Notes:

The Mi-26T2 is the latest upgraded version of the Mi-26. The Mi-26T2 is a modernisation of the Mi-26T heavy-lift transport helicopter designed by Mil Moscow Helicopter Plant, a division of Russian Helicopters.The modernised helicopter is designed to transport heavy cargo and equipment. It can be used to quickly transport up to 82 troops and their equipment, as well as a wide range of heavy-weight combat vehicles. Mi-26T2 - an upgraded version of the helicopter, Mi-26T2 is fitted with a new BREO-26 avionics suite and glass cockpit with five multifunctional LCD displays, new digital autopilot, and NAVSTAR/GLONASS supported navigation system. The Mi-26T2’s array of on-board equipment ensures the helicopter can operate in any part of the world, and ensures it can perform flights to international standards. The latest avionics suite fitted also makes it possible to reduce the number of crew needed from 5 to 2 people, plus an operator should the external sling be in use.

Mi-8 (Hip) Russian Medium Transport Helicopter

System

Alternative Designation: Mi-8T; Hip
Primary Function: Armed assault-transport
Type: Medium twin-turbine transport helicopter
Manufactuer: Kazan Helicopter Plant Ulan-Ude Aviation Plant
Crew: ea3 (2x pilots, 1x flight engineer)
Blades, Main Rotor: 5
Blades, Tail Rotor: ea3
Day/Night Capable: The Mi-8 is equipped with instruments and avionics allowing operation in day, night, and instrument meteorological conditions.
All Weather Capable: The Mi-8 is equipped with instruments and avionics allowing operation in day, night, and instrument meteorological conditions.
Takeoff or Landing Limitations: INA
Vertical Climb Rate: m/s9
Number of Hard Points: ea4
Standard Payload: HIP C: 24 troops, or 3,000 kg internal or external loads on 4x hardpoints.

Landing Gear: Fixed main gear struts run down and out from attachment points on the upper, rear fuselage. A second strut holds the wheel well away from the lower fuselage. The two-wheel nose gear is fitted under the fuselage just behind the cockpit

Dimensions

Length, with Rotors Turning: m25.2
Length, Fuelage: m18.2
Width: m2.5
Height: m5.65
Main Rotor Diameter: m21.3
Tail Rotor Diameter: m3.9
Cargo Compartment, Length: m5.3
Cargo Compartment, Width: m2.3
Cargo Compartment, Height: m1.8
Weight, Maximum Gross: kg12,000
Weight, Normal Takeoff: kg11,100
Weight, Empty: kg6,990

Automotive

Engine Name: 2 x TV2-117
Engine Type: Medium twin-turbine
Engine Power: hp1,482
Speed, Maximum: km/h250
Speed, Average: km/h225
Service Ceiling: m4,500
Range, Maximum Load: km350
Range, Normal Load: km460
Range, with Auxilery Fuel: km950
Fuel, Internal: 445 liters
Fuel, Internal Aux Tank: 915 liters ea
Fuel, External Fuel Tank: 45 liters in port tank, 680 liters in starboard tank
Service Ceiling, Service: m4,500
Service Ceiling,Hover (out of ground effect): m800
Service Ceiling,Hover (in ground effect): m1,900
Vertical Climb Rate: m/s9
Standard Payload: HIP C: 24 troops, or 3,000 kg internal or external loads on 4x hardpoints.

Communications

Radio: INA

Door Mounted Gun

Note: Loaded combat troops can fire personal weapons through windows from inside cabin.

Wing Mounted Weapons

Additional Armament that can be equipped on the Mi-8T: 2 - 7.62-mm or 1x 12.7-mm MG 4-6 - AT-2C Swatter or AT-3 Sagger ATGMs 4-6 - 57-mm rocket pods (16 each) 2 - 80-mm rocket pods (20 each) 4 - 250-kg bombs 2 - 500-kg bombs 2 - 12.7-mm MG pod 2 - Twin 23-mm gun pods 1,830 liters Additional fuel tanks

↳*Rocket System*

Name: UB-32 (rocket pod)

Type: 57 mm, reusable, 32-salvo rocket pod

Length, Launcher: mm2,080

Diameter, Launcher: mm464

Basic Load for the UB-32 Rocket Pod: ea4, one on each hardpoint

Number of Rockets in each UB-32 Rocket Pod: ea32

↳*Rocket*

Name: S-5 Rockets

Type: Rocket

Length, Rocket: mm2,080

Diameter, Rocket: mm481

Weight Empty: kg103

Weight Loaded: kg264

Warhead Types: produced in a variety of sub-types with different warheads, including HEAT anti-armour (S-5K), high-explosive fragmentation (S-5M/MO), smoke, and incendiary rounds

Maximum Effective Range: 3-4 km depending on the warhead and fuze

Basic Load: 32 S-5 Rockets per UB-32 Rocket Pod

Counter Measures (Chaff/Flares): Yes,

Jammer: Hot Brick IR

Notes:

The Mil Mi-8 (Russian: Ми-8, NATO reporting name: Hip) is a medium twin-turbine helicopter, originally designed by the Soviet Union, and now produced by Russia. In addition to its most common role as a transport helicopter, the Mi-8 is also used as an airborne command post, armed gunship, and reconnaissance platform. Along with the related, more powerful Mil Mi-17, the Mi-8 is among the world's most-produced helicopters, used by over 50 countries. As of 2015, it is the third most common operational military aircraft in the world. Mikhail Mil originally approached the Soviet government with a proposal to design an all-new two-engined turbine helicopter after the success of the Mil Mi-4 and the emergence and effectiveness of turbines used in the Mil Mi-6; but the military argued against a new helicopter, as they were content with the current Mil Mi-4.To counter this, Mikhail Mil proposed that the new helicopter was more of an update to new turbine engines rather than an entirely new helicopter; this persuaded the council of ministers to proceed with production. Due to the position of the engine, this enabled Mikhail Mil to justify redesigning the entire front half of the aircraft around the single engine (designed by Oleksandr Ivchenko at OKB-478 in Zaporizhzhia, Ukraine, originally for fixed wing aircraft as all other soviet turbines had been up to that point). The prototype, which was named V-8, was designed in 1958 and based on the Mil Mi-4 with a larger cabin. Powered by an AI-24 2,010 kW (2,700 shp) Soloviev turboshaft engine, the single engined V-8 prototype had its maiden flight in June 1961 and was first shown on Soviet Aviation Day parade (Tushino Air Parade) in July 1961. The Soviet military originally showed little interest in the Mi-8 until the Bell UH-1's involvement in the Vietnam war became widely publicised as a great asset to the United States, allowing troops to move swiftly in and out of a battlefield and throughout the country. It was only then that the Soviet military rushed a troop-carrying variant of the Mil Mi-8 into production. By 1967, it had been introduced into the Soviet Air Force as the Mi-8. There are numerous variants, including the Mi-8T, which, in addition to carrying 24 troops, is armed with rockets and anti-tank guided missiles. The Mil Mi-17 export version is employed by around 20 countries; its equivalent in Russian service in the Mi-8M series. The only visible difference between the Mi-8 and Mi-17 is that the tail rotor is on the starboard side (right side) of the Mi-8, whereas in Mi-17 it is on the port side. Also Mi-17 also has some improved armour plating for its crew. The naval Mil Mi-14 version is also derived from the Mi-8. The Mi-8 is constantly improving and the newest version still remains in production in 2016. During an official visit to the United States in September 1959, Nikita Khrushchev took a flight in the S-58 presidential helicopter for the first time and was reportedly extremely impressed.[9][10] On Khrushchev's return, he ordered the creation of a similar helicopter, which was to be ready for the return visit by the American president, to save face. A luxury version of the Mi-4 was quickly created and Khrushchev took an inspection flight, during which Mikhail Mil proposed that his helicopter in development was more suitable. However, it would be necessary to have a second engine for reliability. This gave Mikhail Mil the power under the orders of Khrushchev to build the original two-engined helicopter, which for the first time in Soviet history would need purpose-built turbine engines, rather than those adapted from fixed wing aircraft (as in the Mil Mi-6 and the first prototype V-8) and an entirely new main rotor gear box that would be designed in-house for the first time. In May 1960, the order was given for Mikhail Mil to create his twin engine helicopter. The Sergei Isotov Design Bureau accepted the task of creating the engines. The second prototype (still equipped with the one turbine engine as the Isotov engines were still under development) flew in September 1961. Two months after the engines were completed by Isotov, the third prototype designated V-8A equipped with two 1,120 kW (1,500 shp) Isotov TV2 engines, made its first flight piloted by Nikolai Ilyushin on 2 August 1962, marking the first flight of any Soviet helicopter to fly with purpose built gas turbine engines. The aircraft completed its factory based testing in February 1963. The fourth prototype was designed as a VIP transport, with the rotor changed from four blades to five blades in 1963 to reduce vibration, the cockpit doors replaced by blister perspex slides and a sliding door added

to the cabin. The fifth and final prototype was a mass production prototype for the passenger market. In November 1964, all joint testing had been completed and the soviet government began mass production. Production started in the Kazan Production Plant, with the first aircraft completed by the end of 1965.

CH-47F American Medium Transport Helicopter

Tiers:

Variants:

- **HC-1B:** The pre-1962 designation for Model 114 development aircraft that would be redesignated CH-47 Chinook
- **CH-47A:** The all-weather, medium-lift CH-47A Chinook was powered initially by Lycoming T55-L-5 engines rated at 2,200 horsepower (1,640 kW), but then replaced by the T55-L-7 rated at 2,650 hp (1,980 kW) engines or T55-L-7C engines rated at 2,850 hp (2,130 kW). The CH-47A had a maximum gross weight of 33,000 lb (15,000 kg), allowing for a maximum payload around 10,000 lb (4,500 kg)
- **ACH-47A:** The ACH-47A was originally known as the Armed/Armored CH-47A (or A/ACH-47A). It was officially designated ACH-47A as a U.S. Army Attack Cargo Helicopter, and unofficially referred to as Guns A Go-Go. Four CH-47A helicopters were converted to gunships by Boeing Vertol in late 1965. Three were assigned to the 53rd Aviation Detachment in South Vietnam for testing, with the remaining one retained in the U.S. for weapons testing. By 1966, the 53rd was redesignated the 1st Aviation Detachment (Provisional) and attached to the 228th Assault Support Helicopter Battalion of the 1st Cavalry Division (Airmobile). By 1968, only one gunship remained, and logistical concerns prevented more conversions. It was returned to the United States, and the program stopped.
- **CH-47B:** The CH-47B was an interim solution while Boeing worked on a more substantially improved CH-47C. The CH-47B was powered by two Lycoming T55-L-7C 2,850 shp (2,130 kW) engines. It featured a blunted rear rotor pylon, redesigned asymmetrical rotor blades, and strakes along the rear ramp and fuselage to improve flying characteristics. It could be equipped with two door-mounted M60D 7.62 mm NATO machine guns on the M24 armament subsystem and a ramp-mounted M60D using the M41 armament subsystem. Some CH-47 "bombers" were equipped to drop tear gas or napalm from the rear cargo ramp onto Viet Cong bunkers. The CH-47B could be equipped with a hoist and cargo hook. The Chinook proved especially valuable in "Pipe Smoke" aircraft recovery missions. The "Hook" recovered about 12,000 aircraft valued at over $3.6 billion during the war; 108 were built.
- **CH-47C:** The CH-47C principally featured more powerful engines and transmissions.[61] Three sub-versions were built; the first had Lycoming T55-L-7C engines delivering 2,850 shp (2,130 kW). The "Super C" included Lycoming T55-L-11 engines delivering 3,750 shp (2,800 kW), an upgraded maximum gross weight of 46,000 lb (21,000 kg), and a pitch stability augmentation system. The T55-L-11 engines suffered difficulties, as they had been hurriedly introduced to increase payload; thus, they were temporarily replaced by the more reliable Lycoming T55-L-7C. The type was distinguishable from the standard "C" by the uprated maximum gross weight.
- **CH-47D:** The CH-47D shares the same airframe as earlier models, the main difference being the adoption of more powerful engines. Early CH-47Ds were originally powered by two T55-L-712 engines, the most common engine is the later T55-GA-714A. With its triple-hook cargo system, the CH-47D can carry heavy payloads internally and up to 26,000 pounds (12 t) (such as 40-foot or 12-metre containers) externally. It was first introduced into service in 1979. In air assault operations, it often serves as the principal mover of the 155 mm M198 howitzer, accompanying 30 rounds of ammunition, and an 11-man crew. The CH-47D also has advanced avionics, such as the Global Positioning System. Nearly all US Army CH-47D were conversions from previous A, B, and C models, a total of 472 being converted. The last

U.S. Army CH-47D built was delivered to the U.S. Army Reserve, located at Fort Hood, Texas, in 2002.[

- **MH-47D:** The MH-47D variant was developed for special forces operations and has inflight refueling capability, a fast rope-rappelling system, and other upgrades. The MH-47D was used by U.S. Army 160th Special Operations Aviation Regiment. 12 MH-47D helicopters were produced. Six were conversions from CH-47A models and six were conversions from CH-47C models.
- **MH-47E:** The MH-47E has been used by U.S. Army Special Operations. Beginning with the E-model prototype manufactured in 1991, a total of 26 Special Operations Aircraft were produced. All aircraft were assigned to 2–160th SOAR(A) "Nightstalkers", home based at Fort Campbell, Kentucky. E models were conversions from existing CH-47C model airframes. The MH-47E has similar capabilities as the MH-47D, but includes an increased fuel capacity similar to the CH-47SD and terrain following/terrain avoidance radar.
- **CH-47F:** In 2001, the first CH-47F, an upgraded CH-47D, made its maiden flight; the first production model rolled out on 15 June 2006 at Boeing's facility in Ridley Park, Pennsylvania, and first flew on 23 October 2006. Upgrades include 4,868-shaft-horsepower (3,630 kW) Honeywell engines and the airframe featuring greater single-piece construction to lower maintenance requirements. The milled construction reduces vibration, as well as inspection and repair needs, and eliminates flexing points to increase service life. The CH-47F can fly at speeds of over 175 mph (282 km/h) with a payload of more than 21,000 lb (9.5 t). New avionics include a Rockwell Collins Common Avionics Architecture System (CAAS) cockpit, and BAE Systems' Digital Advanced Flight Control System (DAFCS).[75] AgustaWestland assembles the CH-47F under license, known as the Chinook ICH-47F, for several customers.[78] Boeing delivered 48 CH-47Fs to the U.S. Army through August 2008; at that time Boeing announced a $4.8 billion contract with the Army for 191 Chinooks.
- **MH-47G:** The MH-47G Special Operations Aviation (SOA) version is currently being delivered to the U.S. Army. It is similar to the MH-47E, but features more sophisticated avionics including a digital Common Avionics Architecture System (CAAS). The CAAS is a common glass cockpit used by different helicopters such as MH-60K/Ls, CH-53E/Ks, and ARH-70As. The MH-47G also incorporates all of the new sections of the CH-47F.
- **CH-47J:** The CH-47J is a medium-transport helicopter for the Japan Ground Self-Defense Force (JGSDF), and the Japan Air Self-Defense Force (JASDF).[95] The differences between the CH-47J and the CH-47D are the engine, rotor brake and avionics, for use for general transportation, SAR and disaster activity like U.S. forces.The CH-47JA, introduced in 1993, is a long-range version of the CH-47J, fitted with an enlarged fuel tank, an AAQ-16 FLIR in a turret under the nose, and a partial glass cockpit. Both versions are built under license in Japan by Kawasaki Heavy Industries, who produced 61 aircraft by April 2001.
- **HH-47:** On 9 November 2006, the HH-47, a new variant of the Chinook based on the MH-47G, was selected by the U.S. Air Force as the winner of the Combat Search and Rescue (CSAR-X) competition. Four development HH-47s were to be built, with the first of 141 production aircraft planned to enter service in 2012.[
- **Sea Chinook:** For years US Navy has been operating different versions of the CH-53 helicopter. CH-47s regularly conduct ship-based operations for U.S. Special Forces and other international operators. Due to budget issues, technical problems and delays with CH-53K, the director of the Pentagon’s cost assessment office directed US Navy to consider maritime versions of CH-47. Naval versions must be protected against the corrosive seaborne environment and be able to operate from aircraft carriers and amphibious ships
- **Civilian models:** Model 234LR (long range): Commercial transport helicopter. The Model 234LR can be fitted out as an all-passenger, all-cargo, or cargo/passenger transport helicopter. Model 234ER (extended range): Commercial transport version. Model MLR (multi-purpose long range): Commercial transport version. Model 234UT (utility transport): Utility transport helicopter. Model 414: The Model 414 is the international export version of the CH-47D. It is also known as the CH-47D International Chinook.

System

Alternative Designation: CH-47F

Primary Function: The CH-47F performs various transport missions. It transports troops, war supplies and battlefield equipment. This helicopter is also deployed in medical evacuation, search and rescue, aircraft recovery, parachute drop and other operations.

Type: Medium Transport Helicopter

Crew: ea3

Passengers: The CH-47F accommodates 33 to 55 passengers, depending on cargo area configuration. However usually it carries less passengers. Alternatively it can carry up to 24 litters, plus medical attendants.

Blades, Main Rotor: ea3

Blades, Tail Rotor: ea3

Cargo Capacity: It can carry up to 10 900 kg of cargo internally and 12 700 kg externally on a sling load.

Cargo Hooks: The helicopter has three external cargo hooks and can carry various loads, such as light vehicles, artillery

pieces or shelters.

Internal Payload: 10.9 tons

External Payload: 12.7 tons

Dimensions

Length: 30.1 m

Main Rotor Diameter: 18.29 m

Height: 5.68 m

Weight, Empty: 10.19 tons

Weight, Maximum Take Off: 22.68 tons

Automotive

Engine Name: 2 x Honeywell T55-GA-714A

Engine Type: Turboshafts

Engine Power: 2 x 4 733 shp

Maximum Speed: 315 km/h

Cruising Speed: 291 km/h

Service Ceiling: 5.64 km

Range: 741 km

Ferry Range: 2 252 km

Main Weapon System

Note: This military transport helicopter can be armed with up to three 7.62 mm machine guns or miniguns. Two of them can be mounted in the doors and one on loading ramp.

Notes:

In 2001, the first CH-47F, an upgraded CH-47D, made its maiden flight; the first production model rolled out on 15 June 2006 at Boeing's facility in Ridley Park, Pennsylvania, and first flew on 23 October 2006. Upgrades include 4,868-shaft-horsepower (3,630 kW) Honeywell engines and the airframe featuring greater single-piece construction to lower maintenance requirements.[75] The milled construction reduces vibration, as well as inspection and repair needs, and eliminates flexing points to increase service life. The CH-47F can fly at speeds of over 175 mph (282 km/h) with a payload of more than 21,000 lb (9.5 t). New avionics include a Rockwell Collins Common Avionics Architecture System (CAAS) cockpit, and BAE Systems' Digital Advanced Flight Control System (DAFCS). AgustaWestland assembles the CH-47F under license, known as the Chinook ICH-47F, for several customers. Boeing delivered 48 CH-47Fs to the U.S. Army through August 2008; at that time Boeing announced a $4.8 billion contract with the Army for 191 Chinooks. In February 2007, the Royal Netherlands Air Force became the first

international customer, ordering six CH-47Fs, expanding their fleet to 17. On 10 August 2009, Canada signed a contract for 15 extensively modified and upgraded CH-47Fs for the Canadian Forces, later delivered in 2013–2014 with the Canadian designation CH-147F. On 15 December 2009, Britain announced its Future Helicopter Strategy, including the purchase of 24 new CH-47Fs to be delivered from 2012. Australia ordered seven CH-47Fs in March 2010 to replace its six CH-47Ds between 2014 and 2017. In late 2015, Australia has sought permission to order three more CH-47Fs. In September 2015 India approved purchase of 15 CH-47F Chinooks. On 7 November 2016, Singapore announced that the CH-47F would replace its older Chinooks, which had been in service since 1994. This would enable the Republic of Singapore Air Force to meet its requirements for various operations, including Search and Rescue (SAR), Aeromedical Evacuation (AME), and Humanitarian Assistance and Disaster Relief (HADR) operations. A CH-47F Block 2 is planned to be introduced after 2020. The Block 2 aims for a payload of 22,000 lb (10,000 kg) with 4,000 ft (1,200 m) and 95 °F (35 °C) high and hot hover performance, eventually increased up to 6,000 ft (1,800 m), to carry the Joint Light Tactical Vehicle; maximum takeoff weight would be raised to 24,500 kg (54,000 lb). It features the composite-based Advanced Chinook Rotor Blade (derived from the cancelled RAH-66 Comanche) 20% more powerful Honeywell T55-715 engines, and the active parallel actuator system (APAS); the APAS enhances the digital advanced flight-control system, providing an exact torque split between the rotors for greater efficiency. A new fuel system combines the three fuel cells in each sponson into one larger fuel cell and eliminating intracell fuel transfer hardware, reducing weight by 90 kg (200 lb) and increasing fuel capacity. Electrical capacity is increased by three 60 kVA generators. The U.S. Army plans for a Block 3 upgrade after 2025, which could include a new 6,000 shp-class engine with boosted power capacity of the transmission and drive train developed under the future affordable turbine engine (FATE) program and a lengthened fuselage. The Future Vertical Lift program plans to begin replacing the Army's rotorcraft fleet in the mid-2030s, initially focusing on medium-lift helicopters, thus the CH-47 is planned to be in service beyond 2060, over 100 years after first entering service.

EC725 French Caracal Medium Transport Helicopter

Tiers:

Variants:

- **H225:** This is the civilian variant of the H225M. It can carry 24 passengers and an attendant for offshore operations or eight to 10 passengers in a VIP configuration. It is also equipped with a full de-icing/anti-icing system.
- **H225e:** This is an improved version of the H225 launched in February 2014. It is designed for longer-range flights, particularly for offshore oil and gas airlift missions. The helicopter is powered by Turbomeca Makila 2B turboshaft engines, which provide enhanced performance and an extended range of 300 nm (555 km) with 10 passengers. The engine has a new combustion chamber and blades in the high-pressure turbine, which permits the H225e to take off at its maximum weight. A new seating layout provides increased comfort for passengers and offers better access. The upgraded cockpit features a Euronav 7 moving map system; automatic identification system (AIS); TCAS2 collision-avoidance system; and a flight-management system. Enhanced operational capabilities include the ability to perform automatic GPS approaches to oil rigs or airfields that are not equipped with radio navigation systems.
- **Eurocopter EC225 Super Puma:** The Airbus Helicopters H225 (previously Eurocopter EC225 Super Puma) is a long-range passenger transport helicopter developed by Eurocopter as the next generation of the civilian Super Puma family. It is a twin-engined aircraft and can carry up to 24 passengers along with two crew and a cabin attendant, dependent on customer configuration. The helicopter is marketed for offshore support and VIP passenger transport duties, as well as public service missions. The civil-orientated EC225 has a military counterpart, which was originally designated as the Eurocopter EC725; it was rebranded in 2015 as the H225M. In 2015, the EC225 was formally renamed to the H225, in line with Eurocopter's corporate rebranding as Airbus Helicopters

Notes:

The Eurocopter EC725 Caracal, now called Airbus Helicopters H225M, is a long-range tactical transport military helicopter developed from the Eurocopter AS532 Cougar for military use. It is a twin-engined aircraft and can carry up to 28 seated troops along with two crew, depending on customer configuration. The helicopter is marketed for troop transport, casualty evacuation, and combat search and rescue duties, and is similar to the civilian EC225. The EC725 was developed to meet a French Air Force requirement for a specialist helicopter for Combat Search and Rescue operations. The AS 532 A2 Cougar model was examined and rejected for this purpose following extensive trials between 1996 and 1999. The primary improvements desired by the French Air Force were more powerful engines, greater flight endurance and improved combat durability. Eurocopter opted to pursue development of a more ambitious derivative of the AS 532 to meet this need, which was later designated as the EC725. The EC725 was initially named Cougar Mk II+ due to treaty reasons. The new aircraft also featured new mission equipment and autonomous avionics, along with other changes to meet the French specification. On 27 November 2000, the first EC725 prototype performed its maiden flight at Marignane, and on 15 January 2001, the first public presentation of the new helicopter took place. In concurrent development of the military-orientated EC725, Eurocopter also developed a civil-orientated counterpart, which was designated as the EC225. The French Air Force subsequently ordered an initial six EC725s to perform the Combat Search & Rescue mission, the first of these was delivered in February 2005. A follow-on order for eight more EC725s was placed for the French Armed Forces in November 2002; a total fleet of 20 EC725s in French service was envisioned in 2004. By 2015, the EC725, since re-designated as the H225M, was being manufactured on two separate production lines in France and Brazil. In July 2015, Airbus Helicopters announced that it was considering setting up a third assembly line in India if the firm was successful at winning an Indian tender for naval helicopters. he EC725 is based on the Eurocopter AS 532 Cougar, improving upon the design with a five-blade composite main rotor incorporating a new airfoil shape to reduce vibration levels. The helicopter can be fitted with removable armour plating to protect the troops and is powered by two Turbomeca Makila 1A4 turboshaft engines mounted over the cabin, which feature a dual-channel Full Authority Digital Engine Control (FADEC) system. They can be fitted with an anti-icing system to enable the aircraft to operate in very cold climates. Other improvements include a reinforced main rotor gearbox and an all glass cockpit. The cockpit is equipped with an integrated display system featuring a digital map and Active Matrix Liquid Crystal Displays. The helicopter has day and night time search and rescue capabilities by way of a search radar and Forward Looking Infra Red (FLIR); these allow the EC725 to be flown under visual meteorological and instrument flight rules conditions. The EC725 can be equipped with various military equipment and armaments, such as a pair of 7.62 mm FN MAG machine guns mounted within forward left and right windows, or a pair of 68 mm (2.75") Thales Brandt or

Forges de Zeebrugge side-mounted rocket launchers, each with 19 rockets, or the MU90 Impact aerial-launched torpedo. Brazilian EC725s are equipped with a Helibras-built countermeasures suite, which includes chaff and flares to confuse radar and heat-guided missiles respectively; Thales has also produced self-protection systems to equip French EC725s. The Exocet anti-ship missile has also been integrated upon Brazilian Navy EC725s. Eurocopter developed four primacy cabin configurations for the type. The Troop Transport version contains a seating arrangement for a maximum of 29 troops, in addition to the crew. A dedicated VIP transport version is designed to contain between 8 and 12 passengers. The Casualty Evacuation version can carry up to 12 stretchers along with a total of four seated medical staff. The Combat SAR configuration is fully equipped to perform search and rescue duties in a combat environment. According to Airbus Helicopters, the H225M is capable of undertaking various mission roles including combat search and rescue, long-range tactical transport, aeromedical transport, logistic support and shipboard maritime operations. The armed version carries gun pods, rocket pods and Hellfire air-to-surface missiles (HForce Generic Weapon System (GWS) with Thales Scorpion helmet-mounted sight display (HMSD) and Wescam electro-optical sensor)

NOTES

Description: INSET LINE-DRAWING SHOWS NOSE AND INTAKE DIFFERENCES OF THE MIG-27.THIS DIFFERENCE ALLOWS FOR A LASER RANGEFINDER/TARGET DESIGNATOR. THE SWEEP WING IS CAPABLE OF THREE ANGLES: 16, 45, AND 72 DEGREES. THE VENTRAL FIN ON THE BOTTOM REAR OF THE FUSELAGE FOLDS FOR TAKEOFF AND LANDING. UP TO FIVE EXTERNAL FUEL TANKS CAN BE CARRIED ON THE MIG-23, AND FOUR ON THE MIG-27, BUT THE MIG-27 CAN ALSO BE FITTED FOR AERIAL REFUELING. AVAILABLE MUNITIONS ARE SHOWN ABOVE; NOT ALL MAY BE EMPLOYED AT ONE TIME. MISSION DICTATES WEAPONS CONFIGURATION. EXTERNAL STORES ARE MOUNTED ON UNDERWING AND UNDERBODY HARDPOINTS. EACH WING HAS ONE POINT, TWO POINTS ARE UNDER THE INTAKES ALONG THE FUSELAGE, AND THE CENTER FUSELAGE ATTACHMENT POINT GIVES FIVE TOTAL STATIONS. THE MIG-27 THEN ADDS TWO MORE BOMB RACKS UNDER THE WINGS FOR A TOTAL OF SEVEN STATIONS.

