grenade launchers are available, as well as smoke screen system, as an option.

Active Protection System: INA

Explosive Reactive Armor: Yes,

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Equipment: No

Smoke Equipment: INA

Fire-Extinguishing System: Yes

Notes:

The CS/VP3 is an armoured 4 × 4 vehicle developed and produced by Poly Technologies from China. It is believed to be an export vehicle built with the intention to provide customers with a brand new armoured platform at a lower cost than Western producers are able to achieve. It is in service with several African countries and Saudi Arabia. It is believed to be based on the Caprivi Mk 1 armoured vehicle designed by Mobile Land Systems of South Africa.

Cougar H American 4x4 Mine-Resistant Ambush Protected (MRAP) Vehicle

Tiers:

Variants:

- **Cougar HEV (Hardened engineer vehicle):** 4×4 and 6×6 vehicles ordered in 2004 by the USMC.
- **Badger ILAV (Iraqi Light Armored Vehicle):** Based on the Cougar and manufactured by FPII and BAE Systems for the Iraqi Army. The ILAV is based on the Cougar, which can carry ten passengers (the six-wheel version can carry 16). The Cougar/ILAV vehicle uses a capsule design to protect the passengers and key vehicle components from mines and roadside bombs. The larger Cougar costs about $730,000 each, fully equipped. The Cougars have been very popular with American troops, and with Iraqis who have worked with them. 865 ILAVs were ordered by Iraq and 18 by Yemen. The ILAV gives the Iraqis the same degree of protection that most Coalition troops have.
- **Cougar JERRV (Joint EOD rapid response vehicle):** 4×4 and 6×6 variants for the US Army, USAF, and USMC. Approx. 200 ordered in 2005 and 2006, with another 200 ordered in late 2006 but now called MRAPs to take account of the new US military/political initiative to be seen to be responding to public concerns about casualties.
- **Cougar ISS:** Based on the Cougar 4×4, the ISS is fitted with an integrated independent suspension system that gives the vehicle increased cross-country mobility.
- **Ridgeback PPV (Protected Patrol Vehicle):** British version of the Cougar 4x4 from FPII base vehicles with a British armor package and electronics, including installation of Enforcer remote weapon stations on some vehicles. In 2015, Salisbury coroner David Ridley raised several "points of concern" relating to the vehicle when recording a narrative verdict on the deaths of four soldiers who drowned in Helmand, Afghanistan in June 2010.
- **Mastiff PPV (Protected Patrol Vehicle):** British version of the Cougar 6×6 which arrived in Afghanistan during December 2006, with FPII providing the base vehicle and NP Aerospace in the UK integrating electronics and the British armour package. The Mastiff 2 is an improved version with a capacity of 2 + 8 which arrived in Afghanistan during June 2009. The Mastiff is armed with a 7.62 mm GPMG, 12.7 mm Heavy Machine Gun or 40 mm Grenade Machine Gun.
- **Mastiff 2 'Protected Eyes':** A version of the British Mastiff specially designed for the Talisman Counter-IED program. It is fitted with an M151 Protector remote weapon station, mine plow, optical camera and a Micro Air Vehicle (MAV) with screens in the back to display its camera feed.
- **Wolfhound (Heavy Tactical Support Vehicle):** British modification of the Cougar 6×6, with FPII providing the base vehicle and NP Aerospace in the UK integrating electronics and the British armor package. The first Wolfhounds entered service in Afghanistan in October 2010. 130 have been ordered for gun tractor and logistical roles.
- **Timberwolf:** Cougar variant that was being marketed by Malley Industries of Dieppe, NB Canada for the replacement of the RG-31 and LAV for the Canadian Forces; Malley Industries lost the contract to Textron TAPV.
- **Fire Support Cougar:** Cougar 4x4 chassis fitted with the complete turret and main gun assembly of the Panhard AML-90 armored car. In service with the Djiboutian Army.
- **Recovery of Airbase Denied by Ordnance (RADBO):** Category I Cougar equipped with a U.S. Air Force-designed directed energy weapon, interrogator arm, console, and other features to clear unexploded ordnance from airfields.

Main Gun

↳*System*

Name: M153 CROWS II

Type: Common Remotely Operated Weapon Station (CROWS)

Proliferation: More than a thousand M153 CROWS II systems are in use. It has been employed on M1 Abrams main battle tanks, various versions of the Humvee, Buffalo MRVs, RG-31 Nyalas, RG-33s, the Army's M1126 Stryker APC, and was soon integrated into the Oshkosh M-ATV, JERRV, Caiman, and MaxxPro.

Manufacturer: (Kongsberg Gruppen

Maximum Elevation: deg+60

Minimum Elevation: deg-20

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Available Weapons to Mount to the M153 Crows II: The CROWS system provides an operator with the ability to acquire and engage targets while inside a vehicle, protected by its armor. It is designed to mount on a variety of vehicle platforms and supports the Mk 19 grenade launcher, M2 .50 Caliber Machine Gun, M240B Machine Gun, and M249 Squad Automatic Weapon.

Gyro-stabilized: Yes

Daylight Video Camera: Yes

Thermal Camera: Yes

Laser Rangefinder: Yes

Computerized FCS: Yes

Weight: kg172

Note: Its camera systems can identify targets out to 1,500 meters away, and the mount's absorption of about 85% of weapon recoil delivers an estimated 95% accuracy rate, as well as the ability to track targets moving 25 mph (40 km/h).

↳*Ammunition*

Note #1: The CROWS system provides an operator with the ability to acquire and engage targets while inside a vehicle, protected by its armor. It is designed to mount on a variety of vehicle platforms and supports the Mk 19 grenade launcher, M2 .50 Caliber Machine Gun, M240B Machine Gun, and M249 Squad Automatic Weapon.

Note #2: Large ammunition boxes enable for sustained firing periods, carrying 96 rounds for the Mk 19, 400 rounds for the M2, 1,000 rounds for the M240B, and 1,600 rounds for the M249. Each CROWS costs $190,000.

Protection

Armor: Allround protected from .50 cal

Applique Armor: Available

Mine Clearing: Available

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: INA

Note: Official data states that the Cougar is able to withstand a blast of at least 14 kg TNT (30.86 lb) under a wheel and 7 kg TNT (15.43 lb) under a belly.

Notes:

The Cougar is an MRAP and infantry mobility vehicle structured to be resistant to landmines and improvised munitions. The Cougar comes in two main configurations, a 4×4 and 6×6. It is designed for the transport and protection of troops and equipment, especially against mines or IEDs. The two main configurations come in specific variants. It is a family of armored vehicles produced by Force Protection Inc, which manufactures ballistic and mine-protected vehicles. The vehicles are integrated by Spartan Motors.[3] These vehicles are protected against small arms, land mines and improvised explosive devices (IEDs) using a combination of design features and materials to protect both the crew and engine compartment against a wide range of attacks.[7] A Monocoque type, V-shaped hull extends to the engine bay and serves to direct the blast away from under the vehicle. The dual air-conditioners help keep heavily dressed troops from overheating in temperatures over 100 °F (38 °C) in Iraq. Force Protection, Inc. was formed in 2002 when Sonic Jet purchased Technical Solutions Group, using the name Sonic Jet until 2004. Technical Solutions Group had been a defense company in the US that was involved in a range of

products, including mine-resistant vehicles based on South African designs. A few vehicles were sold to the US Army for evaluation, and a small fleet of heavily protected vehicles were sold to the British Army in 2001. In 2004, the new Cougar was designed by a small British-led team in the US at Force Protection, Inc., in response to an urgent requirement by the US Marine Corps. This was a new design, developed in the US, based on an evolution of vehicle mine-protection technology used by the South African Army and Rhodesian Security Forces since the 1970s. The very first sketches of the new vehicle were made in late March 2004 in response to those initial USMC inquiries. The rapid development and production that followed was based upon the USMC request that the first vehicle be delivered within 6 months of an order – which was subsequently placed in mid-April 2004 for 27 units. The new design was called Cougar to provide a degree of continuity with the older designs, but had little in common with them. The former vehicles were almost entirely non-compliant with NATO standards for protection, human factors and safety, which made those designs obsolete. The Cougar was effectively a totally new vehicle which incorporated the latest US-made automotives, a new hull design and structure, as well as built-in growth potential, including dimensions that allowed for the addition of the latest armor and protection systems. After being built, the first vehicle was only trialed by doing some circuits of the company campus and trundling over a few rocks and beams set up by the designer to provide a degree of shake-down testing as well as a demonstration course. Urgent operational requirements dictated that the first unit be shipped to theatre as fast as possible and those involved in the project decided that the risk of doing so was outweighed by the advantages of having the vehicle available. The Cougar was fully trialed when it became part of the MRAP program. The first Cougars were called HEV (hardened engineer vehicle), which became JERRV when the Army joined the program, and then MRAP for political reasons when the requirement for many thousands of units was issued. Some 4,000 of these vehicles were fielded under the US military's MRAP (Mine Resistant Ambush Protected) and other vehicle programs. US Defense secretary Robert Gates demanded that the vehicles be ordered in larger numbers after the Marines reported in 2004 that no troops had died in more than 300 IED attacks on Cougars. Since then, Cougar vehicles have been hit by improvised explosive devices (IEDs) many times in Iraq with few fatalities. Britain chose the Cougar over the RG-31 Nyala for their "Mastiff" APV. As of December 2011, the Pentagon planned to add the Crows II remote weapon station and the Frag Kit 6 anti-EFP armor. Official data states that the Cougar is able to withstand a blast of at least 14 kg TNT (30.86 lb) under a wheel and 7 kg TNT (15.43 lb) under a belly.

Cougar HE American 6x6 Mine-Resistant Ambush Protected (MRAP) Vehicle

System

Alternative Designation: Cougar HE
Type: MRAP
Manufacturer: General Dynamics Land Systems
Mission: When it comes to reliability, even after a hit the Cougar can return to the field in a matter of hours and perform a number of tasks such as Command and Control, EOD, Patrol, Convoy Support, Forward Observation, Reconnaissance, Med-

Evac and more.

Family: MRAP

Crew: ea2

Passenger Capacity: ea10

Note: These vehicles were designed to have good road speeds and endurance (to allow for the long distances traveled, as well as reduced maintenance requirements because of their wheeled design) and were specifically designed to maximize passenger survivability against small arms ambushes and conventionally laid mines.

Self-Entrenching Blade: No

Smoke Equipment: No

Survivability Equipment: Hull can withstand a double TM57 level mine explosion (14 kg of TNT) under any wheel or a single detonation (7 kg of TNT) under the central vehicle

Notes:

The RG-31 Nyala is a 4×4 multi-purpose mine-resistant ambush protected infantry mobility vehicle manufactured in South Africa by Land Systems OMC (the division of Denel SOC LTD, located in Benoni, South Africa) and in Turkey by FNSS Defence Systems. It is based on the Mamba APC of TFM Industries. The RG-31 is built from a V-shaped all-steel welded armor monocoque hull and high suspension, typical of South African mine protected vehicles, providing excellent small-arms and mine blast protection. The vehicle is designed to resist a blast equivalent to two TM-57 anti-tank mines detonating simultaneously. The RG-31 is classified by the United States Department of Defense as a category 1 Mine Resistant Ambush Protected (MRAP) vehicle. The vehicle accommodates a crew of 8 or 10, including the driver, depending on model. Dismounting is provided via a large rear door and two front doors. The RG-31 has become the multi-purpose vehicle of choice of the UN and other peacekeeping and security forces. It is finding favour with non-governmental organisations requiring a vehicle with a non-aggressive appearance to protect their personnel against land mines. In July 2016, the Letterkenny Army Depot in Pennsylvania rolled out the latest variant of the RG31, with improvements including an engine upgrade from 275 to 300 hp, a transmission upgrade from 2,500 to a 3,000 series, independent suspension, 360-degree spotlights for night visibility, and an armored gunner's hatch. The depot is scheduled to produce 929 these RG31s through 2020.

Cadillac Gage Commando American 4x4 Light Armored Vehicle

Tiers:

Variants:

- **LAV-150 Commando V-100:** Original model with gasoline engine with top speed of 100 km/h. Variants included APCs, 81-mm mortar carriers, command vehicles, Dragon missile carrier, TOW missile carrier, police & fire variants, & turreted versions with various weapons
- **LAV-150 Command V-150:** Diesel engine with top speed of 89 km/h
- **LAV-150 Command V-150S:** Stretched by an additional 0.46 m, improved cross-country performance, & higher payload capacity
- **LAV-150 Command V-150ST:** Stretched variant with a turbo-charged engine with bottom of side hatch forming a step to dismount
- **LAV-150 Commando V-200 (Singapore):** Chrysler gasoline engine with different variants (20-mm turret, 90-mm turret, RBS-70 SAM system for air defense, recovery vehicle, & 120-mm mortar carrier)
- **LAV-150 V-300:** 6 X 6 variant with 9-10 troops, 3 crew, 105 km/h speed, & amphibious
- **DN-III/V Caballo (Mexico):** DN-88 has 7.62-mm MG in turret; DN-V has 12.7-mm MG; both have mount for RM-12 light MG in rear
- **Malaysian Upgraded V-150:** Proposed version to covert Malaysian army V-150s from gasoline to diesel engines
- **M1117 ASV/ASV-150:** Bridges the gap between the HMMWV & APC with a turret featuring a MK-19 40-mm AGL & a 14.7 (.50 caliber) machine gun
- **M707 Armored Knight:** Artillery support vehicle
- **Mobile Strike Force Vehicle (MSFV) (Afghanistan):** 3 variants (APC with gunner protective kit, APC with turret, & ambulance) additional protection using off-the-shelf parts
- **Tactical Armored Patrol Vehicle (Canada):** When fielded, it will use the Kongsberg Protector remotely operation weapons station
- **Commando Advanced APC:** Extended vehicle to increase troop capacity with V-shaped hull to deflect mine blasts

System

Alternative Designations: LAV-150 Commando
Description: 4 X 4 light armored vehicle with an exit door on both sides of the vehicle for 2 soldiers with no firing ports

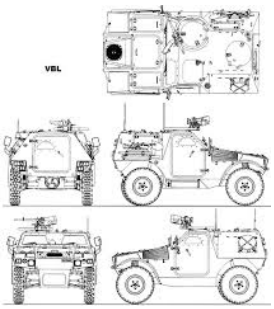
Notes:

The Cadillac Gage Commando, frequently denoted as the M706 in US military service, is an American armored car designed to be amphibious. It was engineered by Cadillac Gage specifically for the United States Military Police Corps during the Vietnam War as an armed convoy escort vehicle. The Commando was one of the first vehicles to combine the traditionally separate roles of an armored personnel carrier and a conventional armored car, much like the Soviet BTR-40. Its notable height, amphibious capability, and waterproofed engine allowed American crews to fight effectively in the jungles of Vietnam by observing their

opponents over thick vegetation and fording the country's deep rivers. The Commando was eventually produced in three distinct marks: the V-100, V-150, and V-200, all of which were modified for a number of diverse battlefield roles. An unlicensed variant of the Commando series, the Bravia Chaimite, was also manufactured in Portugal. After the American military disengagement from Vietnam, the Commando series was gradually retired from active US service. It was superseded in the Military Police Corps by the derivative M1117 Armored Security Vehicle during the 1990s. The V-100 series of vehicles was developed in the early 1960s by the Terra-Space division of the Cadillac Gage company of Warren, Michigan. By 1962 a patent was filed and received by Terra-Space for a vehicle then only known as the Commando. The first prototype emerged in 1963, and the production variants entered service in 1964. The vehicle is equipped with four-wheel drive and uses axles similar to the ones used in the M34 series of trucks. The engine is a gasoline-powered 360-cubic-inch Chrysler V8, same as in the early gas models of the M113 armored personnel carriers. Its 5-speed manual transmission allows it to traverse relatively rough terrain. The M706 has a road speed of 62 mph (100 km/h), and can travel across water at 3 mph (4.8 km/h). A Commando's armor consists of high hardness alloy steel called Cadaloy, which protects against projectiles up to 7.62×51mm. Partly because of its armor, the M706 has an unloaded mass of over 7 tons. As a result, a common problem with the vehicle is rear axle failure caused by the extreme weight. However, because the armor also provides the monocoque structural framework, it can be lighter than a soft vehicle to which armor has been added, and the angle of the armor also helps protect against hits and mine blasts. The V-100 was available in turret and open-top models. Factory prototype turret options included the T-60, T-70, and T-90. The T-60 featured a combination of either two .50 caliber machine guns, two .30 caliber machine guns, or one of each, and had manual traverse. The specific .30 caliber machine gun options were extremely varied, with from factory configurations including the M1919A4E1, M37, M73, M219, and MG42. Later the M60 and FN MAG were also added to the list of options. The Cadillac Gage company also intended to use the solenoid trigger equipped fixed machine gun version of the Stoner 63 weapon system, but this was dropped after tests showed the smaller caliber cartridge to be unsuited to this role. The T-90 featured a single 20 mm cannon with power traverse. The T-70, developed for police use, featured 4 tear gas launchers, vision blocks all around the turret for 360-degree vision, and no other weapons. The T-70 and T-90 were not put into mass production with a modified T-60, with the guns mounted together in the center, instead of on the outer edges, becoming the standard. A variant of this turret featuring the 7.62 mm General Electric Minigun was also developed. In addition an open-topped variant with a central parapet was developed. The intended usage of this variant was to be a mortar portee, but a total of five machine gun mounts could also be fitted. There were 2 in front, one in the rear all three M2 Browning or Mk 19 capable and one folding pintle point on each side capable of mounting any .30 caliber machine gun such as the M1919 Browning machine gun, M60 or any other machine gun of that class. An enclosed raised superstructure "pod" was also developed for converting the V-100 into either a command vehicle or for police use. The variants for police work featured special elongated firing ports for better angles of fire for tear gas grenade launchers. Relatively large-gunned variants of the V-100 began appearing in 1964, when Cadillac Gage marketed the Commando against the Alvis Saladin and Panhard AML-90 for a Royal Saudi Army requirement specifying a wheeled armoured vehicle equipped with a large semi-automatic cannon. A number of V-150s were later successfully tested and offered with a Mecar low-pressure 90mm smoothbore gun. With the new turret and gun, the V-150 was manned by a crew of three, although it retained enough space for eight additional passengers if no additional shell racks were added. At maximum capacity its hull could store up to thirty-nine rounds of 90mm ammunition and still seat four additional passengers. Subsequent V-150 models incorporated a slightly larger turret armed with a much more powerful Cockerill Mk.III 90mm gun, the same as that carried by the EE-9 Cascavel. A third fire support option involved the retrofitting of the Commando chassis with the complete turret and 76mm L23A1 gun of the FV101 Scorpion light tank.

Panhard VBL French 4x4 Light Armored Car



Tiers:

Variants:

- **VBL AT4CS:** A54CS 84-mm ATGM carrier with range only to 250 m with ring-mounted 7.62-mm machine gun
- **VBL SOURCE:** Upgraded optics
- **VBL Information:** Improved target designation
- **VAP Deep Penetration Vehicle:** Long wheel-base for deep reconnaissance missions
- **ULTRAV M11:** Stretched for NBC detection
- **Wasp Milan ER:** Remote weapon station with a 1-tube ATGM launcher & 7.62-mm machine gun
- **VBL Canon:** 20-mm remote turret
- **VBL Ingwe (South Africa):** Armed Long Range Reconnaissance Turret with 4 Ingwe ATGM launchers
- **MPCV (Multi-purpose Combat Vehicle):** VBR chassis with 4 rail missile launcher turret with 8 missiles & 12.7-mm machine gun
- **VBL Tourelle Fermee:** Remote turret that can fire a 12.7-mm MG, 7.62-mm MG, or 40-mm AGL
- **VBR:** Stretch variant can carry 5 soldiers; remote weapon station with M2HB MG & smoke grenade launchers
- **VBL Eryx:** Short-range (600 m) AT carrier with secondary 7.62-mm machine gun
- **VB2L Poste de Commandement:** Command version with extra radios, map board, & 7.62-mm MG for self-protection
- **VBL TOW (Greece):** Single tube with 4 rounds with range to 3,750 m
- **VBL Milan:** 1 Milan firing unit with 6 missiles with range to 2 km
- **VBL Samantha:** Griffon surveillance radar to designate SAM missile & AA artillery targets
- **VBL Anti-Tank:** Equipped with the HOT or TOW turret, but also can be integrated with Kornet or Ingwe missile systems
- **VBL Albi:** Fires Mistral/Mistral 2 SAMs
- **VBL with PL127 Turret:** 12.7-mm MG or 40-mm AGL

System

Alternative Designation: The Panhard Véhicule Blindé Léger ("Light armoured vehicle"), also known by its acronym Panhard VBL or simply VBL

Armor, Explosive Reactive : mmNo

Armor, Turret Front : mm5-11.5

NBC Protection: Collective

Self-Entrenching Blade: No

Smoke Equipment: Yes

Survivability Equipment: Increased mine protection, Kevlar blankets

Notes:

The Panhard Véhicule Blindé Léger ("Light armoured vehicle"), also known by its acronym Panhard VBL or simply VBL, is a French wheeled 4x4 all-terrain vehicle built by Panhard. The vehicle is offered in various configurations, and was designed to combine the agility of the Peugeot VLTT liaison vehicle with adequate protection against small arms fire, artillery fragments, mines and NBC weapons. Produced between 1985 and 2010, the vehicle has been used by the French Army and other European, African and Central American armies in various conflicts since the 1980s. The French VBL programme started in 1978. The French Army was looking for a light reconnaissance vehicle, intended to work with the AMX-10 RC, the Hotchkiss M201 being obsolete when compared with the Soviet BRDM-2s. The new vehicle needed to be armed with a single machine gun for reconnaissance (recce) or with the MILAN missile for anti-tank combat, while being protected from NBC hazards and small arms fire. Both Renault and Panhard proposed a prototype, the trials beginning in 1982. Before its selection by the French armed forces in 1985, the Panhard model was ordered by the Mexican Army in 1984. In 1985, a pre production of 15 vehicles for the French Army was launched while the VBL started its active operational service in the French Army in 1990. The French Army ordered 569 VBLs in 1990, 330 between 1994 and 1997, and 700 VB2L (lengthened variant) before 2004. The VBL, sold abroad as the ULTRAV M-11 has been produced at Marolles-en-Hurepoix, around 10 vehicles being produced each month in 2004. The 1,500th VBL was produced in 2001 and the last VBL of the 2,600 VBLs left the plant in 2010. The VBL has two compartments: a motor bay, placed forward to protect the second compartment, which is for the crew. Its compact internal dimensions led to the design of a lengthened version of the VBL. The crew of the VBL is protected against NBC weapons. The recce versions have two crew members while the anti-tank versions have a crew of three. The French Army version of the VBL is equipped with a Peugeot XD3T turbo-diesel engine. This engine is used on many civilian cars, such as the Peugeot 505,

Peugeot 605 and Talbot Tagora and the VBL used many other standard civilian components. Its 95 hp (71 kW) power and 29.5 hp/t (22.0 kW/t) power ratio enable the VBL to speed at 95 km/h (59 mph). It has a fuel consumption of 16 litres (3.5 imp gal; 4.2 US gal) per 100 km (62 mi). Its range of 600 km (370 mi) can be extended to 800 km (500 mi) by two external fuel tanks. Designed to be lighter than 3.5 t (3.4 long tons; 3.9 short tons), the mass of the VBL has increased to 4 t (3.9 long tons; 4.4 short tons). The VBL is fully amphibious and drives at 5.4 km/h (3.4 mph) in water; it is also air transportable by C-130, C-160, Il-76 and A400M. It can be transported underslung by larger helicopters, such as the AS332 Super Puma, and may also be para-dropped.

Nimr II Emirati 4x4 Light Armored Vehicle

Tiers:

1 2 3 4

Variants:

- **Note:** NIMR II vehicles serve as cargo/troop carrier, automatic weapon platform, ambulance, missile carrier, communication/shelter carriers amongst many other roles.
- **NIMRAD (Nimr Air Defense):** NIMRAD (Nimr Air Defense) is an air defense vehicle, based on the Nimr 4x4 armored chassis. The Bin Jabr Group teamed up with MBDA of France and Rheinmetall Defense Electronics of Germany to develop this air defense vehicle. The NIMRAR has a small turret and is armed with four Mistral 2 man-portable surface-to-air missiles. The NIMRAD was first demonstrated in 2007.
- **NIMRAT (Nimr Anti-Tank):** NIMRAT (Nimr Anti-Tank) is an anti-tank vehicle, based on the Nimr 4x4 armored chassis. It was developed to meet Iraqi Army requirement. As well as the NIMRAD, this anti-tank vehicle was also jointly developed by Bin Jabr Group, MBDA and Rheinmetall Defense Electronics. It has a similar turret as the NIMRAD air defense vehicle, but instead is armed with MILAN and MILAN ER anti-tank guided missiles. The NIMRAT can engage armored vehicles, tanks, buildings and field fortifications. Developers claim that within 12 hours a standard NIMRAD can be converted to NIMRAT, or vice versa.
- **6x6 armored personnel carrier:** 6x6 armored personnel carrier. It has a 2-doors for the driver and co-driver, as well as rear door for entry and exit. There are some observation windows, as well as associated firing ports provided for the troops to fire their individual weapons. It was replaced in production by an improved Nimr Hafeet vehicle with 6x6 configuration.

System

Alternative Designation: Nimr II
Description: The Nimr II (Arabic for tiger II) is an armored version of the Nimr tactical vehicle.
Crew: ea1
Passengers: ea3/7
Airlift Capable: Yes, The Nimr can be airlifted by a C-130 Hercules military transport aircraft. The 4x4 version can be also airlifted underslung by a CH-53 helicopter.
Note #1: The Nimr II can also tow trailers and light artillery pieces.

↳*Dimensions*

Length,: m5.19

Maximum Road Speed: km/h135

Maximum Range: km800

Gradient: %60

Side Slope: %40

Vertical Step: m0.5

Trench: m0.5

Fording: m1.2

Note: Vehicle has a permanent all-wheel drive. The Nimr II comes as standard with a central tyre inflation system. It improves mobility over difficult terrain, such as sand. It is also fitted as standard with run-flat tyres. This protected vehicle is fitted with a front-mounted winch.

Main Weapon System

Note: This armored vehicle has a roof hatch and can be fitted with a roof-mounted 7.62 mm or 12.7 mm machine gun machine gun, or 40-mm grenade launcher. Sometimes the Nimr II is even fitted with a heavy machine gun. Depending on customer requirements this vehicle can be fitted with remotely controlled weapon station. Some vehicles are fitted with smoke grenade dischargers.

↳*System*

Name: Caracal Assault Rifle 817

Alternative Designation: CAR 817

Date of Introduction: 2016

Country: United Arab Emirates

Manufactuer: Caracal International company

Caliber: mm7.62

Length, Stock Extended: mm884

Length, Stock Retracted: mm802

Barrel Length: mm406

Weight, Without Magazine: kg3.3

Muzzle Velocity: m/s750

Cyclic Rate of Fire: rds/min650-750

Practical Rate of Fire: rds/min30-90

Magazine Capacity: 10, 20, 25 rounds

Range of Effective Fire: m600

Sight: Iron

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62x51 mm

Protection

Armor: The Nimr II offers protection for the passengers against small arms fire and some level of protection against mine blasts and improvised explosive devices. The basic armor provides ballistic protection against 7.62x51 mm NATO ball rounds. Mine protection is against 6 kg of TNT under any wheels.
Applique Armor: Available, Protection level can be tailored to suit the threat by installing add-on composite armor. With add-on armor kit fitted maximum level of ballistic protection is against 7.62x51 mm NATO armor-piercing rounds. Maximum level of blast protection is against 6 kg of TNT anywhere under the hull. So with maximum armor the Nimr II is better protected than the US M1114 up armored HMMWV. An NBC protection system was proposed as an option.
Explosive Reactive Armor: No
Active Protection System: INA
NBC Protection: Optional
Smoke Equipment: Available

Notes:

The NIMR II High Mobility Tactical Vehicle (HMTV) was developed and manufactured by a joint venture between Jordan's King Abdullah II Design and Development Bureau (KADDB) and Bin Jabr Enterprises of the United Arab Emirates (UAE). The original vehicles have been designed to meet the United Arab Emirates Armed Forces stringent requirements and are in series production. There are a number of the NIMR HMTV in production utilising both 4x4 and 6x6 technologies. These high mobility robust vehicles have been designed to out perform other vehicles in their class providing greater power and load-carrying capability whilst being reliable and multi-mission capable. The Nimr II vehicle has been designed to carry out military, police and peacekeeping missions in the Middle East area thanks to a cooling system that allows the vehicle to withstand the desert climate with temperatures ranging from -25 to 55 Celsius. In February 2099, Libyan government has signed an agreement with Bin Jabr Group for 120 NIMRs. Bin Jabr Group will manufacture and deliver 120 NIMR 4x4 multi mission combat platforms to the Libyan Armed Forces, according to local news. A Pro-Gadhafi Libyan Army NIMR II Armored Vehicle was seen in Zawiyah, March 17, 2011, during news of the national Libyan television, which confirms the delivery of NIMR II to the Libyan armed forces. This military vehicle is available both with 4x4 and 6x6 configurations.

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Sayyad AFV is an Iranian light, multi-purpose, tracked armored vehicle, sometimes described as a "quick reaction tank". The overall design is similar to that of the British FV102 Striker, and it is often mistaken for the Tosan tank. However, there are some major differences between the Sayyad and the Striker. The Sayyad is shorter in length than the Striker, and it has one less road wheel. The hull is slightly redesigned and storage baskets have also been added. There are two variants of the Sayyad. One with either a single or a double Toophan anti-tank missile launcher, with six reload missiles in storage baskets. The other is a multiple rocket launcher variant with two 23 tube launchers for 77mm rockets. The vehicle is intended to be used to provide a fast platform for anti-tank missiles and small artillery rockets. It entered service in 2010.

BMPT Terminator Russian Heavy Fire Support Combat Vehicle

Tiers:

Variants:

- **BMPT-72 (Terminator-2):** BMPT on a T-72 chassis. The BMPT-72 is a little smaller than the BMPT and weights 6 tonnes less. The crew is 3, 2 less than its parent. The BMPT-72 can have one of two different engines, either the 840 horsepower V-84MS or the 1,000 horsepower V-92S2. The -72 version has a 50km shorter range at 500km and does not have the grenade launchers. This support combat vehicle was first revealed at the Russian Arms Expo (RAE) at Nizhny Tagil, Russia in 2013. The Terminator 2 is being sold as an armor upgrade package, rather than an actual tank, with two engines available. The two engines are the V-84MS (840 hp, 2000 rpm, V12, 4-stroke, multi-fuel, liquid cooling, and gear driven centrifugal type supercharger) and the V-92S2 (1000 hp, 2000 rpm, V12, 4-stroke, multi-fuel, liquid cooling, and turbocharger). These upgrades removed the two frontal 30mm grenade launchers; this reduced the crew from five to three, but also lightened the load from 48 tonnes to 44 tonnes. The armament of the BMPT-72 Terminator 2 is the same (except for the removal of the two 30mm grenade launchers), however, the armament is better protected and the structural support of the four ATGMs is enhanced and positioned horizontally instead of vertically. The FCS has also gotten an upgrade with a new multi-channel gunner's sight that is equipped with a thermal channel, night vision, laser range finder, laser guidance system for missiles, and independent 2-plane stabilization of field of view with a sighting range of 5000 meters. The BMPT-72 received a new digital ballistic computer with weather and topographical support and the armament is stabilized on two axes with electromechanical traversing and elevating drives. Lastly, improved NBC protection is provided for the crew.
- **BMPT-72 (Terminator-3):** Will be based on the Armata Universal Combat Platform and ave an automatic gun turret and in the future may have integrated air defense systems and my be fully unmanned.

Range, Day Sight: km5

Range, Thermal Sight: km7

Note:: The commander's B07-K1 panoramic sight is located at the top of the BMPT and has a 360° field of view. This panoramic sight has optical, low-level laser rangefinder and television channels. The B07-K2 standard gunner's sight consists of optical and thermal channels and a laser rangefinder. The vehicle also has hunter-killer capabilities with its separate commander's panoramic sight and gunner's sight which can detect both ground and aerial targets. The gunner is able to use the commander's sight to engage targets if his own sight is disabled or destroyed. The commander of the vehicle also has the ability to override the command to take control of the turret and guns from the gunner. The navigation system used by the BMPT is a combined GPS/GLONASS module.

Protection

Hull Armor: Has additional armor without adding weight because turret is lightly armored

Turret Armor: Unmanned

Applique Armor: Yes

Explosive Reactive Armor: Yes, Relikt

Active Protection System: No

Mine Clearing: Can be added

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: Yes

Notes:

The BMPT "Terminator" is a post-Cold war Armored Fighting Vehicle (AFV), designed and manufactured by the Russian company Uralvagonzavod. This vehicle was designed for supporting tanks and other AFVs in urban areas. The BMPT is

unofficially named the "Terminator" by the manufacturers. It is heavily armed and armored to survive in urban combat. This AFV is armed with Ataka-T Guided Weapon System armed with four 9M120 Ataka missile launchers, two 30 mm 2A42 auto-cannons, two AG-17D grenade launchers, and one coaxial 7.62 mm PKTM machine gun. The BMPT is built on the chassis of theT-72 main battle tank which is used in large numbers by the Russian Army and has been manufactured under license by many other countries. The BMPT was designed based on combat experience gained during the Soviet–Afghan War and the First Chechen War. Multiple prototypes of a tank support combat vehicle were created prior to the design of the current BMPT. The Object 199 "Ramka" was the prototype later to be known as the modern BMPT with the official producer being Uralvagonzavod. As of late 2013, the only operator of the BMPT was Kazakhstan. A small number were delivered to the Russian Ground Forces for evaluation beginning in 2005. The Russian Defense Ministry finally ordered the BMPT in August 2017. Deliveries of more than 10 vehicles began in early 2018. The version, unofficially referred to as the "Terminator-3," incorporates the chassis, hulls, and components of the T-90A tank. A small number were delivered to the Russian Ground Forces for evaluation beginning in 2005. The Russian Defence Ministry finally ordered the BMPT in August 2017.[4] Deliveries of more than 10 vehicles were begun in early 2018. The version, unofficially referred to as the "Terminator-3," incorporates the chassis, hulls, and components of the T-90A tank.

BMPT-72 Terminator 2 Russian Tank Support Armored Fighting Vehicle

Tiers:

Variants:

- **BMPT "Terminator":** The BMPT "Terminator" (Tank Support Fighting Vehicle)[2] is an armored fighting vehicle (AFV), designed and manufactured by the Russian company Uralvagonzavod. This vehicle was designed for supporting tanks and other AFVs in urban areas. The BMPT is unofficially named the "Terminator" by the manufacturers. It is heavily armed and armored to survive in urban combat. This AFV is armed with Ataka-T Guided Weapon System armed with four 9M120 Ataka missile launchers, two 30 mm 2A42 autocannons, two AG-17D grenade launchers, and one coaxial 7.62 mm PKTM machine gun.
- **BMPT-72 Terminator 3:** BMPT-72 Terminator 3 will be based on Armata Universal Combat Platform and have an automatic gun turret and in the future may have integrated air defense systems and may be fully unmanned.

System

Alternative Designation: BMPT-72 (Terminator 2)
Type: Tank Support Armoured Fighting Vehicle
Manufacturer: UralVagonZavod Corporation
Crew: eaThree (commander, gunner, driver)
Chassis: The multipurpose tank support combat vehicle BMPT-72 is built on the chassis of T-72 battle tank.

Dimensions

Length: 7.2 m
Width: 3.59 m
Height: INA
Weight, Combat: 44 tons
Ground Pressure: INA

Automotive

Engine Name: The BMPT-72 (Terminator 2) can be motorized with two types of engine, the original 850 hp B84MC or the new 1000 hp.
Engine Type: B92C2 power plants, both are 12 cylinder V type multi fuel, liquid cooled Diesel engines. The B92C2 is a turbo supercharger which offers higher power and efficiency.
Engine Power: hp800-1,000

Transmission: hydraulically assisted transmission with 7 forward and 1 reverse gears.

Range: km500

Speed, Maximum Road: km/h60

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Suspension: The torsion bar suspension each side consists of six roadwheels with the idler at the front, drive sprocket at the rear and three return rollers supporting the inside of the track only. Shock-absorbers are fitted at the first, second and sixth roadwheel stations. The upper part of the suspension is protected by armour plates at the front and slat armour at the rear

Vertical Step: 850 mm

Trench: 2.8 m

Fording Depth: fording depth of 1.2m without preparation (1.8 m after 15 min of preparation).

Note: The BMPT-72 uses also an auxiliary power unit to extend mission endurance and running all systems on silent watch.

Main Gun

Turret: The BMPT-72 or Terminator 2 is fitted with a new unmanned redesigned fully stabilized electromechanical turret, with lower profile and better protection.

Turret Elevation: The turret can be rotated on 360 ° with elevation from -5° to +25° for the anti-tank missile and from -5° to +45° for the guns and coaxial machine gun.

Turret Traverse: 360 °

↳*System*

Name: Shipunov 2A42

Type: Autocannon

Caliber: 30 mm

Length: 3.027 m

Barrel Length: 2,416 mm

Weight: 115 kg

Barrels: 1

Action: Gas-operated

Rate of Fire: 200 to 300 rds/min (low) 550-800 rds/min (high)

Muzzle Velocity: 960 metres per second

Maximum Firing Range: 4,000 metres (4,400 yd) (HEI)

Effective Firing Range: 2,000 metres (2,200 yd) (AP-T)

Feed System: Twin Feed

↳*Ammunition*

Type: Rifle

Caliber: mm30

Cartridge: 30 × 165mm

Basic Load: 850 Rounds

Note: The guns can fire a wide range of ammunitions as APERS-T (Anti-Personnel ammunitions), HEF-I (High-explosive Fragmentation Incendiary), AP-T (Armour Piercing)., and KE (Kinetic Energy).

Coaxial Weapon System

↳*System*

Name: PKMT

Type: General-Purpose Machine Gun

Caliber: mm7.62

Length: 1,192 mm

Barrel Length: 605 mm

Weight: 10.5 kg

Action: Gas-operated, open bolt

Rate of Fire: 700–800 rounds/min

Muzzle Velocity: 825 m/s

Maximum Firing Range: 4,000 m

Effective Firing Range: 1,500 m

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Basic Load: 2,100 Rounds

Anti-Tank Guided Missile (ATGM) System

↳*System*

Name: Ataka-T Launcher

Type: Anti-Tank Guided Missile Launcher

Quantity: 2 x Ataka-T launchers

Location: Two anti-tank guided missile Ataka-T launcher units are mounted to each side of the turret.

↳*Ammunition*

Name: 9M1201 Missile

Type: Anti-Tank Guided Missile

Length: INA

Diameter: INA

Weight: INA

Warheads: The missile 9M1201 can be equipped with two types of warheads, hollow-charge and high-explosive concrete-piercing.

Basic Load: 4 x 9M1201 Missile

Maximum Range: 6,000 m

Fire Control

Name: INA

Computerized FCS: Yes, Advanced automatic fire control system. The BMPT-72 or Terminator 2 is fitted with advanced automatic fire control system which can be used for terrain observation, target location and detection on the move at day and night

Day and Night Vision: Yes

Panoramic Sight: Yes

Main Gun Stabilization: INA

Thermal Camera: Yes

Laser Range Finder: Yes

Ballistic Computer: Yes

Note #1: The commander and the gunner of the BMPT-72 are equipped with control panel and LCD screen. The gunner is equipped with multichannel device with sighting and thermal channels, laser range finder, GM laser control channel and independent FoV (Field of View) stabilized in azimuth and elevation. The commander panoramic sight is fitted with video and thermal channels, laser range finder and independent FoV stabilized in azimuth and elevation. Gunner and commander are able to detect a target at a distance of 5,000 m with sighting channel and 3,500 m with the thermal channel.

Note #2: The BMPT-72 can be fitted with a snorkel to cross a river with a depth of 5 m maximum.

Protection

Hull Armor: Basic steel armour, explosive reactive armour ERA at front and glacis, slat armour at the rear.

Turret Armor: Compared with the BMPT predecessor, the BMPT-72 has an improved fire control system and better turret weapon station protection. The turret protection includes armored shields for the missiles, protecting the missiles from splinters and firing of small arms.

Applique Armor: The rear parts of the turret and the chassis are fitted with slat armour to increase protection against anti-tank rocket-propelled grenade (RPG) attacks. The anti-tank launch units include armored shields for the missiles, protecting the missiles from splinters and small arms fire.

Explosive Reactive Armor: The BMPT-72 hull and turret are made of steel armour and integrates latest protection systems with explosive reactive armour (ERA) to the front of the turret, a detachable ERA module on the glacis plate and applique ERA on the sides of the hull and turret.

Active Protection System: INA

Mine Clearing: INA

Dozer Blade: A dozer blade mounted under the nose of the tank is used for clearing obstacles and preparing fire positions and, like most other Russian tanks. The dozer blade can be brought into the operating position in 1 or 2 minutes and enables the BMTT-72 tank to prepare its own defilade position without calling on engineer support.

NBC Protection: Yes

Smoke Equipment: Six smoke-grenade launchers are fitted on the turret.

Notes:

Boyevaya Mashina Podderzhki Tankov-72 (BMPT-72), also known as Terminator 2, is a new version of the BMPT tank support combat vehicle developed by UralVagonZavod Corporation, Russia. The BMPT-72 was launched at the Russian Arms Expo (RAE) exhibition in Nizhny Tagil, Russia, in September 2013. The new vehicle, fitted with guided weapon system, is capable of destroying infantry vehicles, enemy tanks and other armoured objects. The multipurpose tank support combat vehicle BMPT-72 is built on the chassis of T-72 battle tank. The BMPT-72 can survive in different climatic zones, including urban areas, and in any light conditions. The new variant follows the earlier BMPT tank support combat vehicle developed by Uralvagonzavod and Ural Transport Machine Building Design Bureau. The crew size of the BMPT-72 has been reduced to three, by removing two grenade launching positions aboard the BMPT. The driver sits in the centre of the forward hull, while the gunner and commander positions are at the rear. The new vehicle offers improved gun power, protection and command and control system over the BMPT. The combat weight is also reduced from 47t to 44t. The length and width of the vehicle are 7.2m and 3.59m respectively. The BMPT-72 infantry fire support vehicle is armed with two 30mm 2A42 automatic cannons that can load ammunition of 850 rounds, four laser-guided Ataka-T anti-tank missile systems and one PKTM coaxial machine gun with remote reloading mechanism. The tank features sighting and thermal channels, a laser range finder, integrated laser control channel for missile guidance and independent stabilisation of field of vision in azimuth and elevation planes, to enable the multispectral gunner’s sight. The commander is provided with panoramic sight and the gunner’s position is fitted with day periscopes. The sighting channel allows the gunner and commander to detect targets at 5,000m distance during day time. The BMPT-72 is provided with an increased fire control system for terrain observation and target location in all weather and any light conditions. The vehicle is equipped with a ballistic computer with a set of weather and topographical sending units. The vehicle also includes a two-axis stabilised weapon unit with electromechanical traversing and elevating drives.

→→Wheeled Heavy Armored Vehicles

Bushmaster Australian 4x4 Protected Mobility Vehicle

Tiers:

Variants:

- **Planned Variants:** ADI (now Thales Australia) planned at least six variants. These included an armored ambulance; command vehicle; mortar carrier with internally mounted 81-mm or 120-mm weapon; fire support vehicle with 12.7-mm machine gun and 40-mm automatic grenade launcher; engineering vehicle; and firefighting vehicle.
- **Bushmaster ambulance:** This variant can transport two stretchered patients, or one stretchered and four seated patients at one time. They are equipped with the latest medical equipment and provide protection against blasts and ballistic threats.
- **Bushmaster EOD:** The Bushmaster explosive ordinance disposal (EOD) variant is fitted with a 27 ft 11 in (8.5 m) interrogator arm with a 225-degree arc of operation around the front of the vehicle. The arm can be installed onto any existing Bushmaster vehicle to modify it into an EOD variant. The two-piece articulated arm can include the following attachments: interrogation tool with clasp claw; work light; camera; detection equipment; and proximity detector. The vehicle can also be fitted with a roller clearance system that is hydraulically operated, steerable and easily attached and released. An EOD robot can also be stored internally .
- **Bushmaster combat support vehicle:** Thales Australia privately developed a prototype Bushmaster combat support vehicle in 2005. It was previously known as the Copperhead . This 4 x 4 vehicle features the Bushmaster cab at the front, with a flat-bed cargo area at the rear, which can carry up to 11,000 lb (5,000 kg) of cargo. The cargo area measures 101 sq ft (9.4 sq m). Upgradeable ballistic protection options are available for the crew cabin. The vehicle has a top speed of 60 mph (100 km/h) and a maximum range of 500 mi (800 km). It also offers high clearance for obstacles, tight turning circle and the ability to travel off-road in all conditions, according to the manufacturer. A dual-cab variant, offered for the British operational utility vehicle system (OUVS) program, featured a larger interior cabin with room for two crew and up to six passengers with four side-opening passenger doors and a flatbed area of 54 sq ft (5 sq m) and a 6,600-lb (3,000-kg) payload.
- **Bushmaster 6 x 6:** Thales Australia has conducted studies of a 6 x 6 version of the Bushmaster, which would have a gross vehicle weight of up to 25.6 tons.

System

Alternative Designation: Bushmaster

Type: Protected Mobility Vehicle

Crew: ea2 (commander, driver)

Passenger Capacity: 8 troops

Dimensions

Length, Overall: 6.60 m

Length, Hull: 7.09 m

Height: 2.65 m

Width: 2.50 m

Cabin Volume: 11.2 cubic m

Ground Clearance, Hull: 0.43 m

Ground Clearance, Axle Housings: 0.40 m

Wheel Track: 2.10 m

Wheel Base: 3.90 m

Weight, Unloaded: 12,500 kg

Weight, Combat: 15,000 kg

Weight, Payload: 2,500 kg

Automotive

Engine Name: 1 x Caterpillar 3126 ATAAC

Engine Type: 6-cylinder turbocharged air-to-air after-cooled diesel

Engine Power: 300 hp at 2,400 rpm with 25 percent torque rise

Transmission: ZF 7HP502 full automatic with front-end retarder for controlled slope descent

Tires: 395/85 R20 with bead locks or optional run-flat inserts

Inflation System: optional dual-channel with dash-mounted push button control, providing 4 settings highway, sand, mud/snow and emergency

Brakes: dual circuit Meritor air-operated disc brakes assisted by a hydraulic retarder

Suspension: AxleTech 4000 series coil spring with short-long-arm wishbone and double-acting hydraulic shock-absorbers, bump-stop rubbers

Axles: Arvin Meritor/Timoney 4000 series independent suspension axle system, 7,700-kg capacity with diff locks front, center and rear

Speed, Road: 100 km/h

Range: 800 km

Vertical Obstacle: 0.50 m

Fording: 1.20 m w/out preparation

Gradient: %60

Side Slope: %40

Approach Angle: deg40

Departure Angle: deg38

Turning Circle: 18.6 m

Fuel Capacity: 319 Liters

Main Gun

Name: M2 Browning
Type: Heavy Machine Gun
Caliber: 12.7 mm
Length: 1,654 mm
Barrel Length: 1,143 mm
Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)
Action: Short recoil-operated
Rate of Fire: 450–600 rounds/min
Muzzle Velocity: 890 m/s
Maximum Firing Range: 7,400 m
Effective Firing Range: 1,800 m
Feed System: Belt-fed (M2 or M9 links)

↳*Ammunition*

Type: Rifle
Caliber: mm12.7
Cartridge: .50 BMG (12.7×99mm NATO)
Basic Load: 1,200

Auxiliary Weapon System

Note: Manned swing mounts up to 7.62mm (one front and two rear)

Fire Control

Name: INA
Computerized FCS: No
Thermal Sight Vehicle Commander: INA
Thermal Sight Gunner: INA

Protection

Hull Armor: all-welded steel to withstand 5.56-mm and 7.62-mm ball ammunition
Turret Armor: INA
Applique Armor: INA
Explosive Reactive Armor: No
Active Protection System: INA
Mine Clearing: No
Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: 8 x grenade launchers (bank of 4 on each side of vehicle hull)

Notes:

The Bushmaster Protected Mobility Vehicle or Infantry Mobility Vehicle is an Australian-built four-wheel drive armoured vehicle. The Bushmaster was primarily designed by the then government-owned Australian Defence Industries (ADI), and is currently produced by Thales Australia with a support contract provided by Oshkosh Truck following the acquisition of ADI. The Bushmaster is currently in service with the Australian Army, Royal Australian Air Force, Royal Netherlands Army, British Army, Japan Ground Self Defense Force, Fiji Infantry Regiment, Jamaica Defence Force and the New Zealand Army. The role of the Bushmaster is to provide protected mobility transport (or protected troop lift capability), with infantry dismounting from the vehicle before going into action. As the Bushmaster is only lightly armoured, the term Infantry Mobility Vehicle (IMV) was initially adopted to distinguish it from a heavier wheeled or tracked armoured personnel carrier, such as the ASLAV and M113 also in Australian service. Later the Bushmaster's designation was changed to Protected Mobility Vehicle (PMV). The Bushmaster is optimised for operations in northern Australia, and is capable of carrying up to 9 soldiers and their equipment, fuel and supplies for 3 days, depending on the type of variant. The vehicle is fitted with air conditioning and was once planned to have a cool water drinking system, but was omitted upon production due to cost constraints. After operational complaints the drinking water cooling system is being reconsidered for installation. It has a road cruise speed of 100 km/h and an operational range of 800 km. The Bushmaster is a mine protected vehicle and provides a high degree of protection against land mines, using its v-hull monocoque to deflect the blast away from the vehicle and its occupants. The vehicle's armour provides protection against small arms of up to 7.62 mm ball ammunition, 81mm mortar fragments, Claymore mines, and with additional applique armour, protection for armour-piercing ammunition of up to 7.62mm. The fuel and hydraulic tanks of the vehicle are located outside the crew compartment, while it also has an automatic fire suppression system. The troop carrier variant of the Bushmaster is fitted with one gun ring. The forward gun ring can be fitted with a 5.56 mm or 7.62 mm machine gun. The two rear hatches each have a mounting boss to allow the attachment of a swing mount capable of holding a 7.62 mm machine gun. The Bushmaster is air transportable by C-130 Hercules, C-17 Globemaster III and Mil Mi-26 aircraft. It is the first armoured vehicle to be designed and completely manufactured in Australia since the Sentinel tank during World War II.

Kamaz-53949 Typhoon-K Russian 4x4 Armored Mine-Resistant Ambush Protected (MRAP)

Tiers:

Variants:

- **Linza Armored Ambulance:** Armored Ambulance
- **Logistic Support Vessel:** INA
- **Command Post Vehicle:** INA

System

Alternative Designation: Kamaz-53949 Typhoon-K
Type: 4x4 Armoured Vehicle
Manufacturer: Remdiesel
Crew: ea2
Passenger Capacity: ea8
Payload Capacity: 2,000kg

Dimensions

Length: 6.7m
Width: 2.5m
Height: 2.8m
Curb Weight: 13,700kg
Ground Clearance: The ground clearance of the vehicle can be automatically adjusted in line with the speed, surface and person-specific driving style.

Automotive

Engine Name: Cummins 6ISBe 350 P-6

Engine Type: Diesel

Engine Power: The engine generates a maximum power of 350hp at a maximum torque of 1,090Nm.

Power-to-Weight Ratio: The power-to-weight ratio of the vehicle is 20.2hp/t.

Transmission: six-speed automatic transmission system.

Range: km1,000

Speed, Maximum Road: 100km/h

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Suspension: The Typhoon-K is equipped with a hydro-pneumatic independent suspension system with ride height adjustment according to the requirements of the users.

Central Tire Inflation System: Yes

Vertical Step: 0.6m

Trench: 0.5m

Fording: 1.5m without preparation

Main Weapon System

Note: The Kamaz-53949 is fitted with a stabilised remotely controlled weapon station (RCWS). The RCWS can be armed with medium-to-heavy machine guns, including a 7.62mm medium machine gun (MMG) or a 12.7mm / 14.5mm heavy machine gun (HMG).

↳*System*

Name: NSV

Type: Heavy Machine Gun

Caliber: 12.7

Length: 1,560 mm

Barrel Length: INA

Weight: 25 kg (55.12 lb) (gun only) 41 kg (90.39 lb) on tripod 11 kg (24.25 lb) (50-round belt)

Action: Gas-operated

Rate of Fire: 700–800 rounds/min

Muzzle Velocity: 845 m/s

Effective Firing Range: 1500 m vs. air (maximum) 2000 m vs. ground targets

Feed System: 50-round belt

Sights: Iron sights

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: 12.7×108mm

Basic Load: 2,000 Rounds

Fire Control

Name: INA

Computerized FCS: No

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: No

Protection

Hull Armor: The vehicle protects the occupants from 14.5mm-calibre ammunition, armour-piercing rounds and incendiary rounds. It can withstand the impact of 8kg TNT explosion under the floor and 10kg TNT explosion under the wheels. The vehicle offers STANAG 4569 level III protection against anti-personnel and anti-tank mines, as well as improvised explosive devices (IEDs). The V-shaped hull reduces the blast impact by deflecting the kinetic objects away from the hull in the event of TNT device explosion anywhere under the bottom of the vehicle. The hull is hinged with sandwich armour, comprising conventional internal steel armour and new-generation external ceramic armour.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

Kamaz-53949 Typhoon-K is a 4×4 mine-protected armoured vehicle manufactured by Remdiesel, a subsidiary of KAMAZ, to meet the requirements of armed forces and special units worldwide. The vehicle was recently displayed at the International Military-Technical Forum ARMY-2017 held in Moscow, Russia, in August. Russian state-owned arms exporter Rosoboronexport and Remdiesel signed an agreement to promote the vehicle in export markets across the North Africa, Middle East, Central and South East Asia, Latin America and Commonwealth of Independent States (CIS) regions. The Typhoon-K is primarily used to safely transport troops and military cargoes in mine-inflated zones. It can also be configured as a command post vehicle, ambulance and logistics support vehicle. Kamaz-53949 design The Typhoon-K is based on the common chassis utilised by the Kamaz family of all-wheel drive medium and heavy-duty vehicles. The vehicle also shares most of the components and assemblies with the other platforms in the family. The vehicle accommodates two crew members and eight fully equipped troops. The hull features four side doors and a rear door. The roof is fitted with two hatches for observation, firing and emergency exit purposes. The Kamaz-53949 vehicle measures 6.7m-long, 2.5m-wide and 2.8m-high. It has a curb weight of 13,700kg and can carry a payload of 2,000kg. The vehicle also features a signature reduction package, an all-around video surveillance system and an automatic fire-extinguishing unit. Armament of Kamaz-53949 Typhoon-K The Kamaz-53949 is fitted with a stabilised remotely controlled weapon station (RCWS). The RCWS can be armed with medium-to-heavy machine guns, including a 7.62mm medium machine gun (MMG) or a 12.7mm / 14.5mm heavy machine gun (HMG).

Notes:

The Supacat is amphibious and has a low ground pressure, enabling it to traverse rough terrain whilst carrying up to eight troops (and two crew), a standard NATO pallet or other stores (ammunition etc.). A GPMG may also be fitted to create an effective mobile fire support platform. It has permanent six wheel drive (6x6) with the front four wheels (two axles) steered conventionally by using a rotating handlebar arrangement. These handlebars also operate the steering brakes, which act independently on each side of the vehicle giving brake steering. The Supacat is built around a steel rectangular hollow section chassis frame, which forms the entire shape of the vehicle and to which all components and attachments are fitted. The 'body' of the Supacat forms a hull that enables the vehicle to float and protects the majority of mechanical components. The vehicle can be configured for a number of roles: *Basic ATMP *FLPT (Fork Lift Pallet Trailer) to lift, handle and carry pallets up to 1.6 tonnes. *SLLPT (Self Loading Lightweight Pallet Trailer) *'Fuel Cat', which is able to carry and pump up to 1000 litres of aviation fuel. It also carries an engine start system for aircraft and is able to tow an APFC (Air Portable Fuel Container). *Mounted crane *Aircraft crash recovery *Radio rebroadcast stations *Casualty evacuation *The Supacats were initially taken into service by the United Kingdom in 1988 and have been heavily used in active service. A modified Supacat 6X6 MK III was used in the movie Brazil. Supacat re-branded to SC Group in September, 2015, the Supacat brand retained for the group's core defence business.

Panhard VBL French 4x4 All-Terrain Vehicle

Tiers:

1 2 **3** 4

Variants:

- **VBL AT4CS:** A54CS 84-mm ATGM carrier with range only to 250 m with ring-mounted 7.62-mm machine gun
- **VBL SOURCE:** Upgraded optics
- **VBL Information:** Improved target designation
- **VAP Deep Penetration Vehicle:** Long wheel-base for deep reconnaissance missions
- **ULTRAV M11:** Stretched for NBC detection
- **Wasp Milan ER:** Remote weapon station with a 1-tube ATGM launcher & 7.62-mm machine gun
- **VBL Canon:** 20-mm remote turret
- **VBL Ingwe (South Africa):** Armed Long Range Reconnaissance Turret with 4 Ingwe ATGM launchers
- **MPCV (Multi-purpose Combat Vehicle):** VBR chassis with 4 rail missile launcher turret with 8 missiles & 12.7-mm machine gun
- **VBL Tourelle Fermee:** Remote turret that can fire a 12.7-mm MG, 7.62-mm MG, or 40-mm AGL
- **VBR:** Stretch variant can carry 5 soldiers; remote weapon station with M2HB MG & smoke grenade launchers
- **VBL Eryx:** Short-range (600 m) AT carrier with secondary 7.62-mm machine gun
- **VB2L Poste de Commandement:** Command version with extra radios, map board, & 7.62-mm MG for self-protection
- **VBL TOW (Greece):** Single tube with 4 rounds with range to 3,750 m
- **VBL Milan:** 1 Milan firing unit with 6 missiles with range to 2 km
- **VBL Samantha:** Griffon surveillance radar to designate SAM missile & AA artillery targets
- **VBL Anti-Tank:** Equipped with the HOT or TOW turret, but also can be integrated with Kornet or Ingwe missile systems
- **VBL Albi:** Fires Mistral/Mistral 2 SAMs
- **VBL with PL127 Turret:** 12.7-mm MG or 40-mm AGL

System

Alternative Designation: The Panhard Véhicule Blindé Léger ("Light armoured vehicle"), also known by its acronym Panhard VBL or simply VBL

Armor, Explosive Reactive : mmNo

Armor, Turret Front : mm5-11.5

NBC Protection: Collective

Self-Entrenching Blade: No

Smoke Equipment: Yes

Survivability Equipment: Increased mine protection, Kevlar blankets

Notes:

The Panhard Véhicule Blindé Léger ("Light armoured vehicle"), also known by its acronym Panhard VBL or simply VBL, is a French wheeled 4x4 all-terrain vehicle built by Panhard. The vehicle is offered in various configurations, and was designed to combine the agility of the Peugeot VLTT liaison vehicle with adequate protection against small arms fire, artillery fragments, mines and NBC weapons. Produced between 1985 and 2010, the vehicle has been used by the French Army and other European, African and Central American armies in various conflicts since the 1980s. The French VBL programme started in 1978. The French Army was looking for a light reconnaissance vehicle, intended to work with the AMX-10 RC, the Hotchkiss M201 being obsolete when compared with the Soviet BRDM-2s. The new vehicle needed to be armed with a single machine gun for reconnaissance (recce) or with the MILAN missile for anti-tank combat, while being protected from NBC hazards and small arms fire. Both Renault and Panhard proposed a prototype, the trials beginning in 1982. Before its selection by the French armed forces in 1985, the Panhard model was ordered by the Mexican Army in 1984. In 1985, a pre production of 15 vehicles for the French Army was launched while the VBL started its active operational service in the French Army in 1990. The French Army ordered 569 VBLs in 1990, 330 between 1994 and 1997, and 700 VB2L (lengthened variant) before 2004. The VBL, sold abroad as the ULTRAV M-11 has been produced at Marolles-en-Hurepoix, around 10 vehicles being produced each month in 2004. The 1,500th VBL was produced in 2001 and the last VBL of the 2,600 VBLs left the plant in 2010. The VBL has two compartments: a motor bay, placed forward to protect the second compartment, which is for the crew. Its compact internal dimensions led to the design of a lengthened version of the VBL. The crew of the VBL is protected against NBC weapons. The recce versions have two crew members while the anti-tank versions have a crew of three. The French Army version of the VBL is equipped with a Peugeot XD3T turbo-diesel engine. This engine is used on many civilian cars, such as the Peugeot 505, Peugeot 605 and Talbot Tagora and the VBL used many other standard civilian components. Its 95 hp (71 kW) power and 29.5 hp/t (22.0 kW/t) power ratio enable the VBL to speed at 95 km/h (59 mph). It has a fuel consumption of 16 litres (3.5 imp gal; 4.2 US gal) per 100 km (62 mi). Its range of 600 km (370 mi) can be extended to 800 km (500 mi) by two external fuel tanks. Designed to be lighter than 3.5 t (3.4 long tons; 3.9 short tons), the mass of the VBL has increased to 4 t (3.9 long tons; 4.4 short tons). The VBL is fully amphibious and drives at 5.4 km/h (3.4 mph) in water; it is also air transportable by C-130, C-160, Il-76 and A400M. It can be transported underslung by larger helicopters, such as the AS332 Super Puma, and may also be para-dropped.

Speed, Maximum Swim: km/h5

Fording Depth: Amphibious

Protection

Active Protection System: No

Armor, Applique: No

Armor, Explosive Reactive: No

NBC Protection: Yes

Smoke Equipment: INA

Survivability Equipment: INA

Notes:

GAZ-3344 is capable to move through harder obstacles, by virtue of torque transmission to both units' tracks, low specific ground pressure, unit-folding at the same traction force and speed, and the forced vertical unit-folding system. Modular structure of the second unit enables installation of any equipment within the capacity limits. Various versions available.

Bv206 Swedish Articulated All-Terrain Tracked Carrier

Tiers:

Variants:

- **Bv 206A:** Ambulance version, which is capable of carrying stretchers in the rear compartment.
- **Bv 206F:** Firefighting vehicle
- **RaBv 2061:** Swedish Army communications/command version, fitted with radio equipment and workplaces for staff members.
- **PvBv 2062:** Swedish Army anti-tank vehicle, an open top version of the Bv 206 armed with a 90 mm Pvpj 1110 recoilless anti-tank gun.
- **PvBv 2063:** Swedish Army anti-tank vehicle, similar to PvBv 2062, but fitted with the launch system for an ATGM, either the TOW (Rbs 55) or the Bofors BILL (Rbs 56).
- **Bv 206S:** The Bv206S is an armored personnel carrier variant of the Bv 206, which provides protection from small arms fire for the occupants. It is in service with the armed forces of France, Germany (379 Bv 206D/S ordered), Spain, Netherlands, Italy (189 units), Sweden (50 units), Greece (Bv 208) and Singapore (300 units), which has replaced it with the Bronco All Terrain Tracked Carrier. Using a Steyr M1-"Monoblock" engine (6-cylinder, 130 kW), the vehicle can carry the driver and 12 combat-equipped troops — four in the front compartment and eight in the rear. The Bv 206S can be slingloaded by Boeing CH-47 Chinook and Sikorsky CH-53E Super Stallion helicopters or carried in the C130 Hercules.

System

Grade, hard surface: %60

Grade, Deep Snow: %30

Turning Radius: m8

Main Weapon System

Note: Variants of the basic Bv 206 abound. It is used as alight artillery tractor, an ambulance, a communication or command post, to carry various anti-tank weapons such as the Bofors BILL or TOW, for ground-to-air missile systems such as Bofors RBS 90, and even to carry radar systems.

Protection

Armor: Depends on Variant. Armored variant of the Bv 206 is the Bv 206S. It has modified cabs and armor plating on all its bodywork. Recent member of the Bv 206 family is the BvS 10 improved armored version. It is new larger vehicle, with improved load capacity. The BvS 10 has the same superior mobility in difficult terrain, combined with the same speed on road.

Armor, Applique: Available

Armor, Explosive Reactive: No

Active Protection System: No

NBC Protection: Yes

Smoke Equipment: Yes

Notes:

Development of the Bv 206 articulated all-terrain tracked carrier began in 1974. Three batches of trial vehicles were delivered between 1976 and 1978 and the first production examples were were delivered to the Swedish Defense Administration in 1980. Since then the Bandvagn 206 has been produced in thousands by Hagglunds and is in service all around the world. It is a family of multi-purpose amphibious tracked vehicles. The Bv 206 is widely used, especially by the Swedish armed forces, the US Army (who have developed a desert version), the British Armed Forces, and the German Army (who use only diesel-engined versions). The type has been license-produced in Chile. The Bv 206 in its basic carrier form is a twin-unit articulated tracked vehicle that can carry up to 17 troops or 2 250 kg of supplies (6 troops or 630 kg in the front unit, 11 troops or 1 620 kg in the rear unit). Normally both front and rear units are fully enclosed but for some applications the rear unit can vary considerably and in some cases is left fully opened, such as the mortar carrier or can accommodate a variety of bodies. From the earliest stage the Bv 206 was designed to be versatile and it has been proven so in service. The engine originally a Ford V6 petrol unit but later a Mercedes-Benz diesel, is in the front unit together with the automatic transmission. Connection to the rear unit is made via an articulated joint which is also used for steering. It gives great flexibility in all axles and extremely good maneuverability. The simplicity in the handling of the vehicle involves a minimum of driver training. Most bodies make extensive use of light plastic-based materials but the chassis uses light alloys. Power is driving on all four of the tracks, which

exert a ground pressure of less than half of the man's foot. The Bv 206 can negotiate such obstacles as soft snow, drifting sand and marshlands. It can climb considerable gradients, swim without preparation and and work in arctic cold or in tropical heath. The vehicle can be airdropped and transported by a variety of aircraft and helicopters. Variants of the basic Bv 206 abound. It is used as alight artillery tractor, an ambulance, a communication or command post, to carry various anti-tank weapons such as the Bofors BILL or TOW, for ground-to-air missile systems such as Bofors RBS 90, and even to carry radar systems. Armored variant of the Bv 206 is the Bv 206S. It has modified cabs and armor plating on all its bodywork. Recent member of the Bv 206 family is the BvS 10 improved armored version. It is new larger vehicle, with improved load capacity. The BvS 10 has the same superior mobility in difficult terrain, combined with the same speed on road. In 2015 BAE Systems Hagglunds revealed a new BvS 10 Beowulf. It is proposed as a replacement of the Bv 206. The new vehicle can carry more than 3 times more payload.

Notes:

The URO VAMTAC (Vehículo de Alta Movilidad Táctico, "High Mobility Tactical Vehicle") is a Spanish four-wheel drive military vehicle manufactured by the UROVESA. Externally it is similar in appearance and design to the Humvee of the United States Military due to similar requirements. More than 2,000 of the vehicles have been delivered to the Spanish Armed Forces. Several other countries operate the VAMTAC as well, and it has seen service most recently in Afghanistan and Syria. The vehicle comes in two models, named I3, S3 and ST5, and has several configurations. The VAMTAC is available in a number of variants with different body types. The main forms are pick-up, command/control and chassis-cab. Pick-up and chassis-cab variants are available with two-door, four-door or reduced size four-door version. The chassis-cab variant is used to mount a vide variety of

shelters, or cargo bodies. The command/control variant has four-doors and cargo area, covered with soft, or sloping hard top. Open top models are available. The URO VAMTAC was developed by the Spanish company URO, Vehiculos Especiales S.A. so that it would meet the requirements of the Spanish military for a multipurpose, air-portable, high mobility off-road vehicle with good payload capacity. Just as the HMMWV entered production in 1984 the Spanish army started to think of purchasing their own multirole vehicle that would replace Land Rovers. VAMTAC concept did not materialize until 1995 when a competition was held for a next-generation tactical vehicle. The American HMMWV was also a natural candidate for several reasons. UROVESA decided to design a vehicle that could exceed the US design. After the vehicle was tested by the Spanish Ministry of Defence, UROVESA received a five-year contract and the URO VAMTAC was produced from 1998 to 2003. In October 2005, the Ministry of Defence awarded a new five-year contract for the URO VAMTAC after a three-month trial period. This also introduced some changes, and the two models of the vehicle which were named T3 and T5, were re-designated as I3 and S3 respectively. The URO VAMTAC is similar in appearance and design to the U.S. Military's Humvee, because both vehicles were designed to meet similar requirements and specifications.

The Uro VAMTAC is available in a wide range of versions with different body types. Notable variants include an ambulance vehicle, anti-tank vehicle equipped with TOW or MILAN anti-tank guided missiles and an anti-aircraft vehicle armed with Mistral surface-to-air missiles.

Hawkei PMV Australian 4x4 Protected Mobility Vehicle

Tiers:

Variants:

- **Command:** Dual cab manned by a crew of four to six, weapons system options including up to 12.7mm guns or 40mm grenade systems in various mounts with a remote operated option.
- **Border Protection:** Dual cab manned by a crew of four to six, various equipment options including force protection radar, surveillance and communications systems.
- **Special Operations Vehicle:** Dual cab manned by a crew of four to six with up to three weapon systems:[14] Front co-driver swing mount; Roof mounted manual gunring or remote weapon station; and/or Rear-facing swing mount.
- **Utility:** Single-extended cab with a flat-bed cargo area measuring; L: 2,000 mm (79 in) x W: 2,400 mm (94 in). The vehicle is manned by a crew of 2-3 and has a kerb weight of 6,800 kg (14,991 lb) with a rated cargo load of 3,000 kg (6,614 lb). The load bed is designed to accommodate four 1000mm × 1200mm (40" x 48") NATO standard military pallets or a single tricon (one-third ISO 20 ft) container.

System

Alternative Designation: Hawkei PMV

Type: Protected Mobility Vehicle

Manufacturer: Thales Australia

Crew: eaGenerally 4 to 6

Passenger Capacity: INA

Dimensions

Length: 5,780mm

Width: 2,396mm

Height: 2,300mm

Weight, Combat: 7,000 kg (15,432 lb) (kerb), 10,000 kg (22,046 lb) (GVM)

Automotive

Engine Name: Steyr M16

Engine Type: six-cylinder turbocharged diesel engine.

Engine Power: 200 kW (268 hp) @ 4,000rpm 610 N·m (450 lb·ft) @ 2,000rpm

Range: km600

Speed, Maximum Road: 130km/h (max) 100km/h (governed)

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Steering System: Power rack and pinion

Suspension: AxleTech 3000, fully independent suspension, coil and double wishbone

Transmission: List of ZF transmissions#8-speed auto, eight-speed automatic

Main Weapon System

Note: A remotely controlled weapon station (RCWS) is installed in the Hawkei vehicle. It is an automated control weapon station principally used for light and medium-calibre weapons. The RCWS can accommodate remote control weapons encompassing 5.56mm, 7.62mm, and 12.7mm machine guns, 40mm automatic grenade launchers, anti-tank missiles and observation pods. The RCWS can accommodate weapons up to 12.7mm machine guns and is manufactured by Samson Technologies Corporation, US.

Protection

Armor: Greater than STANAG 4569, Level 1. Additional Applique armour provided by Plasan composite and V-shaped monocoque hull

Applique Armor: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Hawkei PMV is a light Four-wheel drive protected mobility vehicle originally designed to meet an Australian Defence Force (ADF) requirement for a light armoured patrol vehicle to replace some of its Land Rover Perentie variants. The Hawkei is a highly mobile, highly protected, 7-tonne vehicle, with in-built systems to allow it to be used as a fighting platform. It has been developed with Vehicle Electronic Architecture to be mission system ready. Prime contractors include: Thales Australia, Boeing Australia, Plasan (Israel) and PAC Group. In October 2015, the Australian Government announced the purchase of 1,100 Hawkeis from Thales Australia. As part of a wider project to replace the ADF's fleet of operational support vehicles, Project Land 121 Phase 4 – Protected Mobility Vehicle (Light) or PMV-L, is a requirement for up to 1,300 specialised light armoured vehicles replace some of the in-service Land Rovers. Key criteria for the project included: off-road mobility, integrated vehicle electronic architecture, substantial payloads, high levels of protection against land mines, improvised explosive devices and ballistic weapons while being light enough to be air transported by military helicopters. The three options considered as part of the project were: Option 1, Joint Light Tactical Vehicle (JLTV) Program - align the PMV-L requirement to the United States JLTV program to replace its fleet of High Mobility Multipurpose Wheeled Vehicle or 'Humvee' (awarded 25 August 2015 to Oshkosh offering L-ATV); Option 2, Manufactured and Supported in Australia (MSA); and Option 3, Market available – pursuit of this option is subject to Australian Government decisions on Options 1 and 2. Competitors for the MSA option included the combat proven MOWAG Eagle IV from General Dynamics Land Systems; the British military then selected Ocelot from Force Protection; and the Hawkei offering from Thales Australia. The JTLV option included entries from BAE Systems/Navistar, AM General/General Dynamics and Lockheed Martin. In December 2011 the Australian Department of Defence announced Hawkei as the preferred vehicle for further development and testing under the MSA option. In October 2015, Prime Minister Malcolm Turnbull and Minister for Defence Marise Payne announced the purchase of 1,100 Hawkeis and 1,000 trailers at a cost of $1.3 billion. In November 2017 it was reported that the Hawkei was being considered by Poland as part of a modernisation of the country's military. This could result in an initial purchase of 50 vehicles, and as many as 700 over the long term. In September 2018 the Australian National Audit Office released a report which criticised aspects of the Hawkei project. The report judged that Australia should have remained in the JLTV program to provide competition for the Hawkei procurement and that the Department of Defence had not kept ministers fully informed about the Hawkei program. This included not providing ministers with a study which found that there were few benefits from building the vehicles in Australia. The ANAO was unable to publish some elements of the audit after Attorney General Christian Porter ruled that publishing it would compromise national security.

Thales had taken legal action earlier in the year seeking to have material removed from the report. As of December 2018, the Hawkei is facing reliability issues following a demonstration test conducted on 19 November 2018, delaying full-rate production.

M998 HMMWV American 4x4 High Mobility Multipurpose Wheeled Vehicle

Tiers:

System

Alternative Designation: M998 HMMWV
Type: 4x4 High Mobility Multipurpose Wheeled Vehicle
Manufacturer: AM General
Family: HMMWV
In Service: 1984-Present
Crew: ea1
Passenger Capacity: 8 maximum (can also carry casualties)

Dimensions

Length: 4.84 m
Width: 2.16 m
Height: 1.83 m
Wheelbase: 3.30 m
Ground Clearance: 0.41 m
Weight, Combat: 4,672 kg
Payload: 1,996 kg

Automotive

Engine Name: 1 x General Motors V8

Engine Type: 6.5L turbo-charged, diesel fuel injection

Engine Power: 160 hp at 3,400 rpm

Transmission: automatic w/4 forward gears, 1 reverse gear

Notes:

The High Mobility Multi-purpose Wheeled Vehicle (HMMWV) is the replacement vehicle for the M151 series jeeps. The HMMWV's mission is to provide a light tactical vehicle for command and control, special purpose shelter carriers, and special purpose weapons platforms throughout all areas of the modern battlefield. It is supported using the current logistics and maintenance structure established for Army wheeled vehicles. The HMMWV is equipped with a high performance diesel engine, automatic transmission and four wheel drive that is air transportable and droppable from a variety of aircraft. The HMMWV can be equipped with a self-recovery winch capable of up to 6000 pound 1:1 ratio line pull capacity and can support payloads from 2,500 - 4,400 pounds depending on the model. The HMMWV is produced in several configurations to support weapons systems; command and control systems; field ambulances; and ammunition, troop and general cargo transport. The M998, M998A1, M1038 and M1038A1 HMMWVs are cargo/troop carrier configurations of the HMMWV family. The vehicles are equipped with basic armor and used to transport equipment, materials, and/or personnel. The cargo carrier configuration is capable of transporting a payload (including crew) of 2,500 pounds and the troop carrier is capable of transporting a two man crew and eight passengers. Both use a troop seat kit for troop transport operations. The cargo/troop carrier can also be configured in a four man crew configuration. The vehicles can climb 60% slopes and traverse a side slope of up to 40% fully loaded. The vehicles can ford hard bottom water crossing up to 30 inches without a deep water fording kit and up to 60 inches with the kit. The M1038, M1038A1 are equipped with the self-recovery winch which can also be used to recover like systems. The M998A1 and M1038A1 models have the latest modifications applied to the vehicles.

Mercedes-Benz G-Class German 4x4 Light Utility Vehicle

Notes:

The Mercedes-Benz G-Class, sometimes called G-Wagen (short for Geländewagen, "terrain vehicle"), is a mid-size four-wheel drive luxury SUV manufactured by Magna Steyr (formerly Steyr-Daimler-Puch) in Austria and sold by Mercedes-Benz. In certain markets, it has been sold under the Puch name as Puch G. The G-Wagen is characterised by its boxy styling and body-on-frame construction. It uses three fully locking differentials, one of the few vehicles to have such a feature. Despite the introduction of an intended replacement, the unibody SUV Mercedes-Benz GL-Class in 2006, the G-Class is still in production and is one of the longest produced vehicles in Daimler's history, with a span of 40 years. Only the Unimog surpasses it.

Dongfeng EQ2101 (Warrior) Chinese 6x6 Tactical Utility Vehicle

Tiers:

Variants:

- **Dongfeng EQ2101EB:** Dongfeng EQ2101EB is a cargo version with a 2-door cabin with a large cargo area at the rear. It has capacity for driver plus 3 passengers and has a payload capacity of 2 000 kg
- **Dongfeng EQ2101MCTB:** is a light vehicle protected with the 6x6 configuration. This vehicle has 4 doors. One of them is a type door with shell. The upper part opens upwards, while the lower part opens downwards. This vehicle accommodates driver, more up to 11 passengers.
- **Dongfeng EQ2101:** The Dongfeng EQ2101 was designed to provide troops with logistical and utilitarian support
- **Dongfeng EQ2016E Chinese 4x4 Truck:**

System

Alternative Designation: At the time of its introduction this vehicle was also called the Mengshi (Chinese for brave soldier).
Manufacturer: Dongfeng Off-road Vehicles Co.
Type: 6x6 support vehicle for infantry fire teams
Crew: ea2
Troop Compartment Capacity: ea11
Cargo Capacity: Can carry equipment such as ‘artillery, anti-tank missiles, antiaircraft missiles and assault bridges
Maximum Effective Range: km500
Gradient: %40
Lateral Slope: %30
Vertical Step: m0.45

↳*Weapon 4*

Name: Konkurs or Kornet

Type: Anti-tank missiles

Notes:

The UAZ Patriot is a Russian light utility vehicle. It was introduced in 2005. An updated version is produced since 2015. Originally it was developed as a civilian vehicle. This utilitarian vehicle with good cross-country capability, is also used by the military. It uses 4x2 (front wheel drive) on hard surface roads and 4X4 is engaged only when travelling over tough terrain. The UAZ patriot has been exported to Armenia, and possibly some other countries. A baseline vehicle has a fully-enclosed body with 5-doors. It accommodates driver plus 4 passengers and can carry 200 kg of cargo. There is a version, that accommodates driver and up to 8 passengers. Also there are 2-door and 4-door pickup versions. Full payload capacity is 525 to 800 kg, depending on the version. The firepower in the back of the vehicles will enable their operators to suppress enemy fire in a radius of up to 2 km. The weapons can be mounted aboard a rotary turret, allowing the user to instantaneously change his arc of fire. Additionally, the vehicle can be equipped with Konkurs or Kornet anti-tank missiles, capable of hitting enemy targets at distances of up to 5 km. It can also be fitted with a 120 mm mortar with an effective range of 9 km.

Nimr Emirati 4x4 Light Utility Vehicle

Tiers:

Variants:

- **Armored personnel carrier:** Fully enclosed 10-seat armored body.
- **Armored ambulance:**
- **Hafeet 620A:** Armor protected version. Length: 6.92m Width: 2.35m Height: 2.33m Wheelbase: 3.92m Gross weight: 15mt Range: 600km Crew: 2 Operating temps: -19C-+49C Turning radius: 20m
- **Hafeet 620A Water Tank Vehicle:** A WEW 2.3m3 water tank with its own pumping and UV radiation module. Introduced in 2017.
- **Hafeet 630A:** An armored version configured as artillery support vehicles in both observation and command and control configuration.
- **Hafeet 640A:** Armored version with a double cab
- **Hafeet Air Defense Vehicle (ADV):** Based on the Hafeet 640A. Rear chassis is fitted with the MBDA Multi Purpose Combat System (MPCS), the turret of which comprises a gyro-stabilized day/thermal sensor suite with integrated laser rangefinder and four IR Mistral missiles. Introduced in 2015.

Notes:

The Nimr (Arabic: نمر; meaning Tiger) is a family of all-terrain military armored personnel carrier (APC) vehicles, co-developed with GAZ and produced by Nimr LLC in the United Arab Emirates. The Nimr is designed specifically for military operations in the harsh desert climates found in the Middle East. Currently the Nimr is produced in the UAE by Nimr Automotive, and can be considered as an Emirati vehicle. The company is currently a leading manufacturer of tactical military vehicles in the Middle East and North Africa. In 2012 UAE and Algeria signed an agreement for production of armored version of the Nimr in Algeria. Since 2015 the Nimr Automotive is a part of Emirates Defense Industries Company (EDIC), which incorporates a number of UAE's defense manufacturers. In concept the Nimr is similar to the US HMMWV, though there are some differences between the two. Currently newer version of this vehicle are produced. The Nimr is a purpose designed military vehicle with good cross-country mobility. In terms of size and payload capacity the Nimr fits the gap between jeeps and light trucks. It can carry loads of up to 2 750 kg, depending on the version. The Nimr can also tow trailers and light artillery pieces. The baseline Nimr accommodates driver plus 3 passengers. It has got a cargo area are at the rear. However there are numerous versions of this military vehicle with different cabs, different body types and seating configurations. There is a version that accommodates driver plus 7 passengers. In 2005 a 6x6 version of this tactical vehicle was revealed. There are armored versions of the Nimr. These vehicles provide protection for the crew against small arms fire, artillery shell splinters and explosions. An NBC protection system was proposed as an option. The Nimr can carry various weapon. Some versions have a universal gun mount ring on top of the roof and can be armed with a 7.62 mm, or 12.7 mm machine gun, or 40 mm automatic grenade launcher. The Nimr is powered by a 5.9-liter Cummins ISBe 250 turbocharged diesel engine, developing 250 hp. Vehicle has a permanent all-wheel drive. The Nimr comes as standard with a central tyre inflation system. It improves mobility over difficult terrain, such as sand. It is also fitted as standard with run-flat tyres. Winch was proposed as an option. The Nimr can be airlifted by a C-130 Hercules military transport aircraft. The 4x4 version can be also airlifted underslung by a CH-53 helicopter.

GAZ-2975 Tigr Russian Combat Support Vehicle / Light Utility Vehicle

Tiers:

Parent:

GAZ-2330 Tigr Russian Light Utility Vehicle

Variants:

- **GAZ-2975:** GAZ-2975-A prototype unarmored three-door station wagon sport utility vehicle. GAZ-29751 - 3 door wagon, GAZ 29752 - 5-door wagon designed to carry four people and from 500 to 1000 kilograms of cargo, GAZ-297533 - two door with tilt covered load platform.
- **GAZ-2330:** Standard unarmoured production variant
- **GAZ - 29651 "Punisher":** A simplified version of GAZ - 2975. The result of the project " Punisher ", concludes in the creation of a family of cars with carrying capacity from 1 to 2.5 tons, allegedly became the armored vehicle Wolf.[
- **Tigr-2:** GAZ-3121 "Tiger-2" - an experimental rebodied civilian style SUV, presented for the first time in September 2006 at the Moscow Motor Show in the exhibition "Russian cars". Released a small series from 2008, mainstream sales at dealers were planned to start in 2009.
- **SP46:** In 2007, a ceremonial parade variant was designed, the СП46 (SP 46) ceremonial Tigr is a two-door convertible with a removable rigid roof. It features two seats in the front and one in the back, and is finished with modern luxury car appointments. This Tigr is equipped with an automatic Allison 1000 series transmission and Cummins B205 turbo diesel. Vehicle weight was reduced to 4,750 kg (10,470 lb), as this version is unarmoured.
- **STS:** The CTC (English:STS) GAZ-233014 "Tiger" - a special vehicle -The Russian Army's armored version. Winged sheathed hull of anti-splinter coating AOD based aramid fiber. 4-stroke diesel engine Cummins B 205 turbo provides a specific power of at least 205 hp. STS GAZ-233014 was accepted for the supply of units State of the General Staff of the Russian Federation Order of the Minister of Defense of the Russian Federation March 6, 2007. The STS took part in 2014, the Crimean operation.[
- **SPM-1:** GAZ-233034 Tigr is used by the Russian Interior Ministry OMON in counter-terrorism operations and territorial defense. It is armoured, with IEC 50963-96 Class 3 side/rear protection and Class 5 frontal protection (GOST P 50963-96, level 1 corresponds to the STANAG 4569).
- **SPM-1 AAV:** The SPM-1 Aircraft Assault Vehicle is an SPM-1 fitted with a large remote-control hydraulic ladder system. It is designed to provide access to the second or third floors of buildings and aircraft.
- **SPM-2 "Tigr-Alpha-BB":** (Special Police Vehicle SPM-2) ГАЗ-233036 Tigr-Alfa-BB (Tiger-Alpha-VV) is an SPM-1 with GOST 50963-965 level 5 ballistic protection all around (instead of a mixture of level 3 and 5).
- **R-145BMA:** This variant is designed as a command center for special events and crises. It is a SPM-2 fitted with extensive communications equipment.
- **Kornet-D:** In 2011, the Tula Instrument Design Bureau demonstrated an upgraded Kornet-EM antitank missile system. Two such units were mounted on a modified chassis of the SPM-2 Tigr.
- **"Project 420":** In early 2010, an improved Tigr armored vehicle with a 420-horsepower 5.9 litres (360.0 cu in) Cummins ISB and a Chrysler 545RFE automatic transmission was created. This engine/transmission combination was originally designed for a Dodge Ram pickup. Externally, the vehicle featured an additional air intake on the bonnet and enlarged brakes. Acceleration time to 100 km/h (62 mph) was reduced from 35 to 23 seconds compared to the standard version, and the top speed increased from 140 km/h (87 mph) to 160 km/h (99 mph).
- **Tigr-M:** During the 2010 Interpolitex exhibition, the Multi-purpose Armored Vehicle (Ru:автомобиля многоцелевого назначения (АМН)) AMS 233 114 Tigr-M was presented by the Military Industrial Company. It featured a new YaMZ-534 diesel engine, a new armored hood, air filter installation, an increase in the number of rear passenger seats (from 8 to 9) and the replacement of the bicuspid rear hatch with a large square hatch.

- **Tigr-6A SPV:** The CTC GAZ-233014 "Tiger" SPV prototype vehicle was first shown at the Bronnitsi Armoured Vehicles Show on June 10, 2011. Based on the SPM-2, the SPV is designed for combat officer transport. It has a four-door station wagon body with increased GOST 6A armor protection (heavy mine protection and special shock-absorbing seats/footrests which are not attached to the floor). As of November 2012, tests are being conducted.
- **GAZ-29751:** 3 door wagon
- **GAZ-29752:** 5-door wagon designed to carry four people and from 500 to 1000 kilograms of cargo
- **GAZ-297533:** Two door with tilt covered load platform

Notes:

The "Tigr" ("Tiger"), which is often referred to as the "Russian Hummer", was developed by the GAZ Automobile Works for special-purpose militia units. The GAZ-2975 Tigr was officially taken into service at the end of 2006 and manufactured in 2007. The vehicle is intended to carry and protect personnel. It can accommodate up to 10 officers armed and in full gear. The vehicle has been field- and combat-tested before being sent to serve with OMON. Its armor can defeat 7.62-calibre ammunition and can withstand shell fragments. The vehicle was designed to transport troops and various equipment quickly on road and off-road. It has a chassis frame construction, with a traditional layout of front engine, middle crew compartment, and rear cargo area. Standard features include: power steering, independent all-wheel torsion suspension with hydraulic shock absorbers and stabilizer bars, a transfer case with a locking center differential, limited slip differentials, two-speed transfer case, automatic tire inflation, engine block heater, and electric winch. The GAZ-233001 has optional air conditioning, stereo, electric windows, and an anti-lock braking system. Armored versions of the Tigr feature 5 mm (0.20 in) (7 mm (0.28 in) for the SPM-2) heat-treated and stress-relieved armor plates. The Tigr can carry a half ton of cargo. The available engines are a Cummins 5.9 L (360 cu in) B180 turbodiesel with 180 hp (130 kW); a Cummins 5.9 L (360 cu in) B205 turbodiesel producing 180 hp (130 kW); a Cummins 5.9 L (360 cu in) B-214 turbodiesel making 215 hp (160 kW); or a GAZ-562 3.2 L (200 cu in) turbodiesel with 197 hp (147 kW). Designed for performance in mountain, arctic, and desert environments, the Tigr is capable of operating at ambient temperatures ranging from −14–50 °C (7–122 °F). Moreover, the vehicle has approach and departure angles of 52 degrees and a wading depth of 1.2 m (3.9 ft).

ACMAT ALTV French 4x4 Light Utility Vehicle

Tiers:

Variants:

- **Torpedo:** Open cab version. Missions include utility, fire support, reconnaissance and border surveillance, as well as recovery, cargo / troop / personnel transport, patrol, and ambulance. Anti-mine protection Level 1. he ALTV Torpedo can be fitted with 24-volt pre-equipment for radio communication systems. A self-recovery electric winch of 3,800 kg pulling force can be added at the front of the chassis.
- **ALTV SAN:** Field ambulance version. Crew: 2 in cab Rear: 2 seats with 12 stretcher, or 1 folding seat with 4 stretchers Length 5.47 m Width 1.90 m Height 2.50 m
- **ALT SW:** Enclosed station wagon version.
- **ALT SC:** Two door version.
- **ALTV DC:** Four door version.

Notes:

The ALTV light tactical vehicle is available with two-door (ALTV SC) or four-door (ALTV DC) cab. An open-cab version (ALTV Torpedo) for special forces is also available. Vehicle has a payload capacity of 1.3 - 1.4 t, depending on the version. A cargo area in the rear can be used to carry troops, cargo, shelters, or standard ISO pallets. It is fitted with benches for the troop transportation. The ALTV can carry up to 10 men both in the cab and cargo area. Bars and canvas cover for the cargo area are optional. The ALTV can be armed with a ring-mounted 7.62-mm or 12.7-mm machine gun, or 40-mm automatic grenade launcher. Vehicle can be also used as a weapon carrier for anti-tank or anti-aircraft missiles. The engine compartment is equipped with a snorkel system for making shallow water crossings.