↳***MIG-27L***

Description: EXPORT VERSIONS BUILT BY HINDUSTAN AERONAUTICS IN INDIA.

↳***J-8***

Description: CHINESE AIRCRAFT IS LOOSELY BASED ON MIG-21AND MIG-23 FEATURES.

Notes:

The Mikoyan-Gurevich MiG-23 (Russian: Микоян и Гуревич МиГ-23; NATO reporting name: Flogger) is a variable-geometry fighter aircraft, designed by the Mikoyan-Gurevich design bureau in the Soviet Union. It is a third-generation jet fighter, the world's most-produced variable-geometry aircraft, along with similar Soviet fighters such as the Su-15 "Flagon". It was the first Soviet fighter to field a look-down/shoot-down radar and one of the first to be armed with beyond visual range missiles. Production started in 1969 and reached large numbers with over 5,000 aircraft built. Today the MiG-23 remains in limited service with some export customers. The basic design was also used as the basis for the Mikoyan MiG-27, a dedicated ground-attack variant. Among many minor changes, the MiG-27 replaced the MiG-23's nose-mounted radar system with an optical panel holding a laser designator and a TV camera. The MiG-23's armament evolved as the type's avionics were upgraded and new variants were deployed. The earliest versions, which were equipped with the MiG-21's fire control system, were limited to firing variants of the R-3/K-13 (AA-2 "Atoll") missile. The R-60 (AA-8 "Aphid") replaced the R-3 during the 1970s, and from the MiG-23M onwards the BVR R-23/R-24 (AA-7 "Apex") was carried. The MiG-23MLD is capable of firing the R-73 (AA-11 "Archer"), but this missile was not exported until the MiG-29 was released for export. The helmet-mounted sight associated with the R-73 missile was fitted on the MiG-23MLDG and other experimental MiG-23MLD sub variants that never entered production as had been originally planned. The reason was that these MiG-23MLD sub variants had less priority than the then ongoing MiG-29 program, and the Mikoyan bureau therefore decided to concentrate all their efforts on the MiG-29 program and halted further work on the MiG-23. Nevertheless, a helmet-mounted sight is now offered as part of the MiG-23-98 upgrade. There were reports of the MiG-23MLD being capable of firing the R-27 (AA-10 "Alamo") beyond experimental tests; however, it seems only Angola's MiG-23-98s are capable of doing so. A MiG-23 was used to test and fire the R-27, R-73, and R-77 (AA-12 "Adder") air-to-air missiles during their early flight and firing trials. Ground-attack armament includes 57 mm rocket pods, general-purpose bombs up to 500 kg in size, gun pods, and Kh-23 (AS-7 "Kerry") radio-guided missiles. Up to four external fuel tanks could be carried.

MiG-17 (Fresco) Russian Fighter Aircraft

Tiers:

1 2 3 4

System

Alternate Designation(s): MiG-17; NATO: Fresco
Primary Function / Type: Fighter Aircraft
Manufacturer: Mikoyan-Gurevich
Crew: 1
Number of Engines: 1
Number of Hard Points: 2 pylons with a capacity of up to 500 kg (1,100 lb) of stores

Dimensions

Length: 11.36 m
Height: 3.36 m
Wingspan: 9.63 m
Wing Area: 22.60 sq m
Weight, Empty: 3,930 kg
Weight, Maximum Takeoff: 6,700 kg

Automotive

Engine Name: Klimov VK-1A
Number of Engines: 1
Engine Type: Turbojet

Maximum Power, Dry: 2,700 kg

Maximum Power with Afterburner: 3,380 kg

Internal Fuel Capacity: 1,410 liters

Maximum Speed: 1,100 km/h

Maximum Range: 2,020 km

Service Ceiling: 16,600 m

G Limits: +8

Rate of Climb: 65 m/s

Main Gun System

↳*Gun System #1*

Name: Nudelman-Rikhter NR-23

Type: Autocannon

Caliber: 23mm

Quantity: 2 × 23 mm (0.906 in) Nudelman-Rikhter NR-23 autocannon

Length: 1,980 mm

Barrel Length: 1,450 mm

Width: 165 mm

Height: 136 mm

Weight: 39 kg

Barrels: 1

Action: Short recoil

Rate of Fire: 800–850 rpm

Muzzle Velocity: 690 m/s

↳*Gun System #1 Ammunition*

Type: Rifle

Caliber: 23mm

Cartridge: 23×115 mm

Basic Load: 80 rounds per gun, 160 rounds total

↳*Gun System #2*

Name: Nudelman N-37

Type: Autocannon

Caliber: 37mm

Length: 2,455mm

Barrel Length: INA

Weight: 103 kg

Barrels: 1

Action: Short recoil

Rate of Fire: 400 rounds per minute

Muzzle Velocity: 690 m/s

↳***Gun System #2 Ammunition***

Type: Rifle

Caliber: 37mm

Cartridge: 37x155mm

Basic Load: 40 rounds total

Fire Control Radar: INA

Laser Desingator: INA

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The design of the MiG-17 was undertaken to correct the deficiencies that the earlier MiG-15 had at higher speeds. It was the first Soviet fighter to have an afterburning engine, the Klimov VK-1. In 1949, the Mikoyan-Gurevich (MiG) design bureau began work on a new fighter to replace the MiG-15. Two features of the aircraft were a thinner wing of greater sweep and a redesigned tail that improved stability and handling at speeds approaching Mach 1 (speed of sound). Although similar in appearance to the MiG-15, the MiG-17 has more sharply swept wings, an afterburner, better speed and handling characteristics and is about three feet longer. The wings of the aircraft are mid-mounted, swept-back, and tapered with blunt tips. They have wide wing roots. The engine is one turbojet inside the body and has a round air intake in the nose. It has a single, small exhaust. The fuselage is short, thick, cigar-shaped and tapered to the rear. It has a blunt nose and bubble canopy. The tail fin is swept-back and tapered with rounded tip. Flats are high-mounted on the tail fin, swept-back, and tapered. Flats and fin overhang the exhaust. The prototype MiG-17 (NATO code name Fresco) first flew in January 1950 and was reported to have exceeded Mach 1 in level flight. Production began in late 1951, but the aircraft were not available in sufficient quantities to take part in the Korean War. Deliveries to the Soviet Air Force began in 1952. Five versions of the aircraft eventually were produced. Early production MiG-17s were fitted with the VK-1 engine, a Soviet copy of the Rolls-Royce Nene. The VK-1F, an improved version with a simple afterburner and variable nozzle, was developed for the main production version, the MiG-17F (Fresco C). In 1955 the radar equipped MiG-17PF (Fresco D) entered service as a limited all-weather interceptor. The MiG-17PFU was armed with four AA-1 "Alkali" radar-guided missiles, making it the Soviet Union's first missile armed interceptor. Even though it was considered obsolete by the mid-1960s, the MiG-17 gave a good account over Vietnam, being flown by most of the top North Vietnamese pilots, including the leading ace, Colonel Tomb. The MiG-17 served with nearly 30 air forces worldwide, including the Soviet Union, Warsaw Pact countries, China, Afghanistan, North Korea, Sri Lanka, Syria, Morocco, Cuba, Indonesia, and Cambodia. Though smaller than the USAF F-86 Sabre of Korean War fame, its weight and performance favorably compared to that aircraft. Soviet production of the MiG-17 ended in 1958 with over 6,000 produced. It continued to be built under license in Poland as the Lim-5P and in China as the J-5/F-4. China's first reproduced jet fighter plane, the J-5, successfully flew in Shenyang for the first time on 19 July 1956, and General Nie Rongzhen went in person to Shenyang to offer congratulations.

JAS 39 Gripen Swedish Multirole Fighter Aircraft

Tiers:

Variants:

- **JAS 39A:** initial version that entered service with the Swedish Air Force in 1996. A number have been upgraded to the C standard.
- **JAS 39B:** two-seat version of the 39A for training, specialised missions and type conversion. To fit the second crew member and life support systems, the internal cannon and an internal fuel tank were removed and the airframe lengthened 0.66 m (2 ft 2 in).
- **JAS 39C:** NATO-compatible version of Gripen with extended capabilities in terms of armament, electronics, etc. Can be refuelled in flight.
- **two-seat version of the 39C, with similar alterations as the 39B.:** Improved version following on from the Gripen Demo technology demonstrator. Changes from the JAS 39C/D include the more powerful F414G engine, Raven ES-05 AESA radar, increased fuel capacity and payload, two additional hardpoints, and other improvements. These improvements have reportedly increased the Gripen NG costs to an estimated 24,000 Swiss Francs (US$27,000) per hour,[390] and increased the flyaway cost to 100 million Swiss Francs (US$113M).
- **AS 39E:** single-seat production version developed from the Gripen NG program, priced at US$85 million a unit. Sweden and Brazil have ordered the variant. Brazil's designation for this variant is F-39E
- **single-seat production version developed from the Gripen NG program, priced at US$85 million a unit.[392] Sweden and Brazil have ordered the variant.[84][173][235] Brazil's designation for this variant is F-39E:** two-seat version of the E variant. Eight ordered by Brazil,[248] to be developed and assembled in São Bernardo do Campo, Brazil; planned for pilot training and combat, being optimised for back seat air battle management, with jamming, information warfare and network attack, besides weapon system officer and electronic warfare roles. Brazil's designation for the variant is F-39F.

System

Alternate Designation(s): JAS 39 Gripen
Primary Function / Type: Fighter, attack, and reconnaissance aircraft
Manufacturer: Saab Group
In Service: 1996-Present
Crew: JAS 39A/C 1 JAS 39B/D 2

Number of Engines: 1

Day/Night Capable: Yes

All Weather Capable: Yes

Number of Pylons: 5 (four wing, one centerline), 2 wingtip rails

Weight, Total Load: JAS 39B/D: 5,300 kg; JAS 39C: 5,300 kg

Automotive

Engine Name: Volvo RM12 turbofan engine (now GKN Aerospace Engine Systems), a licence-manufactured derivative of General Electric F404, fed by a Y-duct with splitter plates; changes include increased performance and improved reliability to meet single engine use safety criteria, as well as a greater resistance to bird strike incidents.

Number of Engines: 1

Type: The Volvo RM12 is a low-bypass afterburning turbofan jet engine developed for the Saab JAS 39 Gripen fighter.

Engine Power: Maximum thrust: 54 kN (12,100 lbf) military thrust 80.5 kN (18,100 lbf) with afterburner

Maximum Range: 3,000 km

Maximum Speed: 2,450 km/h, Mach 2.0

Service Ceiling: 16,000 m

Acceleration: 30 sec Mach 0.5 to Mach 1.1

Climb Rate: 100 sec, brake release to 32,084 ft (10,000 m) 180 sec, brake release to 45,932 ft (14,000 m)

Turn Rate: 20 deg/sec sustained, 30 deg/sec instantaneous

Load: 9 g/-3 g max

Cannon Weapon System

↳*System*

Name: Mauser BK-27

Type: 27 mm Revolver Cannon

Caliber: 27mm

Manufacturer: Mauser (now Rheinmetall)

Proliferation: 3,100

In Service: 1977-Present

Length: 2.31 m

Barrel Length: 1.73 m

Weight: 100 kg

Barrel: Single Barrel

Action: Revolver

Rate of Fire: 1,000–1,700 rpm

Muzzle Velocity: 1,100 m/s

↳*Ammunition*

Type: Rifle

Caliber: 27 mm

Cartridge: 27×145 mm

Basic Load: 120

Pylon Weapons System

Number of Pylons: 5 (four wing, one centerline), 2 wingtip rails

Note: The Gripen is compatible with a number of different armaments, beyond the aircraft's single 27 mm Mauser BK-27 cannon (omitted on the two-seat variants), including air-to-air missiles such as the AIM-9 Sidewinder, air-to-ground missiles such as the AGM-65 Maverick, and anti-ship missiles such as the RBS-15. In 2010, the Swedish Air Force's Gripen fleet completed the MS19 upgrade process, enabling compatibility with a range of weapons, including the long-range MBDA Meteor missile, the short-range IRIS-T missile and the GBU-49 laser-guided bomb.

Weapons Load: 3,600 kg

↳*Missile System (Option 1)*

Name: AIM-9 Sidewinder

Type: Short-Range Air-to-Air Missile

In Service: 1956-Present

Proliferation: Widely Proliferated

Basic Load: INA

Length: 3.02 m

Diameter: 127.0 mm

Warhead: WDU-17/B annular blast-frag

Warhead Weight: 9.4 kg

Detonation mechanism: IR proximity fuze

Engine: Hercules/Bermite Mk. 36 Solid-fuel rocket

Wingspan: 279.4 mm

Operational Range: 1.0 to 35.4 km

Speed: Mach 2.5+

Guidance System: Infrared homing (most models) semi-active radar homing (AIM-9C)

Launch Platform: Aircraft, naval vessels, fixed launchers, and ground vehicles

↳*Missile System (Option 2)*

Name: AGM-65 Maverick

Type: Air-to-Ground Missile

Basic Load: INA

Manufacturer: Raytheon Missile Systems Raytheon

Proliferation: 70,000+

Length: 249 cm (8 ft 2 in)

Diameter: cm30

Warhead: 57 kg (126 lb) WDU-20/B shaped-charge (A/B/C/D/H models) 136 kg (300 lb) WDU-24/B penetrating blast-fragmentation (E/F/G/J/K models) E models utilize FMU-135/B delayed impact fuze

Weight: 210–304 kg

Engine: A/B:Thiokol SR109-TC-1 D/E/F/G/H/J/K: SR114-TC-1 (or Aerojet SR115-AJ-1) Solid propellant rocket motor via a WPU-4/B or WPU-8/B propulsion section

Wingspan: 710 mm

Propellant: Solid propellant

Operational Range: Greater than 22 km

Speed: 1,150 km/h

Guidance System: system A/B/H/J/K:: Electro-optical guidance D/F/G: imaging infrared guidance E: Laser guidance

↳*Missile System (Option 3)*

Name: RBS-15

Type: Long-Range Fire-and-Forget Surface-to-Surface and Ar-to-Surface, Anti-Ship Missile.

Manufacturer: Saab Bofors Dynamics, Diehl BGT Defence

In Service: 1985-Present

Proliferation: Widely Proliferated

Length: m4.33

Diameter: cm50

Wingspan: 1.4 m

Warhead: 200 kg HE blast and pre-fragmented warhead.

Detonation Mechanism: impact or proximity

Engine: Turbojet

Operational Range: 70 km for RBS-15 Mk. I and II, 250 km for RBS-15 Mk. III, 300+km for RBS-15 MkV

Flight Altitude: Sea skimming

Speed: Subsonic

Guidance System: inertial, GPS, terminal active radar homing (J band)

Launch Platform: naval ships, aircraft and land-based missile launchers

Rockets

Note: Bofors M70 rockets

↳*Bombs*

Note: DWS 39 submunition dispenser, iron bombs

Fire Control / Avionics

Fire Control System Type: INA

Fire Control Radar: Saab PS-05A

PS-05A Radar: The Gripen entered service using the PS-05/A pulse-Doppler X band multi-mode radar, developed by Ericsson and GEC-Marconi, which is based on the latter's advanced Blue Vixen radar for the Sea Harrier that also served as the basis for the Eurofighter's CAPTOR radar. The all-weather radar is capable of locating and identifying targets 120 km (74 mi) away,and automatically tracking multiple targets in the upper and lower spheres, on the ground and sea or in the air. It can guide several beyond visual range air-to-air missiles to multiple targets simultaneously. Saab stated the PS-05/A is able to handle all types of air defence, air-to-surface, and reconnaissance missions, and is developing a Mark 4 upgrade to it.The Mark 4 version has a 150% increase in high-altitude air-to-air detection ranges, detection and tracking of smaller targets at current ranges, 140% improvement in air-to-air mode at low altitude, and full integration of modern weapons such as the AIM-120C-7 AMRAAM, AIM-9X Sidewinder, and MBDA Meteor missiles.

Laser Desingator: Yes

Reconnaissance: Vinten Vicon 70 pod can be mounted on wingtip rails (to be replaced by MRPS)

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW Counter Measures: Yes, Rb 74 pod can be mounted on wingtip rails

Chaffs/Flares: Yes

Notes:

The Saab JAS 39 Gripen (IPA: ['gri:pɛn]; English: griffin) is a light single-engine multirole fighter aircraft manufactured by the Swedish aerospace company Saab. It was designed to replace the Saab 35 Draken and 37 Viggen in the Swedish Air Force (Flygvapnet). The Gripen has a delta wing and canard configuration with relaxed stability design and fly-by-wire flight controls. It is powered by the Volvo RM12, and has a top speed of Mach 2. Later aircraft are modified for NATO interoperability standards and to undertake air to air refuelling. In 1979, the Swedish government began development studies for an aircraft capable of fighter, attack and reconnaissance missions to replace the Saab 35 Draken and 37 Viggen. A new design from Saab was selected and developed as the JAS 39, first flying in 1988. Following two crashes during flight development and subsequent alterations to the aircraft's flight control software, the Gripen entered service with the Swedish Air Force in 1996. Upgraded variants, featuring more advanced avionics and adaptations for longer mission times, began entering service in 2003. o market the aircraft internationally, Saab formed partnerships and collaborative efforts with overseas aerospace companies. One example of such efforts was Gripen International, a joint partnership between Saab and BAE Systems formed in 2001. Gripen International was responsible for marketing the aircraft, and was heavily involved in the successful export of the type to South Africa; the organisation was later dissolved amidst allegations of bribery being employed to secure foreign interest and sales. On the export market, the Gripen has achieved moderate success in sales to nations in Central Europe, South Africa and Southeast Asia; bribery has been suspected in some of these procurements, but authorities closed the investigation in 2009. A further version, designated Gripen JAS 39E/F, is beginning deliveries to the Swedish and Brazilian air forces as of 2019; it has previously been referred to as Gripen NG or Super-JAS. The changes include the adoption of a new power plant, the General Electric F414G, an active electronically scanned array radar, and significantly increased internal fuel capacity. Saab has proposed other derivatives, including a navalised Gripen Maritime for carrier operations and an optionally manned aircraft for

unmanned operations. Sweden and Brazil have ordered the Gripen E/F and Switzerland initially selected it for procurement. As of September 2019, 298 Gripens have been built. Gripen offers high agility, advanced target acquisition systems - including a powerful multi-role radar, modern weapons, low environmental signatures and a comprehensive electronic warfare (EW) suite. The JAS39 Gripen system is designed to counter all current and future threats. The aircraft has been developed for the Swedish Air Force by the Industry Group JAS (SAAB, Ericsson, Volvo Aero and FFV Aerotech) in close co-operation with the Swedish Defence Material Administration (FMV). In partnership with Sweden's Saab, British Aerospace is engaged in a number of marketing campaigns for the highly capable Gripen fourth generation combat aircraft. Engineering activity associated with improving the operability of the aircraft in the export market is now underway. In 1995 Saab and British Aerospace (BAe) signed an agreement for the joint marketing of the Gripen. Hereby, Saab gained access to the global sales organization of British Aerospace, as well as to its governmental support in international marketing. British Aerospace will adapt the export version of the Gripen to NATO standards, and also produce certain subsystems for the aircraft. The agreement, which followed on more than a decade of cooperation between the two companies, became the basis for a consolidation between Saab and British Aerospace. It also paves the way for SaabCs deepened integration with the European aerospace industry. Saab intends to be an active player along with British Aerospace, Aerospatiale (France), DASA (Germany) and CASA (Spain) in the creation of an integrated European defense and aerospace industry - Eurospace. In November 1998, South Africa announced that it will probably buy 28 Gripens. The value of the order is 12 billion SEK (1.5 billion USD) and the contract was expected to be signed in May or June of 1999. During the coming 10-15 years, Saab hopes to export at least 400 aircraft, on a total market for fighter aircraft estimated at 2,000 aircraft. The Gripen is currently being offered to Chile, the Philippines, the Czech Republic, Hungary, Austria and Brazil. Another candidate, Poland, recently announced that it will chose the Boeing F 18 Hornet. An important factor when offering the Gripen for export, is the aircraft missile system. Currently, the Gripens used by the Swedish Air Force are armed with AIM-120 AMRAAM, AIM-9 Sidewinder, the Saab Dynamics RBS 15 for ship targets, and the Maverick ground attack missile. Saab Dynamics cooperates with the major European missile manufacturers in the development of new air-to-air missiles for the Eurofighter, the Rafale and the Gripen. The two main projects currently underway are the Meteor and the IRIS-T. The Meteor is a radar-guided, medium range (10-120 km.) air-to-air missile, which will compete with future versions of the Raytheon AIM-120 AMRAAM. The Meteor program features Matra BAe Dynamics, Saab Dynamics, Alenia Difesa, Marconi and German LFK. The IRIS-T is an IR-guided, short-range air-to-air missile, primarily funded by Germany for the Eurofighter. The project group includes Bodenseewerk Geratechnik and Saab Dynamics.

Su-57 (Felon) Russian Stealth Fighter

Tiers:

System

Alternate Designation(s): Su-57; NATO: Felon
Primary Function / Type: stealth, single-seat, twin-engine multirole fifth-generation jet fighter
Manufacturer: Komsomolsk-on-Amur Aircraft Plant
Crew: 1
Number of Engines: 2
Day/Night Capable: Yes
All Weather Capable: Yes
Number of Hard Points: 8

Dimensions

Length: 20.1 m
Height: 4.6 m
Wingspan: 14.1 m
Weight, Empty: 18,000 kg
Weight, Normal: 25,000 kg
Weight, Maximum: 35,000 kg
Weight, Combat Load: 7,500 kg
Weight, Air-to-Air Payload: 2,260 kg

Automotive

Engine Name: 2 x Saturn/Lyulka 117S
Number of Engines: 2
Engine Power: 14,200 kg each
Fuel: 10,300 kg
Maximum Speed: 2,450 km/h, Mach 2.0
Supersonic Cruise: 1,590 km/h, Mach 1.3
Maximum Range: 3,500 km
Supersonic Range: 1,500 km
Climb Rate: 350 m/sec
Ceiling: 20,000 m
Load Limit: 10-11 g
Endurance: 3.3 hours

Chin Mounted Weapon System

↳*System*

Name: Gryazev-Shipunov GSh-30-1
Type: Autocannon
Caliber: mm30
Length: 1,978 mm
Barrel Length: 1,500 mm
Width: 156 mm
Height: 185 mm
Weight: 46 kg
Barrels: 1
Action: Short recoil operated
Rate of Fire: 1,800 rounds/min
Muzzle Velocity: 900 m/s
Maximum Firing Range: 1,800m
Effective Firing Range: 200-1,800m

↳*Ammunition*

Type: Rifle
Caliber: mm30
Shell: 30×165mm
Basic Load: INA

Wing Mounted Weapon Systems

Hardpoints: 8

Anti-ship Missiles: 2 × Kh-35E

Anti-Radiation Missiles: *4 × Kh-58UShKE *250, 500, 1500 kg guided bombs *Anti-tank "Drill"500 kg cluster-bomb + active homing[

↳*Missile System (Option 1)*

Name: R-77 (AA-12 Adder)

Type: Medium-Range Air-to-Air Missile

Basic Load: 4 x R-77 (AA-12 Adder)

Operational Range: 80–100 km

Flight Altitude: 5–25 km

Speed: Mach 4

Guidance System: Inertial with mid-course update and terminal active radar homing/infrared homing (R-77T)

↳*Missile System (Option 2)*

Name: Kh-38/Kh-38M Missile

Type: Air-to-Surface Missile

Basic Load: 4 x Kh-38/Kh-38M Missile

Date of Introduction: 2012

Manufacturer: Tactical Missiles Corporation JSC

Length: 4.2 m

Diameter: 0.31 m

Wingspan: 1.14 m

Weight: 520 kg

Warhead: HE fragmentation, cluster warhead, armor-piercing

Warhead Weight: up to 250 kg

Detonation Mechanism: Contact fuse

Engine: Solid rocket motor

Operational Range: up to 70 km

Flight Ceiling: 12000 m

Flight Altitude: 200-12000 m

Speed: Mach 2.2

Guidance System: Laser, active radar, IR, satellite, depending on variant

↳*Missile System (Option 3)*

Name: R-37 (AA-X-13/AA-13 Axehead) Missile

Type: Supersonic Air-to-Air Missile

Manufacturer: Tactical Missiles Corporation

Date of Introduction: 2019

Basic Load: 2 x R-37 (AA-X-13/AA-13 Axehead) Missile

Length: 4.20 m

Diameter: 38 cm

Wingspan: 0.7 m

Weight: 600 kg

Warhead: HE, fragmenting

Propellant: Boost-Sustain Solid Rocket

Warhead Weight: 60 kg

Operational Range: 150-398 km

Speed: Mach 5

Guidance System: Inertial with mid-course update, semi-active and active radar homing

Fire Control / Avionics

Fire Control Radar: Byelka radar (400 km, 60 tracks with 16 targeted)

Laser Desingator: Yes, 101KS-O: Laser Directional Infrared Counter Measures

Radio Electronic System: Sh-121 multifunctional integrated radio electronic system (MIRES)

Radar Systems: N036-1-01: Frontal X-band active electronically scanned array (AESA) radar N036B-1-01: Cheek X-band AESA radars for increased angular coverage N036L-1-01: Slat L-band arrays for IFF

IFF: Yes

Protection

Stealth Properties: The Su-57 is planned to be the first operational aircraft in Russian Air Force service to use stealth technology. Similar to other stealth fighters such as the F-22, the airframe incorporates planform edge alignment to reduce its radar cross-section (RCS); the leading and trailing edges of the wings and control surfaces and the serrated edges of skin panels are carefully angled to reduce the number of directions the radar waves can be reflected. Weapons are carried internally in weapons bays within the airframe and antennas are recessed from the surface of the skin to preserve the aircraft's stealthy shape. The infrared search-and-track sensor housing is turned backwards when not in use and its rear is treated with radar-absorbent material (RAM) to reduce its radar return. To mask the significant RCS contribution of the engine face, the walls of the inlet ducts are coated with RAM and the partial serpentine ducts obscure most of the engines' fan and inlet guide-vanes (IGV); the remaining exposed engine face is masked by a radar blocker similar in principle to that used on the F/A-18E/F. According to Sukhoi's radar blocker patent, the slanted blocker grid is placed in front of the IGV at a distance of 0.7—1.2 times the diameter of the duct. The fuselage of the aircraft is coated with RAM to absorb radar emissions and reduce the reflection back to the source. Due to the extensive use of polymeric carbon plastics composites, the aircraft has four times fewer parts compared to the Su-27, weighs less and is easier to mass-produce.The aircraft canopy is made of composite material and 70-90 nm thick metal oxide layers with enhanced radar wave absorbing to minimize the radar return of the cockpit by 30% and protect the pilot from the impact of ultraviolet and thermal radiation. The Su-57's design emphasizes frontal stealth, with RCS-reducing features most apparent in the forward hemisphere; the shaping of the aft fuselage, the seams between parts, and rivets are much less optimized for radar stealth compared to the F-22.However, during MAKS 2019 the craftsmanship of the fuselage was actually finer than expected and looked smooth despite the rivets. The combined effect of airframe shape and RAM of the production aircraft is estimated to have reduced the aircraft's RCS to a value thirty times smaller than that of the Su-27.Sukhoi's patent for the Su-57's stealth features cites an average RCS of approximately 0.1 to 1 m2,compared to the Su-27's of approximately 10 to 15 m2.Like other stealth fighters, the Su-57's low observability measures are chiefly effective against high-frequency (between 3 and 30 GHz) radars, usually found on other aircraft. The effects of Rayleigh scattering and resonance mean that low-frequency radars, employed by weather radars and early-warning radars are more likely to detect the Su-57 due to its size. Such radars are also large, susceptible to clutter and

are less precise.
Heat Signature Reduction: INA
Add on Armor: INA
NBC Protection: Yes
EW Counter Measures: L402 Himalayas electronic countermeasure suite
Chaffs/Flares: Yes
Warning System: 101KS-U: Ultraviolet missile approach warning system

Notes:

The Sukhoi Su-57 (Russian: Сухой Су-57; unconfirmed NATO reporting name: Felon) is a stealth, single-seat, twin-engine multirole fifth-generation jet fighter being developed since 2002 for air superiority and attack operations. The aircraft is the product of the PAK FA (Russian: ПАК ФА, short for: Перспективный авиационный комплекс фронтовой авиации, romanized: Perspektivny Aviatsionny Kompleks Frontovoy Aviatsii, lit. ''prospective aeronautical complex of front-line air forces''), a fifth-generation fighter programme of the Russian Air Force. Sukhoi's internal name for the aircraft is T-50. The Su-57 is planned to be the first aircraft in Russian military service to use stealth technology. Its maiden flight took place on 29 January 2010 and the first production aircraft are planned to be delivered in 2020. The fighter is designed to have supercruise, supermaneuverability, stealth, and advanced avionics to overcome the prior generation fighter aircraft as well as ground and naval defences. The Su-57 is intended to succeed the MiG-29 and Su-27 in the Russian Air Force. The prototypes and initial production batch are to be delivered with a highly upgraded Lyulka AL-31 variant, the AL-41F1, as an interim powerplant while an advanced clean-sheet design engine, currently designated the izdeliye 30, currently in final stages of development and expected to be available after mid-2020s. The aircraft is expected to have a service life of up to 35 years. The Su-57 is intended to be a fifth-generation multirole fighter aircraft and the first operational stealth aircraft for the Russian Air Force. Although most information is classified, sources within the Sukhoi company and Defence Ministry have openly stated that the aircraft is to be stealthy, supermaneuverable, have supercruise capability, incorporate substantial amounts of composite materials, and possess advanced avionics such as active phased-array radar and sensor fusion. The aircraft has a blended wing body fuselage and incorporates all-moving horizontal and vertical stabilizers; the vertical stabilizers toe inwards to serve as the aircraft's airbrake. The aircraft incorporates thrust vectoring and has adjustable leading–edge vortex controllers (LEVCONs) designed to control vortices generated by the leading edge root extensions, and can provide trim and improve high angle of attack behaviour, including a quick stall recovery if the thrust vectoring system fails. The advanced flight control system and thrust vectoring nozzles make the aircraft departure-resistant and highly maneuverable in both pitch and yaw, enabling the aircraft to perform very high angles of attack maneuvers such as the Pugachev's Cobra and the bell maneuver, along with doing flat rotations with little altitude loss. The Su-57 has a climb rate ranging from 330 m/s (1,100 ft/s) to 361 m/s (1,180 ft/s). The aircraft makes extensive use of composites, with the material comprising 25% of the structural weight and almost 70% of the outer surface. Weapons are housed in two tandem main weapons bays between the engine nacelles and smaller bulged, triangular-section bays near the wing root. Internal weapons carriage eliminates drag from external stores and enables higher performance compared to external carriage, as well as enhancing stealth. The Su-57's aerodynamics and engines enable it to achieve Mach 2 and fly supersonic without afterburners, or supercruise, a significant kinematic advantage over prior generations of aircraft. Combined with a high fuel load, the fighter has a supersonic range of over 1,500 km (930 mi), more than twice that of the Su-27. Extendable refueling probe is available to further increase its range. In the Su-57's design, Sukhoi addressed what it considered to be the F-22's limitations, such as its inability to use thrust vectoring to induce roll and yaw moments and a lack of space for weapons bays between the engines, and complications for stall recovery if thrust vectoring fails.

J-11 (Flanker-L) Chinese Air Superiority Fighter

Tiers:

1 **2** 3 4

Variants:

- **J-11A:** Chinese/Russian assembled Su-27SK from Russian-made kits. 104 were built. They were later upgraded with MAWS. Unconfirmed upgrades include improved cockpit displays, and fire control systems for R-77 or PL-10 missiles. It is also called J-11.
- **J-11B:** Indigenously-produced version using Chinese technology, and the first J-11 variant to use the WS-10A turbofan. The airframe is slightly lighter due to greater use of composites. It has new avionics, a glass cockpit, MAWS, and onboard oxygen generator system. Upgrading to AESA radar may have been planned. Photos of China's latest, very long range PL-15 missile on a J-11B may well indicate the undergoing upgrades of AESA radar to the aircraft. More recently aircraft have been spotted with light grey radomes which may indicate ongoing upgrades.
- **J-11BS:** A twin-seat version of the J-11B. In 2012, the number of J-11B and J-11BS in service was over 120.
- **J-11BH:** Naval version of the J-11B. It was first sighted in May 2010.
- **J-11BSH:** Naval version of the J-11BS.
- **J-15:** Carrier-based version based on the J-11B, incorporating structural elements from the Sukhoi Su-33 prototype purchased from Ukraine in 2001. It uses avionics from the J-11B.
- **J-16:** Twin-seat strike fighter based on Russian Sukhoi Su-30MKK sold to China in 2000.[33] A further development of the J-11BS.
- **J-11D:** ariant with fixed electronically scanned array radar, IRST, and capability to fire heavier imaging/infrared (IIR) air-to-air missiles. The airframe makes greater use of composite materials, especially in the engine intakes for lower radar observability. The wings have three hardpoints each. Unconfirmed reports claim it has a new fly-by-wire control system, glass cockpit, improved EW systems, and an improved version of the WS-10A engine.

Notes:

The J-11 was finally born in 1998 as a Chinese version of the Soviet-designed Sukhoi Su-27SK air superiority fighter after China secured a $US2.5 billion production agreement which licensed China to build 200 Su-27SK aircraft using Russian-supplied kits. Under the terms of the agreement, these aircraft would be outfitted with Russian avionics, radars and engines. However, in 2004, Russian media reported that Shenyang co-production of the basic J-11 was halted after around 100 examples were built. The PLAAF later revealed a mock-up of an upgraded multi-role version of the J-11 in mid-2002. The indigenous J-11B variant incorporates various Chinese material modifications and upgrades to the airframe with improved manufacturing methods in addition to the inclusion of domestic Chinese technologies such as radar, avionics suites and weaponry, including anti-ship and PL-12 air-to-air missiles presumably for the role of a maritime strike aircraft. The alleged reason for the sudden stop in the production line of the J-11 was because it could no longer satisfy the PLAAF's requirements, due to elements such as the obsolete avionics and radar, which were structured for aerial missions. The J-11/J-11B's legitimacy remains unproven, despite a wealth of information coming to light since 2007. In the course of a press conference at the 2009 Farnborough Airshow, Alexander Fomin, Deputy Director of Russia's Federal Service for Military-Technical Co-operation, reported that Russia had not so far tabled any questions to China with regard to "copying" military equipment. Fomin reported that Russia handed China the licences to manufacture the aircraft and its components, including an agreement on the production of intellectual property rights. Details of intellectual property rights, however have not been disclosed, fuelling speculation about a "secret" contract or parts of the original contract. The licence, at least officially, did not include an aircraft carrier version- Sukhoi Su-33 nor any variant of it, such as the Shenyang J-15. At the MAKS 2009, Rosoboron export's General Manager Anatoli Isaykin was quoted saying: "Russia is going to investigate the J-11B, as a Chinese copy of the Su-27 and Sukhoi Company is partaking in the process." In 2010, Rosoboronexport announced via their official website that it was in talks with the Chinese side, regarding the ongoing production of weapons that Russia considers as unlicensed. In light of the ongoing investigations, Rosoboronexport expressed its concern over future sales of advanced Russian systems and components to China. At the Zhuhai 2002 airshow, a photo was released allegedly depicting a J-11 modified for flight testing of a single WS-10 Taihang turbofan. Andrei Chang, a military specialist on China reported that one J-11A was outfitted with the indigenously produced WS-10A turbofan engine, J-11B also uses WS-10A. However, Russian media reports also indicate that China still intends to upgrade the current J-11 fleet's engines with either Saturn-Lyulka or Salyut powerplants. Engines under consideration include the Saturn AL-31-117S (a development of the Lyulka AL-31F planned for the Russo-Indian Su-30MKIs), and the Salyut AL-31F-M1, an improved variant of the AL-31F engine. In 2002, Russian media reported that Shenyang Aircraft Corporation was looking into replacing Russian-made J-11/Su-27SK components with domestic, Chinese-made parts. Specifically, to replace the Russian-made NIIP N001 radar with a Chinese-made fire control radar based on the Type 147X/KLJ-X family, the AL-31F engine with WS-10A, and Russian R-77 AAM's with Chinese-made PL-9 and PL-12 AAM's. One J-11 was photographed with an AL-31F and a WS-10A engine installed for testing in 2002. However, it was not until 2007 when the Chinese government finally revealed information on the domestic J-11: the J-11 used to test WS-10 was designated as J-11WS, and it was when state television station CCTV-7 aired J-11B footages in mid-2007 when the existence of J-11 with domestic components was finally confirmed officially. Serial manufacturing of the WS-10 and integration with the J-11, proved to be more difficult than expected. As a result, even though several related prototypes had been tested and at least one regiment converted to the Taihang powered J-11B version in 2007, these aircraft were later grounded for an extended period due to a poor operational reliability. A report in the Washington Times suggested that the Chinese engines lasted 30 hours before they needed servicing, compared to 400 hours for the Russian versions. Defects were traced back to the engine manufacturer, Shenyang Liming Aircraft Engine Company employing sub-standard manufacturing and quality control procedures. Several subsequent batches temporarily reverted to the original, Russian AL-31F turbofans. The engines manufacturing problems had finally been solved by the end of 2009 and the WS-10A had reportedly proved mature enough to power the Block 02 aircraft.

NOTES

Description: THE SOVIETS LICENSED THE MANUFACTURE OF THE MIG-21F AND ITS ENGINE TO CHINA IN 1961, AND ASSEMBLY OF THE FIRST J-7 USING CHINESE-MADE COMPONENTS BEGAN EARLY1964. THE J-7 AIRCRAFT WAS THE MOST WIDELY PRODUCED CHINESE FIGHTER, REPLACING OLDER J-6 FIGHTERS, THE CHINESE VERSION OF THE MIG-19. IN 1995 IT WAS PROJECTED THAT J-7 PRODUCTION WOULD CONTINUE FOR AT LEAST ANOTHER DECADE, RESULTING IN A TOTAL INVENTORY OF NEARLY 1000 AIRCRAFT BY 2005, BUT THE PLAAF INVENTORY HAS REMAINED AT ABOUT 500 AIRCRAFT, SUGGESTING THAT PRODUCTION WAS EITHER SUSPENDED OR TERMINATED.

Notes:

The Chengdu J-7 (Chinese: □-7; third generation export version F-7; NATO reporting name: Fishcan is a People's Republic of China license-built version of the Soviet Mikoyan-Gurevich MiG-21. Though production ceased in 2013, it continues to serve, mostly as an interceptor, in several air forces, including the People's Liberation Army Air Force. In the 1950s and early 1960s, the Soviet Union shared most of its conventional weapons technology with the People's Republic of China. The famous MiG-21, powered by a single engine and designed on a simple airframe, was inexpensive but fast, suiting the strategy of forming large groups of 'people's fighters' to overcome the technological advantages of Western aircraft. However, the Sino-Soviet split abruptly ended the initial cooperation, and from July 28 to September 1, 1960, the Soviet Union withdrew its advisers from China, resulting in the project being stopped in China. Soviet Premier Nikita Khrushchev unexpectedly wrote to Mao Zedong in

February, 1962, to inform Mao that the Soviet Union was willing to transfer MiG-21 technology to China, and he asked the Chinese to send their representatives to the Soviet Union as soon as possible to discuss the details. The Chinese viewed this offer as a Soviet gesture to make peace, and they were understandably suspicious, but they were nonetheless eager to take up the Soviet offer for an aircraft deal. A delegation headed by General Liu Yalou, the commander-in-chief of the People's Liberation Army Air Force (PLAAF) and himself a Soviet military academy graduate, was dispatched to Moscow immediately, and the Chinese delegation was given three days to visit the production facility of the MiG-21, which was previously off-limits to foreigners. The authorization for this visit was personally given by Nikita Khrushchev, and on March 30, 1962, the technology transfer deal was signed. However, given the political situation and the relationship between the two countries, the Chinese were not optimistic about gaining the technology, and thus they were prepared for reverse engineering. Russian sources state that several complete examples of the MiG-21 were sent to China, flown by Soviet pilots, and China also received MiG-21Fs in kits, along with parts and technical documents. Just as the Chinese had expected, however, when the Soviets delivered the kits, parts and documents to Shenyang Aircraft Factory five months after the deal was signed, the Chinese discovered that the technical documents provided by the Soviets were incomplete and that some of the parts could not be used. China set about to reverse-engineer the aircraft for local production, and in doing so, they succeeded in solving 249 major problems and reproducing eight major technical documents that were not provided by the Soviet Union. One of the major flaws was with the Hydraulics systems, which grounded up to 70% of aircraft in some squadrons until the systems were upgraded. Another major upgrade was modifications to the fuel storage to make the aircraft more stable. The MiG-21 carries most of its fuel in the forward fuselage, causing the center of gravity to shift and become unstable after about 45 minutes of operation. The J-7 has redesigned fuel tanks and significantly larger drop tanks in order to maintain a more stable center of gravity, and therefore better Longitudinal static stability. The cockpit was also revised to replace the Soviet ejection seat, which was found to be unacceptable. The forward opening canopy was replaced by a standard canopy hinged to the rear and jettisoned before the seat ejected. Otherwise, the re-engineering effort was largely successful, as the Chinese-built J-7 aircraft showed only minor differences in design and performance from the original Soviet MiG-21. In March 1964, Shenyang Aircraft Factory began the first domestic production of the J-7 jet fighter, which they successfully accomplished the next year. However, the mass production of the J-7 aircraft was severely hindered by an unexpected social and economic problem—the Cultural Revolution—that resulted in poor initial quality and slow progress, which, in turn, resulted in full-scale production only coming about in the 1980s, by which time the original aircraft design was showing its age. In 1987 the J-7E was released, having a greatly improved wing, among other improvements. It was roughly 45% more maneuverable, and its takeoff and landing performance was greatly increased. It was also equipped with a helmet mounted sight, as well as being the first MiG-21 to be equipped with HOTAS and a multipurpose display. Many of the electronic components were British in origin, such as the gun sight and the multi purpose display. The aircraft is capable of using PL-8/Python 3 missiles with both the helmet mounted sight or the radar fire control, but the two are not connected. The pilot may use only one system at a time.[5] In the mid 1980s Pakistan requested an aircraft with greater radar capabilities. Both the standard radar and the British Marconi radar were plagued by ground clutter, but China did not have any experience with air to ground radar at the time. In 1984 Pakistan provided assistance by having their American trained F-16 pilots provide training on proper operation of ground attack radar, which enabled the Chinese to develop the J-7M. In the late 1980s the J-7MP and J-7PG introduced significant upgrades to the radar system by converting to an Italian FAIR Grifo-7 radar. This more than tripled the effective range of the radar, as well as greatly increased the angle which the radar could detect target. The J-7 only reached its Soviet-designed capabilities in the mid 1980s. However, the fighter is affordable and has been widely exported as the F-7, often with Western systems incorporated, like the ones sold to Pakistan. There are over 20 different export variants of the J-7, some of which are equipped to use European weaponry, such as French R.550 Magic missiles. The Discovery Channel's Wings Over The Red Star series claims that the Chinese intercepted several Soviet MiG-21s en route to North Vietnam (during the Vietnam War), but these aircraft did not perform in a manner consistent with their original specifications, suggesting that the Chinese actually intercepted down-rated aircraft that were intended for export, rather than fully capable production aircraft. For this reason, the Chinese had to re-engineer the intercepted MiG-21 airframes in order to achieve their original capabilities. China later developed the Shenyang J-8 based both on the expertise gained by the program, and by utilizing the incomplete technical information acquired from the Soviet Ye-152 developmental jet. In May 2013, J-7 production has ceased after decades of manufacturing. The last 12 F-7BGIs were delivered to the Bangladesh Air Force.

J-8F Chinese Interceptor Fighter Aircraft

Tiers:

Variants:

- **J-8 (Finback-A) Series:** First flew on 5 July 1969. Initial day fighter variant, resembles an enlarged MiG-21. Equipped with 2 x WP-7A turbojet engines, SR-4 ranging radar 2 x Type 30-I 30mm cannon (200 rounds each), and 2 x PL-2 IR-guided AAMs. Limited production. J-8I First flew on 24 April 1981. Improved all-weather version with SL-7A fire-control radar (40 km range), twin-barrel Type 23-III 23 mm cannon, & up to 4 AAMs (or rockets/bombs). Limited production. J-8E Final version of the J-8I series. J-8E is equipped with a type 204 (JL-7) mono-pulse fire-control radar with look down shot down capability, SM-8A aeronautical optical gun-sight, onboard computer, new cockpit panel, and redesign ejection escape system and oxygen supply system. The original two Type 30-I 30mm cannons were replaced by two Type 23-III 23mm cannons. The four under-wing stores stations are capable of carrying the more advanced PL-5 series short-range AAM. These aircraft were also fitted with an improved electronic countermeasures (ECM) suite including KJ-8602B all-aspect radar warning receiver (RWR). JZ-8 (J-8R) Reconnaissance version of J-8 or J-8I. J-8ACT First flew on 24 June 1990, fly-by-wire testbed aircraft.
- **J-8II (Finback-B) Series:** J-8II (Finback-B) First flown on 12 June 1984, the improved J-8I prototype with redesigned nose/front section and fuselage. replacing the nose air inlet with a solid nose and lateral air intakes, similar to those of the MiG-23. China received several MiG-23s in the late 1970s from Egypt and the hinged ventral fin and lateral intakes indicate probable reverse engineering from the MiG-23. Equipped with Type 208 (SL-4A) monopulse radar (40 km range). J-8II Batch 02 (J-8IIB) First flew in November 1989, improved J-8II with SL-8A (Type 208?) PD radar (70 km range). Powered by 2 x WP-13AII turbojet engines. Armed with twin-barrel 23mm Type 23-III cannon (copy of GSh-23L) and up to 4 PL-5 or PL-8 AAMs (or rockets/bombs). No BVR capability. Peace Pearl J-8 (J-8II) During the Sino-US cooperation era, up to 50 J-8IIs were to be delivered to the US for upgrades and installation of AN/APG-66(v) radar and fire control system for US$500 million, under the Peace Pearl programme. However, the project was cancelled and only about 24 J-8II were produced. USAF Air Force Flight Test Center (6510 Squadron) took the task of test flight of modified J-8II. J-8IIACT (J-8II-BW2) First flew in 1988, fly-by-wire testbed and technology demonstrator. J-8IID (J-8D) First flew on 21 November 1990, modified J-8B with fixed refuelling probe and updated avionics such as TACAN navigation system. F-8IIM Unveiled in Zhuhai Air Show 1996, export version of J-8B with Russian Phazotron Zhuk-8II PD radar (75 km range, and able to track up to ten airborne targets and attack two of them simultaneously), R-27R1 (AA-10) AAM and Kh-31P anti-radiation missile. The F-8IIM was to be powered by two, more powerful WP-13B turbojet engines. This aircraft is often mistakenly referred to as the "J-8IIM" with Kh-31A anti-ship missile (ASM) capability, but its radar lacked sea search mode for anti-shipping role. The F-8IIM failed to attract any export customers and no domestic orders.[7] Conversion from older airframe was reportedly much fewer than the 100 units of Zhuk-8II radar delivered, and the conversion might have only been an experimental programme with none entering service. The F-8IIM fighter will probably be equipped with Russia's or China's helmet sight and advanced PL-9 and P-73 missiles. Phazotron, a Russian firm, has signed contracts with China to provide 150–200 improved Zhuk radars mainly in support of China's new F-8II fighter. J-8III (J-8C) Upgraded J-8II with FBW system and 2 x WP-14 powerplants. Compared to the J-8II, the J-8C had a number of improvements including a new multi-mode pulse Doppler radar which was reportedly based on the Israeli Elta EL/M 2035 radar technology. The aircraft was also equipped with a digital fire-control system and a new 'glass' cockpit with multifunctional displays (MFD). The J-8C programme entered full scale development around 1991 and the aircraft first flew successfully on 12 December 1993. Development halted in favour of other version described below, but was used to test new radars such as Type 1471 (KLJ-1) and other avionics associated with FBW system. From this version on, electronic warfare pods such as BM/KG300G and KZ900, as well as navigational / targeting pods including Blue Sky navigation pod and FILAT become operational on J-8II. Canceled after 2nd testbed had crashed. J-8IIF (J-8F) It is reported that during 2006–2008, J-8II production suffered major setback due to engine problem. J-8IIG Modified J-8II with tail hook and other improvements for developmental work on ship-borne aircraft for carrier operations, such as in April 1987, evaluating & testing the Chinese reverse-engineered steam catapult from that of HMAS Melbourne (R21), which

was finally confirmed 27 years later in April 2014 by CCTV-13. J-8G An advanced modified variant of the J-8II tasked with the suppression of enemy air defence (SEAD) mission was said to have been developed by the SAC in the 2000s. The aircraft, reportedly designated J-8G, was said to be capable of carrying two indigenous YJ-91 anti-radiation missile and electronic warfare suite to attack enemy radar stations. J-8IIM (2006) At Zhuhai Air Show 2006, a new variant "J-8IIM" was put on display with upgraded systems similar to the J-8H.[16] The most significant improvement is the radar upgrade with a new Type 1471 domestic radar used by the J-8H. JZ-8F A reconnaissance version of the J-8F with internal camera in the forward fuselage replacing the cannon. J-8T Upgraded J-8 with JL-10A X-band radar. Export variant, F-8T, has WP-13B-II engines. China National Aero-Technology Import & Export Corporation claims J-8T is equipped with improved integrate avionic and various guided weapons. J-8T can carry out air-to-air BVR intercepting mission, air-to-ground precise attacking mission and stand-off attacking mission. J-8DF J-8D upgraded to J-8F standard. Lack of cooling duct below intake. Can fire PL-12 and PL-8 missiles.

System

Alternative Designations: J-8F

Manufactuer: Shenyang Aircraft Corporation

Crew: 1

Underfuselage Hardpoint: 1 x under fuselage hardpoint

Underwing Hardpoints: 6 x underwing hardpoints for external fuel, bombs,rockets or PL-2B or PL-7 air-to-air missiles

Dimensions

Length: 21.59 m

Height: 5.41 m

Wingspan: 9.34 m

Wing Area: 42.2 sq m

Empty Weight: 9,820 kg

Normal Takeoff Weight: 14,300 kg

Maximum Takeoff Weight: 17,800 kg

Automotive

Engine Name: 2 x Wopen 13A-II turbojets

Engine Power: 14,815 lb (6,720 kg) static thrust each with afterburner

Maximum Speed at Maximum Altitude: 1,263 knots (1,454 mph, 2,340 km/h, Mach 2.2)

Maximum Speed at Sea Level: 01 knots (808 mph, 1,300 km/h)

Combat Radius: 800 km

Climb Rate: 12,000 m/min

Acceleration: 20,000 m

Ceiling: 20,000 m

Main Gun System

↳*Gun System #1*

Name: Gryazev-Shipunov GSh-23

Type: Autocannon

Caliber: 23mm

Location: underfuselage gun pack

Length: 1,387 mm

Barrel Length: 1,000 mm

Weight: 49.2 kg

Barrels: 2

Action: Gast principle

Rate of Fire: 3,400–3,600 rounds/min (alleged)

Muzzle Velocity: 715 m/s

Effective Firing Range: INA

↳*Gun System #1 Ammunition*

Type: Autocannon

Caliber: 23mm

Cartridge: 23x115 mm

Basic Load: 1,000 Rounds

Missile Weapon System

↳*Missile Weapon System #1*

Name: PL-2B

Type: Air-to-Air Missile

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC)

Length: 2.99 m

Diameter: 127 mm

Wingspan: 528 m

Weight: 76 kg

Warhead: 11.3 kg high explosive

Detonation Mechanism: Impact / Proximity

Propellant: solid fuel

Operational Range: 10 km

Flight Ceiling: 21,500 m

Maximum Speed: Mach 2.5

Guidance System: Nitrogen cooled passive InPb infrared seeker

↳*Missile Weapon System #2*

Name: PL-7

Type: Air-to-Air Missile

Length: 2.74 m

Wingspan: 0.66 m

Weight: 89 kg

Warhead: 12.5 kg

Speed: Mach 2.5

Range: 14 km

Guidance System: Infrared Homing

↳***Missile Weapon System #3***

Name: PL-12

Type: Air-to-Air Missile

Length: INA

Diameter: INA

Weight: 180 kg

Operational Range: 100 km

Guidance System: Active Radar

Avionics / Fire Control

Fire Control Radar: Type 1492 X-band fire-control radar

Data Link Antenna: Yes

Navigation Radar: INA

In-FLight Refueling Probe: Yes

Intelligence Pod: BM/KZ900 electronic intelligence pod

Notes:

The J-8F Chinese Interceptor Fighter Aircraft is a model of the J-8II Series. This variant features the Type 1492 X-band fire-control radar, glass cockpit and more powerful WP-13BII engines. Plans called for the latter to be replaced by the WP-4 power plant. There is an additional pair of wing fences to improve handling. Some newer models are equipped with a new data link antenna behind the cockpit. The J-8F is armed with the newer PL-12 active radar-guided missile. The J-8F features a glass cockpit, in-flight refueling probe and a secondary air-to-ground capability. The BM/KZ900 electronic intelligence pod has been integrated with the aircraft's centerline station. Development began in 1997, followed by a first flight in 2000. Testing concluded in 2002. The J-8F entered service in 2003. Retrofitted models are designated J-8DF. The naval variant is the J-8FH. The J-8II series appear quite different from the original J-8, with a new forward fuselage, intake ramps with splitter plates and nose structure more reminiscent of the F-4 Phantom II or Sukhoi Su-15 to house a new, more powerful radar. The J-8II is powered by two Wopen-13A (WP-13A) engines. The design and development team was led by Gu Songfen, who is also a key member of J-8I design team. It was hoped to equip the production J-8B with an American AN/APG-66(V) radar (to be dubbed the J-8C), but this proved politically impossible after the Tiananmen Square protests of 1989 so the indigenous Type 208A monopulse radar fire-control radar initially was used. Although the Type 208A was an improvement over the original J-8I radar, the Type 208A did not have true beyond visual range capabilities (The detection range of the Type 208 was 40 km) nor look-down/shoot-up ground attack capabilities, thereby falling short of the PLAAFs initial requirements and the redesign of the airframe. The J-8B was the early production batch of the new J-8II series. In addition to receiving a new radar, new engine and redesigned noses, cockpit and intake, the J-8B also benefited from a new head-up display, integrated inertial navigation system/Global positioning satellite system and TACAN technology. Later J-8Bs were equipped with the more robust KLJ-1 pulse-Doppler radar fire-control radar and radar warning receiver, theoretically giving the later batch BVR capabilities. J-8B is the second Chinese aircraft to be equipped with a data link, the first being the Chengdu J-7III, and the data link is designated as Type 483 (developed from Type 481 data link used for J-7III), which enables ground-controlled interception centres to feed

directions directly to the autopilots of J-8Bs to fly "hands off" to the interception. At least 30 J-8Bs have been converted by the PLA Navy to J-8D standard, with an aerial refuelling probe for use with Xian H-6DU tankers in addition to newly built J-8Ds. The most significant difference between the J-8B and J-8D is the use of the new Type-02 airframe that was heavier than the J-8B and featured uneven length wing fences. The heavier 'Type 02' airframe is able to carry a larger payload and can tolerate higher G-loadings. The new airframe also has a stiffer radome. A few minor differences between the later J-8B batches and the J-8D are the J-8Ds slightly improved avionics. The use of the KLJ-1 pulse-Doppler radar was used through the J-8Ds entire production run. The J-8B and J-8D both suffered from China's difficulty in developing a MRAAM. Although the Type 208A was theoretically capable of using semi-active radar homing missiles and the KLJ-1 was certainly capable; no such missile, semi-active or active, were available at the time. Both variants were only initially armed with SRAAMs such as the PL-2 and PL-5, and the more advanced infrared-homing PL-8 SRAAM. An early attempt to remedy these technological shortcomings still present after the redesign of the J-8 to the J-8II was the J-8C. The project began shortly after failure to obtain American cooperation for the J-8B, so Shenyang turned to Israel and Russia instead. The J-8C was considered a 'radical' upgrade of the original J-8II with a new radar based on the Israeli Elta EL/M 2035 multi-mode pulse Doppler radar, digital fire-control system, a new 'glass' cockpit, in-flight refuelling probe and equipped with a new WP-14 Kunlun engine. These upgrades were said to 'bring the fighter into the same league as modern Russian and Western fighters such as Mikoyan MiG-29 and Dassault Mirage 2000'. The project was cancelled in the late 1990s after two prototypes were built in favour of further development of the Shenyang J-11 fighter (which is based on the Sukhoi Su-27). The J-8IIM, first flown in 1996, is a further improved version. One major improvement over the J-8II is the capable Russian-made Zhuk-8II coherent pulse-Doppler radar, 100 of which have been delivered in the 1990s. Additionally, the J-8IIM carried new multifunction displays, integrated INS/GPS navigation system, new fire-control systems, new alternators and a new electronic countermeasures suite. The J-8IIM possessed true BVR capabilities with the use of the R-27 (air-to-air missile) semi-active infrared seeker medium-ranged missile. New WP-13B turbojet engines were adopted as well. The J-8IIM has had no new orders from China or the export market, where it is offered as the F-8IIM. It was heavily marketed to Iran but ultimately was not exported anywhere. However the experience and technological achievements gained from the J-8C and F-8IIM projects were later applied by Shenyang Aircraft Company to the later J-8H/F variants. It was also during this time that the Shanghai Academy of Spaceflight Technology certified the PL-11 in 2001 after successfully test firing five missiles from the J-8II. The J-8H configuration features the more powerful WP-13B turbojet engines, improved avionics and the improved Type 1471 pulse-doppler fire control radar with look-down/shoot-down capability and a range of new operating modes. With the radar upgrade comes the ability to fire the PL-11 and the PL-12/SD-10 MRAAM, which employs an Active radar homing (ARH) seeker. The J-8H also is equipped with IFR probe, INS/GPS, HOTAS, and an integrated ECM suite, with twin wing fences on each side of the wings that greatly increased handling ability. The J-8Ds heavier airframe is used but with modified wing fences. Production of the J-8H and the J-8D it had superseded has now ceased in favor of upgrading earlier J-8D aircraft to J-8H standards. It is uncertain if the older J-8B will be upgraded to J-8H standards given the difference in airframe. The J-8F is the most modern and capable J-8 variant currently in service and has been in production since 2003. The J-8H/F has inherited many of the improvements of the earlier J-8C and F-8IIM, and in some cases, has improved on them. The J-8F features a glass cockpit, a more powerful WP-13BII turbojet engine and enhanced Type 1492 radar for enhanced air-to-air capabilities with the PL-12 active radar homing medium range air-to-air missile, full air-to-ground and air-to-sea capabilities using the AS-17 'Krypton' anti-radar missile, and a variety of Chinese designed precision guided laser and satellite guided bombs, making it the first true Multirole combat aircraft variant of the J-8 series. The J-8F also possesses all the avionic and electronic upgrades the J-8H received. The earlier J-8B/Ds can be distinguished from later J-8H/Fs by their dark green radomes, compared to the latter's black radomes. Introduction of the more powerful WP-14 Kunlun turbojet engine for the J-8 series is planned to go under way in the coming years. The J-8F also serves in the People's Liberation Army Naval Air Force as well. A notable variant of the J-8F is the JZ-8F which has been introduced into the PLAAF in the tactical reconnaissance role. Little information has been released on the JZ-8F, other than the use of an internal camera compartment which replaces the twin 23 mm cannon, rather than a camera pod as used by the older JZ-8. In 1988, one J-8II airframe was converted into the J-8ACT an experimental fly-by-wire testbed for the J-10 programme. The J-8ACT had a shorter fuselage and a pair of canards were fixed to the side of each intake, and replaced older FBW technological demonstrators based on the older Shenyang J-6 and J-8I airframes. To date, no plans for a twin-seat J-8 design have been announced.

MiG-23ML (Flogger-G) Russian Fighter Aircraft

Tiers:

System

Alternate Designation(s): MiG-23ML; Flogger-G
Primary Function / Type: Fighter Aircraft
Manufacturer: Mikoyan-Gurevich / Mikoyan
Crew: 1
Number of Engines: 1
Number of Hard Points: 2 × fuselage, 2 × wing glove and 2 × wing pylons with a capacity of up to 3,000 kg (6,600 lb) of stores

Dimensions

Length: 15.88 m
Wingspan, Extended: 13.95 m
Wingspan, Swept: 7.77 m
Wing Area: 27.3 m sq
Height: 4.80 m
Weight, Empty: 10,000 kg
Weight, Weapons Loaded: 3,000 kg
Weight, Normal Takeoff: 16,100 kg
Weight, Maximum Takeoff: 18,900 kg

Automotive

Engine Name: 1 x Khachaturov R-35-300
Number of Engines: 1
Engine Type: Turbojet
Engine Power, Dry: 8,006 kg
Engine Power, Afterburner: 12,474 kg

Fuel Capacity: 5,750 liters

Speed at Altitude: 2,443 km/h, Mach 2.3

Speed at Sea Level: 1,468 km/h, Mach 1.2

Service Ceiling: 18,300 m

G Limits: +8.5

Rate of Climb: 230 m/s

Take-Off Distance: 500 m

Landing Distance: 750 m

Main Gun System

↳*System*

Name: Gryazev-Shipunov GSh-23

Type: Autocannon

Caliber: 23mm

Quantity: 1 × 23 mm Gryazev-Shipunov GSh-23L autocannon

Length: 1,387 mm

Barrel Length: 1,000 mm

Weight: 49.2 kg

Barrels: 2

Action: Gast principle

Rate of Fire: 3,400–3,600 rounds/min

Muzzle Velocity: 715 m/s

↳*Ammunition*

Type: Rifle

Caliber: 23mm

Cartridge: 23x115 mm

Basic Load: 260 rounds

Missile Systems

Air-to-Air Missiles: *2 × R-60 *R-73 *2 × R-23 *R-77 *2 × R-27R

Air-to-Surface Missiles: *Kh-23 Grom

↳*Missile System #1*

Name: R-23; NATO: AA-7 Apex

Type: Air-to-Air Missile

Manufacturer: Vympel NPO

Length: 4.50 m

Diameter: 223 mm

Weight: 222 kg

Warhead Type: expanding-rod high explosive

Warhead Weight: 25 kg

Engine: solid fuel rocket

Propellant: 1.04 m

Operational Range: 35 km

Maximum Speed: Mach 3

Guidance System: semi-active radar homing

Rocket Systems

↳*Rocket System #1*

Name: S-5

Type: Rocket

Note: The S-5 is a 55 mm (2.2 in) calibre unguided rocket fired from a 57 mm calibre tube. It is used by fighter bombers and helicopters. It consists of a steel body containing a solid fuel rocket, and a high-explosive warhead with a mechanical impact fuse. At the rear of the rocket is an elongated exhaust nozzle, with eight attached forward folding wings. The fins fold around the rocket when it is stowed in its launch tube, springing back as soon as it leaves the launch tube. In flight, the fins provide a stabilizing spin to the rocket, turning at approximately 750 rpm. The solid rocket motor burns for just 1.1 seconds, during which time it covers about 300 meters (985 ft). The S-5 is carried in rocket pods, with 4–32 rockets. The first were ORO-57 launchers, made in variants with capacity of 4, 8 and 16 rockets. Most typical became ORO-57K for 8 rockets, used especially with MiG-19. Then, beginning in the early 1960s, the typical launcher became UB-16-57, with 16 rockets, developed in several variants, for helicopters and planes. UB stands for "universal block", as it could be carried on conventional bomb hardpoints, "57" refers to the actual diameter of the launch tube (the diameter of the rocket plus 2 mm). The first variant and UB-16-57U had a conical forward part while the next variant UB-16-57D had a blunt forward part. Starting in 1968, a variant UB-16-57UMP was produced, with a conical forward part and five protruding inner tubes.[1] In the 1970s, UB-32 was developed with 32 rockets, carried by heavier aircraft. In Poland, Mars-2 launcher was developed for 16 rockets, and in Romania, LPR 57 launchers for 16 rockets.

Bomb Weapon Systems

Note: Bombs: Up to 500 kg (1,100 lb) bombs per hardpoint

Fire Control / Avionics

Search/Track Radar: High Lark J-band

Infrared: IRST with IR sensor

Laser Desingator: INA

Radar Warning: Sirena 3

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

MiG-23ML The early "Flogger" variants were intended to be used in high-speed missile attacks, but it was soon noticed that fighters often had to engage in more stressful close-in combat. Early production aircraft had actually suffered cracks in the fuselage during their service career. Maneuverability of the aircraft was also criticized. A considerable redesign of the airframe was performed, resulting in the MiG-23ML (L – lightweight), which made it in some ways a new aircraft. Empty weight was reduced by 1250 kg, which was achieved partly by removing a rear fuselage fuel tank. Aerodynamics were refined for less drag. The dorsal fin extension was removed. The lighter weight of the airframe resulted in a different sit on the ground, with the aircraft appearing more level when at rest compared to the nose-high appearance of earlier variants. This has led to a belief that the undercarriage was redesigned for the ML variant, but it is identical to earlier variants. The airframe was now rated for a g-limit of 8.5, compared to 8 g for the early generation MiG-23M/MF "Flogger-B". A new engine model, the R-35F-300, now provided a maximum dry thrust of 84 kN (18,800 lbf), and 127 kN (28,700 lb) with afterburner. This led to a considerable improvement in maneuverability and thrust-to-weight ratio. The avionics set was considerably improved as well. The S-23ML standard included Sapfir-23ML radar and TP-23ML IRST. The new radar was more reliable and a had maximum detection range of about 65 km against a fighter-sized target (25 km in look-down mode). The navigation suite received a new, much improved autopilot. New radio and datalink systems were also installed. The prototype of this variant first flew in 1976 and production began 1978.

MiG-19 (Farmer) Russian Fighter Aircraft

Tiers:

Variants:

- **Farmer-A:** Initial production day fighter version with Klimov VK-5 engine, one 37-mm and two 23-mm cannon, plus wing pylons for rocket pods.
- **Farmer-B (MiG-19S):** Similar to Farmer-A, but with Klimov RD-9B engine, night/all-weather capability.
- **Farmer-C:** Day fighter version with new armament. Models with AM-5 engine designated MiG-19S; those with RD-9F engine designated MiG-19SF.
- **Farmer-D:** Similar to Farmer-C, but with all-weather capability. Models with Farmer-C armament are designated MiG-19PF; those carrying four AA-1 Alkali** missiles are designated MiG-19PM.
- **Farmer-E:** Day fighter version with same armament as the MiG-19PM.
- **J-6/F-6:** Chinese-manufactured versions; see separate database entry.

System

Alternate Designation(s): MiG-19; NATO: Farmer
Primary Function / Type: Fighter Aircraft
Manufacturer: Mikoyan-Gurevich
Crew: 1
Number of Engines: 2
Number of Hard Points: 4 pylons in total, 2 for drop fuel tanks only, 2 for weapons, with a capacity of up to 500 kg (1,100 lb) of stores

Dimensions

Length: 12.54 m
Height: 3.80 m
Wingspan: 9.20 m
Wing Area: 25.0 sq m
Weight, Empty: 5,500 kg
Weight, Normal Takeoff: 7,500 kg
Weight, Maximum Takeoff: 10,200 kg

Automotive

Engine Name: 2 x Klimov RD-9F

Number of Engines: 2

Engine Type: Turbojet

Engine Power, Dry: 2,800 kg static thrust each

Engine Power, with Afterburner: 3,568 kg static thrust each

Internal Fuel Capacity: 2,170 liters

Maximum Speed, High Altitude: 1,452 km/h, Mach 1.35

Maximum Speed, Sea Level: 1,339 km/h, Mach 1.1

Cruise Speed: 950 km/h, Mach 0.9

Climb Rate: 6,900 m/min

Ceiling: 16,775 m

Ferry Range: 2,200 km

Main Gun System

↳*System*

Name: Nudelman-Rikhter NR-30

Type: Autocannon

Caliber: 30mm

Quantity: 3 × 30 mm Nudelman-Rikhter NR-30 autocannon

Length: 2,153 mm

Barrel Length: 1,600 mm

Width: 181 mm

Height: 186 mm

Weight: 66 kg

Barrels: 1

Action: Short recoil

Rate of Fire: 850–1,000 rpm

Muzzle Velocity: 780 m/s

↳*Ammunition*

Type: Rifle

Caliber: 30mm

Cartridge: 30x155mm

Basic Load: (75 rounds for wing-root guns, 55 rounds for the fuselage gun

Main Missile Systems

↳*Main Missile System #1*

Name: K-13; NATO: AA-2 Atoll
Type: Infrared Homing Air-to-Air Missile
Length: 2.830 m
Diameter: 127 mm
Wingspan: 631 mm
Weight: 90 kg
Warhead Weight: 7.4 kg
Operational Range: 1-3.5 km
Maximum Speed: Mach 2.5
Guidance System: infrared homing

EW Counter Measures: INA
Chaffs/Flares: INA

Notes:

The Mikoyan-Gurevich MiG-19 (Russian: Микоян и Гуревич МиГ-19; NATO reporting name: Farmer) is a Soviet second generation, single-seat, twin jet-engined fighter aircraft, the world's first mass-produced supersonic aircraft. It was the first Soviet production aircraft capable of supersonic speeds in level flight. A comparable U.S. "Century Series" fighter was the North American F-100 Super Sabre, although the MiG-19 would primarily oppose the more modern McDonnell Douglas F-4 Phantom II and Republic F-105 Thunderchief over North Vietnam.

MiG-21bis (Fishbed-L) Fighter Aircraft

System

Alternate Designation(s): MiG-21bis; NATO: Fishbed-L

Primary Function / Type: Fighter/Interceptor

Manufacturer: Russia

In Service: 1972-Present

Crew: 1

Number of Engines: 1

Number of Hard Points: 4 with a capacity of up to 2,000 kg (4,400 lb) of stores

Rocket-Assisted Take-Off, Ground (RATOG) Capable: Yes

Note #1: It has a broader fin and parachute brake housing relocated as bullet fairing below rudder.

Note #2: t incorporates a series of changes made during PF production and adds a side-hinged canopy and broader vertical tail surfaces.

Dimensions

Length: 14.7 m

Width (Wing Span): 7.154 m

Height: 4.1 m

Wing Area: 23 m2

Weight, Gross: 8,725 kg

Weight, Maximum Take Off: 8,800 kg

Automotive

Engine Name: 1 x Tumansky R-25-300 Turbojet
Number of Engines: 1
Static Thrust: 6,200-kg static thrust
Traction (dry / with afterburning): 40.2 / 67.2 kN
Maximum Range: 660 km (410 mi, 360 nmi) clean at 11,000 m (36,089 ft) 604 km (375 mi; 326 nmi) at 11,000 m (36,089 ft) with two R-3S missiles 793 km (493 mi; 428 nmi) at 10,000 m (32,808 ft) with two R-3S missiles and 800 l (210 US gal; 180 imp gal) drop-tank
Maximum Speed: 2,237 km/h
Cruising Speed: 1,000 km/h
Landing Speed: 250 km/h
Service Ceiling: 17,500 m
Time to Altitude: 17,000 m (55,774 ft) in 8 minutes 30 seconds
Fuel: 2,885 liters
Take-Off Run: 830 m
Landing Run with SPS and Brake Parachute: 550 m

Main Gun System

↳*System*

Name: 1 × internal 23 mm Gryazev-Shipunov GSh-23L autocannon
Type: 23mm Autocannon
Caliber: 23mm
Basic Load: 200
Length: GSh-23: 1,387 mm (4 ft 7 in) GSh-23L: 1,537 mm (5 ft 1 in)
Barrel Length: mm1,000
Weight: GSh-23: 49.2 kg (108 lb) GSh-23L: 50 kg (110 lb)
Barrels: 2
Action: Gast principle
Rate of Fire: 3,400–3,600 rounds/min
Muzzle Velocity: m/s715

↳*Ammunition*

Type: Rifle, Autocannon
Caliber: mm23
Cartridge: 23x115 mm
Basic Load: 200

Wing Mounted Weapon Systems

Air-to-Air Missiles: AA-12 Adder AA-11 Archer AA-10 Alamo AA-8 Aphid AA-2 Atoll

Air-to-Surface Missiles: unguided bombs, rockets AS-17 Krypton AS-12 Kegler AS-9 Kyle KAB-500Kr

↳*Missile System (Option 1)*

Name: R-77 (AA-12 Adder)

Type: Medium-range, active radar homing air-to-air missile.

Basic Load: INA

Production history Manufacturer: Vympel

In Service: 2002-Present

Proliferation: The Russian Air Force finally entered the R-77-1 (AA-12B) into service in 2015.[5][6] It was subsequently deployed by Su-35S fighters in Syria on combat air patrols.

Length: 3.6 m (R-77), 3.71 m (R-77-1)

DIameter: mm200

Warhead: 22.5 kg HE fragmenting (R-77)

Detonation Mechanism: laser proximity fuse

Engine: Solid fuel rocket motor (R-77), air-breathing ramjet (R-77-PD)

Wingspan: mm700

Operational Range: 80–100 km (R-77), 110 km (R-77-1) 193 km (R-77M)

Flight Altitude: km5-25

Speed: Mach 4,Mach 5 for K-77PD (RVV-AE-PD)[

Guidance System: Inertial with mid-course update and terminal active radar homing/infrared homing (R-77T)

Launch Platforms: Mikoyan-Gurevich MiG-21-93/LanceR/Bison, Mikoyan-Gurevich MiG-23, Mikoyan-Gurevich MiG-25, Mikoyan-Gurevich MiG-27, Mikoyan MiG-29, Mikoyan MiG-31, Mikoyan MiG-35, Sukhoi Su-27, Sukhoi Su-30, Sukhoi Su-33, Sukhoi Su-34, Sukhoi Su-35, HAL Tejas, Yakovlev Yak-141, Chengdu J-10

↳*Missile System (Option 2)*

Name: KH-31 (AS-17 Krypton)

Type: Medium-range air-to-surface

Basic Load: INA

Manufacturer: Tactical Missiles Corporation (Zvezda-Strela before 2002)

In Service: 1988-Present

Proliferation: INA

Length: Mod 1 : 4.700 m (15 ft 5.0 in)[3] Mod 2 (AD/PD) : 5.3 m (17 ft 5 in)

Diameter: 360 mm

Weight: Kh-31A :610 kg (1,340 lb) Kh-31P :600 kg (1,320 lb)

Warhead: HE shaped charge

Detonation Mechanism: Impact

Warhead Weight: Kh-31A :94 kg (207 lb) Kh-31P :87 kg (192 lb

Engine: Solid fuel rocket in initial stage, ramjet for rest of trajectory

Wingspan: mm914

Propellant: kerosene

Operational Range: Kh-31A: 25 km–103 km (13.5–55.6 nmi; Kh-31P: up to 110 km (60 nmi; 70 mi)

Speed: Kh-31A/P: 2,160–2,520 km/h (1,340–1,570 mph) MA-31: Mach 2.7 (low), Mach 3.5 (high)

Guidance System: Kh-31A: inertial guidance with active radar homing Kh-31P: inertial with passive radar

Launch Platform: Both : Su-27SM, Su-30MKI, Su-25, Su-34, Su-35, MiG-29M, HAL Tejas Mk1 and Mk2, MiG-29K Kh-31A only : Su-33 Also : Su-24M

↳*Bomb Weapon System*

Name: KAB-500Kr

Type: Electro-optical TV-guided fire and forget bomb

Basic Load: INA

Manufacturer: Russia

Proliferation: INA

Length: m3.05

Diameter: INA

Warhead Type: Hardened, armor-piercing warhead

Weight: kg520

Warhead Weight: kg380

Penetration: up to 1.5 metres (4 feet 11 inches) of reinforced concrete.

Effective Range: the weapon's seeker can lock onto a target at ranges of up to 15 to 17 km (9.3 to 10.6 mi), depending on visibility.

Note: It uses a standard Soviet/Russian FAB-500 general-purpose bomb, with a nominal weight of 500 kg (1,100 lb), as a warhead, adding a low-light television seeker and guidance fins to turn it into a guided, unpowered glide bomb.

Notes:

MiG-21bis Fishbed-L This is a third-generation MiG-21 with the airframe redesigned for simpler construction, longer fatigue life, greater fuel capacity. The Jay Bird radar is believed to be compatible with the AA-8 Aphid** AAM. It may also be fitted with R-25 engine. The MiG-21bis has a 6,535-lb (7,500-kg) static thrust Tumansky R-25 engine and improved avionics, including a Swift Rods** instrument landing system (ILS) antenna. R-25-engined aircraft have initial rate of climb of 58,000 ft/min (17,700 m/min). It was also manufactured by Hindustan Aeronautics Ltd. (HAL) in Nasik, India. The Mikoyan-Gurevich MiG-21 (Russian: Микоян и Гуревич МиГ-21; NATO reporting name: Fishbed) is a supersonic jet fighter and interceptor aircraft, designed by the Mikoyan-Gurevich Design Bureau in the Soviet Union. Its nicknames include: Balalaika, because its planform resembles the stringed musical instrument of the same name; Ołówek, Polish for "pencil", due to the shape of its fuselage, and; Én bạc, meaning "Silver Swallow", in Vietnamese. Approximately 60 countries over four continents have flown the MiG-21, and it still serves many nations six decades after its maiden flight. It made aviation records, became the most-produced supersonic jet aircraft in aviation history, the most-produced combat aircraft since the Korean War and previously the longest production run of a combat aircraft (now exceeded by both the McDonnell Douglas F-15 Eagle and General Dynamics F-16 Fighting Falcon). It's also one of the earliest examples of planes capable of performing the Cobra maneuver. The MiG-21 was the first successful Soviet aircraft combining fighter and interceptor characteristics in a single aircraft. It was a lightweight fighter, achieving Mach 2 with a relatively low-powered afterburning turbojet, and is thus comparable to the American Lockheed F-104 Starfighter and Northrop F-5 Freedom Fighter and the French Dassault Mirage III. Its basic layout was used for numerous other Soviet designs; delta-winged aircraft included Su-9 interceptor and the fast E-150 prototype from MiG bureau while the mass-produced successful front fighter Su-7 and Mikoyan's I-75 experimental interceptor combined a similar fuselage shape with swept-back wings. However, the characteristic layout with the shock cone and front air intake did not see widespread use outside the USSR and finally proved to have limited development potential, mainly because of the very small space available for the radar. Like many aircraft designed as interceptors, the MiG-21 had a short range. This was exacerbated by the poor placement of the internal fuel tanks ahead of the centre of gravity. As the internal fuel was consumed, the center of gravity would shift rearward beyond acceptable parameters. This had the effect of making the plane statically unstable to the point of being difficult to control, resulting in an endurance of only 45 minutes in clean condition. This can be somewhat countered by carrying fuel in external tanks closer to the center of gravity. The Chinese variants somewhat improved the internal fuel tank layout (also second generation of Soviet variants), and also carry significantly larger external fuel tanks to counter this issue. Additionally, when more than half the fuel was used up, violent maneuvers prevented fuel from flowing into the engine hereby causing it to shut down in flight. This increased the risk of tank implosions (MiG-21 had tanks pressurized with air from the engine's compressor), a problem inherited from the MiG-15, MiG-17 and MiG-19. The short endurance and low fuel capacity of the MiG-21F, PF, PFM, S/SM and M/MF variants—though each had a somewhat greater fuel capacity than its predecessor—led to the development of the MT and SMT variants. These had an increased range of 250 km (155 mi) compared to the MiG-21SM, but at the cost of worsening all other performance figures, such as a lower service ceiling and slower time to altitude. The delta wing, while excellent for a fast-climbing interceptor, meant any form of turning combat led to a rapid loss of speed. However, the light loading of the aircraft could mean that a climb rate of 235 m/s (46,250 ft/min) was possible with a combat-loaded MiG-21bis, not far short of the performance of the later F-16A. Mig-21's Tumansky R-25 jet engine's specialty was the addition of a second fuel pump in the afterburning stage. Activating the ЧР (rus. "чрезвычайный режим" - emergency mode) booster feature allows the engine to develop 97.4 kilonewtons (21,896 lbf) of thrust under 4,000 meters (13,000 ft) of altitude. The limit of operation is 1 minute for dogfight practice and 3 minutes for an actual wartime emergency, as further use causes the engine to overheat. Use of this "diamond regime" provided a massive 97.4 kN of thrust for no more than 3 minutes in actual wartime use. Use of this temporary power gave the MiG-21bis slightly better than 1:1 thrust-to-weight ratio and a climbing rate of 254 meters/second, equalling the F-16's nominal capabilities in close-quarters dogfight. In air combat practice with the MiG-21bis, use of WEP thrust was limited to 1 minute, to spare on the engines' 800 flight hours lifetime, since every second of super-afterburner use counted as several minutes of regular power run due to extreme thermal stress. When WEP was on, the MiG-21bis's R-25 engine produced a huge 5 meter long blowtorch exhaust - the six or seven brightly glowing rhomboid "shock diamonds" visible inside the flames gave the emergency-power setting its "diamond regime" name. Given a skilled pilot and capable missiles, it could give a good account of itself against contemporary fighters. Its G-limits were increased from +7Gs in initial variants to +8.5Gs in the latest variants. It was replaced by the newer variable-geometry MiG-23 and MiG-27 for ground support duties. However, not until the MiG-29 would the Soviet Union ultimately replace the MiG-21 as a maneuvering dogfighter to counter new American air superiority types. The MiG-21 was exported widely and remains in use. The aircraft's simple controls, engine, weapons, and avionics were typical of Soviet-era military designs. The use of a tail with the delta wing

aids stability and control at the extremes of the flight envelope, enhancing safety for lower-skilled pilots; this in turn enhanced its marketability in exports to developing countries with limited training programs and restricted pilot pools. While technologically inferior to the more advanced fighters it often faced, low production and maintenance costs made it a favorite of nations buying Eastern Bloc military hardware. Several Russian, Israeli and Romanian firms have begun to offer upgrade packages to MiG-21 operators, designed to bring the aircraft up to a modern standard, with greatly upgraded avionics and armaments.

MiG-15 (Fagot) Russian Fighter Aircraft

Tiers:

Variants:

- **MiG-15:** This was a developmental/early production model with the RD-45 engine providing 4,850 lb (2,200 kg) of static thrust.
- **MiG-15bis:** This was the basic production version. Some were modified for ground attack and reconnaissance missions. Attack models could carry up to 2,200 lb (1,000 kg) of ordnance on wing pylons.
- **MiG-15UTI Midget:** This was a two-seat trainer version. Most had their guns removed. It was also built in Poland as the Lim-3; in the former Czechoslovakia as the CS-2; and in China as JJ-2 (domestic) and T-2 (export).