CSK-131 (Dongfeng CSK131) Chinese 4x4 Light Tactical Vehicle

Tiers:

Variants:

- **EQ2050:** First generation of Mengshi is a licence-built of Hummer H1. It has got a Cummins EQ150-20 engine. However, it doesn't receive an official designation and only seen limited service within PLA.
- **EQ2060:** Second generation of Mengshi. Improvements based on EQ2050. It has new engine and cabin design for comfort. It only seen limited service within PLA
- **CSK-141 (CS/VN11):** Dongfeng CSK141 is a Chinese light protected vehicle developed by Dongfeng Corporation. Although sharing a lot of similarities to the CSK-131, the chassis of CSK-141 has a much longer wheelbase with a longer crew cabin having space for 10 infantry. CSK141 shares similar electronics with CSK131 such as computer, satellite suite and night vision cameras. This vehicle features unusual clamshell doors on either side which the door divide into upper and lower part. It's one of the two principal light armored vehicle currently fielded by PLA.
- **EQ2111:** EQ2111 is the prototype for next generation MRAP light tactical vehicle.
- **CSK-181:** CSK-181 is the new generation of light tactical vehicle developed by Dongfeng for PLA. CSK-181 is based on CSK-141 with one driver, one weapon station operator as co-driver with eight infantry seats. The variant has improved satellite communication capability, longer range night-vision cameras and most importantly, Mine-Resistant Ambush Protection capability.
- **CSZ181/CTL181:** CSZ181 and CTL181 are light protected trucks modified on CSK-181.

Notes:

The Dongfeng CSK131 is Chinese light protected vehicle. It was developed by Dongfeng company as a private venture. It is an armored version of Donfeng EQ2050 tactical vehicle, which is widely used by the Chinese armed forces. At the time of its introduction this vehicle was also called the Mengshi (Chinese for brave soldier). The CSK131 is used by China's armed forces. It is also being proposed for export customers. The Dongfeng CSK131 is has got an armored hull and provides protection for the passengers against small arms fire and artillery shell splinters. This vehicle is sometimes seen with armored windscreen shutters. All-round protection is against 7.62x39 mm ball rounds from a 100 m range. Front arc withstands hits from 7.62x39 mm armor-piercing rounds. The Dongfeng CSK131 can be seen as China's equivalent of up armored HMMWV. The CSK131 accommodates driver and 5 passengers. Vehicle has a payload capacity of 2 000 kg and can carry various cargo and supplies instead of troops. It can also tow light trailers and artillery pieces. The Dongfeng CSK131 can mount various weapons on top of the roof. This vehicle can be fitted with shielded machine gun position or remotely-controlled weapon station. It was seen armed with a 12.7 mm heavy machine gun, and 35 mm automatic grenade launcher. Vehicle is powered by an ISDe 200-41 turbocharged diesel engine, developing 200 hp. It is a license-produced Cummins engine. Vehicle has a full-time all-wheel drive and is fitted with a central tyre inflation system. It improved mobility over difficult terrains, such as sand, mud and snow. Wide

track of this vehicle allows to drive in tracks left by the main battle tanks. Vehicle is equipped with a self-recovery winch.

LUAZ-967 Russian 4x4 Amphibious Vehicle

Tiers:

Variants:

- **LuAZ-967A:** 37-hp engine with top speed of 75 km/h that can tow trailers & light artillery up to 300 kg
- **LuAZ-967M:** Final production model until 1991 with same engine as the LuAZ-967A
- **Geolog:** 6 X 6 version never produced
- **Evacuation Role:** 2 stretcher & 2 seated

Survivability Equipment: 200 kg winch available for self-recovery

Notes:

The LuAZ-967 (Ukrainian: ЛуАЗ-967) was the Transporter of the Front Line, a small Soviet four-wheel drive amphibious vehicle. Light enough to be air transportable, it had a 400 kg (880 lb) payload over most terrain. The design originated after the Korean War, when the Soviets saw a need for small off-road vehicles comparable to the American Jeep, to supplement the overly-large and -heavy GAZ-69s then in service. It was to be used by Russian Airborne Troops (VDV) for casualty evacuation, munition supply and the transport of light armaments. Developed at NAMI (the National Automobile Institute), the prototype, known as NAMI 049, was completed in 1958. Unlike the Jeep, it had a Fibreglass body, four-wheel torsion bar independent suspension, and permanent four-wheel drive with locking hubs. It had a wheelbase of 1,800 mm (71 in), a ground clearance of 280 mm (11 in), and was powered by a 22 hp (16 kW; 22 PS) MD-65 motorcycle engine (copied from an Orbita motorcycle). Trials proved it underpowered, and the body too fragile. A second prototype, the NAMI 049A, had a 746 cc (45.5 cu in) V4 MeMZ 965 engine (selected for use in the ZAZ-965), steel body, and rear wheel drive (with optional drive to the front wheels). The torsion bars were replaced with a coil spring setup. It weighed 1,350 kg (2,980 lb), with a 37 hp (28 kW; 38 PS) MeMZ 967A engine, and was able to pull a 300 kg (660 lb) trailer; it could cross a 58° gradient, and top speed was 47 mph (76 km/h). It was produced between 1961-1975 at Lutsk automobile plant - LuAZ. It was succeeded by the LuAZ-969B, LuAZ-969, LuAZ-969M and the LuAZ-1302. The LuAZ 967M had a MeMZ-967A 887 cc (54 cu in) gasoline engine from the ZAZ automobile. An air-cooled, carbureted ohv V4, it developed 37 hp (28 kW) at 2,250 rpm. A 4+1 speed transmission has separately engaged crawl gear.

Unlike many small military vehicles, it was a front wheel drive 4×2, the rear axle was selectively engaged only when 4×4 was needed. The watertight steel body had 4-wheel independent suspension with torsion bars and 285 mm (11 in) of ground clearance. The driving controls were on the truck's centerline, both the controls and the windshield could be folded down for a lower profile.

Peugeot P4 French 4x4 Light Utility Vehicle

Tiers:

1 2 **3** 4

Variants:

- **P4D:** In 1992, the Army converted their petrol P4s into diesel P4D (P4 Diesel) models. The conversion was executed by Panhard (1300 VLTT) and the Établissements régionaux du matériel. The engine, a 2.5-liter Peugeot four-cylinder, is the same as used in the original diesel P4.
- **P4P:** The P4 P (P4 Protégé, "protected P4") is an armoured version, with 80 units built in the 1990s. An armored version was made at the request of Peugeot by CBH Institutions (Constructions Blindées of Hardricourt). This version has been evaluated by the French Army and commissioned by the Navy for the Protection of sensitive sites. Five different versions were produced. P4 CBH AKIS 2400 P4 CBH SUPER AKIS 2850 P4 CBH 3120 The four digits at the end of the name signify the three wheelbases of 2,400, 2,850, or 3,120 mm (94.5, 112.2, or 122.8 in) that were available. Some P4 armored CBH have been manufactured for use in Lebanon. An operation Manufacturer and the GIGN was conducted in November 1988 for testing rolling over 24 hours. The P4 Shielded CBH AKIS blue police carried out the range of 1000 km to the average of 134.5 km per hour and the total distance of 3180 km in 24 hours is an average of 132.5 km / hour with 4 men on board. The engine was a 2.5-litre turbo exchanger amended by CBH, which had an output of 150 hp. This record was not approved at the request of the Gendarmerie.
- **P4 VPS:** Version of the P4 for the 1st Marine Infantry Paratroopers Regiment. They are equipped to have greater firepower and a higher degree of autonomy: A machine gun MIT50 (calibre 12.7 mm) coaxial A machine gun-type ANF1 (7.62 mm calibre) River crossing equipment

System

Alternative Designation: Peugeot P4
Type: Light Utility Vehicle
Manufacturer: INA
Crew: ea1
Passenger Capacity: ea3
Note: The P4 can be fitted with various adapters for mounting machine guns and other weapons. These were used by recon units. Some vehicles were fitted with MILAN ATGW launchers. These were used by motorized infantry units.

Notes:

The P4 is an unarmoured off-road vehicle used by the military of France. It was manufactured by Peugeot but is now manufactured by Panhard. It is to be replaced with the PVP by Panhard. The P4 is a derivative of the Mercedes Geländewagen military version built under license by Peugeot for the French military. Peugeot did not have a licence to export the vehicle anywhere else than to the countries bound to France by defence agreements. It's scheduled to be replaced by the ACMAT Light Tactical Vehicle Station Wagon. The Peugeot P4 is a light, unarmoured, four-wheel-drive vehicle manufactured by Peugeot, and used by the Military of France under the designation of "Véhicule léger tout-terrain" ("Light all-terrain vehicle"). It is based on the Mercedes-Benz G-Class and equipped with Peugeot engine and equipment. In the late 1960s, the French army decided that its 10,000 Jeeps needed to be replaced. The replacement vehicle would carry four men with radio equipment and would be small enough to be parachuted and transported by plane. After many technical issues, the new vehicle was designed in the 1970s. Agreement was reached between Peugeot and Mercedes to co-produce the vehicle on a 50:50 basis. Peugeot installed the engine of the Peugeot 504 and the transmission of the Peugeot 604 on the Mercedes-Benz G-Class; it also installed the

electrical systems, welded the exterior and painted the car. The rest was done by Mercedes. The plant in Sochaux did the final assembly. The first prototype was tested in 1978, beginning a long series of tests and trials, notably a rally in south Algeria with a petrol and a diesel P4. The French Army ordered 15,000 P4s, both petrol and diesel versions; in 1981, the order was reduced to 13,500 units with the downsizing of the Army. From 1985, production was transferred to Panhard in Marolles-en-Hurepoix, where 6,000 vehicles were produced. In 2016, P4s were donated to the Cameroonian military for its special forces units. A civilian version was made, but encountered little success because of the high price and a poor power-to-weight ratio.

UAZ-469 Russian 4x4 Light Utility Vehicle

Tiers:

Variants:

- **UAZ-469:** Initial model fielded in 1973 with 70 horsepower UMZ 451 MI engine with inferior road performance & crew features
- **UAZ-469B:** Export version with lower off-road performance capabilities. Increased ground clearance.
- **UAZ-3151 Upgrade:** Improved vehicle first produced in 1985
- **UAZ-3152:** Medical utility version. Space for driver, one medic, & 1 stretcher patient
- **BJ-212:** Chinese UAZ-469 variant
- **UAZ-3151 UMM Police Car:** Insulated five-door metal body and optional special equipment
- **UAZ-469RH:** Modified for nuclear, biological, and chemical (NBC) resistance

Notes:

The UAZ-469 is an off-road military light utility vehicle manufactured by UAZ. It was used by Soviet and other Warsaw Pact armed forces, as well as paramilitary units in Eastern Bloc countries. In the Soviet Union, it also saw widespread service in state organizations that needed a robust and durable off-road vehicle. Standard military versions included seating for seven personnel. Developed from the GAZ-69 , UAZ-471 and UAZ-460, the UAZ-469 was introduced in 1971 to replace the GAZ-69. It was powered by the same 75 hp (56 kW; 76 PS) 2,445 cc (149.2 cu in) UMZ 452MI inline-four engine as the UAZ-452 and was able to run on gasoline with an octane rating as low as 72 (although 76 was preferred). The UAZ-469 presented two great advantages: it was able to drive in virtually any terrain and it was very easy to repair. The vehicle was originally not available for purchase by the public, but many were sold as surplus to private owners. Modifications include a basic UAZ-469B with ground clearance of 220 mm (8.7 in), and a specialized military UAZ-469, with ground clearance increased to 300 mm (12 in).

After slight modernisation in 1985, due to new industry designation standards, they were renamed: the UAZ-469 became the UAZ-3151, while the UAZ-469B became the "UAZ-31512". Manufacture of the UAZ-31512 for the Russian Army continued until 2011, while manufacture for the civilian market was discontinued due to new emission standards. However, the currently manufactured UAZ Hunter is an updated version of the old UAZ-469B. The Hunter was originally sold in Germany and some Asian countries as the "UAZ Tigr" (Tiger), until General Motors complained that the name was too similar to the Opel Tigra, and in Germany, it was renamed "Baijah Taigah". The 469 was exported to eighty countries.

Notes:

The Mercedes-Benz G-Class, sometimes called G-Wagen (short for Geländewagen, "terrain vehicle"), is a mid-size four-wheel drive luxury SUV manufactured by Magna Steyr (formerly Steyr-Daimler-Puch) in Austria and sold by Mercedes-Benz. In certain markets, it has been sold under the Puch name as Puch G. The G-Wagen is characterised by its boxy styling and body-on-frame construction. It uses three fully locking differentials, one of the few vehicles to have such a feature. Despite the introduction of an intended replacement, the unibody SUV Mercedes-Benz GL-Class in 2006, the G-Class is still in production and is one of the longest produced vehicles in Daimler's history, with a span of 40 years. Only the Unimog surpasses it.

CSK-141 (Dongfeng CSK141) Chinese 4x4 Tactical Vehicle

Tiers:

Variants:

- **CS/VN11:** Export version. Publicly revealed in 2016. Has standard rear doors rather than clam shell doors. Has a remotely controlled weapon system.
- **Dongfeng EQ2101:** 6x6 with more powerful engine. Available in protected and unprotected versions. Shares automotive components with the CSK131 and CSK141 protected vehicles.

System

Protection

Armor: Standard protection for the crew and passengers against small arms fire, up to 7.62x39, and artillery shell splinters. Frontal arc protection is against 7.62x39 mm armor-piercing rounds.
Applique Armor: INA
NBC Protection: Yes
Smoke Equipment: INA
Self-Recovery Wench: Yes

Notes:

Dongfeng CSK141 is a Chinese light protected vehicle developed by Dongfeng Corporation. Although sharing a lot of similarities to the CSK-131, the chassis of CSK-141 has a much longer wheelbase with a longer crew cabin having space for 10 infantry. CSK141 shares similar electronics with CSK131 such as computer, satellite suite and night vision cameras. This vehicle features unusual clamshell doors on either side which the door divide into upper and lower part. It's one of the two principal light armored vehicle currently fielded by PLA. All CSK-141 are equipped with a remote-controlled turret that can be mounted with machine guns, anti-tank missile and grenade launchers. The Dongfeng EQ2101 variants features a 6x6 configuration, and the CS/VN11 is the export version. First released in 2016, CS/VN11 has conventional side doors instead of clamshell type side doors.

Nimr Hafeet 620 Emirati 6x6 Light Utility Truck

Tiers:

Variants:

- **HAFEET 620:**
- **HAFEET 620A:** Logistics and Utility Vehicle
- **HAFEET 640A:** Artillery Support Vehicle (Observation and Command & Control configurations)
- **HAFEET APC:**
- **HAFEET Ambulance:**

System

Alternative Designation: Nimr Hafeet

Description: Light Utility Truck. The Nimr Haffet is essentially a new-generation version of the original Nimr 6x6, that appeared back in 2005.

Cab Seating: ea1 + 1/3 men

Airlift Capable: INA

Note: There are 2-, 3- or 4-door versions of the Hafeet. All versions can be armored.

↳*Dimensions*

Length: m6.9

Width: m2.3

Height: m2.1

Weight, Empty: tons8 - 11.5

Payload Capacity: tons2.4-5

Automotive

Engine Name: Cummins ISBe 300

Engine Type: Diesel

Engine Power: hp296

Maximum Road Speed: km/h110

Maximum Range: km650

Gradient: %43

Side Slope: %30

Vertical Step: m0.4

Trench: m0.5

Fording: m1

Note #1: This military vehicle can also tow trailers and light artillery pieces.

Note #2: Vehicle is fitted with a central tyre inflation system and run-flat tyres as standard. Also there is a recovery winch, which also comes as standard.

Main Weapon System

Note: This armored vehicle has a roof hatch and can be fitted with a roof-mounted 7.62 mm or 12.7 mm machine gun machine gun, or 40-mm grenade launcher. Sometimes the Nimr II is even fitted with a heavy machine gun. Depending on customer requirements this vehicle can be fitted with remotely controlled weapon station. Some vehicles are fitted with smoke grenade dischargers.

↳*System*

Name: Caracal Assault Rifle 817

Alternative Designation: CAR 817

Date of Introduction: 2016

Country: United Arab Emirates

Manufactuer: Caracal International company

Caliber: mm7.62

Length, Stock Extended: mm884

Length, Stock Retracted: mm802

Barrel Length: mm406

Weight, Without Magazine: kg3.3

Muzzle Velocity: m/s750

Cyclic Rate of Fire: rds/min650-750

Magazine Capacity: 10, 20, 25 rounds

Range of Effective Fire: m600

Sight: Iron

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62x51 mm

Protection

Armor: The armored cab provides protection for the passengers against small arms fire and artillery shell splinters, mines and improvised explosive devices.
Applique Armor: Available, There are numerous versions of the Nimr Hafeet. Due to its modular nature the vehicle can be configured to suit various battlefield roles.
Explosive Reactive Armor: No
Active Protection System: INA
NBC Protection: Optional
Smoke Equipment: Available, smoke grenade dischargers
Fire Suppression System: Yes
Protective Net: Protective net against anti-tank rocket launchers
Battle Field Management System: Available

Notes:

The HAFEET Class of 6x6 vehicles provides a multipurpose platform for all military requirements at 13,000 kg capacity from utility vehicles to fully protected patrol vehicles. A universal 6x6 chassis is utilised for a common logistic basis. All vehicles in the HAFEET Class can be protected, and specific protected models are included for crew survivability with fully tested and certified cabins. The main role of the Hafeet is to provide troops with logistical and utility support. Also there are some specialized versions of this vehicle. It is a purpose-designed military vehicle, which can operate in demanding conditions. It has good cross-country mobility and can travel over difficult terrain. The Hafeet has a payload capacity and size of a light truck. However due to its military nature the Hafeet can withstand heavy use or even abuse, far exceeding that of militarized commercial vehicles, or those based on commercial drivelines. Most versions of the Hafeet can carry loads with a maximum weight of 2 400-5 000 kg. This military vehicle can also tow trailers and light artillery pieces. There are 2-, 3- or 4-door versions of the Hafeet. All versions can be armored. The armored cab provides protection for the passengers against small arms fire and artillery shell splinters, mines and improvised explosive devices.

Automotive

Engine Power: hp231
Speed, Maximum Road: km/h89
Fording Depth: m1.2
Engine Name: OM 934 LA
Engine Type: Turbodiesel
Ground Clearance: mm410
Turning Radius: m16.3
Engine Size: liters5.1
Fuel Capacity: liters160 main tank. 240 with auxiliary tank.
Angle of Approach: degrees41
Angle of Departure: degrees39

Notes:

Extremely maneuverable with 8 forward gears and 6 reverse gears with automatic transmission. The central tire pressure regulation system allows the driver to choose between three different tire pressure conditions: road, sand, and off-road. The OM 934 engine is Euro 6 emissions compliant. Cold engine start down to -15C. The Unimog U 4023/U 5023 makes its way. Advancement and safety, perfection and responsibility, power and innovation – those are just some of the values which Unimog customers rightfully connect with Mercedes-Benz and for which Unimog vouches. It combines great efficiency, state-of-the-art large-series production technology and outstanding off-road capability to form a truly successful overall concept that stands for Mercedes-Benz's decade-long experience in the development and production of highly off-road capable commercial vehicles. The off-road capability of the Unimog begins with its unique chassis concept: The torsionally flexible chassis with 3-point mounting of cab, engine and transmission as well as the axle suspension with thrust tube technology, wishbones and coil springs allow axle articulation of up to 30 degrees. All-wheel drive, single tyres, Tirecontrol plus central tyre inflation system and differential locks ensure maximum off-road traction. And the vehicle's low centre of gravity ensures stability even on extremely steep slopes. When off-road, the Unimog also benefits in particular from its ground clearance of up to half a metre.

Armament: Can be armed with a 7.62mm general purpose machine gun mounted on a swivel station and a 12.7mm heavy

machine gun mounted on 360° or 3/4 ring mount

Additional armament: Based on the mission requirements, the vehicle can carry a range of weapons such as medium and heavy machine guns, rocket-propelled and automatic grenade launchers, and shoulder-launched missile systems in the rear cargo area. Cabin and platform reinforcements are also available for weapons supports.

Protection

Applique Armor: Optional VFI systems can withstand the ballistic attack with 7.62mm NATO

Notes:

ACMAT (Ateliers De Construction Mécanique De L'atlantique, also known as ALM-ACMAT) since 22 May 2006 is a wholly owned subsidiary of Renault trucks. Known for their reliability, simplicity, ruggedness and their 80% (over 3,500) commonality of parts across the entire product line, these vehicles were originally targeted at African and Asian countries who could not afford more expensive vehicles. The ACMAT company built their vehicles based on standardization, commonality of parts and components, and on interchangeability; parts are interchangeable with vehicles built 30 years ago. Parts commonality includes cabs, structural components, engines and drive trains. ACMAT uses many of the same parts for all of its line of vehicles. The VLRA series of tactical military trucks has been developed especially for reconnaissance, escort and support duties. It is also used as a heavy patrol vehicle, equipped for long reconnaissance missions. All VLRA variants have full-time all-wheel drive and an integrated water tank that holds 200 liters of drinking water.

Light Strike Vehicle Singapore 4x4 Light Utility Vehicle

Tiers:

1 **2** 3 4

Variants:

- **SRAMS:** 120-mm Super Rapid Advanced Mortar System (SRAMS) with an auto-loader & 6 rounds on vehicle
- **Ammo Carrier:** Accompanies the SRAMS with additional crew member
- **Spider with Spike ATGM:** Anti-tank weapons carrier
- **Light Strike Vehicle Mark II:** The primary role of the LSV MK. II is against armoured threats. It is designed to be helicopter portable and manoeuvrable over cross-country terrain. The vehicle is equipped with enhanced networking capabilities to support the integration with other combat systems during operations.

System

Alternative Designations: The Light Strike Vehicle (LSV) was a US designed vehicle named the Flyer designated R-12D produced in Australia and later in Singapore.
Description: 4 X 4 dune buggy type vehicle with rollover frame can hold up to 6 passengers in addition to the crew.
Manufacturer: Singapore Technologies Kinetics Ltd (ST Kinetics) Australian Defence Industries
Crew: ea3
Passengers: ea6

Dimensions

Length: 4,250 mm
Width: 2,110 mm
Height: Top of roll cage: 1,900 mm
Curb Weight: 1,500 kg
Payload Capacity: kg1,000

Engine Name: Peugeot

Engine Type: 2 litre turbocharged intercooled diesel

Engine Power: hp104

Operational Range: km350

Speed (Max Road): km/h110

Speed (Max Off-Road): km/h80

Speed (Average cross-country): INA

Speed (Max Swim): N/A

Fording Depths: m0.60

Transmission: semi-automatic transaxle, 3 forward and 1 reverse gears

Suspension: Independent all-round

Main Weapon System

Note: A typical weapon installation could be a 7.62mm machine gun forward plus a pedestal mount for a missile launcher or a 40 mm automatic grenade launcher such as the 40AGL. The STK 50 heavy machine gun can also be mounted. Some vehicles in service with the Singapore Army carry a rear-mounted pedestal for two Spike anti-tank guided weapons (ATGW), with stowage for five missiles. Others have been seen with a combined 40 mm AGL and 7.62 mm machine gun mounting supplemented by a pintle-mounted 7.62 mm machine gun, while others have been seen mounting the MILAN ATGW.[

↳*System*

Name: STK 40 AGL

Type: 40 mm automatic grenade launcher

In Service: 1991-Present

Manufacturer: Chartered Industries of Singapore (now ST Kinetics)

Proliferation: Bangladesh Cyprus: Cypriot Army announced purchase of CIS 40 AGLs in 2007. Indonesia: Made under license by PT Pindad for the Indonesian military as Pindad SPG-3 in 1994. Georgia: Used on Nurol Ejder and Otokar Cobra AFVs Papua New Guinea: Used by the Royal Papua New Guinea Constabulary. Philippines: Philippine Army, Philippine Marine Corps Singapore: Used as a main armament on the Bionix 40/50 IFVs.

Length: 966 mm

Barrel Length: 350 mm

Width: 376 mm

Weight: kg33

Action: Blowback operation

Rate of Fire: 350-500 rounds/min

Muzzle Velocity: m/s242

Maximum Firing Range: m2,200

Feed System: Linked belt

Sights: Folding leaf sight

↳ ***Ammunition***

Type: Grenade

Caliber: 40mm

Cartridge: 40x53mm grenade

Secondary Weapon System

Note: 1–2× FN MAG General-Purpose Machine Guns

Self-entrenching Blade: No

NBC Protection System: No

Smoke Equipment: INA

Survivability Equipment: Off-road mobility, speed, 360°crew fire, & quick dismount for protection

Notes:

The Light Strike Vehicle (LSV) is a light fast attack vehicle used by the Singapore Army. In 2013, the Singapore designed and made Light Strike Vehicle Mark II (LSV MK.II) entered service to replace the ageing Singapore and Australian made Light Strike Vehicle in service since 1998. The Light Strike Vehicle (LSV) was a US designed vehicle named the Flyer designated R-12D produced in Australia and later in Singapore. The Flyer R-12 high-speed mobility vehicle was originally designed by HSMV Corporation, subsequently purchased by the Flyer Group (now Flyer Defense, a Division of Marvin Group). The Flyer was based on the chassis of the R-1 Rescue All Terrain Transport (RATT). The vehicle is powered by a rear-mounted, 2-litre, 110HP water-cooled turbocharged diesel coupled to a three-speed semi-automatic transmission. The chassis is constructed of welded chrome-moly seamless tubing and a long travel progressive suspension. In 1995, the Flyer R-12D Light Strike Vehicle was a proposal for the cancelled Australian Army project “Mulgara” by Australian Defence Industries (ADI)/ Raceco-HSMV (US). Later, Flyer Defense LLC designed an upgraded Flyer designated the R-12D Flyer 1 which was produced in the US for the Greek Army special forces in left hand drive. A second generation Flyer designated the Flyer 21 was developed by Flyer Defense LLC (also referred to as the Flyer Internally Transportable Vehicle (ITV-1)). The ITV-1 did not enter full production. In 2003, ST Kinetics provided the United Arab Emirates (UAE) with prototype Flyers for a potential contract of between 60 and 90 light strike vehicles. At the Eurosatory 2004 in Paris, the Israeli company Rafael Armament Development Authority unveiled the Mantis high-mobility attack vehicle prototype based on the US produced Flyer ITV-1. The Mantis did not enter full production, however, several prototype Mantis Flyers were successfully deployed in counter smuggling operations along the Israel-Egypt border and tested by special forces. In 2004, the Malaysia government military company DEFTECH formed a partnership with Flyer Defense LLC to market the Flyer Advance Light Strike Vehicle (ALSV) GEN II (variant ITV-1) in the region, after ST Kinetics had commenced developing their own vehicle, the partnership continues today. In 2008, the Indian government military company Ordnance Factory Board (OFB) produced a Flyer ITV-1 prototype with Flyer Defense LLC for the Indian Army Light Support Vehicle (LSV) contract. The vehicle did not enter production.

Notes:

The 9P148 is a Soviet anti-tank missile carrier. Unusually this anti-tank vehicle has got no proper name and is referred by its military index designation. It is based on a BRDM-2 armored scout car chassis and is fitted with Konkurs (Western designation AT-5 Spandrel) anti-tank guided missiles. It was a successor to the 9P122 anti-tank missile carrier, which was also based on the BRDM-2 chassis, but packed older and less capable Malyutka (AT-3 Sagger) missiles. The 9P148 was first seen in 1977. This missile carrier was exported to a number of Soviet allies. Despite its age the 9P148 is still used by the Russian military. It is also operational with some former Soviet republics and export operators, including Armenia, Bulgaria, Czech republic, Hungary, Moldova, Romania and Slovakia. The 9P148 vehicle has five Konkurs missiles in ready-to-launch position on the roof and carries 10 reload missiles internally. When not in use the whole launcher with missiles is retracted inside the hull. The launcher is reloaded under complete armor protection. The platform vehicle is a BRDM-2M/GAZ-41-08. A variety of ATGM mixes have been seen with 9P148, between AT-4 (Spigot) and AT-5-type (Spandrel) ATGMS. The primary benefit of adaptability is increased launcher load and adaptability to user countries' inventories of ATGMs. Most common ATGM is AT-5. As AT-5B is produced, it is likely to replace AT-5 in better-budgeted country inventories. Reload time for the launcher is 25 seconds. Russian firms have developed countermeasures, such as encoded-pulse beacons for ATGMs and counter-dazzler adjustments to the 9S451M1 guidance box. Filters can be mounted in front of reticles. The 1PN66 thermal sight is available for the ATGM launcher. Acquisition range is approximately 2,500 meters. Russian KBP offers a drop-in one-man turret, called Kliver, with a stabilized 2A72 30-mm gun, a 4 Kornet ATGM launcher, thermal sights, and improved fire control system.

ZTL-11 Chinese 105mm Anti-Tank Vehicle

Tiers:

Variants:

- **ZBL-09:** a wheeled infantry armoured fighting vehicle designed and manufactured by the Chinese Defense Company NORINCO China North Industries Corp. The ZBD-09 was presented for the first during the military parade in Beijing for the 60th anniversary of the Chinese army (PLA), the 01 October 2009. The ZBD-09 was based to the chassis of the VN1 8x8 wheeled chassis.
- **ZBL-08:** ZBL-08 is the designation for Infantry Fighting variant in the Type 08 vehicle family. The modular design claims to be able to field variety of different models including an APC model, assault gun, an Engineering model, a 122 mm self propelled howitzer model, a 155 mm self propelled howitzer model, an air defense model, a self-propelled mortar model, a reconnaissance model, a command vehicle model and much more.
- **Type 08 Armoured Personal Carrier:** Based on IFV variant but the modified crew cabin has a higher ceiling. The Armored Personnel Carrier can be armed either with a manual controlled, armor-plate protected 12.7 machine gun or a remote controlled weapon station
- **Type 08 Armored Reconnaissance Vehicle:** rmed with a 30 mm turret, the vehicle has a chassis that similar to the one used by IFV variant. The Armored Reconnaissance Vehicle will advanced before IFVs and assault guns for intelligence gathering. On-board high definition electro-optical cameras, thermal imaging system and laser designator can transmit battlefield and target information for other data-linked vehicles for target identification and designation. The Armored Reconnaissance Vehicle can provide better situational awareness for the infantry fighting squadron. The main radar and electric-optic sight is mounted on a retractable mast. There's also a version of the vehicle that doesn't have 30 mm turret. Instead, the chassis of APC variant is used. The secondary version of the Armored Reconnaissance Vehicle has more cameras onboard yet lack self-defense
- **PLL-05 Mortar Carrier:** Based on IFV variant. It's armed with a 120mm dual purpose mortar.
- **PLL-09 (Type 09) Modular Self-propelled Howitzer system:** Based on IFV variant. Can be armed with either a 122mm or 155mm howitzer, to provide indirect fire support for infantry
- **Type 09 Anti-Air Reconnaissance Vehicle:** Armed with a single barrel 35mm revolving auto cannon, the Air Defense variant has a unique chassis and is equipped with thermal-tracking sight, targeting and surveillance radars. The data collected by the radars can be data-linked back to command and armored reconnaissance vehicle.
- **VE32A:** Reconnaissance vehicle[
- **CS/AA5:** Specialized IFV variants with a remote-controlled 40mm turret. The chassis of CS/AA5 is based on Type 08 IFV.
- **VN-1:** Export variant based on Type 08 IFV. The VN-1C is armed with a 30 mm remote weapons station and a HJ-73 anti-tank missile.

Notes:

ZTL-11 is the second wheeled armored fighting vehicle equipping China's army. The ZTL-11 is a derivative of the Type-08 infantry combat vehicle (ZBL-08), Compared with the previous PTL-02, except that the 105mm gun was used instead of the 100mm gun, and the chassis was changed from 6 to 8 wheels, the affiliation was transferred from the artillery to the armor, and the fire support became a fire assault. The ZLT-11 wheeled armored assault vehicle in China's active service is an 8X8 chassis equipped with a low-rear 105-line tank gun. It has a total weight of 23 tons, a length of 8 meters, a width of 3 meters and a height of 2.1 meters. The water can be used to float in the river. Has good mobility and strong firepower.

Type 92B Chinese 4x4 Anti-Tank Guided Missile Carrier

Tiers:

1 2 3 4

Variants:

- **Red Arrow-9A:** MMW-Homing Version - in development.
- **RED ARROW-9B:** Semi-Active laser homing - in development.
- **92B:** A recently shown 4-tube launcher mounts missiles in an armored box. A single tube launcher was developed for light vehicles. Initial version is on the NJ2046 4x4 light utility vehicle.
- **Single tube launcher:**
- **High explosive thermobaric.:**
- **The system is only vehicle-mounted. First fielded vehicle is type:**

Notes:

This is a WZ 551 4 x 4 vehicle fitted with small, traversable launcher holding four Red Arrow 8 ATGW; eight reloads are stowed in hull. Elevation is -7/+13 degrees (-124/+231 mils). Rate of fire is 2 rounds/min. The vehicle weighs 27,558 lb (12,500 kg) when combat loaded; it has a crew of four. This variant is in service with the Chinese army and has been reportedly supplied to Bosnia-Herzegovina. An alternative configuration is equipped with a 73-mm gun, 7.62-mm coaxial machine gun and the Red Arrow 73 anti-tank missile. The Type 92B is armed with the Red Arrow 9 heavy long-range anti-tank weapon system. This variant was shown publicly for the first time in 1999.

Variants:

- **Major HMMWV A0/A1/A2 versions:** *M56/M56A1 Coyote Smoke Generator Carrier (mounted on a HMMWV; not a Type Classified HMMWV) *M707 Knight (replaced, originally mounted on a M1025A2 HMMWV; not a Type Classified HMMWV) *M966/M966A1 TOW Missile Carrier, basic armor, without winch *M996 Mini-ambulance, two-litter, hard top (type classified but not produced) *M997/M977A1/M977A2 Maxi-ambulance, four-litter, basic armor *M998/M998A1 Cargo/Troop Carrier without winch *M998 HMMWV Avenger (mounted on a HMMWV; not a Type Classified HMMWV) *M1025/M1025A1 Armament Carrier, basic armor, without winch *M1025A2 Armament/TOW Missile Carrier, basic armor *M1026/M1026A1 Armament Carrier, basic armor, with winch *M1035/M1035A1/M1035A2 Soft top Ambulance, two-litter *M1036 TOW Missile Carrier, basic armor, with winch *M1037 Shelter Carrier, without winch *M1037 Shelter Carrier MSE *M1038/M1038A1 Cargo/troop Carrier with winch *M1042 Shelter Carrier, with winch *M1043/M1043A1 Armament Carrier, supplemental armor, without winch *M1043A2 Armament Carrier, supplemental armor *M1044/M1044A1 Armament Carrier, supplemental armor, with winch *M1045/M1045A1 TOW Missile Carrier, supplemental armor, without winch *M1045A2 TOW Missile Carrier, supplemental armor *M1046/M1046A1 TOW Missile Carrier, supplemental armor, with winch *M1069 Tractor for M119 105-mm Gun *M1097/M1097A1 Heavy Hummer Variant (HHV) *1097A2 base platform *M1097A2 Cargo/Troop Carrier/Prime Mover (replacing the M998A1) *M1097A2 Shelter Carrier *M1097 Heavy HMMWV Avenger (mounted on a HMMWV; not a Type Classified HMMWV) *Packhorse – Attachment to convert an M1097 to tractor version for semi-trailers *XM1109 Up-Armored Heavy Hummer Variant (UA-HHV) (replaced by M1114) *M1123 Troop/cargo (U.S. Marines specific M1097A2)

System

Alternative Designation: M1167 HMMWV

Type: 4x4 Expanded Capacity TOW Armament Carrier

Manufacturer: AM General

Family: HMMWV

In Service: 1987-Present

Crew: ea1

Passenger Capacity: 8 maximum (can also carry casualties)

Dimensions

Length: 4.84 m

Width: 2.16 m

TOW Height: 1.88 m

Wheelbase: 3.30 m

Ground Clearance: 0.41 m

Vehicle Weight, (TOW Basic Armor): 3,075 kg

Payload Weight, (TOW Basic Armor): 1,597 kg

Gross Weight, (TOW Basic Armor): 4,672 kg

Vehicle Weight, (TOW Extra Armor): 3,295 kg

Payload Weight, (TOW Extra Armor): 1,380 kg

Gross Weight, (TOW Extra Armor): 4,672 kg

Automotive

Engine Name: 1 x General Motors V8

Engine Type: 6.5L turbo-charged, diesel fuel injection

Engine Power: 160 hp at 3,400 rpm

Transmission: automatic w/4 forward gears, 1 reverse gear

Fuel Capacity: 94 liters

Range: 483 km

Speed, Maximum Road: km/h105

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.56

Fording Depth: m1.52

Suspension: independent double A-arm with coil spring on all wheels, with front stabilizer bar

Main Weapon System

Name: BGM-71

Type: TOW Anti-Tank Guided Missile

Length: 1.17 m

Diameter: 152 mm

Wingspan: 0.45 m

Engine: 2 x Hercules solid-fuel rocket motors; first motor has short burn to allow TOW to clear tube; second motor sustains TOW flight until impact; TOW 2 motor provides 30 percent greater impulse than the basic TOW

Total Weight: 18.9 kg

Warhead Weight: 3.9 kg

Elevation: INA

Traverse: This variant features a TOW missile launcher and a ring mount for various weapon systems with a 360-degree arc of fire.

Maximum Speed: 300 m/sec

Range: 3,000 m

Guidance System: semi-automatic command to line-of-sight (SACLOS) wire guidance

Infrared: automatic tracking of xenon or thermal beacon in tail

Basic Load: 6 x BGM-71 TOW Anti-Tank Guided Missiles

Auxiliary Weapon System

Note: basic vehicle does not have weapons fitted; armament carrier can be fitted with a 7.62-mm or 12.7-mm machine guns or a 40-mm grenade launcher; TOW carrier has launcher

Protection

Armor: INA

Applique Armor: Available

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1167 was a TOW missile carrier configuration in the Expanded Capacity HMMWV series. The M1167 was equipped with an M41 Improved Target Acquisition system (ITAS) used to mount and operate the missile launcher system and featured armor ballistic protection for crew, missile stowage, secondary weapons mount for close range, and ammunition. These tactical vehicles were designed for use over all types of roads, as well as cross-country terrain, in all weather conditions. All vehicles were able to stow a minimum of 6 missiles mounted in the cargo area and are equipped with a pintle hook for towing, tiedowns, and lifting eyes for air, rail, or sea shipment. The optional front self-recovery winch permitted recovery operations of similar vehicles. Fully loaded M1167s could climb road grades as steep as 40 percent (22 degrees) and traverse a side slope of up to 30 percent (13.5 degrees). The vehicle could ford hard bottom water crossings up to 30 inches (76 centimeters) without a deep water fording kit and 60 inches (152 centimeters) with the kit. The primary difference between the M1167 and the M1115, was that the M1167 featured a slightly lower default armor package based on the Integrated Armor Protection package (or A-Kit) for the M1151A1/M1152A1/M1165A1 type vehicles, but was capable of mounting the supplemental armor (B-Kits). Frag Kits could also be installed. These vehicles reflected the US Army's Long Term Armor Strategy of developing vehicles with adaptable armor packages.

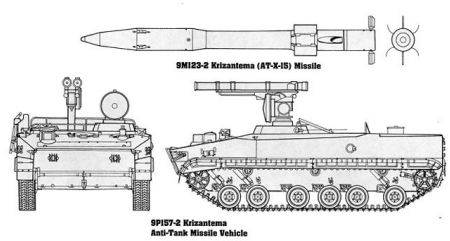
NBC Protection: None

Smoke Equipment: 8 smoke grenade launchers

Notes:

The M901 ITV (Improved TOW Vehicle) is an American armored vehicle introduced into service in 1979, and designed to carry a dual M220 TOW launcher. It is based on the ubiquitous M113 Armored Personnel Carrier chassis. The M901 ITV is no longer in service with the United States Army, its primary user. The M901 ITV provides the crew and weapon system protection from small-arms fire and artillery fragments. The squad leader has a 270-degree range of view through the squad leader's periscope (SLP). The turret launcher has the capability for day and night acquisition and tracking of targets, and it provides firing coverages of 360 degrees in azimuth and +35 to −30 degrees in elevation. The ITV has stowage provisions for tripod-mounted TOW components configured so the ground system can be dismounted and set up in three to five minutes. In addition, the ITV is completely amphibious and is air transportable. It has the following characteristics: * A hydraulically and electrically powered "hammerhead" turret, attached to a modified M27 cupola, that can be operated manually. * A complete M220-series TOW weapon system stowed and strapped in fixed mounting brackets. The day sight tracker and night sight (AN/TAS-4 or AN/TAS-4a) are mounted in a ready state at the head of the turret. The missile guidance system is also connected at the base of the turret. * A dual M220 TOW launcher. * M243 smoke grenade launchers. * A 3x acquisition sight with a 25-degree field of view. * Remote actuators that allow day sight tracker and night sight adjustments. * A machine gun mounted on a traversing rail. The system is capable of firing two missiles without reloading and carries ten TOW rounds in the missile rack. Reloading is performed under armor protection and is accomplished by tilting the launching apparatus back so that the crew can reach the turret through the carrier's rear roof hatch. The missile launcher targeting head is at the end of a pivoting arm which raises the launcher assembly for firing. When stowed, the turret is aimed down and to the rear of the vehicle. A major limitation of the M901 is that it is practically unable to move while the turret is in firing position and unable to fire while it is in the stowed position. A common workaround is to move the vehicle while the turret is in the loading position, thereby reducing the amount of time to get the turret in a fire position as opposed to the stow position. Moving from the firing to the stowed position is a procedure that takes several seconds and some skill on the part of the operator.

9P157 Khrizantema-S Russian Anti-Tank Guided Missile System



Tiers:

Variants:

- **Krizantema-S launcher assembly:** can mount on ships and vehicles
- **Mi-28N/HAVOC helicopter:** The Tor gyro-stabilized EO pod can be mounted on aircraft for guiding the Krizantema-V air-launch variant.

Smoke Equipment: N/A

Notes:

The 9P157 is a modern tank destroyer of Russian origin. It was developed as launch platform for the 9M123 Khrizantema missile. Although the 9P157 uses a BMP-3 chassis, newer missile and dual guidance mode its mission and design philosophy is similar to the older 9P149 Shturm-S tank destroyer. The 9P157 is based on the BMP-3 chassis but is not fitted with a turret. Instead the troop compartment is filled with a twin round retractable pedestal launcher which is connected to an automatic loader. The 9P157 has an optical sight with laser for SACLOS guidance of the laser guided version of the 9M123 missile. Additionally a retractable radar is mounted for detecting targets for the MMW radar version of the 9M123. The 9P157 carries 15 missiles of which two are ready to fire. The 9M123 missile is able to destroy even the most modern tanks and has a maximum range of 6 km. Reportedly the 9P157 may engage two targets at once, possibly only when using radar guided missiles. The two modes of guidance allows for operation in ECM environments. The 9P157 is operated under full armor protection, with missiles being reloaded automatically. The BMP-3 chassis with steel armor protects the crew from small arms fire and shell splinters. Over the frontal arc it may also resist heavy machine gun fire. An NBC system is fitted as standard. The low silhouette reduces the chance to be hit. The tracked BMP-3 chassis allows for a good all terrain mobility. The 500 hp diesel engine provides a maximum speed of 70 km/h. As with the orignal BMP-3 the 9P157 is fully amphibious.

Notes:

The SU-100 (Samokhodnaya Ustanovka 100) was a Soviet tank destroyer armed with a 100 mm anti-tank gun in a casemate superstructure. It was used extensively during the last year of World War II and saw service for many years afterwards with the armies of Soviet allies around the world. The SU-85 was developed from the chassis of the T-34 tank replacing the turret with a larger, fixed superstructure that allowed a larger gun to be fitted: the 85 mm D-5 gun, providing dramatically upgraded firepower compared to the T-34's 76.2 mm models. Introduced to service in 1943, the SU-85 was quickly rendered obsolete as a new tank design featured the same gun on the T-34-85. This prompted the design of a more advanced turretless tank destroyer with an even more powerful cannon. Development was conducted under supervision of L. I. Gorlitskiy, chief designer of all medium Soviet self-propelled guns. The work started in February 1944 and the first prototype of the SU-100, "Object 138", was delivered in March. After intensive testing with different models of 100 mm gun Soviet engineers approved the D-10S gun for mass production. This gun was developed in Constructors Bureau of Artillery Factory No. 9 under the guidance of F. F. Petrov. After the Second World War this gun was installed on T-54 and T-55 tanks; these vehicles and their derivatives were in service forty years after initial development. It was built at the UZTM (Russian abbreviature УЗТМ for Уральский Завод Тяжелого Машиностроения – Ural Heavy Machinery Factory, also called Uralmash) in Yekaterinburg. The SU-100 quickly proved itself to be able to penetrate around 125 mm (4.9 in) of vertical armor from a range of 2,000 m (1.2 mi) and the sloped 80 mm (3.1 in) front armor of the German Panther from 1,500 m (0.93 mi). The hull of the SU-100 had major improvements over the SU-85; the thickness of the front armour was increased from 45 to 75 mm (1.8 to 3.0 in), and the commander's workplace was made in a small sponson on the right side of the hull; combined with the commander's cupola this improved the commander's effectiveness. Its German Jagdpanzer-family counterparts — the Jagdpanzer IV, Jagdpanther and Jagdtiger, by comparison, lacked this key piece of observational equipment. On the other hand, the SU-100's optics were inferior. For better ventilation two ventilator units were installed, instead of only one as in the SU-85. Mass production began in September 1944.

FV102 Striker British Anti-Tank Missile Carrier

Tiers:

Variants:

- **Scorpion (FV101):** Original variant with 3-man crew
- **Spartan (FV103):** Artillery & engineer vehicle with 3-man crew & 4 dismountable troops; 80 k/hr; 483 km range; 1 7.62-mm MG
- **Striker (FV102):** AT vehicle with 5 Swingfire CLOS ATGMS (5 reloads) & 1 7.62-mm L37A1 MG
- **Scorpion 90:** 3-man crew; 73 k/hr; Cockerill Mk IIIK 90-mm gun & 1 7.62-mm MG
- **Samaritan (FV104):** Ambulance for 4 litter patients, 5 seated patients, or 2 litter/3 seated patients; 2-man crew; 483 km range
- **Sultan (FV105):** Command vehicle with at least 2 radios; total 5-6 personnel; 483 km range
- **Samson (FV106):** 483 km range, ARV with internal main winch, tow bars, & tow cables
- **Scimitar (FV107):** Scorpion with 1 30-mm Rarden L21 rifled gun (165 rounds) & 1 7.62-mm coax MG; 80 k/hr; 644 km range;
- **Scorpion 2:** Description of late production Scorpions with Perkins engine & other upgrades with 2-man turret with 30-mm, 76-mm, or 90-mm main armament options
- **Saber:** Reconditioned recon vehicle with 30-mm Rarden cannon & Hughes 7.62-mm coaxial chain gun
- **Scorpion (Jordan):** Upgraded original Scorpion with Perkins engine & other upgrades
- **Spartan with MILAN ATGM:** 2-round turret must be reloaded from outside the vehicle (11 reloads)
- **Scorpion 90 (Venzeula):** Scorpion 90 with Belgain CMI Defence 90-mm Mk II gun & Perkins engine
- **Sturgeon:** OPFOR vehicle used in Suffield, Canada based on the Spartan
- **Salamander:** OPFOR vehicle used in Suffield, Canada based on the 76-mm Scorpion
- **Scorpion (Malaysia):** Scorpion 90 with 76-mm AGL & Perkins engine
- **Omani Scorpion:** Increased protection package & some received a Cummins diesel engine
- **Scorpion vehicle-mounted automatic mortar FCS:** Fires Denel's 60-mm or BAE Systems' 81-mm L16 mortars
- **CVR(T) Life-Extension Program (LEP):** LEP with diesel engine, better optics & communication

System

Alternative Designations: FV102 Striker
Type: Anti-Tank Missile Carrier
Manufacturer: Alvis Vehicles, Coventry, England
Family: CVR(T) Family

In Service: 1975-1985 (Great Britain) Other nations still utilize this piece of equipment

Crew: ea3

Dimensions

Length: m4.80

Width: m2.4

Height: m22

Weight: tons8.13

Ground Pressure: 0.36 kg/cm sq

Ground Clearance: m0.36

Automotive

Engine Name: Cummins BTA 5.9-litre (Diesel)

Type: Diesel

Engine Power: hp195 hp

Cruising Range: 640

Speed, Maximum Road: km/h80

Speed, Average Cross: INA

Speed Maximum Swim: km/h6.4

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.5

Trench: m2

Fording Depth: m1

Fording with Preperation Depth: mAmphibious

Transmission: Self Change Gears TN15X

Suspension: torsion bar, 5 road wheels, front drive, rear idler, 2 hydraulic shock absorbers

Fuel Capacity: 423 liters

Main Weapon System

↳*Wire-Guided Anti-Tank Missile*

Name: Swingfire

Type: Wire-Guided Anti-Tank Missile

Engine: Solid rocket motor

Length: m1.07

Diameter: m0.17

Fin Span: m0.39

Weight: kg27

Warhead Type: HEAT

Warhead Weight: kg7

Basic Load: ea10

Maximum Elevation: degINA

Minimum Elevation: degINA

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Maximum Firing Range: m4,000

Minimum Firing Range: m150

Detonation Mechanism: Impact

Armor Penetration: mm800

Guidance System: Guidance of the Swingfire is by wire, with a Manual Command Line Of Site (MCLOS) interface. later replaced by a Semi-Automatic Command Line Of Sight (SACLOS) guidance system in some Swingfire launchers, as part of the "SWIG" (Swingfire With Improved Guidance) upgrade. The missile is controlled in flight using a simple joystick.

Steering System: Thrust Vector Control

Speed: m/s185

Note: The name of the missile comes from the ability to make a rapid turn of up to 90° after firing.

Auxilery Weapon System

↳*System*

Name: L43A1 FN MAG, 7.62 mm General-Purpose Machine Gun

Type: 7.62mm General Purpose Machine Gun

Manufacturer: Fabrique Nationale (FNH / FNH UK) and U.S. Ordnance

Proliferation: + 1 Million

Max Rate of Fire: rds/min650-1,000

Length, Total: mm1,263

Length, Barrel: mm630

Width: mm118.7

Height: mm263

Weight: 11.8 kg

Action: Gas-operated long-stroke piston, open bolt

Effective Firing Range (Bipod): 800 m

Effective Firing Range (Tripod): 1,800 m

Maximum firing range: 3,500 m

Feed System: Non-disintegrating DM1 or disintegrating M13 linked belt

Sights: Folding leaf sight with aperture and notch, front blade

↳*Ammunition*

Name: INA

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Muzzle Velocity: m/s840

Basic Load: ea3,000

Fire Control

Name: INA

Computerized FCS: INA

Commander Periscopes: ea7

Roof Mounted Day Sight: Yes, with magnifications of 1x and 10x.

Gunner Periscopes: ea2

Navigation System: Yes

Night Vision: Rank Precision Industries passive night sight

Note: A special optical sight with a 100 m cable allows the crew to engage enemy targets from a safe cover.

Protection

Armor (turret front): mmAgainst 14.5-mm rounds (remainder of the vehicle against 7.62-mm rounds)

Applique armor: mmINA

Explosive reactive armor: mmINA

Active Protection System: INA

Self-entrenching blade: No

NBC Protection System: Yes

Smoke Equipment: 8 Smoke dischargers

Survivability Equipment: Enhanced mine protection available

Notes:

FV102 Striker was the Swingfire wire-guided anti-tank missile carrying member of the CVR(T) family. The FV102 Striker was externally very similar to the FV103 Spartan but carried five missiles in a ready-to-fire bin at the back of the vehicle. Five reload missiles were carried in the vehicle. The bin was elevated to 35° (622mils) for firing. The targeting sight could be demounted and operated at a distance from the vehicle which could remain in cover, even completely screened as the missile can turn up to 90° after launch to come onto the target heading. The missiles were originally steered by joystick control using manual command to line of sight (MCLOS). This was later updated to the semi-automatic command to line of sight (SACLOS) system where the controller merely sights the target.[1] Secondary armament was a general purpose machine gun.

9K114 Shturm-S Russian Anti-Tank Guided Missile Carrier

Tiers:

Variants:

- **Variants:** 9M114 Kokon / AT-6 Spiral Entered service in 1976. 9M114V Shturm-V – Air to surface version for helicopters. 9M114 Shturm / AT-6A Spiral SACLOS 9M114M HEAT warhead. 9M114F Thermobaric warhead. 9M114M1 Shturm / AT-6B Spiral SACLOS, heavier 7.4 kg (16 lb) warhead penetrating 600–650 mm, longer 6 km (3.7 mi) range. 9M114M2 Shturm / AT-6C Spiral SACLOS, further increased 7 km (4.3 mi) range. 9M120 Shturm-VM / AT-9 Spiral-2 – see 9M120 Ataka-V

System

Alternative Designation: 9K114 Shturm

Ammunition

↳*ATGM, AT-9 / Ataka*

Range, Maximum: m6000

Range, Minimum: m400

Penetration (KE, CE): mm1100, CE

Warhead Type: Shaped Charge (HEAT)

Missile Weight: kg48.3

Notes:

The Shturm (Storm) self-propelled anti-tank guided-missile (ATGM) system consists of the 9K114 MT-LS multipurpose tracked armored vehicle mounting launchers for the 130-mm Shturm semi-automatic command to line-of-sight (SACLOS) AT-6 Spiral anti-tank guided missile (ATGM). The vehicle can also carry the AT-9 Ataka ATGM. A variety of night sights are available, such as the Kornet-T sight with 3500m range (4000 for detecting helicopters). In OPFOR Tier 1, the 9P149 night sight is 1PN79M3 2nd generation, and ranges to 5500m. A modular AT-6 ATGM launcher system with launcher / autoloader is available for installation on vehicles, fixed sites and boats. AT-9 (9M120F) and AT-6 (9M114F) thermobaric HE multi-purpose missiles range to 6000m 9A2200 (Ataka) anti-helicopter missile. It has a proximity fuze and a HE / Frangible rod warhead which assures a kill with a hit or a near miss. It can also be used against light armored vehicles. Other missile types: A version of Ataka, 9M120-1 now has RF plus laser beam rider guidance. It can be used on 9P149 and P-157, and some rotary wing aircraft. Upgrades AT-6B and AT-6C/Kokon-M (9M114M1, 2) can be launched from helicopters; but their length exceeds the 1832mm limit for the SHTURM-S autoloader, preventing ground use. The missile can be deployed on a variety of platforms, including the Mi-24V and from 1979-onwards the MT-LB based 9P149 tank destroyer. There is also a shipborne version of the missile, with the launcher holding six missiles. The missile is transported and launched from a glass-reinforced plastic tube. The missile uses a Soyuz NPO solid-rocket sustainer, with a small booster stage to launch the missile from its tube. The missile is SACLOS with a radio command link. The use of a radio link allows the missile to travel much faster and further than if it were wire guided. The radio link is a VHF system with five frequency bands and two codes to minimize the risk of jamming. The system comprises a KPS-53AV 8× daylight-only direct vision sight with an integrated laser rangefinder. After the missile is launched, the gunner has to keep the sight's crosshairs on the target until impact. Appropriate steering commands are transmitted to the missile via the radio link. The missile flies above the gunner's line of sight to the target. With the range of the target determined by the laser rangefinder, the missile descends onto the target just before impact. This is done primarily to clear obstacles, instead of achieving a top-attack, and can be switched off. It is possible to engage low and slow moving helicopters with the system; however, since the missile only has a contact fuze, a direct hit would be needed. Soviet sources report kill ratios of 75–85% during the Soviet invasion of Afghanistan. Also a Mil demonstration in Sweden in late 1995 using a Mi-28A firing Shturm and Ataka missiles also showed good results: from a hovering helicopter, a Shturm was fired at a target 900 m away; and from level flight at 200 km/h an Ataka was fired at a target 4,700 m away. Both missiles passed within 1 m of their aiming point. It is possible there were problems with early models of the missile; Soviet stocks of the missile were rebuilt to AT-6B and C standard by 1994. 30 June 2014 adopted by the Russian army modernized self-propelled antitank missile system 9M114 Shturm-S into 9K132 Shturm-SM having a sight with television and thermal channels as well as a new missile with a high-explosive fragmentation warhead and a proximity fuse.

9P162 Kornet-T Russian Anti-Tank Missile Carrier

Tiers:

Variants:

- **ATM Alternate Kornet turret:** A manned turret with an overhead weapon system (OWS). ATM can mount on a variety of vehicles. (see pg. 6-68) KPB offers the Kvartet/9P163-2 overhead weapons module to mount on a variety of vehicles (e.g., HMMWV and VBL, see pg 6-31). It has a dual twin (4-tube) launcher and central module with TV/FLIR sights.
- **KPB prototype overhead weapons module:** KPB displayed a prototype overhead weapons module to mount on a variety of vehicles (displayed on a HMMWV). It has dual twin (4-tube) launcher, and a central module with TV/FLIR sights and MG.

System

Mobility: Entrenching blade

NBC Protection: Collective

Notes:

The 9P162 Kornet-T is a new anti-tank missile carrier. It is armed with Kornet anti-tank guided missiles. It is intended to replace the ageing Shturm-S (based on the MT-LB tracked armored vehicle) and 9P148 (based on BRDM-2 armored scout car). First Kornet-T anti-tank missile carriers were delivered in 2003. A first batch of 20 production vehicles was delivered to the Russian Army in 2012. The Kornet-T is based on the BMP-3 infantry fighting vehicle chassis. It is similar to the Khrizantema, which is also based on the BMP-3 cassis. The Khrizantema entered service with the Russian Army back in 2004. It seems that the Kornet-T will be used by motorized units, while the Khrizantema by artillery units. The Kornet-T can engage tanks, fortifications and low-flying helicopters. This missile carrier can operate and fire in day/night conditions, in adverse weather conditions and when enemy uses countermeasures. This anti-tank missile carrier is fitted with an automatic loader. A total of 16 missiles are carried by the vehicle. 12 missiles are stored in the autoloader and 4 more are stored inside the hull. This missile carrier has two launchers. Both missiles can be launched against the same target. Vehicle can also engage two targets simultaneously. During travelling both launches are retracted inside the hull. Vehicle has a brief deployment time. The Kornet heavy anti-tank guided missile was adopted by the Russian Army back in 1994. From the start it was developed as a universal missile, which could be fired from various platforms. The Kornet is a fire-and-forget type anti-tank missile. This laser-guided missile has a range of 100 to 5 500 m. Maximum range at night is 3 500 m. Missiles are available with tandem HEAT and thermobaric warheads. A tandem HEAT warhead penetrates up to 1 200 m behind explosive reactive armor. It is sufficient to defeat even the latest main battle tanks. Furthermore the Kornet-T is capable of launching a salvo of 2 missiles less than a second apart either at a single target. This two-missile salvo is intended to overcome active protection systems. If launched at a single target the first missile triggers the active protection system of a tank, while the second missile hits the target. If the tank lacks active protection system this two-missile salvo improves a probability of the tank's destruction. The Kornet missiles were exported to a number of countries. Kornet-E is a downgraded export version of this missile. It is worth noting that Russia usually sell abroad

only downgraded versions of its weaponry. These missiles saw combat in the Middle East in 2003 during Invasion of Iraq, in 2006 during Lebanon War. It was also used several times by Hamas and Hezbollah fighters against Israeli targets. New Kornet-EM missiles with anti-tank warheads have a range of 8 000 m, while missiles with thermobaric warheads have a range of 10 000 m. New missiles can be launched from all previous Kornet launchers. Kornet Missiles are smaller comparing with those of the Khrizantema. This anti-tank missile carrier is operated by a crew of two, including gunner and driver. Vehicle has a welded aluminum alloy armor hull. Front arc is made of composite armor. Protection is similar to that of the BMP-3 infantry fighting vehicle. Front arc provides protection against 30-mm armor-piercing rounds. All-round protection is against 14.5-mm armor-piercing rounds. It seems that protection can be enhanced with add-on explosive reactive armor kit. The Kornet-T is fitted with NBC protection and automatic fire suppression systems. This anti-tank missile carrier is powered by an UTD-29 turbocharged diesel engine, developing 500 hp. This vehicle might be also fitted with a modern UTD-32T turbocharged diesel engine, developing 660 hp. This engine is used on improved BMP-3M IFV. This anti-tank missile carrier is fully amphibious. On water it is propelled by two waterjets. Vehicle can fire missiles even while afloat. Recently Russia adopted another new anti-tank missile carrier. This is Kornet-D, based on the Tigr light utility vehicle. This vehicle carries two banks with 4 launchers each.

Effective Range: 1,800-2,000 m

Fire Control

Name: INA

Computerized FCS: INA

Rangfinder: Optional laser rangefinder mounted over main gun or integrated with gunner's sight

Protection

Armor (turret front): 16-mm

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Self-entrenching Blade: No

NBC Protection System: Available

Smoke Equipment: Available (up to 3 smoke dischargers on either side for a total of 6)

Survivability Equipment: Welded multi-layer armor

Notes:

The EE-9 Cascavel (Portuguese pronunciation: [kɐʃ.kɐ.ˈvɛɫ], translated to Rattlesnake) is a six-wheeled Brazilian armoured car developed primarily for reconnaissance. It was engineered by Engesa in 1970 as a replacement for Brazil's ageing fleet of M8 Greyhounds. The vehicle was first fitted with the Greyhound's 37mm main gun, and subsequently, a French turret adopted from the Panhard AML-90. Later models carry unique Engesa turrets with a Belgian 90mm Cockerill Mk.3 cannon produced under licence as the EC-90. The Cascavel shares many components with the EE-11 Urutu, its armoured personnel carrier counterpart; both entered production in 1974 and are now operated by over 20 nations in South America, Africa, and the Middle East. Rights to the design were also sold to the United States via the FMC Corporation. About 2,767 Cascavels and Urutus were manufactured before Engesa ceased operations in 1993.

BRM-1K Russian Amphibious Combat Reconnaissance Vehicle (CRV)

Tiers:

Variants:

- **BRM-1:** Baseline ARV (BMP M1976/1)
- **BRM-1K:** Smoke grenade launchers, additional communications (R-130, R-014D telegraph), PSNR-K Radar

System

Alternative Designations: BRM-1K; BMP M1976
Description: BMP-1 modified for recon with space for 2 passengers (see Chapter 3)
Manufacturer: Kurganmashzavod
In Service: 1976-Present
Crew: 6 (machine commander, pilot, transmitter, navigation system operator and two operators of reconnaissance systems)

Dimensions

Weight, Gun and Intergral Bipod: kg9

Weight, Tripod: kg7.7

Action: Gas-operated, open bolt

Rate of Fire: 650 rounds/min

Effective Firing Range: 100-1,500

Maximum Firing Range: m3,800

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea2,000

Anti-Tank Guided Missile (ATGM)

Name: 9M14 Malyutka (AT-3 Sagger)

Type: manual command to line of sight (MCLOS) wire-guided anti-tank guided missile (ATGM) system

Manufacturer: Soviet Union, Russia as successor state and other countries under license and domestic versions

In Service: 1963-Present

Length: mm860

Width: mm393

Diameter: mm125

Weight, 9M14M: kg10.9

Weight, Launcher and Guidance System: kg30.5

Effective Firing Range: m500-3,000

Warhead Weight: kg2.6

Speed: m/s115

Guidance System: MCLOS, SACLOS (Later variants)

Fire Control

Radar: 1RL133-1 Terrestrial radar

Radar Deployment: automatically retractable into the compartment at the rear of the turret

Fire Control System: Yes

Target Coordinate System: Yes

Navigation System: TNA-4 navigation system

Laser Rangefinder: Yes, 1D8 laser rangefinder

NRBC Recognition Facilities: Yes

Night Sights: The Russian Alis or Sanoet thermal gunner's sight can be installed.

Additional Sights: 1PN22M2 sight

Protection

Armor (turret front): mm19-23

Applique armor: mmAvailable

Explosive reactive armor: mmAvailable

Active Protection System: No

Self-entrenching blade: No

NBC Protection System: Automatic overpressure system

Smoke equipment: VEESS, Smoke grenade launchers available

Notes:

The BRM-1K is a Russian armored reconnaissance vehicle. It was developed in the Soviet Union in the 1970s by KB TchTZ and produced by Kurganmashzavod. The BRM-1K entered service in 1972. The BRM-1K is for reconnaissance missions on the battlefield. It is developed from the BMP-1 Armored Infantry Fighting Vehicle. It has the same architecture as the BMP-1 with the engine on the front right and the cockpit on the front left. The BRM-1K received a new two-seat turret unlike the single-seat turret of the BMP-1. The armament consists of the 73mm Grom 2A28 gun, identical to the BMP-1. The BRM-1K is equipped with a 1RL133-1 terrestrial radar. On the first BRM-1 version the radar is deployed manually. On the BRM-1K version, the radar is automatically retractable into the compartment at the rear of the turret. The crew of the BRM-1K is composed of six men: machine commander, pilot, transmitter, navigation system operator and two operators of reconnaissance systems.

Eagle IV Swiss 4x4 Reconnaissance Vehicle

Tiers:

Variants:

- **Eagle I:** INA
- **Eagle II Reconnaissance Vehicle:** This variant is slightly heavier than the Eagle I with a better power-to-weight ratio. The chassis is based on the enhanced capability vehicle (ECV) Humvee. It is fitted with a metal and composite armor shell capable of withstanding NATO Standard Agreement (STANAG) Level II or III threats. A Mowag armored MBk2 observation cupola is fitted.
- **Eagle III Artillery Forward Observation Vehicle:** This vehicle is used for target surveillance, acquisition, observation, reconnaissance and patrol missions. It carries a crew of four (driver, surveyor, forward observer and signals operator). Panoramic bulletproof windows ring the vehicle, which is fitted with a raised roof. It is protected by high-hardness armored steel and composite armor. Additional mine protection is available as an option.
- **Eagle IV Military Tactical Vehicle:** The military tactical vehicle is suited as a platform for mission roles such as reconnaissance, surveillance, command or military police tasks. It is based on the advanced Mowag Duro 3 chassis technology with roll stabilizer and the De-Dion axle system. Along with the permanent all-wheel drive system, the roll stabilizer and axle system help give the vehicle high off- and on-road mobility.
- **Eagle V:** This is a further development of the Eagle IV with a larger payload capacity, internal volume and increased crew protection, while providing the same mobility. The vehicles can be optimized for different missions with the application of modular add-on kits. It is available in 4 x 4 and 6 x 6 variants. The former was made public in 2010 and the latter in 2012. The two variants are about 80 percent common.
- **Eagle BAT ambulance:** This ambulance accommodates an emergency doctor, rescue assistant and a driver/paramedic. The vehicle permits patient transport and emergency treatment under protection.
- **Eagle V 6 x 6:** The is a 6 x6 compact off-road vehicle powered by a six-cylinder turbo-diesel engine coupled to a five-speed automatic transmission and a two-stage transfer case.
- **VERO robotics kit:** Developed by Ruag Defence in Switzerland, this is a robotics kit that can be retrofitted onto the Eagle IV, among other vehicles.

System

Alternative Designation: Eagle IV

Type: Reconnaissance Vehicle

Family: Eagle Series

Crew: 4 (driver, commander, signals operator, observer)

Passenger Capacity: INA

Dimensions

Length: 5.40 m

Width: 2.16 m

Height: 2.40 m

Weight, Combat: 7,400 kg

Weight, Empty: 5,000 kg

Weight, Gross: 8,500 kg

Payload: 2,200 kg

Automotive

Engine Name: 1 x Cummins ISBe

Engine Type: 5.9 liter (360 cu in) turbo common rail 4-stroke diesel

Engine Power: 250 hp (184 kW)

Fuel Capacity: 180 liters

Transmission: Allison 1000 5-speed automatic

Acceleration: 11 sec (0-50 kph, 0-31 mph)

Range: km480

Speed, Maximum Road: km/h120

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Fording Depth: 0.8 m

Gradient: 60 percent

Side Slope: 40 percent

Vertical Step: 0.5 m

Trench: 0.5 m

Turning Diameter: 16.5 m

Main Gun

Note: 1 x 7.62-mm machine gun facing forward in turret. Name of 7.62mm Machine Gun: INA

Fire Control

Name: INA

Computerized FCS: No

Main Gun Stabilization: No

Protection

Hull Armor: Protection against 5.56-mm and 7.62-mm ball ammo from 33 yds (30 m) and up; and protection against 7.62-mm steel jacket ammo from 109 yds (100 m) and up

Turret Armor: Protection against 5.56-mm and 7.62-mm ball ammo from 33 yds (30 m) and up; and protection against 7.62-mm steel jacket ammo from 109 yds (100 m) and up

Applique Armor: Available, The Eagle IV is armored with composite plates mounted to the inner face of aluminum plates to

provide a high-level of ballistic protection. A non-armored version is also available.

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: Yes, Overpressure System

Smoke Equipment: Yes, 6 x smoke-grenade launchers facing rear from turret

Notes:

Eagle IV Military Tactical Vehicle The military tactical vehicle is suited as a platform for mission roles such as reconnaissance, surveillance, command or military police tasks. It is based on the advanced Mowag Duro 3 chassis technology with roll stabilizer and the De-Dion axle system. Along with the permanent all-wheel drive system, the roll stabilizer and axle system help give the vehicle high off- and on-road mobility. The Eagle IV is also capable of carrying a high payload with a low gross vehicle weight. It can be equipped with an NBC overpressure system, central tire inflation system (CTIS), winch, mission-specific cargo module and an optional EURO IV engine. The vehicle can also be fitted with an overhead weapon station.

Notes:

The MOWAG Eagle is a wheeled armored vehicle designed by the Swiss MOWAG corporation. It has gone through several generations of development. The current vehicle, introduced in November 2003, is the Eagle IV, which is based on the Duro IIIP chassis. The original MOWAG Eagle used the chassis and running gear of the United States Humvee, while the Eagle II and Eagle III use the chassis and running gear of the Humvee ECV. A Prototype is now part of the Military Museum Full. The MOWAG

Eagle IV and V used the chassis and running gear of the Mowag Duro. A modular 6×6 variant that was developed for an Australian Army tender made its market debut at Eurostatory 2012.

FV101 Scorpion 90 British Amphibious Combat Reconnaissance Vehicle

Tiers:

1 2 **3** 4

Variants:

- **Scorpion (FV101):** Original variant with 3-man crew
- **Spartan (FV103):** Artillery & engineer vehicle with 3-man crew & 4 dismountable troops; 80 k/hr; 483 km range; 1 7.62-mm MG
- **Striker (FV102):** AT vehicle with 5 Swingfire CLOS ATGMS (5 reloads) & 1 7.62-mm L37A1 MG
- **Scorpion 90:** 3-man crew; 73 k/hr; Cockerill Mk IIIK 90-mm gun & 1 7.62-mm MG
- **Samaritan (FV104):** Ambulance for 4 litter patients, 5 seated patients, or 2 litter/3 seated patients; 2-man crew; 483 km range
- **Sultan (FV105):** Command vehicle with at least 2 radios; total 5-6 personnel; 483 km range
- **Samson (FV106):** 483 km range, ARV with internal main winch, tow bars, & tow cables
- **Scimitar (FV107):** Scorpion with 1 30-mm Rarden L21 rifled gun (165 rounds) & 1 7.62-mm coax MG; 80 k/hr; 644 km range;
- **Scorpion 2:** Description of late production Scorpions with Perkins engine & other upgrades with 2-man turret with 30-mm, 76-mm, or 90-mm main armament options
- **Saber:** Reconditioned recon vehicle with 30-mm Rarden cannon & Hughes 7.62-mm coaxial chain gun
- **Scorpion (Jordan):** Upgraded original Scorpion with Perkins engine & other upgrades
- **Spartan with MILAN ATGM:** 2-round turret must be reloaded from outside the vehicle (11 reloads)
- **Scorpion 90 (Venzeula):** Scorpion 90 with Belgain CMI Defence 90-mm Mk II gun & Perkins engine
- **Sturgeon:** OPFOR vehicle used in Suffield, Canada based on the Spartan
- **Salamander:** OPFOR vehicle used in Suffield, Canada based on the 76-mm Scorpion
- **Scorpion (Malaysia):** Scorpion 90 with 76-mm AGL & Perkins engine
- **Omani Scorpion:** Increased protection package & some received a Cummins diesel engine
- **Scorpion vehicle-mounted automatic mortar FCS:** Fires Denel's 60-mm or BAE Systems' 81-mm L16 mortars
- **CVR(T) Life-Extension Program (LEP):** LEP with diesel engine, better optics & communication

Smoke Equipment: 8 Smoke dischargers, 4 on each side of the turret

Survivability Equipment: Enhanced mine protection available

Notes:

The Scorpion 90 or Scorpion 2 was a version armed with the long-barrelled Cockerill Mk3 M-A1 90mm gun designed for the export market. The FV101 Scorpion is a British armoured reconnaissance vehicle. It was the lead vehicle and the fire support type in the Combat Vehicle Reconnaissance (Tracked), CVR(T), family of seven armoured vehicles. Manufactured by Alvis, it was introduced into service with the British Army in 1973 and was withdrawn in 1994. More than 3,000 were produced and used as a reconnaissance vehicle or a light tank. It holds the Guinness world record for the fastest production tank; recorded doing 82.23 km/h (51.10 mph) at the QinetiQ vehicle test track, Chertsey, Surrey, on 26 January 2002.

BOV M11 Serbian 4x4 Armored Reconnaissance Vehicle

Tiers:

Variants:

- **BOV-M (Slovenia):** Some built with 12.7-mm MGs
- **BOV-VP:** Security version with swing out gates to direct crowds
- **BOV-1/Polo M-83:** Sans troop compartment with 2 ATGM launcher pods with 3 AT-3 launchers each with machine gun mounted before the two AT-3s
- **BOV-3:** 3 turret-mounted 20-mm cannons for air defense
- **BOV-30:** 2 turret-mounted 30-mm cannons for air defense
- **LOV (Croatia):** No raised compartment, increased hull protection, but with a 12.7-mm machine gun
- **BOV-SN:** Ambulance
- **Yugo import BOV variants:** Serbia has a variants that include SP AA vehicles with the Igla or Stinger missiles or the ZU-23; AT vehicles with the AT-5 Spandrel; or an armored reconnaissance vehicle with a 20-mm M55 cannon, 7.62-mm PKT machine gun with twin AT-3 Sagger AT launchers or a single Spandrel system

Central Tire Inflation System: Yes

Notes:

The BOV M11 is part of the BOV family of light armored vehicles. The M11 is a 4x4 all-wheel drive vehicle specialized in reconnaissance. It is armored vehicle manufactured in SDPR "Complex Battle Systems" factory in Velika Plana, Serbia. The BOV M11 has primary role as reconnaissance vehicle and command-reconnaissance vehicle. If used by artillery units it could be remote observation post that observes enemy and guides firing. It has a crew of 3, including driver, commander and gunner. Has room for four more personnel that could include based on concrete mission scouts and artillery command platoon’s CO. The vehicle has a four-wheel drive and is powered by a diesel engine developing 190 hp. It has many special reconnaissance systems and artillery systems built in based on concrete mission role. Driver has thermal camera sight at front and CCD TV camera at rear.[3] It is armed with 12.7 mm remote-controlled weapon station for day and night combat and fire on move and stand. It is possible to integrate another RCWS with 7.62mm gun and for more recce combat role RCWS with 30 mm grenade launcher BGA-30 or M10 RCWS with 20mm gun and 7.62mm coaxial gun. Equipment for artillery reconnaissance vehicle include: 1. Artillery electronic direction finder (AEG) 2. Communications equipment 3. Artillery battery FCS computer

Self-entrenching blade: No

NBC Protection System: Available

Smoke Equipment: Available (up to 3 smoke dischargers on either side for a total of 6)

Survivability Equipment: Welded multi-layer armor

Notes:

The EE-9U Cascavel MX-8 Brazilian Armored Reconnaissance Vehicle is the modernized version of the original EE-9 Cascavel. EE-9U Cascavel MX-8: Version modernized by Equitron for the Brazilian Army and the other Cascavel users. It is equipped with a 300 hp (220 kW) MTU / Mercedes electronic engine with overcharging by turbocharger and intercooler. The boomerang suspension has received improvements in performance, the disc brake system is completely new and the engine exhaust drawing as well, expelling the air upwards and not backwards, thus reducing the thermal signature of the car. It also provides a highly praised air conditioning system for the crew. Integrates night vision for the driver and shooting systems. The tower received the electro-hydraulic system of rotation and tube elevation (back-up by manual system) similar to that used in the German KMW's Leopard tank, as well as receiving the laser, thermal and infrared rangefinder systems made by Orlaco, of Netherlands, selected by the commander and / or shooter through a joystick and associated keys, and increased ammunition capacity in the tower. On the outside, two anti-tank missile launchers (ATGM), which can be sized to receive both systems such as MSS-1.2 (integrating the laser rangefinder of the vehicle) and more sophisticated ones like the Russian Ataka and the Israeli Spike (with autonomous acquisition and targeting system)

BRDM-1 Russian 4x4 Amphibious Armored Scout Car

Tiers:

Variants:

- **BRDM-1 Model 1957:** Open-topped crew compartment
- **BRDM-1 Model 1958:** Closed-top crew compartment
- **BRDM-1 Model 1959:** 1 7.62-mm MG at front roof
- **BRDM-1 Model 1960:** 3 7.62-mm MGs at front & sides
- **BRDM-1U:** Command vehicle with 4 antennas
- **BRDM1-RKh:** NBC reconnaissance vehicle with lane-marking equipment
- **2P27 Tank Destroyer:** 2K16 launcher for 3 AT-1 Snapper ATGM missiles
- **2P32 Tank Destroyer:** 2K8 launcher for 4 AT-2 Swatter ATGM missiles
- **2P110 Tank Destroyer:** 9K14M launcher for 6 AT-3 Sagger ATGM missiles
- **SPW-4OP (East Germany):** Unarmed BRDM-1
- **SPW-40PA (East Germany):** Armed BRDM-1
- **9P111 (East Germany):** 9P110 Tank Destroyer
- **FUG (Hungary):** Hungarian designation for BRDM-1

System

Alternative Designations: BTR-4OP (4 X 4)

Description: Light fully amphibious 4 X 4 wheel drive armor scout car with 2 firing ports on each side of the hull & 2 large hatches in the forward part of the roof; 2 belly wheels can be lowered to improve cross-country performance & cross ditches with space for 3 other soldiers besides the crew; personnel must enter & exit the vehicle from the hatches on top of the vehicle.

In Service: Russia: 1957-1970s. Current Operators: Republic of the Congo Cuba: 50 Eritrea Guinea: 10 Kazakhstan Mozambique: 51; >28 operational in 2013. Sudan: 5 Transnistria Vietnam: 50 Zambia: 44

Weapon System

↳*DShKM*

Caliber/length: 12.7-mm

Type: Machine Gun

Ammo: 1250 Rounds (250 in box, 1000 Ready): Light Ball, Ball-T, API

Maximum Effective Range: 2000 m (Day); INA (Night); 1500 m (Anti-aircraft-estimate)

Armor penetration: 8 at 500 m (Est)

Muzzle velocity: m/s800 (Est)

↳*SGMB (Rear roof)*

Caliber/length: 7.62-mm

Type: Medium Machine Gun

Ammo: 1250 Rounds (250 in box, 1000 Ready): Light Ball, Ball-T, API

Maximum Effective Range: 1000 m (Day); INA (Night); 1000 m (Anti-Aircraft)

Armor penetration: 8 at 500 m

Muzzle velocity: m/s800

Protection

Armor: Welded steel 10 mm maximum

Applique Armor: Available

Active Protection System: No

Explosive Reactive Armor: No

NBC Equipment: Yes

Smoke Equipment: INA

Notes:

The BRDM four-wheel-drive amphibious scout car first appeared in the spring of 1959 and rapidly became the standard light wheeled reconnaissance vehicle in most of the Warsaw Pact armies. It was replaced by the newer BRDM-2 and the Hungarian FUG scout cars. Resembling a cross between the GAZ-46 (MAY) amphibious jeep and the BTR-40 armored personnel carrier, the BRDM combines amphibious features with full armored cover. Cross-country ability is heightened by the use of a centralized tire pressure regulation system and through the use of two sets of small belly wheels which can be lowered to add flotation and assist in crossing gaps. The BRDM-1 reconnaissance 4X4 vehicle was built in a number of variants, including the BRDM-1Rkh NBC Reconnaissance Armoured car and the BRDM-1U wheeled armored command vehicle. Four versions of the BRDM are in existence: the basic BRDM reconnaissance vehicle; the BRDM-rkh radiological-chemical reconnaissance vehicle with marking-flag dispensing devices; the BRDM-U command vehicle distinguishable only by extra radio antennas; and three different antitank guided missile carriers for AT-1 SNAPPER, AT-2 SWATTER, and AT-3 SAGGER antitank missiles. All versions of the BRDM are propelled in the water by a single water jet. Recognition of the BRDM-rkh is facilitated by the presence of two canvas box-shaped devices mounted outboard on the rear deck. These are the marking-flag dispensers.

BRM-3K Rys Russian Amphibious Combat Reconnaissance Vehicle (CRV)

Tiers:

Variants:

- **BRM-3K / Kredo-1:** BRM-3K CRV with 2-3m mast with a Kredo-1 radar system. Catherine 2nd generation thermal sight night range to 5-7km. 1D22 LTD ranges to 7km.

System

Alternative Designation: Rys, Lynx, Model 501
Description: BMP-1 modified for reconnaissance with space for 3 passengers
Manufacturer: Russian UralVagonZavod company
Crew: 6 (commander, gunner, driver, navigator/computer operator, wireless operator and reconnaissance group commander)

Dimesions

Length: m7.0
Width: m3.15
Height: m2.37

Name: PK Machine Gun, "Kalashnikov's Machine Gun")

Type: mm7.62

Manufacturer: Degtyaryov plant

In Service: 1961-Present

Length: mm1,203

Barrel Length: mm605

Weight, Gun and Integral Bipod: kg9

Weight, Tripod: kg7.7

Action: Gas-operated, open bolt

Rate of Fire: 650 rounds/min

Effective Firing Range: m100-1,500

Maximum Firing Range: m3,800

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea2,000

Anti-Tank Guided Missile (ATGM)

Note: Provision is made for an ATGW launcher and four missiles. The ATGW system can be dismounted and fired remotely from the vehicle

Fire Control

FCS Name: INA

Computerized FCS: Yes, The FCS controls the operations of target detection and identification, gun laying and firing of the 57mm automatic gun and 7.62mm machine-gun when firing from a halt, on the move and on the float in any combat environment

Main Gun Stabilization: Yes, The fire control system with two-plane stabilization

Laser Range Finder: Yes

Fire on the Move: Yes

Fire on the Water: Yes

Radar Type: Mast-mounted-1RL-133-1 radar

Maximum Radar Range, Vehicles: km8-10

Maximum Radar Range, Person: km4

Radar Traverse Left: deg120

Radar Traverse Right: deg120

Navigation System: Yes

Note #1: The FCS is equipped with a sight unit, comprising a combined sight with thermal-imaging and TV channels, a laser-finder and independent dual-axis field of view stabilization

Note #2: A portable Reconnaissance equipment can be fitted to the vehicle to enable a remote connection with the vehicle up to 6km away

Protection

Front Arc Armor: Front arc - protection against 30mm bullets (~Level 5 acc. to STANAG 4569)

Hull Armor: All-around fire - protection against 7.62mm bullets (~Level 3 acc. to STANAG 4569)

Turret Armor: The turret is in the centre of the vehicle with the commander seated on the right and the gunner on the left

Applique Armor: Available

Explosive Reactive Armor: No

Smoke Equipment: INA

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Notes:

The new version of russian BRM-3K combat reconnaissance vehicle is equipped with a new turret armed with a 57mm automatic cannon AU-220M. This new version is based on the chassis of BRM-3K Rys fitted with a new turret armed with a 57mm automatic cannon using gun mount module AU-220M “Baikal”. AU-220M Remote Controlled Weapon Station armed with BM-57 57mm automatic cannon, developed by CRI BUREVESTNIK and proposed by Uralvagonzavod. It has the capacity to be used against ground and aerial targets as helicopter and drones. The 57mm gun with the AP round has a penetration capability of 130mm of Steel at a range of 1.000m. A 7,62mm coaxial machine gun is mounted to right side of the main armament. A bank of four smoke grenade dischargers is mounted on each side of the turret. The BRM-3K Rys (lynx) was developed in the early 1990s. It was intended to supplement and replace the BRM-1K reconnaissance vehicle. It is based on the BMP-3 infantry fighting vehicle chassis. The hull and turret of the BRM-3K are of all-welded aluminium armour construction providing the crew with protection from small arms fire and shell splinters. The turret is in the centre of the vehicle with the commander seated on

the right and the gunner on the left. The vehicle can carry a total of 12 military personnel including driver, gunner and commander. The troop compartment is at the rear of the hull with entry via two doors in the hull rear opening left and right, with the left door having a firing port.

AMX-10RC French 6x6 Amphibious Armored Reconnaissance Vehicle (ARV)

Tiers:

Parent:

AMX-10P French Infantry Fighting Vehicle (IFV)

Variants:

- **AMX-10RC Renové:** The AMX-10RC Renové (AMX-10RCR) is the upgraded version of the AMX-10RC in service with France. Of the original 337 vehicles produced for the French Army, only 256 were upgraded and the upgraded vehicles were used operationally in Afghanistan, Côte d'Ivoire, and Mali.
- **AMX-10RC, T40M turret:**
- **AMX-10RC, DAS:** Development goal: Improve the protection of the AMX-10RC through active protection measures.

IFF Capabile: No

Fire on the Move: No

Hunter-Killer Engagement Capability: INA

Periscopes (Commander): ea6

Commander's Thermal Image: Panoramic M389 day telescope and the Thales Castor thermal cameras

Periscopes (Gunner): ea3

Gunner's Thermal Image: M504 telescope and the Thales Castor thermal cameras

Fast Information, Navigation, Decision, and Reporting System: Yes

Map Database: Yes

Range Finder: M550 laser rangefinder

Boresight Unit: M553 boresight unit

Protection

Hull Armor: welded aluminum armor, Vehicle withstands hits from medium-caliber weapons and artillery shell splinters

Turret Armor: turret provides the crew with protection from small arms fire and shell splinters

Applique Armor: Yes, add on armor kit

Active Protection System: No

NBC Protection: Yes

IR Signature: INA

Jamming System: INA

IR Countermeasure System (LIRE): INA

Smoke: Yes, four Gallix grenade launchers

Notes:

The AMX-10RC was developed during the late 1970s. It entered service with the French Army in 1979. The French Army obtained a total of 284 of these vehicles. It was one of the first, if not the first production fire support vehicle, armed with a powerful 105 mm gun. The AMX-10RC is no longer produced. Between 2005 and 2010 a total of 256 of these armored vehicles were upgraded to the AMX-10RCR standard in order to keep them in operational service. In the near future these are due to be replaced by a new Jaguar armored reconnaissance and combat vehicle. French Army has a requirement for up to 250 new machines, that will replace in French Army service the AMX-10RCs, as well as some other armored vehicles. Deliveries of the Jaguar are scheduled to begin in 2020. The AMX-10RC has been exported to Morocco and Qatar. This tank destroyer has seen action during numerous military conflicts.

Eagle V Swiss 4x4 Reconnaissance Vehicle

Tiers:

Variants:

- **Eagle I:** INA
- **Eagle II Reconnaissance Vehicle:** This variant is slightly heavier than the Eagle I with a better power-to-weight ratio. The chassis is based on the enhanced capability vehicle (ECV) Humvee. It is fitted with a metal and composite armor shell capable of withstanding NATO Standard Agreement (STANAG) Level II or III threats. A Mowag armored MBk2 observation cupola is fitted.
- **Eagle III Artillery Forward Observation Vehicle:** This vehicle is used for target surveillance, acquisition, observation, reconnaissance and patrol missions. It carries a crew of four (driver, surveyor, forward observer and signals operator). Panoramic bulletproof windows ring the vehicle, which is fitted with a raised roof. It is protected by high-hardness armored steel and composite armor. Additional mine protection is available as an option.
- **Eagle IV Military Tactical Vehicle:** The military tactical vehicle is suited as a platform for mission roles such as reconnaissance, surveillance, command or military police tasks. It is based on the advanced Mowag Duro 3 chassis technology with roll stabilizer and the De-Dion axle system. Along with the permanent all-wheel drive system, the roll stabilizer and axle system help give the vehicle high off- and on-road mobility.
- **Eagle V:** This is a further development of the Eagle IV with a larger payload capacity, internal volume and increased crew protection, while providing the same mobility. The vehicles can be optimized for different missions with the application of modular add-on kits. It is available in 4 x 4 and 6 x 6 variants. The former was made public in 2010 and the latter in 2012. The two variants are about 80 percent common.
- **Eagle BAT ambulance:** This ambulance accommodates an emergency doctor, rescue assistant and a driver/paramedic. The vehicle permits patient transport and emergency treatment under protection.
- **Eagle V 6 x 6:** The is a 6 x6 compact off-road vehicle powered by a six-cylinder turbo-diesel engine coupled to a five-speed automatic transmission and a two-stage transfer case.
- **VERO robotics kit:** Developed by Ruag Defence in Switzerland, this is a robotics kit that can be retrofitted onto the Eagle IV, among other vehicles.

System

Alternative Designation: Eagle V

Dimensions

Length: 5.40 m

Width: 2.20 m

Height: 2.32 m

Weight, Combat: 7,400 kg

Ground Clearance: 0.40 m

Wheelbase: 3.53 m

Internal Protected Volume: 6 cu m

Gross Weight: 10,000 kg

Payload: 3,000 kg

Automotive

Engine Name: 1 x Cummins ISB 6.7E3245

Engine Type: Turbocharged Diesel

Engine Power: 245 hp (183 kW)

Fuel Capacity: 180 liters

Transmission: Allison 2500 SP 5-speed automatic

Range: km700

Speed, Maximum Road: km/h110

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Fording Depth: 1.2 m

Gradient: 60 percent

Side Slope: 40 percent

Vertical Step: 0.4 m

Trench: 0.5 m

Turning Diameter: 15.0 m

Angle of Approach: 42 deg

Angle of Departure: 45 deg

Main Gun

Note: The vehicle can be armed with a remotely operated weapon station armed with weapons up to 12.7-mm machine guns.

Fire Control

Name: INA

Computerized FCS: No

Main Gun Stabilization: No

Protection

Hull Armor: Protection against 5.56-mm and 7.62-mm ball ammo from 33 yds (30 m) and up; and protection against 7.62-mm steel jacket ammo from 109 yds (100 m) and up

Turret Armor: Protection against 5.56-mm and 7.62-mm ball ammo from 33 yds (30 m) and up; and protection against 7.62-mm steel jacket ammo from 109 yds (100 m) and up

Applique Armor: Available, The Eagle IV is armored with composite plates mounted to the inner face of aluminum plates to provide a high-level of ballistic protection. A non-armored version is also available.

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: Yes, An NBC overpressure system is fitted.

Smoke Equipment: Yes, 6 x smoke-grenade launchers facing rear from turret

Notes:

Eagle V This is a further development of the Eagle IV with a larger payload capacity, internal volume and increased crew protection, while providing the same mobility. The vehicles can be optimized for different missions with the application of modular add-on kits. It is available in 4 x 4 and 6 x 6 variants. The former was made public in 2010 and the latter in 2012. The two variants are about 80 percent common. The 4 x 4 version accommodates a driver and three to five troops. A cargo version has a two-seat cab. Payload capacity is 7,275 lb (3,300 kg) to 7,940 lb (3,600 kg).

FV101 Scorpion British Combat Reconnaissance Vehicle

Tiers:

Variants:

- **Scorpion (FV101):** Original variant with 3-man crew
- **Spartan (FV103):** Artillery & engineer vehicle with 3-man crew & 4 dismountable troops; 80 k/hr; 483 km range; 1 7.62-mm MG
- **Striker (FV102):** AT vehicle with 5 Swingfire CLOS ATGMS (5 reloads) & 1 7.62-mm L37A1 MG
- **Scorpion 90:** 3-man crew; 73 k/hr; Cockerill Mk IIIK 90-mm gun & 1 7.62-mm MG
- **Samaritan (FV104):** Ambulance for 4 litter patients, 5 seated patients, or 2 litter/3 seated patients; 2-man crew; 483 km range
- **Sultan (FV105):** Command vehicle with at least 2 radios; total 5-6 personnel; 483 km range
- **Samson (FV106):** 483 km range, ARV with internal main winch, tow bars, & tow cables
- **Scimitar (FV107):** Scorpion with 1 30-mm Rarden L21 rifled gun (165 rounds) & 1 7.62-mm coax MG; 80 k/hr; 644 km range;
- **Scorpion 2:** Description of late production Scorpions with Perkins engine & other upgrades with 2-man turret with 30-mm, 76-mm, or 90-mm main armament options
- **Saber:** Reconditioned recon vehicle with 30-mm Rarden cannon & Hughes 7.62-mm coaxial chain gun
- **Scorpion (Jordan):** Upgraded original Scorpion with Perkins engine & other upgrades
- **Spartan with MILAN ATGM:** 2-round turret must be reloaded from outside the vehicle (11 reloads)
- **Scorpion 90 (Venzeula):** Scorpion 90 with Belgain CMI Defence 90-mm Mk II gun & Perkins engine
- **Sturgeon:** OPFOR vehicle used in Suffield, Canada based on the Spartan
- **Salamander:** OPFOR vehicle used in Suffield, Canada based on the 76-mm Scorpion
- **Scorpion (Malaysia):** Scorpion 90 with 76-mm AGL & Perkins engine
- **Omani Scorpion:** Increased protection package & some received a Cummins diesel engine
- **Scorpion vehicle-mounted automatic mortar FCS:** Fires Denel's 60-mm or BAE Systems' 81-mm L16 mortars
- **CVR(T) Life-Extension Program (LEP):** LEP with diesel engine, better optics & communication

System

Alternative Designations: FV101 (See variants)

Description: Initially a light tank, it took on another of roles; passengers depends on the variant; specifications are for the Scorpion

Type: Armored reconnaissance vehicle

Manufacturer: Alvis Vehicles, Coventry, England

Family: e Combat Vehicle Reconnaissance (Tracked), CVR(T), family

Crew: ea3

Note: For a long period of time it was the main vehicle in armored reconnaissance regiments. In 1994 this vehicle was withdrawn from active service with the Royal army, but it still operational with export customers.

Protection

Armor (turret front): mmAgainst 14.5-mm rounds (remainder of the vehicle against 7.62-mm rounds)
Applique armor: mmINA
Explosive reactive armor: mmINA
Active Protection System: INA
Self-entrenching blade: No
NBC Protection System: Yes
Smoke Equipment: 8 Smoke dischargers
Survivability Equipment: Enhanced mine protection available

Notes:

The FV101 Scorpion is a British armoured reconnaissance vehicle. It was the lead vehicle and the fire support type in the Combat Vehicle Reconnaissance (Tracked), CVR(T), family of seven armoured vehicles. Manufactured by Alvis, it was introduced into service with the British Army in 1973 and was withdrawn in 1994. More than 3,000 were produced and used as a reconnaissance vehicle or a light tank. It holds the Guinness world record for the fastest production tank; recorded doing 82.23 km/h (51.10 mph) at the QinetiQ vehicle test track, Chertsey, Surrey, on 26 January 2002. The Scorpion was armed with the low velocity 76 mm L23A1 gun, which could fire high-explosive, HESH, smoke and canister rounds. Stowage was provided for 40 or 42 rounds. A 7.62 mm coaxial machine gun (3,000 rounds carried) was also fitted, as were two multi-barreled smoke grenade dischargers, one on each side of the turret. The main armament has an elevation of 35 degrees and a depression of 10 degrees; the turret has a full 360-degree traverse. The original engine was the Jaguar J60 Mk 100b 4.2-litre petrol engine, which was replaced by a Cummins or Perkins diesel engine. The maximum speed was about 50 miles per hour (80 km/h) and it could accelerate from nought to 30 miles per hour (48 km/h) in 16 seconds. The maximum speed on water (with the flotation screen deployed) was 3.6 mph (5.8 km/h). The Irish engineering company IED replaced the existing Jaguar engine in Irish Army Scorpions in a successful re-powering process with a Steyr M16 TCA HD engine (6-cylinder, 145 kW), making the Scorpion more powerful and more reliable in critical environments. The FV101 was a very light armoured vehicle, weighing in at a mere 8 tonnes. This meant some compromises had to be made on protection. The vehicle had 12.7 mm of sloped aluminium armour, giving an average effective thickness of 25 mm. The FV101 had all-around protection from shell fragments and 7.62 mm

rounds, and the heavily sloped frontal arc was designed to be resistant to 14.5 mm rounds fired from a 200 meter range. The initial manufacture of the aluminium armour resulted, after time and effects of the environment, in failure. This phenomenon was known as Stress Corrosion Cracking (SCC) and it seriously affected all early builds.

Eagle II Swiss 4x4 Reconnaissance Vehicle

Tiers:

Variants:

- **Eagle I:** INA
- **Eagle II Reconnaissance Vehicle:** This variant is slightly heavier than the Eagle I with a better power-to-weight ratio. The chassis is based on the enhanced capability vehicle (ECV) Humvee. It is fitted with a metal and composite armor shell capable of withstanding NATO Standard Agreement (STANAG) Level II or III threats. A Mowag armored MBk2 observation cupola is fitted.
- **Eagle III Artillery Forward Observation Vehicle:** This vehicle is used for target surveillance, acquisition, observation, reconnaissance and patrol missions. It carries a crew of four (driver, surveyor, forward observer and signals operator). Panoramic bulletproof windows ring the vehicle, which is fitted with a raised roof. It is protected by high-hardness armored steel and composite armor. Additional mine protection is available as an option.
- **Eagle IV Military Tactical Vehicle:** The military tactical vehicle is suited as a platform for mission roles such as reconnaissance, surveillance, command or military police tasks. It is based on the advanced Mowag Duro 3 chassis technology with roll stabilizer and the De-Dion axle system. Along with the permanent all-wheel drive system, the roll stabilizer and axle system help give the vehicle high off- and on-road mobility.
- **Eagle V:** This is a further development of the Eagle IV with a larger payload capacity, internal volume and increased crew protection, while providing the same mobility. The vehicles can be optimized for different missions with the application of modular add-on kits. It is available in 4 x 4 and 6 x 6 variants. The former was made public in 2010 and the latter in 2012. The two variants are about 80 percent common.
- **Eagle BAT ambulance:** This ambulance accommodates an emergency doctor, rescue assistant and a driver/paramedic. The vehicle permits patient transport and emergency treatment under protection.
- **Eagle V 6 x 6:** The is a 6 x6 compact off-road vehicle powered by a six-cylinder turbo-diesel engine coupled to a five-speed automatic transmission and a two-stage transfer case.
- **VERO robotics kit:** Developed by Ruag Defence in Switzerland, this is a robotics kit that can be retrofitted onto the Eagle IV, among other vehicles.

FV107 Scimitar British Armored Reconnaissance Vehicle

Tiers:

1 2 **3** 4

Variants:

- **Scorpion (FV101):** Original variant with 3-man crew
- **Spartan (FV103):** Artillery & engineer vehicle with 3-man crew & 4 dismountable troops; 80 k/hr; 483 km range; 1 7.62-mm MG
- **Striker (FV102):** AT vehicle with 5 Swingfire CLOS ATGMS (5 reloads) & 1 7.62-mm L37A1 MG
- **Scorpion 90:** 3-man crew; 73 k/hr; Cockerill Mk IIIK 90-mm gun & 1 7.62-mm MG
- **Samaritan (FV104):** Ambulance for 4 litter patients, 5 seated patients, or 2 litter/3 seated patients; 2-man crew; 483 km range
- **Sultan (FV105):** Command vehicle with at least 2 radios; total 5-6 personnel; 483 km range
- **Samson (FV106):** 483 km range, ARV with internal main winch, tow bars, & tow cables
- **Scimitar (FV107):** Scorpion with 1 30-mm Rarden L21 rifled gun (165 rounds) & 1 7.62-mm coax MG; 80 k/hr; 644 km range;
- **Scorpion 2:** Description of late production Scorpions with Perkins engine & other upgrades with 2-man turret with 30-mm, 76-mm, or 90-mm main armament options
- **Saber:** Reconditioned recon vehicle with 30-mm Rarden cannon & Hughes 7.62-mm coaxial chain gun
- **Scorpion (Jordan):** Upgraded original Scorpion with Perkins engine & other upgrades
- **Spartan with MILAN ATGM:** 2-round turret must be reloaded from outside the vehicle (11 reloads)
- **Scorpion 90 (Venzeula):** Scorpion 90 with Belgain CMI Defence 90-mm Mk II gun & Perkins engine
- **Sturgeon:** OPFOR vehicle used in Suffield, Canada based on the Spartan
- **Salamander:** OPFOR vehicle used in Suffield, Canada based on the 76-mm Scorpion
- **Scorpion (Malaysia):** Scorpion 90 with 76-mm AGL & Perkins engine
- **Omani Scorpion:** Increased protection package & some received a Cummins diesel engine
- **Scorpion vehicle-mounted automatic mortar FCS:** Fires Denel's 60-mm or BAE Systems' 81-mm L16 mortars
- **CVR(T) Life-Extension Program (LEP):** LEP with diesel engine, better optics & communication

Protection

Armor (turret front): The Scimitar has a thin aluminum armor hull. It provides protection only against small arms fire and artillery shell splinters.

Applique armor: INA

Explosive reactive armor: INA

Active Protection System: INA

Self-entrenching blade: No

NBC Protection System: Yes

Smoke Equipment: 8 Smoke dischargers

Survivability Equipment: Enhanced mine protection available

Notes:

The FV107 Scimitar is an armoured reconnaissance vehcile (sometimes classed as a light tank) used by the British Army. It was manufactured by Alvis in Coventry. It is very similar to the FV101 Scorpion, but mounts a high velocity 30 mm L21 RARDEN cannon instead of a 76 mm gun. It was issued to Royal Armoured Corps armoured regiments in the reconnaissance role. Each regiment originally had a close reconnaissance squadron of five troops, each containing eight FV107 Scimitars. The FV107 Scimitar is one of the CVR(T) series of vehicles. It entered service in 1971. Initially, the engine was the Jaguar J60 4.2-litre 6-cylinder petrol engine, the same as used by several Jaguar cars. This has now been replaced by a Cummins BTA 5.9 diesel engine in British Army Scimitars, under the CVR(T) Life Extension Program (LEP). The Scimitar lifespan has once again (as of mid 2009) been extended to accommodate the shift in timeframe of the Future Rapid Effect System program, which would have seen new armoured vehicles introduced to replace the ageing CVR(T) range of vehicles. With new modifications, air

filtration units and gearbox upgrades (late 2009), as well as hull alterations (late 2009) and the creation of a CVR(T) Spartan & CVR(T) Scimitar hybrid the CVR(T) range (early 2010) is expected to continue well beyond 2017.

Notes:

The BRM-1 (BMP-R or BMP M1976) is an armored reconnaissance vehicle that is derived from the BMP Fighting Vehicle (BMP M1976/1) without smoke grenade launchers, added comms (R-130, R-014D telegraph), and Tall Mike radar but with four more passengers. The BMP Ml976 reconnaissance vehicle has the same enlarged two-man turret as the M1975 but mounts the standard 73-mm main gun (without the SAGGER launcher). The BMP M 1976(2) model has a small parabolic antenna on the roof. One of these vehicles is assigned, along with three BMP-1s, to the reconnaissance company of a motorized rifle or tank regiment, and three of them are assigned to the reconnaissance battalion of a motorized rifle or tank division.

PRP-4A Argus Russian Artillery Reconnaissance Vehicle

Tiers:

Variants:

- **PRP-4MU:** The PRP-4MU armoured reconnaissance vehicle is intended for reconnaissance of stationary and moving ground targets day and night, under any weather conditions, at ambient temperature ranging from - 40o C up to + 40o C, up to 3000 m above sea level.

System

Alternative Designation: PRP-4A Argus
Type: Artillery Reconnaissance Vehicle
Manufacturer: INA
Family: PRP Series
Crew: ea4
Passenger Capacity: INA
Chassis: The PRP-4A is based on the BMP-1 infantry fighting vehicle chassis.
Note: This reconnaissance vehicle has a number of sensors and can operate in day or night conditions.

Dimensions

Length: 6.74 m
Width: 2.94 m
Height: 2.15 m
Weight, Combat: 13.8 t
Ground Pressure: INA

Automotive

Engine Name: UTD-20S1
Engine Type: Diesel
Engine Power: hp300
Range: km550

Speed, Maximum Road: km/h65

Speed, Average Cross: INA

Speed Maximum Swim: km/h7

Gradient: 60%

Side Slope: 30%

Vertical Step: 0.7 m

Trench: 2.2 m

Fording Depth: Amphibious

Main Gun

Note: The PRP-4A is armed only with a 7.62 mm machine gun for self-defense.

Radar

Name: IL120-1 Battlefield Surveillance Radar

Type: The Argus is fitted with a mast-mounted battlefield surveillance radar.

Targets: This radar detects mobile and stationary targets.

Detection Range, Person: 7km

Detection Range, Vehicles: 12-20 km. Once the hostile tank is stationary and its engine is turned off, detection range is reduced to 2 km.

Detection Range, Buildings: 25 km

Fire Control

Name: INA

Computerized FCS: No

Laser Rangefinder: Yes, 1D14-1 periscopic laser rangefinder

Thermal Camera: Yes

Optical Electronic Surveillance System Range: 20-40 meters

Dismounted Observation Post Maximum Distance from the Vehicle: 6 km

Protection

Hull Armor: The vehicle's armor is welded rolled steel varying in thickness between 6 millimetres (0.24 in) thick on the top of the hull. Armor of this reconnaissance vehicle provides all-round protection against 12.7 mm rounds. Front arc partially withstands 20 mm rounds.

Turret Armor: 33mm

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: Yes

Notes:

The PRP-4A Argus mobile reconnaissance post is the latest version of the PRP-4 Nard, which was adopted back in the early 1980s. The PRP-4A Argus has enhanced capabilities over its predecessor. Its main role is to carry out reconnaissance for artillery units, determine target coordinates and act as a general forward observation vehicle. It entered service with the Russian Army in 2009. It is being produced in small numbers for the Russian Army. This reconnaissance vehicle is also being offered for export. PRP-4A Argus is a new armoured vehicle designed to provide reconnaissance and observation for artillery units. The vehicle is produced by Rubtsovsk Machine Building Plant, a part of Russian company Uralvagonzavod. Rubtsovsk Affiliate presented the upgraded PRP-4A Argus reconnaissance vehicle at the Russia Arms Expo 2013. The PRP-4A entered service with the artillery brigade of the Central Military District in February 2015. Rubtsovsk delivered eight PRP-4A Argus vehicles under a three-year contract by late-2016.

ASLAV-S Australian 8x8 Amphibious Armored Surveillance Vehicle

Tiers:

Variants:

- **ASLAV Type I:** The ASLAV Type I is the most numerous type; it is a turreted vehicle derived from the LAV-25 and comes in only one variant.[
- **ASLAV-25 (Reconnaissance):** ASLAV-25 (Reconnaissance) – is an Armoured Car with a crew of three (commander, gunner & driver). The two man turret has day, thermal and infrared imaging weapon systems, a stabilised M242 25mm dual-feed chain gun and two FN MAG 58 7.62 mm machine guns. The ASLAV-25 conducts troop-level tactical reconnaissance and can carry up to six dismounts in the rear.
- **ASLAV Type II:** The ASLAV Type II has no turret and greater internal capacity and is derived from the Canadian Bison Armoured Personnel Carrier. The ASLAV Type II has a crew of two (commander and driver) and is armed with a pintle mounted M2 12.7 mm machine gun. In a number of vehicles, the standard machine gun pintle mount was replaced by a Kongsberg Protector remote weapon station (RWS), which can accommodate either a 12.7 mm machine gun or a Mk 19 40mm automatic grenade launcher. Using a common hull design installed with interchangeable Mission Role Installation Kits (MRIKs), it can be converted into any one of four variants.
- **ASLAV-PC (Personnel Carrier):** is an Armoured Personnel Carrier capable of carrying seven fully equipped troops in support of troop level tactical reconnaissance
- **ASLAV-C (Command):** is an Armoured Command Vehicle, it is equipped with an enhanced radio installation and radio masts, map boards, stowage compartments, specialised seating and an stowable annex. In addition to the crew, the ASLAV-C can accommodate three staff officers and provides command and control at the Squadron and Regimental Headquarter level.
- **ASLAV-S (Surveillance):** is a specialised surveillance vehicle equipped with a hydraulically raised mast mounted thermal imager, laser range finder, day television camera and battlefield surveillance radar RASIT or AMSTAR. The ASLAV-S supports tactical reconnaissance with ground surveillance and observation and can carry four crew and two occasional troops.
- **ASLAV-A (Ambulance):** is an Armoured Ambulance and is fitted with specialist medical equipment and in addition to the crew can accommodate a medic and three lying patients or six sitting patients.
- **ASLAV Type III:** The ASLAV Type III has no turret and is used by members of the Royal Australian Electrical and Mechanical Engineers for repair and recovery. The ASLAV Type III has a crew of two (commander and driver) and usually carries a third mechanic, it is armed with a pintle mounted FN MAG 58 7.62 mm machine gun, although some have been fitted with the Kongsberg Protector RWS. The ASLAV Type III comes in two variants utilising two specialist MRIKs.
- **ASLAV-F (Fitter):** is a maintenance support vehicle that provides a protected mobile workshop for field repair personnel, including vehicle parts and tools, and is fitted with a HIAB 650 crane.
- **ASLAV-R (Recovery):** is an Armoured Recovery Vehicle that is equipped with a heavy winch to recover disabled vehicles to a more accessible location or tow them to a repair facility

System

Alternative Designation: ASLAV-S
Type: Armored Surveillance Vehicle
Family: ASLAV
Crew: ea4

Passenger Capacity: ea2

Thermal Image Viewer: equipped with a hydraulically raised mast mounted thermal imager

Laser Range Finder: Yes

Day Vision Television Camera: Yes

Night Vision Television Camera: Yes

Surveillance Radar: Battlefield Surveillance Radar

Radar Frequency: I band

Radar Range: 40 km

Man-portable Surveillance and Target Acquisition Radar (MSTAR): Yes, the Man-portable Surveillance and Target Acquisition Radar (MSTAR) is a lightweight all-weather battlefield Doppler radar operating in the J band. It is usually used by artillery observers to acquire and engage targets in bad visibility or at night. It is capable of detecting, recognizing and tracking helicopters, slow moving fixed-wing aircraft, tracked and wheeled vehicles and troops, as well as observing and adjusting the fall of shot. The radar display is an electro-luminescent screen that can be overlaid with a map grid. It also shows the areas of ground visible to the radar and those that are masked by terrain. Target location can be presented as either map coordinates or bearing and distance (polar coordinates) from the radar. The complete radar weighs 30 kilograms (66 lb) It can detect targets out to 30 kilometres (19 mi), with a maximum range of 42 kilometres (26 mi). The radar head (antenna and electronics) are connected by remoting cable to the display. The rotating head can be mounted on either a tripod on the ground or an elevated mast, the latter fitted to the Warrior Artillery Observation Post vehicle (FV514), or the Coyote Reconnaissance Vehicle. When fitted to the mast power is taken from the vehicle supply and the display is inside the vehicle. For dismounted use the radar uses standard military rechargeable dry batteries and is man-carried in three loads. The radar can be set up in under three minutes.

Dimensions

Length: m6.53.

Width: m2.62

Height: m2.69

Weight, Combat: 13.2 t

Automotive

Engine Name: 6V53T

Engine Type: Detriot Diesel

Engine Power: hp275

Range: km660

Speed, Maximum Road: km/h100

Speed, Average Cross: INA

Speed Maximum Swim: km/h10

Gradient: %60

Side Slope: %30

Vertical Step: 0.5

Trench: m2

Fording Depth: Amphibious

Note: The ASLAV-S is fully amphibious with 3 minute preparation. It is propelled on water by two water jets mounted at the rear of the hull.

Main Gun

Note: The turret can be traversed and the main gun fired while vehicle is afloat.

↳*System*

Name: M242 25mm Bushranger Chain Gun

Type: 25mm Chain Gun

Caliber: 25mm

Manufacturer: Hughes Helicopters (1981–1985) McDonnell Douglas Helicopters (1985–2002) Alliant Techsystems (2002–2015) Orbital ATK (2015–2018) Northrop Grumman Innovation Systems (2018–present)

In Service: 1981-Present

Proliferation: >11,000

Length: 2,672mm

Barrel Length: 2,175mm

Width: 318mm

Height: 373mm

Weight: 119 kg

Barrels: Single barrel (progressive RH parabolic twist)

Action: Open bolt

Rate of Fire: • Cyclic: 200rpm with 1hp or 500rpm with 8hp

Muzzle Velocity: 1,100 metres per second (3,600 ft/s)

Maximum Firing Range: 6,800 m

Effective Firing Range: 3,000 m

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm25

Shell: 25×137 mm

Basic Load: 720

Notes: A wide range of ammunition has been developed for this weapon, providing it with the capability to defeat the majority of armored vehicles it is likely to encounter, up to and including some light tanks. The ammunition used in the M242 may also be used in a variety of weapons such as the GAU-12 Equalizer, the French Giat M811, or the Swiss Oerlikon KBA weapon system. It has the capability to fire U.S. manufactured ammunition as well as the NATO equivalents thereof. Primarily though, it fires six types of rounds: the M791, M792, M793, M910, MK210, and M919.

Auxiliary Weapon System

↳*System*

Name: Mk 48 Machine Gun

Alternative Designation: Mark 48, or Mk 48, or Maximi

Type: Light Machine Gun

Caliber: 7.62mm

Proliferation: Widely Proliferated

Manufacturer: FN Herstal

In Service: 2003-Present

Length: 1,000 mm

Barrel Length: 502 mm

Weight: 8.2 kg (22.006 lb) empty 11.2 kg (24.7 lb) w/ 100 rounds

Action: Gas-operated, open bolt

Rate of Fire: 710 (± 50) rounds/min

Maximum FIring Range: 3,600 m

Effective Firing Range: 800 m

Feed System: Disintegrating belt (M13 link)

Sights: INA

↳***Ammunition***

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO (STANAG 2310)

Basic Load: 1,200

Fire Control

Name: INA

Computerized FCS: No

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: INA

Automatic Fire Suppression: Yes

Protection

Hull Armor: Armor of the ASLAV-S provides protection against small-arms fire, mine-blasts and artillery fragments.

Turret Armor: INA. The ASLAV-S is fitted with a two-man turret, similar to that of the LAV-25.

Applique Armor: Protection of this reconnaissance vehicle can be increased by fitting add-on ceramic armor tiles. Vehicle can be also fitted with slat armor, which improves protection against RPG rounds.

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

ASLAV-S (Surveillance) – is a specialized surveillance vehicle equipped with a hydraulically raised mast mounted thermal imager, laser range finder, day television camera and battlefield surveillance radar RASIT or AMSTAR. The ASLAV-S supports tactical reconnaissance with ground surveillance and observation and can carry four crew and two occasional troops. The ASLAV-S uses the same hull as the ASLAV-PC and is converted with a mission kit. This includes the RASIT ground surveillance radar, thermal imager, laser rangefinder, daytime TV camera and other observation equipment. It has a crew of four. The Australian Light Armoured Vehicle (ASLAV) is an eight-wheeled amphibious armored reconnaissance vehicle used by the Australian Army. It was built by General Dynamics Land Systems Canada, and developed from the Canadian Army's LAV-25 and Bison armored fighting vehicles. In 2014, the Australian army took delivery of 14 upgraded ASLAV-S vehicles. These were equipped with a mast-mounted Multi-Spectral Surveillance Suite (MSSS) featuring stabilized infrared and high-resolution color day still and TV cameras; laser rangefinder; and the Australian version of the DRS Technology Man-portable Surveillance and Target Acquisition Radar (MSTAR). The system is mounted on a 30-ft (9-m) hydraulic mast installed through the rear roof of the vehicle. This enables long-range target detection and automatic alignment of the sensor package to the detected target location. The MSSS also provides secure voice and digital command, control and communications and precise, jam-resistant navigation via a GPS /inertial navigation system. All MSSS functions can be performed under armor. The ASLAV is a highly mobile, eight-wheel drive, amphibious armoured fighting vehicle that can be deployed by land, sea or air (in Royal Australian Air Force C-130s or C-17s). It is fitted with GPS, an intra-vehicular navigation system and a radio harness capable of supporting HF, VHF, UHF and digital radios. The ASLAV is capable of speeds of 100 km/h (62 mph) and has a maximum range in excess of 660 km (410 mi). The eight-wheel drive provides excellent cross-country mobility and redundancy, the vehicle is capable of operation with only four working wheels, and can continue to operate with eight punctured tires through the use of solid-core run-flat tires. It is fully amphibious and is driven in the water by permanent shrouded propellers located at the rear of the hull at speeds of up to 10 km/h (6.2 mph)

BRM-3K Rys Russian Amphibious Armored Reconnaissance Vehicle

Tiers:

Variants:

- **BMP-3M:** KBP and Kurganmashzavod have upgraded the vehicle with a new engines and turret with a new ATGM system 9K116-3 Basnya. The upgraded vehicle is called the BMP-3M and the new Bakhcha-U turret which includes a new automatic fire control system with ballistic computer, new SOZH gunner's sight with laser rangefinder and an ATGM guidance channel, thermal imager, TKN-AI commander's vision device with laser illuminator and new ammunition loading system for ATGM.
- **BMP-3M Ataka:** BMP-3M version with a two men turret armed with 30 mm 2A72 autocannon, and 9M120-1 Ataka ATGM
- **BMMP:** Version for naval infantry, fitted with the turret of the BMP-2.
- **BMP-3K:** Tactical command variant, includes additional radio R-173, an intercom for seven users, an AB-R28 independent portable power unit, a navigation device TNA-4-6 and the "Ainet" air burst round detonation system. The BMP-3K lacks the bow machine guns and has its whip antennas mounted on the rear hull. Crew: 3+3
- **BMP-3F:** Armed with the standard 2K23 turret. Specially designed for operations at sea, with improved seaworthiness and buoyancy, capability to move afloat at sea state 3 and fire with the required accuracy at sea state 2. Compared to the basic model, the vehicle design features changes increasing floatability and vehicle stability: the self-entrenching equipment is omitted, a lightweight anti-surge vane and an air intake tube are introduced; the BMP-3F turret is also protected by anti-surge vanes. Water jet propellers develop a speed of 10 km/h when afloat. The BMP-3F design allows the vehicle to come ashore under rough sea conditions and to tow the same-type vehicle. A new main sight, the SOZH, which has an integrated laser range finder and an ATGM guidance channel, is installed. This version can endure continuous amphibious operation for seven hours with the running engine
- **BT-3F:** Amphibious version based on BMP-3F with the original turret replaced by a smaller remote weapon station with either 7.62, 12.7 or 14.5mm machine gun. It can accommodate a crew commander, driver, gunner, and 14 troops, and can use optional ERA armor.
- **BRM-3K "Rys" (Ob.501):** Surveillance and reconnaissance variant with 1PN71 thermal sight (3.7x/11x, 3 km range), 1PN61 active-pulse night vision device (3 km range), 1RL-133-1 ("TALL MIKE") I-band surveillance radar (3 km man, 12 km vehicle), 1V520 computer and a TNA-4-6 navigation system. The armament consists of the stabilized 30 mm autocannon 2A72 (600 rounds) and a coaxial 7.62 mm machine gun (2,000 rounds) or AU-220M Baikal remote weapon station with 57 mm BM-57 autocannon and 7.62mm PKMT machine gun.
- **BMP-3 Dragoon:** New IFV version with an unmanned turret which can be armed with a variety of combat modules, including standard BMP-3's Bakhcha-U turret with a 2A70 100 mm cannon, a 2A72 30 mm autocannon and a PKTM 7.62 mm machine gun, the AU-220M Baikal remote weapon station module with a 57 mm BM-57 gun and a module with a 125 mm 2A82-1M tank gun, the new 816 h.p.
- **BREM-L "Beglianka" (Ob.691):** Armoured recovery vehicle with five-tonne crane and 20/40 metric tonne capacity winch.

- **BMP-3 "Khrizantema-S":** Self-propelled anti-tank version with 9M123 Khrizantema (AT-15) ATGM system with radar and laser guidance. The 9P157-2 carries two 9M123 missiles on launch rails, which are extended from a stowed position; the radar is also stowed during transit. The missiles are re-loaded automatically from an internal magazine with 15 rounds (missiles are stored and transported in sealed canisters) and can also accept munitions manually loaded from outside the vehicle.
- **9P163M-1 "Kornet-T":** Anti-tank version with Kornet (AT-14) missile system. Some sources call it the 9P162. The Kornet is similar in function to the Khrizantema missile system. The 9P163M-1 carries two 9M133 missiles on launch rails, which are extended from a stowed position during transit. Missiles are re-loaded automatically by the tank destroyer from an internal magazine with 16 rounds (missiles are stored and transported in sealed canisters).
- **2S18 "Pat-S" (Ob.697):** Self-propelled version of the 152 mm howitzer 2A61 "Pat-B". This was only a prototype, further development led to the 2S31 Vena.
- **DZM "Vostorg-2":** Combat engineer vehicle with a dozer blade and excavating bucket. Prototype.
- **UR-07:** Mine clearing system. The UR-07 might replace the UR-77 "Meteorit". It has the same chassis as the BMP-3 but a bigger steel hull with two launch ramps in the rear. The ramps are used to fire rockets towing hose-type mine-clearing line charges to clear mine fields.
- **UNSh (Ob.699):** Basic chassis for specialised variants.
- **Hermes or TKB-841:** Air-defence vehicle with high-velocity missiles and radar system. Prototype.[68] 2S31 Vena – Self-propelled mortar carrier equipped with a 120 mm mortar based on BMP-3 chassis. It entered production in 1996 and service in 2010.
- **2S38 ZAK-57 Derivatsiya-PVO:** Self-propelled air defense vehicle based on BMP-3 chassis fitted with a 57 mm autocannon and passive reconnaissance and target tracking equipment.[72] It is designed to shoot down unmanned aerial vehicles (UAVs), cruise missiles, air-to-surface missiles, aircraft, helicopters, and MLRS rockets.
- **UDAR UGV:** Unmanned ground vehicle based on the tracked chassis of the BMP-3 with the center hull raised to fit the DUBM-30 Epoch armed with 2A42 autocannon, 7.62mm PKMT machine gun, and Kornet-M ATGM.
- **Vikhr UGV:** Unmanned ground vehicle based on BMD-3 equipped with a smaller turret armed with 2A72 autocannon, 7.62mm coaxial machine gun and six anti-tank guided missiles 9M133M Kornet-M, three on each side of the turret.
- **Prokhod-1:** Unmanned mine-clearing vehicle based on the BMP-3 chassis. It is equipped with the anti-mine TMT-C trawl, and a remote weapon station turret with a 12.7mm machine gun.

System

Alternative Designation: BRM-3K Rys

Manufacturer: Kurganmashzavod

Type: Armored Reconnaissance Vehicle

Family: BMP-3

Crew: ea3

Passenger Capacity: ea7

Fighting Module: 2K23 Fighting Module

Navigation: The BRM-3K is also fitted with the navigation device to enable it to determine its own position of the battlefield. Information would normally be collected and then transmitted to the next chain of command. Communication aids ensure data and radio links at a maximum range of 350 km.

Radar System

Radar Name: Mast-mounted-1RL-133-1 radar

Radar Effective Range, Vehicles: 8-10 km

Radar Effective Range, People: up to 4 km away

Note: When active, this radar is elevated to a height of 1 m and can be traversed 120° either side regardless of the turret position. It is retracted into the vehicle when not in use. A portable reconnaissance equipment can be fitted to enable a remote connection with the vehicle up to 6 km away.

Main Weapon System

↳*System*

Name: 2A72, 30mm Automatic Cannon

Type: mm30

Max Rate of Fire: rds/min330

Maximum Effective Firing Range (Air Targets): km4

Maximum Effective Firing Range (Ground Targets): km2

Maximum Effective Firing Range (Light Armor Vehicles): km1.5

Loader Type: Dual-belt feed

Maximum Elevation: deg-5

Minimum Elevation: deg+60

Fire on the Move: Yes

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

Firing Modes: single shot, 10-round burst, or automatic mode.

↳*Ammunition (Option 1)*

Name: 3UBR8

Type: 195 AP rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,120

Basic Load: INA

Penetrator Type: tungsten alloy sub-calibre penetrator

Penetration: can defeat 28 mm of RHA set at a 60° angle from a range of 1,000 m

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

↳*Ammunition (Option 2)*

Name: 3UOF8

Type: 305 HE-type rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s960

Basic Load: eaINA

Lethal Radius: m25.95

Charge Type: A-IX-2

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Caliber: mm7.62

Cartridge: mm7.62×54

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

Anti-Tank Guided Missile (ATGM)

↳*System*

Name: 9M117 Bastion (AT-10)

Type: Anti-Tank Guided Missile

Caliber: mm100

In Service: 1983-present

Charge Type: Reduced Explosive Charge

Muzzle Velocity: m/s400-500

Length: mm1,048

Weight: kg27

Basic Load: ea8

Rocket Motor: Ignites 1.6 seconds after firing the missile and it burns for 6 seconds

Guidance System: beam-riding laser guidance.

Steering System: laser sensor to detect the modulation of the light.

Flight Time (4,000 meters): seconds12

Self Destruct Time: seconds26-41

Telescopic Sight: 1K13 day/night telescopic sight (with integral 1K13BZ laser emitter)

Stabilising Fins: ea4

Searchlight: L4 IR searchlight

Effective Firing Range: m100-4,000

Warhead Type: HEAT

Penetration: mm650-750

Note: The 9M117 Bastion (AT-10) is prone to radio or optical jamming

Fire Control

Name: 1K13-2

Computerized FCS: Yes

Thermal Sight Vehicle Commander: optical sight 1PZ-10, a day/night vision device TKN-3MB

Thermal Sight Gunner: 1K13-2 II night channel, 5.5x

Gunner Day Sights: 1K13-2, 8x ; 1P3-10 antiaircraft, 2.6x; PPD-1 stand-by

Main Gun Stabilization: Yes, 2E52 electro-mechanical stabiliser

Stabilizer Modes: The stabiliser has three modes: automatic; semi-automatic; and guidance.

Ballistic Computer: Yes, V539 ballistic computer

Rangfinder: Laser

Infrared Searchlight: Yes, IR searchlight OU-3GA2

Cross-Wind Sensor: Yes

Minutes Of Angle (MOAs): 1.69

Protection

Armor Type: Welded of aluminum alloy armor

Hull Armor (Front): protection against 30 mm armor-piercing rounds.

Hull Armor (Sides and Back): protection is against 14.5 mm armor-piercing rounds.

Turret Armor: mm30-35

Applique Armor: On Turret

Explosive Reactive Armor: Available

Active Protection System: Yes, Arena active protection system

Mine Clearing: Yes, KMT-8 mine plow available

Self-Entrenching Blade: Yes

NBC Protection: Yes, Collective

Smoke Equipment: 6 VEESS

Countermeasures System: Shtora countermeasures systems

Automatic Fire Suppression System: Yes

Notes:

The Russian UralVagonZavod company has published a test firing video of a BMP-3 IFV equipped with an AU-220M Baikal turret that hosts a 57mm autocannon capable of engaging targets located at up to 14.5 kilometer distance. The remote-controlled turret is made by a company called Burevestnik which is a subsidiary of UralVagonZavod. By 2018 the Russian army was experimenting with different calibers for the module's cannon. In the past, all armored IFVs and APCs were equipped with either 30mm or 100mm guns – the former doesn't possess enough firepower to penetrate some modern armor, while the latter is generally too excessive and impairs the rate of fire and accuracy of the cannon. The new version of the Russian BRM-3K combat reconnaissance vehicle is equipped with a new turret armed with a 57mm automatic cannon AU-220M. This new version is based on the chassis of BRM-3K Rys fitted with a new turret armed with a 57mm automatic cannon using gun mount module AU-220M "Baikal". AU-220M Remote Controlled Weapon Station armed with BM-57 57mm automatic cannon, developed by CRI BUREVESTNIK and proposed by Uralvagonzavod. It has the capacity to be used against ground and aerial targets as helicopter and drones. The 57mm gun with the AP round has a penetration capability of 130mm of Steel at a range of 1.000m. A 7,62mm coaxial machine gun is mounted to right side of the main armament. A bank of four smoke grenade dischargers is mounted on each side of the turret. The BRM-3K Rys (lynx) was developed in the early 1990s. It was intended to supplement and replace the BRM-1K reconnaissance vehicle. It is based on the BMP-3 infantry fighting vehicle chassis. The hull and turret of the BRM-3K are of all-welded aluminium armour construction providing the crew with protection from small arms fire and shell splinters. The turret is in the centre of the vehicle with the commander seated on the right and the gunner on the left. The vehicle can carry a total of 12 military personnel including driver, gunner and commander. The troop compartment is at the rear of the hull with entry via two doors in the hull rear opening left and right, with the left door having a firing port.v The conventional BMP-3 main armament consists of a 100mm 2A70 cannon with a coaxial 30mm 2A72 autocannon. In this case, the original turret was removed and replaced by the AU-220M Baikal turret which hosts the 57mm autocannon chambered in 57x348mm SR and a PKTM machine gun chambered in 7.62x54mmR. The turret also contains 80 rounds of 57mm ammunition and 500 7.62x54mmR cartridges. With the AU-220M combat module the vehicle will be able to fire 80 rounds of artillery shells a minute, with a striking range of up to 12 km. AU-220M is designed for installation on future armored combat vehicles and modernization of currently deployed vehicles in order to increase fire power of motorized rifled and infantry units. AU-220M main armament can also be used to accomplish air defense missions thus expanding combat flexibility of armored combat vehicles. It is designed as a remote-controlled unmanned artillery module. The FCS controls the operations of target detection and identification, gun laying and firing of the 57mm automatic gun and 7.62mm machine-gun when firing from a halt, on the move and on the float in any combat enviroment. The FCS is equipped with a sight unit, comprising a combined sight with thermal-imaging and TV channels, a laser-finder and independent dual-axis field of view stabilization. The vehicle will be able to fire 10 projectiles fitted with remote fuzes at a target and, on command, detonate all the charges simultaneously. It will also be able to fire guided munitions – their flight trajectory to the target can be controlled. What's more, the upgraded BMP-3 combat module will be automatic and unmanned. During combat the crew will be inside the most heavily armored part of the vehicle, firing at targets using onboard computers. The operators will select different types of ammunition via a control panel in response to what's happening on the battlefield. The AU-220M's 57 mm projectile is unlikely to cut through the front armor of an Abrams or a Leopard MBT, but even against the heaviest of armor, engineers bet on the hail of high-explosive projectiles knocking out optics, destroying aerials, smashing caterpillar tracks and jamming turrets. Potentially, every Soviet-era BMP-3 model could be upgraded, amounting to thousands of vehicles both in Russia and those used by militaries abroad. As a result, the new BMP-3 will be able to fire from stationary positions, on the move, and even while floating on water. Weather conditions and time of day will make absolutely no difference to the vehicle – rain, snow, slush, or scorching heat are no problem.

ASLAV-25 Australian 8x8 Amphibious Armored Reconnaissance Vehicle

Tiers:

Variants:

- **ASLAV Type I:** The ASLAV Type I is the most numerous type; it is a turreted vehicle derived from the LAV-25 and comes in only one variant.[
- **ASLAV-25 (Reconnaissance):** ASLAV-25 (Reconnaissance) – is an Armoured Car with a crew of three (commander, gunner & driver). The two man turret has day, thermal and infrared imaging weapon systems, a stabilised M242 25mm dual-feed chain gun and two FN MAG 58 7.62 mm machine guns. The ASLAV-25 conducts troop-level tactical reconnaissance and can carry up to six dismounts in the rear.
- **ASLAV Type II:** The ASLAV Type II has no turret and greater internal capacity and is derived from the Canadian Bison Armoured Personnel Carrier. The ASLAV Type II has a crew of two (commander and driver) and is armed with a pintle mounted M2 12.7 mm machine gun. In a number of vehicles, the standard machine gun pintle mount was replaced by a Kongsberg Protector remote weapon station (RWS), which can accommodate either a 12.7 mm machine gun or a Mk 19 40mm automatic grenade launcher. Using a common hull design installed with interchangeable Mission Role Installation Kits (MRIKs), it can be converted into any one of four variants.
- **ASLAV-PC (Personnel Carrier):** is an Armoured Personnel Carrier capable of carrying seven fully equipped troops in support of troop level tactical reconnaissance
- **ASLAV-C (Command):** is an Armoured Command Vehicle, it is equipped with an enhanced radio installation and radio masts, map boards, stowage compartments, specialised seating and an stowable annex. In addition to the crew, the ASLAV-C can accommodate three staff officers and provides command and control at the Squadron and Regimental Headquarter level.
- **ASLAV-S (Surveillance):** is a specialised surveillance vehicle equipped with a hydraulically raised mast mounted thermal imager, laser range finder, day television camera and battlefield surveillance radar RASIT or AMSTAR. The ASLAV-S supports tactical reconnaissance with ground surveillance and observation and can carry four crew and two occasional troops.
- **ASLAV-A (Ambulance):** is an Armoured Ambulance and is fitted with specialist medical equipment and in addition to the crew can accommodate a medic and three lying patients or six sitting patients.
- **ASLAV Type III:** The ASLAV Type III has no turret and is used by members of the Royal Australian Electrical and Mechanical Engineers for repair and recovery. The ASLAV Type III has a crew of two (commander and driver) and usually carries a third mechanic, it is armed with a pintle mounted FN MAG 58 7.62 mm machine gun, although some have been fitted with the Kongsberg Protector RWS. The ASLAV Type III comes in two variants utilising two specialist MRIKs.
- **ASLAV-F (Fitter):** is a maintenance support vehicle that provides a protected mobile workshop for field repair personnel, including vehicle parts and tools, and is fitted with a HIAB 650 crane.
- **ASLAV-R (Recovery):** is an Armoured Recovery Vehicle that is equipped with a heavy winch to recover disabled vehicles to a more accessible location or tow them to a repair facility

System

Alternative Designation: ASLAV-25
Type: Armored Reconnaissance Vehicle
Family: ASLAV
In Service: In the Australian Army, the ASLAV equips the Cavalry Squadrons of the Royal Australian Armoured Corps. A Cavalry Squadron comprises a headquarters element, an echelon and three sabre troops of six ASLAVs, each troop is further

broken down into two patrols each comprising two ASLAV-25s and one ASLAV-PC. The ASLAV equips two squadrons from each of the Australian Army's Armoured Cavalry Regiments, the 1st Armoured Regiment in Adelaide, the 2nd Cavalry Regiment in Townsville, and the 2nd/14th Light Horse Regiment (Queensland Mounted Infantry) in Brisbane, as well as the School of Armour at Puckapunyal.

Crew: ea3

Passenger Capacity: ea6

Dimensions

Length: m6.53.

Width: m2.62

Height: m2.69

Speed, Maximum Road: km/h100

Speed, Average Cross: INA

Speed Maximum Swim: km/h10

Gradient: %60

Side Slope: %30

Vertical Step: 0.5

Trench: m2

Fording Depth: Amphibious

Note: The ASLAV-25 is fully amphibious with 3 minute preparation. It is propelled on water by two water jets mounted at the rear of the hull.

Main Gun

Note: The turret can be traversed and the main gun fired while vehicle is afloat.

↳*System*

Name: M242 25mm Bushranger Chain Gun

Type: 25mm Chain Gun

Caliber: 25mm

Manufacturer: Hughes Helicopters (1981–1985) McDonnell Douglas Helicopters (1985–2002) Alliant Techsystems (2002–2015) Orbital ATK (2015–2018) Northrop Grumman Innovation Systems (2018–present)

In Service: 1981-Present

Proliferation: >11,000

Length: 2,672mm

Barrel Length: 2,175mm

Width: 318mm

Height: 373mm

Weight: 119 kg

Barrels: Single barrel (progressive RH parabolic twist)

Action: Open bolt

Rate of Fire: • Cyclic: 200rpm with 1hp or 500rpm with 8hp

Muzzle Velocity: 1,100 metres per second (3,600 ft/s)

Maximum Firing Range: 6,800 m

Effective Firing Range: 3,000 m

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm25

Shell: 25×137 mm

Basic Load: 720

Notes: A wide range of ammunition has been developed for this weapon, providing it with the capability to defeat the majority of armored vehicles it is likely to encounter, up to and including some light tanks. The ammunition used in the M242 may also be used in a variety of weapons such as the GAU-12 Equalizer, the French Giat M811, or the Swiss Oerlikon KBA weapon system. It has the capability to fire U.S. manufactured ammunition as well as the NATO equivalents thereof. Primarily though, it fires six types of rounds: the M791, M792, M793, M910, MK210, and M919.

Auxiliary Weapon System

↳*System*

Name: Mk 48 Machine Gun

Alternative Designation: Mark 48, or Mk 48, or Maximi

Type: Light Machine Gun

Caliber: 7.62mm

Proliferation: Widely Proliferated

Manufacturer: FN Herstal

In Service: 2003-Present

Length: 1,000 mm

Barrel Length: 502 mm

Weight: 8.2 kg (22.006 lb) empty 11.2 kg (24.7 lb) w/ 100 rounds

Action: Gas-operated, open bolt

Rate of Fire: 710 (± 50) rounds/min

Maximum FIring Range: 3,600 m

Effective Firing Range: 800 m

Feed System: Disintegrating belt (M13 link)

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO (STANAG 2310)

Basic Load: 1,200

Fire Control

Name: INA

Computerized FCS: No

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: INA

Automatic Fire Suppression: Yes

Protection

Hull Armor: Armor of the ASLAV-25 provides protection against small-arms fire, mine-blasts and artillery fragments.

Turret Armor: INA. The ASLAV-25 is fitted with a two-man turret, similar to that of the LAV-25.

Applique Armor: Protection of this reconnaissance vehicle can be increased by fitting add-on ceramic armor tiles. Vehicle can be also fitted with slat armor, which improves protection against RPG rounds.

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Australian Light Armoured Vehicle (ASLAV) is an eight-wheeled amphibious armoured reconnaissance vehicle used by the Australian Army. It was built by General Dynamics Land Systems Canada, and developed from the Canadian Army's LAV-25 and Bison armoured fighting vehicles. The ASLAV is a highly mobile, eight-wheel drive, amphibious armoured fighting vehicle that can be deployed by land, sea or air (in Royal Australian Air Force C-130s or C-17s). It is fitted with GPS, an intra-vehicular navigation system and a radio harness capable of supporting HF, VHF, UHF and digital radios. The ASLAV is capable of speeds of 100 km/h (62 mph) and has a maximum range in excess of 660 km (410 mi). The eight-wheel drive provides excellent cross-country mobility and redundancy, the vehicle is capable of operation with only four working wheels, and can continue to operate with eight punctured tyres through the use of solid-core run-flat tyres. It is fully amphibious and is driven in the water by permanent shrouded propellers located at the rear of the hull at speeds of up to 10 km/h (6.2 mph)

Effective Range: 1,800-2,000 m

Fire Control

Name: INA

Computerized FCS: INA

Rangfinder: Optional laser rangefinder mounted over main gun or integrated with gunner's sight

Protection

Armor (turret front): 16-mm

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Self-entrenching Blade: No

NBC Protection System: Available

Smoke Equipment: Available (up to 2 smoke dischargers on either side for a total of 4)

Survivability Equipment: Welded multi-layer armor

Notes:

The EE-9 Cascavel Mark 3 was the first Cascavel built for export. Iran Imports a large ammount of their military weapons and vehciles from other countries. The Mark 3 was powered by a Mercedes-Benz OM 352A 170-hp diesel engine connected to an Allison Transmission AT-540 automatic transmission. A central tire inflation system was fitted. Mark 3 vehicles were equipped with a French Hispano-Suiza H 90 turret with a Giat 90-mm gun. The H 90 turret carries 20 rounds for the main gun and 2,000 rounds for the coaxial 7.62-mm machine gun. Elevation was -8/+15 degrees and 360 degrees of traverse. There were two smoke dischargers, one on ei ther side of turret rear.

Notes:

The BRDM-2 (Boyevaya Razvedyvatelnaya Dozornaya Mashina, Боевая Разведывательная Дозорная Машина, literally "Combat Reconnaissance/Patrol Vehicle") is an amphibious armoured patrol car used by Russia and the former Soviet Union. It was also known under the designations BTR-40PB, BTR-40P-2 and GAZ 41-08. This vehicle, like many other Soviet designs, has been exported extensively and is in use in at least 38 countries. It was intended to replace the earlier BRDM-1, compared to which it had improved amphibious capabilities and better armament. The BRDM-2 has a crew of four: a driver, a co-driver, a commander, and a gunner. It has two pairs of chain-driven belly wheels lowered by the driver, which allow trench crossing just like its predecessor, and a centralized tire pressure regulation system, which can be used to adjust the tire pressure of all four tires or individual tires while the vehicle is in motion to suit to the ground conditions. Externally, it differs from the BRDM-1 by having a larger, box-like hull. It retains the boat-like bow of the BRDM-1. However, the crew compartment is now further forward and the new GAZ-41 gasoline V-8 engine is in the rear. Thanks to this, the engine is much better protected from enemy fire. The engine compartment is also separated from the crew compartment by an armoured barrier. The driver's and commander's stations are in the front of the vehicle, with the driver positioned on the left and commander on the right. Both of them sit in front of a bulletproof windscreen, which provides them with their primary view of the battlefield. When in combat, the windscreen can be additionally protected by twin armoured shutters. When the shutters are in their opened position, they protect the driver and commander from being blinded by the sunlight and ensure that the windscreen won't be blurred by rain or snow. The commander and driver have periscopes allowing both of them a more detailed view of the surrounding terrain. The commander has six TNP-A periscopes (five in the front and one on the side of the vehicle), a TPKU-2B day sight and a TKN-1 night sight(night-vision device). The driver has four TNP-A periscopes (all in the front), one of which can be replaced by a TWN-2B night-vision device. The gunner is in the turret during combat, but when traveling he is seated inside the hull. The crew mounts and dismounts the vehicle via two hatches over driver's and commander's stations. On either side of the hull adjacent to the crew position, there is a firing port. Immediately behind the firing port there are three TNP-A periscopes, which protrude from the outside of the hull, giving the crew some vision to the front and rear of the vehicle. The engine is larger than the BRDM's (it is a 140 hp V-8 instead of a 90 hp 6-cylinder). The BRDM-2 has an IR spotlight and four IR driving lights, as well as an over pressure collective NBC filter system. The IR spotlight is located on top of the commander's periscope. The vehicle also has an R-123 radio and an antenna on the right side of the hull next to the commander's hatch, for communication. There's also a winch mounted internally at the front hull that has a 30 m cable and a 4 tonne capacity. The winch is intended to be used, among others, for self-recovery when stuck in difficult terrain. A spare tire can be mounted on top of the turret. This was most often practiced by Polish crews. Like its predecessor, the BRDM-2 is amphibious. The GAZ-41 gasoline V-8 engine supplies power to the circular water-jet, equipped with a four-bladed propeller at the rear of the vehicle, which is covered with an armoured shutter while on land. This shutter must be removed before entering water. The water-jet allows amphibious travel with a speed of 10 km/h for 17 to 19 hours. A trim board, which is stowed under the nose of the hull when traveling, is erected at the front of the hull before entering the water to improve the vehicle's stability and displacement in the water and to prevent

the water from flooding the bow of the BRDM-2. While in its traveling position, it serves as additional armour. The armament is the same as the BTR-60PB armoured personnel carrier; a 14.5 mm KPVT heavy machine gun with a coaxial 7.62 mm PKT general-purpose machine gun as a secondary weapon, both in a small conical BPU-1 turret mounted on the hull in a central position above the belly wheels.[1] The 14.5 mm KPVT heavy machine gun has a practical rate of fire of 150 rounds per minute and a cyclic rate of fire of 600 rounds per minute. It has an effective range during daylight operations of 2,000 m. It can penetrate 20 mm of armour at a range of 1,000 m and 30 mm of armour at a range of 500 m. It can also fire at air targets, in which case the tactical range is 1,400 m. It uses the 14.5 mm API-T, 14.5 mm I-T, 14.5 mm HE-T, 14.5 mm and MDZ type ammunition. The 7.62 mm PKT coaxial general-purpose machine gun has an effective range during day time operations of 1,000 m while the vehicle is stationary and from 400 m to 500 m while the vehicle is on the move. It is fired in 2 to 10 round bursts and has a practical rate of fire of 250 rounds per minute and a cyclic rate of fire of 650 rounds per minute. During daylight operations, the gunner uses the PP-61AM sight, which has a field of view of 23 degrees and x2.6 magnification. The BPU-1 turret is unusual because it has no top hatch opening. Contrary to the popular belief, the BPU-1 turret was originally designed for the BRDM-2. The turret was later used in the Soviet BTR-60PB, the Polish SKOT-2A and the Czechoslovak OT-64A. The turret allows the armament to be elevated between −5 and +30 degrees. On the left side of the turret, there is an air inlet on the hull top. There are also two air-inlet louvers in the forward part of the engine compartment's roof and four smaller air-inlet louvers to the rear. Both sides have centrally placed vision blocks. The vehicle armor, which is composed of welded steel, protects it fully against small arms fire and small shell fragments; but doesn't protect it against big artillery fragments or .50-calibre machine gun fire, which can penetrate the BRDM-2's maximum armor of 14 mm. The BRDM-2-series tires are not protected by armour and are particularly vulnerable to puncture from fire of all kinds. There are three different production lots, which have different cooling vents on the engine deck. The late production version has mushroom-type vents. It also has slightly modified turret and can elevate its armament to +60 degrees. Final production BRDM-2s have additional turret periscopes and a TNA-2 navigation apparatus.

VN-3 Chinese 4x4 Armored Scout Car

Tiers:

Variants:

- **CS/VN3B:** This is an upgraded version of the CS/VN3 with add-on armour to increase ballistic and mine protection. The roof of the crew compartment is fitted with a remotely operated weapon station armed with a 7.62mm machine gun.
- **CS/VN3C::** he Armored Infantry Fighting Vehicle variant of the CS/VN3. The vehicle is fitted with a one man-turret armed with a 30mm automatic cannon.

System

Alternative Designation: May be referred to as CS/VN3

Magazine: Belt fed, 50 rounds
Operation: Hybrid direct impingement and short recoil
Armor Penetration: INA

↳*System (Option 2)*

Name: KPV-14.5 heavy machine gun
Type: 14.5mm Heavy Machine Gun
Manufacturer: V.A. Degtyarev Plant

Date of Introduction: 1949-present

Proliferation: Widely Proliferated

Weight: kg49

Length, Total: mm1,980

Length, Barrel: mm1,346

Width: mm162

Height: mm225

Action: Short Recoil Operation

Rate of Fire: rds/min600

Feed System: 40-round belt

Sights: Iron or Optical

↳*Ammunition*

Type: Anti-tank rifle, Heavy machine gun

Caliber: mm14.5

Cartridge: mm14.5x114

Muzzle Velocity: m/s1,005

Basic Load: INA

Maximum Firing Range: m4,000

Effective Firing Range: m3,000

Armor Penetration: Yes

Round Variant 1: BS: Armor-piercing incendiary original anti-tank round. The projectile weighs 64.4 grams and is 51 millimeters long with a 38.7 gram core of tungsten carbide with 1.8 grams of incendiary material in the tip. The overall round weighs approximately 200 grams and is 155 millimeters long. The projectile has a muzzle velocity of approximately 1,006 meters per second and can penetrate 30-32 millimeters of RHA steel at an incidence of 0 degrees at a range of 500 meters, or 40 millimeters at a range of 100 meters.

Round Variant 2: B-32: Armor-piercing incendiary full metal jacket round with a hardened steel core. Projectile weight is 64 g and muzzle velocity is 1006 m/s. Armour penetration at 500 m is 32 mm of RHA at 90 degrees.

Round Variant 3: BZT: Armor-piercing incendiary tracer full metal jacket round with a steel core. Projectile weight is 59.56 g and muzzle velocity is 1,006 m/s. Tracer burns to at least 2,000 m.

Round Variant 4: MDZ: High-explosive incendiary bullet of instant action. Projectile weight is 59.68 g.

Round Variant 5: ZP: Incendiary tracer round

Round Variant 6: DGJ02: APIDS-T cartridge uses a 45 g tungsten penetrator, wrapped in a discarding sabot (similar to the US military SLAP cartridges) with dual colour tracer to aid ranging. The sabot splits and leaves the penetrator between 150 and 200 m from the muzzle. It has a muzzle velocity of 1,250 m/s and is quoted as being able to penetrate 20 mm of armour plate set at an angle of 60° at 1000 m.

Round Variant 7: DGE02: APHEI cartridge weighs between 175 and 188 g. At 1000 m it is quoted as having a 90 percent chance of being able to penetrate 15 mm of armour plate set at 30°. At 300 m after penetrating a 2 mm soft steel plate (representing an aircraft skin) it can further penetrate a 1.2 mm thick steel plate producing 20 fragments. Upon explosion between 75 and 95 incendiary pieces are formed which have an 80% chance of igniting aviation fuel.

Auxiliary Weapon System

Length, Barrel: mm658
Diameter: mmINA
Weight (Gun Only): kg12.6
Weight (With Tripod): kg17.5
Action: Gas-operated, open bolt
Rate of Fire: rds/min700-800
Feed System: Belts in 100/200/250 round boxes
Sights: Open sights. Optical/Night vision scope can be outfitted.
Variant 1: Type 80 - The copy of the PKM GPMG, chambered in 7.62×54mmR
Variant 2: Type 86 - A machine gun only used for tanks as a secondary weapon.
Variant 3: CF06 - An export-only version of the Type 80, which is chambered for 7.62 NATO ammunition.
Variant 4 (Foreign): BD-14 - A variant of the Type 80 made by Bangladesh Ordnance Factories under license which uses 7.62×51mm NATO instead of 7.62×54mmR

↳*Ammunition*

Type: Rifle
Caliber: mm7.62×54mmR
Muzzle Velocity: m/s840
Basic Load: INA, Belts in 100/200/250 round boxes
Effective Firing Range: m100-1,500 (With Sight Adjustments)
Min Range: m100
Armor Penetration: Available

Fire Control

Laser Target Designation: INA

Protection

Hull Armor: All-welded Steel, provides an unspecified level of protection from small arms fire, shell splinters and some types of mine.
Applique Armor: Available

NBC Protection: Yes

Ballistic Glass: Yes

Fire Detection and Suppression System: Yes

Smoke Equipment: Yes, Two banks of three smoke grenade launchers are mounted on the turret.

Firing Ports: Yes

Air Conditioning System: Yes

Notes:

The VN3 armored scout car had been developed in China. It resembles the French Panhard VBL or Swiss MOWAG Eagle III armored scout cars, but is slightly larger. This vehicle was revealed in 2007. It is understood that development of this light reconnaissance vehicle is now complete. Currently it is produced in small quantity for the Chinese Army. It is also being proposed for export customers as a light multi-purpose armored personnel carrier. It is worth mentioning that this armored vehicle costs far less, than comparable Western or Russian systems. The VN3 armored scout car has an all-welded steel hull. It provides protection from small arms fire, artillery shell splinters, as well as some types of mines. This armored scout car is fitted with a one-person turret, armed with a 12.7 mm or 14.5 mm heavy machine gun. The VN3 has a crew of five, including commander, gunner, driver and two scouts. Occupants enter and leave the vehicle through side or rear doors, or roof hatches. There are some firing ports and associated vision blocks provided for the occupants. Vehicle is powered by a front-mounted diesel engine. Alternatively the VN3 armored scout car could be configured as an armored personnel carrier, with the turret removed. In this case it has a crew of two and accommodates eight troops. Other variants of this scout car include a larger unidentified 4x4 armored vehicle, fitted with a 30 mm turret-mounted cannon. This vehicle uses turret similar to that of the ZLC 2000 airborne combat vehicle. Another variant is amphibious and can carry HJ-8 anti-tank missiles.

Panhard VBL French 4x4 Scout Car

Tiers:

Variants:

- **VBL AT4CS:** A54CS 84-mm ATGM carrier with range only to 250 m with ring-mounted 7.62-mm machine gun
- **VBL SOURCE:** Upgraded optics
- **VBL Information:** Improved target designation
- **VAP Deep Penetration Vehicle:** Long wheel-base for deep reconnaissance missions
- **ULTRAV M11:** Stretched for NBC detection
- **Wasp Milan ER:** Remote weapon station with a 1-tube ATGM launcher & 7.62-mm machine gun
- **VBL Canon:** 20-mm remote turret
- **VBL Ingwe (South Africa):** Armed Long Range Reconnaissance Turret with 4 Ingwe ATGM launchers
- **MPCV (Multi-purpose Combat Vehicle):** VBR chassis with 4 rail missile launcher turret with 8 missiles & 12.7-mm machine gun
- **VBL Tourelle Fermee:** Remote turret that can fire a 12.7-mm MG, 7.62-mm MG, or 40-mm AGL
- **VBR:** Stretch variant can carry 5 soldiers; remote weapon station with M2HB MG & smoke grenade launchers
- **VBL Eryx:** Short-range (600 m) AT carrier with secondary 7.62-mm machine gun
- **VB2L Poste de Commandement:** Command version with extra radios, map board, & 7.62-mm MG for self-protection
- **VBL TOW (Greece):** Single tube with 4 rounds with range to 3,750 m
- **VBL Milan:** 1 Milan firing unit with 6 missiles with range to 2 km
- **VBL Samantha:** Griffon surveillance radar to designate SAM missile & AA artillery targets
- **VBL Anti-Tank:** Equipped with the HOT or TOW turret, but also can be integrated with Kornet or Ingwe missile systems
- **VBL Albi:** Fires Mistral/Mistral 2 SAMs
- **VBL with PL127 Turret:** 12.7-mm MG or 40-mm AGL

System

Alternative Designation: The Panhard Véhicule Blindé Léger ("Light armoured vehicle"), also known by its acronym Panhard VBL or simply VBL

Description: 4 X 4 armored vehicle carrier serves in a variety of roles. Some variants can carry more than the crew.

Armor, Explosive Reactive : mmNo

Armor, Turret Front : mm5-11.5

NBC Protection: Collective

Self-Entrenching Blade: No

Smoke Equipment: Yes

Survivability Equipment: Increased mine protection, Kevlar blankets

Notes:

The Panhard Véhicule Blindé Léger ("Light armoured vehicle"), also known by its acronym Panhard VBL or simply VBL, is a French wheeled 4x4 all-terrain vehicle built by Panhard. The vehicle is offered in various configurations, and was designed to combine the agility of the Peugeot VLTT liaison vehicle with adequate protection against small arms fire, artillery fragments, mines and NBC weapons. Produced between 1985 and 2010, the vehicle has been used by the French Army and other European, African and Central American armies in various conflicts since the 1980s. The French VBL programme started in 1978. The French Army was looking for a light reconnaissance vehicle, intended to work with the AMX-10 RC, the Hotchkiss M201 being obsolete when compared with the Soviet BRDM-2s. The new vehicle needed to be armed with a single machine gun for reconnaissance (recce) or with the MILAN missile for anti-tank combat, while being protected from NBC hazards and small arms fire. Both Renault and Panhard proposed a prototype, the trials beginning in 1982. Before its selection by the French armed forces in 1985, the Panhard model was ordered by the Mexican Army in 1984. In 1985, a pre production of 15 vehicles for the French Army was launched while the VBL started its active operational service in the French Army in 1990. The French Army ordered 569 VBLs in 1990, 330 between 1994 and 1997, and 700 VB2L (lengthened variant) before 2004. The VBL, sold abroad as the ULTRAV M-11 has been produced at Marolles-en-Hurepoix, around 10 vehicles being produced each month in 2004. The 1,500th VBL was produced in 2001 and the last VBL of the 2,600 VBLs left the plant in 2010. The VBL has two compartments: a motor bay, placed forward to protect the second compartment, which is for the crew. Its compact internal dimensions led to the design of a lengthened version of the VBL. The crew of the VBL is protected against NBC weapons. The recce versions have two crew members while the anti-tank versions have a crew of three. The French Army version of the VBL is equipped with a Peugeot XD3T turbo-diesel engine. This engine is used on many civilian cars, such as the Peugeot 505, Peugeot 605 and Talbot Tagora and the VBL used many other standard civilian components. Its 95 hp (71 kW) power and 29.5 hp/t (22.0 kW/t) power ratio enable the VBL to speed at 95 km/h (59 mph). It has a fuel consumption of 16 litres (3.5 imp gal; 4.2 US gal) per 100 km (62 mi). Its range of 600 km (370 mi) can be extended to 800 km (500 mi) by two external fuel tanks. Designed to be lighter than 3.5 t (3.4 long tons; 3.9 short tons), the mass of the VBL has increased to 4 t (3.9 long tons; 4.4 short tons). The VBL is fully amphibious and drives at 5.4 km/h (3.4 mph) in water; it is also air transportable by C-130, C-160, Il-76 and A400M. It can be transported underslung by larger helicopters, such as the AS332 Super Puma, and may also be para-dropped.

HJ-62C (YW-531H) Chinese Amphibious Armored Scout Vehicle

Tiers:

1 2 3 4

Variants:

- **Type 85/YW 531H:** Domestic/export base model
- **YW703H:** Command variant
- **Type 85 Armored Command Vehicle:** 2-man crew, 6 staff, additional communications equipment, & fewer ammunition rounds; used at regimental or division level
- **Type 85 Recovery Vehicle:** 1000 KG crane with 5-man crew
- **Type 85 Maintenance Engineering Vehicle:** Similar to the WZ 751 (ambulance), but for support
- **Type 85 Mortar Carriers:** 82-mm & 120-mm variants similar to the YW 531
- **WZ 751 Armored Ambulance:** 2-man crew with space for 4 litter or 8 seat patients; 12.7-mm MG
- **Type 85 SP Howitzer (Type 70-1/YW 302):** Type 54-1 122-mm howitzer on Type 85 chassis
- **Type 85 ATGM Launcher Vehicle:** Railed hull with 4-rail Red Arrow-8 SACLOS wire-guided ATGM
- **YW 307 IFV:** Type 89 with a 25-mm cannon similar to the Bushmaster & the 7.62-mm coaxial MG
- **YW 309 Infantry Combat Vehicle (ICV):** 3-man crew, 73-mm low pressure main gun, 7.62-mm coaxial MG & Red Arrow 3 ATGM
- **HJ-8 Anti-Tank Vehicle:** AT traversable launcher with 4 HJ-8 ATGMs & 4 loads in storage in the hull
- **NVH-1:** Joint Chinese/British variant with 25-mm gun
- **Type 90:** Updated design with reduced height, improved hull shape, & better transmission
- **Thai versions:** Similar to the Chinese variants, but armed with a M-2HB MG
- **Artillery Command Post Vehicle:** YW 531H modified with a raised rear superstructure
- **YW 306:** 130-mm MRL platform
- **Type 89 (YW 534/WZ 534):** Improved power pack & night vision equipment for domestic use & export with longer & wider chassis, improved engine, & mobility

System

Notes:

The HJ-62C Chinese Armoured Scout Vehicle is a variant of the Type 85 (Type YW531H) Armoured Personnel Carrier. This has its turret removed and is fitted with an elevated arm on top of which is mounted a battlefield surveillance radar with a detection range of 25 km for vehicles and 10 km for personnel. The YW531H Type 85 Chinese Armored Personnel Carrier s a tracked armoured fighting vehicle produced by Chinese company Norinco (industrial index: Type YW531H). It is an improved version of the Type 63 armoured personnel carrier. The vehicle is bigger, has additional firing ports and periscopes, a longer chassis with an additional road wheel on each side, and is equipped with an NBC protection system. The Type 85 series was developed in 1985, exclusively for the export market; for the PLA, the very similar Type 89 AFV was designed. The main user of the Type 85 series are the Royal Thai Armed Forces who received their first vehicles in 1987. The hull is made of welded steel, and provides protection against small arms fire. The vehicle carries a maximum of 15 including crew. The driver sits in the front left of the hull, and has a single piece hatch, which opens to the left. The driver is provided with two day periscopes which cover the front and right of the vehicle. One of the drivers periscopes can be replaced by a night vision device. The commander sits behind the driver and has a single piece hatch. The air-cooled, turbocharged diesel engine sits to the right rear of the driver. It has a large intake located in the top of the hull, with an exhaust on the right hand side. The engine feeds a manual transmission with five forward gears and one reverse gear. Track is driven at the front by a drive sprocket, and passes over five dual rubber-typed road wheels and track-return rollers, then loops over an idler at the rear, before returning to the front again. A 12.7 millimetre calibre machine gun with armoured shields is located in an open mount at the front of a small hatch in the center of the hull which opens into the troop compartment. The gun can traverse through 360 degrees and can be elevated to an angle of 90 degrees. A total of 1,120 rounds is carried on board. Two oblong roof hatches and a large rear door provide access to the troop compartment. On either side of the forward hull, a cluster of four 76 mm smoke grenade dischargers is mounted. The vehicle is amphibious, a folding trim board stowed at the front of the hull needs to be raised, and the vehicle can then propel itself in the water using its tracks. Standard equipment includes an NBC system, a Type 889 or VRC-83 radio, and a Type 803 intercom system.

Notes:

Ural IMZ-8 The latest model of Ural motorcycles with different modifications. The various modifications of this model are also known as “Tourist”, “Solo”, “Gear-Up”, “Voyage”, “Cobra”, “Retro” and “Wolf”. The Wolf was the first chopper produced in russia. Its production started in 1999, but due to low demand on it the Wolf went out of production in 2011.

KTM 450 EXC Austrian Off-Road Motorcycle

Tiers:

Variants:

- **2000 - 2002:** The factory RFS (Racing Four Stroke) KTM 400 EXC won the 1999 World Enduro Championship. The 2000 RFS KTM 400 EXC had a right side kickstarter but also had the E-start button. KTM took a different approach to the configuration of the motor than most other manufacturers. While others used a 90mm-plus bore piston with a very short stroke of 60mm, the KTM RFS motor used an 89mm x 64mm boiconfiguration which provided more torque at the expense of higher RPM's
- **2003:** This was the first year of the 450 EXC model. It evolved from the earlier 400 EXC model, with an increased displacement via a longer stroke.
- **2005-2007:** These years saw a new frame. Improving the handling without major changes. Rear body work changed to the single piece design off the SX model. The 2006 450 EXC made 42 hp (31 kW) and 37.5 ft-lbs. torque.
- **2007:** This was the first year that the 450 EXC was offered in full factory 50-state street legal trim. The conversion of the previously available model required changes in gearing, exhaust, DOT approved tires and lights and the addition of turn signals, and a horn. Other than these changes the bike was virtually the same as the previously off-road only bike. The US off-road only version of the EXC was replaced by the XC (Close-ratio transmission) and XC-W (wide-ratio transmission) models. 2007 was also the last year of the RFS motor. The RFS is very torquey and is known to have very good reliability. In some cases, the fully stock engines last for more than 45k miles. The RFS bike is known to be a good dual sport and super motard bike. The wide ratio 6-speed transmission will run all day long on the highway. Due to their dual-sport ability, there are larger aftermarket fuel tanks available (11~26L).
- **2008 - 2009:** As of 2008 the US version of the 450 EXC continued to be sold in street legal trim but was replaced by the off-road only 450 XC or 450 XC-W in the US market. A new chassis was introduced in 2008 with improvements in suspension and handling. The RFS motor available in 250 cc, 400 cc, 450 cc and 510 cc models between 2000 and 2007 was replaced with the XC4 motor beginning with the 2008 model year. The XC4 450's have more power; with a 95 mm x 63.4 mm bore and stroke producing about 51 hp (38 kW). Reliability may have gone down; some people experience top-end issues with the new engine, while others run without incident. 2008 models had oil migration issues(fixed on 2009 models).
- **2010 - 2012:** Offered as the Champions Edition in 2010. New features include new front Brembo brake caliper, PDS needle design, frame welded to steering head 10mm lower, reinforced gearbox (1,2,5,6 idler gears), reworked chain adjuster & clamping rail, better tension on timing chain (noise reduction). Oil pump gears, shaft, cover and o-ring also updated on 2011 models.
- **2013 - 2015:** For 2013, new features include EFI Fuel-injection, a diaphragm spring clutch and a lighter battery. The XC(W) and XC(F) models both have a plug on the right side of the engine case where a kick start lever can be added.
- **2016 - Present:** For 2016, KTM redesigned the 450 from the ground up. A new chassis, motor, ergos, and WP XPlor 48MM forks and PDS shock. They achieved a weight reduction of 5 kg from 2016. The seat height was lowered by 10mm to 38 inches and the foot pegs raised by 6mm for better ground clearance.

Notes:

The Kawasaki KLR250/KL250D was a motorcycle produced from 1984 to 2005 as the successor to the 1978 to 1983 KL250C, with only minor changes during the model run. This lightweight dual sport motorcycle was used for several years by the US military for a variety of tasks, including messenger duty and reconnaissance. It was produced by Kawasaki Heavy Industries in Japan and exported to many parts of the world, including the U.S. and Canada, Europe and Australia. The Chilean national police ("Carabineros de Chile") made extensive use of the KLR250. It is similar in appearance to the larger KLR650. The KLR250 shares many engine parts with an ATV sold by Kawasaki, the KSF250 "Mojave". In the USA the KLR250 was discontinued at the end of the 2005 model run and was replaced by the KLX250S in 2006. In other markets the KLX250 was introduced in 2001 and has been sold to the current day.

Fuel Consumtion: 7.84 litres/100 km (12.8 km/l or 30.00 mpg)

Frame Type: Double loop steel tube

Front Suspension: IMZ leading link fork

Rear Suspension: Double sided swing-arm with two Sachs hydraulic spring shock absorbers, 5x adjustable

Front Brakes: Single disc. Brembo

Rear Brakes: Expanding brake (drum brake)

Wheels: Aluminum rims with steel spokes

Fuel Capacity: 19.00 litres

Reserve Fuel Capacity: 3.79 litres

Protection

Armor: INA

Applique Armor: No

Active Protection System: No

NBC Protection: INA

Smoke Equipment: No

Notes:

Our bikes are happy cruising between 65 and 75 mph. Our 749cc engine combined with powerful low end torque is the perfect size to compliment the steering dynamics of our all steel sidecar. In addition to a 4 speed transmission, every Ural comes with a mechanical reverse gear. Reverse can be engage by the foot pedal to the right of the rear brake. Every Ural comes standard with a lockable and water tight sidecar trunk. It's the perfect size for extra gear, supplies, and whatever else your adventures may need. Standard Accessories: • LED Sidecar Fog Lights (Gear Up) • Sidecar Power Outlet • Sidecar Tonneau Cover • Jerry Can (Gear Up) • Folding Utility Shovel (Gear Up) • Luggage Rack (Gear Up) • Universal Spare Wheel - Fits All 3 Positions

Dragon Runner 10 American Micro Unmanned Ground Robot

Tiers:

Variants:

- **Dragon Runner 20:** Dragon Runner 20 Small Unmanned Ground Robot Small and lightweight, yet rugged and feature-packed, the Dragon Runner 20 (DR-20) is a highly specialized and mobile robot designed to provide situational awareness, safety and support for reconnaissance, security, inspection and IED missions. The mission dictates exactly how the DR-20 will be used – making it the perfect choice for defense and security applications especially in congested urban settings. Whether it's at a security checkpoint, deep inside a sewer or drainpipe or tasked with an EOD mission, the DR-20 supports a wide range of scenarios. At 20 pounds, the DR-20 can be hand carried by one person and easily deployed.

System

Alternative Designation: Dragon Runner 10
Type: Micro Unmanned Ground Robot
Manufacturer: QinetiQ North America
Crew: eaUnmanned
Communications: Vehicle on-board microphone
Environmental: IP 65 rated
Cameras: (2) Front and rear, day and night
Controller: Dragon Runner 10 wearable controller
Payloads (optional): Manipulator arm, hazmat sensors

Dimensions

Length: 44 cm
Width: 33 cm
Height: 18 cm
Weight: 5 kg

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: INA

Maximum Speed: 4.8 Km/h

Operational Range: Greater than 1,970 ft (600m) Line-of Sight when equipped with external antennas.

Endurance: 2-3 hours (mission dependent)

Protection

Hull Armor: INA

Applique Armor: INA

Notes:

The Dragon Runner 10 (DR-10) is a lightweight, expandable robot that offers protection and support to small unit, dismounted operations. Designed to provide situational awareness by ‘scouting out’ while the operator remains at safe distance, the DR-10 keeps military forces and first responders away from dangerous situations. At approximately 10 pounds the DR-10 can be hand carried or easily transported inside a rucksack—it can even be thrown! This compact and durable robot is operated with an easy-to-use remote controller. Its robust design allows it to perform in the most challenging environments and adverse weather conditions. Whether it’s under a car or deep inside a sewer or drainpipe, the DR-10 has the dexterity to go where personnel can’t. From unmanned, reconnaissance missions to delivering remote sensors and placing counter-IED charges, these micro robots protect people, assets and save lives. Features: *Provides real-time situational awareness *Small enough to fit inside an assault pack *Light enough to be hand carried *Tough enough to be thrown &Operates in adverse weather conditions

Titan American Unmanned Ground Vehicle (UGV)

Tiers:

1 2 3 4

System

Alternative Designation: Titan

Type: Unmanned Ground Vehicle

Manufacturer: Milrem and QinetiQ North America

Crew: Unmanned Ground Vehicle

Mission: The vehicle is intended to save the lives of soldiers as it performs critical and hazardous tasks currently handled by war fighters in the combat zone.

Platform: The platform includes two track modules connected by a payload frame. The open architecture of the Titan UGV allows for the integration of mission equipment and systems to support a range of operations.

Payload Types: The typical payload aboard the vehicle includes an earth-moving blade / bucket, casualty evacuation (CASEVAC) litter racks, logistics support basket and ruck mounts, anti-personnel obstacle breaching system (APOBS) mounts, counter-improvised explosive device (C-IED) roller rake mount, and C-IED sensing systems. The vehicle can also be interfaced with third party payloads such as remote weapon station (RWS), interrogation arms, reconnaissance, surveillance, and target acquisition (RSTA) systems to support combat, chemical, biological, radiological and nuclear (CBRN) defence, RSTA and route clearance missions.

Sling Load Capable: Yes, The UGV can be transported by helicopters internally or as slung load.

:

:

Note: The Titan UGV was preferred by the US Army for Phase 1 evaluation of the Squad Manoeuvre Equipment Transport (SMET) programme.

Dimensions

Length: m2.00

Width: m2.10

Height: m1.01

Weight, Combat: kg907.18

Payload Area Length: m1.82

Payload Area Width: m1.21

Maximum Payload Weight: kg680.38

Maximum Pull Force: kg907.18

Automotive

Engine Name: INA

Engine Type: Diesel-electric hybrid tracked drive modules

Engine Power: INA

Generator: 10kW JP8 generator

Batteries: Absorbent glass mat (AGM) lead acid or lithium-ion batteries.

Maximum Range, All-Electric Run-Silent Mode: km20

Endurance, All-Electric Run-Silent Mode: hours2

Maximum Range, Diesel and Electric Hybrid Mode: km100

Endurance, Diesel and Electric Hybrid Mode: hours72

Speed, Maximum Road: km/h24

Speed Maximum Swim: Not Amphibious

Trench: mm762

Main Weapon System

Note: The typical payload aboard the vehicle includes an earth-moving blade / bucket, casualty evacuation (CASEVAC) litter racks, logistics support basket and ruck mounts, anti-personnel obstacle breaching system (APOBS) mounts, counter-improvised explosive device (C-IED) roller rake mount, and C-IED sensing systems. The vehicle can also be interfaced with third party payloads such as remote weapon station (RWS), interrogation arms, reconnaissance, surveillance, and target acquisition (RSTA) systems to support combat, chemical, biological, radiological and nuclear (CBRN) defence, RSTA and route clearance missions.

Navigation and Control

Command and Control Unit: QinetiQ tactical robot controller (TRC) and robotic appliqué kit (RAK).

Tactical Robot Controller (TRC): The TRC is a single pocket system integrating a 6.5in monitor, button layout and auxiliary port. It can be easily attached to the communications pack of Titan to command and control the UGV’s operations.

Robotix Applique Kit (RAK): The RAK provides multiple optional autonomous features and allows the integration of night vision and thermal cameras, microphone and radio systems. The multiple crew-compliant radio options enable a line-of-sight (LOS) range of more than 800m.

Unmanned Mode Capable: Yes

Manned Mode Capable: Yes

Notes:

Titan is a first-of-its-kind modular, hybrid, unmanned ground vehicle that provides soldier safety and support for small military dismounted operations. Titan is a large Unmanned Ground Vehicle (UGV) that provides “lighten-the-load” support for small dismounted military operations. Developed by QinetiQ North America and Milrem Robotics, Titan features a multi-mission, reconfigurable platform that increases unit effectiveness while increasing soldier safety. Unlike existing UGVs, Titan is a highly modular platform that allows different superstructures to be mounted and integrated onto the middle vehicular platform for complex missions such as rescue, transport and reconnaissance. The flexibility and versatile nature of the system not only increases efficiency, it also significantly reduces life cycle costs and soldier workload. Multi-mission modular payloads High mobility / all-terrain operations Multiple controller and camera options Operable in manned or unmanned modes Open architecture Wide variety of payloads and accessories for CBRN, route clearance and integration autonomy packages Diesel/Electric hybrid for run-silent mode and squad auxiliary power Power-off-load capability

MARS A-800 Russian Unmanned Ground Logistics Vehicle

Tiers:

1 **2** 3 4

System

Alternative Designation: Mars A-800

Manufacturer: KB Avrora LLC

Crew: Unmanned

Payload: 500 kg

↳*Dimensions*

Length: 3000 mm

Width: 2150 mm

Height: 1270 mm

Weight: 1450 kg

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: 65 hp

Maximum Road Speed: 35 km/h

Maximum Water Speed: 5 km/h

Maximum Range: 200 km

Notes:

MARS A-800 (Mobile Autonomous Robotic System) is the tracked Unmanned Ground Vehicle. For the first time it was presented at the RAE-2015 exhibition within the framework of the stand organized by the Skolkovo Foundation. MARS A-800 is designed to support infantry, carry out transport and logistics and other missions. The system can carry up to 6 people, transport a different cargo, including ammunition. MARS A-800 can be equipped with various special equipment and weapons. Key scenarios: "Follow me". Operator MARS A-800 fixes on its equipment an active mark. The platform tracks the movement of the label and follows it. The settings select the nature of the movement and the distance to the master. During the movement, the system independently routes the route, circling the obstacles encountered. "Track". It is carried out by target designation on a map or by pre-stored points. In this mode, the MARS A-800 can autonomously deliver cargo (food, ammunition), evacuate the wounded, conduct reconnaissance. "Cyclic Incoming". Cyclical movement along a predetermined route, observation and

detection of targets, tracking of data from video cameras and radar. "Telecontrol". The platform can be remotely controlled by the operator from the console. This possibility is necessary in a number of situations, such as training, overcoming complex obstacles, loading/unloading, etc. MARS A-800 is created on the Russian manufactured tracked floating chassis. The platform has an engine capacity of up to 65 hp, which allows to reach speeds of up to 35 km/h and carry up to 500 kg of payload. Power reserve as standard - up to 200 km. If the fuel tank is equipped with an increased capacity, the power reserve may increase to 500 km. It is possible to drop the UGV with a parachute system. The built-in generator can be used to supply power to the camp or to recharge the batteries of special equipment.

Nerehta Russian Armed Unmanned Ground Vehicle (AUGV)

Tiers:

System

Alternative Designation: NA

Family: Unmanned, Armed Ground Vehicle

Crew: ea0

Passenger Capacity: Number of passengers has not been published however, it is advertised that the Nerekhta can carry passengers and litters

Maximum Effective Range: mDepends on weapon system

Range Between System and Operator: 20km; extendable with the addition of a mast

Effective Range: m2,100

Fire Control

Note: INA

Protection

Note: None

Notes:

The "Nerehta" UGV / AUGV (Armed, Unmanned Ground Vehicle) is a remote-operator-driven, tracked battlefield infantry support vehicle. UGVs have been featured in recent Russian war games and many sources credit Russia with being in the lead in UGV technology in the world. The vehicle is manufactured by the Degtyarev Plant of Russia and was first demonstrated in 2016. Testing of the product ensued in 2017 by Russian ground forces. It was further demonstrated by the Army in 2018. The vehicle has a compact form with an overall length of 2.5 meters, a width of 1.6 meters and a height of 90 centimeters. Its weight reaches 1,700 kilograms while its payload capacity is set around 700 kilograms. There are four double-tired road wheels to a hull side with the drive fitted aft and the track idler at front. Two track return rollers are used. Over the center of the hull roof is a trainable, traversing, weapons mount which carries a single (optional) 12.7mm Kord Heavy Machine Gun (HMG), Kalashnikov 7.62mm Medium Machine Gun (MMG) or 30mm AG-30M Automatic Grenade Launcher (AGL). When used in the transport role, this fitting is removed to make space for externally-mounted cargo to include personnel. The Nerehta can also be used for CASEVAC. An operator is required for the proper battlefield function of this system and range of the remote-control is approximately 20,000 meters (extendable by way of mast assembly). Drive power is provided for by electric motors. The Nerehta has been developed to take on a multitude of modern battlefield roles including general reconnaissance, artillery spotting/support, cargo transportation, and basic infantry fire support. its compact size certainly makes a good fit for lighter-armed elements such as airborne units and will most likely be a part of Russian Airborne in the near-future. The UGV can also serve Army elements in urban fighting rather well.

Dragon Runner 20 American Small Unmanned Ground Robot

Tiers:

Variants:

- **Dragon Runner 10:** Dragon Runner 10 Micro Unmanned Ground Robot The Dragon Runner 10® (DR-10) is a lightweight, expandable robot that offers protection and support to small unit, dismounted operations. Designed to provide situational awareness by ‘scouting out’ while the operator remains at safe distance, the DR-10 keeps military forces and first responders away from dangerous situations. At approximately 10 pounds the DR-10 can be hand carried or easily transported inside a rucksack—it can even be thrown! This compact and durable robot is operated with an easy-to-use remote controller. Its robust design allows it to perform in the most challenging environments and adverse weather conditions. Whether it’s under a car or deep inside a sewer or drainpipe, the DR-10 has the dexterity to go where personnel can’t. From unmanned, reconnaissance missions to delivering remote sensors and placing counter-IED charges, these micro robots protect people, assets and save lives.

Ripsaw American Unmanned Light Tank

Tiers:

Variants:

- **Ripsaw UGV:** Ripsaw UGV (non-militarized) prototype could accelerate to 65 mph (105 km/h) in about 3.5 seconds, since it was lighter, but it wasn’t as strong/rugged.
- **Ripsaw MS1 tactical UGV:** Ripsaw MS1 tactical UGV utilizes a powerful oversized and customized 650-horsepower (660 PS; 480 kW) Duramax 6.6L V8 diesel engine that delivers 900 ft·lbf (1,200 N·m) of torque. The Ripsaw MS1 was a test platform made to test off-road capabilities. It was exclusively unmanned, cost $200,000 and could accelerate from 0–65 mph (0–105 km/h) in 3 seconds.
- **Ripsaw MS2 UGV:** Ripsaw MS2 UGV is made to be larger, faster, and more modular than the MS1. It weighs 4.5 short tons (4.1 t) and can carry a one-short-ton (0.91 t) payload. The lightweight tubular chassis design is powered by a 6.6 liter duramax diesel engine generating 600 horsepower (610 PS; 450 kW) and 1,000 ft·lbf (1,400 N·m) of torque. Fully loaded, the MS2 can accelerate from 0–50 mph (0–80 km/h) in 5.5 seconds and has a top speed of 60 mph (97 km/h). The vehicle can traverse 50 degree gradients and 45 degree slopes. It can be optionally manned or tele-operated from a nearby command vehicle. Armament can include an M240 machine gun or M2 .50-caliber machine gun, and it has been tested with the Javelin missile. If the Ripsaw is damaged or destroyed, parts can be "cannibalized" in the field and re-assembled quickly. An MS2 vehicle costs $750,000.
- **Ripsaw MS3 UGV:** Ripsaw MS3 UGV is being tested by United States Army Research, Development and Engineering Command under the Remote Armed Maneuver Platform (RAMP) initiative to integrate the M153 CROWS remote weapon system onto an unmanned vehicle. RAMP was demonstrated at Fort Benning, Georgia in October 2013 as part of the Army's Armed Unmanned Ground Vehicle (AUGV) program
- **Ripsaw EV2:** Ripsaw EV2 is a luxury version, with a fully enclosed body and two seats inside the cab. It can exceed speeds of over 60 mph (97 km/h) and has a range of approximately 300 miles (480 km). It is currently unknown if the EV2 can mount remotely-operated weapon systems or not. This model is designed for the civilian market but still costs $295,000 with customizable features.
- **Ripsaw M5:** Ripsaw M5 is fully autonomous, all electric tank with max speed up to 60 mph (96 km/h) with a modular design. This would make it as one of the fastest, most flexible production ready tank on the planet. Its speed and autonomous capability could enable the tank battle group to get out of a nuclear strike
- **Ripsaw EV2:** The coveted Ripsaw EV2 represents one of the world's most capable off-road vehicles ever developed. Offered to the public as a luxury high performance light weight go fast super tank in 2015, Ripsaw has become world class iconic and is one of the most sought after and highly valued extreme vehicles on the planet. Howe and Howe Tech is pleased to offer in 2018 the all new redesigned super advanced "suspended cockpit" single seater EV3F1, two seater EV3F2 and the four seater EV3F4 Ripsaws.
- **Ripsaw EV3F1:** Ripsaw EV3F1 are the most extreme and most terrain dominant Ripsaws ever developed. Designed with up to 1500hp and an astonishing .2 hp/lbs power to weight ratio, with over 112 inches of track on the ground, the Ripsaw EV3-F1 stands as one of the world's most exhilarating single seat off-road vehicles ever conceived. Wheel speed

is no longer necessary to traverse slopes of loose terrain such as mud, sand and snow. The Ripsaw SSR sets new benchmarks in terrestrial platform development and now stands as the pinnacle of extreme high speed off-road travel.

- **Ripsaw EV3 - F2:** Ripsaw EV3 - F2 (Extreme Vehicle - Floating Cockpit) series Ripsaws are a two seater version of the EV3-F1. Designed with up to 1500hp and an astonishing .2 hp/lbs power to weight ratio, with over 112 inches of track on the ground, the Ripsaw EV3-F2 stands as one of the world's most exhilarating two seater off-road vehicles ever conceived. Wheel speed is no longer necessary to traverse slopes of loose terrain such as mud, sand and snow. The Ripsaw EV3 series extreme vehicles set new benchmarks in terrestrial mobility and now stands as the pinnacle of extreme high speed off-road travel.
- **Ripsaw EV3 - F4:** Ripsaw EV3 - F4 (Extreme Vehicle - Floating Cockpit) series Ripsaws are a Four seater version of the EV3-F1. Designed with up to 1500hp and an astonishing power to weight ratio, with over 112 inches of track on the ground, the Ripsaw EV3-F4 stands as one of the world's most exhilarating four seater off-road vehicles ever conceived. Wheel speed is no longer necessary to traverse slopes of loose terrain such as mud, sand and snow. The Ripsaw EV3F4 sets new benchmarks in terrestrial platform development and now stands as the pinnacle of extreme high speed off-road travel.