Notes:

The Mikoyan-Gurevich MiG-15 (Russian: Микоян и Гуревич МиГ-15; USAF/DoD designation: Type 14; NATO reporting name:

Fagot) is a jet fighter aircraft developed by Mikoyan-Gurevich for the Soviet Union. The MiG-15 was one of the first successful jet fighters to incorporate swept wings to achieve high transonic speeds. In combat over Korea, it outclassed straight-winged jet day fighters, which were largely relegated to ground-attack roles, and was quickly countered by the similar American swept-wing North American F-86 Sabre. When refined into the more advanced MiG-17, the basic design would again surprise the West when it proved effective against supersonic fighters such as the Republic F-105 Thunderchief and McDonnell Douglas F-4 Phantom II in the Vietnam War of the 1960s. The MiG-15 is believed to have been one of the most produced jet aircraft; in excess of 13,000 were manufactured. Licensed foreign production may have raised the production total to almost 18,000. The MiG-15 remains in service with the Korean People's Army Air Force as an advanced trainer. The first turbojet fighter developed by Mikoyan-Gurevich OKB was the Mikoyan-Gurevich MiG-9, which appeared in the years immediately after World War II. It used a pair of reverse-engineered German BMW 003 engines. The MiG-9 was a troublesome design that suffered from weak, unreliable engines and control problems. Categorized as a first-generation jet fighter, it was designed with the straight-style wings common to piston-engined fighters. The Germans had been unable to develop turbojets with thrust over 1,130 kilograms-force (11,100 N; 2,500 lbf) running at the time of the surrender in May 1945, which limited the performance of immediate Soviet postwar jet aircraft designs. They did inherit the technology of the advanced axial-compressor Junkers 012 and BMW 018 engines, in the class of the later Rolls-Royce Avon, that were some years ahead of the then currently available British Rolls-Royce Nene engine. The Soviet aviation minister Mikhail Khrunichev and aircraft designer A. S. Yakovlev suggested to Premier Joseph Stalin that the USSR buy the conservative but fully developed Nene engines from Rolls-Royce (having been alerted to the fact that the U.K. Labour government wanted to improve post-war UK-Russia foreign relations) for the purpose of copying them in a minimum of time. Stalin is said to have replied, "What fool will sell us his secrets?" However, he gave his consent to the proposal and Mikoyan, engine designer Vladimir Klimov, and others travelled to the United Kingdom to request the engines. To Stalin's amazement, the British Labour government and its Minister of Trade, Sir Stafford Cripps, were perfectly willing to provide technical information and a license to manufacture the Rolls-Royce Nene. Sample engines were purchased and delivered with blueprints. Following evaluation and adaptation to Russian conditions, the windfall technology was tooled for mass-production as the Klimov RD-45 to be incorporated into the MiG-15. To take advantage of the new engine, the Council of Ministers ordered the Mikoyan-Gurevich OKB to build two prototypes for an advanced high-altitude daytime interceptor to defend against bombers. It was to have a top speed of 1,000 kilometres per hour (620 mph) and a range of 1,200 kilometres (750 mi). Designers at MiG's OKB-155 started with the earlier MiG-9 jet fighter. The new fighter used Klimov's British-derived engines, swept wings, and a tailpipe going all the way back to a swept tail. The German Me 262 was the first fighter fitted with an 18.5° wing sweep, but it was introduced merely to adjust the center of gravity of its heavy Junkers Jumo 004 pioneering axial-compressor turbojet engines. Further experience and research during World War II later established that swept wings would give better performance at transonic speeds. At the end of World War II, the Soviets seized many of the assets of Germany's aircraft industry. The MiG team studied these plans, prototypes and documents, particularly swept-wing research and designs, even going so far as to produce a flying testbed in 1945 to investigate swept-wing design concepts as the piston-engined "pusher"-layout, MiG-8 Utka (Russian for "duck", from its tail-first canard design). The swept wing later proved to have a decisive performance advantage over straight-winged jet fighters when it was introduced into combat over Korea. The design that emerged had a mid-mounted 35-degree swept wing with a slight anhedral and a tailplane mounted up on the swept tail. Western analysts noted that it strongly resembled Kurt Tank's Focke-Wulf Ta 183, a later design than the Me 262 that never progressed beyond the prototype stage. While the majority of Focke-Wulf engineers (in particular, Hans Multhopp, who led the Ta-183 development team) were captured by Western armies, the Soviets did capture plans and wind-tunnel models for the Ta-183. The MiG-15 bore a much stronger likeness to the Ta-183 than the American F-86 Sabre, which also incorporated German research.[citation needed] The MiG-15 does bear a resemblance in layout, sharing the high tailplane and nose-mounted intake, although the aircraft are different in structure, details, and proportions. The MiG-15's design understandably shared features, and some appearance commonalities with the MiG design bureau's own 1945–46 attempt at a Soviet-built version of the Messerschmitt Me 263 rocket fighter in the appearance of its fuselage. The new MiG retained the previous straight-winged MiG-9's wing and tailplane placement while the F-86 employed a more conventional low-winged design. To prevent confusion during the height of combat the US painted their aircraft with bright stripes to distinguish them. The resulting prototypes were designated I-310. The I-310 was a swept-wing fighter with 35-degree sweep in wings and tail, with two wing fences fitted to each wing to improve airflow over the wing. The design used a single Rolls-Royce Nene fed by a split-forward air intake. A duct carried intake air around the cockpit area and back together ahead of the engine. Its first flight was 30 December 1947, some two months after the American F-86 Sabre had first flown. It demonstrated exceptional performance, reaching 1,042 kilometres per hour (647 mph) at 3,000 metres (9,800 ft). The Soviet Union's first swept-wing jet fighter had been the underpowered Lavochkin La-160, which was otherwise more similar to the MiG-9. The Lavochkin La-168, which reached production as the Lavochkin La-15, used the same engine as the MiG but used a shoulder mounted wing and t-tail; it was the main competitive design. Eventually, the MiG design was favoured for mass production. Designated MiG-15, the first production example flew on 31 December 1948. It entered Soviet Air Force service in 1949, and subsequently received the NATO reporting name "Fagot". Early production examples had a tendency to roll to the left or to the right due to manufacturing variances, so aerodynamic trimmers called "nozhi" (knives) were fitted to correct the problem, the knives being adjusted by ground crews until the aircraft flew correctly. An improved variant, the MiG-15bis ("second"), entered service in early 1950 with a Klimov VK-1 engine, another version of the Nene with improved metallurgy over the RD-45, plus minor improvements and upgrades. Visible differences were a headlight in the air intake separator and horizontal upper edge airbrakes. The 23 mm cannon were placed more closely together in their undercarriage. Some "bis" aircraft also adopted under-wing hardpoints for unguided rocket launchers or 50–250 kg (110–550 lb) bombs. Fighter-bomber modifications were dubbed "IB", "SD-21", and "SD-5". About 150 aircraft were upgraded to SD-21 specification during 1953–1954. The MiG-15 arguably had sufficient power to dive at supersonic speeds, but the lack of an "all-flying" tail greatly diminished the pilot's ability to control the aircraft as it approached

Mach 1. As a result, pilots understood they must not exceed Mach 0.92, where the flight surfaces became ineffective. Additionally, the MiG-15 tended to spin after it stalled, and often the pilot could not recover. Later MiGs incorporated all-flying tails. The MiG-15 was originally intended to intercept American bombers like the B-29. It was even evaluated in mock air-to-air combat trials with a captured U.S. B-29, as well as the later Soviet B-29 copy, the Tupolev Tu-4. To ensure the destruction of such large bombers, the MiG-15 carried autocannons: two 23 mm with 80 rounds per gun and a single 37 mm with 40 rounds. These weapons provided tremendous punch in the interceptor role, but their limited rate of fire and relatively low velocity made it more difficult to score hits against small and maneuverable enemy jet fighters in air-to-air combat. The 23 mm and 37 mm also had radically different ballistics, and some United Nations pilots in Korea had the unnerving experience of 23 mm shells passing over them while the 37 mm shells flew under. The cannon were fitted into a simple pack that could be winched out of the bottom of the nose for servicing and reloading, allowing pre-prepared packs to be rapidly swapped out.

Mirage F1 French Fighter Aircraft

Tiers:

Variants:

- **Mirage F1A:** Single-seat ground-attack fighter aircraft, with limited daylight-only air-to-air capability. Fitted with lightweight EMD AIDA 2 ranging radar instead of Cyrano IV of other variants, with laser rangefinder under nose, retractable refuelling probe and more fuel.[
- **Mirage F1B:** The French Air Force also ordered 20 Mirage F1Bs, a two-seat operational conversion trainer; these were delivered between October 1980 and March 1983. The extra seat and controls added only 30 cm (12 in) to the length of the fuselage, but at the cost of less internal fuel capacity and the loss of the internal cannon
- **Mirage F1C:** INA
- **Mirage F1D:** Two-seat training version, based on the Mirage F1E multi-role fighter, ground-attack aircraft.
- **Mirage F1E:** Single-seat all-weather multi-role fighter and ground-attack aircraft.
- **Mirage F1CG:** Greece operated 40 Dassault Mirage F1CG single seat aircraft. F1CG was first ordered in 1974 and entered service with the Hellenic Air Force in 1975 The aircraft were used by 334 Squadron and 342 Squadron.Mirage F1CG was armed with the Sidewinder AIM-9P missile, rather than the most commonly used Matra Magic II, and it could carry four AIM-9Ps, rather than just two.
- **Mirage F1CR:** When it became clear that the Mirage F1 was becoming a successful production aircraft, Dassault began investigating the possibility of a dedicated reconnaissance version for its most important client, the French Air Force. However, the escalating cost of fighter aircraft meant that add-on pods for this purpose were a more economical alternative.
- **Mirage F1CT:** The Mirage F1CT is a ground attack version of the Mirage F1C-200. Following their replacement in the air defence role by the Mirage 2000, the French Air Force had a number of surplus Mirage F1C-200s, and in 1988 it launched a conversion programme to turn these aircraft into interim ground attack aircraft to replace elderly Mirage IIIEs and Mirage Vs.
- **Mirage F1AZ and F1CZ:** The South African Air Force (SAAF) flew both the Mirage F1AZ ground-attack version as well as the radar-equipped Mirage F1CZ fighter. The first two examples of the first order (48 aircraft, comprising 32 F1AZ and 16 F1CZ) were delivered on 5 April 1975. In July of the same year, the remainder of the F1CZs were delivered and 3 Squadron was recommissioned to operate the aircraft from AFB Waterkloof. In 1975 the F1CZs also appeared at a South African airshow, the public were not informed that it was already in service. The SAAF retired the F1CZs in 1992, followed by the F1AZs in 1997.
- **Mirage F1 M-53:** Developed for the participation in the "European" NATO fighter competition of early seventies, seeking to replace the F-104G. It was equipped with a more powerful engine, the SNECMA M-53, and other improvements. Failed to succeed, the contest was eventually won by the General Dynamics F-16. The Mirage F.1 came in second place.
- **Mirage F1M:** The F1M upgrade (unrelated to the M-53 prototype) was applied to 48 Spanish F1CE/EE and four F1EDA trainers under a FFr700 million (US$96m) contract awarded to Thomson-CSF in October 1996. The prototype F1M flew in

April 1998, and CASA delivered the remainder between March 1999 and 15 March 2001. The project included a revised cockpit with colour LCDs and a Smart HUD from Sextant Avionique, a Sextant inertial navigation system with GPS interface; NATO-compatible Have Quick 2 secure communications; Mode 4 digital IFF; a defensive aids suite; and flight recorders.[

System

Alternate Designation(s): Mirage F1

Primary Function / Type: Fighter Aircraft

Manufacturer: Dassault Aviation

Total Built: Total: 720 Gabon Gabonese Air Force received 6 F1AZ aircraft from South Africa, with two more to be delivered. Iran Iranian Air Force Mirage F1BQ Islamic Republic of Iran Air Force seized 24 F1BQs and F1EQs flown over from Iraq, during the 1991 Persian Gulf War. Libya Libyan Air Force received 16 F1AD, 6 F1BD & 16 F1ED aircraft. All were grounded but, twelve were contracted for refurbishment, of which only four were returned to service. Of these twelve, two were taken to Malta when their pilots defected France will renovate Libya's small fleet of Mirage F1s and train its personnel as part of a defence co-operation agreement signed in 2012. Morocco Royal Moroccan Air Force received 30 F1CHs, 14 F1EHs & 6 F1EH-200s. 23 are still operational and 27 have been upgraded to ASTRAC. South Africa Paramount Aerospace Systems acquired four former French Air Force Mirage F1B. United States Draken International has acquired 20 former Spanish Air Force Mirage F1Ms and 2 F1B aircraft for use in the Adversary Air role providing support to the United States Air Force. Textron subsidiary Airborne Tactical Advantage Company acquired 63 former French Air Force Mirage F1B, F1CT, and F1CR for dissimilar air combat training and aggressor squadron purposes for the US Air Force

Notes:

The Dassault Mirage F1 is a French fighter and attack aircraft designed and manufactured by Dassault Aviation. It was developed as a successor to the popular Mirage III family. During the 1960s, Dassault commenced development of what would become the Mirage F1 as a private venture, alongside the larger Mirage F2. Work on the F1 eventually took precedence over the more costly F2, which was cancelled during the late 1960s. The French Air Force (Armée de l'Air) took interest in the fledgling fighter to meet its requirement for an all-weather interceptor aircraft. Accordingly, initial production units were equipped with the Thomson-CSF Cyrano IV monopulse radar. During the latter half of 1974, the Mirage F1 entered service in the French Air Force. Shortly thereafter, the type was deployed as the main interceptor of the French Air Force, a capacity which it continued to serve in until the arrival of the Mirage 2000. It later transitioned to an aerial reconnaissance role. During June 2014, the last French Mirage F1s was retired from service. Powered by a single SNECMA Atar 9K-50 turbojet engine, which provided about 7 tonnes-force (69 kN; 15,000 lbf) of thrust, and armed with an array of French and American-sourced armaments, the Mirage F1 has been operated as a light multipurpose fighter and has been exported to around a dozen nations. The type has seen action in a large number of armed conflicts involving several of its operators, including the Western Sahara War, the Paquisha War, the Cenepa War, the Iran–Iraq War, the Gulf War, the South African Border War, the War in Afghanistan, the Chadian–Libyan conflict, the 2011 military intervention in Libya, and the Northern Mali conflict. More than 720 Mirage F1s were manufactured between 1966 and 1992. It was succeeded in production by the Dassault Mirage 2000. The Dassault Mirage F1 was a single-engine fighter aircraft, designed to function as both an interceptor aircraft and as a capable ground attack platform. While officially developed for the French Air Force as a capable air defense aircraft, Dassault had placed considerable emphasis on developing the Mirage F1 for ground attack duties as a secondary role during its early design. Developed by the company to function as a successor to the successful Mirage III and Mirage 5 families, it drew heavily upon its predecessors as well, sharing the same fuselage as the Mirage III, while adopting a considerably different wing configuration. The Mirage F1 used a shoulder-mounted swept wing, instead of the Delta wing of the Mirage III, which resulted in a more than 50% reduction in required runway lengths and increased internal fuel tankage for 40% greater combat range. The approach speed prior to landing is 25% less than the preceding Mirage IIIE. According to Dassault, the negative performance impact associated with the

increased thickness of the Mirage F1's wing over the Mirage III's counterpart had been offset by improvements made to the propulsion system.The wing is fitted with both double-slotted trailing edge flaps and full-span leading edge slats, the latter being automatically operated to reduce the aircraft's turn radius during combat. A key area of advancement on the Mirage F1 over its predecessors was in its onboard avionics. The Thomson-CSF Cyrano IV monopulse radar system, developed from the Cyrano II unit installed on the Mirage IIIE, serves as the main sensor; it operates in three different modes: air-target acquisition and tracking, ground mapping, and terrain avoidance. The later Cyrano IV-1 model also provided for a limited look-down capability. According to aerospace publication Flight International, the Cyrano IV radar was capable of detecting aerial targets at double the range of earlier models. The standard production Mirage F1 was furnished with an Instrument Landing System (ILS), radar altimeter, UHF/VHF radio sets, Tactical Air Navigation system (TACAN) and aground data link. Other avionics include an autopilot and yaw damper. The Mirage F1 was powered by a single SNECMA Atar 9K-50 turbojet engine, which was capable of providing roughly 7 tonnes-force (69 kN; 15,000 lbf) of thrust, giving the aircraft a maximum speed of 1,453 MPH and an altitude ceiling of 65,615 feet. Flight International described the Atar engine as being "unexpectedly simple", despite the adoption of an afterburner.[8] An improved engine, initially known as the Super Atar and later as the Snecma M53, was intended to be eventually adopted on production Mirage F1 aircraft, as well as for successor aircraft. The initial armament of the Mirage F1 was a pair of internal 30 mm cannons, and a single Matra R530 medium-range air-to-air missile, which was carried under the fuselage. It could carry a total combined payload of 13,889lb of bombs and missiles, all of which would be carried externally. After 1979, the medium-range R530 was replaced by the improved Matra Super 530 F missile as the latter came into service in quantity with the French Air Force. In 1977, the R550 Magic was released; the Mirage F1 has these missiles mounted on rails on the wingtips. Around the same time, the American AIM-9 Sidewinder was also introduced to the Mirage F1's armament; both the Spanish and Hellenic Air Forces had requested the integration of the Sidewinder upon their own Mirage F1CE and Mirage F1CG fighters.

Radar: 1 x Skyranger

Notes:

The Chengdu J-7 (Chinese: □-7; third generation export version F-7; NATO reporting name: Fishcan is a People's Republic of China license-built version of the Soviet Mikoyan-Gurevich MiG-21. Though production ceased in 2013, it continues to serve, mostly as an interceptor, in several air forces, including the People's Liberation Army Air Force. In the 1950s and early 1960s, the Soviet Union shared most of its conventional weapons technology with the People's Republic of China. The famous MiG-21, powered by a single engine and designed on a simple airframe, was inexpensive but fast, suiting the strategy of forming large groups of 'people's fighters' to overcome the technological advantages of Western aircraft. However, the Sino-Soviet split abruptly ended the initial cooperation, and from July 28 to September 1, 1960, the Soviet Union withdrew its advisers from China, resulting in the project being stopped in China. Soviet Premier Nikita Khrushchev unexpectedly wrote to Mao Zedong in February, 1962, to inform Mao that the Soviet Union was willing to transfer MiG-21 technology to China, and he asked the Chinese to send their representatives to the Soviet Union as soon as possible to discuss the details. The Chinese viewed this offer as a Soviet gesture to make peace, and they were understandably suspicious, but they were nonetheless eager to take up the Soviet offer for an aircraft deal. A delegation headed by General Liu Yalou, the commander-in-chief of the People's Liberation Army Air Force (PLAAF) and himself a Soviet military academy graduate, was dispatched to Moscow immediately, and the Chinese delegation was given three days to visit the production facility of the MiG-21, which was previously off-limits to foreigners. The authorization for this visit was personally given by Nikita Khrushchev, and on March 30, 1962, the technology transfer deal was signed. However, given the political situation and the relationship between the two countries, the Chinese were not optimistic about gaining the technology, and thus they were prepared for reverse engineering. Russian sources state that several complete examples of the MiG-21 were sent to China, flown by Soviet pilots, and China also received MiG-21Fs in kits, along with parts and technical documents. Just as the Chinese had expected, however, when the Soviets delivered the kits, parts and documents to Shenyang Aircraft Factory five months after the deal was signed, the Chinese discovered that the technical documents provided by the Soviets were incomplete and that some of the parts could not be used. China set about to reverse-engineer the aircraft for local production, and in doing so, they succeeded in solving 249 major problems and reproducing eight major technical documents that were not provided by the Soviet Union. One of the major flaws was with the Hydraulics systems, which grounded up to 70% of aircraft in some squadrons until the systems were upgraded. Another major upgrade was modifications to the fuel storage to make the aircraft more stable. The MiG-21 carries most of its fuel in the forward fuselage, causing the center of gravity to shift and become unstable after about 45 minutes of operation. The J-7 has redesigned fuel tanks and significantly larger drop tanks in order to maintain a more stable center of gravity, and therefore better Longitudinal static stability. The cockpit was also revised to replace the Soviet ejection seat, which was found to be unacceptable. The forward opening canopy was replaced by a standard canopy hinged to the rear and jettisoned before the seat ejected. Otherwise, the re-engineering effort was largely successful, as the Chinese-built J-7 aircraft showed only minor differences in design and performance from the original Soviet MiG-21. In March 1964, Shenyang Aircraft Factory began the first domestic production of the J-7 jet fighter, which they successfully accomplished the next year. However, the mass production of the J-7 aircraft was severely hindered by an unexpected social and economic problem—the Cultural Revolution—that resulted in poor initial quality and slow progress, which, in turn, resulted in full-scale production only coming about in the 1980s, by which time the original aircraft design was showing its age. In 1987 the J-7E was released, having a greatly improved wing, among other improvements. It was roughly 45% more maneuverable, and its takeoff and landing performance was greatly increased. It was also equipped with a helmet mounted sight, as well as being the first MiG-21 to be equipped with HOTAS and a multipurpose display. Many of the electronic components were British in origin, such as the gun sight and the multi purpose display. The aircraft is capable of using PL-8/Python 3 missiles with both the helmet mounted sight or the radar fire control, but the two are not connected. The pilot may use only one system at a time. In the mid 1980s Pakistan

requested an aircraft with greater radar capabilities. Both the standard radar and the British Marconi radar were plagued by ground clutter, but China did not have any experience with air to ground radar at the time. In 1984 Pakistan provided assistance by having their American trained F-16 pilots provide training on proper operation of ground attack radar, which enabled the Chinese to develop the J-7M. In the late 1980s the J-7MP and J-7PG introduced significant upgrades to the radar system by converting to an Italian FAIR Grifo-7 radar. This more than tripled the effective range of the radar, as well as greatly increased the angle which the radar could detect target. The J-7 only reached its Soviet-designed capabilities in the mid 1980s. However, the fighter is affordable and has been widely exported as the F-7, often with Western systems incorporated, like the ones sold to Pakistan. There are over 20 different export variants of the J-7, some of which are equipped to use European weaponry, such as French R.550 Magic missiles. The Discovery Channel's Wings Over The Red Star series claims that the Chinese intercepted several Soviet MiG-21s en route to North Vietnam (during the Vietnam War), but these aircraft did not perform in a manner consistent with their original specifications, suggesting that the Chinese actually intercepted down-rated aircraft that were intended for export, rather than fully capable production aircraft. For this reason, the Chinese had to re-engineer the intercepted MiG-21 airframes in order to achieve their original capabilities. China later developed the Shenyang J-8 based both on the expertise gained by the program, and by utilizing the incomplete technical information acquired from the Soviet Ye-152 developmental jet. In May 2013, J-7 production has ceased after decades of manufacturing. The last 12 F-7BGIs were delivered to the Bangladesh Air Force.

Time to Altitude: 17,000 m (55,774 ft) in 8 minutes 30 seconds

Fuel: 2,885 liters

Communications

Cannon Weapon System

↳*System*

Name: 1 × internal 23 mm Gryazev-Shipunov GSh-23L autocannon

Type: 23mm Autocannon

Caliber: 23mm

Basic Load: 200

Length: GSh-23: 1,387 mm (4 ft 7 in) GSh-23L: 1,537 mm (5 ft 1 in)

Barrel Length: mm1,000

Weight: GSh-23: 49.2 kg (108 lb) GSh-23L: 50 kg (110 lb)

Barrels: 2

Action: Gast principle

Rate of Fire: 3,400–3,600 rounds/min

Muzzle Velocity: m/s715

↳*Ammunition*

Type: Rifle, Autocannon

Caliber: mm23

Cartridge: 23x115 mm

Basic Load: 200

Wing Mounted Weapon Systems

Air-to-Air Missiles: AA-12 Adder AA-11 Archer AA-10 Alamo AA-8 Aphid AA-2 Atoll

Air-to-Surface Missiles: unguided bombs, rockets AS-17 Krypton AS-12 Kegler AS-9 Kyle KAB-500Kr

↳*Missile System (Option 1)*

Name: R-77 (AA-12 Adder)

Type: Medium-range, active radar homing air-to-air missile.

Basic Load: INA

Production history Manufacturer: Vympel

In Service: 2002-Present

Proliferation: The Russian Air Force finally entered the R-77-1 (AA-12B) into service in 2015.[5][6] It was subsequently deployed by Su-35S fighters in Syria on combat air patrols.

Length: 3.6 m (R-77), 3.71 m (R-77-1)

DIameter: mm200

Warhead: 22.5 kg HE fragmenting (R-77)

Detonation Mechanism: laser proximity fuse

Engine: Solid fuel rocket motor (R-77), air-breathing ramjet (R-77-PD)

Wingspan: mm700

Operational Range: 80–100 km (R-77), 110 km (R-77-1) 193 km (R-77M)

Flight Altitude: km5-25

Speed: Mach 4,Mach 5 for K-77PD (RVV-AE-PD)[

Guidance System: Inertial with mid-course update and terminal active radar homing/infrared homing (R-77T)

Launch Platforms: Mikoyan-Gurevich MiG-21-93/LanceR/Bison, Mikoyan-Gurevich MiG-23, Mikoyan-Gurevich MiG-25, Mikoyan-Gurevich MiG-27, Mikoyan MiG-29, Mikoyan MiG-31, Mikoyan MiG-35, Sukhoi Su-27, Sukhoi Su-30, Sukhoi Su-33, Sukhoi Su-34, Sukhoi Su-35, HAL Tejas, Yakovlev Yak-141, Chengdu J-10

↳*Missile System (Option 2)*

Name: KH-31 (AS-17 Krypton)

Type: Medium-range air-to-surface

Basic Load: INA

Manufacturer: Tactical Missiles Corporation (Zvezda-Strela before 2002)

In Service: 1988-Present

Proliferation: INA

Length: Mod 1 : 4.700 m (15 ft 5.0 in)[3] Mod 2 (AD/PD) : 5.3 m (17 ft 5 in)

Diameter: 360 mm

Weight: Kh-31A :610 kg (1,340 lb) Kh-31P :600 kg (1,320 lb)

Warhead: HE shaped charge

Detonation Mechanism: Impact

Warhead Weight: Kh-31A :94 kg (207 lb) Kh-31P :87 kg (192 lb

Engine: Solid fuel rocket in initial stage, ramjet for rest of trajectory

Wingspan: mm914

Propellant: kerosene

Operational Range: Kh-31A: 25 km–103 km (13.5–55.6 nmi; Kh-31P: up to 110 km (60 nmi; 70 mi)

Speed: Kh-31A/P: 2,160–2,520 km/h (1,340–1,570 mph) MA-31: Mach 2.7 (low), Mach 3.5 (high)

Guidance System: Kh-31A: inertial guidance with active radar homing Kh-31P: inertial with passive radar

Launch Platform: Both : Su-27SM, Su-30MKI, Su-25, Su-34, Su-35, MiG-29M, HAL Tejas Mk1 and Mk2, MiG-29K Kh-31A only : Su-33 Also : Su-24M

↳*Bomb*

Name: KAB-500Kr

Type: Electro-optical TV-guided fire and forget bomb

Basic Load: INA

Manufacturer: Russia

Proliferation: INA

Length: m3.05

Diameter: INA

Warhead Type: Hardened, armor-piercing warhead

Weight: kg520

Warhead Weight: kg380

Penetration: up to 1.5 metres (4 feet 11 inches) of reinforced concrete.

Effective Range: he weapon's seeker can lock onto a target at ranges of up to 15 to 17 km (9.3 to 10.6 mi), depending on visibility.

Note: It uses a standard Soviet/Russian FAB-500 general-purpose bomb, with a nominal weight of 500 kg (1,100 lb), as a warhead, adding a low-light television seeker and guidance fins to turn it into a guided, unpowered glide bomb.