Notes:

The Ripsaw is a developmental unmanned light tank designed and built by Howe & Howe Technologies for evaluation by the United States Army. The Howe brothers started the Ripsaw as a small family project in 2000. They introduced it at a Dallas vehicle show in 2001, where it caught the interest of the U.S. Army. Later that year the U.S. Military ordered a prototype MS-1 to be made and shipped to Iraq. The Ripsaw is intended to perform various missions including convoy protection, perimeter defense, surveillance, rescue, border patrol, crowd control, and explosive ordnance disposal. For perimeter defense or crowd control, a belt of M5 Modular Crowd Control Munitions (MCCM) can be mounted around the vehicle to break up crowds or non-lethally engage personnel with flash-bang effects and rubber bullets. Cameras provide 360-degree coverage for situational awareness for the operator. The Army has tested the Ripsaw while remote-controlled by a soldier in another armored vehicle up to 1 km (0.62 mi) away. Its weapon system is modified to fire remotely using the Advanced Remote Armament System (ARAS), a gun that loads its own ammunition and can swap out various types of ammunition, such as lethal and non-lethal, in just a few seconds. These capabilities allow manned vehicles to send the Ripsaw out in front of them and engage targets without exposing soldiers to threats. As of March 2017, the Army is still testing the vehicle as an unmanned platform to test remote weapons stations.

TAROS V2 Czechoslovakian 6x6 Unmanned Ground Logistics Vehicle

Tiers:

1 2 3 4

System

Alternative Designation: TAROS V2

Type: Unmanned ground vehicle (UGV)

Crew: Unmanned

Payload: INA

Accessories: The enlarged configurations can be fitted with a range of accessories, including weapon, robotic or sensor systems. The vehicle’s design offers low operating and logistics costs.

↳*Dimensions*

Length: 2.74m

Wide: 1.77m

Height: 2.04m high when the column is down and 2.54m when extended.

Weight: The gross weight in the standard 6×6 configuration is approximately 1,400kg.

Automotive

Engine Name: INA

Engine Type: The module can be recharged by the ND 6050D charger powered by a combustion engine housed in the 2x2E module.Each wheel of the UGV is equipped with 10kW electro-motor drive-train, transmission and suspension systems, as well as an electro-mechanical actuator for steering. The damaged wheels or electro motor of the vehicle can be easily be replaced by the soldiers using onboard tool kit.

Engine Power: INA

Note: The TAROS V2 is powered by electric/hybrid propulsion system. Each wheel is driven by an electric motor, which develops a power of 4.8kW.

Armament

Note: The TAROS V2 is armed with a remote controlled gun carriage developed by the Defence University in Brno. The gun carriage can accommodate personal weapons such as a CZ 805 BREN automatic assault rifle. The vehicle features a robotic weapon system to support fighting activities of the mechanised, reconnaissance and Special Forces operating in tough and complex conditions. The robotic weapon system mounted on the vehicle has a length of 4.4m, width of 2.5m and height of 2.8m without weapons. The robotic weapon system weighs 13kg and is powered by 36V electric system.

Notes:

TAROS V2 is a 6×6 wheeled, unmanned, all-terrain, modular and automated robotic ground vehicle unveiled in December 2014. The vehicle was developed by VOP CZ in collaboration with its subsidiary Centre for Advanced Field Robotics (CAFR), and Tactical Department of the Faculty of Military Leadership of the University of Defence in Brno. The TAROS V2 provides combat and logistic support in high-risk areas and complex environments. It was developed under the 21st century Soldier Programme for the army of the Czech Republic (ACR). The TAROS V2 is identical to the Lockheed Martin Squad Mission Support System (SMSS) in appearance and functionality. The vehicle is also available in a 4×4 configuration, which can be upgraded to 4×4, 6×6 and 8×8 remote-controlled configurations. The enlarged configurations can be fitted with a range of accessories, including weapon, robotic or sensor systems. The vehicle's design offers low operating and logistics costs. In all configurations, the vehicle is powered by accumulators of the 4×4 module. The module can be recharged by the ND 6050D charger powered by a combustion engine housed in the 2x2E module. The 4×4 module also houses command-and-control electronics and a modular sensor suite. An additional 2x2R module with a remote-controlled knuckle boom crane can expand the operating capabilities of the unmanned ground vehicle (UGVs) for remote-controlled operations in the high-risk environments. Each wheel of the UGV is equipped with 10kW electro-motor drive-train, transmission and suspension systems, as well as an electro-mechanical actuator for steering. The damaged wheels or electro motor of the vehicle can be easily be replaced by the soldiers using onboard tool kit. The vehicle measures 2.74m long, 1.77m wide and 2.04m high when the column is down and 2.54m when extended. The gross weight in the standard 6×6 configuration is approximately 1,400kg. The TAROS V2 is armed with a remote controlled gun carriage developed by the Defence University in Brno. The gun carriage can accommodate personal weapons such as a CZ 805 BREN automatic assault rifle. The vehicle features a robotic weapon system to support fighting activities of the mechanised, reconnaissance and Special Forces operating in tough and complex conditions. The robotic weapon system mounted on the vehicle has a length of 4.4m, width of 2.5m and height of 2.8m without weapons. The robotic weapon system weighs 13kg and is powered by 36V electric system.

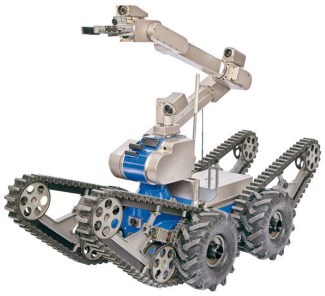
Telemax PRO German Remote-Controlled Robot



Tiers:

Variants:

- **Telemax 4x4:** elemax with wheels: Versatile and cost-efficient! The starter version with a broad wheelbase and 4-wheel drive for rapid deployments on challenging terrains and delicate flooring requiring protection.
- **Telemax PRO:** The original telemax: Compact design and high reach! A truly versatile robot capable of handling significant gradients and obstacles, it boasts an impressive manipulator reach, both vertically and horizontally, combined with minimal dimensions. Perfect for deployments in built-up areas and confined spaces.
- **Telemax HYBRID:** The best of both worlds – Compact and strong! The combination of a powerful arm and compact dimensions for the toughest challenges.
- **Telemax PLUS:** The biggest and strongest telemax: Versatile and strong! Our largest and strongest telemax, its exceptional ability to handle gradients and terrains makes it ideal for a particularly broad range of applications.
- **Telemax RECCE:** Fast solution for reconnaissance: Agile and smart! Compact and high performance reconnaissance system without a manipulator provides detailed information from the site, especially when equipped with our autonomy/3D mapping accessory.

Mobility, Gap Width: 600 mm

Fording Depth: 266-660 mm

Battery: NiMh battery (24 V, 15 Ah) or Li-ion battery (26 V, 40 Ah)

Endurance: NiMh battery (24 V, 15 Ah): approx. 2 h with 1 battery; approx. 4 h with 2 batteries Li-ion battery (26 V, 40 Ah): approx. 5 h with 1 battery; approx. 10 h with 2 batteries

Protection

Hull Armor: INA

Applique Armor: INA

Notes:

Telemax PRO The original telemax: Compact design and high reach! A truly versatile robot capable of handling significant gradients and obstacles, it boasts an impressive manipulator reach, both vertically and horizontally, combined with minimal dimensions. Perfect for deployments in built-up areas and confined spaces. Features: *Precision 7-axis manipulator with TCP control and automatic tool change *Telescopic joint allows for increased reach of manipulator *Lifting capacity up to 20 kg (44 lbs.) *Compact dimensions *4-track drive system with a top speed of up to 10 km/h (6.2 mph) *More than 30 pre-programmed automatic motion sequences for manipulator and flippers *Interchangeability of accessories within the telemax family, e.g. batteries, tools, cameras and sensors

Telemax 4x4 German Remote-Controlled Robot

Tiers:

Variants:

- **Telemax 4x4:** elemax with wheels: Versatile and cost-efficient! The starter version with a broad wheelbase and 4-wheel drive for rapid deployments on challenging terrains and delicate flooring requiring protection.
- **Telemax PRO:** The original telemax: Compact design and high reach! A truly versatile robot capable of handling significant gradients and obstacles, it boasts an impressive manipulator reach, both vertically and horizontally, combined with minimal dimensions. Perfect for deployments in built-up areas and confined spaces.
- **Telemax HYBRID:** The best of both worlds – Compact and strong! The combination of a powerful arm and compact dimensions for the toughest challenges.
- **Telemax PLUS:** The biggest and strongest telemax: Versatile and strong! Our largest and strongest telemax, its exceptional ability to handle gradients and terrains makes it ideal for a particularly broad range of applications.
- **Telemax RECCE:** Fast solution for reconnaissance: Agile and smart! Compact and high performance reconnaissance system without a manipulator provides detailed information from the site, especially when equipped with our autonomy/3D mapping accessory.

System

Alternative Designation: Telemax 4x4
Type: Remote-Controlled Robot
Manufacturer: Faulhaber
Crew: ea1
Payload Capacity: up to 20 kg
Note: More than 16 pre-programmed automatic manipulator motion sequences

Dimensions

Length: 1018 mm
Width: 603 mm
Height: 813 mm
Manipulator, Upward Reach: 2071 mm
Manipulator, Forward Reach: 1586 mm
Manipulator, Downward Reach: 1060 mm
Weight: Standard speed version: 66 kg (145 lbs.) High speed version: 68 kg (149 lbs.)
Firing Channel: 3

Payload: 35 kg

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: INA

Drive: 4 wheels

Maximum Speed: Standard speed version: max. 4.5 km/h (2.7 mph) High speed version: max. 11.5 km/h (7 mph)

Operational Range: INA

Mobility, Slopes: 38° (standard speed version, depending on surface)

Mobility, Stairs: 17.5°

Mobility, Obstacle Height: 200 mm

Mobility, Gap Width: 330 mm

Fording Depth: 280 mm

Battery: NiMh battery (24 V, 15 Ah):

Endurance: NiMh battery (24 V, 15 Ah): approx. 3 h with 1 battery; approx. 6 h with 2 batteries Li-ion battery (26 V, 40 Ah): approx. 7.5 h with 1 battery; approx. 15 h with 2 batteries

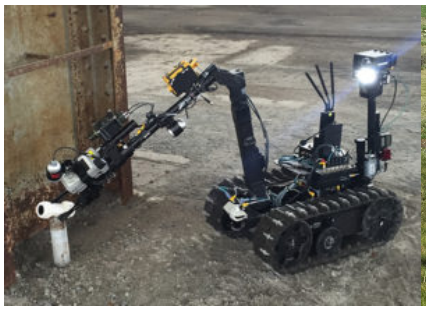
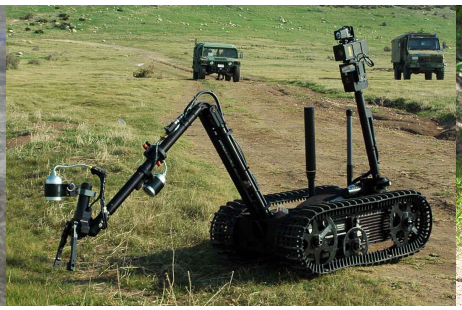
Telemax HYBRID The best of both worlds – Compact and strong! The combination of a powerful arm and compact dimensions for the toughest challenges. Features: *Strong precision 6-axis manipulator with TCP control and automatic tool change *Reinforced axes on lower arm and gripper *Lifting capacity up to 37 kg (82 lbs.) *Compact dimensions *4-track drive system with a top speed of up to 10 km/h (6.2 mph) *More than 30 pre-programmed automatic motion sequences for manipulator and flippers *Interchangeability of accessories within the telemax family, e.g. batteries, tools, cameras and sensors *Optional version for CBRN defense

Talon 5 American Medium-Sized Tactical Robot





Tiers:

Variants:

- **Talon 5:** TALON Medium-Sized Tactical Robot Since its introduction in 2000, QinetiQ North America's TALON® family of robots has earned a reputation for durability, flexibility, reliability and performance in keeping personnel, assets and civilians out of harm's way. In military, law enforcement and first responder applications, TALONs are widely deployed for improvised explosive device (IED) and explosive ordnance disposal (EOD), reconnaissance, communications, CBRN (Chemical, Biological, Radiological, Nuclear), HAZMAT, security, heavy lift, defense and rescue missions. Our TALON CBRN/Hazmat modular kit is available for TALON IV and V models. TALONs have been used worldwide, from Ground Zero after the 2001 World Trade Center attack, to IRAQ and Afghanistan, searching for the Boston Marathon bombing suspect and assisting with security during major sporting events. Now on its fifth generation, TALON 5 is the first Interoperability Profile (IOP) fielded robotic system that has successfully gone through Army Test and Evaluation Command testing.
- **TALON CBRN/Hazma:** TALON CBRN/Hazmat kit is equipped with a variety of sensors that provides ultimate protection in dangerous CBRN missions. Proven Protection For over 15 years, TALON robots have been used for EOD and CBRN operations. TALON's were first military robot deployed in Bosnia for moving and disposing of live explosives and the first to be used in active combat in Afghanistan and in Iraq. Deployed at Ground Zero after the Sept. 11 (9/11) attack on the World Trade Center in NYC, TALON robots were used extensively to support search and rescue and recovery efforts. Out of the two robot types used at Ground Zero, TALONs were the only robots to handle the difficult and dangerous mission without requiring a major repair. Even after repeated contamination, TALON remained operational. Flexible and Rugged Operation The CBRN kit is configurable for TALON IV and above models. TALON's optional, heavy-lift, multiple-degreeof freedom arm can be used to open doors and trunks making it a valuable additional to critical and dangerous missions.

System

Alternative Designation: Talon 5
Type: Medium-Sized Tactical Robot
Manufacturer: QineticQ North America
Crew: eaUnmanned
Maximum Payload Weight: 68 kg
Vertical Reach: 95 cm
Horizontal Reach: 157 cm
Gripper Force: 49.9 kg
Gripper Rotation: 360° (continuous)
Controller Options: Laptop Control Unit Tactical Robot Controller (TRC) UC-LITE (Universal Controller - Lightweight Interoperable Tactical Equipment)
Communications: External IP Radio (Persistent System's MPU5 Radio) Gigabit Ethernet Communications Backbone

Cameras: 4
Available I/O Ports: *2x IOP A connectors *1x IOP B connector *4x Gigabit Ethernet and 12VDC (24VDC opt.) *2x RS-232 ports *1x USB port **1x CAN bus 6x Interfaces for legacy TALON accessories

Dimensions

Length: 87 cm
Length, with Arm Extended: 110 cm
Width: 58 cm
Height: 83 cm
Weight: 81 kg

Automotive

Engine Name: INA
Engine Type: INA
Engine Power: INA
Maximum Speed: INA
Operational Range: Over 2,600 feet (800 m) Line-of-Sight
Endurance: 3-4 hours (mission dependent)
Stair Climbing: 45° slope
Turning Circle: (133 cm

Protection

Double payload area on the chassis 4-track drive system with a top speed of up to 5 km/h (3.1 mph) More than 30 pre-programmed automatic motion sequences for manipulator and flippers Interchangeability of accessories within the telemax family, e.g. batteries, tools, cameras and sensors

Tanks

→Main Battle Tanks

MBT-2000 (Type 90-II) Chinese Main Battle Tank (MBT)

Tiers:

Variants:

- **Al-Khalid:** The Al-Khalid is an MBT manufactured in Pakistan by Heavy Industries Taxila (HIT) and the MBT-2000 is an MBT marketed for export by China North Industries Corporation (NORINCO).
- **VT-1A:** Export Version of the MBT-2000. Bangladesh: 44, Morocco: 54, Myanmar: 50

System

Alternative Designation: MBT-2000, Type 90-11, Al-Khalid
Estimated out of Service Date: 2035-2050
Manufacturer: NORINCO
Type: Main Battle Tank
Status: In Production
Family: INA
Crew: ea3
Passenger Capacity: INA
Maximum Effective Range (Road): km500
Maximum Effective Range (Main Gun): m5,000
Add on Parts: Yes, Additional Armor

Dimensions

Length: m10.33
Width: m3.5
Height: m2.4
Weight, Combat: tons48
Ground Pressure: kg/mINA

Automotive

Engine Name: Ukrainian 1,200 hp 6TD-2 six cylinder turbocharged multi-fuel diesel engine.
Engine Type: Diesel
Engine Power: hp1,200
Cruising Range: km500
Speed, Maximum Road: km/h65
Speed, Average Cross: 55
Speed Maximum Swim: km/hINA
Gradient: deg60
Side Slope: deg40
Vertical Step: m0.85
Fording Depth: m1.4
Fording with Preparation: m5
Tench: m2.7
Suspension: Torsion Bar
Hydraulic Shock Absorbers: Yes

Communications

↳*TBR-121*

VHF Transceiver: Yes
VHF Range: km1 to 50
Proliferated: Widely
Digital Data: Yes, Full
Control: Self-Adaptive Control (Including Automatic Antenna Tuner)
Frequency Agile: Yes
Wireless Network Capabilities: Yes
Note:: Very similar in capabilities to the US SINCGARS ASIP

Main Gun

↳*System*

Name: MBT-2000 Main Gun
Type: 125 mm smoothbore gun
Max Rate of Fire: rds/min6-8
Sustain Rate of Fire: INA
Time the Max Rate of Fire can be Sustained: INA

Range Finder Type: Laser

Loader Type: Autoloader

Thermal Jacket: Yes

Fume Extractor: Yes

↳*Ammunition (Option 1)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Muzzle Velocity: m/s850

Basic Load: 39 in total any combination

Maximum Effective Range: m5,000

Minimum Effective Range: mINA

Armor Penetration: Yes

Max Dispersion: mrad0.23

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Fragments: ea2,500

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 2)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Muzzle Velocity: m/s915

Basic Load: 39 in total any combination

Maximum Effective Range: m3,000

Minimum Effective Range: mINA

Armor Penetration: Estimated at 800 mm triple charge HEAT

Max Dispersion: INA

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

↳*Ammunition (Option 3)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot Tracer or APFSDS-T rounds.

Name: 3VBM?/3BM69 "Vacuum-1"

Caliber: mm125

Basic Load: 39 in total any combination

Muzzle Velocity: m/s2,050

Muzzle Energy: MJ15-24

Maximum Effective Range: m3,000

Minimum Effective Range: mINA

Projectile Dimension: mm900

Penetration: mm1,000

Projectile Weight: kg11

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Tank Commander's Weapon System

↳*System*

Name: W-85

Type: 12.7mm Anti-Aircraft Machine Gun

Max Rate of Fire: rds/min550-600

Sustain Rate of Fire: INA

Time the Max Rate of Fire can be Sustained: INA

Range Finder Type: Iron/Optical

Feed System: Belt

Operation: Gas Operated, Open Belt

Traverse: deg360

Elevation Angle: deg90

↳*Ammunition*

Type: Type 54 Round

Caliber: mm12.7x108

Muzzle Velocity: m/s850

Basic Load: ea750 (50 Round Belts)

Effective Range: km2.5

Armor Penetration: Yes

Mounted: Co-axially with the 125mm Main Gun

Loader's Weapon System

↳*System*

Name: Type 80 Chinese Heavy Machine Gun

Type: 7.62 Coaxial Machine Gun

Manufacturer: NORINCO

Length, Total: 1,192

Length, Barrel: mm658

Weight (Gun Only): kg12.6

Weight (With Tripod): kg17.5

Max Rate of Fire: rds/min700-800

Sustain Rate of Fire: rds/minINA

Time the Max Rate of Fire can be Sustained: secondsINA

Range Finder Type: Scope

Action: Gas-operated, open bolt

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

Variant 1: Type 80 - The copy of the PKM GPMG, chambered in 7.62×54mmR

Variant 2: Type 86 - A machine gun only used for tanks as a secondary weapon.

Variant 3: CF06 - An export-only version of the Type 80, which is chambered for 7.62 NATO ammunition.

Variant 4 (Foreign to China): BD-14 - A variant of the Type 80 made by Bangladesh Ordnance Factories under license which uses 7.62×51mm NATO instead of 7.62×54mmR

↳*Ammunition*

Type: Rifle

Caliber: mm7.62x54

Muzzle Velocity: m/s840

Basic Load: ea4,000

Effective Range: m100-1,500 (With Sight Adjustments)

Armor Penetration: Yes

Fire Control

Name: INA

Computerized FCS: Yes, Image Stablished FCS

Ballistic Computer: Yes

Thermal Sight Tank Commander: Yes

Two-Axis Panoramix Sight (Commander): Yes

Commander's sight Magnication: x6 with a 10 deg FOV

Thermal Sight Gunner: Yes

Two-Axis Stabilised Fixed Roof-Mounted Sight (Gunner): Yes

Gunner's Sight Magnification: x3 with a 20 percent FOV and x10 with a 6 deg FOV.

Main Gun Stabilization: Yes

Auto-Tracking Function: Yes

Image-Stabilized Gunner Sight: Yes

Fire Control Computer and Sensors: Yes

Laser Rangfinder: Yes

Automatic Target Tracker (ATT): Yes

Thermal Imager Module: Yes

Roof Mounted Crosswind/Angular Velocity Sensor: Yes

Protection

Hull Armor: all-welded steel, Protects from small arms fire and shell splintering

Turret Armor: all-welded steel, Protects from small arms fire and shell splintering

Applique Armor: Yes, Modular Armor

Explosive Reactive Armor: Yes, added to the Glacis Plate, Sides, forward roof, and Vehicle Nose

Active Protection System: Yes

Mine Clearing: No

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: Available

IR Reflective Paint: yes

Anti-Neutron Liner: Yes

Notes:

The MBT-2000 was developed in China by NORINCO, where it was known as the Type 90-II and was later marketed for export as the MBT-2000. The MBT-2000 developed and offered for export by NORINCO is believed to have very similar specifications as the Al-Khalid and externally appears almost identical. The MBT-2000 has been exported by NORINCO to Bangladesh. The MBT-2000 has a crew of three, a 125 mm smoothbore gun as a main armament, and an all-welded steel construction with additional layer of composite armour over the frontal arc for protection.

M48A5 American Main Battle Tank (MBT)

Tiers:

Variants:

- **M48:** M48: Differed from the M47 in having yet another new turret design and a redesigned hull, doing away with the bow machine gun position, featuring the M41 90 mm gun. These turrets give the M48 its distinctive non-M26 style look. Originally, the gun featured a Y-shape muzzle brake, but this was changed to the more characteristic T-shape.
- **M48C:** M48C: Over a hundred original production hulls were found to be lacking correct ballistic protection and were relegated to training as the M48C.
- **M48A1:** M48A1: New driver hatch and M1 commander's cupola, allowing the M2HB .50 caliber machine gun to be operated and reloaded from within the vehicle.
- **M48A2:** M48A2: Improved powerpack and transmission, redesigned rear plate, and improved turret control.
- **M48A2C:** M48A2C: M48A2s with an improved rangefinder, M17, new ballistic drive and bore evacuator for the main gun, and the auxiliary tensioning wheels were deleted.
- **M48 AVLB:** M48 AVLB: M48A2 chassis, fitted with a scissors-type bridge. All later upgraded to A3 standard.
- **M48A3:** Refit of M48A1 through M48A2C models to diesel engines and a new fire control system. 1,019 converted.
- **M48A3 Mod. B:** M48A3 Mod. B: Additional armor on the exhausts and tail lights, and a raised commander's cupola.
- **M48A4:** M48A4: upgrade proposed 15 October 1966 by Chrysler Defense, mating the T95E5 turret of the original variant of the M60 series tank to the M48A3 hull. Used by Israel in some Magach 3 variants.
- **M48A5:** M48A5: Up-gunned with the 105 mm M68 gun. 2,069 converted.
- **M48A5E1:** M48A5E1: New laser rangefinder, digital fire-control system, improving night vision system.
- **M48A5PI:** M48A5PI: M1 cupola replaced by the Israeli Urdan model.
- **M67 "Zippo":** M67 "Zippo": M48 armed with a flamethrower inside a dummy model of the main gun with a fake muzzle brake. Named after a popular brand of cigarette lighter.
- **M247 Sergeant York::** M247 Sergeant York: This self-propelled anti-aircraft gun, cancelled in 1985 before it was deployed, used the M48A5 chassis.

System

Alternative Designation: M48A5
Date of Introduction: 1976
Type: Main Battle Tank
Proliferation: Greece: 390 M48A5 MOLF. Iran: 180 M48A5. South Korea: Around 300 M48A3K and 500 M48A5K1/K2 are in service. M48A3K are expected to be replaced by the K2 Black Panther in the distant future. Most of the M48A3K are used in

reserve, but the South Korean military continues to use a few tanks in active service. However, the South Korean M48A3Ks are being replaced with K-1 tanks. Lebanon: 104 M48A1 and M48A5. Morocco: 225 M48A5. Taiwan: 450 CM-11, 100 CM-12 Thailand: 105 M48A5PI. Turkey: 758 M48A5T2 in service. All other variants, 2,250 pieces including the 1,389 M48A5T1 are phased out of active service. West Germany: 20 Minenräumpanzer Keiler. Poland: 4 Minenräumpanzer Keiler, from Germany.

In Service: 1976-Present

Crew: 4 (commander, gunner, loader, driver)

Dimensions

Length, Hull: 6.42 m

Length, Gun Forward: 9.31 m

Width: 3.63 m

Height: 3.09 m

Track, Length on Ground: 4.00 m

Track, Width: 0.71 m

Ground Clearance: 0.41 mm

Ground Pressure: 0.88 kg/cm sq

Weight, Combat: 48,987 kg

Weight, Unloaded: 46,287 kg

Automotive

Engine Name: 1 x Teledyne Continental AVDS-1790-2D 1,790-cu in (29.3-liter) air-cooled

Engine Type: V-12 Diesel

Engine Power: 750 hp at 2,400 rpm

Range: 499 km

Speed, Maximum Road: 48 kph

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: 60%

Vertical Obstacle: 0.92 m

Trench: 2.59 m

Fording Depth, without Preparation: 1.22 m

Fording Depth, with Preparation: 2.44 m

Main Armament

↳*System*

Name: M68

Type: 105mm Rifled Gun

Caliber: 105mm

Length: 5,550 mm

Barrel Length: 50 Calibres

Weight: 1,128 kg

Fume Extractor: Yes

Elevation: -9 deg to 19 deg

Traverse: 360 deg

Maximum Firing Range: 4,000 m

Sights: INA

↳***Ammunition***

Type: Rifle

Caliber: mm105

Shell: INA

Shell Weight: INA

Basic Load: 54 Rounds

Coaxial Weapon System

↳***System***

Name: M73 Machine Gun

Type: Medium Machine Gun

Caliber: 7.62mm

Quantity: 2 x 7.62mm M73 machine gun

Manufacturer: United States

Proliferation: The M73 and M219 are 7.62 mm NATO caliber machine guns designed for tank use. NATO no longer uses them, but they were used on the M48 Patton and M60 Patton MBT series (including the M728 Combat Engineer Vehicle), and on the M551 Sheridan Armored Reconnaissance / Airborne Assault Vehicle (AR/AAV).

In Service: 1959-1990s

Length: 1,219.2 mm

Barrel Length: 609.6 mm

Weight: 14.1 kg

Rate of Fire: 500-625 round/min

Action: Recoil-operated/short-recoil operation with gas assist

Muzzle Velocity: 853.44 m/s

Maximum Firing Range: 3,657.6 m

Effective Firing Range: 899.8 m

Feed System: Belt Feed, left or right hand

Sight: INA

↳***Ammunition***

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×51mm NATO
Basic Load: 2,000 Rounds

Auxiliary Weapon System

↳***System***

Name: M60D
Type: 7.62mm
Caliber: General-Purpose Machine Gun
Quantity: 2 x 7.62mm M60D Machine Gun
Manufacturer: Saco Defense U.S. Ordnance
Proliferation: Widely Proliferated
In Service: 1957-Present
Length: 1,105 mm
Barrel Length: 560 mm
Weight: 10.5 kg
Action: Gas-operated, short-stroke gas piston, open bolt
Rate of Fire: 550–650 RPM
Muzzle Velocity: 853 m/s
Effective Firing Range: 1,100 m
Feed System: Disintegrating belt with M13 Links
Sights: Iron sights
Note: The M60D is a mounted variant of the standard M60. It can be mounted on boats, vehicles and as a pintle-mounted door gun in helicopters. When used in aircraft, it differs from the M60C in that it is not controlled by the pilot—rather, it is mounted in a door and operated by a member of the crew. Like the rest of the M60 family, it is an air-cooled, gas-operated, belt-fed weapon. Unlike other models, however, the M60D normally has spade grips and an aircraft ring-type sight or similar, as well as an improved ammunition feed system. A canvas bag is also affixed to the gun to capture ejected casings and links, preventing them from being sucked into the rotor blades or into an engine intake. The M60D was equipped on the UH-1B Huey (using the M23, XM29, M59, and the Sagami mounts), the CH-47 Chinook (using the M24 and M41 mounts) in both door and ramp locations, the ACH-47A "Guns-A-Go-Go" variant of the Chinook (using the XM32 and XM33 mounts), and on the UH-60 Black Hawk (using the M144 mount). The M60D is also used by the British on Royal Air Force Chinooks. In US service, the M60D has been primarily replaced by the M240H. The M60D is still manufactured by U.S. Ordnance and still used on the SH-60 Seahawk.

↳***Ammunition***

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×51mm NATO

Basic Load: 3,000 Rounds Each

Fire Control

Name: INA

Computerized FCS: Yes, The fire control system included a rangefinder, mechanical ballistic computer, ballistic drive, and gunner's periscope. Collectively, these mechanical devices resembled in miniature the fire control systems used in naval gunnery. Only after the Second World War did such systems become small enough for use in combat vehicles. These mechanical fire control systems permitted tanks to engage effectively at much longer ranges than in World War II, a critical consideration for the Army, expecting to enter the European battlefield outnumbered. Instead of a gunner's sight being slaved to the gun tube, the ballistic computer and drive computed the range and elevated the gun. The gunner's primary responsibility lay in keeping the sight on the target.

Thermal Sight Tank Commander: thermal sights (Taiwanese and Turkish M48s only)

Infrared: driving lights and searchlights

Main Gun Stabilization: INA

Rangefinders: There are two basic types of optical rangefinders, stereoscopic and coincidence. With a stereoscopic model range determination occurred by measuring the distance from the observer to a target using the observer's capability of binocular vision. The coincidence rangefinder uses a single eyepiece. Light from the target enters the rangefinder through two windows located at either end of the instrument. The ARCOVE emphasis upon increased long range accuracy led to the incorporation of a fire control system (FCS) in the M48.

Ballistic Computer: M13 electro-mechanical ballistic computer. The mechanical ballistic computer made a more accurate computation of range possible by mathematically accounting for such factors as vehicle cant and ammunition type. Many developmental range finders based on pulses of IR light, such as the OPTAR rangefinder of the T95 continued into 1957.

Protection

Hull Armor: hull front: 101/120 mm hull sides: 76 mm hull rear: 44 mm hull top: 57 mm

Turret Armor: turret front: 110 mm turret sides: 76 mm turret rear: 50 mm turret top: 25 mm

Applique Armor: INA

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: limited protection

Smoke Equipment: M339 smoke grenade dischargers; engine smoke-laying system

Notes:

M48A5 In the mid-1970s, the vehicle was modified to carry the heavier 105 mm gun. The original program designation was XM736. The designation was subsequently changed to M48A3E1 and was finally standardized as M48A5. As many components from the M60A1 were utilized as possible. Anniston Army Depot was issued a contract to convert 501 M48A3 tanks to the M48A5 standard and this was completed in December 1976. These early M48A5's were essentially M48A3 tanks with the 105mm gun added. They retained the M1 cupola armed with a .50 cal machine gun. Based on Israeli experience in upgrading M48 series tanks, further changes were included starting in August 1976. These included replacing the M1 cupola with a low-profile "Urdan" type cupola that mounted an M60D machine gun for use by the tank commander. A second M60D machine gun was mounted on the turret roof for use by the loader. Internal ammunition stowage for the 105mm main gun was also increased to 54 rounds. These tanks were initially given the designation M48A5API; but, after early conversions were brought up to the later standard, the API was removed and these tanks were known simply as M48A5. In addition to the conversion of M48A3 tanks, an additional conversion process for bringing M48A1 tanks to M48A5 standard was also developed. By March 1978, 708 M48A5 tanks had been converted from the M48A1 model. Work continued until December 1979, at which time 2069 M48A5's had been converted. The vast majority of M48A5 tanks in service with US Army units were assigned to National Guard

and Army Reserve Units. A notable exception was the 2nd Infantry Division in the Republic of Korea, who replaced their M60A1 tanks with M48A5's, which arrived in June and July 1978. On 2nd Infantry Division M48A5 tanks the commander's M60D was replaced with a .50 caliber M2 machine gun. By the mid-1990s, the M48s were phased out of U.S. service. Many other countries, however, continued to use these M48 models.

Challenger 2 (FV4034) British Main Battle Tank (MBT)

Tiers:

Variants:

- **Titan:** The Titan armoured bridge layer is based on aspects of the Challenger 2 running gear and replaced the Chieftain Armoured Vehicle Launched Bridge (ChAVLB). The Titan came into service in 2006 with the Royal Engineers, with 33 in service. Titan can carry a single 26-metre-long bridge or two 12-metre-long bridges. It can also be fitted with a bulldozer blade.
- **Trojan:** The Trojan Armoured Vehicle Royal Engineers is a combat engineering vehicle designed as a replacement for the Chieftain AVRE (ChAVRE). It uses the Challenger 2 chassis, and carries an articulated excavator arm, a dozer blade, and attachment rails for fascines. Entering service in 2007, 33 were produced
- **Challenger 2E:** The Challenger 2E is an export version of the tank. It has a new integrated weapon control and battlefield management system, which includes a gyrostabilised panoramic SAGEM MVS 580-day/thermal sight for the commander and SAGEM SAVAN 15 gyrostabilised day/thermal sight for the gunner, both with eyesafe laser rangefinder. This allows hunter/killer operations with a common engagement sequence. An optional servo-controlled overhead weapons platform can be slaved to the commander's sight to allow operation independent from the turret. The power pack has been replaced by a new 1,500 hp (1,100 kW) EuroPowerPack with a transversely mounted MTU MT883 diesel engine coupled to Renk HSWL 295TM automatic transmission. The increase in both vehicle performance and durability is significant. The smaller volume but more powerful Europowerpack power pack additionally incorporates as standard a cooling system and air-intake filtration system proved in desert use. The free space in the hull is available for ammunition stowage or for fuel, increasing the vehicle's range to 550 km (340 mi). This powerpack was previously installed on the French Leclerc tanks delivered to the UAE as well as the recovery tank version of the Leclerc in service with the French Army. Further developed versions of the Europowerpack have more recently been installed in the latest serial produced Korean K2 Black Panther tank as well as the new Turkish ALTAY tank. BAES announced in 2005 that development and export marketing of 2E would stop. This has been linked by the media to the failure of the 2E to be selected for the Hellenic Army in 2002, a competition won by the Leopard 2
- **CRARRV:** The Challenger Armoured Repair and Recovery Vehicle (CRARRV) is an armoured recovery vehicle based on the Challenger 1 hull (with the updated Challenger 2 powertrain) and designed to repair and recover damaged tanks on the battlefield. It has five seats but usually carries a crew of three soldiers from the Royal Electrical And Mechanical Engineers (REME), of the recovery mechanic and vehicle mechanic/technician trades. There is room in the cabin for two further passengers (e.g. crew members of the casualty vehicle) on a temporary basis. The size and performance are similar to the MBT, but instead of armament it is fitted with: A main winch with 50 tonnes-force pull in a 1:1 configuration or 98 tonnes-force pull using an included pulley in a 2:1 configuration and anchor point on the vehicle, plus a small auxiliary winch to aid in deploying the main winch rope. Atlas crane capable of lifting 6,500 kg (14,300 lb) at a distance of 4.9 m (16 ft) (this is sufficient to lift a Challenger 2 power pack). In order to improve flexibility and supplement the transportation of power packs around the battlefield, the British Army procured a quantity of dedicated CRARRV High Mobility Trailers (CRARRV HMT). Each CRARRV HMT enables a CRARRV to transport a single (Challenger, Titan or Trojan) power pack or two Warrior power packs, by altering the configuration of dedicated fixtures and attachment of fittings. Dozer blade to use as an earth anchor/stabiliser, or in obstacle clearance and fire position preparation. Large set of recovery and heavy repair tools including a man-portable ultrathermic cutting system with an underwater cutting capability and a man-portable welder. The design prototype is on display at The REME Museum at MoD Lyneham, Wiltshire.

System

Alternative Designation: Challenger 2, FV4034, CR2 and the retrospective designation CR2 Mk1

Date of Introduction: 1998

Manufacturer: Alvis plc, BAE Systems Land & Armaments

Proliferation: Great Britain: 446, Oman: 38

Type: Main Battle Tank

Status: 1993-2002

Family: 3rd Generation Main Battle Tank (MBT)

Crew: ea4 (commander, gunner, loader/operator, driver)

Passenger Capacity: INA

Maximum Effective Range (Road): km500

Note: The Challenger 2 main battle tank was developed as a private venture to replace the previous Chieftain MBT in service with British Army.

Dimensions

Length (Hull): m8.33

Length (With Gun Forward): m11.55

Width (Normal): m3.5

Width (With Applique Armor): m4.2

Communications

↳***There is no data on the type of Military Radio/Communications Equipment***

Main Gun

↳***System***

Name: L30A1 (LFF) Challenger Main Armament or CHARM 120 mm Rifled Gun
Type: mm120
Manufacturer: Royal Ordnance Factory
Barrel Length: m6.6
Barrel Material: Electroslag refined (ESR) steel.
Max Rate of Fire: rds/min10
Reload Time (1 Round): seconds6
Barrel Life: 400 effective full charges
Breach Mechanism: Split sliding-block breech
Maximum Effective Range: m3,000
Range Finder Type: Laser
Loader Type: Manual, with two-piece ammunition comprising a fully combustible bag charge and projectile.
Maximum Elevation: deg-10
Minimum Elevation: deg+20
Fire on the Move: Yes
Thermal Jacket: Yes
Muzzle Reference System: Yes
Central Bore Evacuator: Yes
Barrel Lining: Chrome, which extends the life of the barrel
Fume Extractor: Yes
Breach Machanism: split-block sliding breech, with an elastomeric obturating pad made necessary by the combustible case charges.
Note 1: The Challenger 2 gun claims the longest-distance tank kill in history. During Gulf War it defeated an Iraqi tank at a range of 4 km.
Note 2: The Challenger 2 is one of the few MBTs in the world to carry a 120 mm rifled main gun

↳***Ammunition (Option 1)***

Type: Armour-piercing fin-stabilized discarding sabot (APFSDS) L23
Caliber: mm120
Muzzle Velocity: m/s1,534
Diameter: mm120
Height: mm500
Basic Load: 50 total rounds of any combination of 120mm Projectiles

Armor Penetration: INA

Effective Range: m3,000

Penetrator: Monobloc tungsten alloy rod

Case Charge: L8 combustible case charge

Note: Average Projectile Load would consists of the following: 33 L26 APFSDS rounds, 13 L31A7 HESH, and 3 white L34 phosphorous smoke rounds.

↳*Ammunition (Option 2)*

Type: APFSDS L26 (CHARM 1)

Caliber: mm120

Muzzle Velocity: INA

Effective Range: m2,100

Penetrator: Monobloc tungsten nickel copper long rod

Case Charge: L14A1 or L14A2

Basic Load: 50 total rounds of any combination of 120mm Projectiles

Variant: APFSDS L27A1 (CHARM 3).

↳*Ammunition (Option 3)*

Type: HESH L31

Caliber: 120

Muzzle Velocity: m/s670

Basic Load: 50 total rounds of any combination of 120mm Projectiles

Effective Range: 2,000

Coaxial Weapon System

↳*System*

Name: L94A1, Hughes EX-34

Type: mm7.62mm Chain Gun

Manufacturer: Heckler & Koch

Produced: 1980 to early 1990s, 1996-1998

Max Rate of Fire: rds/min500-600

Range Finder Type: INA

Weight: kg17.86

Length (Total): m1.25

Length (Barrel): mm703

Action: Electrically driven

Feed System: disintegrating link belt

Variants: EX-31, L95A1 (short barreled version)

↳*Ammunition*

Type: Chain Gun Ammunition

Caliber: mm7.62

Cartridge: 7.62×51mm NATO (linked)

Muzzle Velocity: m/s862

Basic Load: INA

Effective Range: m200-3,000

Armor Penetration: No, Low penetration makes it ineffective against armor

Loader's Weapon System (Operator/Loader's hatch)

↳*System*

Name: L37A2 Machine Gun

Type: 7.62 mm

In Service: 1963-present

Length (Overall): mm1,232

Length (Barrel): mm630

Weight: kg10.90

Max Rate of Fire: rds/min750

Effective Range: m800

Range Finder Type: INA

Action: Gas-Operated

↳*Ammunition*

Type: Rifle

Caliber: 7.62x51mm NATO

Muzzle Velocity: m/s840

Basic Load: INA

Effective Range: m800

Armor Penetration: No

Fire Control

Name: Mk5, IFCS Mk 11/12

Computerized FCS: Yes

Thermal Sight Tank Commander: SAGEM VS 580-10 gyro stabilised sight

Thermal Sight Gunner: Yes, Thales Gunner's Primary Sight

Main Gun Stabilization: Yes, 2-plane

Range Finder: Laser

Infrared: Searchlight

Battle Management System: Yes, similar to that used in the M1A1 Abrams Tank

Gun Control Equipment (GCE): MIL-STD-1553 databus

:

Protection

Hull Armor: Chobham / Dorchester Level 2 (classified)

Turret Armor: Chobham / Dorchester Level 2 (classified)

Applique Armor: Available, The sides of the vehicle are protected by short armoured skirts, which stretch the full length of the vehicle.

Explosive Reactive Armor: Available

Active Protection System: Yes, Dorchester level 2 armour

Mine Clearing: Plow Variant

Self-Entrenching Blade: Yes, Pearson Engineering Combat Dozer Blade

NBC Protection: Yes, MDH Defence Vehicle NBC filtration system

Smoke Equipment: Yes, VIRSSS (Visual and Infra-Red Smoke Screening System).

IR Signature: INA

Automatic Fire Suppression Systems: Yes

Meteorological Sensor: Available

Note: It is one of the most protected tanks in the world. This main battle tank provides a very high level of protection against direct fire weapons.

Notes:

The FV4034 Challenger 2 (MOD designation "CR2") is a third generation British main battle tank (MBT) in service with the armies of the United Kingdom and Oman. It was designed and built by the British company Vickers Defence Systems (now known as BAE Systems Land & Armaments). Vickers Defence Systems began to develop a successor to Challenger 1 as a private venture in 1986. A £90 million deal for a demonstrator vehicle was finalised in January 1989. In June 1991, the Ministry of Defence placed a £520 million order for 140 vehicles, with a further 268 ordered in 1994. Production began in 1993 and the unit's tanks were delivered in July 1994, replacing the Challenger 1. The tank entered service with the British Army in 1998, with the last delivered in 2002. It is expected to remain in service until 2035. The Royal Army of Oman ordered 18 Challenger 2s in 1993 and a further 20 tanks in November 1997. The Challenger 2 is an extensive redesign of the Challenger 1. Although the hull and automotive components seem similar, they are of a newer design and build than those of the Challenger 1 and only around 3% of components are interchangeable.A visual recognition feature is the armoured housing for the TOGS thermal gunsight; the Challenger 2 has this above the gun barrel, the Challenger 1 has it at the right hand side of the turret. The tank's drive system provides a 550 km range, with a maximum road speed of 59 km/h. The Challenger 2 main battle tank was developed as a private venture to replace the previous Chieftain MBT in service with British Army.

Type 88B / A Chinese Main Battle Tank (MBT)

Tiers:

1 2 **3** 4

Variants:

- **Type 88A:** Despite the nomenclature, this is a variant of the Type 88B. It uses a modified Type 83-I 105mm rifled gun with a longer tube. It is fitted with FY series double explosive reactive armor capable of resisting HEAT-FRAG and APFSDS rounds. Some known differences: Combat Weight: 39,500kg, Dimensions: Length with gun forward: 10.65m; Speed: 57kph; Range: 430km; Range with external tanks: 600km; Main Gun: 105mm Type 83-I rifled gun fitted with a thermal shroud and fume extractor; Fire Control: JSFCS-212; Rangefinder: Internal Laser.

Notes:

The Type 88B has a modified gun loading system that has been changed to accept new types of 105mm ammunition. The weight is increased to 38,500kg. It may be fitted with a semi-automatic transmission and have a VRC-83 instead of a YRC-83.

T-64BV Model 2017 Ukrainian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-64A:** Production version of base tank. Tank has a history of reliability problems, and lacks the high armor protection, track skirts, a fcs and atgm launch capability for t-64b.
- **T-64BK:** Command tank version, with 10-m whip antenna.
- **T-64B1:** Variant has partial era mounted; the few original t-80s retained were upgraded to this standard
- **T-64B:** T-64B or 447A (1976) – Fitted with redesigned armour, 1A33 fire control system, 9K112-1 "Kobra" ATGM system (NATO code "AT-8 Songster"), TPN-1-49-23 sight, 2A46-2 gun, 2E26M stabiliser and 6ETs40 loader. Later B/BV models have more modern systems 1A33-1, TPN-3-49, 2E42 and a 2A46M-1 gun. From 1985 the T-64B was fitted with stronger glacis armour; older tanks were upgraded with a 16-mm armour plate. Tanks, equipped with the 1,000 hp 6DT engine are known as T-64BM.
- **T-64U/T-64BM2:** Upgrade series marketed by ukrainian malyshev in 2001. T-64u prototype featured 2nd gen era, composite armor, and fire suppression equipment. Variant added t-80u fire control (1a42 gunner day sight) and thermal night sight-permits it to replace rf-guided at-8/kobra atgm with better refleks series (svir/invar) laser-beam rider atgms. Ukrainian-developed lbr-guided atgm kombat similar to refleks. A later variant changed the fcs to t-80ud/t-90 type, with 1a45 day sight, and agat thermal night sight
- **BM BULAT:** This 45 mt upgrade variant is currently being advertised. It includes an 850-hp engine, fcs with 1g46m lrf-based sight and catherine-based thermal night sight. Remote fired 12.7-mm mg and 5,000 m

System

Alternative Designation: T-64BV Model 2017
Type: Main Battle Tank
Family: T-64 Family
Crew: ea3
Passenger Capacity: INA, IT"S A TANK
Maximum Effective Range: km600
Navigation System: SN-4215 networked satellite navigation unit
Note: The T-64 became the primary MBT of Soviet forces until it was replaced by the T-80 and T-72.

Dimensions

Length (Gun Forward): m9.23
Length (Hull): m6.54
Width: m3.41
Height: m2.17

Weight, Combat: tons42

Ground Pressure: kg/mINA

Automotive

Engine Name: 5TDF Diesel

Engine Type: Diesel

Power to Weight Ratio: hp/ton16.6

Engine Power: hp700

Cruising Range: km600

Speed, Maximum Road: km/h60

Speed, Average Cross: 50

Speed Maximum Swim: km/hNot Amphibious

Gradient: Deg60

Side Slope: Deg40

Vertical Step: m0.8

Trench: m2.72

Fording Depth (Without Preparation): m1.4

Fording Depth (With Preparation): m5

Communication

Type: Lybid K-2RB digital radio

Maximum Range: km70

Main Gun

↳*System*

Name: D-81T (aka 2A46)125 mm smoothbore gun

Type: 125 mm smoothbore

Max Rate of Fire: rds/min8

Manual Load Time: rds/min1-2

Weight (Barrel): kg1,073

Autoloader: Yes, Carousel-Type Autoloader

Fire on the Move: Yes, Main Gun

Maximum Elevation: Deg+14

Minimum Elevation: Deg-6

Traverse Range: Deg360

Automatic Loader: Yes

Thermal Sleeve: Yes

Evacuator Type: central bore evacuator

Effective Full Charge (EFC) Life: rds600

Breech Type: semi-automatic horizontal sliding breech block

Loading System: Korzina electric and hydraulic automatic loading system

Carousel: The carousel can accommodate 28 two-piece rounds of ammunition, and rotates automatically after each round is fired

Carousel Load Time: min13-15

Basic Load Time: min27

Rate of Fire: rds/min6-8

↳*Ammunition (Option 1)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot ((APFSDS))

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Effective Range: m2,000-3,000

Maximum Range: m4,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Dimension: mm900

Projectile Weight: kg11

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Effective Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Proectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 1)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: 915

Max Dispersion: INA

Maximum Range: m3,00

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Name: Kobra (AT-8 Songster)

Type: SACLOS Anti-Tank Missile System

Caliber: mm125

Manufacturer: KB Tochmash

In Service: 1976-present

Proliferation: Widely Proliferated throughout Armenia, Azerbaijan, Belarus, India Iran, Russia, Ukraine, and Uzbekistan

Basic Load: ea4-6

Weight: kg23.2

Warhead Weight: kg4.5

Guidance System: SACLOS Radio

Effective Firing Range: m100-4,000

Muzzle Velocity: m/s125 m/s, which increases to 800m/s at its peak m/s

Flight Time to a 4,000 Meter Targetsec: 9-10

Armor Penetration: 600mm of RHA

Hit Probability: %80

Variants: 9M112M, 9M112M2, 9M124

Note: Fired from the T-64 and T-80 Family of Russian Tanks

Coaxial Weapon System

↳*System*

Name: Type 54 DShK Anti-Aircraft Machine Gun

Type: 12.7mm Heavy Machine Gun

Proliferation: over 1 Million

Length (Total): mm1,625

Length (Barrel): mm1,070

Weight (Gun Only): kg34

Weight (on Wheeled Mounting): kg157

Max Rate of Fire: rds/min600

Range Finder Type: Optical

Action: Gas-Operated, Flapper Locking

Sights: Iron/Optical

Feed System: 50 Round Belt

Turret: single seat and placed at the rear of the vehicle roof. It is sharp-pointed at the front.

Variants: DK, DShKM, DSHKS, Type 54 HMG

Fire on the Move: Yes

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: mm12.7x108

Muzzle Velocity: m/s850

Basic Load: ea300

Effective Range: m2,500

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Loader's Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: mm7.62

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length (Overall): mm1,203
Length (Barrel): mm605
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×54mmR
Muzzle Velocity: m/s825
Basic Load: ea250
Effective Range (Iron Sights): m100- 1,000
Effective Range (With Sight Adjustments): m100-1,500
Maximum Firing Range: m3,800

Fire Control

Name: IG43 fire-control
Computerized FCS: Yes
Thermal Sight Tank Commander: TPN-1-TPV Ukrainian night sight
Thermal Sight Gunner: TPN-1-TPV Ukrainian night sight
Main Gun Stabilization: 2-Plane, 2Eh26M armament stabiliser
Fire on the Move: Yes
Rangefinder: two-axis stabilised IG42 laser rangefinder sight
Ballistic Computer: 1V517 tank ballistic computer
Vision Blocks: 1 x TPNO-16, 2 x TPNA-65 day vision blocks
PZU-5 monocular periscopic sight: Available
Searchlight: Luna infrared searchlight

Protection

Hull Armor: Cast and welded steel armour
Turret Armor: Cast and welded steel armour with Nizh ERA
Armor Protection (Front): mm370-440 of RHA against KE rounds and 500 mm to 575 mm of RHA against HEAT rounds
Applique Armor: Available

Self-Entrenching Blade: KMT-4 roller or the KMT-6 track width mine plough,
Explosive Reactive Armor: Nizh ERA, capable of defeating HEAT and APFSDS Rounds
Number of ERA Plates: ea200-300
Active Protection System: Yes
Mine Clearing: Roller-plow available
NBC Protection: Yes
Smoke Equipment: "Tucha" 81-mm smoke grenade launchers on the left of the turret.
IR Signature: INA
Automatic Fire Suppression Systems.: Available, PPO fire detection and suppression system,
ERA Protection (HEAT Warheads): mm450
ERA Protection (Artillery Shells): mm200

Notes:

In 2019, UkrOboronProm reported that the Kharkiv Armored Plant (KhBTZ) had delivered over 100 updated tanks to the Ukrainian Armed Forces. The upgraded tanks included new thermal imaging for all crew, remove Luna infrared searchlight, include TPN-1-TPV Ukrainian night sight in place of TPN1-49-23, Nizh reactive armour modules designed for bolt-on replacement on T-64BV turrets, SN-4215 networked satellite navigation unit, and Lybid K-2RB digital radio (under licence from Motorola) providing secure communications with a 70 km range. Russian defense reporter and expert Alexey Khlopotov claims the tank is superior to the Russian upgraded T-72B3.

VT4 (MBT3000) Chinese Main Battle Tank (MBT)

Tiers:

Variants:

- **MBT:** No Data
- **Heavy Infantry Fighting Vehicle:** With additional reinforced frontal armor, 100 mm main gun, 30 mm cannon, and two remote weapons stations at the rear.

System

Alternative Designation: VT4, MBT-3000
Type: Main Battle Tank
Expected Out of Service Date: 2050
Manufacturer: Norinco
Crew: ea3
Maximum Effective Range: km500
Periscopes (Day): ea3
Periscopes (Night): ea1
Panoramic Sight (Commander): Yes

Dimensions

Length: m10.1
Width: m3.5
Height: m2.4
Weight, Combat: kg47,174

Automotive

Engine Name: Water-cooled electronically controlled turbodiesel

Engine Type: Turbodiesel

Engine Power: hp1,200

Transmission: Ch1000B Integrated Transmission

Cruising Range: km500

Speed, Maximum Road: km/h70

Speed, Average Cross: 50

Speed, Maximum Swim: km/hINA

Fording Depth: m5

Gradient: %60

Side Slope: %40

Vertical Obstacle: m1.2

Communications

Radio: Tadiran CNR-9000

Note: The Tadiran CNR-9000 is described as a multi-mode VHF/FM COMSEC/ECCM radio for voice and data communications. The mature, third-generation frequency-hopping radio.

↳*TBR-121 VHF Radio*

VHF Transceiver: Yes

VHF Range: km1 to 50

Proliferated: Widely

Digital Data: Yes, Full

Control: Self-Adaptive Control (Including Automatic Antenna Tuner)

Frequency Agile: Yes

Wireless Network Capabilities: Yes

Note:: Very similar in capabilities to the US SINCGARS ASIP

:

Main Gun

↳*System*

Name: 125-mm ZPT98 smoothbore cannon

Type: Smoothbore gun

Caliber: mm125

Length (Barrel): mm6,250

Diameter (Barrel): mmINA

Weight (Gun): kg2,400

Barrel Type: 1 with a sliding gun barrel and a smoke evacuator in the middle

Loader: Automatic

Feed: 8 rds/min via automatic loader

After: Wedge Cross

Recoil: Hydraulic and Pneumatic

Shooting Elevation Angle: deg-5 to +15

Rate of Fire (Automatic): Automatic loading machine: 8 rounds / minute

Rate of Fire (Manual): Manual loading: 1-4 rounds/minute

Sight: Sight with Tank

↳*Ammunition (Option 1)*

Type: High Explosives (HE)

Name: 3VOF128/3OF82

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Number of Rounds: ea38 (22 in Autoloader)

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Max Range: m5,000

Min Range: mINA

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Round Weight: kg33

Projectile Weight: kg23

Fragments: ea2,500

Armor Penetration: Yes

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 2)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Number of Rounds: ea22

Muzzle Velocity: m/s915

Max Dispersion: INA

Max Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Fragments: INA

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

↳*APFSDS Rounds (Option 3)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot Tracer or APFSDS-T rounds.

Name: 3VBM?/3BM69 "Vacuum-1"

Caliber: mm125

Number of Rounds: ea22

Muzzle Velocity: m/s2,050

Muzzle Energy: MJ15-24

Max Range: m3,000

Projectile Dimension: mm900

Round Weight: INA

Penetration: mm1,000

Projectile Weight (Estimated): kg11

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Coaxial Weapon System

↳*System*

Name: W-85 Heavy Machine Gun

Type: Anti-Aircraft Machine Gun

Manufacturer: Norinco

Length: mmINA

Diamter: mmINA

Weight (Gun Only): kg18.5

Weight (Tripod): kg17.5

Action: Gas

Rate of Fire: rds/m550-600

Feed System: Belt

Sightts: Iron/Optical

↳***Ammunition***

Type: Rifle

Caliber: 12.7x108

Muzzle Velocity: m/s850

Basic Load: eaINA

Effective Firing Range (vs. Air): m1,500

Effective Firing Range (vs. Ground): m2,000

Armor Penetration: Available

Tertiary Weapon System

↳***System***

Name: Type 80 Chinese Heavy Machine Gun

Manufacturer: Norinco

Type: 7.62mm Heavy Machine Gun

Length, Total: mm1,192

Length, Barrel: mm658

Diameter: mmINA

Action: Gas Operated

Rate of Fire: rds/m700-800

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

↳***Ammunition***

Type: 7.62×54mmR

Caliber: mm7.62

Muzzle Velocity: m/s840

Number of Rounds: Belts in 100/200/250 round boxes

Effective Firing Range: m100-1,500

Armor Penetration: INA

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes

Laser Range Finder (Commander): Yes

Thermal Sight Gunner: Yes

Laser Range Finder (Gunner): Yes

Sights: Stabilised day/night second-generation cool TI sights.

Main Gun Strabillization: Yes

Roof-Mounted Stabilized Panoramic Sight: Yes

Navigation: GPS Positioning

Range, Day Sight: mINA

Range, Thermal Sight: mINA

Hunter/Killer Engagements: Enabled

IFF: Yes

Rear View Camera: Yes

Fire Control Radars: ea4

Munition Launchers: ea4

Munition Launchers Maximum Range: yd109

Protection

Hull Armor (Frontal Arc with Side Skirts): Composite Armor

Applique Armor: Yes, composite, with explosive reactive armor (ERA) on the turret and hull front (optional on sides)

Explosive Reactive Armor: Yes, can be added

Active Protection System: Yes, GL5 Active Defense System

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes, 6 x forward-firing electrically operated smoke grenades

Explosion-Suppression System: Yes

Notes:

The VT-4 is an advanced main battle tank designed by China primarily for export. Its main cannon, fire-control, armor and protective systems are reportedly competitive with those on other advanced tanks around the world. Norinco officials describe the VT4 as the most advanced tank offered by the company. The VT-4 has a crew of three. The driver sits in the front; the fighting compartment is in the center; and the powerpack is at the rear. The driver, situated at the center of the front of the tank, is equipped with three day periscopes, the center of which can be replaced by a passive periscope for night driving. A single-piece hatch is provided above the driver's seat. The driver also has a rear-view camera and monitor for operating the tank in reverse.

T-90A Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-90K:** Commander's version of the T-90, with additional communication (station R-163-50K) and navigation equipment (TNA-4-3)
- **T-90:** The T-90 family is built around a core of MBTs that have been widely exported and developed independently by various countries. The original T-90 is an upgrade of the T-72BM and was designed to show that Russian tank production was heading in a new direction, away from the issues that surround the T-80. In theory, the T-90 is the most capable MBT in the fleets of many armies around the world, and its development continues as new systems become available.
- **T-90AK:** Command version of T-90A.
- **T-90AM:** Latest version of the T-90A.[77] The main features include the modernisation of the old turret design, which is equipped with a new advanced fire control system "Kalina" (with integrated combat information and control systems), a new automatic loader and a new upgraded gun 2A46M-5, as well as a remote-controlled anti-aircraft gun "UDP T05BV-1". The new version also includes the Relikt (Реликт (динамическая защита) ERA bricks instead of the Kontakt-5 ERA bricks.
- **T-90M:** New modernized version of T-90A. It's a program of modernization of Vladimir tanks and will include 400 tanks currently in service. Tanks will receive 2A82-1M gun (same as in T-14) and fire control system Kalina. They will be upgraded with Afghanit APS and Relikt ERA. The upgrades are also aimed at improving network-centric warfare capabilities and coordination with Armata project vehicles. The first contract was signed in 2017 and serial production started in 2018.
- **T-90S:** Export version of the T-90, later adopted by the Russian Armed Forces as the T-90A. These tanks were made by Uralvagonzavod and were updated with 1,000 hp (750 kW) engines made by Chelyabinsk Tractor Plant. These tanks carry a leaner version of the Shtora-1 passive/active protection system which lacks the infra-red dazzlers carried on the turret. Sometimes called T-90C (Cyrillic letter es looks like a Latin c). These were initially supplied with cast turrets of the early T-90, and when stocks were depleted, new, welded turrets were fabricated.
- **T-90SK:** Commander's version of the T-90S, with additional communication and navigation equipment. It differs in radio and navigation equipment and Ainet remote-detonation system for HEF rounds.
- **T-90S:** "Bhishma" – modified T-90S in Indian service.
- **T-90MS:** Also known as T-90SM is an updated version of the T-90S. It is equipped with a 1,130 hp engine, a PNM Sosna-U gunner view. a UDP T05BV-1 RWS with a 7.62 mm machine gun, GLONASS, inertial navigation systems, new Relikt explosive reactive armour (ERA) that covers more of the tank, and a steering wheel. A new removable turret bustle is included, which provides storage for eight additional rounds. The T-90MS is ready for serial production.[88] 4 video cameras provide a 360° view of the environment, while the tank is more connected to command. The T-90MS has an upgraded thermal imager that can detect tanks over 3300 meters away.
- **BREM-1M:** Armoured recovery vehicle.
- **IMR-3M:** Combat engineer vehicle.
- **MTU-90:** Bridge layer tank with MLC50 bridge.
- **BMR-3M:** Mine clearing vehicle.
- **MTU-2020:** Bridge layer tank based on the T-90A whose chassis has been extended, along with the addition of a road wheel.

System

Alternative Designation: T-90 "Vladimir"/T-90A

Type: Main Battle Tank

Family: T-90 Family of Main Battle Tanks

Manufacturer: Uralvagonzavod

Generation: 3+

Status: In service

Crew: ea3 (commander, gunner and driver)

Passenger Capacity: INA

Maximum Effective Range (Land): km500

Maximum Effective Range (ATGM): m5,000

Note: The T-90 is the most modern tank currently in service with the Russian Army, which has a requirement for around 1 500 of these tanks. Also currently it is the only mass-produced MBT in Russia.

Estimated Service Life: 25-30 years

Shell Weight: kg19.6

Projectile Weight: kg5.67

Charge Weight: kg5

Penetration: mm/deg140/60

↳*Ammunition (Option 3)*

Type: 3BK12M, 125mm (HEAT)

Caliber: mm125

Muzzle Velocity: m/s905-950

Effective Firing Range: m4,000

Shell Weight: kg29

Projectile Weight: kg19

Charge Weight: kg5

Penetration: mm/deg220/60

↳*Ammunition (Option 4)*

Type: 3OF19, 125mm (HE)
Caliber: mm125
Muzzle Velocity: m/s760
Effective Firing Range: m4,000
Shell Weight: kg33
Projectile Weight: kg23
Charge Weight: kg5.0
Penetration: mm/degINA

Anti-Tank Guided Missile

↳*System*

Name: 9M119 Svir, 9M119M Refleks(NATO designation AT-11 Sniper-B)
Type: Laser Beam Anti-Tank Guided Missiles
In Service: 1980's to present
Manufacturer: Degtyarev plant
Cost: $37,500
Mass: kg17.2
Diameter: mm125
Basic Load: ea6
Warhead Type: Tandem hollow-charge
Warhead Weight: kg4.5
Max Rate of Fire: INA
Operational Range: m4,000-5,000
Speed: Subsonic
Guidance System: Laser Beam Riding
Launch Platform: 125 mm smoothbore guns
Variants: 9M119M

Tank Commander's Weapon System

↳*System*

Name: 12.7mm Kord Heavy Machine Gun,
Type: 12.7mm Heavy Machine Gun
Manufacturer: V.A. Degtyarev Plant

Cartridge: 12.7×108mm
In Service: 1998-Present
Weight: kg25.5
Length: mm1,980
Max Rate of Fire: rds/min650-750
Sustain Rate of Fire: rds/min550-600
Action: Gas-operated, rotating bolt
Feed System: 50-round linked belt
Sights: Iron Sights
Variants: 6P50-1, 6P50-2, 6P50-3, 6P49

↳ ***Ammunition***

Cartridge: 12.7×108mm
Caliber: mm12.7mm
Muzzle Velocity: m/s860
Basic Load: ea300
Effective Range: m2,000

Loader's Weapon System

↳ ***System***

Name: 7.62mm PK (Kalashnikov's Machine Gun)
Type: 7.62mm Machine Gun
Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
In Service: 1961-present
Manufacturer: Degtyaryov plant
Proliferation: 1 Million +
Max Rate of Fire: rds/min650
Sustain Rate of Fire: rds/min500
Range Finder Type: INA
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length (Total): mm1,203
Length (Barrel): mm605
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea1,500

Effective Range (Iron Sights): m1,000

Effective Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, ESSA thermal viewer

Thermal Sight Gunner: Yes, ESSA thermal viewer

Panoramic Commander's Sight: No

Main Gun Stabilization: Yes, 2E42-4 Zhasmin System

Note: The Fire Control System is outdated and is from the late 1990s.

Protection

Hull Armor: Steel-composite-reactive blend APFSDS: 550 mm + 250–280 mm with Kontakt-5 = 800–830 mm HEAT: 650–850 mm + 500–700 mm with Kontakt-5 = 1,150–1,550 mm

Turret Armor: Steel-composite-reactive blend APFSDS: 550 mm + 250–280 mm with Kontakt-5 = 800–830 mm HEAT: 650–850 mm + 500–700 mm with Kontakt-5 = 1,150–1,550 mm

Turret Update: The T-90A has a welded Turret, compared to the original T-90

Applique Armor: Available

Explosive Reactive Armor: Yes, Kontakt-5 explosive reactive armor blocks, equivalent to up to 500mm of steel armor

Active Protection System: Yes, the Shtora-1 countermeasures system

Mine Clearing: INA

Self-Entrenching Blade: Yes

NBC Protection: Yes, GO-27 PRKhR radiation and chemical agent detection system.

Deep Wading Kit: Available

Jammer: Yes, TShU1-7 IR jammers located either side of the main gun

Laser Radiation Sensors: Yes

IR dazzlers: Yes

Nakidka Signal Reduction Kit: Available

Smoke Equipment: Yes, banks of 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.

Grenade Maximum Range: m250-300

Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade.

Fire Suppression System: Yes, the Raduga-2 fire-suppression system

Notes:

T-90A – Russian army version with welded turret, V-92S2 engine and ESSA thermal viewer. Sometimes called T-90 Vladimir, in honor of its chief designer Vladimir Potkin. +The T-90 is a third-generation Russian battle tank that entered service in 1993. The tank is a modern variation of the T-72B and incorporates many features found on the T-80U. Originally called the T-72BU, but later renamed to T-90, it is an advanced tank in service with Russian Ground Forces and the Naval Infantry. The T-90 uses a 125 mm 2A46 smoothbore main gun, the 1A45T fire-control system, an upgraded engine, and gunner's thermal sight. Standard protective measures include a blend of steel and composite armour, smoke grenade dischargers, Kontakt-5 explosive-reactive armour and the Shtora infrared ATGM jamming system. It was designed and built by Uralvagonzavod, in Nizhny Tagil, Russia. Since 2011, the Russian armed forces have ceased any further orders for the T-90, and are instead increasing their numbers of the T-14 Armata that began production in 2016. Variants T-90: Successor to T-72BM, originally called T-72BU, with fire control and armor upgrades similar to those on the T-80U. Despite using the lower cost T-72 chassis, this tank incorporated more recent components than the T-80U and is in some ways superior. The original tank had an II night sight, not the thermal sight upgrade, and the under-powered 840hp engine. Upgrades have been added. T-90A: originally known as T-90SM or T-90M, it is now accepted for Russian service as the standard tank. T-90MS: export variant: improved armor protection and ERA; remote control weapon station on turret rook with 12.7 mm MG; traverse forward 316 degrees; elevate -10 to +45 degree. Improved fire control system for engagement of stationary and moving targets while tank is moving. TC panoramic sight for TC-gunner display linked to laser rangefinder; thermal and 4 television camera-each 95 degree wide/45 degree elev. Improved battle management and land navigation tracking system. External auxiliary diesel power unit for fuel conservation. Some reserve main gun ammo in bustle with blowout panels. Turret and hull rear with bar (lourve) armor; anti-laser warning and protection. 125 mm main gun improved accuracy with 2A46M-5 rather than previous 2A46M in T-90s. T-90S: export variant with option for upgrades. Several subsystem changes, such as upgraded FCS, new engine, removal of SHTORA-1, etc., have been added based on customer preferences, and are included in export versions of the tank. Some early T-90S have been upgraded to this standard. Most of these are being sold to India, with the 1,000hp engine upgrade, and with addition of air conditioning. T-90SK: T-90S command variant Bhishma: Indian variant produced from T-90A knockdown kits. It does not use the SHTORA-1 IRCM system. Engine is T-90A upgrade. The tank is sometimes erroneously called T-90S. Various stages of upgrades will be employed in Indian forces. Russia has provided T-90S tanks with Indian intent to upgrade almost all of its T-90 and T-90S remaining versions in knock-down kits with upgrades to meet the Bhishma standard. An issue remains of no air conditioning system in some export MBT to India cause overHEATing of system components and debilitating environment for tank crew in some environments. Project Rhino: most T-90 and T-90S tanks imported by India to be upgraded as Bhishma under this program and agreement with Russia. Other upgrade versions of the T-72 include features of the T-90A such as the improved gun stabilization, improved fire control system, improved engine, and improved ammunition such as the Ainet and the Invar. Other tanks which provide similar capabilities are the Ukrainian T-72AG and T-72mp. The Czech T-72CZM4 also has a 2nd generation thermal sight. Recent Russian tank upgrade packages for the T-72 are the T-72M1, and the T-72M1M. The above Russian upgrades are for modernizing older tanks, versus T-90/T-90A, which are newly produced tanks. Upgraded T-80U, T80UK, and T-84 tanks also have similar capabilities. Weapons & Ammunition Types And Typical Combat Load 125-mm smoothbore gun (est): 43 APFSDS-T: 14 HEAT-MP/HEAT: 3 Frag-HE: 12 Focused Frag Ainet (available) :8 ATGM: 6 Main Armament Ammunition Caliber, Type, Name: 125-mm APFSDS-T, BM-42M Maximum Aimed Range (m): 3,000-4,000 Max Effective Range (m): Day: 3,000-4000 Night: 2,600 Armor Penetration (mm KE): 590-630 at 2,000 meters 125-mm HEAT-MP, BK-29m Maximum Aimed Range (m): 4,000 Max Effective Range (m): Day: 4,000 Night: 2,600 Armor Penetration (mm CE): 650-750 it has some HE effects similar to Frag-HE rounds against personnel and materiel targets. 125-mm HEAT, BK-27 Maximum Aimed Range (m): 4,000 Max Effective Range (m): Day: 3,000+ Night: 2,600 Armor Penetration (mm CE): 700-800 125-mm HE-shrapnel Focused-Fragmentation, Ainet Maximum Aimed Range (m): 5,200 Max Effective Range (m): Day: 5,000 Night: 2,600 Tactical AA Range: 4,000-5,000 Armor Penetration (mm): can defeat IFV and APC 125-mm Frag-HE-t, of-26 Maximum Aimed Range (m): 5,000 Max Effective Range (m): Day: 5,000 Night: 2,600 Armor Penetration (mm): can defeat IFV and APC. A near miss will seriously damage or destroy most IFVs and APCs. Other Ammunition Types: French Giat 125G1 APFSDS-T, Russian BM-42 and bm-32 APFSDS-T. Note: the Russians may have a version of the BM-42M with a DU penetrator. Russian BM-48 APFSDS-T penetrates 650-700 mm Sokol-1 Guided Antitank Round Antitank guided missiles: AT-11B/INVAR Warhead Type: tandem shaped charge (HEAT) Armor Penetration (mm CE): 900, 850 behind ERA Range (m): Day: 5,000 Night: 2,600 AT-11/Refleks: missile with Frag-HE warhead to 5,000 m Notes T-90AM: the Russian military decided against T90A for its forces. In SEP 2011, they displayed T-90AM as a deep modernization of T-90A. They include a low-profile turret with a bustle autoloader and blow-out panels. The new 2a82 gun fires a longer (700+ mm est) and heavier APFSDS-T round to 3,500+ m. The original version of the tank has an 840-hp diesel engine. The engine in subsequent models is upgraded. Engine options include 950, 1,000 and 1,100 hp. The original tank had an II sight from the T-80 series (Buran-PA, 800-1300 meters range). However, marketing materials feature the Agava-2 thermal sight. Recent Gen3 sights are available. These night sights permit night launch of ATGMs. Relikt 3d gen ERA is offered to replace Kontakt-5 in several upgrade packages, or as a separate upgrade. The ERA adds up to 600 mm CE protection and 300 mm KE to turret base armor protection, or about 150 mm more than Kontakt-5. Active protection systems. Arena APS is available. Defensive aides suite is Shtora-1 (laser warning receiver with gun auto-slew, LWR-directed smoke grenade

launchers, and EO-IR jammer), or partial package excluding IR jammers. None is on Bhishma. The Shtora-1 IR ATGM countermeasure illuminators can be detected with night sights. Shtora-1 has no effect against most modern ATGM systems, with encoded tracker beacons. Exclusion of Shtora-1 offers more ERA on the turret front and reduces costs. Protection probably includes radar-absorbent materials and IR-resistant paint. The T-90 may be fielded with full Shtora-1 package (laser warning receiver with auto-slew gun capability, LWR-directed smoke grenade launchers, and EO-IR jammer), with a partial package, or without Shtora-1. Shtora-1 illuminators can be used for night illumination. An improved gun, 2A46M-4, with improved accuracy and use life is available for fitting to the T-90. The BK-29 round, with a hard penetrator in the nose is designed for use against reactive armor, and as an MP round has fragmentation effects. The BK-27 HEAT round offers a triple-shaped charge warhead and 50mm more penetration. The 12.7-mm MG NSVT has both remote electronically operated sight PZU-5 with vertical stabilization, night acquisition, and a gun-mounted K10-T reflex sight.

T-72 Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-72B:** Second Russian main variant of the T-72 after the T-72A.
- **T-72B1:** In 1986, a limited production variant without an ATGM launch capability. Some do not have ERA.
- **T-72BK:** The Commander's variant with additional radios.
- **T-72BM:** Russian T-72B upgrade with 2nd gen ERA. The system is fielded, available for export, and upgraded. Tier 2 and some Tier 3 tanks can challenge US forces under favorable conditions when using modern ammunition and employed by well-trained units with sound tactics. A variety of upgrades are available for the T-72B. They include protection upgrades, such as improved ERA, APS, defensive aids suites with IR jammers, plate armor, welded turret, and grill armor around tracks and grill. Mobility upgrades include a new power train, improved steering, improved mine plows and rollers, and electronic mine spoofing system. Fire control system upgrades include new sights, gun, ammunition, and improved stabilization. With the expanding number of upgrades offered by former Warsaw Pact, Asian, Israeli, and other firms, most T-72-type tanks have some level of upgrade from the basic T-72 MBT. The more affordable upgrade approach for most countries is to execute specific upgrades during maintenance work. But this approach may result in only partially modernized tanks at any one point in the life of the vehicle, and which are not as modern as more recent competitors. An alternative is to produce modernized tanks in small numbers, resulting in high per-unit production costs.
- **T-72BU:** Upgrade variant with the fire control system from the T-80U as well as well as a variety of other changes.
- **T-72BU renamed T-90:** With the limited market for new tanks, the world tank industry has developed upgrades and whole vehicle upgrade packages to tap into the market. Older T-72 tanks can be brought up to the T-72B standard. Some approach the T-90 standard. Most T-72-type tanks fielded reflect some level of upgrade. Upgrade options are expanding from former Warsaw Pact, Asian, Israeli, and other international firms.
- **T-72S / Shilden:** Russian export T-72A upgraded to the T-72B standard. Although visually similar to T-72B, it has slightly less chassis and turret protection. Former Warsaw Pact countries such as Slovakia and Middle Eastern countries like Iran have upgraded their tanks to the T-72S standard.
- **M-84AB1:** Yugoslav upgrade to the M-84, bringing it close to the T-90, and the latest T-72B improved tanks.
- **M-95 Degman:** Croatian M-84 upgrade with box composite armor, ERA, 1200hp and thermal FCS. An export upgrade conversion, AKA M-84D, is offered for Kuwaiti M-84A tanks.
- **PT-91:** Polish upgrade tanks with ERA, Drawa improved FCS, Savan-5 thermal sight, improved gun stabilization, and countermeasures.
- **PT-91M:** Has a 1000hp engine, new guns and FCS, armor changes, and other improvements. PT-91M exported to Singapore. PT-91P is designed for export to Peru.
- **T-72M1:** Demonstrator with 2nd generation ERA and other upgrades were displayed at military shows.
- **T-72M1M:** Includes 3rd generation Relikt ERA and optional Arena Active Protection System (APS). Alternative designations: Rogata and SMT M1988. It is almost the same as the T-72S (Export), except more ERA on the side skirts.

- **AJEYA MK 2:** India is upgrading T-72A tanks close to a Bhishma (T-90S) standard.

System

Alternative Designation: NA

Manufacturer: Uralvagonzavod

Type: Main Battle Tank (MBT)

Crew: ea3

Passenger Capacity: INA

Maximum Effective Range: m500

Note #1: The T-72 Ural main battle tank was developed as a cheaper and more reliable, however less capable alternative to the T-64.

Note #2: 25,000+, one of the most widely produced post-World War II tanks, second only to the T-54/55 family. The T-72 was exported to around 30 countries.

Dimensions

Self-Entrenching Blade: Yes
NBC Protection: Yes
Smoke Equipment: Yes, Grenade launcher 8x; VESS
IR Signature: INA
Automatic Fire Extinguishing Equipment.: Yes

Notes:

The T-72 is a family of Soviet main battle tanks that first entered production in 1971. About 20,000 T-72 tanks were built,making it one of the most widely produced post-World War II tanks, second only to the T-54/55 family. The T-72A version introduced in 1979 is considered a second-generation main battle tank. It was widely exported and saw service in 40 countries and in numerous conflicts. The T-72B3 version introduced in 2010 is considered a third-generation main battle tank.

↳***Ammunition***

Caliber: mm7.62
Muzzle Velocity: m/s840
Basic Load: rounds2,000
Effective Range: m1,500

Anti-Tank Guided Missile

↳***System***

Name: AT-11 Sniper
Type: Gun tube launched, laser guided, ATGM

↳***Ammunition***

Effective Range: mUp to 5,500m depending on version
Miniumum Range: m100
Armor Penetration: 700mm of RHA at 4,000m
Flight Time to Max Range: secs15

Fire Control

Name: INA
Computerized FCS: Yes
Thermal Sight Tank Commander: Yes
Thermal Sight Gunner: Yes

Main Gun Stabilization: Yes

Range, Day Sight: INA

Range, Thermal Sight: INA

Independent and Stabilized Tank Commander's Sight: Yes

Protection

Armor Note: All-welded steel armor that also incorporates composites and ceramics over the frontal arc.

Applique Armor: Likely

Explosive Reactive Armor: Likely

Active Protection System: Yes; unknown type

Mine Clearing: Minimal with onboard blade

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: Yes, Type 94 grenade launchers on both sides of the turret

IR Jammer: Yes; JD-3

Laser Dazzler System: Yes

Notes:

The Type 98 main battle tank (MBT) is a further development in Chinese armor capability and the next step up from the Type 90, from which it is derived. The tank is similar in appearance to the T-72 , with a variety of small differences. It has a more box-like turret, a box-shaped device behind the gunner on the turret roof, a small dome behind the commander's hatch, a different style of hull skirts and tracks with rubber pads. It is armed with a 125-mm carousel-fed autoloader probably of Soviet/Russian design. The commander has a stabilized independent sight. The driver's compartment is located at the front, the turret in the center and the powerpack at the rear. The hull is longer than the T-72 and is made of all-welded steel armor that also incorporates composites and ceramics over the frontal arc. A dozer blade is carried retracted under the front, which can be used to prepare fire positions and clear battlefield obstacles. The driver is seated at the front of the hull in the center and has an adjustable seat that is suspended from the roof. The seat arrangement is designed to reduce the effects of a mine blast on the driver. A single-piece hatch cover is provided that lifts and swings to the right. The driver is equipped with three 1x periscopes; the center one can be replaced by a passive periscope for night driving. The passive periscope is reportedly of the image-intensification type with an effective range of 660 ft (200 m). Compact diesel fuel tanks are fitted to the left and right of the driver's position. The commander is seated on the right and the gunner on the left of the turret. The turret is also fitted with an advanced armor package on either side of the 125-mm gun. The armor can be rapidly changed if it is damaged or upgraded with new technology. A bank of Type 94 76-mm smoke-grenade launchers is mounted on either side of the turret; to the rear is a stowage cage. The tank commander is equipped with a single-piece hatch that opens to the rear and five observation periscopes. To the immediate front is a stabilized 360-degree day/night panoramic sight, which includes a laser rangefinder. The commander also operates the roof-mounted 12.7-mm Type 88 machine gun. This can be elevated from -4 degrees to 75 degrees and has a rate of fire of up to 100 rds/min. The machine gun can also be installed on two other points on the turret roof. The gunner is provided with a single-piece hatch cover that opens to the front and a roof-mounted stabilized day/night sight that includes a laser rangefinder. The latter feeds data to the fire-control computer, enabling the main gun to be rapidly laid onto the target. The computer also receives inputs from other sensors, such as the trunnion tilt sensor, turret horizontal angular velocity sensor and crosswind sensor. According to some sources, the Type 98 may have an automatic target tracker and automated aim error correction via thermal tracking of the projectile. The gunner's thermal stabilized night sight can be magnified by 5x or 11.4x. The 125-mm ZPT-98 main gun is fitted with a thermal sleeve and fume extractor. The barrel is chrome-plated for 21 ft (6.4 m) of its length to increase its service life. The breech mechanism is of the horizontal wedge type. Maximum recoil is said to be 13 in (0.33 m). A total of 42 rounds of ammunition are carried; 22 are in the carousel of the automatic loader. The gun is also capable of firing laser-guided missiles similar to the AT-11 Sniper. The gunner must keep the sight on the target to ensure a hit. The loader is identical to that fitted to Russian T-72 tanks and is said to provide a rate of fire of up to 8 rds/min. Using manual loading, the rate of fire is between one to two rds/min. Mounted to the right is a 7.62-mm Type 86 machine gun. The tank carries 2,000 rounds of 7.62-mm ammunition in belts of 250 rounds. The Type 98 is powered by a Model WD396 V-8 turbocharged diesel engine developing 1,200 hp and coupled to a manual transmission with one reverse and seven forward gears. The suspension is of the torsion bar type with each side having six dual rubber-tired road wheels, drive sprocket at the rear, idler at the front and four track-return rollers. The first, second and sixth road wheels are provided

with special hydraulic shock-absorbers. The upper part of the suspension is covered with an armored skirt for combat operations. The Type 98 is also equipped with a JD-3 infrared jammer and laser dazzler system. The jammer is similar to the Russian Shtora system and has been designed to jam anti-tank guided missiles. Mounted on the turret roof is a pole-type laser detector and a pedestal-mounted ZM-87 laser jamming device. This is operated by the commander or gunner and can neutralize hostile optics. Additionally, the tank also appears to have an active self-defense system of an unknown type. The Chinese system apparently uses a high-powered laser to attack the optics and gunners of enemy systems, in contrast to Russian systems that launch projectiles to disable or detonate incoming anti-tank weapons. The system appears to use a laser warning receiver (LWR), which warns the crew that the tank is being painted by enemy range-finding or targeting lasers. The laser self-defense device can then be used against the enemy by traversing the turret towards the threat, which some reports indicate may be done automatically. The LWR is located in a small dome behind the commander's hatch on top of the turret. The box-shaped device by the gunner's position is probably the self-defense laser. If similar to other proposed and prototype self-defense weapons, the self-defense laser is first used in a low-power mode to target the enemy optics. The power level would then be increased to disable the optics, also likely causing damage to the eyesight of the enemy gunner. It may be a derivative of the Chinese ZM-87 laser interference device, which has a range of up to 4 mi (7 km) with a power booster. Some reports indicate the laser on the Type 98 has a range of up to 5,000 ft (1,525 m). The laser can likely be elevated to defend against helicopters as well as threats on higher ground. Standard equipment includes a nuclear, biological and chemical (NBC) warfare system, fire detection and suppression system, global positioning system and a snorkel for deep fording. Two additional drum fuel tanks can be fitted to the rear to increase range.

Leopard 1A2 German Main Battle Tank (MBT)

Tiers:

Variants:

- **Leopard 1:** The Leopard project started in November 1956 in order to develop a modern tank, the Standard-Panzer, to replace the Bundeswehr's American-built M47 and M48 Patton tanks, which, though just delivered to West Germany's recently reconstituted army, were rapidly becoming outdated. On 25 July 1957, the detailed specifications were released; the new design needed to weigh no more than 30 tonnes, have a power-to-weight ratio of 30 horsepower per tonne, be able to withstand hits by 20 mm rapid-fire guns on every side as well as to operate in a battlefield contaminated with chemical weapons or radioactive fallout, the then-standard baseline for combat with the Warsaw Pact. In addition, the main armament had to consist of a 105 mm caliber weapon (the new British L7A3 105 mm gun was selected), carrying at least as many rounds as current US tank designs. Mobility had priority, while firepower came second; armour was seen as less essential, as it was believed that no real protection against hollow charge weapons was possible anyway.
- **Leopard 1A1:** After the first batch was delivered, the next three batches were the Leopard 1A1 model, which included a new gun stabilization system from Cadillac Gage that allowed the tank to fire effectively on the move. The 1A1 also added the now-famous "skirts" along the sides to protect the upper tracks, and a new thermal jacket on the gun barrel to control heating. A less important change was to use rectangular rubber blocks fastened to the treads with a single pin instead of the earlier two-pin "shaped" versions. The rubber blocks could be easily replaced with metal X-shaped crampons for movement on ice and snow in the winter.
- **Leopard 1A2:** The first 232 tanks of the fifth production batch were delivered as the Leopard 1A2 between 1972 and 1974. The A2 included a heavier and better armoured turret, and therefore did not receive the B&V armour add-ons as did the earlier machines. However, they did receive the other upgrades; the Leopard 1A2A1 received the PZB 200, the Leopard 1A2A2 received digital radios, and the Leopard 1A2A3 got both.
- **Leopard 1A3:** The next 110 vehicles in the fifth batch were fitted with a new welded turret, which was equipped with a new armor consisting of two spaced steel plates with a plastic filling between them (high-hardness armor, and a wedge-shaped gun mantlet, creating the Leopard 1A3. Although the level of armor area density was equivalent to the A2's new welded version, the internal volume was increased by 1.2 m^3 and the effective protection level was increased by half. The improved TRP 2A independent sight was installed for the commander. Upgrades were identical to the 1A2 models, the Leopard 1A3A1 with the night sights, Leopard 1A3A2 with the new radios, and the Leopard 1A3A3 with both.
- **Leopard 1A4:** The Leopard 1A4 formed the sixth batch of 250 vehicles, delivery starting in 1974. The 1A4 was externally similar to the 1A3, but included a new computerized fire control system and the new EMES 12A1 sighting system to aim it. In addition, the commander was provided with his own independent night sighting system, the PERI R12. The new equipment used up space and the ammunition load was reduced to 55 rounds, of which 42 were stored in the magazine to the left of the driver.
- **Leopard 1A5:** In 1980, a research program was undertaken to study further improvements to the Leopard 1, providing it with a completely modern fire control system and fully effective night/bad-weather vision system. The decision was made to base the upgrades on the earlier models, which were no longer competitive. The resulting Leopard 1A5 was based on 1,225 vehicles of the Leopard 1A1A1 model. The turrets were again modified for the 1A5, both in order to store all of the new equipment, as well as to move more of the ammunition into the rear of the turret, as opposed to the left side of the driver where it had previously been stored. The new turret was also able to mount the newer 120 mm gun from the Leopard 2 if desired, although this option has not been used. After trials, the Krupp-Atlas Elektronik EMES 18 fire control system, which was developed from the EMES 15 used on the Leopard 2, was selected in December 1983. The EMES 18 included two new sights on the top of the turret, and no longer required the "bumps" as did the earlier optical systems. A crucial part of the upgrade was the introduction of more effective ammunition, including new APFSDS rounds. The Leopard tank could also be fitted with bolt-on polycarbonate (Lexan) armour panels, which have increased the effectiveness of the armour. The first modified vehicle was delivered in early 1987. Since then, almost all users of

the Leopard 1 have also applied similar changes to their own vehicles, and in most ways the 1A5 be considered the "standard" Leopard 1 today. In the Netherlands, an improved version equivalent to the A5 called "Leopard 1 Verbeterd" (improved) was developed, the same version is used by the Chilean Army.

- **Leopard 1A6:** The Leopard 1A6 prototype was a single Leopard 1 A1A1 testbed, modified with additional armour on the turret and equipped with a 120 mm L/44 gun. The project was ended in 1987, as the Leopard 2 was in widespread service at this point and the 1A5 offered a more reasonable upgrade path for a fraction of the cost.

System

Alternative Designation: Leopard 1A2

Type: Main Battle Tank

Manufacturer: Krauss-Maffei Wegmann, Munich, Germany Krupp-MaK, Kiel, Germany

Crew: 4 (commander, gunner, loader, driver)

Note: Leopard 1A2: This is the Leopard 1A1 with passive night-vision equipment, improved NBC equipment and a stronger cast turret. A total of 232 were built from 1A1s as part of the fifth production batch.

Dimensions

Length, Hull: 7.09 m

Length, Gun Forward: 9.54 m

Width: 3.37 m

Height: INA

Tracks Length, on the Ground: 4.24 m

Tracks Width: 0.55 m

Ground Clearance: 0.44 m

Weight, Unloaded: 38,700 kg

Weight, Combat: 40,000 kg

Ground Pressure: 0.86 kg/cm sq

Automotive

Engine Name: MTU MB 838 Ca M500

Engine Type: 2,282-cu in (37.4-liter) liquid-cooled, 4-stroke, prechamber, inter cooled, turbocharged V-10 multi-fuel

Engine Power: 830 hp at 2,200 rpm

Fuel Capacity: 955 liters

Transmission: ZF 4 HP 250 planetary shifter with hydraulic torque converter; 4 forward/2 reverse gears

Power-to-Weight Ratio: 20.75 hp/metric ton

Suspension: torsion bar, 7 road wheels, rear drive (12- tooth sprocket), front idler, 5 shock absorbs (bump travel 9 in/227 mm, rebound travel 5-6 in/128-156 mm), 4 return rollers

Maximum Speed: 65 km/h

Range, Road: 600 km

Range, Cross-Country: 450 km

Vertical Obstacle: 1.15 m

Trench: 3.00 m

Fording, Unprepared: 1.20 m

Fording, with Preparation: 2.25 m

Fording, with Snorkel: 4.00 m

Gradient: 60 percent

Side Slope: 30 percent

Main Weapon System

↳*System*

Name: 1 x Royal Ordnance L7A3 Rifled Gun

Type: Rifled Gun

Caliber: 105 mm

Length, Barrel: 5.46 m

Muzzle Velocity: INA

Weight: 1,282 kg

Maximum Rate of Fire: 10 rounds per minute (maximum)

Elevation: -9/+20 deg

Traverse: 360 deg

Maximum Firing Range: 4000 m

↳*Ammunition*

Name: L22

Type: Projectile

Caliber: mm105

Basic Load: 60 rounds, 18 ready in turret (Leopard 1A1)

Armor Penetration: INA, Tungsten carbide

Coaxial Weapon System

↳*System*

Name: Heckler & Koch MG5

Type: General Purpose Machine Gun

Caliber: mm7.62

Manufacturer: Heckler & Koch

Length: 1,160 mm

Barrel Length: 550 mm

Height: 239 mm

Width: 120 mm

Weight: 11.20 kg

Action: Gas-operated, rotating bolt

Rate of Fire: 640/720/800 rounds/min

Muzzle Velocity: 840 m/s

Maximum Firing Range: 600–1,000 m

Effective Firing Range: 100–1,000 m

Feed System: Disintegrating DM60/M13 belt in 50-round Gurttrommel or 120-round in separate belt box or from stand-alone ammunition boxes

Sights: Diopter sight or optical sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Basic Load: 1,250 rounds

Armor Penetration: INA

Auxiliary Weapon System

Note: 1 x 7.62-mm air defense machine gun

Fire Control System

Name: FLP-10/EMES 18 integrated fire control

Computerized FCS: Yes, FLP-10/EMES 18 integrated fire control system with Zeiss thermal imaging system retrofitted to approximately 1,300 German Leopard 1A1/1A2s

Main Gun Stabilization: Yes

Direct Fire: Yes

Indirect Fire: Yes

Infrared: Yes, Paint reflects IR

Rangefinder: TEM 2A optical (Leopard 1A2) turret fully stabilized (A3, A4); retrofit of earlier AEG-Telefunken FLER-H modular hybrid computer (1A4 Krupp-Atlas)

Protection

Hull Armor: Glacis 70 mm at 60-deg: Hull Glacis top 25 mm at 83-deg: Hull nose 70 mm at 55-deg: Hull sides 25-35 mm: Hull rear 25 mm at 88 deg: Hull top 10 mm: Hull bottom 15 mm

Turret Armor: Turret mantlet 60 mm; Turret sides 60 mm; Turret rear 60 mm; Turret front 52 mm

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: No

NBC Protection: Yes, collective

Smoke Equipment: 2 x 4-barrel 3-in (76-mm) smoke generators, one each side of turret

Notes:

The Leopard (or Leopard 1) is a main battle tank designed and produced by Porsche in West Germany that first entered service in 1965. Developed in an era when HEAT warheads were thought to make conventional heavy armour of limited value, the Leopard focused on firepower in the form of the German-built version of the British L7 105-mm gun, and improved cross-country performance that was unmatched by other designs of the era. The design started as a collaborative project during the 1950s between West Germany and France, and later joined by Italy, but the partnership ended shortly after and the final design was ordered by the Bundeswehr, with full-scale production starting in 1965. In total, 6,485 Leopard tanks have been built, of which 4,744 were battle tanks and 1,741 were utility and anti-aircraft variants, not including 80 prototypes and pre-series vehicles. The Leopard quickly became a standard of European forces, and eventually served as the main battle tank in over a dozen countries worldwide, with West Germany, Italy and the Netherlands being the largest operators until their retirement. Since 1990, the Leopard 1 has gradually been relegated to secondary roles in most armies. In the German Army, the Leopard 1 was completely phased out in 2003 by the Leopard 2, while Leopard 1-based vehicles are still widely used in utility roles. The Leopard 2 has replaced the Leopard 1 in service with many other nations as well, with derived vehicles using the Leopard 1 hull still seeing service. Currently, the largest operators are Greece, with 520 vehicles, Turkey, with 397 vehicles and Brazil with 378 vehicles. Most of these vehicles have been upgraded with various improvements to armor, firepower and sensors to maintain their ability to engage modern threats. Leopard 1A2 The first 232 tanks of the fifth production batch were delivered as the Leopard 1A2 between 1972 and 1974. The A2 included a heavier and better armored turret, and therefore did not receive the B&V armor add-ons as did the earlier machines. However, they did receive the other upgrades; the Leopard 1A2A1 received the PZB 200, the Leopard 1A2A2 received digital radios, and the Leopard 1A2A3 got both.

Type 90-II Chinese Main Battle Tank (MBT)

Tiers:

Variants:

- **Type 90-IIA:** Type 90-IIA was an export model offered to Pakistan. It was powered by French diesel engine, developing 1 500 hp. It did not enter service because France joined embargo of Pakistan for its nuclear tests.
- **Type 90-IIM or MBT-2000:** Type 90-IIM or MBT-2000 also was an export model aimed to meet Pakistani armed forces requirement. This version was developed to avoid the problem of embargo. Initially it was fitted with Chinese-made engine, which proved to be unreliable. In 2001 this MBT was demonstrated and was still proposed with an option to be fitted with foreign-made powerpack.
- **Al Khalid:** Al Khalid is a further development of the MBT-2000 with some modifications. It is powered by an Ukrainian 6TD diesel engine, developing 1 200 hp. Pakistan acquired license to produce these tanks locally.

Fire Control System

Name: INA

Computerized FCS: Yes

Main Gun Stabilization: Yes

Direct Fire: INA

Indirect Fire: INA

Automated Tracking System: This system is capable of engaging moving or stationary targets while moving in day or night. The automatic target tracking system uses a thermal image display which can be controlled by either the tank gunner or commander. It is capable of tracking soldiers, vehicles and helicopters. The targeting computer can also calculate lead on moving targets.

Note #1:: This FSC includes a laser rangefinder (accurate to within +/-33 ft or 10 m) incorporated into the gunner's sight, ballistic computer, several sensors and a two-axis gun stabilize r. The sensors measure angular velocity and displacement, elevation angle velocity and trunnion cant. The computer also accepts manual updates for crosswind, air and charge temperatures, distance and types of ammunition.

Protection

Hull Armor: Yes, Composite armor plating

Turret Armor: Yes, Composite armor plating

Applique Armor: INA

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, overpressure system, anti-neutron inner liner

Fire Equipment: Yes, automatic suppression and extinguishing system

Smoke Equipment: Yes, 4 x electric dischargers on either side of turret

Note #1:: Its armor was developed from the start to be replaced if damaged or better armor becomes available.

Note #2:: NORINCO also notes that the hull is coated with a layer of "infrared-reflecting" paint to reduce the infrared (IR) signature.

Notes:

The Type 90 MBT was further developed, incorporating advanced features into their next-generation MBT, but besides a few test vehicles for evaluation, this tank was not adopted by the People's Liberation Army, instead, the tank became the export model for Pakistan which developed the MBT-2000 (Al-Khalid) tank based on the Type 90. In the 1970s, the leadership of China's People's Liberation Army was concerned about the Soviet threat and requested an improved main battle tank (MBT). Norinco and the Inner Mongolia First Machine Group Corporation were tasked to develop a series of new tanks. After examining samples of T-72 tanks delivered by Iran in the late 1980s (captured from the Iraqi Army), the Chinese military realized contemporary Chinese tanks were still vulnerable. Design features of the T-72 and some western tanks were used to develop a second generation of Chinese tanks, eventually incorporating a redesigned hull and suspension, a new welded turret and 125 mm autoloaded tank gun. The Type 80 and Type 85 tanks led to the Type 90. The Type 90 was rejected for Chinese service in favour of other designs, but it influenced further development which would lead to China's third-generation Type 99 tanks. The Type 90 is an evolutionary design: the Type 90-II version shares 10% of its components with the Type 59, 15% with Type 69, 20% with Type 85/88C, and is built with 55% new components. This model was put up for sale on the international market. This tank was jointly developed by Beijing 201 Institute (China North Vehicle Research Institute) and Inner Mongolia 617 Factory (Inner Mongolia First Machine Group Corporation). The Type 90 is the first Chinese tank to incorporate the modular design concept for its armor. The frontal arc of the turret is a modular design so that when more advanced composite armor is developed, it can readily replace older composite armor.

Leopard 2A4M CAN Canadian Main Battle Tank (MBT)

Tiers:

Variants:

- **Leopard 2:** The baseline Leopard 2, sometimes informally called the "A0" to differentiate it from later versions, was the first series manufactured version. The vehicles were manufactured from October 1979 until March 1982, altogether 380 vehicles. 209 were built by Krauss Maffei and 171 by MaK. The basic equipment consisted of electrical-hydraulic stabiliser WNA-H22, a fire control computer, a laser rangefinder, a wind sensor, a general-purpose telescope EMES 15, a panorama periscope PERI R17, the gunner's primary sight FERO Z18, on the turret roof as well as a computer-controlled tank testing set RPP 1–8. 200 of the vehicles had a low-light enhancer (PZB 200) instead of thermal imaging. Two chassis served as driver training vehicles.
- **Leopard 2A1:** Minor modifications and the installation of the gunner's thermal sight were worked into the second batch of 450 vehicles Leopard 2, designated the A1. Krauss-Maffei built 248 (Chassis Nr. 10211 to 10458) and Mak built 202 (Chassis Nr. 20173 to 20347). Deliveries of the 2A1 models started in March 1982 and ended in November 1983. The two most notable changes were the modification of the ammunition racks to be identical to those in the M1A1 Abrams, and redesigned fuel filters that reduce refuelling time. A third batch of 300 Leopard 2, 165 by Krauss-Maffei (Chassis Nr. 10459 to 10623) and 135 by MaK (Chassis Nr. 20375 to 20509.), was built between November 1983 and November 1984. This batch included more minor changes that were later retrofitted to the earlier 2A1s.
- **Leopard 2A2:** This designation was given to upgraded vehicles of the first batch of Leopard 2s, brought up to the standard of the second and third batches. This modernisation gradually replaced the original PZB 200 sights in the first batch with thermal sights for the EMES 15 as they became available. Furthermore, the upgrade included the fitting of filler openings and caps to the forward hull fuel tanks to allow separate refuelling, as well as the addition of a deflector plate for the periscope and a large coverplate to protect the existing NBC protection system. Finally, the tank was given new five metre towing cables with a different position. The programme began in 1984 and ended in 1987; the third, fourth and fifth batches, which were produced during this period, had the same features. The modernised first batch can be recognised by the circular plate covering the hole where the cross-wind sensor for the fire-control system was removed.
- **Leopard 2A3:** The fourth batch of 300 vehicles, 165 by Krauss-Maffei (Chassis Nr. 10624 to 10788) and 135 by Mak (Chassis Nr. 20510 to 20644), was delivered between December 1984 and December 1985. The main change was the addition of the SEM80/90 digital radio sets (also being fitted to the Leopard 1 at the same time), and the ammunition reloading hatches being welded shut. Even with these minor changes the new batch was known as the 2A3.
- **Leopard 2A4:** The most widespread version of the Leopard 2 family, the 2A4 models included more substantial changes, including an automated fire and explosion suppression system, an all-digital fire control system able to handle new ammunition types, and an improved turret with flat titanium/tungsten armour. The Leopard 2s were manufactured in eight batches between 1985 and 1992. All the older models were upgraded to 2A4 standard. Until 1994, Germany operated a total of 2,125 2A4s (695 newly built and the rest modified older versions), while the Netherlands had an additional 445 tanks. The 2A4 was also license manufactured in Switzerland as the Panzer 87 "Leopard" or Pz 87. This version included Swiss-built 7.5 mm MG 87 machine guns and communications equipment, and featured improved NBC protection system. Switzerland operated 380 Pz 87 tanks. After 2000, Germany and the Netherlands found themselves with large stocks of tanks that they had no need for after the Cold War. These tanks were sold to NATO or friendly armies around the world. Among these buyers of the surplus tanks were Turkey (purchasing 354 vehicles), Greece (183), Sweden (160), Chile (140), Finland (139), Poland (128), Austria (114), Spain (108), Canada (107), Singapore (96), Norway (52), Denmark (51), and Portugal (37). The Pz 87WE (WertErhaltung) is a planned Swiss modification and upgrade of the Pz 87. The modification significantly improves protection through the addition of the Leopard 2A6M's mine protection kit, thicker armour on the front glacis, and a turret equipped with a Swiss-developed armour package using titanium alloy. The turret roof armour is improved and the smoke grenade launchers redesigned. Further improvements enhance survivability and combat capability, such as a turret electric drive similar to the Leopard 2A5, a

driver rear-view camera, an independent weapons station for the loader, and enhanced command and control systems. The fire control system is also upgraded, using the Carl Zeiss Optronics GmbH PERI-R17A2 fire control system. A remote weapons station containing a fully stabilised Mg 64 0.50 in (12.7 mm) machine gun is also fitted to the tank. The Pz 87-140 is an experimental variant of the Swiss Pz 87 with a 140 mm gun and additional armour, which was later used on the newer production variants. The Leopard 2A4CHL is the upgraded Chilean version of the Leopard 2A4 ordered by Chile in 2007. Upgrades include new electronics, sighting and information systems meant to elevate the Leopard 2A4's networking capability to be equal to that of the Leopard 2A6, a new suspension system and the upgrading of the tanks main gun to the L/55 smoothbore cannon used on the Leopard 2A6. Other upgrades are remote weapon stations over the gunner and commander hatches fitted with the MG3 and HK GMG. The Leopard 2A4CHL also has improved roof and side turret armour and can be uplinked with Chile's battlefield control network. The Leopard 2NG (Next Generation) is a privately funded Turkish upgrade by Aselsan that includes the application of modular composite armour (AMAP), upgraded optics, completely overhauled turret mechanics and a new fire control system on the work since 1995 and to be delivered by late 2011, which is intended to be used on the new Altay MBT. It was developed without an order of the Turkish Army, but might meet the requirements for the modernization of the Turkish Leopard 2A4s. The old powerpack and the L/44 gun barrel are kept, but the combat weight is increased to 65 tonnes. According to Turkish news sources, Finland was interested in getting the Turkish upgrade package to modernise their fleet of Leopard 2A4s. However, in 2015 Finland purchased 120 2A6 vehicles from the Netherlands.

- **Leopard 2 Marksman:** Finland has modernised its Marksman SPAAG vehicles by replacing the original T-55AM chassis with a newer Leopard 2A4 chassis. The upgraded Marksman vehicles were scheduled to enter service with the Finnish Army in 2016. The new Leopard 2 chassis greatly improves mobility compared to the older T-55AM chassis, both on- and off-road. The Leopard 2 chassis is also larger, thus providing a more stable firing platform for the Marksman turret to operate from.
- **Leopard 2 Imp:** "Leopard 2 Improved" was a prototype-series for enhancing the A4, introducing a wedge-shaped, spaced add-on armour to the turret front and the frontal area of the sides. These spaced armour modules defeat a hollow charge prior to reaching the base armour, and causes kinetic-energy penetrators to change direction, eroding them in the process; it does not form a shot-trap, since it does not deflect the penetrators outwards to hit the hull or turret ring. The gun mantlet was redesigned to accept the new armour
- **Leopard 2A5:** From the Leopard 2 Imp was then developed into the A5. There were also some improvements in the main armour composition. The interior received spall liners to reduce fragments if the armour is penetrated. The frontal "heavy" third of the side skirts was replaced with a stronger type. The commander's sight was moved to a new position behind the hatch and it received an independent thermal channel. The gunner's sight was moved to the turret roof as opposed to the cavity in the front armour in previous models. A heavier sliding driver's hatch was fitted. Turret controls went all-electric, increasing reliability and crew safety, as well as weight savings. The gun braking system was improved to prepare for the later mounting of the new L/55 gun tube and to enable firing of more powerful ammunition, such as the DM-53 APFSDS. The first A5s were handed over to the German army tank school in 1995 and started to enter regular service with Panzerbataillon 33 in December the same year. The Leopard 2A5 DK is a variant of the Leopard 2A5 similar to the Leopard 2A6 with some small modifications, used by the Danish Army.
- **Stridsvagn 122:** Also based on the Leopard 2 Improved, Stridsvagn 122 is a Swedish Army tank with 120 units built, 91 of which were licence-produced in Sweden. The tank features increased armour on the turret top and front hull, and improved command-, control- and fire-control systems. Externally, it can be distinguished from the Leopard 2A5 by the French GALIX smoke dispensers, different storage bins, and the much thicker crew hatches. The Strv 122B, a variant equipped with modular AMAP composite armour from IBD Deisenroth, has increased 360° protection against threats like EFPs, RPGs and IEDs.[133] The width of 4 metres (13 ft) has been kept, while the weight increases by only 350 kilograms (770 lb).
- **Leopard 2-140:** In the early 1990s, Rheinmetall began development of a 140 mm smoothbore cannon for use in future tank designs. The new gun was intended to counter new Soviet tank developments, especially since the next generation of Soviet main battle tanks were rumoured to be armed with a 135 mm or 152 mm cannon. The new 140 mm cannon was part of a modernisation programme for the Leopard 2 known as the KWS III.est firing of the new 140 mm cannon was conducted. Results showed that the gun had high penetration values, and had a muzzle velocity of around 2000 metres a second, with potential to be increased further. However, the 140 mm rounds were too heavy for the tank crew to handle effectively. Test firing of the new 140 mm cannon was conducted. Results showed that the gun had high penetration values, and had a muzzle velocity of around 2000 metres a second, with potential to be increased further. However, the 140 mm rounds were too heavy for the tank crew to handle effectively. The KWS III upgrade was to feature a new turret. This new turret was equipped with the planned 140 mm cannon and an autoloader. The introduction of an autoloader reduced the tank's crew to three members, as a dedicated loader was no longer needed. The gun's 32 rounds of ammunition were stored separate from the crew in a large compartment occupying the entire rear of the turret, in order to increase crew survivability in the event of a cook off. The turntable-style turret had the gun offset to the left side, due to the autoloader's lateral feeding of ammunition into the cannon breech. The turret was powered by an electro-hydraulic drive and also featured an IFIS battlefield management system. The crew was protected by an armoured capsule and ballistic protection for the hull was to be improved; planned protection level of the KWS III upgrade was to be equal to or better than the Leopard 2A5. A total of 650 Leopard 2 KWS III tanks were originally projected to be purchased. However, in 1995, the KWS III programme was cancelled due to changes in the political environment. Despite this, development still continued on the 140 mm cannon, with Rheinmetall coordinating with the British Royal Ordnance and French GIAT companies. The 140 mm cannon was fitted to an old Leopard 2

prototype with the turret T19. Counterweights were added to the rear of the turret to balance the increased weight of the 140 mm cannon; however, the modified Leopard 2 was not equipped with any other KWS III upgrades apart from the new gun. Live fire testing showed mixed results, where the 140 mm cannon showed superior penetrating power compared to the existing 120 mm cannon, but also demonstrated poorer handling characteristics. The lack of the autoloader on the prototype further hampered performance.

- **Leopard 2A6:** The Leopard 2A6 includes the addition of the Rheinmetall 120 mm L/55 smoothbore gun and other changes. All German tank battalions of the "crisis intervention forces" are equipped with the A6. Canada purchased 20 Leopard 2A6s from the Netherlands. These were delivered in 2007. Portugal also purchased 37 Leopard 2A6 from the Dutch in 2007, with delivery in 2008. In January 2014, Finland purchased 100 L2A6s, as well as munitions, simulators, and a ten-year supply of reserve parts from the Netherlands. The tanks were delivered in batches between 2015-2019. The Leopard 2A6M is a version of the 2A6 with enhanced mine protection under the chassis, and internal enhancements to improve crew survivability. In the summer of 2007, Canada borrowed 20 A6Ms from Germany for deployment to Afghanistan. The Leopard 2 Hel is a derivative of the 2A6 that was ordered by the Greek Army in 2003 - the "Hel" stands for "Hellenic". The 170 tanks were to be delivered between 2006 and 2009. A total of 140 will be built in Greece by ELBO, which delivered the first units in late 2006. The Leopard 2A6M CAN is a Canadian variant of the Leopard 2A6M. Significant modifications include distinctive black boxes mounted on the rear of the turret bustle, and stand-off slat armour. The first tanks configured in this variant were 20 loaned from the German Bundeswehr in an effort to increase firepower and protection given to Canadian troops operating in the south of Afghanistan. The loaned tanks retain their German MG3 machine guns, the ex-Dutch tanks are also expected to retain their FN MAG machine guns due to commonality with Canadian stocks of C6 GPMG, itself a variant of the FN MAG. Due to the loaned status of the first 20 tanks, the air conditioning unit originally could not be installed as only minimal changes could be made (the crew wore cooling vests instead, and the turret's electric drive generates less heat than the hydraulic drive of the older Leopard C2). The loaned German tanks will be kept by the Canadian Forces and may be further upgraded, while ex-Dutch Leopard 2A6s were modified to German Leopard 2A6M specifications and used as restitution for the loaned tanks. Canadian Leopard 2s in Afghanistan were later fitted with air conditioning units (a much needed commodity in the scorching desert of Afghanistan) and Saab's Barracuda camouflage mats, which also serve to reduce solar loading by 50 percent.
- **Leopard 2A6TR:** The Leopard 2A6TR was the Turkish variant during Turkish Army's tank procurement project in the year 2000. The version was based on 2A6EX. The project was dropped in favor of developing indigenous Altay tank.
- **Leopard 2E:** The Leopard 2E is a derivative of the 2A6, with greater armour protection, developed under a programme of co-production between the defence industries of Spain and Germany. The programme was developed within the frame of collaboration decided in 1995 between the Defence Ministries of both countries, in which also was included the cession of use by a period of five years of 108 Leopard 2A4 from the German Army to the Spanish Army. However, this cession was extended up to 2016, and after that those tanks will be the sole property of the Spanish Army, as has been made public on 24 January 2006, then having been paid a total of 15,124,014 euros in ten yearly installments, giving the Spanish co-ownership from 2006. In 1998, the Spanish government agreed to contract 219 tanks of the Leopard 2E line, 16 recovery tanks Leopard 2ER (Bufalo) and 4 training vehicles. They chose Santa Bárbara Sistemas as the main contractor. The programme, with a budget of 1,939.4 million Euros, also includes the integrated logistical support, training courses for crew instructors and maintenance engineers and driving, turret, maintenance, aiming and shooting simulators. Deliveries of the first batch began in 2004.
- **Leopard 2 PSO:** The new Leopard 2 PSO (Peace Support Operations) variant is designed specially for urban warfare, which had been encountered in peacekeeping operations with increasing frequency. Therefore, the Leopard 2 PSO is equipped with more effective all-around protection, a secondary weapons station, improved reconnaissance ability, a bulldozer blade, a shorter gun barrel (for manoeuvring on urban streets at the expense of fire range), non-lethal armament, close-range surveillance ability (through camera systems), a searchlight and further changes to improve its perseverance and mobility in a built-up non-wide open area. These features are similar to the Tank Urban Survival Kit for the American M1A2 Abrams.
- **Leopard 2A7:** The Leopard 2A7 is fundamentally different from the KMW variant 2A7+ and is not optimised for combat in urban terrain. A total of 20 vehicles are provided for converting. It involves former Dutch A6NL models returned by Canada to Germany. The original upgrade to A6M has been extended in coordination with Canada and includes a crew-compartment cooling-system from the Leopard 2 A6M-HEL series, a new 20 kW auxiliary power unit based on the Steyr Motors M12 TCA UI engine, the Saab Barracuda Mobile Camouflage System (MCS) with Heat-Transfer Reduction (HTR CoolCam) system, a field trial proven combat management and information system (IFIS: Integriertes Führungs- und Informationssystem), onboard network optimization with ultracapacitors in the chassis and turret, a SOTAS IP digital intercom system, a renewal of the fire suppression system in the crew compartment, and the retrofitting of Attica thermal imaging module in the commander optics. The weapon system is adapted for firing HE ammunition. It is also fitted for, but not with, additional passive side protection armour. The first Leopard 2A7 was handed over to the German Army in Munich on 10 December 2014. A total of 14 vehicles were produced for Tank Battalion 203, plus four more going to the Armoured Corps Training Centre and one vehicle at the Technical School for Land Systems and School for Technology of the Army. The last tank remains as a reference vehicle at KMW.
- **Leopard 2A7+:** The Leopard 2A7+ was first shown to the public during the Eurosatory 2010, featuring the label "Developed by KMW – tested and qualified by the German Ministry of Defence". The Leopard 2A7+ has been tested by the Bundeswehr under the name UrbOp (urban operations). The Leopard 2A7+ is designed to operate both in low intensity and high intensity conflicts. The tank's protection has been increased by modular armour; the frontal

protection has been improved with a dual-kit on the turret and hull front, while 360° protection against RPGs and mine protection increase the survivability of the tank in urban operations. The modular armour's system components were first used by Canada in Afghanistan. It can fire programmable HE munitions and the turret mounted MG3 has been replaced with a stabilised FLW 200 remotely controlled weapon station. The mobility, sustainability and situational awareness have also been improved. In December 2018, Hungary ordered 44 2A7+s, making them the second operator of the improved version, after Qatar.

System

Alternative Designation: Leopard 2A4M

Type: Main Battle Tank

Manufacturer: Krauss-Maffei Wegmann Maschinenbau Kiel

Family: Leopard German Main Battle Tank Family

Crew: ea4

Dimensions

Length (gun forward): m9.61

Width: m4.05

Height: m2.5

Weight: t62.5

Fire Control System

Name: Digitaler Ballistikkern (DigBal) digital FCS

Computerized FCS: Yes

Main Gun Stabilization: Hydraulic and provides dual-axis stabilization

Primary Sight: Hauptzielfernrohr (HZF) primary sight System

Commander's Periscope: Carl Zeis fully stabilized monocular PERI R17A1 sight

Thermal Sight Tank Commander: Warmebildgerat X (WBG-X) thermal sight

Thermal Sight Gunner: Warmebildgerat X (WBG-X) thermal sight

Primary Gun Sight: Binocular HZF

Infrared: Yes

Range Finder: EMES 15 laser rangefinder (LRF

Wind Sensor: Yes

Telescope: EMES 15

Tower Sight: FERO Z18

Computer Controlled Tank Testing Set: RPP 1–8

Ballistic Compensator: Field zeroing system

Weapon Slaving System: Waffenachfuhranlage (WNA) H22 weapon slaving system

Emergency Backup Turret Sight: Turmzielfernrohr (TZF) FERO Z18

Fault Detection System: Rechnergesteuertes Panzerpufstsem (RPP 1-8) fault detection system

Field Zeroing System: Feldjustieranlage (FJA) field zeroing system

Protection

Hull Armor: Welded steel plates, with spaced multilayer passive composite armour protecting the glacis and hull sides as well as the turret front and sides. Also areas of the hull are fitted with cage armor for better protection. The cage armor provides protection against RPG rounds and anti-tank guided missies.

Turret Armor: Welded steel plates, with spaced multilayer passive composite armour protecting the glacis and hull sides as well as the turret front and sides. Areas of the turret are also fitted with cage armor and electric turret controls.

Applique Armor: Yes, Track Skirt

Explosive Reactive Armor: INA

Active Protection System: Yes, Dräger Safety AG & Co

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes, KGaA CBRN protection system

Smoke Equipment: MWA [Mehrfachwurfanlage] 76 mm obscurant smoke discharger system

IR Signature: IR suppressive smoke screen system

Fire Suppression System: Yes, Automatic

Grenade Launchers: Eight grenade launchers are mounted on each side of the Turret

Fire Detection and Suppression System: Yes, Kidde-Deugra Brandschutzsysteme System

Emergency Escape Hatch: Yes, below the driver's compartment

Notes:

The Leopard 2A4M CAN is the upgraded Canadian version of the Leopard 2A4 acquired from the Royal Netherlands Army surplus. The Leopard 2A4M CAN is specially designed for the war in Afghanistan, based on experience gained by Leopard 2 operators. The first 20 were delivered in October 2010; of which just five were deployed to Afghanistan at the end of 2010 and operated until July 2011, when combat operations stopped. In the mid 2000s Canadians realized the importance of main battle tanks when their Leopard C2 tanks were rushed in to Afghanistan. Canadians needed a better protected tank, especially against land mines and improvised explosive devices than their C2. There was no point to further upgrade the C2s that are nearly 40 years old and were become increasingly harder to maintain. In an attempt to renovate their heavy armor fleet and for their immediate needs in Afghanistan in 2007 Canada acquired 80 Leopard 2A4, and 20 Leopard 2A6 tanks from Dutch surplus stocks. Another 20 Leopard 2A6 tanks were borrowed from Germany. The oldest and less capable Leopard 2A4 tanks were used by Canadian training squadrons. It is worth noting that Canada actually acquired more Leopard 2A4 and Pz.87 tanks, however these were converted to support vehicles, such as combat engineer vehicles and armored recovery vehicles. In 2009 Canada commissioned Krauss-Maffei Wegmann of Germany to refurbish and upgrade 20 ex-Dutch Leopard 2A4 tanks to the Leopard 2A4M CAN standard. All of these tanks were completed in 2010. Between 2010 and 2011 five Leopard 2A4M tanks were deployed in Afghanistan.

Chonma-ho North Korean Main Battle Tank (MBT)

Tiers:

Variants:

- **Ch'ŏnma-ho ARV:** Armoured recovery vehicle with a casemate superstructure
- **Ch'ŏnma-ho Command:** Command variant of the tank with a fake main gun
- **Juche-Po:** Juche-Po – Self-propelled artillery gun on a modified Ch'ŏnma-ho chassis. The Juche-Po is an improvement over the Tok-Ch'ŏn artillery piece, which was mounted on an ATS-59 chassis. There are at least four M1991 versions of the Juche-Po, each mounting a different gun: the D-30 122 mm, D-74 122 mm, the M-46 130 mm and the ML-20 152 mm howitzer. A fifth M1992 version is armed with the SM-4-1 130 mm howitzer. These artillery pieces can be identified by their six road wheels, as compared to the Tok-Ch'ŏn's five, and a prominent recoil cylinder which protrudes from the turret. Another major difference is that the Juche-Po has a fully encased rounded turret, as opposed to the older open-topped self-propelled artillery pieces used previously.
- **Ch'onma-ho I:** This is a slightly modified version of the T-62A with a 115-mm main gun and a 14.5-mm anti-aircraft machine gun. It is also reported to be lighter, having thinner armor than its predecessor.
- **Ch'onma-ho II:** This is an upgraded version of the Ch'onma-ho I with an externally mounted laser rangefinder above the main gun.
- **Ch'onma-ho III:** This variant was first seen publicly during an April 1992 parade in Pyongyang. It features a laser rangefinder above the 115-mm main gun; thermal shroud on the main gun; full hull-skirting; turret smoke-grenade launchers; two sets on each side of the turret; add-on armor to the turret front and pos sibly the glacis; potential explosive reactive armor (ERA) on the turret sides (from the turret midpoint to turret rear); and an improved fire-control system.
- **Ch'onma-ho IV:** This variant is fitted with a larger gun, said to be the 125-mm main gun from the Russian T-72. Three banks of four smoke-grenade launchers are located on each side of the turret.
- **Ch'onma-ho V:** This updated Ch'onma-ho II has a new engine and 125-mm gun. A box with internal combined night-vision camera and laser rangefinder is fitted above the mantlet.

Basic Load: INA

Armor Penetration: INA

Ammuntion Types: * B-32 - Armor-piercing incendiary full metal jacket round with a tungsten-carbide core. Projectile weight is 64.4 g and muzzle velocity is 976 m/s. Armour penetration at 500 m is 32 mm of rolled homogeneous armour (RHA) at 90 degrees. * BZT - Armor-piercing incendiary tracer full metal jacket round with a steel core. Projectile weight is 59.56 g and muzzle velocity is 1,005 m/s. Tracer burns to at least 2,000 m. * MDZ - High-explosive incendiary bullet of instant action. Projectile weight is 59.68 g.

Fire Control

Name: INA

Thermal Sight Tank Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: INA

Protection

Hull Armor: 15-100 mm
Turret Armor: 200 mm
Applique Armor: Available
Explosive Reactive Armor: Available
Active Protection System: INA
Mine Clearing: INA
Self-Entrenching Blade: INA
NBC Protection: Yes
Smoke Equipment: INA

Notes:

The Ch'ŏnma-ho or spelled as Chonma-ho (Chosŏn'gŭl: □□□; Hanja: □□□) is one of North Korea's secretive indigenous main battle tank designs. The tank is also known by the name of □□□ □□ (□□□ or the "Chollima Tank"). The original Ch'ŏnma-ho is based on the Soviet T-62. There are at least five different operational versions of the Ch'ŏnma-ho. Since its inception, the Ch'ŏnma-ho has apparently undergone several extensive upgrades. Little public information is available about this tank, and its most recent public appearance was the 65th Anniversary Parade held in Pyongyang, North Korea, on 10 October 2010, celebrating the 65th anniversary of North Korea's ruling party. The Ch'ŏnma-ho has been issued to North Korea's premier armored formations, and would lead the initial attempts to break through South Korean defences. Other armour is relegated to a secondary role in this corps or to North Korea's four mechanized corps. To underscore North Korea's concept of combined arms and the importance of armour, and therefore the importance of the Ch'ŏnma-ho, North Korea's sole armour corps is directly grouped with two mechanized corps and a single artillery corps. However, this forms the second echelon of North Korea's deployment to the DMZ, with the first echelon composed of four infantry corps,[8] and the rest in strategic reserve. This may also play a part in a defensive strategy, as the North Korean army is arrayed in depth, and the armour might be strategically placed to both provide offensive power and a second echelon composed of mobile defences to plug a South Korean breakthrough along the DMZ. The Ch'ŏnma-ho is a product of North Korea's approach of Juche, or self-reliance, which also includes several indigenous self-propelled artillery pieces. The idea of juche comes from a North Korean sentiment of abandonment by their allies, China and Soviet Union/Russia. This accounts for their drive towards overproduction and for recent North Korean nuclear developments, as well as the production of long-range missiles which provide North Korea with its longer range striking power. This all manifests itself within the 'triangle' of North Korean military development – armour, artillery and missiles. In fact, this seems reminiscent from Soviet military theory, including the application of overwhelming artillery support and the use of large amounts of armour to create a breakthrough after the initial artillery disruption. In that sense, North Korean military strategy is very mobile, and the large numbers of tanks underscores this. The Ch'ŏnma-ho is an attempt to partially address the technology gap between its current dated tank forces and South Korean K1A1 and the US M1 Abrams tank. It is unknown which units of the Korean People's Army might be outfitted with the Ch'ŏnma-ho. It is clear that the Ch'ŏnma-ho is a general replacement for previously employed tanks, including the T-62, T-34 and Type 59 medium tanks. It is very possible that the Ch'ŏnma-ho will equip the spearhead and elite of North Korea's armoured forces. They are apparently deployed in sufficient numbers to be strategically significant. There might be as many as 800 T-62s in addition to the over 1000 Ch'ŏnma-ho's in the North Korean army, of which any number could be one of the five Ch'ŏnma-ho variants.

T-80UK Russian Main Battle Tank (MBT)

Tiers:

Parent:

T-80B Russian Main Battle Tank (MBT)

Variants:

- **T-80 (1976):** Initial model, with 1,000-hp gas turbine engine, coincidence rangefinder, and no missile capability. This model does not have fittings for explosive reactive armour. The turret is from the T-64A, and thus retains the use of the old coincidence rangefinder. Characteristics of this type are the V shaped water deflector on the front glacis, coincidence rangefinder in front of the commander's cupola, and Luna searchlight mounted in the same position as a T-64. Around 250 were produced, as the tank's armour was essentially obsolete when introduced. Turret vs APFSDS – 380 mm, hull vs APFSDS – 500 mm (without reactive armour). This was, in effect, a pre-production model. It reportedly was fitted with an early version of the Shtora APS.
- **T-80B (1978):** This model had a new turret, laser rangefinder, fire-control, and autoloader allowing the firing of 9M112-1 Kobra antitank guided missile (80% hit probability while stopped and on the move), and improved composite armour. An improved, 1,100-hp, engine was added in 1980, a new gun in 1982, and fittings for reactive armour in 1985. Reactive armour added protection of 400 mm equivalent armour to defend against HEAT warheads. The longest sighting range for T-80B kinetic energy ammunition and for "cumulative" ammunition – 4,000 m, high-explosive fragmentation – 5,000 m (using the "side level" – 10,000 m). A night sight TPNZ-49 in active mode reached 1,300 and a passive – 850 m. "Reflex" guided missile complex with laser beam allowed it to launch missiles at any tank speed
- **T-80BV (1985):** T-80B with explosive reactive armour Kontakt-1
- **T-80UM::** Russian version, with new Buran thermal imaging sight in place of the Luna IR.
- **Object 219A: Early T-80U (Object 219AS) variant:** It has the T-80U's turret, but not the Kontakt-5 ERA. Instead, it uses the old Kontakt-1/3 system; some 219As did not have ERA at all. Often misnamed T-80A. T-80U (1985): Further development with a better turret, Kontakt-5 explosive reactive armour, improved gunsight, and 9M119 Svir missile system. In 1990 a new, 1,250-hp, engine was installed. Overall protection with Kontakt-5 against APFSDS/HEAT is 780/1,320 mm RHAe.9K119M with antitank guided missile 9M119M installed since 1990. Some of the tanks in commander version (T-80UK) equipped with Shtora-1 APS, and thermal imaging night sight TO1-PO2T (detection range / target classification range = 6,400/4,600 meters at night). Basic thermal night sight of the T-80U is within the limits of 1,750/1,500 meters
- **T-80UD Bereza (1987):** Ukrainian diesel version with 1,000-hp 6TD engine and remote-controlled antiaircraft machine gun
- **T-84 (1999):** Further Ukrainian development of T-80UD with 1,200-hp diesel and new welded turret
- **T-80BVD (2002)::** KMDB's upgrade standard for Ukrainian T-80BVs. Changes include the 6TD diesel engine, remote-controlled commander's machine gun, and better optics. None were produced.
- **T-80UM2/Black Eagle (prototype: cancelled)::** Several Russian prototypes were shown at trade shows, with a longer chassis and extra pair of road wheels, and very a large turret with separate ammunition compartment
- **T-80BVM (2017):** up to 3,000 units, installed "Relikt" ERA, PNM Sosna-U gunner sight (as in the T-90, T-72B3), the improved 125mm gun 2A46M-4, the upgraded gas turbine engine and the upgrades of various other systems. More than 120 already in the service.
- **T-80B (1978):** This model had a new turret, laser rangefinder, fire-control, and autoloader allowing the firing of 9M112-1 Kobra antitank guided missile (80% hit probability while stopped and on the move), and improved composite armour. An improved, 1,100-hp, engine was added in 1980, a new gun in 1982, and fittings for reactive armour in 1985. Reactive armour added protection of 400 mm equivalent armour to defend against HEAT warheads. The longest

sighting range for T-80B kinetic energy ammunition and for "cumulative" ammunition – 4,000 m, high-explosive fragmentation – 5,000 m (using the "side level" – 10,000 m). A night sight TPNZ-49 in active mode reached 1,300 and a passive – 850 m. "Reflex" guided missile complex with laser beam allowed it to launch missiles at any tank speed

System

Alternative Designation: T-80UK

Type: Main Battle Tank

Family: T-80 Series

Generation: 3rd Generation Tank

Crew: ea3

Maximum Effective Range (Road): km335

Driver's Vision Blocks: ea3

Dimensions

Length (Gun Forward): m9.65

length (Hull): m6.98

Width: m3.58

Height: m2.22

Weight, Combat: tons46

Ground Pressure: kg/mINA

Automotive

Engine Name: GTD-1000T

Engine Type: Gas turbine engine

Engine Power: hp1,100

Power to Weight Ratio: hp/ton23.9

Cruising Range: km335

Speed, Maximum Road: km/h75

Speed, Average Cross: 48

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg60

Side Slope: deg40

Vertical Step: m1

Trench: m2.85

Fording Depth (No Preparation): m1.8

Fording Depth (With Preparation): m5

Cold Start Ability: Yes

Fuel Tank (Regular): liters2,040

Reul Tank (Additional): liters680
Deep Water Snorkel: Available

Communications

R-163-50K HF Transceiver: Equipped, but no information available
R-163-50U Radio set: Equipped, but no information available
R-163-UP Receiver: Equipped, but no information available

↳*R-173*

Frequency Range: MHz30.00 - 75.99
HF Output: W30
Modulation: FM
Display: Digitial
Entry of Frequency: Keypad
Present Channels: 10
Digital Transmition: KBaudINA
Sensitivity: uV1.5
Range: km50
Operational Voltage: V27+-2
Weight: kg43
Size: mm428 × 222 × 238

↳*Receiver R-174/GRR-5*

Main Principle: Superhet with RF-stage; ZF/IF 455 kHz; 2 AF stage(s)
Wave Bands: Wave Bands given in the notes.
Loudspeaker: Permanent Magnet Dynamic (PDyn) Loudspeaker (moving coil)
Dimensions (WHD): mm307 x 335 x 206
Net Weight: kg27.7
Note: Receiver for mobile purposes, 1.5 - 18 MHz in four ranges, AM/CW (BFO), 200 kHz xtal calibrator. Set compartment (CY-615/URR) consists of two chassis: model R-174/GRR-5 receiver and model PP-308/URR power supply plus speaker unit. Tubes only one times listed.

Main Gun

↳*System*

Name: L48 2A46M-1 Smoothbore Cannon
Type: 125 mm smoothbore Gun
Manufacturer: Spetstekhnika Design Bureau
Max Rate of Fire: rds/min6-8

Maximum Range: m4,000

Manually Load Time: rds/min1-2

Maximum Elevation: deg+14

Minimum Elevation: deg-5

Traverse Range: deg360

Autoloader: Yes, Carousel-Type Autoloader

Fire on the Move: Yes, Main Gun

Evacuator Type: Central Bore

Thermal Sleeve: Yes

Barrel effective Full Life Charge: rds800

Breech Mechanism: Semi-automatic horizontal sliding breech block

Mazimum Pressure: bar5,100

Loading System: Korzina electric and hydraulic automatic loading system

Carousel Reloading Time: minutes13-15

Muzzle Bead: Yes

Barrel Type: Quick Change

Fuze Type: Timed Fuze System

Note: The L48 2A46M-1 It has been extensively developed into 10 different variations and remains the primary armament of Russian frontline tanks.

↳*Ammunition (Option 1)*

Type: High Explosives (HE)

Caliber: mm125

Muzzle Velocity: m/s850

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Maximum Effective Range: m5,000

Armor Penetration: INA

Max Dispersion: mrad0.23

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 2)*

Name: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Type: Smoothbore 125mm Projectile

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Effective Range: m2,000-3,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Weight: kg11

Projectile Dimesnion: mm900

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Effective Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Name: 9M119 Svir, 9M119M Refleks(NATO designation AT-11 Sniper-B)

Type: Laser Beam Anti-Tank Guided Missiles

Caliber: mm125

Manufacturer: Degtyarev plant

In Service: 1980's to present

Proliferation: Widely Proliferated

Operational Range: m4,000-5,000

Weight: kg17.2

Diameter: mm125

Basic Load: ea6

Warhead Type: Tandem hollow-charge

Warhead Weight: kg4.5

Speed: Subsonic

Guidance System: 9S516 guidance system

Launch Platform: 125 mm smoothbore guns

Armor Penetration: 700mmm of homogeneous armour

Time to meet Maximum Range: sec17.6

Control Unit: 9S517 automatic control unit

Voltage Regulator: 9S831 voltage regulator.

Variants: 9M119M

Coaxial Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: 12.7mm Anti-Aircraft Machine Gun

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Weight (Gun Only): kg25

Muzzle Velocity: m/s845

Max Rate of Fire: rds/min700-800

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Length (Total): mm1,560

Action: Gas Operated

Feed System: 50-Round Belt

Sights: Iron Sights

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: 12.7×108mm

Muzzle Velocity: m/s845

Basic Load: ea500

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Loader's Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: 7.62mm Machine Gun

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

Manufacturer: Degtyaryov plant

In Service: 1961-present

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Total): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea1,250

Effective Range (Iron Sights): m1,000

Effective Range (With Sight Adjustments): m100-1,500

Fire Control

Name: 1A45 Irtysh, Updated FCS system over the T-80B

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, day and night, vertical plane PNK-4S (Agat) day/night sight

Commander Day Mode Sight: 10^{0} FOV and ×5 magnification

Thermal Sight Gunner: Yes, stabilised T01-K01R Buran-PA night sight.

Main Gun Stabilization: Yes, 2E26M electro-hydraulic dual plane stabilisation system

Main Gun Stabilization Deployment Time: minutes2

Range, Day Sight: m1,000

Range, Thermal Sight: m2,600

IR Searchlight: Yes, L-4A "Luna" IR Searchlight

TNPO-160 Periscopes: ea2

TNPA-65 Periscopes: ea2

Ballistic Computer: 1V528-1 Ballistic Computer

Wind Sensor: DVE-BS wind sensor

Laser Rangefinder: Yes

FCS Fire Gating Capability: YEs

Fire Control Complex: 1A45 fire-control complex,

Protection

Hull Armor: mm440–450

Armor Type: The T-80B is protected by a third iteration Soviet laminate armour that is known as Combination K

Turret Type: Objekt 476

Turret Armor: Renovated ceramic system, Protection equivalent to 550mm

Applique Armor: Yes, Hull side; track skirts

Explosive Reactive Armor: Yes, Kontakt-5 System. Built in ERA system. Upgrade from the T-80B.

Active Protection System: Arena Available

Mine Clearing: Roller-plow available

Self-Entrenching Blade: Yes

NBC Protection: Yes, ZETS-11-2 detection system collective overpressure system

Smoke Equipment: Yes, two banks of four 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade

Smoke Grenade Range: m250-300

Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade.

IR Signature: The exhaust is box-shaped and designed to direct heat away from the tank

Anti-Radiation Material: Installed as a inside protective layer

Personal Breathing Apparatus: Equipment

Automatic Fire Extinguisher System: Yes

Radiation and Chemical Detector: PRKhR, Model GO-27, radiation and chemical agent detector system

Soft-Kill APS System: Laser-warning receivers

Sensory Awareness Range: deg360

Jamming System: Shtora-1 IR jamming system with TShU1-7 IR jammers, which interfere with the semi-automatic command to line-of-sight (SACLOS) Guidance Systems

Notes:

Exclusive to PACT nations, the T-80UK is essentially a T-80U tank modified and operated by crew able to for command and

control operations. This makes it the only Command Tank variant of thes cousin variant T-80 series of Main Battle Tanks.This unit retains all the devastating features of the mighty T-80U. At speeds of 75 km/h, faster than any other Pact tank besides its cousin variant, it can apply its heavy fire power on hostiles, before they even get a chance to retreat. Heavy power, speed and stabilisers that can even compare to that of advanced air-superiority jets means that it is an excellent and effective Command Tank, able to quickly grasp control points and clean up any hostile forces. Additionally, The T-80UK is equiped with the Shtora-IR Jamming System.

Chieftain MK 3 British Main Battle Tank (MBT)

Tiers:

Variants:

- **FV4202 "40-ton Centurion":** Test vehicle built by Leyland Motors using Centurion components to test reclining drivers position and mantlet-less turret proposed for FV4201. One built, 1956, official specification for FV4201 issued August 1958.
- **FV4201 P1 - FV4201 P7:** Prototypes. Seven built, 485 hp L60 Mk 1 or 485 hp L60 Mk 4,initial vehicles had internal exhaust silencers, short hull. small diameter road wheels, weight 45 long tons, initial vehicles, 49.5 long tons for later vehicles, 1959-1962
- **Chieftain Mk.1:** 40 training vehicles for 1965–1966 with 585 hp L60 Mk 4 engine, strengthened TN12 gearbox, exhaust silencers moved to external armoured box on hull rear plate, larger 'Centurion' 31.6 inch diameter road wheels, re-positioned final drive and idler wheel assemblies, two-piece commander's hatch cover, rubber track pads fitted for road protection, resilient rubber coaming around engine rear decking to prevent damage from gun with gun depression when turret traversed to the rear, stowage rack added to left rear of turret, dummy stowage 'bin' on front glacis and canvas cover over turret nose to conceal ballistic shapes, [v] weight 50 long tons, Issued to 1 RTR and 5 RTR for troop trials. All Mk.1 to Mk.1/4 vehicles were subsequently to be based at Bovington Camp and Catterick Garrison. 11 short hull units converted to be CH AVLB Mk.6
- **Chieftain Mk.1/2:** Upgrade of Chieftain Mk.1 to Chieftain Mk.2 standard, fitted with 650 hp L60 Mk 4A2 engine, training use only
- **Chieftain Mk.1/3:** Upgrade of Chieftain Mk.1, fitted with 650 hp L60 Mk 5A engine, training use only
- **Chieftain Mk.2:** First service model with 650 hp L60 Mk 4A2 engine, L11A2 or L11A3 main gun,[viii] NBC system fitted to rear of turret, revised turret stowage, one-piece commander's hatch cover, armour removed from searchlight cover, rigid flotation panels replaced by facility for deep wading, road speed 25 mph, range 250 miles, weight 51.5 long tons, first vehicles issued to 11th Hussars at Hohne in West Germany in early 1967, improved 650 hp L60 Mk 5A engine fitted 1969
- **Chieftain Mk.3:** Improved 650 hp L60 Mk 6A engine with two-stage air cleaner, improved auxiliary generator (Coventry Climax A30), better stowage, new No. 15 Mk 2 commander's cupola, road speed improved to 30 mph, range increased to 310 miles, weight 53 long tons, 1970
- **Chieftain Mk 3/2:** Fitted with 720 hp L60 Mk 7A, 1971
- **Chieftain Mk 3/3:** Fitted with 720 hp L60 Mk 7A, Improved main gun range finding,provision for Barr & Stroud TLS (Tank Laser Sight) LF2 laser range finder, 1971
- **Chieftain Mk 3/G:** Chieftain Mk.3 with engine induction through fighting compartment. Prototype only
- **Chieftain Mk.3/3P:** Chieftain Mk 3/3 for Iran, 1973
- **Chieftain Mk 3/S:** Production version of Chieftain Mk 3/G with commander's firing control
- **Chieftain Mk.4:** Chieftain Mk.3 with increased fuel capacity. Only two built.
- **Chieftain Mk.5/5P:** Chieftain Mk.5 for Iran, 1975. Engine later upgraded to 750 hp L60 Mk 10A, 1977
- **Chieftain Mk.5/2K:** Chieftain Mk.5 for Kuwait, 1975
- **Chieftain Mk.6:** Chieftain Mk.2 upgraded to Chieftain Mk.5 standard, 1975 In 1975 all earlier Marks of tanks except Mark 1's were upgraded to Chieftain Mk.5 standard as part of the 1975 "Totem Pole" programme,[xvi] including addition of Clansman radios, fitting of TLS, fitment of Muzzle Reference System (MRS) [upon replacement of L11A3 barrel with L11A5 barrel,[xviii] and fitment of 750 hp L60 Mark 8A. These vehicles were re-designated Chieftain Mk's.6 to Mk.8.
- **Chieftain Mk.7:** Chieftain Mk.3 and Chieftain Mk 3/S upgraded to Chieftain Mk.5 standard, 1975
- **Chieftain Mk.7C:** Chieftain Mk.3 upgraded to Chieftain Mk.5 standard for Oman
- **Chieftain Mk.8:** Chieftain Mk.3/3 upgraded to Chieftain Mk.5 standard, 1975 In 1977 the engines of all vehicles were upgraded to the 750 hp L60 Mark 9A, followed by further upgrading with the 840 hp L60 Mark 11A or L60 Mark 12A [xxi] in 1978 as part of the 1977 "Dark Morn" and the 1978 "Sundance" programmes.

- **Chieftain Mk.9:** Chieftain Mk.6 after completing all phases of "Totem Pole", 1979.
- **Chieftain Mk.10:** Chieftain Mk.7 after completing all phases of "Totem Pole". Later upgraded with addition of Stillbrew Crew Protection Package to the turret front and turret ring, 1984–86
- **Chieftain Mk.11:** Chieftain Mk.8 after completing all phases of "Totem Pole". Later upgraded with Stillbrew, 1984–86
- **Chieftain Mk.12:** Chieftain Mk.5 after completing all phases of "Totem Pole". Later upgraded with Stillbrew, 1984–86
- **Chieftain Mk.12/13:** Proposed further upgrades, cancelled when the Challenger 1 was introduced.
- **Chieftain 800:** Chieftain with Chobham armour and new power train
- **Chieftain 900:** Chieftain with Chobham armour, new power train, and Centaur fire control system
- **FV4204 ARV/ARRV:** Armoured Recovery Vehicle, Armoured Recovery and Repair Vehicle.
- **FV4205 AVLB Mk5:** Bridge-laying vehicle
- **Chieftain AVRE (CHAVRE):** Armoured Vehicle Royal Engineers, twelve early "Willich Chieftain AVRE" vehicles converted by 32 Armoured Engineer Regiment and 21 Engineer Base Workshop of the Royal Engineers, Willich, 1987, remaining 48 ex MBTs converted by Vickers Defence Ltd, 1991, to be a British Army combat engineering variant used by the Royal Engineers.
- **Chieftain Marksman:** Self-propelled anti-aircraft gun version, equipped with the Marksman twin gun turret.
- **Khalid /Shir (Lion) 1:** Also known as "4030 Phase 2 Jordan". Jordanian with the running gear of the Challenger 1. In essence, this was a transition vehicle from the Chieftain to the Shir 2, which had been intended for Iran but was subsequently cancelled due to the 1979 Iranian Revolution. The vehicle chassis comprised the front half of a Chieftain hull, Chieftain running gear and the rear of a 4030/2 Chassis (Sloping Hull). This allowed the fitment in the engine bay of a Rolls-Royce CV12 engine producing 1200 bhp at 2,300 rpm.
- **Weapon Carriers:** The Chieftain chassis was adapted to mount air defence weapons ("Marksman" 2 x 35 mm cannon) and a 155 mm howitzer in a number of variants.
- **Shir 2:** 4030 Phase 3" Iranian variant. Visible external differences from Chieftain Mk.5 included a sloping rear hull, the removal of the searchlight from the left turret area and the refitting of storage baskets, the removal of the water channel from around the driver's hatch on the glacis, modification of the light clusters also on the glacis and the enlargement of the sight housing on the commander's cupola. Not delivered, the Shir 2 tanks became Challenger 1 tanks after reworking at ROF Leeds
- **Mobarez Tank:** Iranian upgraded version of Chieftain.

System

Alternative Designation: Chieftain Mk.3; Chieftain Mk 3/3P

In Service: 1973-Present

Type: Main Battle Tank

Family: Chieftain Main Battle Tank Family

Crew: ea4 (commander, gunner, loader, driver)

Dry-Air Cleaner Element: Yes

Cupola Type: Modified no. 15 Mk 2 Commander Cupola

Dimensions

Length (Overall): m10.8

Length (Hull): m7.5

Width: m3.5

Height: m2.9

Weight, Combat: tons55

Ground Pressure: kg/mINA

Automotive

Engine Name: L60 Mk 7A

Engine Type: Diesel

Engine Power: hp720

Gearbox: TN12 gearbox

Maximum Range: km400

Cruising Range: km200

Speed, Maximum Road: km/h48

Speed, Average Cross: 30

Speed Maximum Swim: km/hNot Amphibious

Steering System: Merritt-Wilson differential steering system

Fuel Capacity: liters950

Suspension: Horstmann suspension

Communications

Primary: Twin Clansman VRC 353 VHF Radio sets

Secondary: 1 C42 1 B47 Larkspur VHF radios

Main Gun

↳*System*

Name: 120 mm L11A5 Rifled Tank Gun

Type: mm120

Max Rate of Fire: rds/min8-10

Manufacturer: Royal Ordnance Factories

Proliferation: 3,012

Bore Evacuator: Yes

Thermal Sleeve: Yes

Weight: kg1,778

Length (Total): m6.858

Length (Barrel): m6.6

Gun Recoil: mm370

Breech Type: semi-automatic cam

Maximum Effective Range: m3,000

Maximum Elevation: Deg+20

Minimum Elevation: Deg-10

↳*Ammunition (Option 1)*

Type: Armour-piercing fin-stabilized discarding sabot (APFSDS) L23

Caliber: mm120

Muzzle Velocity: m/s1,534

Basic Load: 64 total of any 120mm projectile combination

Effective Range: m3,000

Penetrator: Monobloc tungsten alloy rod

Diameter: mm120

Height: mm500

Case Charge: L8 combustible case charge

Note: Average Projectile Load would consists of the following: 33 L26 APFSDS rounds, 13 L31A7 HESH, and 3 white L34 phosphorous smoke rounds.

↳*Ammunition (Option 2)*

Type: APFSDS L26 (CHARM 1)

Caliber: mm120

Muzzle Velocity: m/sINA

Maximum Effective Range: m2,100

Penetrator: Monobloc tungsten nickel copper long rod

Case Charge: L14A1 or L14A2

Basic Load: 64 total of any 120mm projectile combination

Variant: APFSDS L27A1 (CHARM 3).

↳*Ammunition (Option 3)*

Type: HESH L31

Caliber: mm120

Muzzle Velocity: m/s670

Basic Load: 64 total of any 120mm projectile combination

Maximum Effective Range: m8,000

Auxiliary Weapon System

↳*System*

Name: FEG AK-63 / AMM

Type: 7.62mm General Purpose Machine Gun

Manufacturer: Fegyver- és Gépgyár

In Service: 1977-Present

Proliferation: +1 Million

Max Rate of Fire: rds/min600

Weight: kg3.6

Length (Total): mm880

Length (Barrel): mm415

Width: INA

Height: INA

Action: Gas-operated, rotating bolt

Effective Firing Range: m500

Feed system: 10, 20, 30, 40-round box magazines, 75 or 100-round drum magazine

Sights: Iron Sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×39mm NATO

Muzzle Velocity: m/sINA

Basic Load: ea200

Fire Control

Name: Fully Integrated Improved Fire-Control System (IFCS)

Computerized FCS: Yes, Marconi 12-12P digital computer

First-Round Hit Probability (Stationary Targets): m3,000

First-Round Hit Probability (Moving Targets): m2,000

Thermal Sight Tank Commander: Yes

Commander's Cupola Traverse Range: Deg360

Thermal Sight Gunner: Yes, the AFV No 36 Mk 2 periscope or L3A1.

Periscopes: Nine AFV No 40 Mk 2 observation periscopes

Main Gun Stabilization: INA

Radar and Defense System: GEC-Marconi Radar and Defence Systems

Search Light: Defence Control Systems Division, IR/white-light searchlight

Search Light Range (IR Mode): m1,000

Search Light Range (White Light Mode): m1,500

Tank Laser Sight Unit (TLSU).: Yes

No 70 Telescopic Sight: Yes, for the Gunner

Gun Control System: all-electric gun control system is a Marconi Fighting Vehicle Gun Control Equipment (FV/GCE) No 7 Mk 4

Laser Rangfinder: Yes, LF2 laser range finder,

Protection

Hull Armor: Welded RHA

Turret Armor: Cast and rolled steel

Applique Armor: Available, Stillbrew armour
Explosive Reactive Armor: Available
Active Protection System: INA
Mine Clearing: INA
Self-Entrenching Blade: Available
NBC Protection: Yes, a modified Iranian NBC package
Smoke Equipment: Yes, on each side of the turret there is six electrically-operated 66 mm smoke grenade dischargers.
IR Detector: Yes
Fire Suppression System: FIREWIRE automatic fire-detection system
Air Ventilation and Filtration System: Yes

Notes:

The Chieftain MK3 Main Battle Tank is a variant of the Chieftain series Main Battle Tanks. The MK3 has a revised suspension, Command's Cupola, engine air cleaner and other additional equipment to assist the tank when operating in the desert environment. The Mk.3 was fitted with additional equipments, dry-air cleaner element, modified No 15 Mk 2 commander cupola, upgraded engine and gave birth to Mk 3/2 (Improved electrical equipment and air cleaners), Mk 3/3 (ER RMG, laser rangefinder, 720 bhp engine & modified NBC pack), Mk 3/3P (Iranian version), Mk 3G (Prototype with turret air-breathing for engine aspiration), and the Mk3s (Mk 3/G with turret air-breathing and commander\'s firing switch).

T-72B Russian Main Battle Tank (MBT)

Tiers:

Parent:

T-72 Russian Main Battle Tank (MBT)

Variants:

- **T-72A:** Second Russian main variant of the T-72.
- **T-72B1:** In 1986, a limited production variant without an ATGM launch capability. Some do not have ERA.
- **T-72BK:** The Commander's variant with additional radios.
- **T-72BM:** Russian T-72B upgrade with 2nd gen ERA. The system is fielded, available for export, and upgraded. Tier 2 and some Tier 3 tanks can challenge US forces under favorable conditions when using modern ammunition and employed by well-trained units with sound tactics. A variety of upgrades are available for the T-72B. They include protection upgrades, such as improved ERA, APS, defensive aids suites with IR jammers, plate armor, welded turret, and grill armor around tracks and grill. Mobility upgrades include a new power train, improved steering, improved mine plows and rollers, and electronic mine spoofing system. Fire control system upgrades include new sights, gun, ammunition, and improved stabilization. With the expanding number of upgrades offered by former Warsaw Pact, Asian, Israeli, and other firms, most T-72-type tanks have some level of upgrade from the basic T-72 MBT. The more affordable upgrade approach for most countries is to execute specific upgrades during maintenance work. But this approach may result in only partially modernized tanks at any one point in the life of the vehicle, and which are not as modern as more recent competitors. An alternative is to produce modernized tanks in small numbers, resulting in high per-unit production costs.
- **T-72BU:** Upgrade variant with the fire control system from the T-80U as well as well as a variety of other changes.
- **T-72BU renamed T-90:** With the limited market for new tanks, the world tank industry has developed upgrades and whole vehicle upgrade packages to tap into the market. Older T-72 tanks can be brought up to the T-72B standard. Some approach the T-90 standard. Most T-72-type tanks fielded reflect some level of upgrade. Upgrade options are expanding from former Warsaw Pact, Asian, Israeli, and other international firms.
- **T-72S / Shilden:** Russian export T-72A upgraded to the T-72B standard. Although visually similar to T-72B, it has slightly less chassis and turret protection. Former Warsaw Pact countries such as Slovakia and Middle Eastern countries like Iran have upgraded their tanks to the T-72S standard.
- **M-84AB1:** Yugoslav upgrade to the M-84, bringing it close to the T-90, and the latest T-72B improved tanks.
- **M-95 Degman:** Croatian M-84 upgrade with box composite armor, ERA, 1200hp and thermal FCS. An export upgrade conversion, AKA M-84D, is offered for Kuwaiti M-84A tanks.
- **PT-91:** Polish upgrade tanks with ERA, Drawa improved FCS, Savan-5 thermal sight, improved gun stabilization, and countermeasures.
- **PT-91M:** Has a 1000hp engine, new guns and FCS, armor changes, and other improvements. PT-91M exported to Singapore. PT-91P is designed for export to Peru.
- **T-72M1:** Demonstrator with 2nd generation ERA and other upgrades were displayed at military shows.
- **T-72M1M:** Includes 3rd generation Relikt ERA and optional Arena Active Protection System (APS). Alternative designations: Rogata and SMT M1988. It is almost the same as the T-72S (Export), except more ERA on the side skirts.
- **AJEYA MK 2:** India is upgrading T-72A tanks close to a Bhishma (T-90S) standard.

System

Alternative Designation: T-72B; NATO designation: SMT M1988; Development designation: Objekt 174M; Synonyms: Super Dolly Parton

In Service: 1984-present

Manufacturer: Uralvagonzavod

Type: Main Battle Tank (MBT)

Family: INA

Crew: ea3

Passenger Capacity: INA

Maximum Effective Range: m500

Note: The T-72B can be distinguished from earlier T-72s by the additional ERA and the additional thickness at the front of the turret.

Dimensions

Length (Gun Forward): m9.53

Length (Hull): m6.95

Width: m3.59

Height: m2.23

Weight, Combat: tons41

Ground Pressure: kg/m0.898 kgf/cm2

Automotive

Engine Name: V-84M

Engine Type: Four stroke, liquid cooled diesel engine with a centrifugal supercharger.

Engine Power: hp840

Power to Weight Ratio: hp/ton18.9

Cruising Range: km700

Speed, Maximum Road: km/h60

Speed, Maximum Off-Road: km/h35-45

Acceleration Speed (0-32 km/h: sec18

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.85

Trench: m2.8

Fording Depth: m1.2

Fording (with Preparation): m5

Fording Kit: OPVT deep water fording kit

Transmission: Synchromesh, hydraulically assisted, with 7 forward and 1 reverse gears

Suspension: Torsion bar

Ground Clearance: m0.49

Fuel Capacity: liters1,200

Gyrocompass: GPK-59 gyrocompass

Rechargeable Batteries: four 12ST-85R 34 AMP rechargeable batteries

Starter Generator: SG-10-1S

Communications

Radio #1: R-173 (Standard Radio for Russian Tanks)

R-173 Range: km0-20

Radio #2: R-168-100U (Standard VHF)

Main Gun

Note: Another primary difference between the T-72A and the T-72B is that the T-72B can fire the 125mm 9K120 Svir Missile Complex

↳*System*

Name: 2A46M/2A46M-5

Type: 125mm Smoothbore

Max Rate of Fire: rds/min8

Manually Load Time: rds/min1-2

Barrel Life: rounds600

Sustain Rate of Fire: INA

Thermal Sleeve: Yes, alloy thermal sleeve

Bore Type: Central Bore Evacuator

Breech Type: semi-automatic horizontal sliding breech block via an interrupted screw thread.

Autoloader: Yes, electromechanical carousel autoloader

Time to reload the Autoloader: min4-5

Fire on the Move: Yes, Main Gun

Maximum Elevation: deg-6

Minimum Elevation: deg+14

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

↳*Ammunition (Option 1)*

Name: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Type: Smoothbore 125mm Projectile

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Effective Range: m2,000-3,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Dimension: mm900

Projectile Weight: kg11

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Note: The 9K120 gun-launched missile complex is a two piece guided missile that is loaded and fired from the main gun in the same way as an ordinary round.

ATGM System Name: 9K120 gun-launched missile complex

Missile Name: 9K119 SVIR / AT-11

Type: Laser Guided Anti-tank guided missile launcher

Manufacturer: KBP Instrument Design Bureau

Caliber: mm125

Round Type: 3UBK20 round

Guidance System: 9M119M Laser Guided Missile

Voltage Converter: 9S831 voltage converter.

Tracking System: IK13 tracker

Basic Load: ea6

Onboard Guidance System: Yes

Sight Assembly: coded laser guidance beam 1K13-49

Gunner's Night Sight: TPN-1-49 secondary night sight.

Fire Control System: 1A40-1

Hit Probability: %80

Penetration: up to 700mm of armor

Warhead Weight (HEAT): kg4.2

Warhead Type: 9N142 shaped charge warhead

Laser Emitter: 1K13 sight's laser

Maximum Effective Range: m4,000

Minimum Effective Range: m100

Elevation Range (Super Elevation): deg-7 to +20

Elevation Range (Standard Elevation): deg-5 to +15

Coaxial Weapon System

System

Name: 7.62mm PKT (Kalashnikov's Machine Gun)
Type: mm7.62
Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
In Service: 1961-present
Manufacturer: Degtyaryov plant
Proliferation: 1 Million +
Max Rate of Fire: rds/min650-750
Effective Rate of Fire: rds/min250
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length: mm1,203
Length (Barrel): mm605
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle
Caliber: mm7.60
Cartridge: 7.62×54mmR
Muzzle Velocity: m/s825
Basic Load: ea2,000
Effective Range (Iron Sights): m1,000
Effective Range (with Sight Adjustments): m100-1,500
Maximum Firing Range: m3,800

Secondary Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)
Type: 12.7 Anti-Aircraft Machine Gun
Proliferation: over 1 Million
Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia
Weight (Gun Only): kg25
Muzzle Velocity: m/s845
↳ **Length (Total):** mm1,560

Max Rate of Fire: rds/min700-800

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Action: Gas Operated

Maximum Elevation: deg+75

Minimum Elevation: deg-4

Sights: Iron Sights

Feed System: 50-Round Belt

↳*Ammunition*

Type: Rifle

Caliber: mm12.7x108

Muzzle Velocity: m/s845

Basic Load: ea300

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Fire Control

Name: 1A40-1

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, 1K13 sight and aiming complex

Thermal Sight Gunner: Gunner's primary sight is the 1A40-1

Main Gun Stabilization: 2E42-2 (Upgrade)

Range, Day Sight: m5,000

Range, Thermal Sight: m1,000

Infrared: Yes

Gyrocompass: GPK-59 gyrocompass

Searchlight: L-4A "Luna" IR searchlight

Collimator Sight: K10T collimator sight

Periscopes: two TNPO-160 prismatic periscopes

Note: The Gunner, using the 1A40-1 sight can designate and engage targets out to a mazimum distance of 4,000 meters with APFSDS and HEAR rounds.

Protection

Hull Armor: Steel and composite armour with additional plates that provide protection equivalent to 950mm of steel against HEAT projectiles, 440mm resistance to KE rounds, and 500mm against shaped charges.

Turret Armor: Steel and composite armour with ERA, 950 mm against HEAT weapons. The Turret has additional Ceramic or

silica inserts to add to the protection level of the T-72B
Applique Armor: Available, Turret top and track skirts
Explosive Reactive Armor: Yes, Kontakt-1. Additional ERA is added to the Turret, Glacis, and sides of the hull.
Armor Cassette Type: 4S20 cassette that is filled with an explosive element and steel armoured plate.
Number of total Armor Cassettes: ea200-300
NBC Protection: Yes, System Sensor Radiation Device and chemical intelligence (PRRM).
Active Protection System: Yes, ZETS11-3 Control System
Mine Clearing: Yes, Roller and plow (optional)
Self-Entrenching Blade: Yes, built in Dozer Blade
Grenade Launcher: Yes, twelve 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.
Grenade Maximum Effective Range: m200-300
Grenade Smoke Screen Size: 30 m wide and 10 m high for 60 seconds per grenade.
Engine Smoke Screen Capable: Yes
IR Signature: INA
Automatic Fire Extinguishing Equipment.: Yes
Note #1: The T-72B can be distinguished from earlier T-72s by the additional ERA and the additional thickness at the front of the turret.
Note #2: The base protection of the T-72B is the same as the T-72A, however the vehicle is upgraded with considerable amounts of additional composite armor.
Note #3: The additional added armor cassettes reduce penetration by as much as 95%.

Notes:

The T-72B MBT (Main Battle Tank) is developed from the Russian main battle tank T-72A. It was entered in service with the Russian army in 1984. Its turret has a new armour package that provides a much higher degree of protection than any previous model of the T-72 MBT. In addition the glacis plate is provided with 20 mm of appliqué armour. Accepted in 1985 and mass-produced since 1988, the T-72B(M) MBT (Ob.187) has protection level comparative to that of the contemporary T-80U, but has a noticeably poorer FCS and vision aids and is underpowered. It is the last model of the (in)famous T-72 line, because the T-72BU MBT, successor to T-72B(M), received a new designation, T-90. However, T-72B(M) tanks and older T-72s upgraded to T-72B(M) standard are the most numerous tanks fielded with the Russian military. With the current financial problems, it will likely remain in wide-spread use well into the 21st century.

Al-Khalid Chinese/Pakistan Main Battle Tank (MBT)

Tiers:

Variants:

- **MBT-2000:** The MBT-2000 was developed in China by NORINCO, where it was known as the Type 90-II and was later marketed for export as the MBT-2000. The MBT-2000 developed and offered for export by NORINCO is believed to have very similar specifications as the Al-Khalid and externally appears almost identical. The MBT-2000 has been exported by NORINCO to Bangladesh. The MBT-2000 has a crew of three, a 125 mm smoothbore gun as a main armament, and an all-welded steel construction with additional layer of composite armour over the frontal arc for protection.
- **VT-1A:** Export Version of the MBT-2000. Bangladesh: 44, Morocco: 54, Myanmar: 50

System

Alternative Designation: MBT-2000, Type 90-11, Al-Khalid
Date of Introduction: 2000
Estimated out of Service Date: 2035-2050
Manufacturer: NORINCO
Proliferation: China: INA, Bangladesh: 44, Morocco: 54, Myanmar: 50. Over 150 total.
Type: Main Battle Tank
Status: In Production
Family: INA
Crew: ea3
Passenger Capacity: INA
Maximum Effective Range (Road): km500
Maximum Effective Range (Main Gun): m5,000
Add on Parts: Yes, Additional Armor

Automatic Target Tracker (ATT): Yes

Thermal Imager Module: Yes

Roof Mounted Crosswind/Angular Velocity Sensor: Yes

Protection

Hull Armor: all-welded steel, Protects from small arms fire and shell splintering

Turret Armor: all-welded steel, Protects from small arms fire and shell splintering

Applique Armor: Yes, Modular Armor

Explosive Reactive Armor: Yes, added to the Glacis Plate, Sides, forward roof, and Vehicle Nose

Active Protection System: Yes

Mine Clearing: No

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: Available

IR Reflective Paint: yes

Anti-Neutron Liner: Yes

Notes:

The Al-Khalid (Urdu: الخالد ٹینک—Al-Xālid Ṫaiŋk, pronounced [əl-ˈxɑːlɪɖ ʈæːŋk] literally "The Eternal Tank") is a main battle tank jointly developed by Pakistan and China during the 1990s, based on the Chinese Type 90-IIM tank.[7] The original prototype

was developed by China North Industries Corporation (Norinco) under the name MBT-2000, and Norinco also offered the tank for export. Around 310 Al Khalid MBTs had been produced by 2014. The Bangladesh Army ordered 44 MBT-2000s from China in 2011. The Norinco-made MBT-2000 is also used by the Royal Moroccan Army. It was trialled by the Peruvian Army for possible acquisition, but was not purchased due to financial problems. Operated by a crew of three and armed with a 125 mm smooth-bore tank gun that is reloaded automatically, the tank uses a fire-control system and night-fighting equipment. Al-Khalid is named after the 7th-century Muslim commander Khalid bin al-Walid (592–642 AD). The current production variant of the Al-Khalid uses a diesel engine and transmission supplied by the KMDB design bureau of Ukraine. The first production models entered service with the Pakistan Army in 2001. The country placed an order with Ukraine to further upgrade the tanks with a new engine. Al-Khalid is designed with a 125 mm bore, 48 calibre long smoothbore, auto-frettaged and chrome-plated gun barrel which is manufactured from highly stiff electroslag remelting steel. The gun is then put under stringent quality control process to ensure standard barrel life of 1,100 rounds EFC; barrels that cannot pass this test are rejected. This gun provides very high internal chamber pressures for APFSDS, HEAT FS and guided missiles. The gun can also fire the following types of conventional ammunition: APFSDS, HEAT-FS and HE-FS. The gun is a modified variant of both the ZPT-98 and KBA-3 series of 125 mm smooth bore gun for Al-Khalid MBT which provided compatibility with Ukrainian ATGMs such as Kombat. The gun retains qualities of both Chinese and Ukrainians mated with indigenous design for better and accurate firepower on stationary and moving targets alike. The Gun-launched, laser-guided anti-tank guided missiles can also be launched.

Chieftain MK 5 British Main Battle Tank (MBT)

Tiers:

Variants:

- **FV4202 "40-ton Centurion":** Test vehicle built by Leyland Motors using Centurion components to test reclining drivers position and mantlet-less turret proposed for FV4201. One built, 1956, official specification for FV4201 issued August 1958.
- **FV4201 P1 - FV4201 P7:** Prototypes. Seven built, 485 hp L60 Mk 1 or 485 hp L60 Mk 4,initial vehicles had internal exhaust silencers, short hull. small diameter road wheels, weight 45 long tons, initial vehicles, 49.5 long tons for later vehicles, 1959-1962
- **Chieftain Mk.1:** 40 training vehicles for 1965–1966 with 585 hp L60 Mk 4 engine, strengthened TN12 gearbox, exhaust silencers moved to external armoured box on hull rear plate, larger 'Centurion' 31.6 inch diameter road wheels, re-positioned final drive and idler wheel assemblies, two-piece commander's hatch cover, rubber track pads fitted for road protection, resilient rubber coaming around engine rear decking to prevent damage from gun with gun depression when turret traversed to the rear, stowage rack added to left rear of turret, dummy stowage 'bin' on front glacis and canvas cover over turret nose to conceal ballistic shapes, [v] weight 50 long tons, Issued to 1 RTR and 5 RTR for troop trials. All Mk.1 to Mk.1/4 vehicles were subsequently to be based at Bovington Camp and Catterick Garrison. 11 short hull units converted to be CH AVLB Mk.6
- **Chieftain Mk.1/2:** Upgrade of Chieftain Mk.1 to Chieftain Mk.2 standard, fitted with 650 hp L60 Mk 4A2 engine, training use only
- **Chieftain Mk.1/3:** Upgrade of Chieftain Mk.1, fitted with 650 hp L60 Mk 5A engine, training use only
- **Chieftain Mk.2:** First service model with 650 hp L60 Mk 4A2 engine, L11A2 or L11A3 main gun,[viii] NBC system fitted to rear of turret, revised turret stowage, one-piece commander's hatch cover, armour removed from searchlight cover, rigid flotation panels replaced by facility for deep wading, road speed 25 mph, range 250 miles, weight 51.5 long tons, first vehicles issued to 11th Hussars at Hohne in West Germany in early 1967, improved 650 hp L60 Mk 5A engine fitted 1969
- **Chieftain Mk.3:** Improved 650 hp L60 Mk 6A engine with two-stage air cleaner, improved auxiliary generator (Coventry Climax A30), better stowage, new No. 15 Mk 2 commander's cupola, road speed improved to 30 mph, range increased to 310 miles, weight 53 long tons, 1970
- **Chieftain Mk 3/2:** Fitted with 720 hp L60 Mk 7A, 1971
- **Chieftain Mk 3/3:** Fitted with 720 hp L60 Mk 7A, Improved main gun range finding,provision for Barr & Stroud TLS (Tank Laser Sight) LF2 laser range finder, 1971
- **Chieftain Mk 3/G:** Chieftain Mk.3 with engine induction through fighting compartment. Prototype only
- **Chieftain Mk.3/3P:** Chieftain Mk 3/3 for Iran, 1973
- **Chieftain Mk 3/S:** Production version of Chieftain Mk 3/G with commander's firing control
- **Chieftain Mk.4:** Chieftain Mk.3 with increased fuel capacity. Only two built.
- **Chieftain Mk.5/5P:** Chieftain Mk.5 for Iran, 1975. Engine later upgraded to 750 hp L60 Mk 10A, 1977
- **Chieftain Mk.5/2K:** Chieftain Mk.5 for Kuwait, 1975
- **Chieftain Mk.6:** Chieftain Mk.2 upgraded to Chieftain Mk.5 standard, 1975 In 1975 all earlier Marks of tanks except Mark 1's were upgraded to Chieftain Mk.5 standard as part of the 1975 "Totem Pole" programme,[xvi] including addition of Clansman radios, fitting of TLS, fitment of Muzzle Reference System (MRS) [upon replacement of L11A3 barrel with L11A5 barrel,[xviii] and fitment of 750 hp L60 Mark 8A. These vehicles were re-designated Chieftain Mk's.6 to Mk.8.
- **Chieftain Mk.7:** Chieftain Mk.3 and Chieftain Mk 3/S upgraded to Chieftain Mk.5 standard, 1975
- **Chieftain Mk.7C:** Chieftain Mk.3 upgraded to Chieftain Mk.5 standard for Oman
- **Chieftain Mk.8:** Chieftain Mk.3/3 upgraded to Chieftain Mk.5 standard, 1975 In 1977 the engines of all vehicles were upgraded to the 750 hp L60 Mark 9A, followed by further upgrading with the 840 hp L60 Mark 11A or L60 Mark 12A [xxi] in 1978 as part of the 1977 "Dark Morn" and the 1978 "Sundance" programmes.

- **Chieftain Mk.9:** Chieftain Mk.6 after completing all phases of "Totem Pole", 1979.
- **Chieftain Mk.10:** Chieftain Mk.7 after completing all phases of "Totem Pole". Later upgraded with addition of Stillbrew Crew Protection Package to the turret front and turret ring, 1984–86
- **Chieftain Mk.11:** Chieftain Mk.8 after completing all phases of "Totem Pole". Later upgraded with Stillbrew, 1984–86
- **Chieftain Mk.12:** Chieftain Mk.5 after completing all phases of "Totem Pole". Later upgraded with Stillbrew, 1984–86
- **Chieftain Mk.12/13:** Proposed further upgrades, cancelled when the Challenger 1 was introduced.
- **Chieftain 800:** Chieftain with Chobham armour and new power train
- **Chieftain 900:** Chieftain with Chobham armour, new power train, and Centaur fire control system
- **FV4204 ARV/ARRV:** Armoured Recovery Vehicle, Armoured Recovery and Repair Vehicle.
- **FV4205 AVLB Mk5:** Bridge-laying vehicle
- **Chieftain AVRE (CHAVRE):** Armoured Vehicle Royal Engineers, twelve early "Willich Chieftain AVRE" vehicles converted by 32 Armoured Engineer Regiment and 21 Engineer Base Workshop of the Royal Engineers, Willich, 1987, remaining 48 ex MBTs converted by Vickers Defence Ltd, 1991, to be a British Army combat engineering variant used by the Royal Engineers.
- **Chieftain Marksman:** Self-propelled anti-aircraft gun version, equipped with the Marksman twin gun turret.
- **Khalid /Shir (Lion) 1:** Also known as "4030 Phase 2 Jordan". Jordanian with the running gear of the Challenger 1. In essence, this was a transition vehicle from the Chieftain to the Shir 2, which had been intended for Iran but was subsequently cancelled due to the 1979 Iranian Revolution. The vehicle chassis comprised the front half of a Chieftain hull, Chieftain running gear and the rear of a 4030/2 Chassis (Sloping Hull). This allowed the fitment in the engine bay of a Rolls-Royce CV12 engine producing 1200 bhp at 2,300 rpm.
- **Weapon Carriers:** The Chieftain chassis was adapted to mount air defence weapons ("Marksman" 2 x 35 mm cannon) and a 155 mm howitzer in a number of variants.
- **Shir 2:** 4030 Phase 3" Iranian variant. Visible external differences from Chieftain Mk.5 included a sloping rear hull, the removal of the searchlight from the left turret area and the refitting of storage baskets, the removal of the water channel from around the driver's hatch on the glacis, modification of the light clusters also on the glacis and the enlargement of the sight housing on the commander's cupola. Not delivered, the Shir 2 tanks became Challenger 1 tanks after reworking at ROF Leeds
- **Mobarez Tank:** Iranian upgraded version of Chieftain.

Name: Fully Integrated Improved Fire-Control System (IFCS)

Computerized FCS: Yes, Marconi 12-12P digital computer

First-Round Hit Probability (Stationary Targets): m3,000

First-Round Hit Probability (Moving Targets): m2,000

Thermal Sight Tank Commander: Yes

Commander's Cupola Traverse Range: Deg360

Thermal Sight Gunner: Yes, the AFV No 36 Mk 1 periscope or L3A1.

Periscopes: Nine AFV No 40 Mk 2 observation periscopes

Main Gun Stabilization: INA

Radar and Defense System: GEC-Marconi Radar and Defence Systems

Search Light: Defence Control Systems Division, IR/white-light searchlight

Search Light Range (IR Mode): m1,000

Search Light Range (White Light Mode): m1,500

Tank Laser Sight Unit (TLSU).: Yes

No 70 Telescopic Sight: Yes, for the Gunner

Gun Control System: all-electric gun control system is a Marconi Fighting Vehicle Gun Control Equipment (FV/GCE) No 7 Mk 4

:

Protection

Hull Armor: Welded RHA

Turret Armor: Cast and rolled steel

Applique Armor: Available, Stillbrew armour

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: Available

NBC Protection: Yes

Smoke Equipment: Yes, on each side of the turret there is six electrically-operated 66 mm smoke grenade dischargers.

IR Detector: Yes

Fire Suppression System: FIREWIRE automatic fire-detection system

Air Ventilation and Filtration System: Yes

Notes:

The Chieftain originated from a British Leyland design of a new tank, dating as early as 1950, when the War Office requested a replacement for the Centurion, as the Medium Tank No 2. The Mk.4 were two prototypes with increased fuel capacity and other minor modifications.

M47 Patton American Main Battle Tank (MBT)

Tiers:

Variants:

- **M46E1:** M46E1 – pilot model, M46 hull with T42 turret, fitted with the M36 90 mm Gun, and was longer to incorporate a radio, ventilator, and featured a stereoscopic rangefinder; only one built[
- **M47:** M47 – main production version, M46 hull modified with redesigned glacis, reduction from five to three track return rollers per side, longer mufflers on rear fenders; 8,576 built
- **M47M:** M47M – The product of an improvement program started in the late 1960s, the M47M featured the engine and fire control elements from the M60A1. The assistant driver's position was eliminated in favor of additional 90 mm ammunition. Not used by the US; over 800 vehicles were produced for Iran and Pakistan
- **M47E:** M47E – Spanish M47M austere version (kept original FCS).
- **M47E1:** M47E1 – Second Spanish upgrade batch with rearranged main gun ammunition storage and crew heater. Both new and upgraded M47Es. 330 converted.
- **M47E2:** M47E2 – 45 built. M47E1 with Rh-105 105 mm gun and improved FCS (still electromechanical). Passive night vision for driver and commander. All M47 series MBT in Spanish service retired 1993.
- **M47ER3:** M47ER3 – Spanish armored recovery vehicle. 22 built.
- **Sabalan:** Sabalan – An Iranian upgraded version of the US M47M, It has side skirts and a newly built turret fitted with a 105-mm gun, laser range finder, new fire control system and communication equipment.[34][35] Never used in active service.

Smoke Equipment: INA

Notes:

The M47 Patton was an American main battle tank, a development of the M46 Patton mounting an updated turret, and was in turn further developed as the M48 Patton. It was the second American tank to be named after General George S. Patton, commander of the U.S. Third Army during World War II and one of the earliest American advocates of tanks in battle. The M47 was the U.S. Army's and Marine Corps' primary tank, intended to replace the M26 Pershing and M46 Patton medium tanks. The M47 was widely used by U.S. Cold War allies, both SEATO and NATO countries, and was the only Patton series tank that never saw combat while in US service. Although similar in appearance to the later M48s and M60s, these were completely new tank

designs. Many different M47 Patton models remain in service internationally. The M47 was the last US tank to have a bow-mounted machine gun in the hull. Although a new power plant corrected the mobility and reliability problems of the M26 Pershing, the subsequently renamed M46 was considered a stopgap solution that would be replaced later by the T42 medium tank. However, after fighting erupted in Korea, the Army decided that it needed the new tank earlier than planned. It was deemed that there was not enough time to finish the development of the T42. The final decision was to produce another interim solution, with the turret of the T42 mounted on the existing M46 hull. Although this interim tank was itself technically immature, Army officials felt the improvements over the M46 in firepower and armor were worth the risk. The composite tank, developed by the Detroit Arsenal, was named the M47 Patton. In December 1950 the Army awarded a $100 million contract to the American Locomotive Company for the production of 500 tanks. It entered production in 1951. Its main gun was the M36 90 mm gun with an M12 optical rangefinder fitted. The secondary armament consisted of two .30 cal Browning machine guns, one in the bow and one coaxial with the 90mm main gun in the turret, and a .50 caliber Browning M2 on a pintle mount on the turret roof. The M47 was the last American-designed tank to include a bow machine gun. The T42 turret had a larger turret ring than the M26/M46 turret, and featured a needle-nose design, which improved armor protection of the turret front, an elongated turret bustle and storage bin which protruded halfway across the engine deck, and sloped sides to further improve ballistic protection; this gave the turret a decidedly lozenge-shaped profile. It also featured the M12 stereoscopic rangefinder, which was designed to improve first-round hit probability but proved difficult to use; the rangefinder protruded from both sides of the upper turret front, which would be a feature of American tanks until the advent of the M1 Abrams in 1980. Production at American Locomotive began in July 1951. Logistical and technical issues plagued production almost from the start. Truman administration policy sought to strengthen American arms makers' resilience to aerial attack by encouraging more decentralized weapons production — away from Detroit. The U.S. curtailed civilian automobile production to boost military production with the onset of the Korean War. As a result, Detroit's newly unemployed automotive workers found little work, while tank manufacturers outside Michigan lacked skilled workers. Truman's policy also counted on civilian factories being able to quickly transition to war-time production. However many factories lacked needed tank production machinery, done away with during World War II demobilization. A faulty Ordnance Corps-designed hydraulic turret-control mechanism, shared by the M41 Walker Bulldog, kept the tanks from Korea while engineers worked on a fix. Engineers improved production quality controls of the hydraulics by April 1952, and set about correcting M47s sidelined in storage. By then Army officials had scrapped plans to send the tanks to Korea, in favor of providing them to troops stationed in Europe and at home. The first M47s were not fielded to the 1st and 2nd Armored Divisions until summer 1952. Standardized in May 1952, the M47 Patton's production ran until November 1953; Detroit built 5,481 tanks, and American Locomotive Company (Alco) produced 3,095, for a total production run of 8576 M47 Pattons.

T-90 Russian Main Battle Tank (MBT)

Variants:

- **T-90A:** Russian army version with welded turret, V-92S2 engine and ESSA thermal viewer. Sometimes called T-90 Vladimir, in honor of its chief designer Vladimir Potkin
- **T-90AK:** Command version of T-90A.
- **T-90AM:** Latest version of the T-90A.[77] The main features include the modernisation of the old turret design, which is equipped with a new advanced fire control system "Kalina" (with integrated combat information and control systems), a new automatic loader and a new upgraded gun 2A46M-5, as well as a remote-controlled anti-aircraft gun "UDP T05BV-1". The new version also includes the Relikt (Реликт (динамическая защита) ERA bricks instead of the Kontakt-5 ERA bricks.
- **T-90M:** New modernized version of T-90A. It's a program of modernization of Vladimir tanks and will include 400 tanks currently in service. Tanks will receive 2A82-1M gun (same as in T-14) and fire control system Kalina. They will be upgraded with Afghanit APS and Relikt ERA. The upgrades are also aimed at improving network-centric warfare capabilities and coordination with Armata project vehicles. The first contract was signed in 2017 and serial production started in 2018.
- **T-90S:** Export version of the T-90, later adopted by the Russian Armed Forces as the T-90A. These tanks were made by Uralvagonzavod and were updated with 1,000 hp (750 kW) engines made by Chelyabinsk Tractor Plant. These tanks carry a leaner version of the Shtora-1 passive/active protection system which lacks the infra-red dazzlers carried on the turret. Sometimes called T-90C (Cyrillic letter es looks like a Latin c). These were initially supplied with cast turrets of the early T-90, and when stocks were depleted, new, welded turrets were fabricated.
- **T-90SK:** Commander's version of the T-90S, with additional communication and navigation equipment. It differs in radio and navigation equipment and Ainet remote-detonation system for HEF rounds.
- **T-90S:** "Bhishma" – modified T-90S in Indian service.
- **T-90MS:** Also known as T-90SM is an updated version of the T-90S. It is equipped with a 1,130 hp engine, a PNM Sosna-U gunner view. a UDP T05BV-1 RWS with a 7.62 mm machine gun, GLONASS, inertial navigation systems, new Relikt explosive reactive armour (ERA) that covers more of the tank, and a steering wheel. A new removable turret bustle is included, which provides storage for eight additional rounds. The T-90MS is ready for serial production.[88] 4 video cameras provide a 360° view of the environment, while the tank is more connected to command. The T-90MS has an upgraded thermal imager that can detect tanks over 3300 meters away.
- **BREM-1M:** Armoured recovery vehicle.
- **IMR-3M:** Combat engineer vehicle.
- **MTU-90:** Bridge layer tank with MLC50 bridge.
- **BMR-3M:** Mine clearing vehicle.
- **MTU-2020:** Bridge layer tank based on the T-90A whose chassis has been extended, along with the addition of a road wheel.