Fire Control / Avionics

Fire Control System Type: INA

Fire Control Radar: Phazotron Kopyo

Laser Desingator: INA

Radar Warning: Sirena

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: No

NBC Protection: Yes

EW Counter Measures: INA

Chaffs/Flares: BVP-1F 120 x 26-mm cartridge dispenser

Notes:

The Mikoyan-Gurevich MiG-21 (Russian: Микоян и Гуревич МиГ-21; NATO reporting name: Fishbed) is a supersonic jet fighter and interceptor aircraft, designed by the Mikoyan-Gurevich Design Bureau in the Soviet Union. Its nicknames include: Balalaika, because its planform resembles the stringed musical instrument of the same name; Ołówek, Polish for "pencil", due to the

shape of its fuselage, and; Én bạc, meaning "Silver Swallow", in Vietnamese. Approximately 60 countries over four continents have flown the MiG-21, and it still serves many nations six decades after its maiden flight. It made aviation records, became the most-produced supersonic jet aircraft in aviation history, the most-produced combat aircraft since the Korean War and previously the longest production run of a combat aircraft (now exceeded by both the McDonnell Douglas F-15 Eagle and General Dynamics F-16 Fighting Falcon). It's also one of the earliest examples of planes capable of performing the Cobra maneuver. The MiG-21 was the first successful Soviet aircraft combining fighter and interceptor characteristics in a single aircraft. It was a lightweight fighter, achieving Mach 2 with a relatively low-powered afterburning turbojet, and is thus comparable to the American Lockheed F-104 Starfighter and Northrop F-5 Freedom Fighter and the French Dassault Mirage III. Its basic layout was used for numerous other Soviet designs; delta-winged aircraft included Su-9 interceptor and the fast E-150 prototype from MiG bureau while the mass-produced successful front fighter Su-7 and Mikoyan's I-75 experimental interceptor combined a similar fuselage shape with swept-back wings. However, the characteristic layout with the shock cone and front air intake did not see widespread use outside the USSR and finally proved to have limited development potential, mainly because of the very small space available for the radar. Like many aircraft designed as interceptors, the MiG-21 had a short range. This was exacerbated by the poor placement of the internal fuel tanks ahead of the centre of gravity. As the internal fuel was consumed, the center of gravity would shift rearward beyond acceptable parameters. This had the effect of making the plane statically unstable to the point of being difficult to control, resulting in an endurance of only 45 minutes in clean condition. This can be somewhat countered by carrying fuel in external tanks closer to the center of gravity. The Chinese variants somewhat improved the internal fuel tank layout (also second generation of Soviet variants), and also carry significantly larger external fuel tanks to counter this issue. Additionally, when more than half the fuel was used up, violent maneuvers prevented fuel from flowing into the engine hereby causing it to shut down in flight. This increased the risk of tank implosions (MiG-21 had tanks pressurized with air from the engine's compressor), a problem inherited from the MiG-15, MiG-17 and MiG-19. The short endurance and low fuel capacity of the MiG-21F, PF, PFM, S/SM and M/MF variants—though each had a somewhat greater fuel capacity than its predecessor—led to the development of the MT and SMT variants. These had an increased range of 250 km (155 mi) compared to the MiG-21SM, but at the cost of worsening all other performance figures, such as a lower service ceiling and slower time to altitude. The delta wing, while excellent for a fast-climbing interceptor, meant any form of turning combat led to a rapid loss of speed. However, the light loading of the aircraft could mean that a climb rate of 235 m/s (46,250 ft/min) was possible with a combat-loaded MiG-21bis, not far short of the performance of the later F-16A. Mig-21's Tumansky R-25 jet engine's specialty was the addition of a second fuel pump in the afterburning stage. Activating the ЧР (rus. "чрезвычайный режим" - emergency mode) booster feature allows the engine to develop 97.4 kilonewtons (21,896 lbf) of thrust under 4,000 meters (13,000 ft) of altitude. The limit of operation is 1 minute for dogfight practice and 3 minutes for an actual wartime emergency, as further use causes the engine to overheat. Use of this "diamond regime" provided a massive 97.4 kN of thrust for no more than 3 minutes in actual wartime use. Use of this temporary power gave the MiG-21bis slightly better than 1:1 thrust-to-weight ratio and a climbing rate of 254 meters/second, equalling the F-16's nominal capabilities in close-quarters dogfight. In air combat practice with the MiG-21bis, use of WEP thrust was limited to 1 minute, to spare on the engines' 800 flight hours lifetime, since every second of super-afterburner use counted as several minutes of regular power run due to extreme thermal stress. When WEP was on, the MiG-21bis's R-25 engine produced a huge 5 meter long blowtorch exhaust - the six or seven brightly glowing rhomboid "shock diamonds" visible inside the flames gave the emergency-power setting its "diamond regime" name. Given a skilled pilot and capable missiles, it could give a good account of itself against contemporary fighters. Its G-limits were increased from +7Gs in initial variants to +8.5Gs in the latest variants. It was replaced by the newer variable-geometry MiG-23 and MiG-27 for ground support duties. However, not until the MiG-29 would the Soviet Union ultimately replace the MiG-21 as a maneuvering dogfighter to counter new American air superiority types. The MiG-21 was exported widely and remains in use. The aircraft's simple controls, engine, weapons, and avionics were typical of Soviet-era military designs. The use of a tail with the delta wing aids stability and control at the extremes of the flight envelope, enhancing safety for lower-skilled pilots; this in turn enhanced its marketability in exports to developing countries with limited training programs and restricted pilot pools. While technologically inferior to the more advanced fighters it often faced, low production and maintenance costs made it a favorite of nations buying Eastern Bloc military hardware. Several Russian, Israeli and Romanian firms have begun to offer upgrade packages to MiG-21 operators, designed to bring the aircraft up to a modern standard, with greatly upgraded avionics and armaments.

J-8 (Finback) Chinese Interceptor Fighter Aircraft

Tiers:

Variants:

- **J-8 (Finback-A) Series:** First flew on 5 July 1969. Initial day fighter variant, resembles an enlarged MiG-21. Equipped with 2 x WP-7A turbojet engines, SR-4 ranging radar 2 x Type 30-I 30mm cannon (200 rounds each), and 2 x PL-2 IR-guided AAMs. Limited production. J-8I First flew on 24 April 1981. Improved all-weather version with SL-7A fire-control radar (40 km range), twin-barrel Type 23-III 23 mm cannon, & up to 4 AAMs (or rockets/bombs). Limited production. J-8E Final version of the J-8I series. J-8E is equipped with a type 204 (JL-7) mono-pulse fire-control radar with look down shot down capability, SM-8A aeronautical optical gun-sight, onboard computer, new cockpit panel, and redesign ejection escape system and oxygen supply system. The original two Type 30-I 30mm cannons were replaced by two Type 23-III 23mm cannons. The four under-wing stores stations are capable of carrying the more advanced PL-5 series short-range AAM. These aircraft were also fitted with an improved electronic countermeasures (ECM) suite including KJ-8602B all-aspect radar warning receiver (RWR). JZ-8 (J-8R) Reconnaissance version of J-8 or J-8I. J-8ACT First flew on 24 June 1990, fly-by-wire testbed aircraft.
- **J-8II (Finback-B) Series:** J-8II (Finback-B) First flown on 12 June 1984, the improved J-8I prototype with redesigned nose/front section and fuselage. replacing the nose air inlet with a solid nose and lateral air intakes, similar to those of the MiG-23. China received several MiG-23s in the late 1970s from Egypt and the hinged ventral fin and lateral intakes indicate probable reverse engineering from the MiG-23. Equipped with Type 208 (SL-4A) monopulse radar (40 km range). J-8II Batch 02 (J-8IIB) First flew in November 1989, improved J-8II with SL-8A (Type 208?) PD radar (70 km range). Powered by 2 x WP-13AII turbojet engines. Armed with twin-barrel 23mm Type 23-III cannon (copy of GSh-23L) and up to 4 PL-5 or PL-8 AAMs (or rockets/bombs). No BVR capability. Peace Pearl J-8 (J-8II) During the Sino-US cooperation era, up to 50 J-8IIs were to be delivered to the US for upgrades and installation of AN/APG-66(v) radar and fire control system for US$500 million, under the Peace Pearl programme. However, the project was cancelled and only about 24 J-8II were produced. USAF Air Force Flight Test Center (6510 Squadron) took the task of test flight of modified J-8II. J-8IIACT (J-8II-BW2) First flew in 1988, fly-by-wire testbed and technology demonstrator. J-8IID (J-8D) First flew on 21 November 1990, modified J-8B with fixed refuelling probe and updated avionics such as TACAN navigation system. F-8IIM Unveiled in Zhuhai Air Show 1996, export version of J-8B with Russian Phazotron Zhuk-8II PD radar (75 km range, and able to track up to ten airborne targets and attack two of them simultaneously), R-27R1 (AA-10) AAM and Kh-31P anti-radiation missile. The F-8IIM was to be powered by two, more powerful WP-13B turbojet engines. This aircraft is often mistakenly referred to as the "J-8IIM" with Kh-31A anti-ship missile (ASM) capability, but its radar lacked sea search mode for anti-shipping role. The F-8IIM failed to attract any export customers and no domestic orders.[7] Conversion from older airframe was reportedly much fewer than the 100 units of Zhuk-8II radar delivered, and the conversion might have only been an experimental programme with none entering service. The F-8IIM fighter will probably be equipped with Russia's or China's helmet sight and advanced PL-9 and P-73 missiles. Phazotron, a Russian firm, has signed contracts with China to provide 150–200 improved Zhuk radars mainly in support of China's new F-8II fighter. J-8III (J-8C) Upgraded J-8II with FBW system and 2 x WP-14 powerplants. Compared to the J-8II, the J-8C had a number of improvements including a new multi-mode pulse Doppler radar which was reportedly based on the Israeli

Elta EL/M 2035 radar technology. The aircraft was also equipped with a digital fire-control system and a new 'glass' cockpit with multifunctional displays (MFD). The J-8C programme entered full scale development around 1991 and the aircraft first flew successfully on 12 December 1993. Development halted in favour of other version described below, but was used to test new radars such as Type 1471 (KLJ-1) and other avionics associated with FBW system. From this version on, electronic warfare pods such as BM/KG300G and KZ900, as well as navigational / targeting pods including Blue Sky navigation pod and FILAT become operational on J-8II. Canceled after 2nd testbed had crashed. J-8IIF (J-8F) It is reported that during 2006–2008, J-8II production suffered major setback due to engine problem. J-8IIG Modified J-8II with tail hook and other improvements for developmental work on ship-borne aircraft for carrier operations, such as in April 1987, evaluating & testing the Chinese reverse-engineered steam catapult from that of HMAS Melbourne (R21), which was finally confirmed 27 years later in April 2014 by CCTV-13. J-8G An advanced modified variant of the J-8II tasked with the suppression of enemy air defence (SEAD) mission was said to have been developed by the SAC in the 2000s. The aircraft, reportedly designated J-8G, was said to be capable of carrying two indigenous YJ-91 anti-radiation missile and electronic warfare suite to attack enemy radar stations. J-8IIM (2006) At Zhuhai Air Show 2006, a new variant "J-8IIM" was put on display with upgraded systems similar to the J-8H.[16] The most significant improvement is the radar upgrade with a new Type 1471 domestic radar used by the J-8H. JZ-8F A reconnaissance version of the J-8F with internal camera in the forward fuselage replacing the cannon. J-8T Upgraded J-8 with JL-10A X-band radar. Export variant, F-8T, has WP-13B-II engines. China National Aero-Technology Import & Export Corporation claims J-8T is equipped with improved integrate avionic and various guided weapons. J-8T can carry out air-to-air BVR intercepting mission, air-to-ground precise attacking mission and stand-off attacking mission. J-8DF J-8D upgraded to J-8F standard. Lack of cooling duct below intake. Can fire PL-12 and PL-8 missiles.

System

NOTES

Description: THE BEST THAT CAN BE SAID FOR THE J-8 IS THAT ONCE UPGRADED IT WILL BE NO MORE THAN AN ADVANCED OBSOLETE AIRCRAFT, COMPARABLE IN CONFIGURATION AND AERODYNAMIC PERFORMANCE TO THE SU-15/FLAGON. THE J-8 AND J-8-II AIRCRAFT ARE TROUBLE-PRONE AIRCRAFT WITH A POOR WEAPON SUITE AND AN INEFFICIENT ENGINE. AT BEST, THE J-8-II CAN BE COMPARED WITH AN EARLY MODEL (1960S) US F-4 PHANTOM. IN FACT, AFTER TWENTY-SIX YEARS THE J-8-II IS STILL IN THE DEVELOPMENT STAGE, HAS RESULTED IN ONLY ABOUT 100 FIGHTERS DEPLOYED, AND MEETS NONE OF

THE REQUIREMENTS OF THE PLAN.

↳***APPEARANCE***

VARIANTS

Description: THIS AIRCRAFT IS AN ADAPTATION OF THE SOVIET MIG-21 FISHBED

↳***J-8/F-8-I FINBACK-A***

Description: INITIAL PRODUCTION VERSION WITH WP-7P ENGINES AND NOSE AIR INTAKES. J-8 IS DESIGNATION FOR AIRCRAFT IN CHINESE SERVICE. F-8/F-8M DENOTES EXPORT VERSION. MORE THAN 100 J-8/F-8-IS WERE PRODUCED

↳***J-8-II FINBACK-B***

Description: RADAR TYPE IS UNIDENTIFIED MONOPULSE RADAR, BUT MAY BE THE LEIHUA TYPE 317A IN SOLID NOSE HOUSING. SEVEN PYLONS FOR INCREASED WEAPONS INVENTORY AND NEW SIDE AIR INTAKES. OTHER CHARACTERISTICS SIMILAR TO F-8-II.

↳***F-8-II FINBACK-B***

Description: IMPROVED VERSION WITH NEW 14,815 WOPEN-13A ENGINES, WING ROOT INTAKES, AND ALL-FLYING HORIZONTAL STABILIZERS, FOLDING VENTRAL FIN, 80%-COMPOSITE MATERIAL VERTICAL FIN AND IMPROVED AVIONICS.

↳***F-8 ILM FINBACK-B***

Description: DESIGNATION FOR RUSSIAN MODIFIED F-8-IIS. INCLUDES RUSSIAN AA-12 AND AA-10 MISSILES, A HEADS-UPDISPLAY, GLOBAL POSITIONING SYSTEM RECEIVER, MULTI-FUNCTION COCKPIT DISPLAYS AND INTEGRATED ELECTRONIC COUNTERMEASURES. ALSO RUSSIAN PHAZOTRON ZHUK 8 II MULTI-FUNCTION PULSE DOPPLER FIRE-CONTROL RADAR.

Notes:

The Shenyang J-8 (Chinese: □-8; NATO reporting name: Finback) is a high-speed, high-altitude Chinese-built single-seat interceptor fighter aircraft. The effort to develop an all-weather interceptor began in full in 1964 and this produced the first Chinese-designed and built jet fighter to combat new, high altitude threats such as the B-58 Hustler bomber, F-105 Thunderchief fighter-bomber and Lockheed U-2 spy plane. In 1964 the People's Liberation Army Air Force requested an aircraft from Shenyang Aircraft Corporation and the 601 Institute to develop a fighter/interceptor to counter bombers and spy planes as the newly introduced Chengdu J-7 (a reverse engineered MiG-21) was incapable of doing so. The prototype took its maiden flight in 1969. Despite the mid 1960s origins of the J-8, due to the political turmoil of the Great Proletarian Cultural Revolution, the J-8 was not produced until 1979 and entered service in 1980. Its basic configuration resembles an enlargement of the delta-winged J-7, utilizes two Liyang (LMC) Wopen-7A turbojet engines, and features a maximum speed of Mach 2.2. The twin engined J-8 competed with rival Chengdu Aircraft Industry Group's single, turbofan powered engine, canard-delta J-9 project and ultimately emerged as the victor largely due to the existing availability of the former's MiG-21 based power plant and proven layout, while the J-9 project was cancelled in 1980 due to difficulty in creating a suitably powerful engine. In order to house a large radar set, the design called for a solid nose and variable geometry side air intakes. However, the lack of familiarity with this type of intake meant the J-8 had to settle for a MiG-21 style nose intake. The solid nose J-8 was finally realized in the J-8II (Finback-B), which was based on the layout of the J-8I (same improvement is like the J-6 to Q-5). The radar chosen for the J-8 was the Type 204 mono-pulse fire-control radar, a primitive ranging radar for daylight within-visual-range operations. The performance of the radar fell well short of the PLAAF's requirements as research into a more capable fire control radar and power source proved difficult and time-consuming. The aircraft was originally armed with cannons and seven hardpoints for missiles, bombs, rockets or fuel tanks. The original weapons layout of the J-8 was two 30 mm Type 30-1 cannons after initial problems with the 30 mm Type 30-II four-barrel Gatling gun. The J-8 was also planned to be armed with the experimental PL-4 medium ranged missile but technical issues and political upheavals prevented any in-depth development and the project was cancelled in 1985 citing unsatisfactory performance. Therefore, the PL-2 IR-homing short-range air-to-air missile (SRAAM) was used instead. Unguided bombs and rockets can also be carried on the J-8. And nowadays with the development of light-weight military nuclear weaponry, the J-8II will now be able to carry missiles with nuclear warheads. Despite entering service relatively recently, it was comparable to many older Soviet fighter designs, with limited maneuverability. The original combat avionics package was soon replaced with an all-weather capability in aircraft designated

J-8I (Finback-A). The J-8I (later redesignated as the J-8A) received a new gun sight, onboard computer, new cockpit design and redesigned ejection escape system and oxygen supply system. The gun armament was also changed from two 30 mm cannons to a single 23 mm twin-barreled cannon and the PL-5 short ranged AAM was also equipped. The later J-8E featured improved electronic warfare systems. The unsatisfactory performance of the J-8I led to a very short production run of 20–50 aircraft and the J-8I has slowly began being phased out as early as the 1990s. A tactical reconnaissance variant of the J-8, known as the JZ-8 was developed in the mid 1980s to take advantage of the J-8s few favourable qualities, most notably its capability of reaching high speeds and altitudes to replace the Shenyang JZ-6 in the tactical reconnaissance role. Using an under-fuselage reconnaissance pod with a KA-112A long focal-length optical camera, the JZ-8 usually operates at heights ranging from ~9,500m-15,000m during reconnaissance missions. By 1982 work began to replace the unimpressive J-8I type with a new design known as the J-8II. The new 1982 requirements from the PLAAF demanded being capable of beyond visual range combat (BVR) with the use medium ranged missiles (MRAAM) and secondary ground attack capabilities. In terms of performance, the aircraft was expected to have better aerodynamic performance at medium to low altitudes and at transonic speeds.

J-11B (Flanker-L) Chinese Air Superiority Fighter

Tiers:

Variants:

- **J-11A:** Chinese/Russian assembled Su-27SK from Russian-made kits. 104 were built. They were later upgraded with MAWS. Unconfirmed upgrades include improved cockpit displays, and fire control systems for R-77 or PL-10 missiles. It is also called J-11.
- **J-11B:** Indigenously-produced version using Chinese technology, and the first J-11 variant to use the WS-10A turbofan. The airframe is slightly lighter due to greater use of composites. It has new avionics, a glass cockpit, MAWS, and onboard oxygen generator system. Upgrading to AESA radar may have been planned. Photos of China's latest, very long range PL-15 missile on a J-11B may well indicate the undergoing upgrades of AESA radar to the aircraft. More recently aircraft have been spotted with light grey radomes which may indicate ongoing upgrades.
- **J-11BS:** A twin-seat version of the J-11B. In 2012, the number of J-11B and J-11BS in service was over 120.
- **J-11BH:** Naval version of the J-11B. It was first sighted in May 2010.
- **J-11BSH:** Naval version of the J-11BS.
- **J-15:** Carrier-based version based on the J-11B, incorporating structural elements from the Sukhoi Su-33 prototype purchased from Ukraine in 2001. It uses avionics from the J-11B.
- **J-16:** Twin-seat strike fighter based on Russian Sukhoi Su-30MKK sold to China in 2000.[33] A further development of the J-11BS.
- **J-11D:** ariant with fixed electronically scanned array radar, IRST, and capability to fire heavier imaging/infrared (IIR) air-to-air missiles. The airframe makes greater use of composite materials, especially in the engine intakes for lower radar observability. The wings have three hardpoints each. Unconfirmed reports claim it has a new fly-by-wire control system, glass cockpit, improved EW systems, and an improved version of the WS-10A engine.

System

Alternate Designation(s): J-11B (Flanker-L)
Primary Function / Type: Air Superiority Fighter
Manufacturer: Shenyang Aircraft Corporation
Crew: 1
Number of Engines: 2
Number of Hard Points: 0: 2 under fuselage, 2 under air ducts, 4 under wings, 2 on wingtips with provisions to carry

combinations of: Missiles: PL-12; PL-9; PL-8; Vympel R-77; Vympel R-27; Vympel R-73

Dimensions

Length: 21.9 m
Width (Wing Span): 14.7 m
Height: 5.92 m
Wing Area: 52.84 m2
Empty Weight: 16,380 kg
Gross Weight: 23,926 kg
Max Takeoff Weight: 33,000 kg
Fuel Capacity, Internal Fuel Tank: 9,400 kg

Automotive

Engine Name: 2 × WS-10A turbofan
Number of Engines: 2
Engine Power: 75.22 / 123 kN (16,910 / 27,650 lbf) dry / afterburning
Maximum Range: 3,530 km
Maximum Speed: Mach 2.1
Service Ceiling: 9,000 m
Combat Range: 1,500 km
G Limits: +9
Rate of Climb: 300 m/s

Main Gun System

↳*System*

Name: Gryazev-Shipunov GSh-30-1
Type: Autocannon
Caliber: mm30
Length: 1,978 mm
Barrel Length: 1,500 mm
Width: 156 mm
Height: 185 mm
Weight: 46 kg
Barrels: 1
Action: Short recoil operated
Rate of Fire: 1,800 rounds/min
Muzzle Velocity: 900 m/s

Maximum Firing Range: 1,800m

Effective Firing Range: 200-1,800m

↳*Ammunition*

Type: Autocannon

Caliber: 30mm

Shell: 30×165mm

Basic Load: 1,200 Rounds

Missile Systems

Missile Options: PL-12 PL-9 PL-8 Vympel R-77 Vympel R-27 Vympel R-73

↳*Main Missile System #1*

Name: PL-9

Type: Air-to-Air Missile

Length: 2.9m

Diameter: 0.157m

Wingspan: 0.856m

Weight: 115kg

Warhead: 11.8kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: laser proximity fuse

Engine: Solid-fuel rocket

Operational Range: 22km

Flight Altitude: 4.5km

Maximum Speed: Mach 2.0

Guidance System: multi-element infrared

Rocket Weapon Systems

Note: Unguided rocket launcher

Bomb Weapon Systems

Note: Free-fall cluster bombs

Fire Control / Avionics

Fire Control Radar: NIIP Tikhomirov N001VE Myech coherent pulse Doppler radar. J-11B to be equipped with AESA radar.

Laser Desingator: INA

Optic System: OEPS-27 electro-optic system

HUD: NSts-27 helmet-mounted sight (HMS)

ECM: Gardeniya ECM pods

Onboard Oxygen Generator System (OBOGS): An Onboard Oxygen Generator System (OBOGS). Only the most recent Russian variants have an OBOGS.

MAWS System: An optical MAWS system claimed to operate in the UV band.

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

Cockpit: A unique glass cockpit design, with an asymmetric layout quite different from the Su-30MKK/MK2 and Su-27SMK.

NBC Protection: Yes

EW Counter Measures: Yes

Chaffs/Flares: INA

Notes:

J-11B – Indigenously-produced version using Chinese technology, and the first J-11 variant to use the WS-10A turbofan. The airframe is slightly lighter due to greater use of composites. It has new avionics, a glass cockpit, MAWS, and onboard oxygen generator system. Upgrading to AESA radar may have been planned. Photos of China's latest, very long range PL-15 missile on a J-11B may well indicate the undergoing upgrades of AESA radar to the aircraft. More recently aircraft have been spotted with light grey radomes which may indicate ongoing upgrades. The controversial J-11B is an unauthorised derivative of the Sukhoi J-11A/Su-27SK, built by Shenyang in China. The aircraft has been the subject of an ongoing dispute between Beijing and Moscow which has caused the suspension of production of the second batch on indigenously manufactured legally licenced J-11A/Su-27SK. The J-11B is not an exact clone of the Su-27SK, despite the commonly held view this is so. The airframe and engines can be considered to be 'cloned' but the systems are mostly unique to this variant. Known differences include: A Chinese IRST set located in the centreline position as with the OLS-27 in early Su-27S. A planar array multimode radar which resembles the Phazotron Zhuk-27 series. It includes an IFF interrogator array. An Onboard Oxygen Generator System (OBOGS). Only the most recent Russian variants have an OBOGS. A unique glass cockpit design, with an asymmetric layout quite different from the Su-30MKK/MK2 and Su-27SMK. An optical MAWS system claimed to operate in the UV band. Dielectric panels on the stabilators not seen on any Russian variant. The differences between the J-11B, Su-27SK and Su-27SMK are sufficiently great that this must be considered a unique offshoot of the Flanker family of fighters, not a subtype of the baseline Su-27SK/J-11A. Chinese sources claim that the J-11B variant deployed with PLANAF units, such as the 22nd Fighter Regiment, 8th PLAN Fighter Division, is designated the J-11BH. In 2011 images emerged of the prototype of the J-11BS which is an analogue of the Su27UBK, with the PLANAF variant claimed to be the J-11BSH.

Rocket Weapon Systems

Rocket Weapon System (Option #1): 55 mm rocket pod (12 rounds)

Rocket Weapon System (Option #2): 90 mm rocket pod (7 rounds)

Bomb Weapon System

Bomb Capacity: 50 kg to 500 kg unguided bombs

Avionics / Fire Control System

FCS Name: INA

Computerized FCS: Yes

Radar: 1 x Skyranger

Notes:

J-7B: Renamed J-7II. In Jun 1991, PLAAF discovered heat isolation pads in the pressure accumulator compartment in the rear section of the fuselage of J-7IIs were burnt or melted due to high temperature, so all J-7IIs were grounded. CAC spent half a year to investigate and discovered over two dozen components were affected by the increased temperature of the new engine, and these components were operating outside the temperature range they were originally designed for. Fuselage was subsequently redesigned/reworked/repaired to fix the problem, and rework/repair lasted from January thru May 1992 to fix all J-7IIs in PLAAF and PLANAF. Experience gained was also adopted for all future productions of J-7s after January 1992, and the problem never occurred again afterward. The completion of J-7B marked the final satisfactory closure of the upgrade program originally started more than a decade and half ago with J-7I during Cultural Revolution, which lasted around a decade after the end of Cultural Revolution. The Chengdu J-7 (Chinese: □-7; third generation export version F-7; NATO reporting name: Fishcan is a People's Republic of China license-built version of the Soviet Mikoyan-Gurevich MiG-21. Though production ceased in 2013, it continues to serve, mostly as an interceptor, in several air forces, including the People's Liberation Army Air Force. In the 1950s and early 1960s, the Soviet Union shared most of its conventional weapons technology with the People's Republic of China. The famous MiG-21, powered by a single engine and designed on a simple airframe, was inexpensive but fast, suiting the strategy of forming large groups of 'people's fighters' to overcome the technological advantages of Western aircraft. However, the Sino-Soviet split abruptly ended the initial cooperation, and from July 28 to September 1, 1960, the Soviet Union withdrew its advisers from China, resulting in the project being stopped in China. Soviet Premier Nikita Khrushchev unexpectedly wrote to Mao Zedong in February, 1962, to inform Mao that the Soviet Union was willing to transfer MiG-21 technology to China, and he asked the Chinese to send their representatives to the Soviet Union as soon as possible to discuss the details. The Chinese viewed this offer as a Soviet gesture to make peace, and they were understandably suspicious, but they were nonetheless eager to take up the Soviet offer for an aircraft deal. A delegation headed by General Liu Yalou, the commander-in-chief of the People's Liberation Army Air Force (PLAAF) and himself a Soviet military academy graduate, was dispatched to Moscow immediately, and the Chinese delegation was given three days to visit the production facility of the MiG-21, which was previously off-limits to foreigners. The authorization for this visit was personally given by Nikita Khrushchev, and on March 30, 1962, the technology transfer deal was signed. However, given the political situation and the relationship between the two countries, the Chinese were not optimistic about gaining the technology, and thus they were prepared for reverse engineering. Russian sources state that several complete examples of the MiG-21 were sent to China, flown by Soviet pilots, and China also received MiG-21Fs in kits, along with parts and technical documents. Just as the Chinese had expected, however, when the Soviets delivered the kits, parts and documents to Shenyang Aircraft Factory five months after the deal was signed, the Chinese discovered that the technical documents provided by the Soviets were incomplete and that some of the parts could not be used. China set about to reverse-engineer the aircraft for local production, and in doing so, they succeeded in solving 249 major problems and reproducing eight major technical documents that were not provided by the Soviet Union. One of the major flaws was with the Hydraulics systems, which grounded up to 70% of aircraft in some squadrons until the systems were upgraded. Another major upgrade was modifications to the fuel storage to make the aircraft more stable. The MiG-21 carries most of its fuel in the forward fuselage, causing the center of gravity to shift and become unstable after about 45 minutes of operation. The J-7 has redesigned fuel tanks and significantly larger drop tanks in order to maintain a more stable center of gravity, and therefore better Longitudinal static stability. The cockpit was also revised to replace the Soviet ejection seat, which was found to be unacceptable. The forward opening canopy was replaced by a standard canopy hinged to the rear and jettisoned before the seat ejected. Otherwise, the re-engineering effort was largely successful, as the Chinese-built J-7 aircraft showed only minor differences in design and performance from the original Soviet MiG-21. In March 1964, Shenyang Aircraft Factory began the first domestic production of the J-7 jet fighter, which they successfully accomplished the next year. However,

the mass production of the J-7 aircraft was severely hindered by an unexpected social and economic problem—the Cultural Revolution—that resulted in poor initial quality and slow progress, which, in turn, resulted in full-scale production only coming about in the 1980s, by which time the original aircraft design was showing its age. In 1987 the J-7E was released, having a greatly improved wing, among other improvements. It was roughly 45% more maneuverable, and its takeoff and landing performance was greatly increased. It was also equipped with a helmet mounted sight, as well as being the first MiG-21 to be equipped with HOTAS and a multipurpose display. Many of the electronic components were British in origin, such as the gun sight and the multi purpose display. The aircraft is capable of using PL-8/Python 3 missiles with both the helmet mounted sight or the radar fire control, but the two are not connected. The pilot may use only one system at a time. In the mid 1980s Pakistan requested an aircraft with greater radar capabilities. Both the standard radar and the British Marconi radar were plagued by ground clutter, but China did not have any experience with air to ground radar at the time. In 1984 Pakistan provided assistance by having their American trained F-16 pilots provide training on proper operation of ground attack radar, which enabled the Chinese to develop the J-7M. In the late 1980s the J-7MP and J-7PG introduced significant upgrades to the radar system by converting to an Italian FAIR Grifo-7 radar. This more than tripled the effective range of the radar, as well as greatly increased the angle which the radar could detect target. The J-7 only reached its Soviet-designed capabilities in the mid 1980s. However, the fighter is affordable and has been widely exported as the F-7, often with Western systems incorporated, like the ones sold to Pakistan. There are over 20 different export variants of the J-7, some of which are equipped to use European weaponry, such as French R.550 Magic missiles. The Discovery Channel's Wings Over The Red Star series claims that the Chinese intercepted several Soviet MiG-21s en route to North Vietnam (during the Vietnam War), but these aircraft did not perform in a manner consistent with their original specifications, suggesting that the Chinese actually intercepted down-rated aircraft that were intended for export, rather than fully capable production aircraft. For this reason, the Chinese had to re-engineer the intercepted MiG-21 airframes in order to achieve their original capabilities. China later developed the Shenyang J-8 based both on the expertise gained by the program, and by utilizing the incomplete technical information acquired from the Soviet Ye-152 developmental jet. In May 2013, J-7 production has ceased after decades of manufacturing. The last 12 F-7BGIs were delivered to the Bangladesh Air Force.