System

Alternative Designation: T-90

Type: Main Battle Tank

Family: T-90 Family of Main Battle Tanks

Manufacturer: Uralvagonzavod

Generation: 3+

Status: In service

Crew: ea3 (commander, gunner and driver)

Passenger Capacity: INA

Maximum Effective Range (Land): km500

Maximum Effective Range (ATGM): m5,000

Note: The T-90 is the most modern tank currently in service with the Russian Army, which has a requirement for around 1 500 of these tanks. Also currently it is the only mass-produced MBT in Russia.

Estimated Service Life: 25-30 years

Estimated out of Service Date: 2030-2040

Dimensions

Length: m9.63

Width: m3.78

Height: m2.2

Weight, Combat: tons46

Ground Pressure: kg/mINA

Automotive

Engine Name: V-92S2

Engine Type: V-12 Diesel

Engine Power: hp1,000

Auxiliary Power Unit: Yes

Gas Turbocharger: Yes

Cruising Range: km550

Speed, Maximum Road: km/h60

Speed Maximum Swim: km/hNot Amphibious

Speed, Average Cross: 50

Power to Weight Ratio: hp/tons18.2

Suspension: Torsion bar

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.8

Trench: m2.85

Fording Depth (No Preparation): m1.2

Fording Depth (With Preparation): m5

Fuel Type: Gasoline or Kerosene

Transmission: Mechanical

Fuel Capacity: liters1,200

Communications

Antenna Type: AB-1-P28 Telescopic Antenna

Antenna Height: m11

↳*R-163-50K*

Manufacturer: Sarapul Radioplant OJSC

Product Type: C4ISR

Mount: Vehicle

Status: In Service

Echelon: DIV, BDE, BN

↳*R-163-50K HF transceiver*

Type: High Frequency

Simplex: Yes

Two-Frequency Simplex Telephone: Yes

Two-Frequency Simplex Telegraph Radio: Yes

MHz Range: MHz2-30

Output Power: W50

Operational Range: km350

Note: Compatible with certain VHF Radios in Simplex Mode.

Navigation System

↳*TNA-4 Navigation System*

Gyro Unit: Yes

Distribution Box: Yes

Transformer Type: Pulse

Distance Measurement Unit System: Yes

Speed Indicator System: Yes

Course Heading Indicator Unit: Yes

Track Recorder Map Display.: Yes

Combined Display/Computer Unit: Yes

Main Gun

↳*System*

Name: 2A46M
Type: 125 mm Smoothbore Gun
In Service: 1970 to present
Weight (2A46 125mm Gun): kg2,675
Length (2A46 125mm Gun): mm6,350
Max Rate of Fire (Autoloader): rds/min7
Max Rate of Fire (Manaul): rds/min2-3
Sustain Rate of Fire: rds/min5-7
Range Finder Type: INA
Maximum Elevation: deg+14
Minimum Elevation: deg-6
Traverse Range: deg360
Loader Type: Carousel-type autoloader
Minimum Cycle time for the Autoloader: seconds6.5
Thermal Sleeve: Light Allow
Bore Evacuator: Yes
Breech Type: semi-automatic horizontal sliding breech block via an interrupted screw thread
Breech Maximum Chamber Pressure: 6,500 bar over the 5,100 bar
Max Cycle time for a Round 180deg from the Start Position: seconds15
Carousel Reloading Time: min15

↳*Ammunition (Option 1)*

Type: 3BM42M/3BM44M, 125mm Armour-piercing fin-stabilized discarding sabot (APFSDS)
Caliber: mm125
Muzzle Velocity: m/s125
Basic Load: 34 (Due to extra Radio gear) Total rounds of any combination of 125mm Projectiles
Effective Range (Day): m2,000-3,000
Effective Range (Night): m2,000-2,600
Armor Penetration: Yes, 590-630mm at a range of 2000m
Shell Weight: kg20.4
Projectile Weight: kg7.5
Charge Weight: kg5.3
Penetration: mm/deg270/60

↳*Ammunition (Option 2)*

Type: 3BM9/3BM10, 125mm Armour-piercing discarding sabot (APDS)

Caliber: mm125

Muzzle Velocity: m/s1,715-1,800

Effective Firing Range: m3,000

Shell Weight: kg19.6

Projectile Weight: kg5.67

Charge Weight: kg5

Penetration: mm/deg140/60

↳*Ammunition (Option 3)*

Type: 3BK12M, 125mm (HEAT)

Caliber: mm125

Muzzle Velocity: m/s905-950

Effective Firing Range: m4,000

Shell Weight: kg29

Projectile Weight: kg19

Charge Weight: kg5

Penetration: mm/deg220/60

↳*Ammunition (Option 4)*

Type: 3OF19, 125mm (HE)

Caliber: mm125

Muzzle Velocity: m/s760

Effective Firing Range: m4,000

Shell Weight: kg33

Projectile Weight: kg23

Charge Weight: kg5.0

Penetration: mm/degINA

Anti-Tank Guided Missile

↳*System*

Name: 9M119 Svir, 9M119M Refleks(NATO designation AT-11 Sniper-B)

Type: Laser Beam Anti-Tank Guided Missiles

In Service: 1980's to present

Manufacturer: Degtyarev plant

Cost: $37,500

Mass: kg17.2

Diameter: mm125

Basic Load: ea6

Warhead Type: Tandem hollow-charge

Warhead Weight: kg4.5

Max Rate of Fire: INA

Operational Range: m4,000-5,000

Speed: Subsonic

Guidance System: Laser Beam Riding

Launch Platform: 125 mm smoothbore guns

Variants: 9M119M

Tank Commander's Weapon System

↳*System*

Name: 12.7mm Kord Heavy Machine Gun,

Type: 12.7mm Heavy Machine Gun

Manufacturer: V.A. Degtyarev Plant

Cartridge: 12.7×108mm

In Service: 1998-Present

Weight: kg25.5

Length: mm1,980

Max Rate of Fire: rds/min650-750

Sustain Rate of Fire: rds/min550-600

Action: Gas-operated, rotating bolt

Feed System: 50-round linked belt

Sights: Iron Sights

Variants: 6P50-1, 6P50-2, 6P50-3, 6P49

↳*Ammunition*

Cartridge: 12.7×108mm

Caliber: mm12.7mm

Muzzle Velocity: m/s860

Basic Load: ea300

Effective Range: m2,000

Loader's Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: 7.62mm Machine Gun

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Sustain Rate of Fire: rds/min500

Range Finder Type: INA

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Total): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea1,500

Effective Range (Iron Sights): m1,000

Effective Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: Ainet FCS

Computerized FCS: Yes

Thermal Sight Tank Commander: No

Thermal Sight Gunner: No

Panoramic Commander's Sight: No

Main Gun Stabilization: Yes, 2E42-4 Zhasmin System

Note: The Fire Control System is outdated and is from the late 1990s.

Protection

Hull Armor: Steel-composite-reactive blend APFSDS: 550 mm + 250–280 mm with Kontakt-5 = 800–830 mm HEAT: 650–850 mm + 500–700 mm with Kontakt-5 = 1,150–1,550 mm

Turret Armor: Steel-composite-reactive blend APFSDS: 550 mm + 250–280 mm with Kontakt-5 = 800–830 mm HEAT: 650–850 mm + 500–700 mm with Kontakt-5 = 1,150–1,550 mm

Applique Armor: Available

Explosive Reactive Armor: Yes, Kontakt-5 explosive reactive armor blocks, equivalent to up to 500mm of steel armor

Active Protection System: Yes, the Shtora-1 countermeasures system

Mine Clearing: INA

Self-Entrenching Blade: Yes

NBC Protection: Yes, GO-27 PRKhR radiation and chemical agent detection system.

Deep Wading Kit: Available

Jammer: Yes, TShU1-7 IR jammers located either side of the main gun

Laser Radiation Sensors: Yes

IR dazzlers: Yes

Nakidka Signal Reduction Kit: Available

Smoke Equipment: Yes, banks of 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.

Grenade Maximum Range: m250-300

Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade.

Fire Suppression System: Yes, the Raduga-2 fire-suppression system

Notes:

Commander's version of the T-90, with additional communication (station R-163-50K) and navigation equipment (TNA-4-3). Distinguishing features As a command vehicle the T-90K carries different communications systems to the standard T-90. This can assist in distinguishing the vehicle as it will carry additional antennae on the roof of the turret. However, the T-90K will generally be almost identical to the T-90 to avoid the easy location and targeting of command vehicles.Armament The weapons carried are identical to the T-90, but the additional command equipment limits the space for stored ammunition to 34 rounds instead of 42 rounds in the standard version. Earlier Russian command vehicles, such as the T-80K, also lost the ability to fire the gun-launched guided missile. It is unclear if this effect is carried on with the T-90K but could be a possibility.

M1A2 Abrams SEP American Main Battle Tank (MBT)

Tiers:

Variants:

- **Variants and upgrades:** * XM1-FSED: Preproduction test model. Eleven Full-Scale Engineering Development test bed vehicles were produced in 1977–78. These vehicles were also called Pilot Vehicles and numbered PV-1 through PV-11. * M1: First production variant. Production began (at Chrysler) in 1979 and continued to 1985 (at General Dynamics) (3,273 built for the US). The first 110 tanks were Low Rate Initial Production (LRIP) models, still called XM1s, because they were built prior to the tank being type-classified as the M1. * M1IP (Improved Performance): Produced briefly in 1984 before the M1A1, contained upgrades and reconfigurations like new turret with thicker frontal armor, new turret is referred as "long" turret instead of older "short" turret, armor upgraded from ~650mm line of sight thickness to ~880mm (894 built for US). * M1A1: Production started in 1985 and continued to 1992, pressurized NBC system, rear bustle rack for improved stowage of supplies and crew belongings, redesigned blow-off panels and M256 120 mm smoothbore cannon (4,976 built for the U.S. Army, 221 for USMC, 59 M1A1 AIM SA sold to Australia). * M1A1HA (Heavy Armor): Added 1st generation depleted uranium armor components. Some tanks were later upgraded with 2nd generation depleted uranium armor components, and are unofficially designated M1A1HA+. * M1A1HC (Heavy Common): Added new 2nd generation depleted uranium armor components, digital engine control and other small upgrades common between Army and Marine Corps tanks. * M1A1D (Digital): A digital upgrade for the M1A1HC, to keep up with M1A2 SEP, manufactured in quantity for only 2 battalions. * M1A1 AIM v.1 (Abrams Integrated Management): A program whereby older units are reconditioned to zero hour conditions;[126] and the tank is improved by adding Forward-Looking Infra-Red (FLIR) and Far Target Locate sensors, a tank-infantry phone, communications gear, including FBCB2 and Blue Force Tracking to aid in crew situational awareness, and a thermal sight for the .50 caliber machine gun. * M1A1 AIM v.2/M1A1 SA (Situational Awareness): Upgrades similar to AIM v.1 tanks + new 3rd generation depleted uranium armor components. Configuration for the Royal Moroccan Army, which is almost identical to the Australian variant, except exportable turret armor is installed by General Dynamics Land System to replace the DU armor. * M1A1 FEP (Firepower Enhancement Package): Similar upgrade to AIM v.2 for USMC tanks. * M1A1KVT (Krasnovian Variant Tank): M1A1s that have been visually modified to resemble Soviet-made tanks for use at the National Training Center, fitted with MILES gear and a Hoffman device. * M1A1M: An export variant ordered by the Iraqi Army with depleted uranium armor removed and older thermal imaging system with lower resolution used. * M1A1 (AIDATS upgrade): Upgrade-only variant to all USMC General Dynamics M1A1 Abrams tanks to improve the tank commander's situational awareness with an upgraded thermal sight, color day camera, and a stationary color display. * M1A2 (Baseline): Production began in 1986 and entered service in 1992(77 built for the U.S. and more than 600 M1s upgraded to M1A2, 315 for Saudi Arabia, 1,005 for Egypt, 218 for Kuwait). The M1A2 offers the tank commander an independent thermal sight and ability to, in rapid sequence, shoot at two targets without the need to acquire each one sequentially, also 2nd generation depleted uranium armor components. * M1A2 SEP (System Enhancement Package): Has upgraded third-generation depleted uranium armor components with graphite coating (240 new built, 300 M1A2s upgraded to M1A2 SEP for the US, also unknown numbers of upgraded basic M1s and M1IPs, also 400 oldest M1A1s

upgraded to M1A2 SEP). * M1A2S (Saudi Package): Saudi Arabian variant upgrade of the M1A2 based on M1A2 SEP, with some features, such as depleted uranium armor, believed to be missing and replaced by special armor. (442 M1A2s upgraded to M1A2S). * M1A2 SEPv2: Added Common Remotely Operated Weapon Station as standard, color displays, improved interfaces, a new operating system, improved front and side armor with ERA (TUSK kit), tank-infantry phone as standard, and an upgraded transmission for better durability. * M1A2C (SEPv3): Has increased power generation and distribution, better communications and networking, new Vehicle Health Management System (VHMS) and Line Replaceable Modules (LRMs) for improved maintenance, an Ammunition DataLink (ADL) to use airburst rounds, improved counter-IED armor package, improved FLIR using long- and mid-wave infrared, a low-profile CROWS RWS, Next Generation Armor Package (NGAP), and an Auxiliary Power Unit (APU) under armor to run electronics while stationary instead of the engine, visually distinguishing the version by a small exhaust at the left rear. More passive ballistic protection added to the turret faces, along with new Explosive Reactive Armor mountings (Abrams Reactive Armor Tile (ARAT)) and Trophy Active Protection systems added to the turret sides. Prototypes began testing in 2015, and the first were delivered in October 2017. Fielding is expected to begin in 2020. * M1A2T: Special configuration variant of the M1A2C reportedly being offered for sale to Taiwan as of March 2019 and approved by US State Department as of July 2019. Per DSCA statement, it is roughly equivalent to M1A2C, except depleted uranium armor is replaced by FMS export armor. There is no mention of the Trophy APS system. The new-built tanks will be produced at Anniston Army Depot, Anniston, Alabama, and the Joint Systems Manufacturing Center, Lima, Ohio. * M1A2D (SEPv4): Under engineering development with delivery planned to start by 2021. The Commander's Primary Sight, also known as the Commander's Independent Thermal Viewer, and Gunner's Primary Sight will be upgraded with 3rd Gen FLIR, an improved laser rangefinder and color cameras. Additional improvements will include advanced meteorological sensors, laser warning/detection receivers, directional smoke grenade launchers and integration of the new XM1147 multi-purpose (AMP) 120mm tank round. The AN/VVR-4 laser warning receiver and ROSY rapid obscurant system have been trialed by the US Army for adoption on the Abrams tank and Bradley fighting vehicle. * M1A2-K: Under development, unique variant for the Kuwaiti Army, slated to replace Kuwait's current M1A2 fleet. * M1A3: Under research development as of 2014. Improvements are to include a lighter 120 mm gun, added road wheels with improved suspension, a more durable track, lighter-weight armor, long-range precision armaments, and infrared camera and laser detectors. The variant is believed to have a new diesel engine, instead of the gas turbine engine used in previous M1 variants * M1 TTB (Tank Test Bed): Prototype with unmanned turret, 3 crew members in armored capsule in front of the heavy armored hull, main armament was 120 mm smoothbore gun, M256 derivative or modification, mechanical loading system under turret, never fielded. * CATTB: The Component Advanced Technology Test Bed was an experimental model with a lightweight 120 mm smoothbore cannon, heavy armored turret and upgraded hull based on the M1 chassis. It had a mechanical loading system in turret bustle, a new engine and probably other upgrades, never fielded. The tank went into trials in 1987–88. * M1 Thumper: Experimental variant by Lockheed Martin, equipped with the 140 mm XM291 ATACS smoothbore cannon. Similar to the CATTB, it included a larger, elongated turret to offer protection levels comparable to the M1A2 while allowing the mounting of the larger cannon and its longer ammunition. Cancelled with the end of the Cold War, and never fielded. * M1 AGDS (Air Ground Defense System): Proposed air defence variant of the Abrams equipped with dual 35 mm Bushmaster III autocannons, 12 ADATS missiles and advanced electro-optical and radar targeting systems derived from the ADATS. It was supposed to be capable of both air defence and anti-tank purposes with the ADATS MIM-146 missiles which was a dual purpose ATGM/SAM. The proposal never saw consideration and was never developed further. * M1 Grizzly Combat Mobility Vehicle (CMV). * M1 Panther II: A remote controlled mine clearing vehicle with turret removed, mine rollers on front, and the Standardized Teleoperation System. * M104 Wolverine Heavy Assault Bridge * M1074 Joint Assault Bridge (JAB): Bridgelayer combining a heavy "scissor" bridge with the M1 Abrams chassis. Expected to reach low-rate initial production in 2019 to replace the M60 AVLB and M104 Wolverine * M1150 Assault Breacher Vehicle (ABV): Assault variant for the USMC. Based upon the M1A1 Abrams chassis, the Assault Breacher Vehicle has a variety of systems installed, such as a full-width mine plow, two linear demolition charges, and a lane-marking system. Reactive armor has been fitted to the vehicle providing additional protection against High-explosive anti-tank warhead-based weapons. The turret has been replaced by a new smaller one with two MICLIC launchers at its rear. A M2HB .50 machine gun in a remote weapons station is mounted on the commander's cupola and a bank of grenade launchers are fitted to each side of the superstructure to cover the frontal arc for self-protection. * M1 Armored Recovery Vehicle: Only a prototype produced.

System

Alternative Designation: M1A2 SEP
Type: Main Battle Tank
Crew: 4 (commander, driver, gunner, loader)
SEP Upgrades: a new computerized mass-memory unit; color maps and displays; enhanced Army Force XXI digital command and control capabilities; a second-generation, forward-looking IR (FLIR) system for the gunner and commander;user-friendly soldier/machine interface (SMI); under-armor auxiliary power unit (UAAPU);

Dimensions

Length, Hull: 7.92 m

Width, with Skirts: 3.65 m

Width, without Skirts: 3.48 m

Track Length on Ground: 4.65 m

Track Width: 0.64 m

Ground Clearance, Center of Hull: 0.48 m

Ground Clearance, Sides: 0.43 m

Height: 2.89 m

Gun Length: 9.83 m

Height to Turret Roof: 2.44 m

Weight, Combat: 63,086 kg

Ground Pressure: 1.08 kg/sq cm

Automotive

Engine Name: Textron-Lycoming AGT-1500 2-spool free-shaft, multi-fuel turbine with Allied-Bendix digital electronic fuel control

Engine Type: Multi-Fuel

Engine Power: 1,500 hp at 3,000 rpm

Power-to-Weight Ratio: 23.77 hp/metric ton

Fuel Capacity: 504 gal (1,908 liters)

Transmission: Allison X-1100-3B Automatic hydro-kinetic, hydrostatic steering, 4 forward and 2 reverse gears

Suspension: advanced torsion bar, 7 road wheels with 15-in (381-mm)travel, rear drive, front idler, 3 internal rotary shock absorbers,2 return rollers

Braking: hydro-mechanical

Road Speed: 66 km/h

Speed, 10 Deg Upslope: 27 km/h

Speed, 60 Deg Upslope: 7 km/h

Acceleration: 32 km/h

Range: 426 km

Auxiliary Power Unit: under-armor auxiliary power unit (UAAPU)

Communications

Radio: single-channel ground and airborne radio system (SINCGARS)

Main Gun

↳*System*

Name: M256 smoothbore

Type: 120-mm/46-cal M256 smoothbore with fume extractor and thermal sleeve

Caliber: 120mm

Length: 5.6 m

Barrel Length: 5.3 m

Width: 728 mm

Bore: 120-mm/44-caliber, smoothbore fitted with fume extractor and thermal sleeve

Gun Weight: 1,905 kg

Barrel Weight: 1,175 kg

Recoil, Maximum: 370 mm

Recoil, Normal: 340 mm

Recoil System: 2 hydraulic buffers and 1 hydropneumatic recuperator

Breech Type: semi-automatic vertical sliding wedge

Muzzle Velocity: 1373+ m/sec

Maximum Range: 2,500+ km

Turret Type: electro-hydraulic, manual backup

Feed System: Manual

Elevation: -10/+20 deg

Traverse: 360 deg

↳*Ammunition (Option 1)*

Name: M830

Type: HEAT-MP

Caliber: mm120

Length: 981 mm

Weight: 24.2 kg

Basic Load: 42 rounds

Ammo Types: HEAT-MP-T, APFSDS-T, MPAT, STAFF

↳*Ammunition (Option 2)*

Name: M829

Type: APFSDS

Caliber: 120mm

Length: 935 mm

Weight: 18.7 kg

Basic Load: 42 Rounds

Coaxial Weapon System

↳*System*

Name: 1 x 7.26-mm M240 machine gun
Type: General-Purpose Machine Gun
Caliber: 7.72mm
Length: 1,260 mm
Barrel Length: 630 mm
Width: 120 mm
Height: (260 mm
Weight: 12.5 kg
Action: Gas-operated long-stroke piston, open bolt
Rate of Fire: M240, M240E1, M240C, M240D and M240G: Gas Setting 1: 650–750 RPM Gas Setting 2: 750–850 RPM Gas Setting 3: 850–950 RPM M240B, M240L and M240H: 550–650 RPM Barrett 240LW and 240 LWS: 550–650 RPM
Muzzle Velocity: 853 m/s
Maximum Firing Range: 3,725 m
Effective Firing Range: 800 m (875 yd) (bipod) 1,100 m (1,203 yd) (tripod)
Feed System: Belt-fed using M13 disintegrating links
Sights: Iron sights: front blade and folding rear leaf with aperture and notch

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×51mm NATO
Basic Load: 6,000 Rounds

Loader's Weapon System

Weapon: 1 x 7.62-mm M240 machine gun on Skate Mount
Basic Load: 6,000 Rounds

Commander's Weapon System

↳*System*

Name: 1 x .50-caliber M2 machine gun
Type: Heavy Machine Gun
Caliber: 12.7mm
Length: 1,654 mm
Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min (M2HB) 750–850 rounds/min (AN/M2) 1,200–1,300 rounds/min (AN/M3)

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 1,000

Fire Control

Name: INA

Computerized FCS: Yes

Ballistic Computer: Hughes 12 kilobyte digital computer

Main Gun Stabilization: Yes

Day Optics: Hughes primary stabilized sight with 3- and 10-power day optics

Night Optics: Hughes night-vision/sight with thermal imaging

Rangefinder: GEC Avionics/Kollsman eye-safe CO2 rangefinder replaces the Nd-YAG laser rangefinder

Effective Fire Range: 200 to 7,990 m

Accuracy: 10 m or less

Commander's Thermal Viewer: a Texas Instruments commander's independent thermal viewer (CITV), which permits the commander to search and independently select new targets

Driver's Thermal Viewer: Hughes driver's thermal viewer (DTV) with integrated display, a fire-control electronics unit (FCEU) that coordinates CIT stabilization, primary sight and gun-turret drive

M1A2 SEP Upgrade: improved commander's weapon station (ICWS)

Information System: intervehicular information system (IVIS)

Navigation System: Smith Industries position navigation (POS/NAV) system

Command and Control Upgrade: enhanced Army Force XXI digital command and control capabilities;

FLIR: a second-generation, forward-looking IR (FLIR) system for the gunner and commander

Protection

Hull Armor: upgraded third-generation depleted uranium armor components with graphite coating

Turret Armor: INA

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: In addition to the armor, some USMC Abrams tanks are equipped with a Softkill Active protection system, the AN/VLQ-6 Missile Countermeasure Device (MCD) that can impede the function of guidance systems of some semi-active control line-of-sight (SACLOS) wire- and radio guided anti-tank missiles (such as the Russian 9K114 Shturm) and infrared homing missiles.

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: 200 SCFM-Clean Cooled Air (collective overpressure); AN/VDR-1 radiological warning device

Smoke Equipment: M250 (British L8A1) 2 x 6-barrel smoke discharger (24 rounds), engine exhaust generation

Fire Suppression: automatic detection and suppression

Fuel Cover: Allied Bendix digital electronic fuel control

Note: Enhanced survivability including better armor on gunner's primary sight (GPS) cover;

Notes:

M1A2 Systems Enhanced Package (SEP) Further improvements on the M1A2 have occurred with the production of the M1A2 SEP . The package includes: *enhanced Army Force XXI digital command and control capabilities; *a second-generation, forward-looking IR (FLIR) system for the gunner and commander; *user-friendly soldier/machine interface (SMI); *under-armor auxiliary power unit (UAAPU); *a new computerized mass-memory unit; *color maps and displays. Deliveries of the SEP began in September 1999. The M1A2 Abrams main battle tank is a further development of the M1A1. Currently it is one of the best MBTs in the world. Development of improved M1A1 began in 1988. About 1 200-1 500 M1A2 main battle tanks were delivered to the US army. Out of this number approximately 1 000 out-dated M1 main battle tanks were upgraded to the M1A2 standard. It is planned that this tank will remain in service beyond 2050. The M1A2 has been exported to Kuwait (218) and Saudi Arabia (457). Approved for production in 1990, the M1A2 represents the U.S. Army’s technological improvement of the basic M1A1 design and the most modern battle tank in the world. Outwardly similar in appearance to the M1A1, the most notable exterior changes on the M1A2 are the redesigned Commander's Weapon Station (CWS) and the addition of a Commander's Independent Thermal Viewer) on the left side of the turret forward of the loader's hatch. Internally, however, the M1A2 has been radically redesigned to take advantage of newer technology. Most notable of these improvements is the addition of the Inter-Vehicle Information System (IVIS.) The IVIS system allows for the automatic and continual exchange of information between vehicles. By incorporating information provided by an on board Position/Navigation (POSNAV) system, unit commander's can track the location and progress of subordinate elements automatically, without tasking vehicle crews. In addition enemy positions can be identified, plotted and disseminated, while reports and artillery requests can be automatically formatted, transmitted, and processed. Lastly, map graphic control measures and operational orders can be rapidly distributed via the IVIS system. To ensure information security, all IVIS data transmissions are routed through the M1A2's SINCGARS radio system. Improving on the "hunter-killer" tank commander-gunner target hand off method pioneered on the German Leopard II, the M1A2 takes this a step further by providing the Tank Commander with an independent thermal sight. This CITV sight allows the commander to independently scan for targets in all weather conditions and through battlefield obscurants. In addition to IVIS and the CITV, the M1A2 incorporates a number of additional electronic upgrades. Power distribution throughout the tank has been improved, relying on multiple bus paths so that in the event one conduit is damaged, power may still be delivered to a component via an alternate path. The driver's instrument display has been upgraded to a more detailed digital display and the Gunner's Primary Sight has been stabilized in two axes for increased accuracy. Approved for implementation in 1995, the M1A2 SEP (System Enhancement Package) is a technology upgrade and standardization program, whereby the Army's fleet of M1s and M1A2s will all be brought to a common standard. Most notable among the modifications will be the introduction of a standard under armor auxiliary power unit and the addition a crew compartment air conditioning and cooling unit. Other modifications within the vehicle will include upgrades to the IVIS system (color display, full size keyboard, digital mapping and graphics generation capability, and voice recognition capabilities), upgrades to the Gunner's Primary Sight assembly, and improvement in the tank's intercom and radio communications systems. Production of the M1A2 was halted after the initial run of 627 vehicles. As part of the fleet upgrade program, 547 of the Army's current inventory of M1s are being upgraded to M1A2 SEP standards, which will require the complete remanufacturing of the turret, while the current fleet of M1A2s will undergo a retrofit to bring them up to SEP standards.

T-64BK Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-64A:** Production version of base tank. Tank has a history of reliability problems, and lacks the high armor protection, track skirts, a fcs and atgm launch capability for t-64b.
- **T-64BK:** Command tank version, with 10-m whip antenna.
- **T-64B1:** Variant has partial era mounted; the few original t-80s retained were upgraded to this standard
- **T-64BV:** Variant has kontakt era mounted. Combat weight (mt): 42.5 for t-64bv with explosive reactive armor (mm): standard on t-64bv
- **T-64U/T-64BM2:** Upgrade series marketed by ukrainian malyshev in 2001. T-64u prototype featured 2nd gen era, composite armor, and fire suppression equipment. Variant added t-80u fire control (1a42 gunner day sight) and thermal night sight-permits it to replace rf-guided at-8/kobra atgm with better refleks series (svir/invar) laser-beam rider atgms. Ukrainian-developed lbr-guided atgm kombat similar to refleks. A later variant changed the fcs to t-80ud/t-90 type, with 1a45 day sight, and agat thermal night sight
- **BM BULAT:** This 45 mt upgrade variant is currently being advertised. It includes an 850-hp engine, fcs with 1g46m lrf-based sight and catherine-based thermal night sight. Remote fired 12.7-mm mg and 5,000 m

System

Alternative Designation: T-64BK

Total Built: +6,000 total

Type: Main Battle Tank

Family: T-64 Family

Crew: ea3

Passenger Capacity: INA, IT"S A TANK

Maximum Effective Range: km600

Land Navigation System: Yes

Note: The T-64 became the primary MBT of Soviet forces until it was replaced by the T-80 and T-72.

Main Gun

↳*System*

Name: D-81T (aka 2A46)125 mm smoothbore gun

Type: 125 mm smoothbore

Max Rate of Fire: rds/min8

Manual Load Time: rds/min1-2

Weight (Barrel): kg1,073

Autoloader: Yes, Carousel-Type Autoloader

Fire on the Move: Yes, Main Gun

Maximum Elevation: Deg+14

Minimum Elevation: Deg-6

Traverse Range: Deg360

Automatic Loader: Yes

Thermal Sleeve: Yes

Evacuator Type: central bore evacuator

Effective Full Charge (EFC) Life: rds600

Breech Type: semi-automatic horizontal sliding breech block

Loading System: Korzina electric and hydraulic automatic loading system

Carousel: The carousel can accommodate 28 two-piece rounds of ammunition, and rotates automatically after each

round is fired

Carousel Load Time: min13-15

Basic Load Time: min27

Rate of Fire: rds/min6-8

↳*Ammunition (Option 1)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot ((APFSDS))

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Effective Range: m2,000-3,000

Maximum Range: m4,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Dimension: mm900

Projectile Weight: kg11

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Effective Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Proectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 1)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: 915

Max Dispersion: INA

Maximum Range: m3,00

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Name: Kobra (AT-8 Songster)

Type: SACLOS Anti-Tank Missile System

Caliber: mm125

Manufacturer: KB Tochmash

In Service: 1976-present

Proliferation: Widely Proliferated throughout Armenia, Azerbaijan, Belarus, India Iran, Russia, Ukraine, and Uzbekistan

Basic Load: ea4-6

Weight: kg23.2

Warhead Weight: kg4.5

Guidance System: SACLOS Radio

Effective Firing Range: m100-4,000

Muzzle Velocity: m/s125 m/s, which increases to 800m/s at its peak m/s

Flight Time to a 4,000 Meter Targetsec: 9-10

Armor Penetration: 600mm of RHA

Hit Probability: %80

Variants: 9M112M, 9M112M2, 9M124

Note: Fired from the T-64 and T-80 Family of Russian Tanks

Coaxial Weapon System

↳*System*

Name: Type 54 DShK Anti-Aircraft Machine Gun

Type: 12.7mm Heavy Machine Gun

Proliferation: over 1 Million

Length (Total): mm1,625

Length (Barrel): mm1,070

Weight (Gun Only): kg34

Weight (on Wheeled Mounting): kg157

Max Rate of Fire: rds/min600

Range Finder Type: Optical

Action: Gas-Operated, Flapper Locking

Sights: Iron/Optical

Feed System: 50 Round Belt

Turret: single seat and placed at the rear of the vehicle roof. It is sharp-pointed at the front.

Variants: DK, DShKM, DSHKS, Type 54 HMG

Fire on the Move: Yes

↳***Ammunition***

Type: Rifle

Caliber: mm12.7

Cartridge: mm12.7x108

Muzzle Velocity: m/s850

Basic Load: ea300

Effective Range: m2,500

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Loader's Weapon System

↳***System***

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: mm7.62

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea250

Effective Range (Iron Sights): m100- 1,000

Effective Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: IG43 fire-control

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, TKN-3V combination day/night binocular periscopic

Thermal Sight Gunner: Yes, TPN1-49-23 night sigh

Main Gun Stabilization: 2-Plane, 2Eh26M armament stabiliser

Fire on the Move: Yes

Rangefinder: two-axis stabilised IG42 laser rangefinder sight

Ballistic Computer: 1V517 tank ballistic computer

Vision Blocks: 1 x TPNO-16, 2 x TPNA-65 day vision blocks

PZU-5 monocular periscopic sight: Available

Searchlight: L-2AgM infra-red searchlight

Sight Type: G21 sight with laser telemetry

Wind Sensor: B11 cross-wind sensor

Protection

Hull Armor: cast and welded steel armour

Turret Armor: cast armour welded together

Armor Protection (Front): mm370-440 of RHA against KE rounds and 500 mm to 575 mm of RHA against HEAT rounds

Applique Armor: Available

Self-Entrenching Blade: KMT-4 roller or the KMT-6 track width mine plough,

Explosive Reactive Armor: No Explosive Reactive Armor (ERA)

Active Protection System: Yes

Mine Clearing: Roller-plow available

NBC Protection: Yes

Smoke Equipment: 12 smoke grenade launchers mounted either side of the main gun

IR Signature: INA

Automatic Fire Suppression Systems.: Available, PPO fire detection and suppression system,

Notes:

The T-64BK is a command variant of the T-64B. It is designed for local command of armoured vehicles at the tactical level. It is equipped with additional communications equipment for this purpose.The T-64BK can be differentiated from a T-64B by the positioning of a longer antenna on the turret. The antenna may be secured to the turret with additional cables and when fully extended can be over 10 m long.

Chonma-ho (Pegasus) North Korean Main Battle Tank (MBT)

Tiers:

Variants:

- **Ch'ŏnma-ho ARV:** Armoured recovery vehicle with a casemate superstructure
- **Ch'ŏnma-ho Command:** Command variant of the tank with a fake main gun
- **Juche-Po:** Self-propelled artillery gun on a modified Ch'ŏnma-ho chassis. The Juche-Po is an improvement over the Tok-Ch'ŏn artillery piece, which was mounted on an ATS-59 chassis. There are at least four M1991 versions of the Juche-Po, each mounting a different gun: the D-30 122 mm, D-74 122 mm, the M-46 130 mm and the ML-20 152 mm howitzer. A fifth M1992 version is armed with the SM-4-1 130 mm howitzer. These artillery pieces can be identified by their six road wheels, as compared to the Tok-Ch'ŏn's five, and a prominent recoil cylinder which protrudes from the turret. Another major difference is that the Juche-Po has a fully encased rounded turret, as opposed to the older open-topped self-propelled artillery pieces used previously.
- **Ch'ŏnma-ho Type IV:** The Ch'ŏnma-ho IV is fitted with what resemble EDZ light explosive reactive armour bricks. Judging by photographs, these are mounted specifically on the turret side, with at least eight bricks per side. The Ch'ŏnma-ho IV is reported to be upgraded with new side-mounted smoke launchers
- **Ch'ŏnma-ho Type V:** Newest Version. Very little information on this version

System

Alternative Designation: Chonma-ho, Pegasus,
In Service: 1980 to present
Total Built: More than 1,200 built
Manufacturer: Second Machine Industry Bureau
Type: Main Battle Tank
Family: INA
Crew: ea4
Passenger Capacity: INA
Maximum Effective Range: km400
Note: The most modern Ch'ŏnma-ho tanks seem to be the IV and V versions.

Proliferation: Widely Proliferated

Length (Total): mm1,980

Length (Barrel): mm1,346

Width: mm162

Weight: kg49

Action: Short Recoil Operation

Feed System: 40-round belt

Sights: Iron or Optical

↳***Ammunition***

Type: Rifle

Caliber: mm14.5

Muzzle Velocity: m/s1,005

Basic Load: ea300

Maximum Firing Range: m3,000-4,000

Armor Penetration: Avaialble

Round Variant 1: BS: Armor-piercing incendiary original anti-tank round. The projectile weighs 64.4 grams and is 51 millimeters long with a 38.7 gram core of tungsten carbide with 1.8 grams of incendiary material in the tip. The overall round weighs approximately 200 grams and is 155 millimeters long. The projectile has a muzzle velocity of approximately 1,006 meters per second and can penetrate 30-32 millimeters of RHA steel at an incidence of 0 degrees at a range of 500 meters, or 40 millimeters at a range of 100 meters.

Round Variant 2: B-32: Armor-piercing incendiary full metal jacket round with a hardened steel core. Projectile weight is 64 g and muzzle velocity is 1006 m/s. Armour penetration at 500 m is 32 mm of RHA at 90 degrees.

Round Variant 3: BZT: Armor-piercing incendiary tracer full metal jacket round with a steel core. Projectile weight is 59.56 g and muzzle velocity is 1,006 m/s. Tracer burns to at least 2,000 m.

Round Variant 4: MDZ: High-explosive incendiary bullet of instant action. Projectile weight is 59.68 g.

Round Variant 5: ZP: Incendiary tracer round

Round Variant 6: DGJ02: APIDS-T cartridge uses a 45 g tungsten penetrator, wrapped in a discarding sabot (similar to the US military SLAP cartridges) with dual colour tracer to aid ranging. The sabot splits and leaves the penetrator between 150 and 200 m from the muzzle. It has a muzzle velocity of 1,250 m/s and is quoted as being able to penetrate 20 mm of armour plate set at an angle of 60° at 1000 m.

Round Variant 7: DGE02: APHEI cartridge weighs between 175 and 188 g. At 1000 m it is quoted as having a 90 percent chance of being able to penetrate 15 mm of armour plate set at 30°. At 300 m after penetrating a 2 mm soft steel plate (representing an aircraft skin) it can further penetrate a 1.2 mm thick steel plate producing 20 fragments. Upon explosion between 75 and 95 incendiary pieces are formed which have an 80% chance of igniting aviation fuel.

Smoke Equipment: Yes
IR Signature: INA
"Boom Shield": Equipped in the Late 1980's

Models

Ch'ŏnma-ho I (Ga): Lightened copy of the T-62 with thinner armour
Ch'ŏnma-ho II (Na): Similar to a stock T-62, but has several differences, has a laser rangefinder housed in a blister above the main gun atop the turret (though the original T-62 does have a laser rangefinder, the Ch'onma-ho 1 do not – and the laser rangefinder of the T-62 is an integral part of the fire control system, rather than an add-on part like on the Ch'onma-ho 2). Fitted with spaced appliqué armor on the turret in a ring around the turret ("boom shield") – thin plates of steel welded onto the turret atop bars provide a space between the shields and the turret armor to provide the equivalent of spaced

armor, as well as doubling as turret baskets for crew equipment and vehicle equipment.

Ch'ŏnma-ho III (Da): A simple progressive upgrade of the Ch'onma-ho 2, with a thermal sleeve for the main gun and armored track skirts added. It is possible, but considered unlikely, that lugs for ERA have been added since its introduction; if they are present, they would be most likely found on the glacis and turret sides. A night vision upgrade

Ch'ŏnma-ho IV (Ra): Greatly upgraded armor protection, including composite armor on the glacis and turret front, and appliqué or thickened armor elsewhere. Even the appliqué and/or thickened armor appears to be more advanced than earlier models, does not appear to have gained a huge amount of weight. A ballistic computer was added to the fire control suite, and the fire control suite has been integrated into a complete system rather than being a patchwork of upgrades. Gun stabilization has been improved. Radios are improved, and the suspension beefed up. The new engine is a 750-horsepower model which can lay a thick, oily smoke screen by injecting diesel fuel into its exhaust. Lugs for ERA (similar to the Russian Kontakt-3 ERA) added to turret sides, and lugs on the armored track skirts and on the glacis. Lugs for a relatively small amount of ERA bricks on the turret front; the ERA on the turret front would only protect 40% of hits to the turret front. On side of turret, clusters of four smoke grenade launchers; at the rear of the turret another cluster of four smoke grenade launchers, firing backwards instead of forwards

Ch'ŏnma-ho V (Ma) -: rmor upgrades derived partially from the T-90S and T-72S, as well as a better ballistic computer and the addition of the aforementioned thermal imagers. Upgraded main gun – a copy of the 125mm 2A46 gun, complete with an autoloader. The fire control system replaced with one matching the new main gun, and the spent shell ejection system dispensed . Use wider tracks

Ch'ŏnma-ho VI (Ba): Newly improved armor. fitted with rubber plates to defend shape charged warheads. The chassis has been stretched, and six road wheels per side instead of five

Ch'ŏnma-ho II: Designation for imported T-62

Ch'ŏnma-ho IM: Improved imported T-62

Notes:

The Ch'ŏnma-ho or spelled as Chonma-ho is one of North Korea's secretive indigenous main battle tank designs. The tank is also known by the name of □□□ □□ (□□□ or the "Chollima Tank"). The original Ch'ŏnma-ho is based on the Soviet T-62. There are at least five different operational versions of the Ch'ŏnma-ho. Since its inception, the Ch'ŏnma-ho has apparently undergone several extensive upgrades. Little public information is available about this tank, and its most recent public appearance was the 65th Anniversary Parade held in Pyongyang, North Korea, on 10 October 2010, celebrating the 65th anniversary of North Korea's ruling party.

Karrar Iranian Main Battle Tank (MBT)

Tiers:

Parent:

T-72 Russian Main Battle Tank (MBT)

Variants:

- **T-72A:** Second Russian main variant of the T-72.
- **T-72B1:** In 1986, a limited production variant without an ATGM launch capability. Some do not have ERA.
- **T-72BK:** The Commander's variant with additional radios.
- **T-72BM:** Russian T-72B upgrade with 2nd gen ERA. The system is fielded, available for export, and upgraded. Tier 2 and some Tier 3 tanks can challenge US forces under favorable conditions when using modern ammunition and employed by well-trained units with sound tactics. A variety of upgrades are available for the T-72B. They include protection upgrades, such as improved ERA, APS, defensive aids suites with IR jammers, plate armor, welded turret, and grill armor around tracks and grill. Mobility upgrades include a new power train, improved steering, improved mine plows and rollers, and electronic mine spoofing system. Fire control system upgrades include new sights, gun, ammunition, and improved stabilization. With the expanding number of upgrades offered by former Warsaw Pact, Asian, Israeli, and other firms, most T-72-type tanks have some level of upgrade from the basic T-72 MBT. The more affordable upgrade approach for most countries is to execute specific upgrades during maintenance work. But this approach may result in only partially modernized tanks at any one point in the life of the vehicle, and which are not as modern as more recent competitors. An alternative is to produce modernized tanks in small numbers, resulting in high per-unit production costs.
- **T-72BU:** Upgrade variant with the fire control system from the T-80U as well as well as a variety of other changes.
- **T-72BU renamed T-90:** With the limited market for new tanks, the world tank industry has developed upgrades and whole vehicle upgrade packages to tap into the market. Older T-72 tanks can be brought up to the T-72B standard. Some approach the T-90 standard. Most T-72-type tanks fielded reflect some level of upgrade. Upgrade options are expanding from former Warsaw Pact, Asian, Israeli, and other international firms.
- **T-72S / Shilden:** Russian export T-72A upgraded to the T-72B standard. Although visually similar to T-72B, it has slightly less chassis and turret protection. Former Warsaw Pact countries such as Slovakia and Middle Eastern countries like Iran have upgraded their tanks to the T-72S standard.
- **M-84AB1:** Yugoslav upgrade to the M-84, bringing it close to the T-90, and the latest T-72B improved tanks.
- **M-95 Degman:** Croatian M-84 upgrade with box composite armor, ERA, 1200hp and thermal FCS. An export upgrade conversion, AKA M-84D, is offered for Kuwaiti M-84A tanks.
- **PT-91:** Polish upgrade tanks with ERA, Drawa improved FCS, Savan-5 thermal sight, improved gun stabilization, and countermeasures.
- **PT-91M:** Has a 1000hp engine, new guns and FCS, armor changes, and other improvements. PT-91M exported to Singapore. PT-91P is designed for export to Peru.
- **T-72M1:** Demonstrator with 2nd generation ERA and other upgrades were displayed at military shows.
- **T-72M1M:** Includes 3rd generation Relikt ERA and optional Arena Active Protection System (APS). Alternative designations: Rogata and SMT M1988. It is almost the same as the T-72S (Export), except more ERA on the side skirts.
- **AJEYA MK 2:** India is upgrading T-72A tanks close to a Bhishma (T-90S) standard.

System

Alternative Designation: Karrar

Date of Introduction: 2017

Proliferation: Iran: +420

Manufacturer: Uralvagonzavod

In Service: 2017-Present

Type: Main Battle Tank (MBT)

Family: T-72

Crew: ea3

Passenger Capacity: INA

Dimensions

Length (Gun Forward): m10

Length (Hull): m6.8

Width: m3.50

Height: m2.3

Weight, Combat: tons48

Ground Pressure: kg/mINA

Automotive

Engine Name: V-84M

Engine Type: Four stroke, liquid cooled diesel engine with a centrifugal supercharger.

Engine Power: hp840

Power to Weight Ratio: hp/ton18.5

Cruising Range: km550

Speed, Maximum Road: km/h60

Speed, Maximum Off-Road: km/h35-45

Acceleration Speed (0-32 km/h: sec18

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.85

Trench: m2.8

Fording Depth: m1.2

Fording (with Preparation): m5

Fording Kit: OPVT deep water fording kit

Transmission: Synchromesh, hydraulically assisted, with 7 forward and 1 reverse gears

Suspension: Torsion bar

Ground Clearance: m0.49

Fuel Capacity: liters1,200

Gyrocompass: GPK-59 gyrocompass

Rechargeable Batteries: four 12ST-85R 34 AMP rechargeable batteries

Starter Generator: SG-10-1S

Communications

Radio #1: R-173 (Standard Radio for Russian Tanks)

R-173 Range: km0-20

Radio Reciever: R-173P Radio Receiver

Radio Set: HR R-134

Intercom System: R-174

Tank Navigiation Aids: TNA-4-3 Tank Navigation Aids

Main Gun

↳*System*

Name: 2A46, 125 mm/L48 Smoothbore Cannon

Type: 125mm Smoothbore

Max Rate of Fire: rds/min8

Manually Load Time: rds/min1-2

Barrel Life: rounds600

Sustain Rate of Fire: INA

Thermal Sleeve: Yes, alloy thermal sleeve

Bore Type: Central Bore Evacuator

Breech Type: semi-automatic horizontal sliding breech block via an interrupted screw thread.

Autoloader: Yes, electromechanical carousel autoloader

Time to reload the Autoloader: min4-5

Fire on the Move: Yes, Main Gun

Maximum Elevation: deg-6

Minimum Elevation: deg+14

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

Carousel: The carousel can accommodate 28 two-piece rounds of ammunition, and rotates automatically after each round is fired

Carousel Load Time: min13-15

Basic Load Time: min27

↳*Ammunition (Option 1)*

Name: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Type: Smoothbore 125mm Projectile

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Effective Range: m2,000-3,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Dimension: mm900

Projectile Weight: kg11

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Note: The 9K120 gun-launched missile complex is a two piece guided missile that is loaded and fired from the main gun in the same way as an ordinary round.

ATGM System Name: 9K120 gun-launched missile complex

Missile Name: 9K119 SVIR / AT-11

Type: Laser Guided Anti-tank guided missile launcher

Manufacturer: KBP Instrument Design Bureau

Caliber: mm125

Round Type: 3UBK20 round

Guidance System: 9M119M Laser Guided Missile

Voltage Converter: 9S831 voltage converter.

Tracking System: IK13 tracker

Basic Load: ea6

Onboard Guidance System: Yes

Sight Assembly: coded laser guidance beam 1K13-49

Gunner's Night Sight: TPN-1-49 secondary night sight.

Fire Control System: 1A40-1

Hit Probability: %80

Penetration: up to 700mm of armor

Warhead Weight (HEAT): kg4.2

Warhead Type: 9N142 shaped charge warhead

Laser Emitter: 1K13 sight's laser

Maximum Effective Range: m4,000

Minimum Effective Range: m100

Elevation Range (Super Elevation): deg-7 to +20

Elevation Range (Standard Elevation): deg-5 to +15

Coaxial Weapon System

Note: The NSV 12.7mm Anti-Aircraft Machine Gun is remotely operated

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: 12.7mm Anti-Aircraft Machine Gun

Proliferation: over 1 Million

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Weight (Gun Only): kg25

Muzzle Velocity: m/s845

Length (Total): mm1,560

Max Rate of Fire: rds/min700-800

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Action: Gas Operated

Maximum Elevation: deg+75

Minimum Elevation: deg-4

Sights: Iron Sights

Feed System: 50-Round Belt

↳*Ammunition*

Type: Rifle

Caliber: mm12.7x108

Muzzle Velocity: m/s845

Basic Load: ea300

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Auxiliary Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650-750

Effective Rate of Fire: rds/min250

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length: mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.60

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea2,000

Effective Range (Iron Sights): m1,000

Effective Range (with Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: Upgraded Fire Control System. Name: INA

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, 1K13 sight and aiming complex

Thermal Sight Gunner: Gunner's primary sight is the 1A40-1

Main Gun Stabilization: 2E42-2 (Upgrade)

Range, Day Sight: m5,000

Range, Thermal Sight: m1,000

Infrared: Yes

Gyrocompass: GPK-59 gyrocompass

Searchlight: L-4A "Luna" IR searchlight

Collimator Sight: K10T collimator sight

Periscopes: two TNPO-160 prismatic periscopes

Hunter-Killer Engagement Capability: Yes

Note: The Gunner, using the 1A40-1 sight can designate and engage targets out to a mazimum distance of 4,000 meters with APFSDS and HEAR rounds.

Protection

Hull Armor: Steel and composite armour with additional plates that provide protection equivalent to 950mm of steel against HEAT projectiles, 440mm resistance to KE rounds, and 500mm against shaped charges. The T-72BM also has a additional twelve separate charges of ERA compared to the T-72B.

Turret Armor: Steel and composite armour with ERA, 950 mm against HEAT weapons. The Turret has additional Ceramic or silica inserts to add to the protection level of the T-72BM. Additionally, the T-72BM has arrow-shaped arrays of ERA added to the turret front

Applique Armor: Available, Turret top and track skirts

Explosive Reactive Armor (ERA): Yes, Kontakt-V (UPGRADE). Additional ERA is added to the Turret, Glacis, and sides of the hull.

ERA Explosive Element: 4S22

ERA 4S22 Elements (Plates): ea240

Armor Cassette Type: 4S22 cassette that is filled with an explosive element and steel armoured plate.

Number of total Armor Cassettes: ea200-300

NBC Protection: Yes, System Sensor Radiation Device and chemical intelligence (PRRM).

Active Protection System: Yes, ZETS11-3 Control System

Self-Entrenching Blade: Yes, built in Dozer Blade

Mine Clearing: Yes, Roller and plow (optional)

Grenade Launcher: Yes, twelve 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.

Grenade Maximum Effective Range: m200-300

Grenade Smoke Screen Size: 30 m wide and 10 m high for 60 seconds per grenade.

Engine Smoke Screen Capable: Yes

Exhaust Smoke-Laying System: Yes

Automatic Fire Extinguishing Equipment.: Yes

IR Signature: INA

Note #3: The additional added armor cassettes reduce penetration by as much as 95%.

Notes:

The Karrar (striker) is a new Iranian main battle tank. It is a significantly upgraded version of the Iranian T-72S tank. A number of these tanks were supplied to Iran from Soviet Union. Currently Iran operates around 480 T-72S and even older T-72M1 tanks that could be upgraded to new standard. Footage on the Karrar was released in 2016. The tank itself was first publicly revealed in 2017. The upgraded tank is fitted with new turret, new add-on armor, new observation and aiming systems, new fire control system, and has a number of other upgrades. All of these upgrades significantly improved combat capabilities of the ageing T-72 series tanks in the key areas of protection, firepower and, possibly, mobility. As of 2017 production of the Karrar is underway. However it is unclear if a pre-production or full-scale production batch is being built.

Type 80 (ZTZ80) Chinese Main Battle Tank (MBT)

Tiers:

Variants:

- **Type 80-II:** Type 80-II is fitted with improved fire control and NBC protection systems.
- **Type 85-II:** Type 85-II, developed in 1989, is a further development of the Type 80-II, featuring new turret and additional modular armor at the front of the hull and turret.
- **Type 85-IIA:** Type 85-IIA command tank, fitted with additional communication and navigation equipment.
- **Type 85-III:** Type 85-III is an improved version, aimed mainly at export market.
- **Type 96 i:** Type 96 is a successor to the Type 80 series. It was adopted by the PLA in 1997. This tank was built in large numbers. It is estimated that over 1 500 of these main battle tanks were built, until production ceased in 2005. Other sources claim that 2 000-2 500 of these tanks were built. It is widely used by the PLA and has been exported to Sudan.
- **Type 88:** Type 88 Domestic version of Type 80. Uses an older-style round steel cast turret with new chassis.[7] Domestic version of Type 80.

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: INA

Notes:

Main Battle Tank Series Type 80 is a new type of main battle tank series developed by NORINCO, which has a very strong firepower, advanced fire control system, high mobility and solid armour protection. The tank series type 80 is suitable to fight under modern war condition. The tanks are equipped with an advanced 105 mm rifled gun and can fire four types ammunition. The tanks are provided with an advanced fire control system which consists of a laser range-finder, ballistic computer and-bi-directional stabilizer, therefore the tanks have a high first round hit probability. The tanks are also fitted with various systems and equipment inside the hull and turret for the use of NBC protection, water-crossing submerged, automatic fire-extinguishing, explosion-restraining and night combat. Development NORINCO (China North Industries Corporation) started concept studies for a second-generation MBT in 1978 with the first prototypes being completed in 1985. Development was completed in 1988 and it was designated the Type 80 MBT, although it has also been referred to as the Type 88 and the Type 69-III. Main improvements to the Type 80 compared with the earlier Type 69 MBT include the installation of a new computerised fire-control system for increased first range hit probability, laser range-finder, stabilisation system, 105 mm rifled tank gun, new torsion bar suspension with six roadwheels for increased crosscountry mobility, more powerful diesel engine for increased power-to-weight ratio, passive night vision equipment and the ability to be fitted with a snorkel for deep fording. The Type 80 MBT can engage moving targets from a stationary firing position. Description The hull of the Type 80 is of all-welded steel construction and has the driver's compartment at the front, the fighting compartment in the centre and the engine and transmission at the rear. The driver sits at the front of the hull on the left side and has a single-piece hatch cover that lifts and swings to the left. In front of this are two day periscopes, one of which can be replaced by an infra-red or passive periscope for driving at night. Mounted on the well-sloped glacis plate is a splashboard to stop water rushing up and into the driver's compartment while the tank is fording. To further improve the Type 80's protection a panel of composite armour can be added at the front. The turret is in the centre of the vehicle with the commander on the left, the gunner forward and below the commander and the loader on the right. Composite armour can also be added to the turret for improved protection. The commander has a cupola which can be traversed manually through a full 360° and, a single forward-opening hatch cover with two integral periscopes for observation to the sides. Forward of this hatch cover are a further three periscopes for observation over the frontal arc. The loader has a circular hatch cover that opens to the left. Main armament comprises a 105 mm rifled gun which fires Western- or Chinese-produced ammunition. This has powered elevation from -4.5 to +18° with the turret having powered traverse through 360°. The 105 mm gun, which is similar in appearance to the Western L7/M68, is fitted with a fume extractor and a thermal sleeve. The 105 mm gun fires the following NORINCO-developed rounds: APFSDS-T (muzzle velocity 1,455 m/s), HEAT-T (1,173.5 m/s), HESH (731.5 m/s) and HE (850 m/s). A 7.62 mm machine gun is mounted coaxially with the 105 mm gun and there is a 12.7 mm machine gun on the loader's hatch for anti-aircraft use. Mounted either side of the turret are four forward-firing electrically operated smoke grenade dischargers. A stowage basket runs around the sides and rear of the turret. The stowage basket provides some protection against HEAT projectiles as these would be detonated away from the main armour of the turret. The fire-control system includes a ballistic computer, a laser range-finder integrated into a stabilised sight, sensors and a gun stabilisation system. Night vision equipment fitted is of the second-generation image intensification type. , The Type 80 MBT is powered by a Model VR36 diesel developing 700 hp at 2,000 rpm but late production engines develop 730 hp at 2,000 rpm. Type 80 has two circular exhaust outlets on the right side of the hull. Diesel fuel can be injected so that the tank can lay its own

smoke screen while moving. To extend the operational range of the tank two large drum fuel tanks can be mounted at the rear; these can be jettisoned if required. An unditching beam is normally carried at the rear of the hull under the long range fuel tanks. The torsion bar suspension is new with six dual rubber-tyred roadwheels, drive sprocket at the rear, idler at the front and three track-return rollers. The first, second, fifth and sixth roadwheel stations have hydraulic shock-absorbers. The upper part of the track is covered by skirts with a wavy lower edge which are hinged up to allow access to the suspension for maintenance. Standard equipment includes an overpressure NBC system, night vision equipment for the commander, gunner and driver and provision to install a snorkel in the roof forward of the loader's hatch; this allows the tank to submerge to a depth of 5 m and cross rivers up to 600 m wide. An unditching beam is carried at the rear of the hull under the long-range fuel tanks. Communications equipment installed includes a YRC-83 radio and VIC-8 intercom system. To further increase the tank's survivability on the battlefield, an automatic explosion suppression and fire extinguishing system is fitted.

Type 59G (BD) Durjoy Bangladesh Main Battle Tank (MBT)

Tiers:

Variants:

- **Type 59:** The basic variant, a T-54A clone without IR searchlight. Entered production in 1957.
- **Type 59-I:** Improved variant fitted with a Type 69-II 100 mm rifled gun, as well as a laser rangefinder, hydraulic servo-system, primitive fire-control system, automatic fire suppression system, and rubber track skirt. The Type 59-I includes several versions with different armour and fire control configurations.
- **Type 59-II:** he Type 59-II (also known as WZ-120B) is an upgrade mounting a 105 mm rifled gun, similar to the Royal Ordnance L7, and adding an image intensification/infrared night sight. Mass increased to 36.5 tonnes
- **Type 59D1:** The Type 59D1 (also known as WZ-120C) is an upgrade with explosive reactive armour, computerized stabilized fire-control system, the 105 mm. gun of the Type 59-II, and night vision system
- **Type 59G:** An upgrade of the Type 59, featuring a redesigned turret and armor. It uses a turret similar to that of the Type 96A, a 125 mm gun, modern fire control systems, arrow-shaped armor, spaced armor, and possibly third-generation subsystems.
- **Jaguar:** The Jaguar was a prototype vehicle based off the Type 59 chassis that was jointly developed by the United States and China during 1980s, made possible by the US-Chinese détente of the 1970s. Planned to replace China's existing tank fleet, as well as for the export market, the tank featured improvements to the standard Type 59's engine, armament, armour, turret, optics, electronics, fire control and suspension. Following Tiananmen Square massacre, American-Chinese relations soured and the Chinese withdrew from the project. The Americans continued alone and successfully completed the design, however the end of the Cold War saw a glut in the international tank market and thus no orders were ever placed for the vehicle
- **Type 62 Light Tank:** In the late 1950s, the PLA submitted requirements for a light tank more suitable for operations in China's southern region. Development on the new Type 62 tank began in 1958, which was a scaled-down Type 59 MBT with simplified equipment. The Type 62 light tank entered batch production in 1963, and approx. 800 were produced by 1978. The Type 62 light tank weights only 21 tons, and is equipped with a Type 62-85TC 85 mm rifled gun, and 3 machine guns. An improved Type 62-I version was produced with better FCS with laser rangefinder, and turret storage racks for added protection. Other versions based on the Type 62 include the Type 79 recovery vehicle (prototype only) and Type 82 earth-mover. The PLA deployed the Type 62 light tank to Vietnam during the 1979 Sino-Vietnam conflict. They found that the thin armor of the Type 62 tank could be penetrated easily by hand-held anti-tank weapons, such as the 40 mm RPG. The Type 62 tank suffered severe losses during the conflict, which convinced the PLA to develop new second-generation MBTs. The Type 62 tank received a major upgrade in 2000, with new welded turret, vertically stabilized 105 mm rifled gun, fire-control system, night vision device, smoke grenade launchers, and explosive reactive armor (ERA) package
- **Type 69 / 79:** Improved Type 59 MBT built by 617 Factory (Inner Mongolia First Machine Group Co. Ltd). Only saw limited service in the PLA, but was an export success in the 1980s with more than 2,000 sold worldwide.
- **Type 73:** This armored recovery vehicle is a Type 59 with its turret removed. The vehicle is armed with a single 12.7 mm machine gun. This armored recovery vehicle is not believed to have a winch and is limited to towing operations.
- **Type 59 Heavy Infantry Fighting Vehicle:** The modernized HIFV model of Type 59 weighs around 40 tons and can carry up to seven passengers. Modifications include moving the engine to the front of the vehicle chassis, increasing tank armor including explosive reactive armor on all sides, and installing a rear door for dismounting infantry
- **QN-506:** It is a modernized variant of the Type 59 using the tank's chassis similar to its Russian counterpart the BMPT Terminator. The vehicle was first appeared at the Zhuhai Air Show in China in November 2018, and is armed with two QN-502C anti-tank missiles, ten QN-201 multi-purpose mini missiles, four S-507 loitering munitions, an unmanned 30 mm cannon, a 7.62 mm machine gun, six grenade launchers, and a quadcopter surveillance drone
- **Type T-72Z:** Iran version
- **Kok'san:** North Korea version.

- **Al-Zarrar:** Pakistan version. Heavy Industries Taxila of Pakistan has introduced the Al-Zarrar Main Battle Tank. The Al-Zarrar series was designed to improve and rebuild the Pakistani army's Type 59 tanks by way of more modern armament, fire control, defensive equipment, etc. Improvements include: 125 mm smoothbore gun, firing APFSDS, HEAT-FS and HE-FS. Semi-automatic loading and image Stabilized fire control. 730 hp Engine for improved mobility. Improved suspension. Improved defense with explosive reactive armour and anti-mine cover underneath.
- **Type 59G(BD) Durjoy:** Bangladesh version. Bangladesh Army's Type-59 are being upgraded to Type 59(BD)G Durjoy locally with Chinese assistance. 174 are being upgraded in First batch. Upgradation process includes: 125mm main gun with new turret (Type 96 turret) 28 rounds, Type-85 12.7×108mm Commander's machine gun (3,000 rounds), Co-axial 7.62mm gun (600 rounds), 81mm Smoke grenades. Chinese 3rd generation ERA on front, turret and side skirts. Modular Composite armour on turret front. Cage armour on back of turret to protect from RPG hits. NBC protection, Collective Fire suppression system. Laser warning receiver, Laser designator, Fire control system, Combat data link, Thermal imaging system. 730 H.P. Diesel engine Barrel launched ATGM firing capability. Rubber padded tracks. VLC 3000 radio contact system.

Armor, Turret Rear: mm64

Armor, Turret Top: mm39

Smoke Equipment: 8 x 81-mm smoke grenade launchers. Vehicle engine exhaust smoke system.

Notes:

Type 59G(BD) Durjoy (Bengali:□□□□□□) is an upgrade of the Type 59 tank. The Bangladesh Army's obsolete Type 59 tanks are being upgraded to Type 59G(BD) Durjoy locally with Chinese assistance. The name of the tank Durjoy means Indomitable in Bengali. Since the year 2015 Bangladesh has been upgrading its Type 59 tanks, that were bought from China in the early 2000s. In that period of time, the army bought 780 tanks, that for many years were in service for the Bangladesh army but after a few years were starting to be older compared to its modern relatives. That's why the Bangladesh Army started a project to upgrade only 300 type 59 tanks by the time because they were still functional. In the first batch, the army rebuilt 174 as MK I, and by now the army has been rebuilding other 300 type 59 tanks as MK II. China says that if Bangladesh buys VT5: lightweight main battle tanks, then China will give 300 type 59 tanks for free. The Type 59G Durjoy is one of the former MBTs of the Bangladesh Army, and the MK II is just as strong as the T 72 and it's also able to deliver serious damages into the latest versions of the T 72, because it does not have a sufficient armor to match completely with the latest T 72s, although it has much firepower than its closest relatives, such as the Indian Anjun tank or the Ukrainian Oplot tank, in fact the Durjoy's APFSDS can penetrate 500 mm of armor with 2 kms of distance, but in the same distance the Arjun tank can penetrate only 200 mm of armor and the Ukrainian Oplot tank can penetrate 400 mm of armor. This process of rebuilding the type 59 tanks consists of the change of armor, armaments and also the latest technology systems. In the process, only the hull and the chassis remains the same, because the metal of which the tank is made of can last for over 70 years, that's why great nations such as USA, Russia, France, Germany, Italy, and others still use the chassis and the hull of their older tanks. The tank measures 6,04 meters in length, 3,27 meters in width and 2,59 meters in height all packed up with a weight of 40 tons for the MK I and 42 tons for the MK II.

Type 88 (ZTZ88) Chinese Main Battle Tank (MBT)

Tiers:

1 2 **3** 4

Variants:

- **Type 80-II:** Type 80-II is fitted with improved fire control and NBC protection systems.
- **Type 85-II:** Type 85-II, developed in 1989, is a further development of the Type 80-II, featuring new turret and additional modular armor at the front of the hull and turret.
- **Type 85-IIA:** Type 85-IIA command tank, fitted with additional communication and navigation equipment.
- **Type 85-III:** Type 85-III is an improved version, aimed mainly at export market.
- **Type 96 i:** Type 96 is a successor to the Type 80 series. It was adopted by the PLA in 1997. This tank was built in large numbers. It is estimated that over 1 500 of these main battle tanks were built, until production ceased in 2005. Other sources claim that 2 000-2 500 of these tanks were built. It is widely used by the PLA and has been exported to Sudan.
- **Type 88:** Type 88 Domestic version of Type 80. Uses an older-style round steel cast turret with new chassis.[7] Domestic version of Type 80.
- **Type 80:** First Chinese second generation tank design. Uses an older-style round steel cast turret with new chassis. Four-man crew. Export version of Type 88.

Explosive Reactive Armor: Yes

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: INA

Notes:

In the late 1970s, China's 617 Factory (main contractor), 616 Factory, 477 Factory, and 201 Institute (now China North Vehicle Research Institute) were ordered to develop China's new second-generation tank. The project benefitted from imported Western technologies in the 1980s. The first Type 80 MBT was based on the older Type 79 MBT hull, but equipped with new Chinese-made wheels/tracks, German-designed 730 hp diesel engine, British-designed dual-axis stabilized fire-control with laser range-finder, and NATO-standard 105 mm gun licensed from Austria. The improved version of this tank later entered service in 1988 under the PLA designation of Type 88. The Type 88 tank is unique in that unlike the rest series of Chinese tanks, this series actually includes versions from different families of earlier tanks. Production of Type 88-series MBTs was stopped in 1995. About 400 to 500 Type 88-series tanks are in service with the PLA today. In test its armor was 200 mm vs APFSDS and 300 mm vs HEAT. It has an autoloader which gives it a maximum rate of fire of 2.5 rounds a minute. Type 88 - First Chinese tank to have explosive reactive armor and was accepted into PLA service in 1988, based on Type 80-II design. Front storage racks on turret removed to fit explosive reactive armor (ERA) plates.

M1A1 Abrams American Main Battle Tank (MBT)

Tiers:

Variants:

- **Variants and upgrades:** * XM1-FSED: Preproduction test model. Eleven Full-Scale Engineering Development test bed vehicles were produced in 1977–78. These vehicles were also called Pilot Vehicles and numbered PV-1 through PV-11. * M1: First production variant. Production began (at Chrysler) in 1979 and continued to 1985 (at General Dynamics) (3,273 built for the US). The first 110 tanks were Low Rate Initial Production (LRIP) models, still called XM1s, because they were built prior to the tank being type-classified as the M1. * M1IP (Improved Performance): Produced briefly in 1984 before the M1A1, contained upgrades and reconfigurations like new turret with thicker frontal armor, new turret is referred as "long" turret instead of older "short" turret, armor upgraded from ~650mm line of sight thickness to ~880mm (894 built for US). * M1A1: Production started in 1985 and continued to 1992, pressurized NBC system, rear bustle rack for improved stowage of supplies and crew belongings, redesigned blow-off panels and M256 120 mm smoothbore cannon (4,976 built for the U.S. Army, 221 for USMC, 59 M1A1 AIM SA sold to Australia). * M1A1HA (Heavy Armor): Added 1st generation depleted uranium armor components. Some tanks were later upgraded with 2nd generation depleted uranium armor components, and are unofficially designated M1A1HA+. * M1A1HC (Heavy Common): Added new 2nd generation depleted uranium armor components, digital engine control and other small upgrades common between Army and Marine Corps tanks. * M1A1D (Digital): A digital upgrade for the M1A1HC, to keep up with M1A2 SEP, manufactured in quantity for only 2 battalions. * M1A1 AIM v.1 (Abrams Integrated Management): A program whereby older units are reconditioned to zero hour conditions;[126] and the tank is improved by adding Forward-Looking Infra-Red (FLIR) and Far Target Locate sensors, a tank-infantry phone, communications gear, including FBCB2 and Blue Force Tracking to aid in crew situational awareness, and a thermal sight for the .50 caliber machine gun. * M1A1 AIM v.2/M1A1 SA (Situational Awareness): Upgrades similar to AIM v.1 tanks + new 3rd generation depleted uranium armor components. Configuration for the Royal Moroccan Army, which is almost identical to the Australian variant, except exportable turret armor is installed by General Dynamics Land System to replace the DU armor. * M1A1 FEP (Firepower Enhancement Package): Similar upgrade to AIM v.2 for USMC tanks. * M1A1KVT (Krasnovian Variant Tank): M1A1s that have been visually modified to resemble Soviet-made tanks for use at the National Training Center, fitted with MILES gear and a Hoffman device. * M1A1M: An export variant ordered by the Iraqi Army with depleted uranium armor removed and older thermal imaging system with lower resolution used. * M1A1 (AIDATS upgrade): Upgrade-only variant to all USMC General Dynamics M1A1 Abrams tanks to improve the tank commander's situational awareness with an upgraded thermal sight, color day camera, and a stationary color display. * M1A2 (Baseline): Production began in 1986 and entered service in 1992(77 built for the U.S. and more than 600 M1s upgraded to M1A2, 315 for Saudi Arabia, 1,005 for Egypt, 218 for Kuwait). The M1A2 offers the tank commander an independent thermal sight and ability to, in rapid sequence, shoot at two targets without the need to acquire each one sequentially, also 2nd generation depleted uranium armor components. * M1A2 SEP (System Enhancement Package): Has upgraded third-generation depleted uranium armor components with graphite coating (240 new built, 300 M1A2s upgraded to M1A2 SEP for the US, also unknown numbers of upgraded basic M1s and M1IPs, also 400 oldest M1A1s upgraded to M1A2 SEP). * M1A2S (Saudi Package): Saudi Arabian variant upgrade of the M1A2 based on M1A2 SEP, with some features, such as depleted uranium armor, believed to be missing and replaced by special armor. (442 M1A2s upgraded to M1A2S). * M1A2 SEPv2: Added Common Remotely Operated Weapon Station as standard, color displays, improved interfaces, a new operating system, improved front and side armor with ERA (TUSK kit), tank-infantry phone as standard, and an upgraded transmission for better durability. * M1A2C (SEPv3): Has increased power generation and distribution, better communications and networking, new Vehicle Health Management System (VHMS) and Line Replaceable Modules (LRMs) for improved maintenance, an Ammunition DataLink (ADL) to use airburst rounds, improved counter-IED armor package, improved FLIR using long- and mid-wave infrared, a low-profile CROWS RWS, Next Generation Armor Package (NGAP), and an Auxiliary Power Unit (APU) under armor to run electronics while stationary instead of the engine, visually distinguishing the version by a small exhaust at the left rear. More passive

ballistic protection added to the turret faces, along with new Explosive Reactive Armor mountings (Abrams Reactive Armor Tile (ARAT)) and Trophy Active Protection systems added to the turret sides. Prototypes began testing in 2015, and the first were delivered in October 2017. Fielding is expected to begin in 2020. * M1A2T: Special configuration variant of the M1A2C reportedly being offered for sale to Taiwan as of March 2019 and approved by US State Department as of July 2019. Per DSCA statement, it is roughly equivalent to M1A2C, except depleted uranium armor is replaced by FMS export armor. There is no mention of the Trophy APS system. The new-built tanks will be produced at Anniston Army Depot, Anniston, Alabama, and the Joint Systems Manufacturing Center, Lima, Ohio. * M1A2D (SEPv4): Under engineering development with delivery planned to start by 2021. The Commander's Primary Sight, also known as the Commander's Independent Thermal Viewer, and Gunner's Primary Sight will be upgraded with 3rd Gen FLIR, an improved laser rangefinder and color cameras. Additional improvements will include advanced meteorological sensors, laser warning/detection receivers, directional smoke grenade launchers and integration of the new XM1147 multi-purpose (AMP) 120mm tank round. The AN/VVR-4 laser warning receiver and ROSY rapid obscurant system have been trialed by the US Army for adoption on the Abrams tank and Bradley fighting vehicle. * M1A2-K: Under development, unique variant for the Kuwaiti Army, slated to replace Kuwait's current M1A2 fleet. * M1A3: Under research development as of 2014. Improvements are to include a lighter 120 mm gun, added road wheels with improved suspension, a more durable track, lighter-weight armor, long-range precision armaments, and infrared camera and laser detectors. The variant is believed to have a new diesel engine, instead of the gas turbine engine used in previous M1 variants * M1 TTB (Tank Test Bed): Prototype with unmanned turret, 3 crew members in armored capsule in front of the heavy armored hull, main armament was 120 mm smoothbore gun, M256 derivative or modification, mechanical loading system under turret, never fielded. * CATTB: The Component Advanced Technology Test Bed was an experimental model with a lightweight 120 mm smoothbore cannon, heavy armored turret and upgraded hull based on the M1 chassis. It had a mechanical loading system in turret bustle, a new engine and probably other upgrades, never fielded. The tank went into trials in 1987–88. * M1 Thumper: Experimental variant by Lockheed Martin, equipped with the 140 mm XM291 ATACS smoothbore cannon. Similar to the CATTB, it included a larger, elongated turret to offer protection levels comparable to the M1A2 while allowing the mounting of the larger cannon and its longer ammunition. Cancelled with the end of the Cold War, and never fielded. * M1 AGDS (Air Ground Defense System): Proposed air defence variant of the Abrams equipped with dual 35 mm Bushmaster III autocannons, 12 ADATS missiles and advanced electro-optical and radar targeting systems derived from the ADATS. It was supposed to be capable of both air defence and anti-tank purposes with the ADATS MIM-146 missiles which was a dual purpose ATGM/SAM. The proposal never saw consideration and was never developed further. * M1 Grizzly Combat Mobility Vehicle (CMV). * M1 Panther II: A remote controlled mine clearing vehicle with turret removed, mine rollers on front, and the Standardized Teleoperation System. * M104 Wolverine Heavy Assault Bridge * M1074 Joint Assault Bridge (JAB): Bridgelayer combining a heavy "scissor" bridge with the M1 Abrams chassis. Expected to reach low-rate initial production in 2019 to replace the M60 AVLB and M104 Wolverine * M1150 Assault Breacher Vehicle (ABV): Assault variant for the USMC. Based upon the M1A1 Abrams chassis, the Assault Breacher Vehicle has a variety of systems installed, such as a full-width mine plow, two linear demolition charges, and a lane-marking system. Reactive armor has been fitted to the vehicle providing additional protection against High-explosive anti-tank warhead-based weapons. The turret has been replaced by a new smaller one with two MICLIC launchers at its rear. A M2HB .50 machine gun in a remote weapons station is mounted on the commander's cupola and a bank of grenade launchers are fitted to each side of the superstructure to cover the frontal arc for self-protection. * M1 Armored Recovery Vehicle: Only a prototype produced.

System

Alternative Designation: M1A1

Type: Main Battle Tank

Crew: 4 (commander, driver, gunner, loader)

Dimensions

Length, Hull: 7.92 m

Width, with Skirts: 3.65 m

Width, without Skirts: 3.48 m

Length: 981 mm

Weight: 24.2 kg

Basic Load: 42 rounds

Ammo Types: HEAT-MP-T, APFSDS-T, MPAT, STAFF

↳*Ammunition (Option 2)*

Name: M829

Type: APFSDS

Caliber: 120mm

Length: 935 mm

Weight: 18.7 kg

Basic Load: 42 Rounds

Coaxial Weapon System

↳*System*

Name: 1 x 7.26-mm M240 machine gun

Type: General-Purpose Machine Gun

Caliber: 7.72mm

Length: 1,260 mm

Barrel Length: 630 mm

Width: 120 mm

Height: (260 mm

Weight: 12.5 kg

Action: Gas-operated long-stroke piston, open bolt

Rate of Fire: M240, M240E1, M240C, M240D and M240G: Gas Setting 1: 650–750 RPM Gas Setting 2: 750–850 RPM Gas Setting 3: 850–950 RPM M240B, M240L and M240H: 550–650 RPM Barrett 240LW and 240 LWS: 550–650 RPM

Muzzle Velocity: 853 m/s

Maximum Firing Range: 3,725 m

Effective Firing Range: 800 m (875 yd) (bipod) 1,100 m (1,203 yd) (tripod)

Feed System: Belt-fed using M13 disintegrating links

Sights: Iron sights: front blade and folding rear leaf with aperture and notch

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Basic Load: 6,000 Rounds

Loader's Weapon System

Weapon: 1 x 7.62-mm M240 machine gun on Skate Mount

Basic Load: 6,000 Rounds

Commander's Weapon System

↳*System*

Name: 1 x .50-caliber M2 machine gun

Type: Heavy Machine Gun

Caliber: 12.7mm

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min (M2HB) 750–850 rounds/min (AN/M2) 1,200–1,300 rounds/min (AN/M3)

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 1,000

Fire Control

Name: INA

Computerized FCS: Yes

Ballistic Computer: Hughes 12 kilobyte digital computer

Main Gun Stabilization: Yes

Day Optics: Hughes primary stabilized sight with 3- and 10-power day optics

Night Optics: Hughes night-vision/sight with thermal imaging

Rangefinder: Unity vision with 18-deg field of view, integrated Hughes Nd-YAG laser

Effective Fire Range: 200 to 7,990 m

Accuracy: 10 m or less

Protection

Hull Armor: Chobham-type armor on glacis and turret,armored bulkheads between turret and engine; depleted uranium armor in production since 1988

Turret Armor: INA

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: In addition to the armor, some USMC Abrams tanks are equipped with a Softkill Active protection system, the AN/VLQ-6 Missile Countermeasure Device (MCD) that can impede the function of guidance systems of some semi-active control line-of-sight (SACLOS) wire- and radio guided anti-tank missiles (such as the Russian 9K114 Shturm) and infrared homing missiles.

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: 200 SCFM-Clean Cooled Air (collective overpressure); AN/VDR-1 radiological warning device

Smoke Equipment: M250 (British L8A1) 2 x 6-barrel smoke discharger (24 rounds), engine exhaust generation

Fire Suppression: automatic detection and suppression

Notes:

The M1A1 Abrams main battle tank was developed by General Dynamics. It is a further development of the M1 Abrams. The M1A1 was revealed in 1985 with production commencing the same year. It entered service with US Army in 1986. Production ended in 1992 and approximately 4 800 M1A1 Abrams tanks were built. Currently US Army operates nearly 4 400 of these tanks and US Marine Corps just over 400. It is planned that the fleet of refurbished and upgraded M1A1 tanks will remain with the US military until at least 2021. Export operators are Australia (59), Egypt (1 005) and Iraq (140). Recently Morocco ordered 150 of these main battle tanks. The M1A1 has an improved armor protection comparing with its predecessor. Front turret and hull armor of the M1A1 features advanced composite armor reinforced with depleted uranium mesh for better protection. Like in the previous version ammunition is stored in the turret bustle with blow-out panels for better survivability and crew protection. Interior is lined with Kevlar for protection against spalling. Some tanks, most notably of the US Marine Corps, are fitted with a missile countermeasure device. This device can detect and jam guidance systems of laser-guided missiles. One of the most important improvement over the M1 is the M256 120 mm smoothbore gun, originally developed by Rheinmetall and produced in USA under license. The same gun is fitted on the Leopard 2 up to the version of the 2A5. This gun is loaded manually. Ammunition load was decreased to 40 rounds due to larger size. The M1A1 Abrams has a range of effective fire in excess of 4 km. This feature was successfully demonstrated during the Operation Desert Storm in 1991. A special M829A2 armor-piercing round was developed for the M1A1 to counter threat possessed by latest at that time Soviet/Russian MBTs, such as the T-80U and T-90, fitted with Kontakt-5 explosive reactive armor. Currently the MRM-KE or Mid Range-Munition Kinetic Energy round is under development. It is a gun-launched projectile with rocket assistance on the final stage. It will have a maximum effective range of fire in excess of 12 km and will use kinetic energy warhead. A total of 40 rounds are carried for the main gun. Of them 34 rounds are store in the turret bustle, while another 6 rounds are stored in the fighting compartment, in

protective containers. Secondary armament consists of coaxial 7.62 mm machine gun, another roof-mounted 7.62 mm machine gun operated by gunner and 12.7 mm machine gun operated by commander. The tank is powered by Avco Lycoming (now Honeywell) AGT1500 gas turbine engine, developing 1 500 horsepower. Essentially it is a modified helicopter engine, adapted for use on tanks. It is a multi-fuel engine, which can run on any grade of petrol, diesel, aviation fuel or kerosene. This engine has impressive performance and is compact for its power output. So even though the Abrams tank is heavy and bulky, it is surprisingly agile. It is faster than many other tanks and has superior cross-country performance. Also the engine is remarkably quiet. Due to this feature the Abrams is even nicknamed the Whispering Death. Its gas turbine engine has servicing intervals significantly longer than those of diesel engines, however is troublesome to maintain and has very high fuel consumption comparing with diesels. Engine can be replaced in field conditions within 30 minutes. Chassis and transmission of the M1A1 was improved to coupe with increased tank's weight. This main battle tank can be equipped with mine plow or mine rollers. The M1A1 Abrams main battle tanks were produced in Egypt under license, however Egyptian vehicles have composite armor without depleted uranium mesh of the US tanks. Egyptian Army operates 555 of these vehicles.

Zulfiqar-1 Iranian Main Battle Tank (MBT)

Tiers:

Variants:

- **Zulfiqar-2:** The Zulfiqar-2 is an interim main battle tank prototype used as a test bed. This variant is fitted with a new and more powerful engine. It has an extended chassis and possibly uses an improved autoloader.
- **Zulfiqar-3:** The Zulfiqar-3 is the most advanced variant of the Zulfiqar family. It features considerable upgrades to the fire control system, chassis, engine and main gun. The new variant is equipped with the 2A46 125 mm smoothbore cannon with an autoloader, a laser rangefinder and a new fire control system.

System

Alternative Designation: Zulfiqar-1, Zulfiqar
Manufacturer: Shahid Kolah Dooz Industrial Complex
In Service: 1996-Present
Type: Main Battle Tank
Family: Zulfiqar Class
Crew: ea3 (commander, gunner and driver)
Passenger Capacity: INA

Dimensions

Length (Gun Forward): m9.2
Length (Hull): m7

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

Zolfaqar is a second generation of Iran's main battle tank (MBT). The test prototypes of the tank were evaluated in 1993. Six semi-industrial prototypes of the tank were produced and tested in 1997. The tank has a distinctive box-shaped, steel-welded turret of local design. Zolfaqar combat weight is reported to be 36 tons and has a 780 hp diesel engine; the tank has a 21.7 hp per ton ratio. Zolfaqar is operated by a crew of three personnel. The automatic loader is believed to be the same one from the T-72 tank. The Iranian Zulfiqar (also written Zolfaqar) main battle tank is believed to be pieced together or developed from major components of the Russian T-72 and American M48 and M60 tanks. This tank, which is claimed to be in production in Iran, is said to be similar in configuration to the M-48 and M-60. Other reports suggest that it bears a close resemblance to the American M1 Abrams.t is named after the sword of Shia leader Hazrat Ali.

M60A1 American Main Battle Tank (MBT)

Tiers:

Variants:

- **Note:** There are over 50 Variants of the M60 Main Battle Tank

System

Alternative Designation: M60A1 Main Battle Tank
Type: Main Battle Tank
In Service: 1960s-Present
Crew: 4 (commander, gunner, loader, driver)

Dimensions

Length, Hull: 6.95 m
Length, Gun Forward: 9.44 m
Width: 3.63 m
Height: 3.27 m
Tracks, Length on Ground: 4.24 m
Tracks Width: 0.71 m
Ground Pressure: 0.46 m
Weight, Unloaded: 48,680 kg
Weight, Combat: 52,620 kg
Ground Pressure: 0.87 kg/cm sq

Automotive

Engine Name: 1 x Continental AVDS-1790-2A engine
Engine Type: 1,790-cu in (29.34-liter) air-cooled, 4-stroke, V-12 multi-fuel
Engine Power: 750 hp at 2,400 rpm
Power-to-Weight Ratio: 14.24 hp/metric ton
Fuel Capacity: 375 gal (1,420 liters)

Transmission: CD-850-5 cross drive transmission

Suspension: torsion bar, 6 road wheels, rear drive, front idler, 3 shock absorbers, 3 track return rollers

Range: 480 km

Speed: 48 km/h

Vertical Obstacle: 0.91 m

Trench: 2.59 m

Fording without Preparation: 1.22 m

Fording with Preparation: 2.40 m

Gradiant: 60 %

Side Slope: 30 %

Shock Absorbers: The addition of a shock absorber on the second roadwheel pair was also accompanied by a slight relocation of the first return roller. These modifications were needed due to the increased weight of the M60A1 turret as well as the additional hull armor.

Main Gun

↳*System*

Name: The M60A1 tank uses the M68E1 variant of the gun carried in the M140 mount. The M68E1 gun shares the same firing characteristics as the M68. It featured several design improvements including an updated gun hydraulic configuration, a stabilization upgrade for the gun, a gun elevation kill switch for the loader, improved ballistic drive and other component refinements.

Type: 105mm Rifled Gun

Caliber: 105mm

Length: 5.89 m

Barrel Length: 52 calibres (5.46 m or 17.9 ft)

Weight: 1,282 kg

Rate of Fire: 10 rounds per minute (maximum)

Maximum Range: 4,000 m

Elevation: -10/+20-deg

Traverse: 360-deg, an improved electro-mechanical traverse assembly

Fume Extractor: A mushroom-shaped fume extractor was placed at the rear left of the turret bustle to vent smoke produced from firing the main or coax guns out of the vehicle.

↳*Ammunition*

Type: Rifle Projectile

Caliber: mm105

Shell: INA

Shell Weight: INA

Basic Load: The ammunition load for the main gun was increased to 63 rounds. Round storage was distributed between the turret bustle, with 15 ready rounds of various types were stowed and accessible for the loader, and the rest are stored inside safe containers on the hull floor.

Coaxial Weapon System

↳*System*

Name: 1 x 7.62mm M240 Machine Gun
Type: General-Purpose Machine Gun
Length: 1,260 mm
Barrel Length: 630 mm
Width: 120 mm
Height: 260 mm
Weight: 12.5 kg
Action: Gas-operated long-stroke piston, open bolt
Rate of Fire: M240, M240E1, M240C, M240D and M240G: Gas Setting 1: 650–750 RPM Gas Setting 2: 750–850 RPM Gas Setting 3: 850–950 RPM M240B, M240L and M240H: 550–650 RPM Barrett 240LW and 240 LWS: 550–650 RPM
Muzzle Velocity: 853 m/s
Maximum Firing Range: 3,725 m
Effective Firing Range: 800 m (875 yd) (bipod) 1,100 m (1,203 yd) (tripod)
Feed System: Belt-fed using M13 disintegrating links
Sights: Iron sights: front blade and folding rear leaf with aperture and notch

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×51mm NATO
Basic Load: 6,000 Rounds

Auxiliary Weapon System

↳*System*

Name: M85 Machine Gun
Type: Heavy Machine Gun
Caliber: 12.7mm
In Service: INA
Manufacturer: INA
Proliferation: INA
Length: 1,384.3 mm)
Weight: 29.5 kg
Action: Recoil-operated
Rate of Fire: 400-625 rd/min

Muzzle Velocity: 880.0 m/s

Maximum Firing Range: 6,702.6 m

Effective Firing Range: 1,999.8 m

Feed System: Belt Feed, left or right hand

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7mm

Cartridge: 12.7×99mm NATO (.50 BMG)

Basic Load: Rifle

Fire Control

Name: M19 FCS

Computerized FCS: Yes

Thermal Sight Tank Commander: Texas Instruments AN/VSG-2 tank thermal inder and Mercury-Cadmium-Telluride (HgCdTe) IR detector for passive night and dust vision.

Thermal Sight Gunner: Texas Instruments AN/VSG-2 tank thermal inder and Mercury-Cadmium-Telluride (HgCdTe) IR detector for passive night and dust vision.

Main Gun Stabilization: Add-On Stabilization (AOS) that was introduced in late 1972. This was an add-on kit made to fit with minimum modifications to the existing hydraulic gun control system. The add-on-stabilization system provides stabilization control for both gun elevation and turret traverse. It provides the gunner with the capability of aiming and target tracking and also improved surveillance of the battlefield terrain by the gunner while the tank is moving. It may be used in any one of three modes of control: (1) power-with-stabilization-on, (2) power-with-stabilization-off, and (3) manual. In the power-with-stabilization-on mode, the gunner's aim on target is automatically retained while the vehicle is in motion. This mode provides a fire-on the-move capability. The power-with-stabilization-off option eliminates needless exercise of the stabilization system and provides a back up power mode.

Rangefinder: M17A1 coincidence rangefinder

Searchlight: AN/VSS-1(V)1 IR searchlight above the gun shield.

Ballistic Drive: M10A1 ballistic drive

Ballistic Gunner: mechanical M19E1 ballistic computer for the gunner.

Protection

Hull Armor: The hull's upper glacis armor was increased from 3.67 inches to 4.29 inches at 65 degrees while the turret sides went from 1.9 inches to 2.9 inches at their apex. This brought the frontal armor up to the same 10" line of sight armor standard of the M103 heavy tank.

Turret Armor: M60: equals 7 in (180 mm)

Applique Armor: Available.

Explosive Reactive Armor: INA

Active Protection System: No

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: exhaust smoke generating system; 6-barrel smoke dischargers on turret sides

Notes:

M60A1 series The program to develop the M60A1 was approved in early 1960 in conjunction with abandoning further development of the advanced composite armor and the closure of the T95 Medium Tank project. The first prototype pilots attempts to mate a modified M60 hull with the T95E7 turret took place in March 1960. The turret, even without the siliceous cored armor, provided improved ballistic protection. Additional space for the turret crew was also made available by using the M140 mount thus moving the cannon 5 inches forward. The first two prototypes (Pilot 1 and 2) were ready in May 1961 and the third (Pilot 3) in June 1961, when the vehicle also received its official prototype designation as the M60E1. These vehicles were built by Chrysler Defense. Pilot 1 was sent for evaluation at the Eglin Air Force Base climatic hangar, while Pilot 2 was tested at the Yuma Test Station, and Pilot 3 underwent field trials at Fort Knox. On 22 October 1961, the M60E1 was officially accepted in service under the designation of Tank, Combat, Full Tracked: 105-mm Gun, M60A1. Production began on 13 October 1962 when the Army placed an initial order for 720 of the tanks for 61.2 million dollars. n addition to the new turret design, the hull was upgraded. The hull's upper glacis armor was increased from 3.67 inches to 4.29 inches at 65 degrees while the turret sides went from 1.9 inches to 2.9 inches at their apex. This brought the frontal armor up to the same 10" line of sight armor standard of the M103 heavy tank. A mushroom-shaped fume extractor was placed at the rear left of the turret bustle to vent smoke produced from firing the main or coax guns out of the vehicle. The addition of a shock absorber on the second roadwheel pair was also accompanied by a slight relocation of the first return roller. These modifications were needed due to the increased weight of the M60A1 turret as well as the additional hull armor. The ammunition load for the main gun was increased to 63 rounds. Round storage was distributed between the turret bustle, with 15 ready rounds of various types were stowed and accessible for the loader, and the rest are stored inside safe containers on the hull floor. The uncomfortable wire mesh seats for the loader and gunner were replaced with padded ones. The brake and accelerator pedal and gauges were also rearranged for more efficient and comfortable operation while the steering wheel was replaced by a T bar steering control. The engine and power train were supplied by the Continental AVDS-1790-2A engine and the CD-850-5 cross drive transmission and using the T97 track assembly. Improvements to the electronics package for this version included an improved electro-mechanical traverse assembly and a AN/VSS-1(V)1 IR searchlight above the gun shield.[65] The M19 FCS consisted of the M17A1 coincidence rangefinder, M10A1 ballistic drive and the mechanical M19E1 ballistic computer for the gunner. The M60A1 tank uses the M68E1 variant of the gun carried in the M140 mount. The M68E1 gun shares the same firing characteristics as the M68. It featured several design improvements including an updated gun hydraulic configuration, a stabilization upgrade for the gun, a gun elevation kill switch for the loader, improved ballistic drive and other component refinements.

T-80BK (Ob'yekt 660) Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-80 (1976):** Initial model, with 1,000-hp gas turbine engine, coincidence rangefinder, and no missile capability. This model does not have fittings for explosive reactive armour. The turret is from the T-64A, and thus retains the use of the old coincidence rangefinder. Characteristics of this type are the V shaped water deflector on the front glacis, coincidence rangefinder in front of the commander's cupola, and Luna searchlight mounted in the same position as a T-64. Around 250 were produced, as the tank's armour was essentially obsolete when introduced. Turret vs APFSDS – 380 mm, hull vs APFSDS – 500 mm (without reactive armour). This was, in effect, a pre-production model. It reportedly was fitted with an early version of the Shtora APS.
- **T-80BV (1985):** T-80B with explosive reactive armour Kontakt-1
- **T-80UM::** Russian version, with new Buran thermal imaging sight in place of the Luna IR.
- **Object 219A: Early T-80U (Object 219AS) variant:** It has the T-80U's turret, but not the Kontakt-5 ERA. Instead, it uses the old Kontakt-1/3 system; some 219As did not have ERA at all. Often misnamed T-80A. T-80U (1985): Further development with a better turret, Kontakt-5 explosive reactive armour, improved gunsight, and 9M119 Svir missile system. In 1990 a new, 1,250-hp, engine was installed. Overall protection with Kontakt-5 against APFSDS/HEAT is 780/1,320 mm RHAe.9K119M with antitank guided missile 9M119M installed since 1990. Some of the tanks in commander version (T-80UK) equipped with Shtora-1 APS, and thermal imaging night sight TO1-PO2T (detection range / target classification range = 6,400/4,600 meters at night). Basic thermal night sight of the T-80U is within the limits of 1,750/1,500 meters
- **T-80UD Bereza (1987):** Ukrainian diesel version with 1,000-hp 6TD engine and remote-controlled antiaircraft machine gun
- **T-84 (1999):** Further Ukrainian development of T-80UD with 1,200-hp diesel and new welded turret
- **T-80BVD (2002)::** KMDB's upgrade standard for Ukrainian T-80BVs. Changes include the 6TD diesel engine, remote-controlled commander's machine gun, and better optics. None were produced.
- **T-80UM2/Black Eagle (prototype: cancelled)::** Several Russian prototypes were shown at trade shows, with a longer chassis and extra pair of road wheels, and very a large turret with separate ammunition compartment
- **T-80BVM (2017):** up to 3,000 units, installed "Relikt" ERA, PNM Sosna-U gunner sight (as in the T-90, T-72B3), the improved 125mm gun 2A46M-4, the upgraded gas turbine engine and the upgrades of various other systems. More than 120 already in the service.

System

Family: T-80 Series
Crew: ea3
Maximum Effective Range (Road): km335
Driver's Vision Blocks: ea3
Navigation System: Yes, The T-80BK has land navigation system, which allows the COmmander of a unit to navigate

effectively.

Note: The T-80BK is the command variant of the T-80B. It is an MBT equipped with additional communications equipment allowing local control of armoured units and coordination with the upper levels of C2.

Communications

Note 1:: The T-80BK carries additional long range radios for reconnaissance. Additionally, the T-80BK has a taller radio mast for C2 of local units.

Note 2:: There is no information on the upgrade Radio/Communication Equipment on the T-80B, but the R-173 and the Receiver R-174/GRR-5 are the standard Radios/Receivers on the T-80B

↳*R-173*

Frequency Range: MHz30.00 - 75.99

HF Output: W30

Modulation: FM

Display: Digitial

Entry of Frequency: Keypad

Present Channels: 10

Digital Transmition: KBaudINA

Sensitivity: uV1.5

Range: km50

Operational Voltage: V27+-2

Weight: kg43

Size: mm428 × 222 × 238

↳*Receiver R-174/GRR-5*

Main Principle: Superhet with RF-stage; ZF/IF 455 kHz; 2 AF stage(s)

Wave Bands: Wave Bands given in the notes.

Loudspeaker: Permanent Magnet Dynamic (PDyn) Loudspeaker (moving coil)

Dimensions (WHD): mm307 x 335 x 206

Net Weight: kg27.7

Note: Receiver for mobile purposes, 1.5 - 18 MHz in four ranges, AM/CW (BFO), 200 kHz xtal calibrator. Set compartment (CY-615/URR) consists of two chassis: model R-174/GRR-5 receiver and model PP-308/URR power supply plus speaker unit. Tubes only one times listed.

Main Gun

↳*System*

Name: L48 2A46M-1 Smoothbore Cannon

Type: 125 mm smoothbore Gun

Manufacturer: Spetstekhnika Design Bureau

Max Rate of Fire: rds/min6-8

Maximum Range: m4,000

Manually Load Time: rds/min1-2

Maximum Elevation: deg+14

Minimum Elevation: deg-5

Traverse Range: deg360

Autoloader: Yes, Carousel-Type Autoloader

Fire on the Move: Yes, Main Gun

Evacuator Type: Central Bore

Thermal Sleeve: Yes

Barrel effective Full Life Charge: rds800

Breech Mechanism: Semi-automatic horizontal sliding breech block

Mazimum Pressure: bar5,100

Loading System: Korzina electric and hydraulic automatic loading system

Carousel Reloading Time: minutes13-15

Note: The L48 2A46M-1 It has been extensively developed into 10 different variations and remains the primary armament of Russian frontline tanks.

↳*Ammunition (Option 1)*

Type: High Explosives (HE)

Caliber: mm125

Muzzle Velocity: m/s850

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Maximum Effective Range: m5,000

Armor Penetration: INA

Max Dispersion: mrad0.23

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 2)*

Name: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Type: Smoothbore 125mm Projectile

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Effective Range: m2,000-3,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Weight: kg11

Projectile Dimesnion: mm900

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Effective Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

Note:: The T-80BK is unable is incapable of firing a 9K112 Kobra Missile due to the increased Communication/Radio gear stored onboard.

Coaxial Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: 12.7mm Anti-Aircraft Machine Gun

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Weight (Gun Only): kg25

Muzzle Velocity: m/s845

Max Rate of Fire: rds/min700-800

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Length (Total): mm1,560

Action: Gas Operated

Feed System: 50-Round Belt

Sights: Iron Sights

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: 12.7×108mm

Muzzle Velocity: m/s845

Basic Load: ea500

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Loader's Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: 7.62mm Machine Gun

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

Manufacturer: Degtyaryov plant

In Service: 1961-present

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Total): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea1,250

Effective Range (Iron Sights): m1,000

Effective Range (With Sight Adjustments): m100-1,500

Fire Control

Name: 1A33 FCS

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, the T01-KOIR

Commander Day Mode Sight: 10^0 FOV and ×5 magnification

Thermal Sight Gunner: Yes

Main Gun Stabilization: Yes, 2E26M electro-hydraulic dual plane stabilisation system

Main Gun Stabilization Deployment Time: minutes2

Range, Day Sight: m1,000

Range, Thermal Sight: m2,600

IR Searchlight: Yes, L-4A "Luna" IR Searchlight

TNPO-160 Periscopes: ea2

TNPA-65 Periscopes: ea2

Protection

Hull Armor: mm440–450

Armor Type: The T-80B is protected by a third iteration Soviet laminate armour that is known as Combination K

Turret Armor: Protection equivalent to 550mm

Applique Armor: Yes, Hull side; track skirts

Explosive Reactive Armor: Yes, Kontakt-1 System

Active Protection System: Arena Available

Mine Clearing: Roller-plow available

Self-Entrenching Blade: Yes

NBC Protection: Yes, ZETS-11-2 detection system collective overpressure system

Smoke Equipment: Yes, two banks of four 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade

Smoke Grenade Range: m250-300

Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade.

IR Signature: The exhaust is box-shaped and designed to direct heat away from the tank

Anti-Radiation Material: Installed as a inside protective layer

Personal Breathing Apparatus: Equipment

Automatic Fire Extinguisher System: Yes

Notes:

The T-80BK main battle tank is a further development of the original T-80, which was produced only in small numbers. The T-80B is the first variant produced in quantity. The T-80BK is the command variant of the T-80B. It is an MBT equipped with additional communications equipment allowing local control of armoured units and coordination with the upper levels of C2.

Type 15 (ZTQ-15) Chinese Light Main Battle Tank (MBT)

Tiers:

1 2 3 4

Main Gun

↳*System*

Name: INA

Type: 105mm Rifled Gun

Caliber: 105mm

Loading System: The gun has an automatic bustle-mounted ammunition loading system, which allowed to reduce the crew to 3.

Barrel Length: INA

Diameter: INA

Effective Firing Range: km3

Elevation: INA

Traverse Range: INA

Note: This tank can also launch 105 mm anti-tank guided missiles in this tank can also launch 105 mm anti-tank guided missiles in the same manner as ordinary munitions. These extend the effective range to up to 5 km and have a hit probability of over 90% against stationary targets. Furthermore these missiles have tandem High Explosive Anti-Tank (HEAT) warheads and pose serious threat to main battle tanks, and can even target low-flying helicopters. Also the gun can launch ordinary High Explosive (HE) and HEAT rounds for use against light armored vehicles, buildings, field fortifications and infantry.

↳*Ammunition*

Name: INA

Type: APFSDS

Caliber: 105mm

Basic Load: A total of 38 rounds or missiles are carried for the main gun.

Penetration: up to 500 mm of rolled homogenous armor.

Coaxial Weapon System

↳*System*

Name: Type 67

Type: General-Purpose Machine Gun

Caliber: 7.62mm

Manufacturer: China North Industries Corporation

In Service: 1967-Present

Proliferation: Widely Proliferated

Length: 1,650 mm

Barrel Length: 605 mm

Weight: 11 kg

Action: Gas-operated, tilting breechblock

Rate of Fire: 650-700 rounds/min

Effective Firing Range: 800-1000 m

Feed System: 100/250-round belt

Sights: Rear leaf sight, forward post

↳***Ammunition***

Type: Rifle

Caliber: mm7.62

↳***System***

Name: QLZ-04

Type: Automatic Grenade Launcher

Caliber: 37mm

Manufacturer: Norinco

Proliferation: Widely Proliferated

In Service: 1970s-Present

Length: 1026 mm

Barrel Length: 380 mm

Weight: 20 kg

Muzzle Velocity: 190 m/s

Rate of Fire: 350-400 rounds per minute

Effective Firing Range: 1750 m

Feed System: Belt

Sights: Optical sight, backup iron sights

↳***Ammunition***

Type: Grenade

Caliber: 37mm

Cartridge: HE-FRAG; HE-DP

Basic Load: 30 rounds

Auxiliary Weapon System #2

↳*System*

Name: W85
Type: Heavy Machine Gun
Caliber: 12.7mm
Manufacturer: Norinco
Proliferation: Widely Proliferated
In Service: 1980s-Present
Length: INA
Weight: 18.5 kg (40.79 lb) (gun only) 17.5 kg (38.58 lb) (tripod)
Action: Gas
Rate of Fire: 550-600 rounds/min
Muzzle Velocity: 850 m/s
Feed System: Belt
Sights: Iron/Optical

↳*Ammunition*

Type: Rifle
Caliber: 12.7mm
Cartridge: 12.7×108 mm
Basic Load: INA

Fire Control

Name: INA
Computerized FCS: Yes, a modern Fire Control System.
Main Gun Stabilization: Yes
Laser Rangfinder: Yes
Ballistic Computer: Yes
Wind Sensor: Yes
Gunner's Thermal Sight: Yes
Commander's Panoramic Sight with Thermal Vision.: Yes, Thermal vision allows to engage targets at night and during adverse weather conditions.
Hunter-Killer Engagement Capable: Yes
Navigation: Yes
Satellite Communication: Yes
Battlefield Management System: Yes

Protection

Hull Armor: Standard steel armour protection against firing of small arms and shell splinters.

Turret Armor: Standard steel armour protection against firing of small arms and shell splinters.

Applique Armor: Yes, modular add-on armor kit.

Explosive Reactive Armor: INA

Active Protection System: Yes

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes, This system triggers smoke grenade dischargers once the tank is illuminated by a laser beam.

Note: Some areas of the hull and turret can be covered with cage armor which provides protection against anti-tank rockets and anti-tank guided missiles.

Notes:

The Type 15 (Chinese: 15□; pinyin: Shíwǔ shì) or ZTQ-15 is a Chinese third generation lightweight main battle tank (MBT). The vehicle was a replacement for the antiquated Type 62 light tank introduced in 1963. Type 15 tank is designed to fulfill the requirement from Chinese army for a lighter, mobile modern tank that can effectively operate in China's plateaus, forests, and water-heavy regions in which heavier Type 99 tanks have difficulties traversing. Sightings of Type 15 were reported by Chinese citizens, but its existence was formally confirmed by the Chinese Ministry of Defense in December 2018. The tank is confirmed in service as of 2018. and was showcased in the 70th National Day parade on Oct 1st 2019. Type 15's rifled gun with new 105 mm ammunition, which is superior to the 105mm tank gun (Type 94) fitted on Type 88 tank and Type 59 tank. When launching 105 mm armor-piercing projectiles, Type 15 is capable to effectively penetrates the active main battle tanks equipped by various countries and regions in southern and southwestern China. The tank is equipped with NRBC protection, air conditioning system, command-and control equipment, a tactical command system and a navigation system that includes INS (Inertial Navigation System) and satellite communications.

Type 59 Chinese Main Battle Tank (MBT)

Tiers:

Variants:

- **Domestic models:** Type 59 The basic variant, a T-54A clone without IR searchlight. Entered production in 1957. Type 59-I Improved variant fitted with a Type 69-II 100 mm rifled gun, as well as a laser rangefinder, hydraulic servo-system, primitive fire-control system, automatic fire suppression system, and rubber track skirt. The Type 59-I includes several versions with different armour and fire control configurations. Type 59-II The Type 59-II (also known as WZ-120B) is an upgrade mounting a 105 mm rifled gun, similar to the Royal Ordnance L7, and adding an image intensification/infrared night sight. Mass increased to 36.5 tonnes. Type 59-IIA Although Type 59-II is very successful design, the tank still rely on the West to supply parts. As a result, the Type 59-IIA was developed. By the end of 1984, the China First Tractor Factory and other production facilities began to develop a further upgrade to the Type 59-II. A prototype was completed by October 1985, featured an improved 105mm Type 83 gun, copied version from the Royal Ordnance L7, with a thermal sleeve, new domestic light spot fire control system with a 2-axis stabilizer, and composite armor. The automatic fire suppression system and automatic fire extinguishing devices were improved so that they could be used while generating smoke or firing the onboard smoke grenade launchers. Type 59D1 The Type 59D1 (also known as WZ-120C) is an upgrade with explosive reactive armour, computerized stabilized fire-control system, the 105 mm gun of the Type 59-II, and night vision system. Type 59D Type 59D (also known as WZ-120D) is an upgrade with the Type 59D1, though it is strange. The Type 59D has a longer 105 mm gun, called Type 83A, or Type 94. The gun has a range of 2000 m, and may fire ATGMs out to 5500 m. A thermal sight is available. Type 59G An upgrade of the Type 59, featuring a redesigned turret and armor. It uses a turret similar to that of the Type 96A, a 125 mm gun, modern fire control systems, arrow-shaped armor, spaced armor, and possibly third-generation subsystems. Jaguar The Jaguar was a prototype vehicle based off the Type 59 chassis that was jointly developed by the United States and China during 1980s, made possible by the US-Chinese détente of the 1970s. Planned to replace China's existing tank fleet, as well as for the export market, the tank featured improvements to the standard Type 59's engine, armament, armour, turret, optics, electronics, fire control and suspension. Following Tiananmen Square massacre, American-Chinese relations soured and the Chinese withdrew from the project. The Americans continued alone and successfully completed the design, however the end of the Cold War saw a glut in the international tank market and thus no orders were ever placed for the vehicle. Type 62 Light Tank In the late 1950s, the PLA submitted requirements for a light tank more suitable for operations in China's southern region. Development on the new Type 62 tank began in 1958, which was a scaled-down Type 59 MBT with simplified equipment. The Type 62 light tank entered batch production in 1963, and approx. 800 were produced by 1978. The Type 62 light tank weights only 21 tons, and is equipped with a Type 62-85TC 85 mm rifled gun, and 3 machine guns. An improved Type 62-I version was produced with better FCS with laser rangefinder, and turret storage racks for added protection. Other versions based on the Type 62 include the Type 79 recovery vehicle (prototype only) and Type 82 earth-mover. The PLA deployed the Type 62 light tank to Vietnam during the 1979 Sino-Vietnam conflict. They found that the thin armor of the Type 62 tank could be penetrated easily by hand-held anti-tank weapons, such as the 40 mm RPG. The Type 62 tank suffered severe losses during the conflict, which convinced the PLA to develop new second-generation MBTs. The Type 62 tank received a major upgrade in 2000, with new welded turret, vertically stabilized 105 mm rifled gun, fire-control system, night vision device, smoke grenade launchers, and explosive reactive armor (ERA) package. Type 69 / 79 Improved Type 59 MBT built by 617 Factory (Inner Mongolia First Machine Group Co. Ltd). Only saw limited service in the PLA, but was an export success in the 1980s with more than 2,000 sold worldwide. Type 73 This armored recovery vehicle is a Type 59 with its turret removed. The vehicle is armed with a single 12.7 mm machine gun. This armored recovery vehicle is not believed to have a winch and is limited to towing operations. Type 59 Heavy Infantry Fighting Vehicle The modernized HIFV model of Type 59 weighs around 40 tons and can carry up to seven passengers. Modifications include moving the engine to the front of the vehicle chassis, increasing tank armor including explosive reactive armor on all sides, and installing a rear door for dismounting infantry. QN-506 It is a modernized variant of the Type 59 using the tank's chassis similar to its Russian

counterpart the BMPT Terminator. The vehicle was first appeared at the Zhuhai Air Show in China in November 2018, and is armed with two QN-502C anti-tank missiles, ten QN-201 multi-purpose mini missiles, four S-507 loitering munitions, an unmanned 30 mm cannon, a 7.62 mm machine gun, six grenade launchers, and a quadcopter surveillance drone.
- **Foreign variants:** United Kingdom designed a variant with 105-mm L7 gun as an upgrade package for owners of the Type 59. No Type 59s served with British forces. Marconi offered their Marksman anti-aircraft system as a conversion to operators of the Type 59. The Marksman consisted of a twin 35 mm autocannon system in a turret that could be fitted to almost any MBT. Iran Iran operates Type T-72Z based on Type 59. North Korea North Korea operates Kok'san – 170 mm artillery piece, based on the Type 59 chassis. Pakistan operates Al-Zarrar – Heavy Industries Taxila of Pakistan has introduced the Al-Zarrar Main Battle Tank. The Al-Zarrar series was designed to improve and rebuild the Pakistani army's Type 59 tanks by way of more modern armament, fire control, defensive equipment, etc. Bangladesh Bangladesh operates Type 59G(BD) Durjoy - Bangladesh Army's Type-59 are being upgraded to Type 59G(BD) Durjoy locally with Chinese assistance. 174 are being upgraded in First batch.

System

Mine Clearing: Mine plows and roller-plows available
Self-Entrenching Blade: INA
NBC Protection: Yes
Smoke Equipment: 8 x 81-mm smoke grenade launchers Vehicle engine exhaust smoke system

Notes:

The Type 59 (Chinese: 59□; pinyin: Wǔ jiǔ shì; industrial designation: WZ-120) main battle tank is a Chinese-produced version of the Soviet T-54A tank, the earliest model of the ubiquitous T-54/55 series. The first vehicles were produced in 1958 and it was accepted into service in 1959, with serial production beginning in 1963. Over 10,000 of the tanks were produced by the time production ended in 1980 with approximately 5,500 serving with the Chinese armed forces. The tank formed the backbone of the Chinese People's Liberation Army until the early 2000s with an estimated 5,000 of the later Type 59-I and Type 59-II variants in service in 2002. The Type 59 was modified several times during its service. It was also the basis of several later Chinese tank designs including the Type 69 and Type 79 tanks. The Type 59 is almost identical to the early production Soviet T-54As, however there are some key differences. The Type 59 was not originally fitted with the infrared searchlight or main gun stabilization of the T-54. The Type 59 has a conventional post-war layout with an engine compartment at the rear and a cast dome-shaped gun turret in the centre of the hull. The hull is welded steel varying in thickness between 99 mm on the front lower glacis to 20 mm on the hull floor. The turret varies in thickness from 39–100 mm. The driver sits in the front left of the hull, and is provided with a hatch immediately above his seat, which opens to the left. The driver has two pop-up vision blocks which give coverage ahead and slightly to the right when buttoned up. The commander sits in the turret along with the gunner and loader. The commander's hatch is on the turret left, with the gunner sitting forward and below him. The loader sits on the right of the turret and has a hatch above him. The turret has a non-rotating floor, which complicated the crew's operations as they would not rotate with the turret. The turret mounts a rifled 100 mm Type 59 cannon, for which 34 rounds are typically carried. A Type 59T 7.62 mm machine gun is mounted coaxially with the main gun. A Type 54 12.7 mm anti-aircraft machine gun (the Chinese copy of the Russian 12.7 mm M1938/46 DShKM heavy machine gun) is provided above the gunner's hatch for

which 200 rounds are carried. Additionally, a Type 59T 7.62 mm bow-mounted machine gun is fitted and is fired by the driver through a tiny hole in the center of the front glacis plate. 3,500 rounds of 7.62 mm ammunition are normally carried. The turret has a powered traverse mechanism that is probably comparable to the T-54 traverse mechanism which can rotate the turret through 360 degrees in 21 seconds. Very early models of the Type 59 gun had manual elevation gear, later replaced with a powered system which allowed the gun to be aimed at between +17 and −4 degrees (the average depression for Western tanks is -10, which allows for better usage of hull-down tactics). Later models added vertical stabilization to make firing on the move practical. An infrared searchlight based night vision system was retrofitted to the tank with infrared periscope for the commander gunner and driver. The tank is powered by a Model 12150L V-12 liquid-cooled diesel engine, which develops 520 horsepower at 2,000 rpm. The engine feeds a manual gearbox with five forward and one reverse gear. A total of 815 litres of diesel can be carried internally in the tank, with a further 400 litres carried externally giving a maximum road range of 600 kilometers, or approximately 430 km using only internal fuel. The tank has five road wheels on each side with a prominent gap between the first and second road wheel. The track is driven by a drive sprocket at the rear, with an idler at the front. It is notable that there are no return rollers. The suspension is a torsion bar system. Engine exhaust is on the left fender. Ammunition is stored inside the turret, which increases the odds of a catastrophic secondary explosion should the tank's interior be penetrated by enemy fire. Crew survivability is hence low.

T-55AMV Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-55A:** In 1961, development of improved NBC protection systems began. The goal was to protect the crew from fast neutrons; adequate protection against gamma radiation was provided by the thick armour and a PAZ basic NBC protection system.
- **T-54/T-55 upgrades:** n its long service life, the T-55 has been upgraded many times. Early T-55s were fitted with a new TSh-2B-32P sight. In 1959, some tanks received mountings for the PT-55 mine clearing system or the BTU/BTU-55 plough. In 1967, the improved BM8 APDS round, which could penetrate 275 mm thick armour at a range of 2 km, was introduced. In 1970, new and old T-55 tanks had the loader's hatch modified to mount the 12.7 mm DShK machine gun, to deal with the threat of attack helicopters. Starting in 1974, T-55 tanks received the KTD-1 or KTD-2 laser rangefinder in an armoured box over the mantlet of the main gun, as well as the R-123 or R-123M radio set.[10] Simultaneously, efforts were made to modernize and increase the lifespan of the drive train.
- **T-55AM:** upgraded version of the T-55A. It is fitted with add-on composite armor and rubber side skirts. The gun is fitted with a thermal sleeve. It entered service in 1983.
- **T-55AM-1:** upgraded version of the T-55AM, powered by a V-46-5M diesel engine, developing 690 hp.
- **T-55AD:** fitted with Drozd active protection system. It also has add-on armor. It entered service in 1983.
- **T-55AD-1:** fitted wit a V-46-5M diesel engine, developing 690 hp.
- **T-55AMV:** fitted with add-on explosive reactive armor and new fire control system. It is capable of launching anti-tank guided missiles in the same manner as ordinary projectiles. The missile has a range of 4 000 m at daytime and 1 200 m at night. It penetrates 550 mm of rolled homogenous armor. It entered service in 1985.
- **T-55M:** Upgraded version fitted with add-on composite armor and rubber side skirts. The gun is fitted with a thermal sleeve. This tank entered service in 1983.
- **T-55M-1:** it is a further upgrade of the T-55M, powered by a V-46-5M diesel engine, developing 690 hp. This tank is also fitted with ballistic computer.
- **T-55MV:** it has improved protection and firepower. It is fitted with add-on explosive reactive armor and improved fire control system. It is capable of launching anti-tank guided missiles in the same manner as ordinary projectiles. The T-55MV entered service in 1985.
- **T-55MV-1:** fitted with a V-46-5M diesel.
- **T-62A:** an improved T-55 with a stretched chassis, new suspension, new turret. It was armed with a 100 mm gun with improved ballistics. First prototypes were built in 1958 and it was accepted to service in 1962. Only a small number of these tanks were built for experimental service. However it was a forerunner of the T-62 medium tank, that was produced in thousands.
- **TO-55:** flamethrower tank. Coaxial machine gun has been replaced with a flame thrower.
- **BTS-2 and BTS-3:** armored recovery vehicles.
- **MTU-20 and MTU-55:** armored bridgelayers.
- **BTR-T:** is a heavy armored personnel carrier. It was first publicly revealed in 1997. It was converted from obsolete T-55 medium tank. The turret has been removed in order to create a compartment for dismounts. A number of other modifications were made to the vehicle. This armored vehicle has a crew of 2 and accommodates 5 dismounts. The BTR-T received no production orders.
- **Ti-67:** sraeli version, fitted with American M68 105 mm rifled gun. It is also fitted with Israeli fire control system, new engine and transmission and Blazer explosive reactive armor. About 200 T-54/55 tanks, that were captured from Egyptian and Syrian forces, were upgraded to this standard.
- **T-54E Ramzes II:** a proposed upgrade of Egyptian T-54/55 tanks. It is fitted with American M68 105 mm rifled gun, Belgian fire control system, and American Continental AVDS-1790-5A engine.
- **T-55 Enigma,:** upgraded Iraqi version, fitted with composite add-on armor. Add-on armor weights a total of 4.6 t, so a

counterweight was mounted at the turret rear. This tank also has improved night vision devices.
- **TR-580:** a Romanian version of the T-55 with a longer hull. An extra road wheel on each side has been added. It is fitted with a different engine. This tank is fitted with metal side skirts.

System

Alternative Designation: INA

Total Built: 86,000–100,000+ est.

Manufacturer: KhPZ, UVZ (Soviet Union) Bumar-Łabędy (Poland) ZTS Martin (Czechoslovakia)

Type: Main Battle Tank

Crew: ea4

Passenger Capacity: INA

Maximum Effective Range: m500

Status: In service throughout the world. No new production is possible but facilities exist to upgrade and maintain the vehicles

Dimensions

NBC Protection: Yes, PAZ (Protivoatomnaya Zashchita) NBC protection system

Smoke Equipment: grenlaunch/eng smk sys

Note: The T-55 focuses most of its armour around the front 60 deg arc.

Notes:

The T-55 is an upgrade of the T-54 series. It was produced in the greatest quantities and benefits from improved mobility over the earlier T-54s. The original T-55s are thought to have been pre-production versions. T-55MV, it has improved protection and firepower. It is fitted with add-on explosive reactive armor and improved fire control system. It is capable of launching anti-tank guided missiles in the same manner as ordinary projectiles. The T-55MV entered service in 1985.

Pz 87 (Panzer 87) Swiss Main Battle Tank (MBT)

Tiers:

Parent:

Leopard 2 German Main Battle Tank (MBT)

Variants:

- **Leopard 2A1:** Minor modifications and the installation of the gunner's thermal sight[1] were worked into the second batch of 450 vehicles Leopard 2, designated the A1. Krauss-Maffei built 248 (Chassis Nr. 10211 to 10458) and Mak built 202 (Chassis Nr. 20173 to 20347). Deliveries of the 2A1 models started in March 1982 and ended in November 1983. The two most notable changes were the modification of the ammunition racks to be identical to those in the M1A1 Abrams, and redesigned fuel filters that reduced refuelling time. A third batch of 300 Leopard 2, 165 by Krauss-Maffei (Chassis Nr. 10459 to 10623) and 135 by MaK (Chassis Nr. 20375 to 20509.), was built between November 1983 and November 1984. This batch included more minor changes that were later retrofitted to the earlier 2A1s
- **Leopard 2A2:** This designation was given to upgraded vehicles of the first batch of Leopard 2s, brought up to the standard of the second and third batches. This modernisation gradually replaced the original PZB 200 sights in the first batch with thermal sights for the EMES 15 as they became available. Furthermore, the upgrade included the fitting of filler openings and caps to the forward hull fuel tanks to allow separate refuelling, as well as the addition of a deflector plate for the periscope and a large coverplate to protect the existing NBC protection system. Finally, the tank was given new five metre towing cables with a different position. The programme began in 1984 and ended in 1987; the third, fourth and fifth batches, which were produced during this period, had the same features. The modernised first batch can be recognised by the circular plate covering the hole where the cross-wind sensor for the fire-control system was removed
- **Leopard 2A3:** The fourth batch of 300 vehicles, 165 by Krauss-Maffei (Chassis Nr. 10624 to 10788) and 135 by Mak (Chassis Nr. 20510 to 20644), was delivered between December 1984 and December 1985. The main change was the addition of the SEM80/90 digital radio sets (also being fitted to the Leopard 1 at the same time), and the ammunition reloading hatches being welded shut. Even with these minor changes the new batch was known as the 2A3
- **Leopard 2:** The Leopard 2 is a main battle tank developed by Krauss-Maffei in the 1970s for the West German Army. The tank first entered service in 1979 and succeeded the earlier Leopard 1 as the main battle tank of the German Army. It is armed with a 120 mm smoothbore cannon, and is powered by a V-12 twin-turbo diesel engine. Various versions have served in the armed forces of Germany and 12 other European countries, as well as several non-European nations, including Canada, Chile, Indonesia, Singapore, and Turkey. The Leopard 2 was used in Kosovo with the German Army, and has seen action in Afghanistan with the Dutch, Danish and Canadian contributions to the International Security Assistance Force, as well as also seeing action in Syria with the Turkish Armed Forces against ISIS and the YPG.
- **Leopard 2 Marksman:** Finland has modernised its Marksman SPAAG vehicles by replacing the original T-55AM chassis with a newer Leopard 2A4 chassis. The upgraded Marksman vehicles were scheduled to enter service with the Finnish Army in 2016. The new Leopard 2 chassis greatly improves mobility compared to the older T-55AM chassis, both on- and off-road. The Leopard 2 chassis is also larger, thus providing a more stable firing platform for the Marksman turret to operate from
- **Leopard 2A5:** "Leopard 2 Improved" was a prototype-series for enhancing the A4, introducing a wedge-shaped, spaced add-on armour to the turret front and the frontal area of the sides. These spaced armour modules defeat a hollow charge prior to reaching the base armour, and causes kinetic-energy penetrators to change direction, eroding them in the process; it does not form a shot-trap, since it does not deflect the penetrators outwards to hit the hull or turret ring. The gun mantlet was redesigned to accept the new armour.
- **Stridsvagn 122:** The Stridsvagn 122 is a Swedish Army tank based on the Leopard 2 Improved, with 120 units built, 91

of which were licence-produced in Sweden. The tank features increased armour on the turret top and front hull, and improved command, control and fire control systems. Externally, it can be distinguished from the Leopard 2A5 by the French GALIX smoke dispensers, different storage bins, and the much thicker crew hatches The Strv 122B, a variant equipped with modular AMAP composite armour from IBD Deisenroth, has increased 360° protection against threats like EFPs, RPGs and IEDs. The width of 4 metres (13 ft) has been kept, while the weight increases by only 350 kilograms (770 lb)

- **Leopard 2-140:** n the early 1990s,[citation needed] Rheinmetall began development of a 140 mm smoothbore cannon for use in future tank designs. The new gun was intended to counter new Soviet tank developments, especially since the next generation of Soviet main battle tanks were rumoured to be armed with a 135 mm or 152 mm cannon. The new 140 mm cannon was part of a modernisation programme for the Leopard 2 known as the KWS III. Test firing of the new 140 mm cannon was conducted. Results showed that the gun had high penetration values, and had a muzzle velocity of around 2000 metres a second, with potential to be increased further. However, the 140 mm rounds were too heavy for the tank crew to handle effectively
- **Leopard 2A6:** The Leopard 2A6 includes the addition of the Rheinmetall 120 mm L/55 smoothbore gun and other changes. All German tank battalions of the "crisis intervention forces" are equipped with the A6. Canada purchased 20 Leopard 2A6s from the Netherlands. These were delivered in 2007. Portugal also purchased 37 Leopard 2A6 from the Dutch in 2007, with delivery in 2008. In January 2014, Finland purchased 100 L2A6s, as well as munitions, simulators, and a ten-year supply of reserve parts from the Netherlands. The tanks are being delivered in batches between 2015-2019.
- **Leopard 2E:** he Leopard 2E is a derivative of the 2A6, with greater armour protection, developed under a programme of co-production between the defence industries of Spain and Germany. The programme was developed within the frame of collaboration decided in 1995 between the Defence Ministries of both countries, in which also was included the cession of use by a period of five years of 108 Leopard 2A4 from the German Army to the Spanish Army. However, this cession was extended up to 2016, and after that those tanks will be the sole property of the Spanish Army, as has been made public on 24 January 2006, then having been paid a total of 15,124,014 euros in ten yearly installments, giving the Spanish co-ownership from 2006.
- **Leopard 2 PSO:** The new Leopard 2 PSO (Peace Support Operations) variant is designed specially for urban warfare, which had been encountered in peacekeeping operations with increasing frequency. Therefore, the Leopard 2 PSO is equipped with more effective all-around protection, a secondary weapons station, improved reconnaissance ability, a bulldozer blade, a shorter gun barrel (for manoeuvring on urban streets at the expense of fire range), non-lethal armament, close-range surveillance ability (through camera systems), a searchlight and further changes to improve its perseverance and mobility in a built-up non-wide open area. These features are similar to the Tank Urban Survival Kit for the American M1A2 Abrams
- **Leopard 2A7:** The Leopard 2A7 is fundamentally different from the KMW variant 2A7+ and is not optimised for combat in urban terrain. A total of 20 vehicles are provided for converting. It involves former Dutch A6NL models returned by Canada to Germany. The original upgrade to A6M has been extended in coordination with Canada and includes a crew-compartment cooling-system from the Leopard 2 A6M-HEL series, a new 20 kW auxiliary power unit based on the Steyr Motors M12 TCA UI engine, the Saab Barracuda Mobile Camouflage System (MCS) with Heat-Transfer Reduction (HTR CoolCam) system, a field trial proven combat management and information system (IFIS: Integriertes Führungs- und Informationssystem), onboard network optimization with ultracapacitors in the chassis and turret, a SOTAS IP digital intercom system, a renewal of the fire suppression system in the crew compartment, and the retrofitting of Attica thermal imaging module in the commander optics. The weapon system is adapted for firing HE ammunition. It is also fitted for, but not with, additional passive side protection armour. The first Leopard 2A7 was handed over to the German Army in Munich on 10 December 2014. A total of 14 vehicles were produced for Tank Battalion 203, plus four more going to the Armoured Corps Training Centre and one vehicle at the Technical School for Land Systems and School for Technology of the Army. The last tank remains as a reference vehicle at KMW
- **Leopard 2A7+:** The Leopard 2A7+ was first shown to the public during the Eurosatory 2010, featuring the label "Developed by KMW – tested and qualified by German MoD". The Leopard 2A7+ has been tested by the Bundeswehr under the name UrbOp (urban operations).The Leopard 2A7+ is designed to operate both in low intensity and high intensity conflicts.
- **Pz 87:** Pz 87 (standing for Panzer 87, referring to year of service entry) is the designation given to the Leopard 2A4 vehicles built under licence in Switzerland. The vehicles are essentially the same specification as the fifth and sixth production batch 2A4. This version included Swiss built communications equipment and MG 87 MGs, as well as featuring an improved NBC protection system, the installation of a hydraulic track-tensioning system, and the addition of an exhaust silencer. Late model Pz 87 included a field zeroing system, the sealing of the ammunition loading hatch, and from the 120th vehicle, the addition of heavier armoured side skirts.

Fire Detection and Suppression System: Yes, Kidde-Deugra Brandschutzsysteme System

Emergency Escape Hatch: Yes, below the driver's compartment

Notes:

The Pz 87 WE Leopard 2 (Werterhaltung) is the most modern version of the Pz 87. The first 2 prototypes were completed in 2003 and featured new armor packages, sighting equipment and Remote Weapon Station. However the actual Pz 87 WE did not recieve the full upgrades offered by Swiss Defence Company Ruag. Instead its Battlefield management and communications capabilities were upgraded as well as a new Commanders Independent Sight installed. There are references to a new thermal imager, but is most likely only for the CIS. All work was carried out by Ruag.

Pz 87WE (Panzer 87 Werterhaltung) Swiss Main Battle Tank (MBT)

Tiers:

Parent:

Leopard 2 German Main Battle Tank (MBT)

Variants:

- **Leopard 2A1:** Minor modifications and the installation of the gunner's thermal sight[1] were worked into the second batch of 450 vehicles Leopard 2, designated the A1. Krauss-Maffei built 248 (Chassis Nr. 10211 to 10458) and Mak built 202 (Chassis Nr. 20173 to 20347). Deliveries of the 2A1 models started in March 1982 and ended in November 1983. The two most notable changes were the modification of the ammunition racks to be identical to those in the M1A1 Abrams, and redesigned fuel filters that reduced refuelling time. A third batch of 300 Leopard 2, 165 by Krauss-Maffei (Chassis Nr. 10459 to 10623) and 135 by MaK (Chassis Nr. 20375 to 20509.), was built between November 1983 and November 1984. This batch included more minor changes that were later retrofitted to the earlier 2A1s
- **Leopard 2A2:** This designation was given to upgraded vehicles of the first batch of Leopard 2s, brought up to the standard of the second and third batches. This modernisation gradually replaced the original PZB 200 sights in the first batch with thermal sights for the EMES 15 as they became available. Furthermore, the upgrade included the fitting of filler openings and caps to the forward hull fuel tanks to allow separate refuelling, as well as the addition of a deflector plate for the periscope and a large coverplate to protect the existing NBC protection system. Finally, the tank was given new five metre towing cables with a different position. The programme began in 1984 and ended in 1987; the third, fourth and fifth batches, which were produced during this period, had the same features. The modernised first batch can be recognised by the circular plate covering the hole where the cross-wind sensor for the fire-control system was removed
- **Leopard 2A3:** The fourth batch of 300 vehicles, 165 by Krauss-Maffei (Chassis Nr. 10624 to 10788) and 135 by Mak (Chassis Nr. 20510 to 20644), was delivered between December 1984 and December 1985. The main change was the addition of the SEM80/90 digital radio sets (also being fitted to the Leopard 1 at the same time), and the ammunition reloading hatches being welded shut. Even with these minor changes the new batch was known as the 2A3
- **Leopard 2:** The Leopard 2 is a main battle tank developed by Krauss-Maffei in the 1970s for the West German Army. The tank first entered service in 1979 and succeeded the earlier Leopard 1 as the main battle tank of the German Army. It is armed with a 120 mm smoothbore cannon, and is powered by a V-12 twin-turbo diesel engine. Various versions have served in the armed forces of Germany and 12 other European countries, as well as several non-European nations, including Canada, Chile, Indonesia, Singapore, and Turkey. The Leopard 2 was used in Kosovo with the German Army, and has seen action in Afghanistan with the Dutch, Danish and Canadian contributions to the International Security Assistance Force, as well as also seeing action in Syria with the Turkish Armed Forces against ISIS and the YPG.
- **Leopard 2 Marksman:** Finland has modernised its Marksman SPAAG vehicles by replacing the original T-55AM chassis with a newer Leopard 2A4 chassis. The upgraded Marksman vehicles were scheduled to enter service with the Finnish Army in 2016. The new Leopard 2 chassis greatly improves mobility compared to the older T-55AM chassis, both on- and off-road. The Leopard 2 chassis is also larger, thus providing a more stable firing platform for the Marksman turret to operate from
- **Leopard 2A5:** "Leopard 2 Improved" was a prototype-series for enhancing the A4, introducing a wedge-shaped, spaced add-on armour to the turret front and the frontal area of the sides. These spaced armour modules defeat a hollow charge prior to reaching the base armour, and causes kinetic-energy penetrators to change direction, eroding them in the process; it does not form a shot-trap, since it does not deflect the penetrators outwards to hit the hull or turret ring. The gun mantlet was redesigned to accept the new armour.
- **Stridsvagn 122:** The Stridsvagn 122 is a Swedish Army tank based on the Leopard 2 Improved, with 120 units built, 91

of which were licence-produced in Sweden. The tank features increased armour on the turret top and front hull, and improved command, control and fire control systems. Externally, it can be distinguished from the Leopard 2A5 by the French GALIX smoke dispensers, different storage bins, and the much thicker crew hatches The Strv 122B, a variant equipped with modular AMAP composite armour from IBD Deisenroth, has increased 360° protection against threats like EFPs, RPGs and IEDs. The width of 4 metres (13 ft) has been kept, while the weight increases by only 350 kilograms (770 lb)

- **Leopard 2-140:** n the early 1990s,[citation needed] Rheinmetall began development of a 140 mm smoothbore cannon for use in future tank designs. The new gun was intended to counter new Soviet tank developments, especially since the next generation of Soviet main battle tanks were rumoured to be armed with a 135 mm or 152 mm cannon. The new 140 mm cannon was part of a modernisation programme for the Leopard 2 known as the KWS III. Test firing of the new 140 mm cannon was conducted. Results showed that the gun had high penetration values, and had a muzzle velocity of around 2000 metres a second, with potential to be increased further. However, the 140 mm rounds were too heavy for the tank crew to handle effectively
- **Leopard 2A6:** The Leopard 2A6 includes the addition of the Rheinmetall 120 mm L/55 smoothbore gun and other changes. All German tank battalions of the "crisis intervention forces" are equipped with the A6. Canada purchased 20 Leopard 2A6s from the Netherlands. These were delivered in 2007. Portugal also purchased 37 Leopard 2A6 from the Dutch in 2007, with delivery in 2008. In January 2014, Finland purchased 100 L2A6s, as well as munitions, simulators, and a ten-year supply of reserve parts from the Netherlands. The tanks are being delivered in batches between 2015-2019.
- **Leopard 2E:** he Leopard 2E is a derivative of the 2A6, with greater armour protection, developed under a programme of co-production between the defence industries of Spain and Germany. The programme was developed within the frame of collaboration decided in 1995 between the Defence Ministries of both countries, in which also was included the cession of use by a period of five years of 108 Leopard 2A4 from the German Army to the Spanish Army. However, this cession was extended up to 2016, and after that those tanks will be the sole property of the Spanish Army, as has been made public on 24 January 2006, then having been paid a total of 15,124,014 euros in ten yearly installments, giving the Spanish co-ownership from 2006.
- **Leopard 2 PSO:** The new Leopard 2 PSO (Peace Support Operations) variant is designed specially for urban warfare, which had been encountered in peacekeeping operations with increasing frequency. Therefore, the Leopard 2 PSO is equipped with more effective all-around protection, a secondary weapons station, improved reconnaissance ability, a bulldozer blade, a shorter gun barrel (for manoeuvring on urban streets at the expense of fire range), non-lethal armament, close-range surveillance ability (through camera systems), a searchlight and further changes to improve its perseverance and mobility in a built-up non-wide open area. These features are similar to the Tank Urban Survival Kit for the American M1A2 Abrams
- **Leopard 2A7:** The Leopard 2A7 is fundamentally different from the KMW variant 2A7+ and is not optimised for combat in urban terrain. A total of 20 vehicles are provided for converting. It involves former Dutch A6NL models returned by Canada to Germany. The original upgrade to A6M has been extended in coordination with Canada and includes a crew-compartment cooling-system from the Leopard 2 A6M-HEL series, a new 20 kW auxiliary power unit based on the Steyr Motors M12 TCA UI engine, the Saab Barracuda Mobile Camouflage System (MCS) with Heat-Transfer Reduction (HTR CoolCam) system, a field trial proven combat management and information system (IFIS: Integriertes Führungs- und Informationssystem), onboard network optimization with ultracapacitors in the chassis and turret, a SOTAS IP digital intercom system, a renewal of the fire suppression system in the crew compartment, and the retrofitting of Attica thermal imaging module in the commander optics. The weapon system is adapted for firing HE ammunition. It is also fitted for, but not with, additional passive side protection armour. The first Leopard 2A7 was handed over to the German Army in Munich on 10 December 2014. A total of 14 vehicles were produced for Tank Battalion 203, plus four more going to the Armoured Corps Training Centre and one vehicle at the Technical School for Land Systems and School for Technology of the Army. The last tank remains as a reference vehicle at KMW
- **Leopard 2A7+:** The Leopard 2A7+ was first shown to the public during the Eurosatory 2010, featuring the label "Developed by KMW – tested and qualified by German MoD". The Leopard 2A7+ has been tested by the Bundeswehr under the name UrbOp (urban operations).The Leopard 2A7+ is designed to operate both in low intensity and high intensity conflicts.
- **Pz 87:** Pz 87 (standing for Panzer 87, referring to year of service entry) is the designation given to the Leopard 2A4 vehicles built under licence in Switzerland. The vehicles are essentially the same specification as the fifth and sixth production batch 2A4. This version included Swiss built communications equipment and MG 87 MGs, as well as featuring an improved NBC protection system, the installation of a hydraulic track-tensioning system, and the addition of an exhaust silencer. Late model Pz 87 included a field zeroing system, the sealing of the ammunition loading hatch, and from the 120th vehicle, the addition of heavier armoured side skirts.

System

Alternative Designation: Pz 87WE, Panzer 87 Werterhaltung

Manufacturer: Krauss-Maffei Wegmann Maschinenbau Kiel

Type: Main Battle Tank

Family: Leopard German Main Battle Tank Family

Crew: ea4

Estimated Service Life: years50

Driver Rear-View Camera: Yes

Dimensions

Length (Chassis Overall): m7.7

Width: m3.7

Height: m2.8

Weight, Combat: tons56

Ground Pressure: kg/m0.83

Automotive

Engine Name: MTU MB-837 Ka501 diesel

Engine Type: liquid-cooled V-12 twin-turbo diesel engine

Engine Power: hp1,479

RPMs: RPM2,600

Speed, Maximum Road: km/h69

Cruising Range: km550

Speed, Off Road: km/h50

Speed, Average Cross: 40

Speed Maximum Swim: km/hNot Amphibious

Fording Depth (Without Preparation): m1.0

Fording Depth (With Preparation): m4.0

Gradient: Deg60

Side Slope: Deg30

Vertical Step: m1.5

Trench: m3

Transmission: Renk HSWL 354 transmission

Fuel Capacity (Total): liters1,160

Fuel Consumption (Road): 300 liters per 100km

Fuel Consumption (Cross Country): 500 liters per 100km

Power Pack Weight: kg3,025

Snow Grousers: 3 on the left and 7 on the right

Communications

Name: Prüfzusatzbediengerät 80 (PRZB 80) radio

Type: VHF

Cable Drum (Radio): m800

Antennas Location: mounted on the turret roof, one on each side of the Machine Gun

C2: Enhanced C2 Suite, no name

Main Gun

↳*System*

Name: 120mm Rheinmetall L44 smoothbore gun

Type: 120mm Smoothbore Gun

Manufacturer: Rheinmetall

Max Rate of Fire: INA

Loader Type: Semi-automatic loading system

Basic Load: ea42 Total of any combination 120mm Projectiles

Maximum Elevation: Deg+20

Minimum Elevation: Deg-9

Frontal Arc: Deg285

Rear Arc: Deg75

Fire on the Move: Yes

Weight (Gun Mount): kg3,317

Weight (Gun Barrel): kg1,190

Length (Barrel): m5.6

Thermal Sleeve: Yes

Bore Evacuator: Centrally-mounted bore evacuator

Barrel Interior Chrome Plating: Yes, to increase wear resistance of the barrel

Effective Full Charge (EFC): rounds700

Breech Type: Threaded bayonet connection

Wedge Block Type: Downward-opening semi-automatic sliding wedge block

Breach Mechanism: Hydraulically-operated loading system

Note: The Leopard 2A4 can fire any 120mm NATO Projectile

↳*Ammunition (Option 1)*

Type: DM-13 (XM829) German Armour Piercing Fin Stabilized Discarding Sabot (APFSDS)

Caliber: mm120

Muzzle Velocity: m/s1,750

Basic Load: 42 Total of any combination 120mm Projectiles

Operational Range: mINA

Armor Penetration (Steel): mm230

Cartridge Weight: kg20

Cartridge Length: mm984

Penetrator: Tungsten alloy

Propellant (NC-NG): kg8

Accuracy/Dispersion: 0.2x0.2mil

Maximum Effective Range: m3,000

Cartridge Type: Semi-combustible cartridge

↳*Ammunition (Option 2)*

Type: DM-12 (M325) : High-Explosive Anti-Tank Multi-Purpose (HEAT-MP-T)

Caliber: mm120

Muzzle Velocity: m/s1,078

Basic Load: 42 Total of any combination 120mm Projectiles

Cartridge Weight: kg25

Cartridge Length: mm984

Fuze: PIBD, electric

High Explosive Comp. B:: kg1.8

Accuracy/Dispersion: 0.25X0.25 mil

Maximum Effective Range: m3,100

Cartridge Type: Semi-combustible cartridge

↳*Ammunition (Option 3)*

Type: DM53 120mm KE Projectile (Rheinmetall)

Caliber: mm120

Muzzle Velocity: m/s1,750

Basic Load: 42 Total of any combination 120mm Projectiles

Round Weight: kg21.4

Projectile Length: mm745

Accuracy: mil0.2

Coaxial Weapon System

↳*System*

Name: 7.5mm Mg 51 (Maschinengewehr 1951) Machine Gun

Type: mm7.5mm General Purpose Machine Gun

Manufacturer: Waffenfabrik Bern (Switzerland)

In Service: 1951-present

Weight (Gun with Bipod): kg16

Weight (Gun with Tripod): kg26

Length (Barrel): mm1,270

Length (Total): mm563

Action: Gas-operated, flapper-locked

Rate of Fire: rds/min1,000

Effective Riging Range (With Sight Adjustments): m100-2,000

Feed System: 50-round magazine belt

Sights: Iron sights, 2.3x optical sight

↳***Ammunition***

Type: Rifle

Caliber: mm7.5mm

Cartridge: 7.5×55mm Swiss,

Muzzle Velocity: m/s750

Basic Load: ea2,375

Loader's Weapon System

In Service: 1951-present

Weight (Gun with Bipod): kg16

Weight (Gun with Tripod): kg26

Length (Barrel): mm1,270

Length (Total): mm563

Action: Gas-operated, flapper-locked

Rate of Fire: rds/min1,000

Effective Riging Range (With Sight Adjustments): m100-2,000

Feed System: 50-round magazine belt

Sights: ron sights, 2.3x optical sight

↳***Ammunition***

Type: Rifle

Caliber: mm7.5

Cartridge: 7.5×55mm Swiss

Muzzle Velocity: m/s750

Basic Load: ea2,375

Fire Control

Name: Digitaler Ballistikkern (DigBal) digital FCS

Computerized FCS: Yes

Primary Sight: Hauptzielfernrohr (HZF) primary sight System

Commander's Periscope: Carl Zeis fully stabilised monocular PERI R17A2 sight

Thermal Sight Tank Commander: OPHELIOS-P, also referred to as the Thermal Imaging Module (TIM)

Thermal Sight Gunner: OPHELIOS-P, also referred to as the Thermal Imaging Module (TIM)

Primary Gun Sight: binocular HZF

Main Gun Stabilization: Hydraulic and provides dual-axis stabilisation.

Infrared: Yes

Range Finder: EMES 15 laser rangefinder (LRF).

Wind Senor: Yes

Telescope: EMES 15

Tower Sight: FERO Z18

Computer Controlled Tank Testing Set: RPP 1–8

Ballistic Compensator: Field zeroing system

Weapon Slaving System: Waffenachfuhranlage (WNA) H22 weapon slaving system

Emergency Backup Turret Sight: Turmzielfernrohr (TZF) FERO Z18

Fault Detection System: Rechnergesteuertes Panzerpufstsem (RPP 1-8) fault detection system

Field Zeroing System: Feldjustieranlage (FJA) field zeroing system

Gun Control equipment System: EWNA [Elektrische Waffennachführanlage - electric tracker]

Protection

Hull Armor: welded steel plates, with spaced multilayer passive composite armour protecting the glacis and hull sides as well as the turret front and sides.

Turret Armor: welded steel plates, with spaced multilayer passive composite armour protecting the glacis and hull sides as well as the turret front and sides.

Turret Type: All-electric turret

Applique Armor: Yes, Track Skirt

Explosive Reactive Armor: INA

Active Protection System: Yes, Dräger Safety AG & Co

Mine Clearing: Yes, taken from the Leopard 2A6M

Self-Entrenching Blade: No

NBC Protection: Yes, KGaA CBRN protection system

Smoke Equipment: MWA [Mehrfachwurfanlage] 76 mm obscurant smoke discharger system

IR Signature: IR suppressive smoke screen system

Fire Suppression System: Yes, Automatic

Grenade Launchers: Eight grenade launchers are mounted on each side of the Turret. Minor upgrade over the Pz 87.

Fire Detection and Suppression System: Yes, Kidde-Deugra Brandschutzsysteme System

Emergency Escape Hatch: Yes, below the driver's compartment

Notes:

The Pz 87 WE Leopard 2 (Werterhaltung) is the most modern version of the Pz 87. The first 2 prototypes were completed in 2003 and featured new armor packages, sighting equipment and Remote Weapon Station. However the actual Pz 87 WE did not receive the full upgrades offered by Swiss Defence Company Ruag. Instead its Battlefield management and communications capabilities were upgraded as well as a new Commanders Independent Sight installed. There are references to a new thermal imager, but is most likely only for the CIS. All work was carried out by Ruag.

M1A2 Abrams American Main Battle Tank (MBT)

Tiers:

Variants:

- **Variants and upgrades:** * XM1-FSED: Preproduction test model. Eleven Full-Scale Engineering Development test bed vehicles were produced in 1977–78. These vehicles were also called Pilot Vehicles and numbered PV-1 through PV-11. * M1: First production variant. Production began (at Chrysler) in 1979 and continued to 1985 (at General Dynamics) (3,273 built for the US). The first 110 tanks were Low Rate Initial Production (LRIP) models, still called XM1s, because they were built prior to the tank being type-classified as the M1. * M1IP (Improved Performance): Produced briefly in 1984 before the M1A1, contained upgrades and reconfigurations like new turret with thicker frontal armor, new turret is referred as "long" turret instead of older "short" turret, armor upgraded from ~650mm line of sight thickness to ~880mm (894 built for US). * M1A1: Production started in 1985 and continued to 1992, pressurized NBC system, rear bustle rack for improved stowage of supplies and crew belongings, redesigned blow-off panels and M256 120 mm smoothbore cannon (4,976 built for the U.S. Army, 221 for USMC, 59 M1A1 AIM SA sold to Australia). * M1A1HA (Heavy Armor): Added 1st generation depleted uranium armor components. Some tanks were later upgraded with 2nd generation depleted uranium armor components, and are unofficially designated M1A1HA+. * M1A1HC (Heavy Common): Added new 2nd generation depleted uranium armor components, digital engine control and other small upgrades common between Army and Marine Corps tanks. * M1A1D (Digital): A digital upgrade for the M1A1HC, to keep up with M1A2 SEP, manufactured in quantity for only 2 battalions. * M1A1 AIM v.1 (Abrams Integrated Management): A program whereby older units are reconditioned to zero hour conditions;[126] and the tank is improved by adding Forward-Looking Infra-Red (FLIR) and Far Target Locate sensors, a tank-infantry phone, communications gear, including FBCB2 and Blue Force Tracking to aid in crew situational awareness, and a thermal sight for the .50 caliber machine gun. * M1A1 AIM v.2/M1A1 SA (Situational Awareness): Upgrades similar to AIM v.1 tanks + new 3rd generation depleted uranium armor components. Configuration for the Royal Moroccan Army, which is almost identical to the Australian variant, except exportable turret armor is installed by General Dynamics Land System to replace the DU armor. * M1A1 FEP (Firepower Enhancement Package): Similar upgrade to AIM v.2 for USMC tanks. * M1A1KVT (Krasnovian Variant Tank): M1A1s that have been visually modified to resemble Soviet-made tanks for use at the National Training Center, fitted with MILES gear and a Hoffman device. * M1A1M: An export variant ordered by the Iraqi Army with depleted uranium armor removed and older thermal imaging system with lower resolution used. * M1A1 (AIDATS upgrade): Upgrade-only variant to all USMC General Dynamics M1A1 Abrams tanks to improve the tank commander's situational awareness with an upgraded thermal sight, color day camera, and a stationary color display. * M1A2 (Baseline): Production began in 1986 and entered service in 1992(77 built for the U.S. and more than 600 M1s upgraded to M1A2, 315 for Saudi Arabia, 1,005 for Egypt, 218 for Kuwait). The M1A2 offers the tank commander an independent thermal sight and ability to, in rapid sequence, shoot at two targets without the need to acquire each one sequentially, also 2nd generation depleted uranium armor components. * M1A2 SEP (System Enhancement Package): Has upgraded third-generation depleted uranium armor components with graphite coating (240 new built, 300 M1A2s upgraded to M1A2 SEP for the US, also unknown numbers of upgraded basic M1s and M1IPs, also 400 oldest M1A1s upgraded to M1A2 SEP). * M1A2S (Saudi Package): Saudi Arabian variant upgrade of the M1A2 based on M1A2 SEP, with some features, such as depleted uranium armor, believed to be missing and replaced by special armor. (442 M1A2s upgraded to M1A2S). * M1A2 SEPv2: Added Common Remotely Operated Weapon Station as standard, color displays, improved interfaces, a new operating system, improved front and side armor with ERA (TUSK kit), tank-infantry phone as standard, and an upgraded transmission for better durability. * M1A2C (SEPv3): Has increased power generation and distribution, better communications and networking, new Vehicle Health Management System (VHMS) and Line Replaceable Modules (LRMs) for improved maintenance, an Ammunition DataLink (ADL) to use airburst rounds, improved counter-IED armor package, improved FLIR using long- and mid-wave infrared, a low-profile CROWS RWS, Next Generation Armor Package (NGAP), and an Auxiliary Power Unit (APU) under armor to run electronics while stationary instead of the engine, visually distinguishing the version by a small exhaust at the left rear. More passive

ballistic protection added to the turret faces, along with new Explosive Reactive Armor mountings (Abrams Reactive Armor Tile (ARAT)) and Trophy Active Protection systems added to the turret sides. Prototypes began testing in 2015, and the first were delivered in October 2017. Fielding is expected to begin in 2020. * M1A2T: Special configuration variant of the M1A2C reportedly being offered for sale to Taiwan as of March 2019 and approved by US State Department as of July 2019. Per DSCA statement, it is roughly equivalent to M1A2C, except depleted uranium armor is replaced by FMS export armor. There is no mention of the Trophy APS system. The new-built tanks will be produced at Anniston Army Depot, Anniston, Alabama, and the Joint Systems Manufacturing Center, Lima, Ohio. * M1A2D (SEPv4): Under engineering development with delivery planned to start by 2021. The Commander's Primary Sight, also known as the Commander's Independent Thermal Viewer, and Gunner's Primary Sight will be upgraded with 3rd Gen FLIR, an improved laser rangefinder and color cameras. Additional improvements will include advanced meteorological sensors, laser warning/detection receivers, directional smoke grenade launchers and integration of the new XM1147 multi-purpose (AMP) 120mm tank round. The AN/VVR-4 laser warning receiver and ROSY rapid obscurant system have been trialed by the US Army for adoption on the Abrams tank and Bradley fighting vehicle. * M1A2-K: Under development, unique variant for the Kuwaiti Army, slated to replace Kuwait's current M1A2 fleet. * M1A3: Under research development as of 2014. Improvements are to include a lighter 120 mm gun, added road wheels with improved suspension, a more durable track, lighter-weight armor, long-range precision armaments, and infrared camera and laser detectors. The variant is believed to have a new diesel engine, instead of the gas turbine engine used in previous M1 variants * M1 TTB (Tank Test Bed): Prototype with unmanned turret, 3 crew members in armored capsule in front of the heavy armored hull, main armament was 120 mm smoothbore gun, M256 derivative or modification, mechanical loading system under turret, never fielded. * CATTB: The Component Advanced Technology Test Bed was an experimental model with a lightweight 120 mm smoothbore cannon, heavy armored turret and upgraded hull based on the M1 chassis. It had a mechanical loading system in turret bustle, a new engine and probably other upgrades, never fielded. The tank went into trials in 1987–88. * M1 Thumper: Experimental variant by Lockheed Martin, equipped with the 140 mm XM291 ATACS smoothbore cannon. Similar to the CATTB, it included a larger, elongated turret to offer protection levels comparable to the M1A2 while allowing the mounting of the larger cannon and its longer ammunition. Cancelled with the end of the Cold War, and never fielded. * M1 AGDS (Air Ground Defense System): Proposed air defence variant of the Abrams equipped with dual 35 mm Bushmaster III autocannons, 12 ADATS missiles and advanced electro-optical and radar targeting systems derived from the ADATS. It was supposed to be capable of both air defence and anti-tank purposes with the ADATS MIM-146 missiles which was a dual purpose ATGM/SAM. The proposal never saw consideration and was never developed further. * M1 Grizzly Combat Mobility Vehicle (CMV). * M1 Panther II: A remote controlled mine clearing vehicle with turret removed, mine rollers on front, and the Standardized Teleoperation System. * M104 Wolverine Heavy Assault Bridge * M1074 Joint Assault Bridge (JAB): Bridgelayer combining a heavy "scissor" bridge with the M1 Abrams chassis. Expected to reach low-rate initial production in 2019 to replace the M60 AVLB and M104 Wolverine * M1150 Assault Breacher Vehicle (ABV): Assault variant for the USMC. Based upon the M1A1 Abrams chassis, the Assault Breacher Vehicle has a variety of systems installed, such as a full-width mine plow, two linear demolition charges, and a lane-marking system. Reactive armor has been fitted to the vehicle providing additional protection against High-explosive anti-tank warhead-based weapons. The turret has been replaced by a new smaller one with two MICLIC launchers at its rear. A M2HB .50 machine gun in a remote weapons station is mounted on the commander's cupola and a bank of grenade launchers are fitted to each side of the superstructure to cover the frontal arc for self-protection. * M1 Armored Recovery Vehicle: Only a prototype produced.

System

Alternative Designation: M1A2

Type: Main Battle Tank

Crew: 4 (commander, driver, gunner, loader)

Dimensions

Length, Hull: 7.92 m

Width, with Skirts: 3.65 m

Width, without Skirts: 3.48 m

Track Length on Ground: 4.65 m

Track Width: 0.64 m

Ground Clearance, Center of Hull: 0.48 m

Ground Clearance, Sides: 0.43 m

Height: 2.89 m

Gun Length: 9.83 m

Height to Turret Roof: 2.44 m

Weight, Combat: 63,086 kg

Ground Pressure: 1.08 kg/sq cm

Automotive

Engine Name: Textron-Lycoming AGT-1500 2-spool free-shaft, multi-fuel turbine with Allied-Bendix digital electronic fuel control

Engine Type: Multi-Fuel

Engine Power: 1,500 hp at 3,000 rpm

Power-to-Weight Ratio: 23.77 hp/metric ton

Fuel Capacity: 504 gal (1,908 liters)

Transmission: Allison X-1100-3B Automatic hydro-kinetic, hydrostatic steering, 4 forward and 2 reverse gears

Suspension: advanced torsion bar, 7 road wheels with 15-in (381-mm)travel, rear drive, front idler, 3 internal rotary shock absorbers,2 return rollers

Braking: hydro-mechanical

Road Speed: 66 km/h

Speed, 10 Deg Upslope: 27 km/h

Speed, 60 Deg Upslope: 7 km/h

Acceleration: 32 km/h

Range: 426 km

Communications

Radio: single-channel ground and airborne radio system (SINCGARS)

Main Gun

↳*System*

Name: M256 smoothbore

Type: 120-mm/46-cal M256 smoothbore with fume extractor and thermal sleeve

Caliber: 120mm

Length: 5.6 m

Barrel Length: 5.3 m

Width: 728 mm

Bore: 120-mm/44-caliber, smoothbore fitted with fume extractor and thermal sleeve

Gun Weight: 1,905 kg

Barrel Weight: 1,175 kg

Recoil, Maximum: 370 mm

Recoil, Normal: 340 mm

Recoil System: 2 hydraulic buffers and 1 hydropneumatic recuperator

Breech Type: semi-automatic vertical sliding wedge

Muzzle Velocity: 1373+ m/sec

Maximum Range: 2,500+ km

Turret Type: electro-hydraulic, manual backup

Feed System: Manual

Elevation: -10/+20 deg

Traverse: 360 deg

↳***Ammunition (Option 1)***

Name: M830

Type: HEAT-MP

Caliber: mm120

Length: 981 mm

Weight: 24.2 kg

Basic Load: 42 rounds

Ammo Types: HEAT-MP-T, APFSDS-T, MPAT, STAFF

↳***Ammunition (Option 2)***

Name: M829

Type: APFSDS

Caliber: 120mm

Length: 935 mm

Weight: 18.7 kg

Basic Load: 42 Rounds

Coaxial Weapon System

↳***System***

Name: 1 x 7.26-mm M240 machine gun

Type: General-Purpose Machine Gun

Caliber: 7.72mm

Length: 1,260 mm

Barrel Length: 630 mm

Width: 120 mm

Height: (260 mm

Weight: 12.5 kg

Action: Gas-operated long-stroke piston, open bolt

Rate of Fire: M240, M240E1, M240C, M240D and M240G: Gas Setting 1: 650–750 RPM Gas Setting 2: 750–850 RPM Gas Setting 3: 850–950 RPM M240B, M240L and M240H: 550–650 RPM Barrett 240LW and 240 LWS: 550–650 RPM

Muzzle Velocity: 853 m/s

Maximum Firing Range: 3,725 m

Effective Firing Range: 800 m (875 yd) (bipod) 1,100 m (1,203 yd) (tripod)

Feed System: Belt-fed using M13 disintegrating links

Sights: Iron sights: front blade and folding rear leaf with aperture and notch

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Basic Load: 6,000 Rounds

Loader's Weapon System

Weapon: 1 x 7.62-mm M240 machine gun on Skate Mount

Basic Load: 6,000 Rounds

Commander's Weapon System

↳*System*

Name: 1 x .50-caliber M2 machine gun

Type: Heavy Machine Gun

Caliber: 12.7mm

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min (M2HB) 750–850 rounds/min (AN/M2) 1,200–1,300 rounds/min (AN/M3)

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 1,000

Fire Control

Name: INA

Computerized FCS: Yes

Ballistic Computer: Hughes 12 kilobyte digital computer

Main Gun Stabilization: Yes

Day Optics: Hughes primary stabilized sight with 3- and 10-power day optics

Night Optics: Hughes night-vision/sight with thermal imaging

Rangefinder: GEC Avionics/Kollsman eye-safe CO2 rangefinder replaces the Nd-YAG laser rangefinder

Effective Fire Range: 200 to 7,990 m

Accuracy: 10 m or less

Commander's Thermal Viewer: a Texas Instruments commander's independent thermal viewer (CITV), which permits the commander to search and independently select new targets

Driver's Thermal Viewer: Hughes driver's thermal viewer (DTV) with integrated display, a fire-control electronics unit (FCEU) that coordinates CIT stabilization, primary sight and gun-turret drive

M1A2 Upgrade: improved commander's weapon station (ICWS)

Information System: intervehicular information system (IVIS)

Navigation System: Smith Industries position navigation (POS/NAV) system

Protection

Hull Armor: Chobham-type armor on glacis and turret,armored bulkheads between turret and engine; depleted uranium armor in production since 1988

Turret Armor: INA

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: In addition to the armor, some USMC Abrams tanks are equipped with a Softkill Active protection system, the AN/VLQ-6 Missile Countermeasure Device (MCD) that can impede the function of guidance systems of some semi-active control line-of-sight (SACLOS) wire- and radio guided anti-tank missiles (such as the Russian 9K114 Shturm) and infrared homing missiles.

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: 200 SCFM-Clean Cooled Air (collective overpressure); AN/VDR-1 radiological warning device

Smoke Equipment: M250 (British L8A1) 2 x 6-barrel smoke discharger (24 rounds), engine exhaust generation

Fire Suppression: automatic detection and suppression

Fuel Cover: Allied Bendix digital electronic fuel control

Note: Enhanced survivability including better armor on gunner's primary sight (GPS) cover;

Notes:

M1A2 Abrams Main Battle Tank The M1A2 Abrams main battle tank is a further development of the M1A1. Currently it is one of the best MBTs in the world. Development of improved M1A1 began in 1988. About 1 200-1 500 M1A2 main battle tanks were delivered to the US army. Out of this number approximately 1 000 out-dated M1 main battle tanks were upgraded to the M1A2 standard. It is planned that this tank will remain in service beyond 2050. The M1A2 has been exported to Kuwait (218) and Saudi Arabia (457). Approved for production in 1990, the M1A2 represents the U.S. Army’s technological improvement of the basic M1A1 design and the most modern battle tank in the world. Outwardly similar in appearance to the M1A1, the most notable exterior changes on the M1A2 are the redesigned Commander's Weapon Station (CWS) and the addition of a Commander's Independent Thermal Viewer) on the left side of the turret forward of the loader's hatch. Internally, however, the M1A2 has been radically redesigned to take advantage of newer technology. Most notable of these improvements is the addition of the Inter-Vehicle Information System (IVIS.) The IVIS system allows for the automatic and continual exchange of information between vehicles. By incorporating information provided by an on board Position/Navigation (POSNAV) system, unit commander's can track the location and progress of subordinate elements automatically, without tasking vehicle crews. In addition enemy positions can be identified, plotted and disseminated, while reports and artillery requests can be automatically formatted, transmitted, and processed. Lastly, map graphic control measures and operational orders can be rapidly distributed via the IVIS system. To ensure information security, all IVIS data transmissions are routed through the M1A2's SINCGARS radio system. Improving on the "hunter-killer" tank commander-gunner target hand off method pioneered on the German Leopard II, the M1A2 takes this a step further by providing the Tank Commander with an independent thermal sight. This CITV sight allows the commander to independently scan for targets in all weather conditions and through battlefield obscurants. In addition to IVIS and the CITV, the M1A2 incorporates a number of additional electronic upgrades. Power distribution throughout the tank has been improved, relying on multiple bus paths so that in the event one conduit is damaged, power may still be delivered to a component via an alternate path. The driver's instrument display has been upgraded to a more detailed digital display and the Gunner's Primary Sight has been stabilized in two axes for increased accuracy. Approved for implementation in 1995, the M1A2 SEP (System Enhancement Package) is a technology upgrade and standardization program, whereby the Army's fleet of M1s and M1A2s will all be brought to a common standard. Most notable among the modifications will be the introduction of a standard under armor auxiliary power unit and the addition a crew compartment air conditioning and cooling unit. Other modifications within the vehicle will include upgrades to the IVIS system (color display, full size keyboard, digital mapping and graphics generation capability, and voice recognition capabilities), upgrades to the Gunner's Primary Sight assembly, and improvement in the tank's intercom and radio communications systems. Production of the M1A2 was halted after the initial run of 627 vehicles. As part of the fleet upgrade program, 547 of the Army's current inventory of M1s are being upgraded to M1A2 SEP standards, which will require the complete remanufacturing of the turret, while the current fleet of M1A2s will undergo a retrofit to bring them up to SEP standards.

Pokpung-ho North Korea Main Battle Tank (MBT)

Tiers:

Variants:

- **Pokpung-Ho I:** The initial variant. Armed with the 115 mm 2A20 gun from the T-62 series and equipped with applique and spaced armor. First observed publicly during the spring of 2010.
- **Pokpung-Ho II:** A variant with heavily improved armament and protection, the Pokpung-Ho II mounts a 125 mm 2A26/46 smoothbore gun and has a new turret seemingly augmented with composite armour. ERA was also fitted on the front glacis. First observed publicly during the October 10, 2010 military parade. SA-7 MANPADS can also be fitted.
- **Pokpung-Ho III:** Currently the most advanced variant of the Pokpung-Ho, this version possesses most of the traits of the Pokpung-Ho II but has additional reactive armour on the turret front and forward part of the turret roof.
- **Pokpung-Ho IV:** An upgrade of the Pokpong-Ho I rather than II or III. 2 AT-14 Spriggan launchers fitted above main armament and 1 SA-16 MANPADS fitted on the turret rear.

System

Alternative Designation: Pokpung-ho; Chonma-Ho 215-216

Type: Main Battle Tank

Manufacturer: Ryu Kyong-su Tank Factory

Crew: ea4

Dimensions

Length: m7

Width: m3.5

Height: m2.2

Weight, Combat: tons44.3

Engine Name: INA

Engine Type: 12 cylinder diesel engine

Engine Power: hp1,000

Cruising Range: km370-500

Speed, Maximum Road: km/h60

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Fording Depth: mINA

Main Gun (Option 1)

↳*System*

Name: Chonma-216 (2A46)

Type: 125mm Gun

Length: 6350 mm

Weight: 2675 kg

Muzzle Velocity: APDS: 1715-1800 m/s HEAT: 905-950 m/s HE: 760 m/s

Effective Firing Range: APDS / HEAT: 3000 m HE: 4000 m ATGM: 5000 m

↳*Ammunition (Option 1)*

Name: 3VBM3

Type: APFSDS

Caliber: mm125

Basic Load: INA

Armor Penetration: 140mm

Effective Firing Range: m3,000

↳*Ammunition (Option 2)*

Name: 3VBK7

Type: HEAT

Caliber: mm125

Baslic Load: INA

Armor Penetration: 220mm

Effective Firing Range: m3,000

Main Gun (Option 2)

↳*System*

Name: Chonma-215 (2A20)

Type: 115mm Gun

Caliber: mm115

Barrel Length: m6.05

Rate of Fire: 6–10/minute

Muzzle Velocity: m/s1,600

Effective Firing Range: 2,000 m-high target – 1,870 m; 3 m-high target – 2,260 m; 4,000 m AT-12 missile.

↳*Ammunition*

Name: 3VBM-1

Type: APFSDS

Caliber: mm115

Cartridge: 115 x 728 mmR

Basic Load: INA

Armor Penetration: INA

Secondary Weapon System

Note: The Pokpung-Hu can be equipped with a variety of secondary weapons to include: * 14.5 mm KPVT heavy anti-aircraft machine gun (300 rounds), * 7.62 mm PKT (Chonma-215/216) * Dual AGS-30 automatic grenade launcher, * Dual Bulsae-3, * Dual Igla MANPADS, * 7.62 mm PKT (Chonma mod.2017)

↳*System*

Name: AGS-30

Type: Automatic Grenade Launcher

Caliber: mm30

Manufacturer: ZID

Proliferation: Widely Proliferated.

In Service: 1990-Present

Length: 1,165 mm

Weight, Unloaded: kg16

Action: Blowback

Rate of Fire: 400 round/min

Muzzle Velocity: m/s185

Effective Firing Range: 2,100 m

Feed System: 29 grenades belt

Sights: Adjustable telescopic sight, day-night sight, mechanical sight, portable radar

Note: Main service grenade launcher in the Russian Armed Forces. Completely replaced complex AGS-17

↳***Ammunition***

Name: VOG-17M

Type: HE

Caliber: mm30

Basic Load: 200 Rounds

Armor Penetration: INA

Available Ammunition Options: VOG-17M (HE) IO-30 (HE) IO-30TP (Practice) VOG-30 (HE) VOG-30D (HE) VUS-30 (Smoke) GPD-30 (HE)

Anti-Tank Guided Missile

Note: The Pokpung-ho is also reported to be equipped with the following ATGMs: * Dual Bulsae-3 (9M133 Kornet) * Dual Igla MANPADS

Fire Control

Name: The fire control system of the P'okp'ung-ho is relatively modern and based on the presence of a meteorological mast is almost certainly computerized, and some reports claim that it may be based on the Chieftain FCS, which Iran may have illegally exchanged for North Korean technology.

Computerized FCS: Possibly

Day and Night Sighting System: If the P'okp'ung-ho's FCS is based on the T-72's, it may implement the PNK-3 or PNK-4 day and night sighting system with the 1K13-49 periscope combined passive/active sight guidance system. However the night sighting system is most likely to be the same with obsolete T-62. The quality of the equipment are likely inferior to the South Korean counterparts.

Infrared Sensor: TPN-3-49 or TPN-4)

Main Gun Stabilization: INA

Laser Rangefinder: Yes

Searchlight: Yes

Note: Although the quality of the equipment are likely inferior to the South Korean counterparts, the P'okp'ung-ho is believed to be a considerable threat at medium/short range engagements, although lacking when firing from long ranges at night

Protection

Hull Armor: Although the engine compartment and the layout show some resemblance to a T-72 hull, the chassis is basically a heavily modified version of T-62, with greater length and an additional pair of road wheels. Maximum estimated armor thickness without ERA - 500 mm vs HEAT.

Turret Armor: The turret is reinforced with wedge-shaped armor modules in Pokpung-Ho I and seems to be protected by composite armour similar to the later export variant T-72M1 in Pokpung-Ho II with ERA added in Pokpung-Ho III.

Applique Armor: Available

Explosive Reactive Armor: Optional

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The P'okp'ung-ho or spelled Pokpung-ho (Korean: □□□) is a North Korean main battle tank (MBT) developed in the 1990s. The tank may incorporate technology found in the T-62, T-72, and Ch'onma-ho MBTs. Outside parties codename the tank M-2002 because the tank went through performance trials on February 16, 2002 (therefore being officially confirmed by outside sources), although the tank may have been in existence since 1992. The P'okp'ung-ho is only known to be used in North Korea. Unclassified images of the P'okp'ung-ho finally surfaced in 2010, which showed the tank design appeared to be developed from the later models of the Chonma-ho and influenced by the T-72. The P'ok'pung-ho has better mobility, survivability and firepower than the Ch'onma-ho. Capabilities of the tank have been speculated to be nearly identical to T-90, however the limited access to technical information regarding the P'okp'ung-ho makes accurate comparisons difficult. The P'okp'ung-ho's primary armament was almost certainly the 2A20 115mm gun in early examples; however, later versions seemed to be armed with the 2A26/2A46 125mm smoothbore gun, which fires AP rounds produced in North Korea. The tank also has a heavy KPV anti-aircraft machine gun and a coaxial machine gun, as well as four smoke grenade launchers on the each side of the turret. The tank does not have the capability to fire ATGMs from its main gun. A model displayed at an April 2017 parade was equipped with two MANPADS launchers at the rear of the turret, two ATGM launchers mounted on the left side of the turret, and twin automatic grenade launchers mounted on the right side of commander hatch. Although the engine compartment and the layout show some resemblance to a T-72 hull, the chassis is basically a heavily modified version of T-62, with greater length and an additional pair of road wheels. The glacis plate of the Pokpung-ho is heavily sloped and protected by appliqué armor in the initial version with ERA added in later versions. The turret is reinforced with wedge-shaped armor modules in Pokpung-Ho I and seems to be protected by composite armour similar to the later export variant T-72M1 in Pokpung-Ho II with ERA added in Pokpung-Ho III. The panels along the tracks seem to be made of a light laminar armour. Although the horsepower of the P'okp'ung-ho's engine has been speculated to be as high as 1500, the engine is likely to have around 1000-1100 horsepower. It has been reported that North Korea rejected developing the 1,250 hp (930 kW) engine of the T-80, judging that it would not be suitable for a tank engagement within the narrow, mountainous terrain of Korea, and that it would prove to be of little difference on defensive missions. During aggressive missions, the P'okp'ung-ho can quickly engage the enemy due to its already excellent speed and acceleration, which is the basis of North Korean tank tactics. The fire control system of the P'okp'ung-ho is relatively modern and based on the presence of a meteorological mast is almost certainly computerized, and some reports claim that it may be based on the Chieftain FCS, which Iran may have illegally exchanged for North Korean technology. If the P'okp'ung-ho's FCS is based on the T-72's, it may implement the PNK-3 or PNK-4 day and night sighting system with the 1K13-49 periscope combined passive/active sight guidance system.[3] However the night sighting system is most likely to be the same with obsolete T-62. The quality of the equipment are likely inferior to the South Korean counterparts. The P'okp'ung-ho also has an infrared sensor (TPN-3-49 or TPN-4), a laser rangefinder and a search light, all of which allow the P'okp'ung-ho to operate during the night. Although the quality of the equipment are likely inferior to the South Korean counterparts, the P'okp'ung-ho is believed to be a considerable threat at medium/short range engagements, although lacking when firing from long ranges at night.

T-72A Russian Main Battle Tank (MBT)

Tiers:

Parent:

T-72 Russian Main Battle Tank (MBT)

Variants:

- **T-72B:** Second Russian main variant of the T-72 after the T-72A.
- **T-72B1:** In 1986, a limited production variant without an ATGM launch capability. Some do not have ERA.
- **T-72BK:** The Commander's variant with additional radios.
- **T-72BM:** Russian T-72B upgrade with 2nd gen ERA. The system is fielded, available for export, and upgraded. Tier 2 and some Tier 3 tanks can challenge US forces under favorable conditions when using modern ammunition and employed by well-trained units with sound tactics. A variety of upgrades are available for the T-72B. They include protection upgrades, such as improved ERA, APS, defensive aids suites with IR jammers, plate armor, welded turret, and grill armor around tracks and grill. Mobility upgrades include a new power train, improved steering, improved mine plows and rollers, and electronic mine spoofing system. Fire control system upgrades include new sights, gun, ammunition, and improved stabilization. With the expanding number of upgrades offered by former Warsaw Pact, Asian, Israeli, and other firms, most T-72-type tanks have some level of upgrade from the basic T-72 MBT. The more affordable upgrade approach for most countries is to execute specific upgrades during maintenance work. But this approach may result in only partially modernized tanks at any one point in the life of the vehicle, and which are not as modern as more recent competitors. An alternative is to produce modernized tanks in small numbers, resulting in high per-unit production costs.
- **T-72BU:** Upgrade variant with the fire control system from the T-80U as well as well as a variety of other changes.
- **T-72BU renamed T-90:** With the limited market for new tanks, the world tank industry has developed upgrades and whole vehicle upgrade packages to tap into the market. Older T-72 tanks can be brought up to the T-72B standard. Some approach the T-90 standard. Most T-72-type tanks fielded reflect some level of upgrade. Upgrade options are expanding from former Warsaw Pact, Asian, Israeli, and other international firms.
- **T-72S / Shilden:** Russian export T-72A upgraded to the T-72B standard. Although visually similar to T-72B, it has slightly less chassis and turret protection. Former Warsaw Pact countries such as Slovakia and Middle Eastern countries like Iran have upgraded their tanks to the T-72S standard.
- **M-84AB1:** Yugoslav upgrade to the M-84, bringing it close to the T-90, and the latest T-72B improved tanks.
- **M-95 Degman:** Croatian M-84 upgrade with box composite armor, ERA, 1200hp and thermal FCS. An export upgrade conversion, AKA M-84D, is offered for Kuwaiti M-84A tanks.
- **PT-91:** Polish upgrade tanks with ERA, Drawa improved FCS, Savan-5 thermal sight, improved gun stabilization, and countermeasures.
- **PT-91M:** Has a 1000hp engine, new guns and FCS, armor changes, and other improvements. PT-91M exported to Singapore. PT-91P is designed for export to Peru.
- **T-72M1:** Demonstrator with 2nd generation ERA and other upgrades were displayed at military shows.
- **T-72M1M:** Includes 3rd generation Relikt ERA and optional Arena Active Protection System (APS). Alternative designations: Rogata and SMT M1988. It is almost the same as the T-72S (Export), except more ERA on the side skirts.
- **AJEYA MK 2:** India is upgrading T-72A tanks close to a Bhishma (T-90S) standard.

System

Alternative Designation: T-72A; SMT 1980/2; SMT 1981/3; Objekt 174; Ural; Dolly Parton (Synonyms)

In Service: 1978 to present

Manufacturer: Uralvagonzavod

Type: Main Battle Tank (MBT)

Family: INA

Crew: ea3

Passenger Capacity: INA

Maximum Effective Range: m500

Note: The T-72A can be discerned from the original T-72 by investigating the right of the turret, where the T-72A lacks a port for the rangefinder, additionally, the front of the T-72A's turret is almost vertical, as opposed to an incline on the original vehicle.

Dimensions

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳***System***

Name: 9K119 SVIR / AT-11

Type: Laser Guided Anti-tank guided missile launcher

Manufacturer: KBP Instrument Design Bureau

Caliber: mm125

Round Type: 3UBK20 round

Guidance System: 9M119M Laser Guided Missile

Voltage Converter: 9S831 voltage converter.

Tracking System: IK13 tracker

Basic Load: ea6

Hit Probability: %80

Sight Assembly: coded laser guidance beam 1K13-49

Gunner's Night Sight: TPN-1-49 secondary night sight.

Fire Control System: 1A40-1

Penetration: up to 700mm of armor

Warhead Weight (HEAT): kg4.2

Laser Emitter: 1K13 sight's laser

Onboard Guidance System: Yes

Maximum Effective Range: m4,000

Coaxial Weapon System

↳***System***

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650-750

Effective Rate of Fire: rds/min250

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length: mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.60

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea2,000

Effective Range (Iron Sights): m1,000

Effective Range (with Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Secondary Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: 12.7 Anti-Aircraft Machine Gun

Proliferation: over 1 Million

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Weight (Gun Only): kg25

Muzzle Velocity: m/s845

Length (Total): mm1,560

Max Rate of Fire: rds/min700-800

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Action: Gas Operated

Maximum Elevation: deg+75

Minimum Elevation: deg-4

Sights: Iron Sights

Feed System: 50-Round Belt

↳*Ammunition*

Type: Rifle

Caliber: mm12.7x108

Muzzle Velocity: m/s845

Basic Load: ea300

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Fire Control

Name: 1A40-1

Computerized FCS: Yes, Electric FCS

Thermal Sight Tank Commander: Yes, TPNZ-49

Thermal Sight Gunner: 1K13-49

Main Gun Stabilization: 2Eh28M electrohydraulic system

Range, Day Sight: m5,000

Range, Thermal Sight: m1,000

Infrared: Yes

Gyrocompass: GPK-59 gyrocompass

Searchlight: L-4A "Luna" IR searchlight

Collimator Sight: K10T collimator sight

Periscopes: two TNPO-160 prismatic periscopes

Laser Rangefinder: Yes

Protection

Hull Armor: Steel and composite armour with ERA, equivalent to 500-600 mm of Rolled Homogenous Armor (RHA)

Turret Armor: Steel and composite armour with ERA, 500 mm against APFSDS projectiles and to 560 mm against HEAT weapons.

Applique Armor: Available, Turret top and track skirts

Explosive Reactive Armor: Yes, Kontakt-5

Active Protection System: Yes, ZETS11-3 Control System

Mine Clearing: Yes, Roller and plow (optional)

Self-Entrenching Blade: Yes, built in Dozer Blade

NBC Protection: Yes, System Sensor Radiation Device and chemical intelligence (PRRM).

Grenade Launcher: Yes, twelve 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.

Grenade Maximum Effective Range: m200-300

Grenade Smoke Screen Size: 30 m wide and 10 m high for 60 seconds per grenade.

Engine Smoke Screen Capable: Yes

IR Signature: INA

Automatic Fire Extinguishing Equipment.: Yes

Notes:

The T-72A is the second generation of Soviet-made main battle tank MBT in the T-72 family. The first version of the T-72 entered production in 1970. It is a further development of the T-62 with some features of the T-64A (upgraded version of basic T-64) and has been further developed as the T-90. The T-72A was accepted for service with the Russian army in June 1979 and is a further development of the standard MBT T-72. The T-72 was the most common tank used by the Soviet Army from the 1970s to the collapse of the Soviet Union. It was also exported to other Warsaw Pact countries, as well as Finland, India, Iran, Iraq, Syria and Yugoslavia, as well as being copied elsewhere, both with and without licenses. T-72A (1979) Added laser rangefinder and electronic fire control, turret front and top being heavily reinforced with composite armour (nicknamed Dolly Parton by US intelligence), provisions for mounting reactive armor, smoke grenade launchers, flipper armour mount on front mudguards, internal changes. T-72 Uralvagonzavod produced the first prototype with a 125-mm gun and V-45K engine in 1968 as "Object 172". After intensive comparative testing with the T-64A, Object 172 was re-engineered in 1970 to deal with some minor problems. However, being only a mobilization model, serial production of Object 172 was not possible in peacetime. In an unclear political process decree number 326-113 was issued, which allowed the production of Object 172 in the Soviet Union from 1 January 1972, and freed Uralvagonzavod from the T-64A production. The first batch was built as "Object 172M" and, after some modifications, it was tested again in 1973 and accepted into service as the "T-72" under Soviet ministry directive number 554-172 dated 7 August 1973. At least some technical documentation on the T-72 is known to have been passed to the CIA by the Polish Colonel Ryszard Kukliński between 1971 and 1982. In 2018, the 3rd Central Research Institute in Moscow had tested a proof-of-concept demonstration for robotic tank mobility, and was planning to further develop it based on the T-72B3 and other platforms.