System

Alternate Designation(s): MiG-21PF; NATO: Fishbed-E

Primary Function / Type: Fighter/Interceptor

Manufacturer: Russia

In Service: 1961-Present

Crew: 1

Number of Engines: 1

Number of Hard Points: 4

Rocket-Assisted Take-Off, Ground (RATOG) Capable: Yes

Note: It has a broader fin and parachute brake housing relocated as bullet fairing below rudder.

Dimensions

Length: m15.76

Width (Wing Span): m7.5

Height: m4.1

Weight, Empty: tons5.46

Weight, Maximum Take Off: tons10.1

Automotive

Engine Name: 1 x RD-11-F2S-300 turbojet

Number of Engines: 1

Static Thrust: 6,200-kg static thrust

Traction (dry / with afterburning): 40.2 / 67.2 kN

Maximum Range: km1,225

Maximum Range with external Fuel Tanks: km1,470

Maximum Speed: 2,230 km/h

Cruising Speed: 1,000 km/h

Service Ceiling: km19

Time to Altitude: 17,000 m (55,774 ft) in 8 minutes 30 seconds

Fuel: 2,885 liters

Main Gun System

↳*System*

Name: 1 × internal 23 mm Gryazev-Shipunov GSh-23L autocannon

Type: 23mm Autocannon

Caliber: 23mm

Basic Load: 200

Length: GSh-23: 1,387 mm (4 ft 7 in) GSh-23L: 1,537 mm (5 ft 1 in)

Barrel Length: mm1,000

Weight: GSh-23: 49.2 kg (108 lb) GSh-23L: 50 kg (110 lb)

Barrels: 2

Action: Gast principle

Rate of Fire: 3,400–3,600 rounds/min

Muzzle Velocity: m/s715

↳*Ammunition*

Type: Rifle, Autocannon

Caliber: mm23

Cartridge: 23x115 mm

Basic Load: 200

Wing Mounted Weapon Systems

Air-to-Air Missiles: AA-12 Adder AA-11 Archer AA-10 Alamo AA-8 Aphid AA-2 Atoll

Air-to-Surface Missiles: unguided bombs, rockets AS-17 Krypton AS-12 Kegler AS-9 Kyle KAB-500Kr

↳*Missile System (Option 1)*

Name: R-77 (AA-12 Adder)

Type: Medium-range, active radar homing air-to-air missile.

Basic Load: INA

Production history Manufacturer: Vympel

In Service: 2002-Present

Proliferation: The Russian Air Force finally entered the R-77-1 (AA-12B) into service in 2015.[5][6] It was subsequently deployed by Su-35S fighters in Syria on combat air patrols.

Length: 3.6 m (R-77), 3.71 m (R-77-1)

DIameter: mm200

Warhead: 22.5 kg HE fragmenting (R-77)

Detonation Mechanism: laser proximity fuse

Engine: Solid fuel rocket motor (R-77), air-breathing ramjet (R-77-PD)

Wingspan: mm700

Operational Range: 80–100 km (R-77), 110 km (R-77-1) 193 km (R-77M)

Flight Altitude: km5-25

Speed: Mach 4,Mach 5 for K-77PD (RVV-AE-PD)[

Guidance System: Inertial with mid-course update and terminal active radar homing/infrared homing (R-77T)

Launch Platforms: Mikoyan-Gurevich MiG-21-93/LanceR/Bison, Mikoyan-Gurevich MiG-23, Mikoyan-Gurevich MiG-25, Mikoyan-Gurevich MiG-27, Mikoyan MiG-29, Mikoyan MiG-31, Mikoyan MiG-35, Sukhoi Su-27, Sukhoi Su-30, Sukhoi Su-33, Sukhoi Su-34, Sukhoi Su-35, HAL Tejas, Yakovlev Yak-141, Chengdu J-10

↳*Missile System (Option 2)*

Name: KH-31 (AS-17 Krypton)

Type: Medium-range air-to-surface

Basic Load: INA

Manufacturer: Tactical Missiles Corporation (Zvezda-Strela before 2002)

In Service: 1988-Present

Proliferation: INA

Length: Mod 1 : 4.700 m (15 ft 5.0 in)[3] Mod 2 (AD/PD) : 5.3 m (17 ft 5 in)

Diameter: 360 mm

Weight: Kh-31A :610 kg (1,340 lb) Kh-31P :600 kg (1,320 lb)

Warhead: HE shaped charge

Detonation Mechanism: Impact

Warhead Weight: Kh-31A :94 kg (207 lb) Kh-31P :87 kg (192 lb

Engine: Solid fuel rocket in initial stage, ramjet for rest of trajectory

Wingspan: mm914

Propellant: kerosene

Operational Range: Kh-31A: 25 km–103 km (13.5–55.6 nmi; Kh-31P: up to 110 km (60 nmi; 70 mi)

Speed: Kh-31A/P: 2,160–2,520 km/h (1,340–1,570 mph) MA-31: Mach 2.7 (low), Mach 3.5 (high)

Guidance System: Kh-31A: inertial guidance with active radar homing Kh-31P: inertial with passive radar

Launch Platform: Both : Su-27SM, Su-30MKI, Su-25, Su-34, Su-35, MiG-29M, HAL Tejas Mk1 and Mk2, MiG-29K Kh-31A only : Su-33 Also : Su-24M

↳*Bomb Weapon System*

Name: KAB-500Kr

Type: Electro-optical TV-guided fire and forget bomb

Basic Load: INA

Manufacturer: Russia

Proliferation: INA

Length: m3.05

Diameter: INA

Warhead Type: Hardened, armor-piercing warhead

Weight: kg520

Warhead Weight: kg380

Penetration: up to 1.5 metres (4 feet 11 inches) of reinforced concrete.

Effective Range: he weapon's seeker can lock onto a target at ranges of up to 15 to 17 km (9.3 to 10.6 mi), depending on visibility.

Note: It uses a standard Soviet/Russian FAB-500 general-purpose bomb, with a nominal weight of 500 kg (1,100 lb), as a warhead, adding a low-light television seeker and guidance fins to turn it into a guided, unpowered glide bomb.

Chaffs/Flares: BVP-1F 120 x 26-mm cartridge dispenser

Notes:

MiG-21PF Fishbed-E This is thought to be the principal PF production variant. It has a broader fin and parachute brake housing relocated as bullet fairing below rudder. Later aircraft have a 13,670-lb (6,200-kg) static thrust RD-11-F2S-300 engine. The final, broad version of the fin has no dorsal fillet. A GP-9 23-mm gun pack was carried and it had provision for rocket-assisted take-off, ground (RATOG). Variants designated MiG-21PFS have boundary-layer blowing (known as SPS = sduva porgranichnovo sloya) over plain flaps in place of the earlier Fowler flaps. The Mikoyan-Gurevich MiG-21 (Russian: Микоян и Гуревич МиГ-21; NATO reporting name: Fishbed) is a supersonic jet fighter and interceptor aircraft, designed by the Mikoyan-Gurevich Design Bureau in the Soviet Union. Its nicknames include: Balalaika, because its planform resembles the stringed musical instrument of the same name; Ołówek, Polish for "pencil", due to the shape of its fuselage, and; Én bạc, meaning "Silver Swallow", in Vietnamese. Approximately 60 countries over four continents have flown the MiG-21, and it still serves many nations six decades after its maiden flight. It made aviation records, became the most-produced supersonic jet aircraft in aviation history, the most-produced combat aircraft since the Korean War and previously the longest production run of a combat aircraft (now exceeded by both the McDonnell Douglas F-15 Eagle and General Dynamics F-16 Fighting Falcon). It's also one of the earliest examples of planes capable of performing the Cobra maneuver. The MiG-21 was the first successful Soviet aircraft combining fighter and interceptor characteristics in a single aircraft. It was a lightweight fighter, achieving Mach 2 with a relatively low-powered afterburning turbojet, and is thus comparable to the American Lockheed F-104 Starfighter and Northrop F-5 Freedom Fighter and the French Dassault Mirage III. Its basic layout was used for numerous other Soviet designs; delta-winged aircraft included Su-9 interceptor and the fast E-150 prototype from MiG bureau while the mass-produced successful front fighter Su-7 and Mikoyan's I-75 experimental interceptor combined a similar fuselage shape with swept-back wings. However, the characteristic layout with the shock cone and front air intake did not see widespread use outside the USSR and finally proved to have limited development potential, mainly because of the very small space available for the radar. Like many aircraft designed as interceptors, the MiG-21 had a short range. This was exacerbated by the poor placement of the internal fuel tanks ahead of the centre of gravity. As the internal fuel was consumed, the center of gravity would shift rearward beyond acceptable parameters. This had the effect of making the plane statically unstable to the point of being difficult to control, resulting in an endurance of only 45 minutes in clean condition. This can be somewhat countered by carrying fuel in external tanks closer to the center of gravity. The Chinese variants somewhat improved the internal fuel tank layout (also second generation of Soviet variants), and also carry significantly larger external fuel tanks to counter this issue. Additionally, when more than half the fuel was used up, violent maneuvers prevented fuel from flowing into the engine hereby causing it to shut down in flight. This increased the risk of tank implosions (MiG-21 had tanks pressurized with air from the engine's compressor), a problem inherited from the MiG-15, MiG-17 and MiG-19. The short endurance and low fuel capacity of the MiG-21F, PF, PFM, S/SM and M/MF variants—though each had a somewhat greater fuel capacity than its predecessor—led to the development of the MT and SMT variants. These had an increased range of 250 km (155 mi) compared to the MiG-21SM, but at the cost of worsening all other performance figures, such as a lower service ceiling and slower time to altitude. The delta wing, while excellent for a fast-climbing interceptor, meant any form of turning combat led to a rapid loss of speed. However, the light loading of the aircraft could mean that a climb rate of 235 m/s (46,250 ft/min) was possible with a combat-loaded MiG-21bis, not far short of the performance of the later F-16A. Mig-21's Tumansky R-25 jet engine's specialty was the addition of a second fuel pump in the afterburning stage. Activating the ЧР (rus. "чрезвычайный режим" - emergency mode) booster feature allows the engine to develop 97.4 kilonewtons (21,896 lbf) of thrust under 4,000 meters (13,000 ft) of altitude. The limit of operation is 1 minute for dogfight practice and 3 minutes for an actual wartime emergency, as further use causes the engine to overheat. Use of this "diamond regime" provided a massive 97.4 kN of thrust for no more than 3 minutes in actual wartime use. Use of this temporary power gave the MiG-21bis slightly better than 1:1 thrust-to-weight ratio and a climbing rate of 254 meters/second, equalling the F-16's nominal capabilities in close-quarters dogfight. In air combat practice with the MiG-21bis, use of WEP thrust was limited to 1 minute, to spare on the engines' 800 flight hours lifetime, since every second of super-afterburner use counted as several minutes of regular power run due to extreme thermal stress. When WEP was on, the MiG-21bis's R-25 engine produced a huge 5 meter long blowtorch exhaust - the six or seven brightly glowing rhomboid "shock diamonds" visible inside the flames gave the emergency-power setting its "diamond regime" name. Given a skilled pilot and capable missiles, it could give a good account of itself against contemporary fighters. Its G-limits were increased from +7Gs in initial variants to +8.5Gs in the latest variants. It was replaced by the newer variable-geometry MiG-23 and MiG-27 for ground support duties. However, not until the MiG-29 would the Soviet Union ultimately replace the MiG-21 as a maneuvering dogfighter to counter new American air superiority types. The MiG-21 was exported widely and remains in use. The aircraft's simple controls, engine, weapons, and avionics were typical of Soviet-era military designs. The use of a tail with the delta wing aids stability and control at the extremes of the flight envelope, enhancing safety for lower-skilled pilots; this in turn enhanced its marketability in exports to developing countries with limited training programs and restricted pilot pools. While technologically inferior to the more advanced fighters it often faced, low production and maintenance costs made it a favorite of nations buying Eastern Bloc military hardware. Several Russian, Israeli and Romanian firms have begun to offer upgrade packages to MiG-21 operators, designed to bring the aircraft up to a modern standard, with greatly upgraded avionics and armaments.

J-6 (Farmer) Chinese Fighter Aircraft

Tiers:

1 2 3 4

System

Alternative Designations: J-6

Crew: 1 (pilot)

Vertical Climb Rate (m/s): 152+

Max “G” Force (g): 8

NOTES

Description: THE F-6 (JIAN-6 FIGHTER AIRCRAFT) IS THE CHINESE VERSION OF THE MIG-19, WHICH WAS STILL IN PRODUCTION IN CHINA IN THE MID-1990S.

↳ ***APPEARANCE***

VARIANTS

J-6

Description: EQUIVALENT OF THE MIG-19S/SF DAYTIME FIGHTER WITH 3 X 30 MM GUNS, ONE AT EACH WING ROOT AND ONE ON THE FUSELAGE.

↳***J-6A***

Description: EQUIVALENT OF THE MIG-19PF ALL-WEATHER FIGHTER. ARMED WITH STANDARD J-6 GUNS AND ROCKETS.

↳***J-6B***

Description: EQUIVALENT OF THE MIG-19PM ALL-WEATHER FIGHTER. ARMED WITH THE AA-1 ALKALI RADAR HOMING MISSILES, NO GUNS.

↳***J-6C***

Description: SIMILAR TO THE J-6, BUT WITH BRAKE CHUTE HOUSED IN BULLET-FARING AT THE BASE OF TAILFIN. SAME GUNS AS THE J-6A. EXPORT VARIANT WITH MARTIN-BAKER EJECTION SEATS AND AIM-9 SIDEWINDER MISSILES.

↳***J-6XIN***

Description: SIMILAR TO J-6A, BUT WITH NOSE-MOUNTED INTERCEPTION RADAR. SAME GUNS AS THE J-6A.

↳***JJ-6***

Description: TRAINER VERSION WITH TANDEM TWO-SEAT COCKPIT. EXPORT VERSIONS ARE FT-6. ARMED WITH ONLY THE FUSELAGE GUN.

↳***JZ-6***

Description: A TACTICAL PHOTO-RECONNAISSANCE VERSION, ARMED WITH WING ROOT GUNS ONLY.

↳***F-6***

Description: EXPORT VERSIONS.

Notes:

The Shenyang J-6 (Chinese: □-6; designated F-6 for export versions; NATO reporting name: Farmer) is the Chinese-built version of the Soviet MiG-19 'Farmer' fighter aircraft, the world's first mass-produced supersonic aircraft. Although the MiG-19 had a comparatively short life in Soviet service, the Chinese came to value its agility, turning performance, and powerful cannon armament, and produced it for their own use between 1958 and 1981. While the basic Soviet-built MiG-19 has been retired from all nations, the Shenyang J-6 still flies for nine of its original 15 operators, however, in a very limited capacity. The J-6 airframe contributed to the Chinese ground attack version, the Q-5, which still flies for numerous nations. The J-6 was considered "disposable" and was intended to be operated for only 100 flight hours (or approximately 100 sorties) before being overhauled. The Pakistan Air Force was often able to extend this to 130 hours with diligent maintenance. The J-6 has a maximum speed at altitude of 1,540 km/h (960 mph), Mach 1.45. Service ceiling is 17,900 m (58,700 ft). Combat radius with two drop tanks is about 640 km (400 mi). Powerplant is two Liming Wopen-6A (Tumansky R-9) turbojet engines. In addition to the internal cannon armament, most have provision for four wing pylons for up to 250 kg (550 lb) each, with a maximum ordnance load of 500 kg (1,100 lb). Typical stores include unguided bombs, 55 mm rocket pods, or PL-2/PL-5 (Chinese versions of Soviet K-13 (NATO AA-2 'Atoll') air-to-air missiles.

Missile Weapon Systems

Missile Weapon System (Option #1)

Name: PL-5

Type: Air-to-Air Missile

Length: 3.128 m

Diameter: 0.127m

Wingspan: 0.657m

Weight: 148 kg

Warhead: 6kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: Active infrared, laser proximity fuse(PL-5EII)

Engine: Solid-fuel rocket

Operational Range: 1.3–16km

Maximum Speed: Mach 2.5

Guidance System: Infrared homing, multi-element, dual band detector(PL-5EII)

↳*Missile Weapon System (Option #2)*

Name: PL-8

Type: Air-to-Air Missile

Manufacturer: Xi'an Eastern Machinery Factory and CATIC

Length: 2.95 m

Diameter: 160 mm

Wingspan: 800 mm

Weight: 115 kg

Warhead: 11 kg high explosive

Detonation Mechansim: Impact / Proximity

Engine: solid rocket

Propellant: solid fuel

Operational Range: 20 km

Flight Ceiling: 21 km

Flight Altitude: 05 km

Maximum Speed: Mach 3.5

Guidance System: passive infrared homing

↳*Missile Weapon System (Option #3)*

Name: PL-9

Type: Air-to-Air Missile

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC), Hanzhong Nanfeng Machine Factory

↳

Length: 2.9m

Diameter: 0.157m

Wingspan: 0.856m

Warhead: 11.8kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: laser proximity fuse

Engine: Solid-fuel rocket

Operational Range: 22km

Flight Altitude: 4.5km

Maximum Speed: Mach 2+

Guidance System: multi-element infrared

Rocket Weapon Systems

Rocket Weapon System (Option #1): 55 mm rocket pod (12 rounds)

Rocket Weapon System (Option #2): 90 mm rocket pod (7 rounds)

Bomb Weapon System

Bomb Capacity: 50 kg to 500 kg unguided bombs

Avionics / Fire Control System

FCS Name: JL-7 multi-role pulse-Doppler fire-control radar

Computerized FCS: Yes

Radar: 1 x Skyranger

Data Link: Type 481 data link

HUD: HK-13A head-up display (HUD)

Autopilot: KJ-11 autopilot

Data Computer: ADS-1 air data computer

Radio Compass: WL-7 radio compass

Radio Altimeter: 64A radio altimeter

Beacon Receiver: XS-6A beacon marker receiver

Navigation System: Type 481 data transmission/navigation system

HF Radio: Type 506 HF radio

IFF: Type 605A IFF

Radar Warning Receiver: Type 930-II radar warning receiver (RWR)

Chaff and Flare Dispencer: GT-1 chaff and flare dispense

Notes:

J-7C: renamed production version of J-7III powered by WP-13F. Equipped with Type 481 data link, which enables the ground-controlled interception centers to feed directions directly to the autopilots of the aircraft to fly "hands off" to the interception, and Type 481 data link was later included as standard equipment of all later models for domestic use. A total of 17 built in the production run lasted from 1989 thru 1996. The Chengdu J-7 (Chinese: □-7; third generation export version F-7; NATO reporting name: Fishcan is a People's Republic of China license-built version of the Soviet Mikoyan-Gurevich MiG-21. Though production

ceased in 2013, it continues to serve, mostly as an interceptor, in several air forces, including the People's Liberation Army Air Force. In the 1950s and early 1960s, the Soviet Union shared most of its conventional weapons technology with the People's Republic of China. The famous MiG-21, powered by a single engine and designed on a simple airframe, was inexpensive but fast, suiting the strategy of forming large groups of 'people's fighters' to overcome the technological advantages of Western aircraft. However, the Sino-Soviet split abruptly ended the initial cooperation, and from July 28 to September 1, 1960, the Soviet Union withdrew its advisers from China, resulting in the project being stopped in China. Soviet Premier Nikita Khrushchev unexpectedly wrote to Mao Zedong in February, 1962, to inform Mao that the Soviet Union was willing to transfer MiG-21 technology to China, and he asked the Chinese to send their representatives to the Soviet Union as soon as possible to discuss the details. The Chinese viewed this offer as a Soviet gesture to make peace, and they were understandably suspicious, but they were nonetheless eager to take up the Soviet offer for an aircraft deal. A delegation headed by General Liu Yalou, the commander-in-chief of the People's Liberation Army Air Force (PLAAF) and himself a Soviet military academy graduate, was dispatched to Moscow immediately, and the Chinese delegation was given three days to visit the production facility of the MiG-21, which was previously off-limits to foreigners. The authorization for this visit was personally given by Nikita Khrushchev, and on March 30, 1962, the technology transfer deal was signed. However, given the political situation and the relationship between the two countries, the Chinese were not optimistic about gaining the technology, and thus they were prepared for reverse engineering. Russian sources state that several complete examples of the MiG-21 were sent to China, flown by Soviet pilots, and China also received MiG-21Fs in kits, along with parts and technical documents. Just as the Chinese had expected, however, when the Soviets delivered the kits, parts and documents to Shenyang Aircraft Factory five months after the deal was signed, the Chinese discovered that the technical documents provided by the Soviets were incomplete and that some of the parts could not be used. China set about to reverse-engineer the aircraft for local production, and in doing so, they succeeded in solving 249 major problems and reproducing eight major technical documents that were not provided by the Soviet Union. One of the major flaws was with the Hydraulics systems, which grounded up to 70% of aircraft in some squadrons until the systems were upgraded. Another major upgrade was modifications to the fuel storage to make the aircraft more stable. The MiG-21 carries most of its fuel in the forward fuselage, causing the center of gravity to shift and become unstable after about 45 minutes of operation. The J-7 has redesigned fuel tanks and significantly larger drop tanks in order to maintain a more stable center of gravity, and therefore better Longitudinal static stability. The cockpit was also revised to replace the Soviet ejection seat, which was found to be unacceptable. The forward opening canopy was replaced by a standard canopy hinged to the rear and jettisoned before the seat ejected. Otherwise, the re-engineering effort was largely successful, as the Chinese-built J-7 aircraft showed only minor differences in design and performance from the original Soviet MiG-21. In March 1964, Shenyang Aircraft Factory began the first domestic production of the J-7 jet fighter, which they successfully accomplished the next year. However, the mass production of the J-7 aircraft was severely hindered by an unexpected social and economic problem—the Cultural Revolution—that resulted in poor initial quality and slow progress, which, in turn, resulted in full-scale production only coming about in the 1980s, by which time the original aircraft design was showing its age. In 1987 the J-7E was released, having a greatly improved wing, among other improvements. It was roughly 45% more maneuverable, and its takeoff and landing performance was greatly increased. It was also equipped with a helmet mounted sight, as well as being the first MiG-21 to be equipped with HOTAS and a multipurpose display. Many of the electronic components were British in origin, such as the gun sight and the multi purpose display. The aircraft is capable of using PL-8/Python 3 missiles with both the helmet mounted sight or the radar fire control, but the two are not connected. The pilot may use only one system at a time. In the mid 1980s Pakistan requested an aircraft with greater radar capabilities. Both the standard radar and the British Marconi radar were plagued by ground clutter, but China did not have any experience with air to ground radar at the time. In 1984 Pakistan provided assistance by having their American trained F-16 pilots provide training on proper operation of ground attack radar, which enabled the Chinese to develop the J-7M. In the late 1980s the J-7MP and J-7PG introduced significant upgrades to the radar system by converting to an Italian FAIR Grifo-7 radar. This more than tripled the effective range of the radar, as well as greatly increased the angle which the radar could detect target. The J-7 only reached its Soviet-designed capabilities in the mid 1980s. However, the fighter is affordable and has been widely exported as the F-7, often with Western systems incorporated, like the ones sold to Pakistan. There are over 20 different export variants of the J-7, some of which are equipped to use European weaponry, such as French R.550 Magic missiles. The Discovery Channel's Wings Over The Red Star series claims that the Chinese intercepted several Soviet MiG-21s en route to North Vietnam (during the Vietnam War), but these aircraft did not perform in a manner consistent with their original specifications, suggesting that the Chinese actually intercepted down-rated aircraft that were intended for export, rather than fully capable production aircraft. For this reason, the Chinese had to re-engineer the intercepted MiG-21 airframes in order to achieve their original capabilities. China later developed the Shenyang J-8 based both on the expertise gained by the program, and by utilizing the incomplete technical information acquired from the Soviet Ye-152 developmental jet. In May 2013, J-7 production has ceased after decades of manufacturing. The last 12 F-7BGIs were delivered to the Bangladesh Air Force.

MiG-23UM (Flogger-C) Russian Fighter Aircraft

Tiers:

1 2 3 4

System

Alternate Designation(s): MiG-23UM; Flogger-C
Primary Function / Type: Fighter Aircraft (Trainer)
Manufacturer: Mikoyan-Gurevich / Mikoyan
Crew: 2
Number of Engines: 1
Number of Hard Points: 2 × fuselage, 2 × wing glove and 2 × wing pylons with a capacity of up to 3,000 kg (6,600 lb) of stores
Note: It was based on the MiG-23S, but featured a lengthened cockpit with a second crew station behind the first.