M60 American Main Battle Tank (MBT)

Tiers:

Variants:

- **Note:** There are over 50 Variants of the M60 Main Battle Tank

System

Alternative Designation: M60 Main Battle Tank
Type: Main Battle Tank
In Service: 1959-Present
Crew: 4 (commander, gunner, loader, driver)

Dimensions

Length, Hull: 6.95 m
Length, Gun Forward: 9.44 m
Width: 3.63 m
Height: 3.27 m
Tracks, Length on Ground: 4.24 m
Tracks Width: 0.71 m
Ground Pressure: 0.46 m
Weight, Unloaded: 48,680 kg
Weight, Combat: 52,620 kg
Ground Pressure: 0.87 kg/cm sq

Automotive

Engine Name: 1 x Continental AVDS-1790-2C
Engine Type: 1,790-cu in (29.34-liter) air-cooled, 4-stroke, V-12 multi-fuel
Engine Power: 750 hp at 2,400 rpm
Power-to-Weight Ratio: 14.24 hp/metric ton
Fuel Capacity: 375 gal (1,420 liters)
Transmission: Allison CD-850-6/6A powershift crossdrive; 2 forward/1 reverse gears
Suspension: torsion bar, 6 road wheels, rear drive, front idler, 3 shock absorbers, 3 track return rollers
Range: 480 km
Speed: 48 km/h
Vertical Obstacle: 0.91 m
Trench: 2.59 m
Fording without Preparation: 1.22 m
Fording with Preparation: 2.40 m
Gradiant: 60 %
Side Slope: 30 %

Main Gun

↳*System*

Name: 1 x 105-mm/51-cal M68 rifled gun with fume extractor and thermal sleeve
Type: 105mm Rifled Gun
Caliber: 105mm
Length: 5.89 m
Barrel Length: 52 calibres (5.46 m or 17.9 ft)
Weight: 1,282 kg
Rate of Fire: 10 rounds per minute (maximum)
Maximum Range: 4,000 m
Elevation: -10/+20-deg
Traverse: 360-deg

↳*Ammunition*

Type: Rifle Projectile
Caliber: mm105
Shell: INA
Shell Weight: INA
Basic Load: 63 Rounds

Coaxial Weapon System

↳*System*

Name: 1 x 7.62mm M240 Machine Gun
Type: General-Purpose Machine Gun
Length: 1,260 mm
Barrel Length: 630 mm
Width: 120 mm
Height: 260 mm
Weight: 12.5 kg
Action: Gas-operated long-stroke piston, open bolt
Rate of Fire: M240, M240E1, M240C, M240D and M240G: Gas Setting 1: 650–750 RPM Gas Setting 2: 750–850 RPM Gas Setting 3: 850–950 RPM M240B, M240L and M240H: 550–650 RPM Barrett 240LW and 240 LWS: 550–650 RPM
Muzzle Velocity: 853 m/s
Maximum Firing Range: 3,725 m
Effective Firing Range: 800 m (875 yd) (bipod) 1,100 m (1,203 yd) (tripod)
Feed System: Belt-fed using M13 disintegrating links
Sights: Iron sights: front blade and folding rear leaf with aperture and notch

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×51mm NATO
Basic Load: 6,000 Rounds

Auxiliary Weapon System

↳*System*

Name: M85 Machine Gun
Type: Heavy Machine Gun
Caliber: 12.7mm
In Service: INA
Manufacturer: INA
Proliferation: INA
Length: 1,384.3 mm)
Weight: 29.5 kg
Action: Recoil-operated
Rate of Fire: 400-625 rd/min

Muzzle Velocity: 880.0 m/s

Maximum Firing Range: 6,702.6 m

Effective Firing Range: 1,999.8 m

Feed System: Belt Feed, left or right hand

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7mm

Cartridge: 12.7×99mm NATO (.50 BMG)

Basic Load: Rifle

Fire Control

Name: INA

Computerized FCS: M21 solid-state analog ballistic

Thermal Sight Tank Commander: Texas Instruments AN/VSG-2 tank thermal inder and Mercury-Cadmium-Telluride (HgCdTe) IR detector for passive night and dust vision.

Thermal Sight Gunner: Texas Instruments AN/VSG-2 tank thermal inder and Mercury-Cadmium-Telluride (HgCdTe) IR detector for passive night and dust vision.

Main Gun Stabilization: INA

Rangefinder: ughes AN/VVG-2 ruby laser rangefinder usable by both commander and gunner

Protection

Hull Armor: Upper Glacis: M60: 3.67 in (93 mm) at 65° 8.68 in (220 mm) LoS

Turret Armor: M60: equals 7 in (180 mm)

Applique Armor: Available.

Explosive Reactive Armor: INA

Active Protection System: No

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: exhaust smoke generating system; 6-barrel smoke dischargers on turret sides

Notes:

The M60 is an American second generation main battle tank (MBT). It was officially standardized as the Tank, Combat, Full Tracked: 105-mm Gun, M60 in March 1959. Although developed from the M48 Patton, the M60 series was never officially classified as a member of the Patton tank family, but as a "product-improved descendant" of the Patton tank's design. The United States fully committed to the Main Battle Tank doctrine in 1963 when the Marine Corps retired the last (M103) heavy tank battalion. The M60 tank series became America's primary main battle tank during the Cold War. Over 15,000 M60s were built by Chrysler. Hull production ended in 1983, but 5,400 older models were converted to the M60A3 variant ending in 1990. It reached operational capability with fielding to US Army units in Europe beginning in December 1960. The first combat usage of the M60 was with Israel during the 1973 Yom Kippur War where it saw service under the "Magach 6" designation, performing

well in combat against comparable tanks such as the T-62. In 1982 the Israelis once again used the M60 during the 1982 Lebanon War, equipped with upgrades such as explosive reactive armor to defend against guided missiles that proved very effective at destroying tanks. The M60 also saw use in 1983 with Operation Urgent Fury, supporting US Marines in an amphibious assault into Grenada. M60s delivered to Iran also served in the Iran–Iraq War. The United States' largest deployment of M60s was in the 1991 Gulf War, where the US Marines equipped with M60A1s effectively defeated Iraqi armored forces, including T-72M tanks. The United States readily retired the M60 after Operation Desert Storm, with the last units being retired from active service in 1997. M60-series vehicles continue in front-line service with a number of countries' militaries, though most of these have been highly modified and had their firepower, mobility and protection upgraded to increase their combat effectiveness on the modern battlefield. The M60 underwent many updates over its service life. The interior layout, based on the design of the M48, provided ample room for updates and improvements, extending the vehicle's service life for over four decades. It was widely used by the US and its Cold War allies, especially those in NATO, and remains in service throughout the world today, despite having been superseded by the M1 Abrams in the US military. The tank's hull also developed a wide variety of prototypical, utility and support vehicles such as armored recovery vehicles, bridge layers and combat engineering vehicles. As of 2015 Egypt is the largest operator with 1,716 upgraded M60A3s, Turkey is second with 866 upgraded units in service, and Saudi Arabia is third with over 650 units.

M1A2S Saudi Arabian Main Battle Tank

Tiers:

Variants:

- **Variants and upgrades:** * XM1-FSED: Preproduction test model. Eleven Full-Scale Engineering Development test bed vehicles were produced in 1977–78. These vehicles were also called Pilot Vehicles and numbered PV-1 through PV-11. * M1: First production variant. Production began (at Chrysler) in 1979 and continued to 1985 (at General Dynamics) (3,273 built for the US). The first 110 tanks were Low Rate Initial Production (LRIP) models, still called XM1s, because they were built prior to the tank being type-classified as the M1. * M1IP (Improved Performance): Produced briefly in 1984 before the M1A1, contained upgrades and reconfigurations like new turret with thicker frontal armor, new turret is referred as "long" turret instead of older "short" turret, armor upgraded from ~650mm line of sight thickness to ~880mm (894 built for US). * M1A1: Production started in 1985 and continued to 1992, pressurized NBC system, rear bustle rack for improved stowage of supplies and crew belongings, redesigned blow-off panels and M256 120 mm smoothbore cannon (4,976 built for the U.S. Army, 221 for USMC, 59 M1A1 AIM SA sold to Australia). * M1A1HA (Heavy Armor): Added 1st generation depleted uranium armor components. Some tanks were later upgraded with 2nd generation depleted uranium armor components, and are unofficially designated M1A1HA+. * M1A1HC (Heavy Common): Added new 2nd generation depleted uranium armor components, digital engine control and other small upgrades common between Army and Marine Corps tanks. * M1A1D (Digital): A digital upgrade for the M1A1HC, to keep up with M1A2 SEP, manufactured in quantity for only 2 battalions. * M1A1 AIM v.1 (Abrams Integrated Management): A program whereby older units are reconditioned to zero hour conditions;[126] and the tank is improved by adding Forward-Looking Infra-Red (FLIR) and Far Target Locate sensors, a tank-infantry phone, communications gear, including FBCB2 and Blue Force Tracking to aid in crew situational awareness, and a thermal sight for the .50 caliber machine gun. * M1A1 AIM v.2/M1A1 SA (Situational Awareness): Upgrades similar to AIM v.1 tanks + new 3rd generation depleted uranium armor components. Configuration for the Royal Moroccan Army, which is almost identical to the Australian variant, except exportable turret armor is installed by General Dynamics Land System to replace the DU armor. * M1A1 FEP (Firepower Enhancement Package): Similar upgrade to AIM v.2 for USMC tanks. * M1A1KVT (Krasnovian Variant Tank): M1A1s that have been visually modified to resemble Soviet-made tanks for use at the National Training Center, fitted with MILES gear and a Hoffman device. * M1A1M: An export variant ordered by the Iraqi Army with depleted uranium armor removed and older thermal imaging system with lower resolution used. * M1A1 (AIDATS upgrade): Upgrade-only variant to all USMC General Dynamics M1A1 Abrams tanks to improve the tank commander's situational awareness with an upgraded thermal sight, color day camera, and a stationary color display. * M1A2 (Baseline): Production began in 1986 and entered service in 1992(77 built for the U.S. and more than 600 M1s upgraded to M1A2, 315 for Saudi Arabia, 1,005 for Egypt, 218 for Kuwait). The M1A2 offers the tank commander an independent thermal sight and ability to, in rapid sequence, shoot at two targets without the need to acquire each one sequentially, also 2nd generation depleted uranium armor components. * M1A2 SEP (System Enhancement Package): Has upgraded third-generation depleted uranium armor components with graphite coating (240 new built, 300 M1A2s upgraded to M1A2 SEP for the US, also unknown numbers of upgraded basic M1s and M1IPs, also 400 oldest M1A1s

upgraded to M1A2 SEP). * M1A2S (Saudi Package): Saudi Arabian variant upgrade of the M1A2 based on M1A2 SEP, with some features, such as depleted uranium armor, believed to be missing and replaced by special armor. (442 M1A2s upgraded to M1A2S). * M1A2 SEPv2: Added Common Remotely Operated Weapon Station as standard, color displays, improved interfaces, a new operating system, improved front and side armor with ERA (TUSK kit), tank-infantry phone as standard, and an upgraded transmission for better durability. * M1A2C (SEPv3): Has increased power generation and distribution, better communications and networking, new Vehicle Health Management System (VHMS) and Line Replaceable Modules (LRMs) for improved maintenance, an Ammunition DataLink (ADL) to use airburst rounds, improved counter-IED armor package, improved FLIR using long- and mid-wave infrared, a low-profile CROWS RWS, Next Generation Armor Package (NGAP), and an Auxiliary Power Unit (APU) under armor to run electronics while stationary instead of the engine, visually distinguishing the version by a small exhaust at the left rear. More passive ballistic protection added to the turret faces, along with new Explosive Reactive Armor mountings (Abrams Reactive Armor Tile (ARAT)) and Trophy Active Protection systems added to the turret sides. Prototypes began testing in 2015, and the first were delivered in October 2017. Fielding is expected to begin in 2020. * M1A2T: Special configuration variant of the M1A2C reportedly being offered for sale to Taiwan as of March 2019 and approved by US State Department as of July 2019. Per DSCA statement, it is roughly equivalent to M1A2C, except depleted uranium armor is replaced by FMS export armor. There is no mention of the Trophy APS system. The new-built tanks will be produced at Anniston Army Depot, Anniston, Alabama, and the Joint Systems Manufacturing Center, Lima, Ohio. * M1A2D (SEPv4): Under engineering development with delivery planned to start by 2021. The Commander's Primary Sight, also known as the Commander's Independent Thermal Viewer, and Gunner's Primary Sight will be upgraded with 3rd Gen FLIR, an improved laser rangefinder and color cameras. Additional improvements will include advanced meteorological sensors, laser warning/detection receivers, directional smoke grenade launchers and integration of the new XM1147 multi-purpose (AMP) 120mm tank round. The AN/VVR-4 laser warning receiver and ROSY rapid obscurant system have been trialed by the US Army for adoption on the Abrams tank and Bradley fighting vehicle. * M1A2-K: Under development, unique variant for the Kuwaiti Army, slated to replace Kuwait's current M1A2 fleet. * M1A3: Under research development as of 2014. Improvements are to include a lighter 120 mm gun, added road wheels with improved suspension, a more durable track, lighter-weight armor, long-range precision armaments, and infrared camera and laser detectors. The variant is believed to have a new diesel engine, instead of the gas turbine engine used in previous M1 variants * M1 TTB (Tank Test Bed): Prototype with unmanned turret, 3 crew members in armored capsule in front of the heavy armored hull, main armament was 120 mm smoothbore gun, M256 derivative or modification, mechanical loading system under turret, never fielded. * CATTB: The Component Advanced Technology Test Bed was an experimental model with a lightweight 120 mm smoothbore cannon, heavy armored turret and upgraded hull based on the M1 chassis. It had a mechanical loading system in turret bustle, a new engine and probably other upgrades, never fielded. The tank went into trials in 1987–88. * M1 Thumper: Experimental variant by Lockheed Martin, equipped with the 140 mm XM291 ATACS smoothbore cannon. Similar to the CATTB, it included a larger, elongated turret to offer protection levels comparable to the M1A2 while allowing the mounting of the larger cannon and its longer ammunition. Cancelled with the end of the Cold War, and never fielded. * M1 AGDS (Air Ground Defense System): Proposed air defence variant of the Abrams equipped with dual 35 mm Bushmaster III autocannons, 12 ADATS missiles and advanced electro-optical and radar targeting systems derived from the ADATS. It was supposed to be capable of both air defence and anti-tank purposes with the ADATS MIM-146 missiles which was a dual purpose ATGM/SAM. The proposal never saw consideration and was never developed further. * M1 Grizzly Combat Mobility Vehicle (CMV). * M1 Panther II: A remote controlled mine clearing vehicle with turret removed, mine rollers on front, and the Standardized Teleoperation System. * M104 Wolverine Heavy Assault Bridge * M1074 Joint Assault Bridge (JAB): Bridgelayer combining a heavy "scissor" bridge with the M1 Abrams chassis. Expected to reach low-rate initial production in 2019 to replace the M60 AVLB and M104 Wolverine * M1150 Assault Breacher Vehicle (ABV): Assault variant for the USMC. Based upon the M1A1 Abrams chassis, the Assault Breacher Vehicle has a variety of systems installed, such as a full-width mine plow, two linear demolition charges, and a lane-marking system. Reactive armor has been fitted to the vehicle providing additional protection against High-explosive anti-tank warhead-based weapons. The turret has been replaced by a new smaller one with two MICLIC launchers at its rear. A M2HB .50 machine gun in a remote weapons station is mounted on the commander's cupola and a bank of grenade launchers are fitted to each side of the superstructure to cover the frontal arc for self-protection. * M1 Armored Recovery Vehicle: Only a prototype produced.

System

Alternative Designation: M1A2S

Type: Main Battle Tank

Crew: 4 (commander, driver, gunner, loader)

M1A2S Upgrades: a new computerized mass-memory unit; color maps and displays; enhanced Army Force XXI digital command and control capabilities; a second-generation, forward-looking IR (FLIR) system for the gunner and commander;user-friendly soldier/machine interface (SMI); under-armor auxiliary power unit (UAAPU);

Dimensions

Length, Hull: 7.92 m

Width, with Skirts: 3.65 m

Width, without Skirts: 3.48 m

Track Length on Ground: 4.65 m

Track Width: 0.64 m

Ground Clearance, Center of Hull: 0.48 m

Ground Clearance, Sides: 0.43 m

Height: 2.89 m

Gun Length: 9.83 m

Height to Turret Roof: 2.44 m

Weight, Combat: 63,086 kg

Ground Pressure: 1.08 kg/sq cm

Automotive

Engine Name: Textron-Lycoming AGT-1500 2-spool free-shaft, multi-fuel turbine with Allied-Bendix digital electronic fuel control

Engine Type: Multi-Fuel

Engine Power: 1,500 hp at 3,000 rpm

Power-to-Weight Ratio: 23.77 hp/metric ton

Fuel Capacity: 504 gal (1,908 liters)

Transmission: Allison X-1100-3B Automatic hydro-kinetic, hydrostatic steering, 4 forward and 2 reverse gears

Suspension: advanced torsion bar, 7 road wheels with 15-in (381-mm)travel, rear drive, front idler, 3 internal rotary shock absorbers,2 return rollers

Braking: hydro-mechanical

Road Speed: 66 km/h

Speed, 10 Deg Upslope: 27 km/h

Speed, 60 Deg Upslope: 7 km/h

Acceleration: 32 km/h

Range: 426 km

Auxiliary Power Unit: under-armor auxiliary power unit (UAAPU)

Communications

Radio: single-channel ground and airborne radio system (SINCGARS)

Main Gun

↳*System*

Name: M256 smoothbore

Type: 120-mm/46-cal M256 smoothbore with fume extractor and thermal sleeve

Caliber: 120mm

Length: 5.6 m

Barrel Length: 5.3 m

Width: 728 mm

Bore: 120-mm/44-caliber, smoothbore fitted with fume extractor and thermal sleeve

Gun Weight: 1,905 kg

Barrel Weight: 1,175 kg

Recoil, Maximum: 370 mm

Recoil, Normal: 340 mm

Recoil System: 2 hydraulic buffers and 1 hydropneumatic recuperator

Breech Type: semi-automatic vertical sliding wedge

Muzzle Velocity: 1373+ m/sec

Maximum Range: 2,500+ km

Turret Type: electro-hydraulic, manual backup

Feed System: Manual

Elevation: -10/+20 deg

Traverse: 360 deg

↳*Ammunition (Option 1)*

Name: M830

Type: HEAT-MP

Caliber: mm120

Length: 981 mm

Weight: 24.2 kg

Basic Load: 42 rounds

Ammo Types: HEAT-MP-T, APFSDS-T, MPAT, STAFF

↳*Ammunition (Option 2)*

Name: M829

Type: APFSDS

Caliber: 120mm

Length: 935 mm

Weight: 18.7 kg

Basic Load: 42 Rounds

Coaxial Weapon System

↳*System*

Name: 1 x 7.26-mm M240 machine gun
Type: General-Purpose Machine Gun
Caliber: 7.72mm
Length: 1,260 mm
Barrel Length: 630 mm
Width: 120 mm
Height: (260 mm
Weight: 12.5 kg
Action: Gas-operated long-stroke piston, open bolt
Rate of Fire: M240, M240E1, M240C, M240D and M240G: Gas Setting 1: 650–750 RPM Gas Setting 2: 750–850 RPM Gas Setting 3: 850–950 RPM M240B, M240L and M240H: 550–650 RPM Barrett 240LW and 240 LWS: 550–650 RPM
Muzzle Velocity: 853 m/s
Maximum Firing Range: 3,725 m
Effective Firing Range: 800 m (875 yd) (bipod) 1,100 m (1,203 yd) (tripod)
Feed System: Belt-fed using M13 disintegrating links
Sights: Iron sights: front blade and folding rear leaf with aperture and notch

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×51mm NATO
Basic Load: 6,000 Rounds

Loader's Weapon System

Weapon: 1 x 7.62-mm M240 machine gun on Skate Mount
Basic Load: 6,000 Rounds

Commander's Weapon System

↳*System*

Name: 1 x .50-caliber M2 machine gun
Type: Heavy Machine Gun
Caliber: 12.7mm
Length: 1,654 mm
Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min (M2HB) 750–850 rounds/min (AN/M2) 1,200–1,300 rounds/min (AN/M3)

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 1,000

Fire Control

Name: INA

Computerized FCS: Yes

Ballistic Computer: Hughes 12 kilobyte digital computer

Main Gun Stabilization: Yes

Day Optics: Hughes primary stabilized sight with 3- and 10-power day optics

Night Optics: Hughes night-vision/sight with thermal imaging

Rangefinder: GEC Avionics/Kollsman eye-safe CO2 rangefinder replaces the Nd-YAG laser rangefinder

Effective Fire Range: 200 to 7,990 m

Accuracy: 10 m or less

Commander's Thermal Viewer: a Texas Instruments commander's independent thermal viewer (CITV), which permits the commander to search and independently select new targets

Driver's Thermal Viewer: Hughes driver's thermal viewer (DTV) with integrated display, a fire-control electronics unit (FCEU) that coordinates CIT stabilization, primary sight and gun-turret drive

M1A2S Upgrade: improved commander's weapon station (ICWS)

Information System: intervehicular information system (IVIS)

Navigation System: Smith Industries position navigation (POS/NAV) system

Command and Control Upgrade: enhanced Army Force XXI digital command and control capabilities;

FLIR: a second-generation, forward-looking IR (FLIR) system for the gunner and commander

Protection

Hull Armor: Depleted uranium armor, believed to be missing and replaced by special armor.

Turret Armor: INA

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: In addition to the armor, some USMC Abrams tanks are equipped with a Softkill Active protection system, the AN/VLQ-6 Missile Countermeasure Device (MCD) that can impede the function of guidance systems of some semi-active control line-of-sight (SACLOS) wire- and radio guided anti-tank missiles (such as the Russian 9K114 Shturm) and infrared homing missiles.

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: 200 SCFM-Clean Cooled Air (collective overpressure); AN/VDR-1 radiological warning device

Smoke Equipment: M250 (British L8A1) 2 x 6-barrel smoke discharger (24 rounds), engine exhaust generation

Fire Suppression: automatic detection and suppression

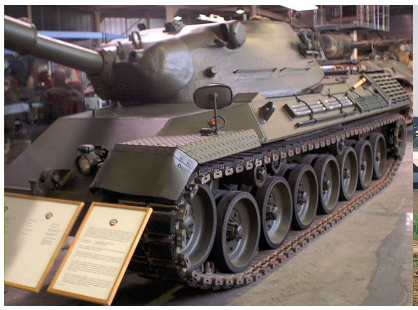
Fuel Cover: Allied Bendix digital electronic fuel control

Note: Enhanced survivability including better armor on gunner's primary sight (GPS) cover;

Notes:

M1A2S (Saudi Package): Saudi Arabian variant upgrade of the M1A2 based on M1A2 SEP, with some features, such as depleted uranium armor, believed to be missing and replaced by special armor. (442 M1A2s upgraded to M1A2S). M1A2 Systems Enhanced Package (SEP) Further improvements on the M1A2 have occurred with the production of the M1A2 SEP . The package includes: *enhanced Army Force XXI digital command and control capabilities; *a second-generation, forward-looking IR (FLIR) system for the gunner and commander; *user-friendly soldier/machine interface (SMI); *under-armor auxiliary power unit (UAAPU); *a new computerized mass-memory unit; *color maps and displays. Deliveries of the SEP began in September 1999. The M1A2 Abrams main battle tank is a further development of the M1A1. Currently it is one of the best MBTs in the world. Development of improved M1A1 began in 1988. About 1 200-1 500 M1A2 main battle tanks were delivered to the US army. Out of this number approximately 1 000 out-dated M1 main battle tanks were upgraded to the M1A2 standard. It is planned that this tank will remain in service beyond 2050. The M1A2 has been exported to Kuwait (218) and Saudi Arabia (457). Approved for production in 1990, the M1A2 represents the U.S. Army’s technological improvement of the basic M1A1 design and the most modern battle tank in the world. Outwardly similar in appearance to the M1A1, the most notable exterior changes on the M1A2 are the redesigned Commander's Weapon Station (CWS) and the addition of a Commander's Independent Thermal Viewer) on the left side of the turret forward of the loader's hatch. Internally, however, the M1A2 has been radically redesigned to take advantage of newer technology. Most notable of these improvements is the addition of the Inter-Vehicle Information System (IVIS.) The IVIS system allows for the automatic and continual exchange of information between vehicles. By incorporating information provided by an on board Position/Navigation (POSNAV) system, unit commander's can track the location and progress of subordinate elements automatically, without tasking vehicle crews. In addition enemy positions can be identified, plotted and disseminated, while reports and artillery requests can be automatically formatted, transmitted, and processed. Lastly, map graphic control measures and operational orders can be rapidly distributed via the IVIS system. To ensure information security, all IVIS data transmissions are routed through the M1A2's SINCGARS radio system. Improving on the "hunter-killer" tank commander-gunner target hand off method pioneered on the German Leopard II, the M1A2 takes this a step further by providing the Tank Commander with an independent thermal sight. This CITV sight allows the commander to independently scan for targets in all weather conditions and through battlefield obscurants. In addition to IVIS and the CITV, the M1A2 incorporates a number of additional electronic upgrades. Power distribution throughout the tank has been improved, relying on multiple bus paths so that in the event one conduit is damaged, power may still be delivered to a component via an alternate path. The driver's instrument display has been upgraded to a more detailed digital display and the Gunner's Primary Sight has been stabilized in two axes for increased accuracy. Approved for implementation in 1995, the M1A2 SEP (System Enhancement Package) is a technology upgrade and standardization program, whereby the Army's fleet of M1s and M1A2s will all be brought to a common standard. Most notable among the modifications will be the introduction of a standard under armor auxiliary power unit and the addition a crew compartment air conditioning and cooling unit. Other modifications within the vehicle will include upgrades to the IVIS system (color display, full size keyboard, digital mapping and graphics generation capability, and voice recognition capabilities), upgrades to the Gunner's Primary Sight assembly, and improvement in the tank's intercom and radio communications systems. Production of the M1A2 was halted after the initial run of 627 vehicles. As part of the fleet upgrade program, 547 of the Army's current inventory of M1s are being upgraded to M1A2 SEP standards, which will require the complete remanufacturing of the turret, while the current fleet of M1A2s will undergo a retrofit to bring them up to SEP standards.

Leopard 1A1 German Main Battle Tank



Tiers:

Variants:

- **Leopard 1:** The Leopard project started in November 1956 in order to develop a modern tank, the Standard-Panzer, to replace the Bundeswehr's American-built M47 and M48 Patton tanks, which, though just delivered to West Germany's recently reconstituted army, were rapidly becoming outdated. On 25 July 1957, the detailed specifications were released; the new design needed to weigh no more than 30 tonnes, have a power-to-weight ratio of 30 horsepower per tonne, be able to withstand hits by 20 mm rapid-fire guns on every side as well as to operate in a battlefield contaminated with chemical weapons or radioactive fallout, the then-standard baseline for combat with the Warsaw Pact. In addition, the main armament had to consist of a 105 mm caliber weapon (the new British L7A3 105 mm gun was selected), carrying at least as many rounds as current US tank designs. Mobility had priority, while firepower came second; armour was seen as less essential, as it was believed that no real protection against hollow charge weapons was possible anyway.
- **Leopard 1A1:** After the first batch was delivered, the next three batches were the Leopard 1A1 model, which included a new gun stabilization system from Cadillac Gage that allowed the tank to fire effectively on the move. The 1A1 also added the now-famous "skirts" along the sides to protect the upper tracks, and a new thermal jacket on the gun barrel to control heating. A less important change was to use rectangular rubber blocks fastened to the treads with a single pin instead of the earlier two-pin "shaped" versions. The rubber blocks could be easily replaced with metal X-shaped crampons for movement on ice and snow in the winter.
- **Leopard 1A2:** The first 232 tanks of the fifth production batch were delivered as the Leopard 1A2 between 1972 and 1974. The A2 included a heavier and better armoured turret, and therefore did not receive the B&V armour add-ons as did the earlier machines. However, they did receive the other upgrades; the Leopard 1A2A1 received the PZB 200, the Leopard 1A2A2 received digital radios, and the Leopard 1A2A3 got both.
- **Leopard 1A3:** The next 110 vehicles in the fifth batch were fitted with a new welded turret, which was equipped with a new armor consisting of two spaced steel plates with a plastic filling between them (high-hardness armor, and a wedge-shaped gun mantlet, creating the Leopard 1A3. Although the level of armor area density was equivalent to the A2's new welded version, the internal volume was increased by 1.2 m^3 and the effective protection level was increased by half. The improved TRP 2A independent sight was installed for the commander. Upgrades were identical to the 1A2 models, the Leopard 1A3A1 with the night sights, Leopard 1A3A2 with the new radios, and the Leopard 1A3A3 with both.
- **Leopard 1A4:** The Leopard 1A4 formed the sixth batch of 250 vehicles, delivery starting in 1974. The 1A4 was externally similar to the 1A3, but included a new computerized fire control system and the new EMES 12A1 sighting system to aim it. In addition, the commander was provided with his own independent night sighting system, the PERI R12. The new equipment used up space and the ammunition load was reduced to 55 rounds, of which 42 were stored in the magazine to the left of the driver.
- **Leopard 1A5:** In 1980, a research program was undertaken to study further improvements to the Leopard 1, providing it with a completely modern fire control system and fully effective night/bad-weather vision system. The decision was made to base the upgrades on the earlier models, which were no longer competitive. The resulting Leopard 1A5 was based on 1,225 vehicles of the Leopard 1A1A1 model. The turrets were again modified for the 1A5, both in order to store all of the new equipment, as well as to move more of the ammunition into the rear of the turret, as opposed to the left side of the driver where it had previously been stored. The new turret was also able to mount the newer 120 mm gun from the Leopard 2 if desired, although this option has not been used. After trials, the Krupp-Atlas Elektronik EMES 18 fire control system, which was developed from the EMES 15 used on the Leopard 2, was selected in December 1983. The EMES 18 included two new sights on the top of the turret, and no longer required the "bumps" as did the earlier optical systems. A crucial part of the upgrade was the introduction of more effective ammunition, including new APFSDS rounds. The Leopard tank could also be fitted with bolt-on polycarbonate (Lexan) armour panels, which have increased the effectiveness of the armour. The first modified vehicle was delivered in early 1987. Since then, almost all users of

the Leopard 1 have also applied similar changes to their own vehicles, and in most ways the 1A5 be considered the "standard" Leopard 1 today. In the Netherlands, an improved version equivalent to the A5 called "Leopard 1 Verbeterd" (improved) was developed, the same version is used by the Chilean Army.
- **Leopard 1A6:** The Leopard 1A6 prototype was a single Leopard 1 A1A1 testbed, modified with additional armour on the turret and equipped with a 120 mm L/44 gun. The project was ended in 1987, as the Leopard 2 was in widespread service at this point and the 1A5 offered a more reasonable upgrade path for a fraction of the cost.

System

Alternative Designation: Leopard 1A1

Type: Main Battle Tank

Manufacturer: Krauss-Maffei Wegmann, Munich, Germany Krupp-MaK, Kiel, Germany

Crew: 4 (commander, gunner, loader, driver)

Dimensions

Length, Hull: 7.09 m

Length, Gun Forward: 9.54 m

Width: 3.37 m

Height: INA

Tracks Length, on the Ground: 4.24 m

Tracks Width: 0.55 m

Ground Clearance: 0.44 m

Weight, Unloaded: 38,700 kg

Weight, Combat: 40,000 kg

Ground Pressure: 0.86 kg/cm sq

Automotive

Engine Name: MTU MB 838 Ca M500

Engine Type: 2,282-cu in (37.4-liter) liquid-cooled, 4-stroke, prechamber, inter cooled, turbocharged V-10 multi-fuel

Engine Power: 830 hp at 2,200 rpm

Fuel Capacity: 955 liters

Transmission: ZF 4 HP 250 planetary shifter with hydraulic torque converter; 4 forward/2 reverse gears

Power-to-Weight Ratio: 20.75 hp/metric ton

Suspension: torsion bar, 7 road wheels, rear drive (12- tooth sprocket), front idler, 5 shock absorbs (bump travel 9 in/227 mm, rebound travel 5-6 in/128-156 mm), 4 return rollers

Maximum Speed: 65 km/h

Range, Road: 600 km

Range, Cross-Country: 450 km

Vertical Obstacle: 1.15 m

Trench: 3.00 m

Fording, Unprepared: 1.20 m

Fording, with Preparation: 2.25 m

Fording, with Snorkel: 4.00 m

Gradient: 60 percent

Side Slope: 30 percent

Main Weapon System

↳*System*

Name: 1 x Royal Ordnance L7A3 Rifled Gun

Type: Rifled Gun

Caliber: 105 mm

Length, Barrel: 5.46 m

Muzzle Velocity: INA

Weight: 1,282 kg

Maximum Rate of Fire: 10 rounds per minute (maximum)

Elevation: -9/+20 deg

Traverse: 360 deg

Maximum Firing Range: 4000 m

↳*Ammunition*

Name: L22

Type: Projectile

Caliber: mm105

Basic Load: 60 rounds, 18 ready in turret (Leopard 1A1)

Armor Penetration: INA, Tungsten carbide

Coaxial Weapon System

↳*System*

Name: Heckler & Koch MG5

Type: General Purpose Machine Gun

Caliber: mm7.62

Manufacturer: Heckler & Koch

Length: 1,160 mm

Barrel Length: 550 mm

Height: 239 mm

Width: 120 mm

Weight: 11.20 kg

Action: Gas-operated, rotating bolt

Rate of Fire: 640/720/800 rounds/min

Muzzle Velocity: 840 m/s

Maximum Firing Range: 600–1,000 m

Effective Firing Range: 100–1,000 m

Feed System: Disintegrating DM60/M13 belt in 50-round Gurttrommel or 120-round in separate belt box or from stand-alone ammunition boxes

Sights: Diopter sight or optical sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Basic Load: 1,250 rounds

Armor Penetration: INA

Auxiliary Weapon System

Note: 1 x 7.62-mm air defense machine gun

Fire Control System

Name: FLP-10/EMES 18 integrated fire control

Computerized FCS: Yes, FLP-10/EMES 18 integrated fire control system with Zeiss thermal imaging system retrofitted to approximately 1,300 German Leopard 1A1/1A2s

Main Gun Stabilization: Yes

Direct Fire: Yes

Indirect Fire: Yes

Infrared: Yes, Paint reflects IR

Rangefinder: TEM 2A optical (Leopard 1A1) turret fully stabilized (A3, A4); retrofit of earlier AEG-Telefunken FLER-H modular hybrid computer (1A4 Krupp-Atlas)

Protection

Hull Armor: Glacis 70 mm at 60-deg: Hull Glacis top 25 mm at 83-deg: Hull nose 70 mm at 55-deg: Hull sides 25-35 mm: Hull rear 25 mm at 88 deg: Hull top 10 mm: Hull bottom 15 mm

Turret Armor: Turret mantlet 60 mm; Turret sides 60 mm; Turret rear 60 mm; Turret front 52 mm

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: No

NBC Protection: Yes, collective

Smoke Equipment: 2 x 4-barrel 3-in (76-mm) smoke generators, one each side of turret

Notes:

The Leopard (or Leopard 1) is a main battle tank designed and produced by Porsche in West Germany that first entered service in 1965. Developed in an era when HEAT warheads were thought to make conventional heavy armour of limited value, the Leopard focused on firepower in the form of the German-built version of the British L7 105-mm gun, and improved cross-country performance that was unmatched by other designs of the era. The design started as a collaborative project during the 1950s between West Germany and France, and later joined by Italy, but the partnership ended shortly after and the final design was ordered by the Bundeswehr, with full-scale production starting in 1965. In total, 6,485 Leopard tanks have been built, of which 4,744 were battle tanks and 1,741 were utility and anti-aircraft variants, not including 80 prototypes and pre-series vehicles. The Leopard quickly became a standard of European forces, and eventually served as the main battle tank in over a dozen countries worldwide, with West Germany, Italy and the Netherlands being the largest operators until their retirement. Since 1990, the Leopard 1 has gradually been relegated to secondary roles in most armies. In the German Army, the Leopard 1 was completely phased out in 2003 by the Leopard 2, while Leopard 1-based vehicles are still widely used in utility roles. The Leopard 2 has replaced the Leopard 1 in service with many other nations as well, with derived vehicles using the Leopard 1 hull still seeing service. Currently, the largest operators are Greece, with 520 vehicles, Turkey, with 397 vehicles and Brazil with 378 vehicles. Most of these vehicles have been upgraded with various improvements to armor, firepower and sensors to maintain their ability to engage modern threats. After the first batch was delivered, the next three batches were the Leopard 1A1 model, which included a new gun stabilization system from Cadillac Gage that allowed the tank to fire effectively on the move. The 1A1 also added the now-famous "skirts" along the sides to protect the upper tracks, and a new thermal jacket on the gun barrel to control heating. A less important change was to use rectangular rubber blocks fastened to the treads with a single pin instead of the earlier two-pin "shaped" versions. The rubber blocks could be easily replaced with metal X-shaped crampons for movement on ice and snow in the winter. Between 1974 and 1977, all of the machines in the first four batches were brought to the same Leopard 1A1A1 standard, and given additional turret armour developed by Blohm & Voss. A further upgrade in the 1980s added leftover image-intensifier night sights, which were being handed down from the Leopard 2 as they were themselves upgraded. The PZB 200 image intensification system was mounted in a large box on the upper right of the gun, creating the Leopard 1A1A2. A further upgrade with SEM80/90 all-digital radios created the Leopard 1A1A3. Later improvements to the image intensifier created the Leopard 1A1A4.

T-64U Ukrainian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-64B:** The T-64 MBT was, at the time it entered service, the third generation of tanks to be produced by factories and design bureaus in Ukraine. It was the first Soviet tank to assume the mantel of an MBT, finally expelling the notion of light, medium, and heavy tanks.
- **T-64BK:** Command tank version, with 10-m whip antenna.
- **T-64B1:** Variant has partial era mounted; the few original t-80s retained were upgraded to this standard
- **T-64BV:** Variant has kontakt era mounted. Combat weight (mt): 42.5 for t-64bv with explosive reactive armor (mm): standard on t-64bv
- **T-64U/T-64BM2:** Upgrade series marketed by ukrainian malyshev in 2001. T-64u prototype featured 2nd gen era, composite armor, and fire suppression equipment. Variant added t-80u fire control (1a42 gunner day sight) and thermal night sight-permits it to replace rf-guided at-8/kobra atgm with better refleks series (svir/invar) laser-beam rider atgms. Ukrainian-developed lbr-guided atgm kombat similar to refleks. A later variant changed the fcs to t-80ud/t-90 type, with 1a45 day sight, and agat thermal night sight
- **BM BULAT:** This 45 mt upgrade variant is currently being advertised. It includes an 850-hp engine, fcs with 1g46m lrf-based sight and catherine-based thermal night sight. Remote fired 12.7-mm mg and 5,000 m

System

Alternative Designation: T-64U
Type: Main Battle Tank
Family: T-64 Family
Crew: ea3
Passenger Capacity: INA
Maximum Effective Range (Road): km600
Maximum Effective Range (Main Gun): m5,000
Note: The T-64 became the primary MBT of Soviet forces until it was replaced by the T-80 and T-72.

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Effective Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Proectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳***Ammunition (Option 1)***

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: 915

Max Dispersion: INA

Maximum Range: m3,00

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳***System***

Name: Kobra (AT-8 Songster)

Type: SACLOS Anti-Tank Missile System

Caliber: mm125

Manufacturer: KB Tochmash

In Service: 1976-present

Proliferation: Widely Proliferated throughout Armenia, Azerbaijan, Belarus, India Iran, Russia, Ukraine, and Uzbekistan

Basic Load: ea4-6

Weight: kg23.2

Warhead Weight: kg4.5

Guidance System: SACLOS

Effective Firing Range: m100-4,000

Muzzle Velocity: m/s125 m/s, which increases to 800m/s at its peak m/s

Flight Time to a 4,000 Meter Targetsec: 9-10

Armor Penetration: 600mm of RHA

Hit Probability: %80

Maximum Chamber Pressure: kgf/cm36,500

Horizontal and Vertical Dispersion: mils0.2

Kombat Gun-Launched Missile Capable: Yes
Variants: 9M112M, 9M112M2, 9M124
Note: Fired from the T-64 and T-80 Family of Russian Tanks

Coaxial Weapon System

↳*System*

Name: Type 54 DShK Anti-Aircraft Machine Gun
Type: 12.7mm Heavy Machine Gun
Proliferation: over 1 Million
Length (Total): mm1,625
Length (Barrel): mm1,070
Weight (Gun Only): kg34
Weight (on Wheeled Mounting): kg157
Max Rate of Fire: rds/min600
Range Finder Type: Optical
Action: Gas-Operated, Flapper Locking
Sights: Iron/Optical
Feed System: 50 Round Belt
Turret: single seat and placed at the rear of the vehicle roof. It is sharp-pointed at the front.
Variants: DK, DShKM, DSHKS, Type 54 HMG
Fire on the Move: Yes

↳*Ammunition*

Type: Rifle
Caliber: mm12.7
Cartridge: mm12.7x108
Muzzle Velocity: m/s850
Basic Load: ea300
Effective Range: m2,500
Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Loader's Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)
Type: mm7.62
Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳***Ammunition***

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea250

Effective Range (Iron Sights): m100- 1,000

Effective Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: 1V528-2 fire-control compute

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, TKN-4S combination day/night binocular periscopic. Additionally, the T-64U is equiped with the PZU-7 Anti-aircraft Sight

Gunner's Aiming System: 1A42 Aiming System

Thermal Sight Gunner: Yes, the IG46 gunner's sight

1G46 Magnification: 2.7 and ×12 magnification

Rangefinder: IG46 Gunner Sight, Laser

IG46 Rangefinder Maximum Range: m400

IG46 Rangefinder Minumum Range: m5,115

Vision Blocks: 1 x TPNO-16, 2 x TPNA-65 day vision blocks

Main Gun Stabilization: 2-Plane, 2E42 system that uses electromechanical systems

Fire on the Move: Yes

Rangefinder: two-axis stabilised IG42 laser rangefinder sight

Ballistic Computer: 1V517 Tank Ballistic Computer

PZU-5 monocular periscopic sight: Available

Searchlight: L-4 searchlight.

Sight Type: 1G21 sight with Laser Telemetry

Wind Sensor: DVE-BS wind sensor

Protection

Hull Armor: Cast and welded steel armour

Turret Armor: Cast armour welded together

Turret Type: ROM-7 commander's cupola

Armor Protection (Front): mm370-440 of RHA against KE rounds and 500 mm to 575 mm of RHA against HEAT rounds

Applique Armor: Available

Self-Entrenching Blade: KMT-4 roller or the KMT-6 track width mine plough,

Explosive Reactive Armor: Nozh ERA system

Nozh ERA Strength: 1.5-2.5 times more effective than exiating ERA Designs.

Noza ERA Compatability: interchangeable with the Russian-developed 4C20 and 4C22 ERA systems.

Active Protection System: Yes

Mine Clearing: Roller-plow available

NBC Protection: Yes

Smoke Equipment: 902A "Tucha-1" smoke grenade launcher in two groups of four, on each side of the gun

IR Signature: INA

Automatic Fire Suppression Systems.: Available, PPO fire detection and suppression system,

Notes:

The T-64U is modernized with a 1A45 fire control (T-80U), as well as PNK-4SU and TKN-4S optics and PZU-7 for the roof HMG. The tank commander is given redundant fire controls or overrides if needed. Kontakt-5 ERA is was added to some of these, but fittings are placed in case. In addition, these have the option to receive the 6TDF 1,000 hp (735 kW) engine.T-64U which integrated on top the 1A45 fire control (from the T-80U and T-84), PNK-4SU and TKN-4S optics for the tank commander and PZU-7 for the AA machine gun. The tank leader is then able to drive the tank and to use the gun directly if needed. Kontakt-5 Armor added few prototypes build

T-64 Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-64A:** Production version of base tank. Tank has a history of reliability problems, and lacks the high armor protection, track skirts, a fcs and atgm launch capability for t-64b.
- **T-64BK:** Command tank version, with 10-m whip antenna.
- **T-64B1:** Variant has partial era mounted; the few original t-80s retained were upgraded to this standard
- **T-64BV:** Variant has kontakt era mounted. Combat weight (mt): 42.5 for t-64bv with explosive reactive armor (mm): standard on t-64bv
- **T-64U/T-64BM2:** Upgrade series marketed by ukrainian malyshev in 2001. T-64u prototype featured 2nd gen era, composite armor, and fire suppression equipment. Variant added t-80u fire control (1a42 gunner day sight) and thermal night sight-permits it to replace rf-guided at-8/kobra atgm with better refleks series (svir/invar) laser-beam rider atgms. Ukrainian-developed lbr-guided atgm kombat similar to refleks. A later variant changed the fcs to t-80ud/t-90 type, with 1a45 day sight, and agat thermal night sight
- **BM BULAT:** This 45 mt upgrade variant is currently being advertised. It includes an 850-hp engine, fcs with 1g46m lrf-based sight and catherine-based thermal night sight. Remote fired 12.7-mm mg and 5,000 m

System

Alternative Designation: T-64B, T-64
Type: Main Battle Tank
Family: T-64 Family
Crew: ea3
Passenger Capacity: INA, IT"S A TANK
Maximum Effective Range: km600
Note: The T-64 became the primary MBT of Soviet forces until it was replaced by the T-80 and T-72.

Main Gun

↳*System*

Name: D-81T (aka 2A46)125 mm smoothbore gun
Type: 125 mm smoothbore
Max Rate of Fire: rds/min8
Manual Load Time: rds/min1-2
Weight (Barrel): kg1,073
Autoloader: Yes, Carousel-Type Autoloader
Fire on the Move: Yes, Main Gun
Maximum Elevation: Deg+14
Minimum Elevation: Deg-6
Traverse Range: Deg360
Automatic Loader: Yes
Thermal Sleeve: Yes
Evacuator Type: central bore evacuator
Effective Full Charge (EFC) Life: rds600
Breech Type: semi-automatic horizontal sliding breech block
Loading System: Korzina electric and hydraulic automatic loading system
Carousel: The carousel can accommodate 28 two-piece rounds of ammunition, and rotates automatically after each round is fired
Carousel Load Time: min13-15

Basic Load Time: min27

Rate of Fire: rds/min6-8

Maximum Effective Range (Day): m2,000

Maximum Effective Range (Night): m600

↳*Ammunition (Option 1)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot ((APFSDS))

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Effective Range: m2,000-3,000

Maximum Range: m4,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Dimension: mm900

Projectile Weight: kg11

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Effective Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Proectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 1)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: 915

Max Dispersion: INA

Maximum Range: m3,00

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Name: Kobra (AT-8 Songster)

Type: SACLOS Anti-Tank Missile System

Caliber: mm125

Manufacturer: KB Tochmash

In Service: 1976-present

Proliferation: Widely Proliferated throughout Armenia, Azerbaijan, Belarus, India Iran, Russia, Ukraine, and Uzbekistan

Basic Load: ea4-6

Weight: kg23.2

Warhead Weight: kg4.5

Guidance System: SACLOS Radio

Effective Firing Range: m100-4,000

Muzzle Velocity: m/s125 m/s, which increases to 800m/s at its peak m/s

Flight Time to a 4,000 Meter Targetsec: 9-10

Armor Penetration: 600mm of RHA

Hit Probability: %80

Variants: 9M112M, 9M112M2, 9M124

Note: Fired from the T-64 and T-80 Family of Russian Tanks

Coaxial Weapon System

↳*System*

Name: Type 54 DShK Anti-Aircraft Machine Gun

Type: 12.7mm Heavy Machine Gun

Proliferation: over 1 Million

Length (Total): mm1,625

Length (Barrel): mm1,070

Weight (Gun Only): kg34

Weight (on Wheeled Mounting): kg157

Max Rate of Fire: rds/min600

Range Finder Type: Optical

Action: Gas-Operated, Flapper Locking

Sights: Iron/Optical

Feed System: 50 Round Belt

Turret: single seat and placed at the rear of the vehicle roof. It is sharp-pointed at the front.

Variants: DK, DShKM, DSHKS, Type 54 HMG

Fire on the Move: Yes

↳***Ammunition***

Type: Rifle

Caliber: mm12.7

Cartridge: mm12.7x108

Muzzle Velocity: m/s850

Basic Load: ea300

Effective Range: m2,500

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Loader's Weapon System

↳***System***

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: mm7.62

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea250

Effective Range (Iron Sights): m100- 1,000

Effective Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: 1A33

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, TKN-3V combination day/night binocular periscopic

Thermal Sight Gunner: Yes, TPN1-49-23 night sigh

Main Gun Stabilization: 2-Plane, 2Eh26M armament stabiliser

Fire on the Move: Yes

Rangefinder: two-axis stabilised IG42 laser rangefinder sight

Ballistic Computer: 1V517 Tank Ballistic Computer

Vision Blocks: 1 x TPNO-16, 2 x TPNA-65 day vision blocks

PZU-5 monocular periscopic sight: Available

Searchlight: L-2AgM infra-red searchlight

Sight Type: 1G21 sight with Laser Telemetry

Wind Sensor: 1B11 cross-wind sensor.

Protection

Hull Armor: cast and welded steel armour

Turret Armor: cast armour welded together

Armor Protection (Front): mm370-440 of RHA against KE rounds and 500 mm to 575 mm of RHA against HEAT rounds

Applique Armor: Available

Self-Entrenching Blade: KMT-4 roller or the KMT-6 track width mine plough,

Explosive Reactive Armor: No Explosive Reactive Armor (ERA)

Active Protection System: Yes

Mine Clearing: Roller-plow available

NBC Protection: Yes

Smoke Equipment: 902A "Tucha-1" smoke grenade launcher in two groups of four, on each side of the gun

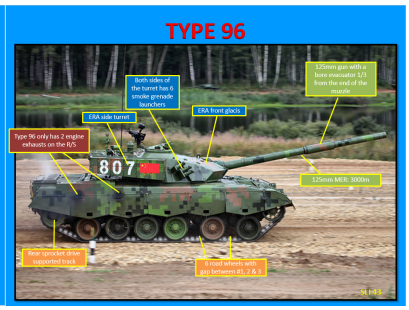
IR Signature: INA

Automatic Fire Suppression Systems.: Available, PPO fire detection and suppression system,

Notes:

The T-64 (T-64B) is a Soviet second-generation main battle tank introduced in the early 1960s. It was a more advanced counterpart to the T-62: the T-64 served tank divisions, while the T-62 supported infantry in motorized rifle divisions. It introduced a number of advanced features including composite armor, a compact engine and transmission, and a smoothbore 125-mm gun equipped with an autoloader to allow the crew to be reduced to three so the tank could be smaller and lighter. In spite of being armed and armored like a heavy tank, the T-64 weighed only 38 tonnes (42 short tons; 37 long tons).

Type 96 (ZTZ96) Chinese Main Battle Tank (MBT)



Tiers:

1 **2** 3 4

Variants:

- **Type 96A:** Additional "arrow shaped" modular armor similar to the Type 99 is installed on the turret front. The back of the hull is now completely flat compared to the Type 96. The Type 96A was first revealed in 2006, but in-service tanks were first seen in a military parade in 2009. The Type 96A is a third-generation upgrade of the Type 96. Its internal electronics may have been upgraded to Type 99 standards. The visual profile of the Type 96A is similar to the Type 99. However, the Type 96A can be distinguished from the Type 99 by the driver's position of the left side of the hull. FY-4 ERA was added on front upper glacis.The vehicle is equipped with a thermal imager. Features an upgraded 800 hp engine. A laser defense system similar to the Shtora has been installed as well. Electro-optical jammers which are able to jam enemy guided missiles, rangefinders, and designators are found on the tank
- **Type 96B:** Variant first seen in July 2016 loaded on a Russia-bound train to participate in the 2016 Tank biathlon. It is equipped with an improved engine, improved high-performance gun with an upgraded fire-control system, new transmission, chassis, ventilation, communications and computer systems, exhaust and suspension. Additionally it features an independent commander sight and lighter, more reliable running wheels. The specifications of the upgraded engine are unknown but is speculated to produce between 1,000 and 1,200 horsepower
- **VT-2:** Export variant of Type-96A. Debuted at the 2012 Defence Services Asia Exhibition. Can be equipped with Remote Weapons Station and has a maximum speed of 70 km/h (on road). Capable of turning on its own axis.

System

↳*Ammunition (Option 3)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS) Rounds.

Name: 3VBM?/3BM69 "Vacuum-1"

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 42 total rounds of any 125mm Projectiles

Maximum Effective Range: m3,000

Projectile Dimension: mm900

Round Weight: INA

Projectile Weight (Estimated): kg11

Armor Penetration: mm1,000

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Tank Commander's Weapon System

↳*System*

Name: Type 80 Chinese Heavy Machine Gun

Type: 7.72mm Heavy Machine Gun

Manufacturer: Norinco

Date of Introduction: 1985

Max Rate of Fire: rds/min700-800

Length (Total): mm1,192

Length (Barrel): mm658

Diameter: mmINA

Weight (Gun Only): kg12.6

Weight (With Tripod): kg17.5

Action: Gas-operated, open bolt

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

Variant 1: Type 80 - The copy of the PKM GPMG, chambered in 7.62×54mmR

Variant 2: Type 86 - A machine gun only used for tanks as a secondary weapon.

Variant 3: CF06 - An export-only version of the Type 80, which is chambered for 7.62 NATO ammunition.

Variant 4 (Foreign): BD-14 - A variant of the Type 80 made by Bangladesh Ordnance Factories under license which uses 7.62×51mm NATO instead of 7.62×54mmR

↳*Ammunition*

Type: Rifle

Periscopes: ea3

Rangefinder: Laser

Sights, Maximum Distance (Day): m5,000

Sights, Maximum Distance (Night): m1,200

Ballistic Computer: Yes

Step Motor Driver: Yes

Crosswind Velocity Sensor: Yes

Note: The Type 96 is unable to perform hunter-killer engagements

Protection

Hull Armor: Type 96: Composite armor (classified)

Turret Armor: Type 96: Composite armor (classified)

Applique Armor: Available, Track Skirts

Explosive Reactive Armor: 2d gen ERA

Active Protection System: INA

Mine Clearing: Roller-plow available

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Grenlaunch 12x; VESS

IR Signature: INA

Grenades: Six 76mm grenades are equipped on each side of the turret

Automatic Fire Suppression System: Yes

Notes:

The Type 96 Main Battle Tank (MBT) was developed from the Type 85-III, which was mainly aimed at the export market. The Type 96 has some minor modifications. Sometimes it is referred as the the Type 88C or ZTZ96. It entered service with Chinese

army in 1997. It replaced in production the previous Type 88 MBT. Production of the original Type 96 ceased in 2005. It is estimated that over 1 500 of these main battle tanks were built. Other sources claim, that 2 000-2 500 of these tanks were produced. Currently it is a mainstay of the China's MBT fleet. These tanks are being gradually upgraded. The only export customer of this tank is Sudan. The Type 96 MBT is armed with a fully-stabilized 125 mm smoothbore gun, fitted with an autoloader. Both the gun and autoloader were copied from the Soviet T-72. This main battle tank might be compatible with the Russian AT-11 Sniper gun-launched anti-tank guided missiles, or its Chinese copy. Maximum rate of fire is 6-8 rounds per minute. A total of 42 rounds are carried.

T-72B3 Russian Main Battle Tank (MBT)

Tiers:

1 2 3 4

Parent:

T-72 Russian Main Battle Tank (MBT)

Variants:

- **T-72A:** Second Russian main variant of the T-72.
- **T-72B1:** In 1986, a limited production variant without an ATGM launch capability. Some do not have ERA.
- **T-72BK:** The Commander's variant with additional radios.
- **T-72BM:** Russian T-72B upgrade with 2nd gen ERA. The system is fielded, available for export, and upgraded. Tier 2 and some Tier 3 tanks can challenge US forces under favorable conditions when using modern ammunition and employed by well-trained units with sound tactics. A variety of upgrades are available for the T-72B. They include protection upgrades, such as improved ERA, APS, defensive aids suites with IR jammers, plate armor, welded turret, and grill armor around tracks and grill. Mobility upgrades include a new power train, improved steering, improved mine plows and rollers, and electronic mine spoofing system. Fire control system upgrades include new sights, gun, ammunition, and improved stabilization. With the expanding number of upgrades offered by former Warsaw Pact, Asian, Israeli, and other firms, most T-72-type tanks have some level of upgrade from the basic T-72 MBT. The more affordable upgrade approach for most countries is to execute specific upgrades during maintenance work. But this approach may result in only partially modernized tanks at any one point in the life of the vehicle, and which are not as modern as more recent competitors. An alternative is to produce modernized tanks in small numbers, resulting in high per-unit production costs.
- **T-72BU:** Upgrade variant with the fire control system from the T-80U as well as well as a variety of other changes.
- **T-72BU renamed T-90:** With the limited market for new tanks, the world tank industry has developed upgrades and whole vehicle upgrade packages to tap into the market. Older T-72 tanks can be brought up to the T-72B standard. Some approach the T-90 standard. Most T-72-type tanks fielded reflect some level of upgrade. Upgrade options are expanding from former Warsaw Pact, Asian, Israeli, and other international firms.
- **T-72S / Shilden:** Russian export T-72A upgraded to the T-72B standard. Although visually similar to T-72B, it has slightly less chassis and turret protection. Former Warsaw Pact countries such as Slovakia and Middle Eastern countries like Iran have upgraded their tanks to the T-72S standard.
- **M-84AB1:** Yugoslav upgrade to the M-84, bringing it close to the T-90, and the latest T-72B improved tanks.
- **M-95 Degman:** Croatian M-84 upgrade with box composite armor, ERA, 1200hp and thermal FCS. An export upgrade conversion, AKA M-84D, is offered for Kuwaiti M-84A tanks.
- **PT-91:** Polish upgrade tanks with ERA, Drawa improved FCS, Savan-5 thermal sight, improved gun stabilization, and countermeasures.
- **PT-91M:** Has a 1000hp engine, new guns and FCS, armor changes, and other improvements. PT-91M exported to Singapore. PT-91P is designed for export to Peru.
- **T-72M1:** Demonstrator with 2nd generation ERA and other upgrades were displayed at military shows.
- **T-72M1M:** Includes 3rd generation Relikt ERA and optional Arena Active Protection System (APS). Alternative designations: Rogata and SMT M1988. It is almost the same as the T-72S (Export), except more ERA on the side skirts.
- **AJEYA MK 2:** India is upgrading T-72A tanks close to a Bhishma (T-90S) standard.

System

Alternative Designation: T-72B3

In Service: 2013-present

Manufacturer: Uralvagonzavod

Type: Main Battle Tank (MBT)

Family: INA

Crew: ea3

Passenger Capacity: INA

Maximum Effective Range: m500

Note: The T-72B3 can be distinguished from the its predecessors by the additional panoramic sight on the left of the turret. Also, you will most likely see the T-72BM or T-72B3 in current theaters of operations.

Height: m2.23

Weight, Combat: tons45

Ground Pressure: kg/m0.898 kgf/cm2

Note: The T-72B3 is much heavier than its predecessors due to the additional Armor and ERA.

Automotive

Engine Name: V-92S2F

Engine Type: Four stroke, liquid cooled diesel engine with a centrifugal supercharger.

Engine Power: hp1,130

Power to Weight Ratio: hp/ton18.9

Cruising Range: km500

Speed, Maximum Road: km/h70

Speed, Maximum Off-Road: km/h35-45

Acceleration Speed (0-32 km/h: sec18

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.85

Trench: m2.8

Fording Depth: m1.2

Fording (with Preparation): m5

Fording Kit: OPVT deep water fording kit

Transmission: Synchromesh, hydraulically assisted, with 7 forward and 1 reverse gears

Suspension: Torsion bar

Ground Clearance: m0.49

Fuel Capacity: liters1,200

Gyrocompass: GPK-59 gyrocompass

Rechargeable Batteries: four 12ST-85R 34 AMP rechargeable batteries

Starter Generator: SG-10-1S

Communications

Radio #1: R-173 (Standard Radio for Russian Tanks)

R-173 Range: km0-20

Radio #2: R-168-25VE Tactical Radio

R-168-25VE Frequency Range: 30 to 107,975 MHz

R-168-25VE Range: km0-35

Antenna: R-168BBMA antenna

Main Gun

Note: Another primary difference between the T-72A and the T-72B is that the T-72B can fire the 125mm 9K120 Svir Missile Complex

↳*System*

Name: 2A46M-5

Type: 125mm Smoothbore

Max Rate of Fire: rds/min8

Manually Load Time: rds/min1-2

Barrel Life: rounds1,200

Sustain Rate of Fire: INA

Thermal Sleeve: Yes, alloy thermal sleeve

Bore Type: Central Bore Evacuator

Breech Type: semi-automatic horizontal sliding breech block via an interrupted screw thread.

Autoloader: Yes, electromechanical carousel autoloader

Time to reload the Autoloader: min4-5

Fire on the Move: Yes, Main Gun

Maximum Elevation: deg-6

Minimum Elevation: deg+14

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

↳*Ammunition (Option 1)*

Name: 3VBM23 Svinets-2 Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Type: Smoothbore 125mm Projectile

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Effective Range: m2,000-3,000

Armor Penetration: mmpenetrate up to 500 mm of RHA at 2,000 m

Muzzle Energy: MJ15-24

Projectile Dimension: mm900

Projectile Weight: kg11

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: The 3VBM23 Svinets-2 APFSDS round is designed to engage modern tanks protected by composite armour and advanced ERA,

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Note: The 9K120 gun-launched missile complex is a two piece guided missile that is loaded and fired from the main gun in the same way as an ordinary round.

ATGM System Name: 9K120 gun-launched missile complex

Missile Name: 9K119 SVIR / AT-11

Type: Laser Guided Anti-tank guided missile launcher

Manufacturer: KBP Instrument Design Bureau

Caliber: mm125

Round Type: 3UBK20 round

Guidance System: 9M119M Laser Guided Missile

Voltage Converter: 9S831 voltage converter.

Tracking System: IK13 tracker

Basic Load: ea6

Onboard Guidance System: Yes

Sight Assembly: coded laser guidance beam 1K13-49

Gunner's Night Sight: TPN-1-49 secondary night sight.

Fire Control System: 1A40-1

Hit Probability: %80

Penetration: up to 700mm of armor

Warhead Weight (HEAT): kg4.2

Warhead Type: 9N142 shaped charge warhead

Laser Emitter: 1K13 sight's laser

Maximum Effective Range: m4,000

Minimum Effective Range: m100

Elevation Range (Super Elevation): deg-7 to +20

Elevation Range (Standard Elevation): deg-5 to +15

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)
Type: mm7.62
Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
In Service: 1961-present
Manufacturer: Degtyaryov plant
Proliferation: 1 Million +
Max Rate of Fire: rds/min650-750
Effective Rate of Fire: rds/min250
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length: mm1,203
Length (Barrel): mm605
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle
Caliber: mm7.60
Cartridge: 7.62×54mmR
Muzzle Velocity: m/s825
Basic Load: ea2,000
Effective Range (Iron Sights): m1,000
Effective Range (with Sight Adjustments): m100-1,500
Maximum Firing Range: m3,800

Secondary Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)
Type: 12.7 Anti-Aircraft Machine Gun
Proliferation: over 1 Million
Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia
Weight (Gun Only): kg25

Muzzle Velocity: m/s845

Length (Total): mm1,560

Max Rate of Fire: rds/min700-800

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Action: Gas Operated

Maximum Elevation: deg+75

Minimum Elevation: deg-4

Sights: Iron Sights

Feed System: 50-Round Belt

↳*Ammunition*

Type: Rifle

Caliber: mm12.7x108

Muzzle Velocity: m/s845

Basic Load: ea300

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Fire Control

Name: 1A40-4

Computerized FCS: Yes

Thermal Sight Tank Commander: Sosna-U thermal sight and the TKN-3MK sight

Thermal Sight Gunner: Sosna-U thermal sight

Main Gun Stabilization: 2E42-2 (Upgrade)

Range, Day Sight: m5,000

Range, Thermal Sight: m1,000

Infrared: Yes

Gyrocompass: GPK-59 gyrocompass

Collimator Sight: K10T collimator sight

Periscopes: two TNPO-160 prismatic periscopes

Battle Management System: Andromeda-D

Note: The Gunner, using the 1A40-1 sight can designate and engage targets out to a mazimum distance of 4,000 meters with APFSDS and HEAR rounds.

Protection

Hull Armor: Steel and composite armour with additional plates that provide protection equivalent to 950mm of steel against

HEAT projectiles, 440mm resistance to KE rounds, and 500mm against shaped charges. The T-72BM also has a additional twelve separate charges of ERA compared to the T-72B.

Turret Armor: Steel and composite armour with ERA, 950 mm against HEAT weapons. The Turret has additional Ceramic or silica inserts to add to the protection level of the T-72BM. Additionally, the T-72BM has arrow-shaped arrays of ERA added to the turret front

Applique Armor: Available, Turret top and track skirts

Explosive Reactive Armor (ERA): Yes, Kontakt-5 (UPGRADE). Additional ERA is added to the Turret, Glacis, and sides of the hull.

ERA Explosive Element: 4S22

ERA 4S22 Elements (Plates): ea240

Armor Cassette Type: 4S22 cassette that is filled with an explosive element and steel armoured plate.

Number of total Armor Cassettes: ea200-300

NBC Protection: Yes, System Sensor Radiation Device and chemical intelligence (PRRM).

Active Protection System: Yes, ZETS11-3 Control System

Self-Entrenching Blade: Yes, built in Dozer Blade

Mine Clearing: Yes, Roller and plow (optional)

Grenade Launcher: Yes, twelve 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.

Grenade Maximum Effective Range: m200-300

Grenade Smoke Screen Size: 30 m wide and 10 m high for 60 seconds per grenade.

Engine Smoke Screen Capable: Yes

IR Signature: INA

Automatic Fire Extinguishing Equipment.: Yes

Cage Armor: Yes

Tank Skirts: Available

Note #1: The additional added armor cassettes reduce penetration by as much as 95%.

Notes:

The T-72B3 is a development of the standard Russian-made T-72B series currently in service in the Russian army. The T-72B3 version was introduced in 2010 and considered as a third-generation of Russian main battle tank. The T-72B3 has significantly improved its combat characteristics with more fire power, protection, mobility and command controllability. Besides the improved armor and targeting systems, it kept all the good features of previous versions of T-72. The modernized version of the T-72, which was a main second-generation battle tank produced in the Soviet Union since the 1970s, is equipped with new generation communications and firing systems and a ballistic data computer. The T-72B3 contract was performed by the Russian Defense Company "Uralvagonzavod". The T-72B3 along with the T-72BM have become the backbone of the Russian Army.

Zulfiqar-2 Iranian Main Battle Tank (MBT)

Tiers:

Variants:

- **Zulfiqar-1:** The Zulfiqar-1 is based on the M60 Patton model acquired under the pre-revolution era. The Zulfiqar-1 was first revealed in public in 1994. A total of six prototypes were completed and field tested in 1997. The Zulfiqar-1 is protected by a welded steel hull and the turret is reinforced by a composite armour. The Zulfiqar-1 is armed with a 125mm Smoothbore gun taken from a T-72.
- **Zulfiqar-3:** The Zulfiqar-3 is the most advanced variant of the Zulfiqar family. It features considerable upgrades to the fire control system, chassis, engine and main gun. The new variant is equipped with the 2A46 125 mm smoothbore cannon with an autoloader, a laser rangefinder and a new fire control system.

System

Alternative Designation: Zulfiqar-2
Manufacturer: Shahid Kolah Dooz Industrial Complex
In Service: 1998-Present
Type: Main Battle Tank
Family: Zulfiqar Class
Crew: ea3 (commander, gunner and driver)
Passenger Capacity: INA

Dimensions

Length (Gun Forward): m9.4
Length (Hull): m7.2
Width: m3.6
Height: m2.5
Weight, Combat: tons41
Ground Pressure: kg/mINA

Automotive

Engine Name: V-46-6-12
Engine Type: V-12 Diesel

Engine Power: hp1,000

Power-to-Weight Ratio: 21.7 hp/metric ton

Cruising Range: km450

Speed, Maximum Road: km/h70

Speed, Average Cross: 40

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.8

Trench: m2.8

Fording Depth: m1.4

Transmission: SPAT 1200 automatic

Day/Night Driving Lights: Yes, mounted on the glacis plate.

Communications

Primary Radio: INA

Secondary Radio: INA

Main Gun

Note: The Zulfiqar-2 is armed with a fully-stabilized 125-mm smoothbore gun, fitted with an autoloader. This gun and associated automatic loader are understood to be from the Russian T-72 MBT.

↳*System*

Name: 2A46M/2A46M-5

Type: 125mm Smoothbore

Max Rate of Fire: rds/min8

Manually Load Time: rds/min1-2

Autoloader: Yes, Carousel-Type Autoloader

Fire on the Move: Yes, Main Gun

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Maximum Elevation: deg+14

Minimum Elevation: deg-6

Fume Extractor: Yes

↳*Ammunition (Option 1)*

Name: 3VBM3

Type: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 39 Total Rounds of any 125mm Projectiles

Effective Range: m2,000-3,000

Muzzle Velocity: m/s915

Basic Load: 39 Total Rounds of any 125mm Russian Projectiles

Max Dispersion: INA

Maximum Range: m3,000

Charge Type: HEAT

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Auxiliary Weapon System

Note: The Zulfiqar-1 lacks a coaxial machine gun

↳*System*

Name: Type 54 (DShKM)

Type: 12.7 mm Type 54 Heavy Machine Gun

Proliferation: +1 Million

Length, Total: mm1,625

Barrel length: mm1,070

Weight (Gun Only): kg34

Weight (On Wheeled Mounting): kg157

Rate of Fire: rds/min600

Action: Gas-Operated, Flapper Locking

Feed System: 50 Round Belt

Sights: Iron/Optical

Variants: DK, DShKM, DSHKS, Type 54 HMG

↳*Ammunition*

Type: Heavy machine gun and anti-materiel rifle cartridge

Caliber: mm12.7

Cartridge: 12.7x108 mm

Muzzle Velocity: m/s850

Basic Load: ea1,200

Maximum Effective Range: m2,500

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Fire Control

Name: Slovenian EFCS-3 fire-control system

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes

Thermal Sight Gunner: Yes

Thermal Sight Driver: Yes, passive periscope for night driving.

Main Gun Stabilization: Yes

Domestic System: Yes

Laser Rangefinder: Yes

Fire on the Move: Yes

Driver Periscopes: three day periscopes for driving

Protection

Hull Armor: Reinforced composite armor on the front arc.

Turret Armor: Turret mounts a laser-warning pod

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Zulfiqar 2, or Zolfaqar 2, is a further development of the Zulfiqar 1. This MBT is named after a legendary sword. It was designed during the 1990s. It appears to be only an interim type, which served as a test bed for the Zulfiqar 3. It was never produced in quantity. This is an upgraded variant with a longer hull, seven road wheels and a more powerful engine. A reworked turret is also equipped.

T-72AK Russian Main Battle Tank (MBT)

Tiers:

Parent:

T-72 Russian Main Battle Tank (MBT)

Variants:

- **T-72B:** Second Russian main variant of the T-72 after the T-72A.
- **T-72B1:** In 1986, a limited production variant without an ATGM launch capability. Some do not have ERA.
- **T-72BK:** The Commander's variant with additional radios.
- **T-72BM:** Russian T-72B upgrade with 2nd gen ERA. The system is fielded, available for export, and upgraded. Tier 2 and some Tier 3 tanks can challenge US forces under favorable conditions when using modern ammunition and employed by well-trained units with sound tactics. A variety of upgrades are available for the T-72B. They include protection upgrades, such as improved ERA, APS, defensive aids suites with IR jammers, plate armor, welded turret, and grill armor around tracks and grill. Mobility upgrades include a new power train, improved steering, improved mine plows and rollers, and electronic mine spoofing system. Fire control system upgrades include new sights, gun, ammunition, and improved stabilization. With the expanding number of upgrades offered by former Warsaw Pact, Asian, Israeli, and other firms, most T-72-type tanks have some level of upgrade from the basic T-72 MBT. The more affordable upgrade approach for most countries is to execute specific upgrades during maintenance work. But this approach may result in only partially modernized tanks at any one point in the life of the vehicle, and which are not as modern as more recent competitors. An alternative is to produce modernized tanks in small numbers, resulting in high per-unit production costs.
- **T-72BU:** Upgrade variant with the fire control system from the T-80U as well as well as a variety of other changes.
- **T-72BU renamed T-90:** With the limited market for new tanks, the world tank industry has developed upgrades and whole vehicle upgrade packages to tap into the market. Older T-72 tanks can be brought up to the T-72B standard. Some approach the T-90 standard. Most T-72-type tanks fielded reflect some level of upgrade. Upgrade options are expanding from former Warsaw Pact, Asian, Israeli, and other international firms.
- **T-72S / Shilden:** Russian export T-72A upgraded to the T-72B standard. Although visually similar to T-72B, it has slightly less chassis and turret protection. Former Warsaw Pact countries such as Slovakia and Middle Eastern countries like Iran have upgraded their tanks to the T-72S standard.
- **M-84AB1:** Yugoslav upgrade to the M-84, bringing it close to the T-90, and the latest T-72B improved tanks.
- **M-95 Degman:** Croatian M-84 upgrade with box composite armor, ERA, 1200hp and thermal FCS. An export upgrade conversion, AKA M-84D, is offered for Kuwaiti M-84A tanks.
- **PT-91:** Polish upgrade tanks with ERA, Drawa improved FCS, Savan-5 thermal sight, improved gun stabilization, and countermeasures.
- **PT-91M:** Has a 1000hp engine, new guns and FCS, armor changes, and other improvements. PT-91M exported to Singapore. PT-91P is designed for export to Peru.
- **T-72M1:** Demonstrator with 2nd generation ERA and other upgrades were displayed at military shows.
- **T-72M1M:** Includes 3rd generation Relikt ERA and optional Arena Active Protection System (APS). Alternative designations: Rogata and SMT M1988. It is almost the same as the T-72S (Export), except more ERA on the side skirts.
- **AJEYA MK 2:** India is upgrading T-72A tanks close to a Bhishma (T-90S) standard.

System

Alternative Designation: T-72AK; Ob'yekt 176K

In Service: 1984 to present

Manufacturer: Uralvagonzavod

Type: Main Battle Tank (MBT)

Family: INA

Crew: ea3

Passenger Capacity: INA

Maximum Effective Range: m500

Note: The T-72AK can be distinguished from the T-72A, and other T-72s, by the presence of the commander's antenna at the rear right of the vehicle. The antenna will be up to 4 m long, noticeably longer than any of its nearby vehicles.

Dimensions

Length (Gun Forward): m9.53

Length (Hull): m6.95

Width: m3.59

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 39 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 39 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Name: 9K119 SVIR / AT-11

Type: Laser Guided Anti-tank guided missile launcher

Manufacturer: KBP Instrument Design Bureau

Caliber: mm125

Round Type: 3UBK20 round

Guidance System: 9M119M Laser Guided Missile

Voltage Converter: 9S831 voltage converter.

Tracking System: IK13 tracker

Basic Load: ea6

Hit Probability: %80

Sight Assembly: coded laser guidance beam 1K13-49

Gunner's Night Sight: TPN-1-49 secondary night sight.

Fire Control System: 1A40-1

Penetration: up to 700mm of armor

Warhead Weight (HEAT): kg4.2

Laser Emitter: 1K13 sight's laser

Onboard Guidance System: Yes

Maximum Effective Range: m4,000

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
In Service: 1961-present
Manufacturer: Degtyaryov plant
Proliferation: 1 Million +
Max Rate of Fire: rds/min650-750
Effective Rate of Fire: rds/min250
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length: mm1,203
Length (Barrel): mm605
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle
Caliber: mm7.60
Cartridge: 7.62×54mmR
Muzzle Velocity: m/s825
Basic Load: ea1,500
Effective Range (Iron Sights): m1,000
Effective Range (with Sight Adjustments): m100-1,500
Maximum Firing Range: m3,800

Secondary Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)
Type: 12.7 Anti-Aircraft Machine Gun
Proliferation: over 1 Million
Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia
Weight (Gun Only): kg25
Muzzle Velocity: m/s845
Length (Total): mm1,560
Max Rate of Fire: rds/min700-800
Weight (On Tripod): kg41
Weight (50-Round Belt): kg11

Action: Gas Operated

Maximum Elevation: deg+75

Minimum Elevation: deg-4

Sights: Iron Sights

Feed System: 50-Round Belt

↳ ***Ammunition***

Type: Rifle

Caliber: mm12.7x108

Muzzle Velocity: m/s845

Basic Load: ea200

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Fire Control

Name: 1A40-1

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, TPNZ-49

Thermal Sight Gunner: 1K13-49

Main Gun Stabilization: 2Eh28M electrohydraulic system

Range, Day Sight: m5,000

Range, Thermal Sight: m1,000

Infrared: Yes

Gyrocompass: GPK-59 gyrocompass

Searchlight: L-4A "Luna" IR searchlight

Collimator Sight: K10T collimator sight

Periscopes: two TNPO-160 prismatic periscopes

Navigation Device: TNA-3 navigation device

Protection

Hull Armor: Steel and composite armour with ERA, equivalent to 500-600 mm of Rolled Homogenous Armor (RHA)

Turret Armor: Steel and composite armour with ERA, 500 mm against APFSDS projectiles and to 560 mm against HEAT weapons.

Applique Armor: Available, Turret top and track skirts

Explosive Reactive Armor: Yes, Kontakt-5

Active Protection System: Yes, ZETS11-3 Control System

Mine Clearing: Yes, Roller and plow (optional)

Self-Entrenching Blade: Yes, built in Dozer Blade

NBC Protection: Yes, System Sensor Radiation Device and chemical intelligence (PRRM).

Grenade Launcher: Yes, twelve 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.

Grenade Maximum Effective Range: m200-300

Grenade Smoke Screen Size: 30 m wide and 10 m high for 60 seconds per grenade.

Engine Smoke Screen Capable: Yes

IR Signature: INA

Automatic Fire Extinguishing Equipment.: Yes

Notes:

T-72AK (Ob'yekt 176K): Command version of T-72A. In NATO code T-72AK was represented by three different designations: T-72AK1, T-72AK2 and T-72AK3 which represented the company command version, battalion command version and regiment command version.

Type 96A (ZTZ-96Gai) Chinese Main Battle Tank (MBT)

Tiers:

1 **2** 3 4

Parent:

Type 96 (ZTZ96) Chinese Main Battle Tank (MBT)

Variants:

- **Type 96:** Domestic version of Type 85-IIM. Also sometimes mistakenly referred to as the Type 88C.[8] Renamed Type 96 when put into PLA service.[1] In comparison to the Type 85 and Type 88, the Type 96 features a more powerful engine, improved electronics and a western-style turret. Type 96 was accepted by the PLA in 1996.
- **Type 96B:** Variant first seen in July 2016 loaded on a Russia-bound train to participate in the 2016 Tank biathlon. It is equipped with an improved engine, improved high-performance gun with an upgraded fire-control system, new transmission, chassis, ventilation, communications and computer systems, exhaust and suspension. Additionally it features an independent commander sight and lighter, more reliable running wheels. The specifications of the upgraded engine are unknown but is speculated to produce between 1,000 and 1,200 horsepower
- **VT-2:** Export variant of Type-96A. Debuted at the 2012 Defence Services Asia Exhibition. Can be equipped with Remote Weapons Station and has a maximum speed of 70 km/h (on road). Capable of turning on its own axis.

System

Alternative Designation: Type 96A, ZTZ-96Gai; Type 96G
Manufacturer: First Inner Mongolia Machinery Factory
Type: Main Battle Tank
Family: Type 96 Main Battle Tank Family
Crew: ea3
Note: The Type 96A looks different from the Type 96 because of the additional arrow shaped armor on the turret front and the extra ERA plates

Dimensions

Length (Hull): m6.33

Communications

↳*TBR-121*

VHF Transceiver: Yes

VHF Range: km1 to 50

Proliferated: Widely

Digital Data: Yes, Full

Control: Self-Adaptive Control (Including Automatic Antenna Tuner)

Frequency Agile: Yes

Wireless Network Capabilities: Yes

Note:: Very similar in capabilities to the US SINCGARS ASIP

Main Gun

↳*System*

Name: 125 mm L50 ZPT-98

Type: 125mm Smoothbore Gun

Max Rate of Fire (Automatic Loading): rds/min8

Max Rate of Fire (Manual Loading): rds/min1-4

Length (Barrel): mm6,000

Barrel Type: 1 with a sliding gun barrel and a smoke evacuator in the middle

Loader Type: Autoloader

Thermal Sleeve: Yes, Light Alloy

Bore Evacuator: Yes

Barrel Life: rounds800

Loader Type: Carousel auto-loader and Manual Loading capable

Launch Mode: Single Shot

After: Wedge Cross

Recoil: Hydraulic and pneumatic

Note: The L50 ZPT-98 can replce the barrel without removing the turret

↳*Ammunition (Option 1)*

Type: High Explosives (HE)

Caliber: mm125

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Muzzle Velocity: m/s850

Basic Load: 42 total rounds of any 125mm Projectiles

Maximum Effective Range: m4,000

Minimum Effective Range: mINA

Max Dispersion: mrad0.23

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Round Weight: kg33

Projectile Weight: kg23

Fragments: ea2,500

Armor Penetration: Yes

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 2)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Muzzle Velocity: m/s915

Basic Load: 42 total rounds of any 125mm Projectiles

Max Dispersion: INA

Maximum Effective Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Fragments: INA

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

↳*Ammunition (Option 3)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS) Rounds.

Name: 3VBM?/3BM69 "Vacuum-1"

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 42 total rounds of any 125mm Projectiles

Maximum Effective Range: m3,000

Projectile Dimension: mm900

Round Weight: INA

Projectile Weight (Estimated): kg11

Armor Penetration: mm1,000

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Tank Commander's Weapon System

↳*System*

Name: Type 80 Chinese Heavy Machine Gun

Type: 7.72mm Heavy Machine Gun

Manufacturer: Norinco

Date of Introduction: 1985

Max Rate of Fire: rds/min700-800

Length (Total): mm1,192

Length (Barrel): mm658

Diameter: mmINA

Weight (Gun Only): kg12.6

Weight (With Tripod): kg17.5

Action: Gas-operated, open bolt

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

Variant 1: Type 80 - The copy of the PKM GPMG, chambered in 7.62×54mmR

Variant 2: Type 86 - A machine gun only used for tanks as a secondary weapon.

Variant 3: CF06 - An export-only version of the Type 80, which is chambered for 7.62 NATO ammunition.

Variant 4 (Foreign): BD-14 - A variant of the Type 80 made by Bangladesh Ordnance Factories under license which uses 7.62×51mm NATO instead of 7.62×54mmR

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Muzzle Velocity: m/s840

Basic Load: ea2,250

Effective Range (With Sight Adjustments): m100-1,500

Armor Penetration: Available

Loader's Weapon System

↳*System*

Name: QJG89

Type: 12.7mm Heavy Machine Gun

Manufacturer: INA

Max Rate of Fire: rds/min400-600

Length (Total): mm2,119

Length (Barrel): mm1,003

Weight (Gun Only): kg18.5

Weight (Tripod): kg17.5

Action: Gas Operated

Feed System: Belt

Sights: Iron/Optical

↳*Ammunition*

Type: Rifle

Caliber: mm12.7x108

Muzzle Velocity: m/s825

Basic Load: ea500

Effective Range (vs. Air): m1,500

Effective Range (vs. Ground): m2,000

Feed System: Belt fed, 50 rounds

Action: Hybrid direct impingement and short recoil

Fire Control

Name: New Updated FCS, ISFCS-213

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes

Thermal Sight Gunner: Yes

Maximum Night Vision Distance: m1,500

Main Gun Stabilization: Dual axis gun stabilisation

Periscopes: ea3

Rangefinder: Laser

Sights, Maximum Distance (Day): m5,000

Ballistic Computer: Yes

Sights, Maximum Distance (Night): m1,200

Step Motor Driver: Yes

Crosswind Velocity Sensor: Yes

Note: The Type 96 is unable to perform hunter-killer engagements

:

Protection

Hull Armor: Type 96: Composite armor, FY Series ERA Added

Turret Armor: Type 96: Composite armor, FY Series ERA Added.

Turret Protection: 670mm of RHAe

Applique Armor: Available, Track Skirts

Explosive Reactive Armor: FY Series ERA

Active Protection System: INA

Mine Clearing: Roller-plow available

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Grenlaunch 12x; VESS

IR Signature: INA

Grenades: Six 76mm grenades are equipped on each side of the turret

Automatic Fire Suppression System: Yes

Jammer: JD-3 IR Jammer

Note: The RY Series ERA is capable of protecting the Type 96A against single or multiple HEAR projectiles and the manufacturer claims the ERA can withstand SABOT Rounds.

Notes:

The Type 96A was an upgrad of the Type 96 that entered service in 2006, it reflects the developments made in Chinese tank design such as the arrow shaped add on turret armour also found on the Type 99. The vehicle described below is offered for export in the format described below with the designation of VT2.A total of 42 rounds are carried. Additional "arrow shaped" modular armor similar to the Type 99 is installed on the turret front. The back of the hull is now completely flat compared to the Type 96. The Type 96A was first revealed in 2006, but in-service tanks were first seen in a military parade in 2009. The Type 96A is a third-generation upgrade of the Type 96. Its internal electronics may have been upgraded to Type 99 standards. The visual profile of the Type 96A is similar to the Type 99. However, the Type 96A can be distinguished from the Type 99 by the driver's position of the left side of the hull. FY-4 ERA was added on front upper glacis.The vehicle is equipped with a thermal imager. Features an upgraded 800 hp engine. A laser defense system similar to the Shtora has been installed as well.[Electro-optical jammers which are able to jam enemy guided missiles, rangefinders, and designators are found on the tank.

Leopard 1A5 German Main Battle Tank (MBT)

Tiers:

Variants:

- **Leopard 1:** The Leopard project started in November 1956 in order to develop a modern tank, the Standard-Panzer, to replace the Bundeswehr's American-built M47 and M48 Patton tanks, which, though just delivered to West Germany's recently reconstituted army, were rapidly becoming outdated. On 25 July 1957, the detailed specifications were released; the new design needed to weigh no more than 30 tonnes, have a power-to-weight ratio of 30 horsepower per tonne, be able to withstand hits by 20 mm rapid-fire guns on every side as well as to operate in a battlefield contaminated with chemical weapons or radioactive fallout, the then-standard baseline for combat with the Warsaw Pact. In addition, the main armament had to consist of a 105 mm caliber weapon (the new British L7A3 105 mm gun was selected), carrying at least as many rounds as current US tank designs. Mobility had priority, while firepower came second; armour was seen as less essential, as it was believed that no real protection against hollow charge weapons was possible anyway.
- **Leopard 1A1:** After the first batch was delivered, the next three batches were the Leopard 1A1 model, which included a new gun stabilization system from Cadillac Gage that allowed the tank to fire effectively on the move. The 1A1 also added the now-famous "skirts" along the sides to protect the upper tracks, and a new thermal jacket on the gun barrel to control heating. A less important change was to use rectangular rubber blocks fastened to the treads with a single pin instead of the earlier two-pin "shaped" versions. The rubber blocks could be easily replaced with metal X-shaped crampons for movement on ice and snow in the winter.
- **Leopard 1A2:** The first 232 tanks of the fifth production batch were delivered as the Leopard 1A2 between 1972 and 1974. The A2 included a heavier and better armoured turret, and therefore did not receive the B&V armour add-ons as did the earlier machines. However, they did receive the other upgrades; the Leopard 1A2A1 received the PZB 200, the Leopard 1A2A2 received digital radios, and the Leopard 1A2A3 got both.
- **Leopard 1A3:** The next 110 vehicles in the fifth batch were fitted with a new welded turret, which was equipped with a new armor consisting of two spaced steel plates with a plastic filling between them (high-hardness armor, and a wedge-shaped gun mantlet, creating the Leopard 1A3. Although the level of armor area density was equivalent to the A2's new welded version, the internal volume was increased by 1.2 m^3 and the effective protection level was increased by half. The improved TRP 2A independent sight was installed for the commander. Upgrades were identical to the 1A2 models, the Leopard 1A3A1 with the night sights, Leopard 1A3A2 with the new radios, and the Leopard 1A3A3 with both.
- **Leopard 1A4:** The Leopard 1A4 formed the sixth batch of 250 vehicles, delivery starting in 1974. The 1A4 was externally similar to the 1A3, but included a new computerized fire control system and the new EMES 12A1 sighting system to aim it. In addition, the commander was provided with his own independent night sighting system, the PERI R12. The new equipment used up space and the ammunition load was reduced to 55 rounds, of which 42 were stored in the magazine to the left of the driver.
- **Leopard 1A5:** In 1980, a research program was undertaken to study further improvements to the Leopard 1, providing it with a completely modern fire control system and fully effective night/bad-weather vision system. The decision was made to base the upgrades on the earlier models, which were no longer competitive. The resulting Leopard 1A5 was based on 1,225 vehicles of the Leopard 1A1A1 model. The turrets were again modified for the 1A5, both in order to store all of the new equipment, as well as to move more of the ammunition into the rear of the turret, as opposed to the left side of the driver where it had previously been stored. The new turret was also able to mount the newer 120 mm gun from the Leopard 2 if desired, although this option has not been used. After trials, the Krupp-Atlas Elektronik EMES 18 fire control system, which was developed from the EMES 15 used on the Leopard 2, was selected in December 1983. The EMES 18 included two new sights on the top of the turret, and no longer required the "bumps" as did the earlier optical systems. A crucial part of the upgrade was the introduction of more effective ammunition, including new APFSDS rounds. The Leopard tank could also be fitted with bolt-on polycarbonate (Lexan) armour panels, which have increased the effectiveness of the armour. The first modified vehicle was delivered in early 1987. Since then, almost all users of

the Leopard 1 have also applied similar changes to their own vehicles, and in most ways the 1A5 be considered the "standard" Leopard 1 today. In the Netherlands, an improved version equivalent to the A5 called "Leopard 1 Verbeterd" (improved) was developed, the same version is used by the Chilean Army.
- **Leopard 1A6:** The Leopard 1A6 prototype was a single Leopard 1 A1A1 testbed, modified with additional armour on the turret and equipped with a 120 mm L/44 gun. The project was ended in 1987, as the Leopard 2 was in widespread service at this point and the 1A5 offered a more reasonable upgrade path for a fraction of the cost.

System

Alternative Designation: Leopard 1A5

Type: Main Battle Tank

Manufacturer: Krauss-Maffei Wegmann, Munich, Germany Krupp-MaK, Kiel, Germany

Crew: 4 (commander, gunner, loader, driver)