Dimensions

Length: 15.88 m
Wingspan, Extended: 13.95 m
Wingspan, Swept: 7.77 m
Wing Area: 27.3 m sq
Height: 4.80 m
Weight, Empty: 10,000 kg
Weight, Weapons Loaded: 3,000 kg
Weight, Normal Takeoff: 16,100 kg
Weight, Maximum Takeoff: 18,900 kg

Automotive

Engine Name: 1 x upgraded Tumansky engine
Number of Engines: 1
Engine Type: Turbojet
Engine Power, Dry: 8,006 kg

Engine Power, Afterburner: 12,474 kg

Fuel Capacity: INA, One forward fuel tank was removed to accommodate an extra seat; this was compensated for by adding a new fuel tank in the rear fuselage.

Speed at Altitude: 2,443 km/h, Mach 2.3

Speed at Sea Level: 1,468 km/h, Mach 1.2

Service Ceiling: 18,300 m

G Limits: +8.5

Rate of Climb: 230 m/s

Take-Off Distance: 500 m

Landing Distance: 750 m

Main Gun System

↳*System*

Name: Gryazev-Shipunov GSh-23

Type: Autocannon

Caliber: 23mm

Quantity: 1 × 23 mm Gryazev-Shipunov GSh-23L autocannon

Length: 1,387 mm

Barrel Length: 1,000 mm

Weight: 49.2 kg

Barrels: 2

Action: Gast principle

Rate of Fire: 3,400–3,600 rounds/min

Muzzle Velocity: 715 m/s

↳*Ammunition*

Type: Rifle

Caliber: 23mm

Cartridge: 23x115 mm

Basic Load: 260 rounds

Missile Systems

Air-to-Air Missiles: *2 × R-60 *R-73 *2 × R-23 *R-77 *2 × R-27R

Air-to-Surface Missiles: *Kh-23 Grom

↳*Missile System #1*

Name: R-23; NATO: AA-7 Apex

Type: Air-to-Air Missile

Manufacturer: Vympel NPO

Length: 4.50 m

Diameter: 223 mm

Weight: 222 kg

Warhead Type: expanding-rod high explosive

Warhead Weight: 25 kg

Engine: solid fuel rocket

Propellant: 1.04 m

Operational Range: 35 km

Maximum Speed: Mach 3

Guidance System: semi-active radar homing

Rocket Systems

↳*Rocket System #1*

Name: S-5

Type: Rocket

Note: The S-5 is a 55 mm (2.2 in) calibre unguided rocket fired from a 57 mm calibre tube. It is used by fighter bombers and helicopters. It consists of a steel body containing a solid fuel rocket, and a high-explosive warhead with a mechanical impact fuse. At the rear of the rocket is an elongated exhaust nozzle, with eight attached forward folding wings. The fins fold around the rocket when it is stowed in its launch tube, springing back as soon as it leaves the launch tube. In flight, the fins provide a stabilizing spin to the rocket, turning at approximately 750 rpm. The solid rocket motor burns for just 1.1 seconds, during which time it covers about 300 meters (985 ft). The S-5 is carried in rocket pods, with 4–32 rockets. The first were ORO-57 launchers, made in variants with capacity of 4, 8 and 16 rockets. Most typical became ORO-57K for 8 rockets, used especially with MiG-19. Then, beginning in the early 1960s, the typical launcher became UB-16-57, with 16 rockets, developed in several variants, for helicopters and planes. UB stands for "universal block", as it could be carried on conventional bomb hardpoints, "57" refers to the actual diameter of the launch tube (the diameter of the rocket plus 2 mm). The first variant and UB-16-57U had a conical forward part while the next variant UB-16-57D had a blunt forward part. Starting in 1968, a variant UB-16-57UMP was produced, with a conical forward part and five protruding inner tubes.[1] In the 1970s, UB-32 was developed with 32 rockets, carried by heavier aircraft. In Poland, Mars-2 launcher was developed for 16 rockets, and in Romania, LPR 57 launchers for 16 rockets.

Bomb Weapon Systems

Note: Bombs: Up to 500 kg (1,100 lb) bombs per hardpoint

Fire Control / Avionics

Search/Track Radar: High Lark J-band

Infrared: IRST with IR sensor

Laser Desingator: INA

Radar Warning: Sirena 3

All-weather, day and night capable: (III/5)

Clear-weather day fighter: (50)

NOTES

Description: ONE OF THE MOST SUCCESSFUL AIRCRAFT PRODUCED FOR EXPORT TO BE PRODUCED OUTSIDE OF THE

UNITED STATES AND THE FORMER SOVIET UNION. THE MIRAGE III/5/50 HAS PROVEN TO BE A COMPETENT GROUND ATTACK AIRCRAFT DESPITE ITS ORIGINAL DEVELOPMENT AS A HIGH ALTITUDE INTERCEPTOR. THE MIRAGE 5 AND 50 ARE SIMILAR TO THE III, BUT FITTED WITH SIMPLIFIED AVIONICS AND HAVE EXCLUSIVELY BEEN EXPORT VARIANTS.

↳***APPEARANCE***

VARIANTS

↳***MIRAGE IIIA***

Description: HIGH ALTITUDE INTERCEPTOR AND STRIKE AIRCRAFT FITTED WITH ROCKET MOTOR FOR TAKE-OFF.

↳***MIRAGE IIIB***

Description: TWO-SEAT TRAINER VERSION OF IIIA WITH STRIKE CAPABILITY RETAINED NO INTERNAL CANNON.

↳***MIRAGE IIIC***

Description: MAJOR PRODUCTION VARIANT OF IIIA. FITTED WITH ATAR 9B3 ENGINE, CYRANO II INTERCEPT AND GROUND-MAPPING RADAR.

↳***MIRAGE IIID***

Description: TWO-SEAT TRAINER/STRIKE AIRCRAFT. NO INTERNAL CANNON.

↳***MIRAGE IIIE***

Description: MAJOR PRODUCTION VARIANT. FITTED WITH ATAR 9C ENGINE, CYRANIO IIBIS RADAR, AND EXTRA AVIONICS BAY.

↳***MIRAGE IIIEA/EO***

Description: AUSTRALIAN LICENSE-BUILT AIRCRAFT. (52 ATTACK AND 48 INTERCEPTOR AIRCRAFT)

↳***MIRAGE 5***

Description: GROUND ATTACK VARIANT ORIGINALLY DEVELOPED FOR THE ISRAELI AIR FORCE. FITTED WITH TWO EXTRA FUSELAGE STORES STATIONS, FIRE CONTROL RADAR DELETED OR REPLACED BY RANGING RADAR. PERFORMANCE IDENTICAL TO MIRAGE III EXCEPT FOR LONGER RANGE ON INTERNAL FUEL

Notes:

The Dassault Mirage III (French pronunciation: [miʁaʒ]) is a family of single-seat, single-engine, fighter aircraft developed and manufactured by French aircraft company Dassault Aviation. It was the first Western European combat aircraft to exceed Mach 2 in horizontal flight. During 1952, the French government issued its specification, calling for a lightweight, all-weather interceptor. Amongst the respondents were Dassault with their design, initially known as the Mirage I. Following favourable flight testing held during 1954, in which speeds of up to Mach 1.6 were attained, it was decided that a larger follow-on aircraft would be required to bear the necessary equipment and payloads. An enlarged Mirage II proposal was considered, as well as MD 610 Cavalier (3 versions), but was discarded in favour of a further-developed design, powered by the newly developed Snecma Atar afterburning turbojet engine, designated as the Mirage III. During October 1960, the first major production model, designated as the Mirage IIIC, performed its maiden flight. Initial operational deliveries of this model commenced during July 1961; a total of 95 Mirage IIICs were obtained by the French Air Force (Armée de l'Air, AdA). The Mirage IIIC was rapidly followed by numerous other variants. The Mirage III was produced in large numbers for both the French Air Force and a wide number of export customers. Prominent overseas operators of the fighter included Argentina, Australia, South Africa, Pakistan and Israel, as well as a number of non-aligned nations. Often considered to be a second-generation fighter aircraft, the Mirage III experienced a lengthy service life with several of these operators; for some time, the type remained a fairly maneuverable aircraft and an effective opponent when engaged in close-range dogfighting. During its service with the French Air Force, the

Mirage III was normally armed with assorted air-to-ground ordnance or R.550 Magic air-to-air missiles. Its design proved to be relatively versatile, allowing the fighter model to have been readily adapted to serve in a variety of roles, including trainer, reconnaissance and ground-attack versions, along with several more extensive derivatives of the aircraft, including the Dassault Mirage 5, Dassault Mirage IIIV and Atlas Cheetah. Some operators have undertaken extensive modification and upgrade programmes of their flights, such as Project ROSE of the Pakistan Air Force. The Mirage III has been used in active combat roles in multiple conflicts by a number of operators. The Israeli Air Force was perhaps the most prolific operator of the fighter outside of France itself; Israel deployed their Mirage IIIs during both the Six-Day War, where it was used as both an air superiority and strike aircraft, and the Yom Kippur War, during which it was used exclusively in air-to-air combat in conjunction with the IAI Nesher, an Israeli-built derivative of the Mirage 5. Ace of ace Giora Epstein achieved all of his kills flying either the Mirage III or the Nesher. During the South African Border War, the Mirage III formed the bulk of the South African Air Force's fleet, comprising a cluster of Mirage IIICZ interceptors, Mirage IIIEZ fighter-bombers and Mirage IIIRZ reconnaissance fighters; following the introduction of the newer Mirage F1, the type was dedicated to secondary roles in the conflict, such as daytime interception, base security, reconnaissance and training. The Argentine Air Force utilised the Mirage IIIEA during the Falklands War, but their lack of an aerial refueling capability limited their usefulness in the conflict. Even using drop tanks, the Mirages only had an endurance of five minutes within the combat area around the British fleet.

J-7G (Fishcan) Chinese FIghter Aircraft

Tiers:

Variants:

- **Note:** The Following is a list of the J-7 Variants: Type 1962/62 series J-7 series J-7I series J-7II series J/F-7M Air Guard series F-7MP/P Sky Bolt series J-7III series F-7C series J-7E series J/F-7F series MiG-21 upgrade subcontract J/F-7MG series J/F-7PG series J/F-7G series F-7BGI JJ-7 trainer series FT-7 trainer series

System

Alternative Designations: J-7G; Fishcan
Manufacturer: Chengdu Aircraft Corporation/Guizhou Aircraft Industry Corporation
Crew: 1
Harpoints: 5 in total – 4× under-wing, 1× centreline under-fuselage with a capacity of 2,000 kg maximum (up to 500 kg each
All-Weather Capable: Yes

Dimensions

Length: 14.86 m
Height: 4.10 m
Wingspan: 7.15 m
Wing Area: 23 sq m
Empty Weight: 5,145 kg
Maximum Payload: 1.6 tons
Maximum Takeoff: 7,372 kg

Automotive

Engine Name: 1 x improved WP-13F
Engine Power, Dry: 9,700 lb (4,400 kg) static thrust
Engine Power, with Afterburner: 13,200 lb (6,000 kg)
Internal Fuel Capacity: 2,485 liters
Maximum Speed: 2,175 km/h
Touchdown Speed: 310-330 km/h
Ceiling: 18,800 m
Climb Rate: 29,528 ft/min (9,000 m/min)
Radius: 370 km

Main Gun System

↳*Main Gun System #1*

Name: Gryazev-Shipunov GSh-30-1
Type: Autocannon
Caliber: mm30
Length: 1,978 mm
Barrel Length: 1,500 mm
Width: 156 mm
Height: 185 mm
Weight: 46 kg
Barrels: 1
Action: Short recoil operated
Rate of Fire: 1,800 rounds/min
Muzzle Velocity: 900 m/s
Maximum Firing Range: 1,800m
Effective Firing Range: 200-1,800m

↳*Main Gun System #1 Ammunition*

Type: Autocannon
Caliber: 30
Shell: 30×165mm
Basic Load: 1,000 Rounds

Missile Weapon Systems

Missile Weapon System (Option #1)

Name: PL-5B

Type: Air-to-Air Missile

Length: 3.128 m

Diameter: 0.127m

Wingspan: 0.657m

Weight: 148 kg

Warhead: 6kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: Active infrared, laser proximity fuse(PL-5EII)

Engine: Solid-fuel rocket

Operational Range: 1.3–16km

Maximum Speed: Mach 2.5

Guidance System: Infrared homing, multi-element, dual band detector(PL-5EII)

↳*Missile Weapon System (Option #2)*

Name: PL-8

Type: Air-to-Air Missile

Manufacturer: Xi'an Eastern Machinery Factory and CATIC

Length: 2.95 m

Diameter: 160 mm

Wingspan: 800 mm

Weight: 115 kg

Warhead: 11 kg high explosive

Detonation Mechansim: Impact / Proximity

Engine: solid rocket

Propellant: solid fuel

Operational Range: 20 km

Flight Ceiling: 21 km

Flight Altitude: 05 km

Maximum Speed: Mach 3.5

Guidance System: passive infrared homing

↳*Missile Weapon System (Option #3)*

Name: PL-9

Type: Air-to-Air Missile

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC), Hanzhong Nanfeng Machine Factory

↳

Length: 2.9m

Diameter: 0.157m

Wingspan: 0.856m

Warhead: 11.8kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: laser proximity fuse

Engine: Solid-fuel rocket

Operational Range: 22km

Flight Altitude: 4.5km

Maximum Speed: Mach 2+

Guidance System: multi-element infrared

Rocket Weapon Systems

Rocket Weapon System (Option #1): 55 mm rocket pod (12 rounds)

Rocket Weapon System (Option #2): 90 mm rocket pod (7 rounds)

Bomb Weapon System

Bomb Capacity: 50 kg to 500 kg unguided bombs

Avionics / Fire Control System

FCS Name: the Chinese fire control radar for J-G is developed from EL/M-2032 fire control radar China obtained from I/J-band KLJ-6E Lieying (Falcon) pulse-Doppler fire-control radar, which is said to be derived from the Israeli EL/M-2001

Computerized FCS: Yes

Ranging Radar: Type 226 ranging radar

Data Link: Type 481 data link

HUD: JT-1 head-up display (HUD)

Autopilot: KJ-11 autopilot

Data Computer: Type 8430 air data computer

Radio Compass: WL-7 radio compass

Radio Altimeter: 64A radio altimeter

Beacon Receiver: XS-6A beacon marker receiver

Navigation System: JD-3 tactical aircraft navigation (TACAN)

HF Radio: Type 506 HF radio

IFF: Type III identification friend or foe (IFF) system

Radar Warning Receiver: KW8602 radar warning receiver (RWR)

Chaff and Flare Dispencer: Type 941-4AC chaff/flare dispenser

Radar Noise Jammer: KG-8605 internal radar noise jammer

Notes:

J/F-7G series is the further development of earlier J-7E series. Contrary to many frequent but erroneous claims, the fire control radar is not the Chinese development of EL/M-2001B radar, because EL/M-2001B is a pulse Doppler ranging only radar. Instead,

the Chinese fire control radar for J-G is developed from EL/M-2032 fire control radar China obtained from Israel when it was a subcontractor for Elbit in the Romanian MiG-21 LanceR program described above. J-7G: Upgraded J-7E with more than 30 improvements with Mr. Song Cheng-Zhi (□□□) as the general designer. Equipped HOTAS and a Chinese derivative of EL/M-2032. However, due to the inherit limitation of the small size of the nosecone, the antenna size of EL/M-2032 has to be greatly reduced, resulting in the drastic decrease of the original 150 km range of EL/M-2032 by approximately 60% to slightly more than 60 km. Development begun in March 2002 and completed in July 2004, with delivery begun in Nov 2004

J-20 Mighty Dragon (Black Eagle) Chinese Stealth Air Superiority Fighter

Tiers:

System

Alternate Designation(s): J-20 Mighty Dragon; Black Eagle

Primary Function / Type: Stealth Air Superiority Fighter

Manufacturer: Chengdu Aerospace Corporation

Crew: 1

Number of Engines: 2

Number of Hard Points: 4× under-wing pylon capable of carrying drop tanks.

Internal Weapons Bay: PL-10 short range AAM; PL-12 Medium Range AAM; PL-15 BVR long range AAM; PL-21 Long Range AAM; LS-6 Precision-guided bomb

Dimensions

Length: 20.4 m

Width (Wing Span): 13.5 m

Wing Area: 78 m2

Empty Weight: 19,391 kg

Gross Weight: 32,092 kg

Maximum Takeoff Weight: 37,013 kg

Automotive

Engine Name: 2 × WS-10B or AL-31FM2 afterburning turbofan

Number of Engines: 2

Engine Type: Afterburning turbofan

Engine Power: 140 or 145 kN (31,000 or 33,000 lbf) with afterburner

Maximum Range: 6,000 km

Maximum Speed: Mach 2

Combat Range: 2,000 km

Service Ceiling: 20,000 m

G Limits: +9/-3

Thrust/Weight: 0.92 (1.12 with loaded weight and 50% fuel) with AL-31FM2 (estimated)

Fuel Capacity: 11,340 kg

Main Gun System

Note: The J-20 is reported to lack an internal autocannon or rotary cannon, suggesting the aircraft is not intended to be used in short range dogfight engagements with other aircraft but engage them with from long standoff ranges with missiles such as the PL-15 and PL-21.

Main Missile Systems

↳*Main Missile System #1*

Name: PL-15

Type: Active Radar-Guided Very Long-Range Air-to-Air Missile

Manufacturer: 607 (Air-to-Air Missile Research Institute)

Length: 4.0 m

Diameter: INA

Wingspan: INA

Engine: Pulsed solid-propellant rocket

Operational Range: 300+ km

Maximum Speed: Mach 4

Guidance System: Active Radar-Guided

↳*Main Missile System #2*

Name: PL-21

Type: Active Radar-Guided Long Range Air-to-Air Missile

Manufacturer: China Aerospace Science and Technology Corporation

Length: 5.5 m

Diameter: 250–300 mm

Engine: Ramjet

Guidance System: active radar with AESA

Bomb Weapon Systems

↳*Bomb #1*

Name: LS-6

Type: Precision-Guided Bomb

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC)

Length: INA

Diameter: INA

Weight: 50 kg version and a 100 kg version

Warhead: Various gravity bombs

Detonation Mechanism: Impact or Proximity

Maximum Speed: Free-fall

Guidance System: INS with GPS or laser guidance

Fire Control / Avionics

Fire Control Radar: INA

Active Electronically Scanned Array: Type 1475 (KLJ-5) active electronically scanned array

Optical Targeting System: EOTS-86 electro-optical targeting system (EOTS)

Infrared Search and Track System: EORD-31 infrared search and track

Targeting and Communication: Prototypes after application "2011" and production models feature revised nose section with an electro-optical/infra-red targeting system and an advanced communications suite on top of the aircraft enables it to datalink with other friendly platforms in service, such as airborne early warning drones. Six electro-optic sensors called Distributed Aperture System[a] similar to EODAS can provide 360-degree coverage for pilot with sensor fusion system combing radar signal with IR image in order to provide better situational awareness. The combination of an integrated targeting pod with spherically located passive-optical tracking system is reported similar to the design concept of Lockheed Martin F-35's avionic suite. Beijing A Star Science and Technology has developed the EOTS-86 electro-optical targeting system and Electro-Optical Distributed Aperture System for the J-20 and potentially other PLAAF fighters to detect and intercept stealth aircraft.

Cockpit, Helmet and Displays: The aircraft features a glass cockpit, with one primary large color liquid crystal displays (LCD) touchscreen, three smaller auxiliary displays, and a wide-angle holographic head-up display (HUD). The size of the primary LCD screen is 24 x 9 inches (25.63 by the diagonal) with two systems for redundant illumination.

Radar

Note: Official information on the type of radar that J-20s use have not yet been released publicly. Some analysts believed that J-20s used Type 1475 (KLJ-5) active electronically scanned array (AESA) radar with 1856 transmit/receive modules, but more recent information's revealed that this radar was designed for upgraded versions of J-11D. Other analysts point out that, based on nose cross-section of J-20 and known data about a single transmit/receive module surface in the J-16's AESA radar-system, J-20s likely fit 2000–2200 transmit/receive modules

Protection

Stealth Properties: Yes, Analysts noted that the J-20's nose and canopy use a similar stealth shaping design as the F-22, yielding similar signature performance in a mature design at the front, while the aircraft's side and axi-symmetric engine nozzles may expose the aircraft to radar. One prototype has been powered by WS-10G engines equipped with different jagged-edge nozzles and tiles for greater stealth. Others have raised doubts about the use of canards on a low-observable design, stating that canards would guarantee radar detection and a compromise of stealth. However, canards and low-observability are not mutually exclusive designs. Northrop Grumman's proposal for the U.S. Navy's Advanced Tactical Fighter (ATF) incorporated canards on a stealthy airframe. Lockheed Martin employed canards on a stealth airframe for the Joint Advanced Strike Technology (JAST) program during early development before dropping them due to complications with aircraft carrier recovery. McDonnell Douglas and NASA's X-36 featured canards and was considered to be extremely stealthy.[80] Radar cross-section can be further reduced by controlling canard deflection through flight control software, as is done on the Eurofighter. The diverterless supersonic inlet (DSI) enables an aircraft to reach Mach 2.0 with a simpler intake than traditionally required, and improves stealth performance by eliminating radar reflections between the diverter and the aircraft's skin. Analysts have noted that the J-20 DSI reduces the need for application of radar absorbent materials. In May 2018, Indian Air Chief Marshal B.S. Dhanoa claimed that Su-30MKI fighters could detect J-20 from "several kilometers away" amid reports from the Indian media that the J-20 is undetectable. Analyst Justin Bronk from Royal United Services Institute noted that Chinese are possibly flying the J-20 with radar reflectors during peacetime for safety and training purposes due to

the potential for accidents and identification from other aircraft or ground installations.[

Heat Signature Reduction: Yes

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: Yes

Notes:

The Chengdu J-20 (Chinese: □-20; pinyin: Jiān-Èrlíng), also known as Mighty Dragon (Chinese: □□; pinyin: Wēilóng, Nato reporting name is Black Eagle) is a single-seat, twinjet, all-weather, stealth, fifth-generation fighter aircraft developed by China's Chengdu Aerospace Corporation for the People's Liberation Army Air Force (PLAAF). The J-20 is designed as an air superiority fighter with precision strike capability; it descends from the J-XX program of the 1990s. The J-20 made its maiden flight on 11 January 2011, and was officially revealed at the 2016 China International Aviation & Aerospace Exhibition. The aircraft was introduced into service in March 2017, and began its combat training phase in September 2017. The first J-20 combat unit was formed in February 2018. The J-20 is the world's third operational fifth-generation stealth fighter aircraft after the F-22 and F-35. The J-20 has a long and wide fuselage, with a chiseled nose section and a frameless canopy. Immediately behind the cockpit are low observable intakes. All-moving canard surfaces with pronounced dihedral are placed behind the intakes, followed by leading edge extensions merging into the delta wing with forward-swept trailing edges. The aft section has twin outward canted all-moving fins, short but deep ventral strakes, and conventional round engine exhausts. One important design criterion for the J-20 is high instability. This requires sustained pitch authority at a high angle of attack, in which a conventional tail-plane would lose effectiveness due to stalling. On the other hand, a canard can deflect opposite to the angle of attack, avoiding stall and thereby maintaining control.[30] A canard design is also known to provide good supersonic performance, excellent supersonic and transonic turn performance, and improved short-field landing performance compared to the conventional delta wing design. Leading edge extensions and body lift are incorporated to enhance performance in a canard layout. This combination is said by the designer to generate 1.2 times the lift of an ordinary canard delta, and 1.8 times more lift than an equivalent sized pure delta configuration. The designer claims such a combination allows the use of a smaller wing, reducing supersonic drag without compromising transonic lift-to-drag characteristics that are crucial to the aircraft's turn performance.

↳*Missile System (Option 2)*

Name: KH-31 (AS-17 Krypton)

Type: Medium-range air-to-surface

Basic Load: INA

Manufacturer: Tactical Missiles Corporation (Zvezda-Strela before 2002)

In Service: 1988-Present

Proliferation: INA

Length: Mod 1 : 4.700 m (15 ft 5.0 in)[3] Mod 2 (AD/PD) : 5.3 m (17 ft 5 in)

Diameter: 360 mm

Weight: Kh-31A :610 kg (1,340 lb) Kh-31P :600 kg (1,320 lb)

Warhead: HE shaped charge

Detonation Mechanism: Impact

Warhead Weight: Kh-31A :94 kg (207 lb) Kh-31P :87 kg (192 lb

Engine: Solid fuel rocket in initial stage, ramjet for rest of trajectory

Wingspan: mm914

Propellant: kerosene

Operational Range: Kh-31A: 25 km–103 km (13.5–55.6 nmi; Kh-31P: up to 110 km (60 nmi; 70 mi)

Speed: Kh-31A/P: 2,160–2,520 km/h (1,340–1,570 mph) MA-31: Mach 2.7 (low), Mach 3.5 (high)

Guidance System: Kh-31A: inertial guidance with active radar homing Kh-31P: inertial with passive radar

Launch Platform: Both : Su-27SM, Su-30MKI, Su-25, Su-34, Su-35, MiG-29M, HAL Tejas Mk1 and Mk2, MiG-29K Kh-31A only : Su-33 Also : Su-24M

↳*Bomb Weapon System*

Name: KAB-500Kr

Type: Electro-optical TV-guided fire and forget bomb

Basic Load: INA

Manufacturer: Russia

Proliferation: INA

Length: m3.05

Diameter: INA

Warhead Type: Hardened, armor-piercing warhead

Weight: kg520

Warhead Weight: kg380

Penetration: up to 1.5 metres (4 feet 11 inches) of reinforced concrete.

Effective Range: he weapon's seeker can lock onto a target at ranges of up to 15 to 17 km (9.3 to 10.6 mi), depending on visibility.

Note: It uses a standard Soviet/Russian FAB-500 general-purpose bomb, with a nominal weight of 500 kg (1,100 lb), as a warhead, adding a low-light television seeker and guidance fins to turn it into a guided, unpowered glide bomb.

Notes:

MiG-21PFM Fishbed-F This is a NATO designation for MiG-21PF. Modified PF/PFS (M = modifikatsirovanny). It incorporates a series of changes made during PF production and adds a side-hinged canopy and broader vertical tail surfaces. The Mikoyan-Gurevich MiG-21 (Russian: Микоян и Гуревич МиГ-21; NATO reporting name: Fishbed) is a supersonic jet fighter and interceptor aircraft, designed by the Mikoyan-Gurevich Design Bureau in the Soviet Union. Its nicknames include: Balalaika, because its planform resembles the stringed musical instrument of the same name; Ołówek, Polish for "pencil", due to the shape of its fuselage, and; Én bạc, meaning "Silver Swallow", in Vietnamese. Approximately 60 countries over four continents have flown the MiG-21, and it still serves many nations six decades after its maiden flight. It made aviation records, became the most-produced supersonic jet aircraft in aviation history, the most-produced combat aircraft since the Korean War and previously the longest production run of a combat aircraft (now exceeded by both the McDonnell Douglas F-15 Eagle and General Dynamics F-16 Fighting Falcon). It's also one of the earliest examples of planes capable of performing the Cobra maneuver. The MiG-21 was the first successful Soviet aircraft combining fighter and interceptor characteristics in a single aircraft. It was a lightweight fighter, achieving Mach 2 with a relatively low-powered afterburning turbojet, and is thus comparable to the American Lockheed F-104 Starfighter and Northrop F-5 Freedom Fighter and the French Dassault Mirage III. Its basic layout was used for numerous other Soviet designs; delta-winged aircraft included Su-9 interceptor and the fast E-150 prototype from MiG bureau while the mass-produced successful front fighter Su-7 and Mikoyan's I-75 experimental interceptor combined a similar fuselage shape with swept-back wings. However, the characteristic layout with the shock cone and front air intake did not see widespread use outside the USSR and finally proved to have limited development potential, mainly because of the very small space available for the radar. Like many aircraft designed as interceptors, the MiG-21 had a short range. This was exacerbated by the poor placement of the internal fuel tanks ahead of the centre of gravity. As the internal fuel was consumed, the center of gravity would shift rearward beyond acceptable parameters. This had the effect of making the plane statically unstable to the point of being difficult to control, resulting in an endurance of only 45 minutes in clean condition. This can be somewhat countered by carrying fuel in external tanks closer to the center of gravity. The Chinese variants somewhat improved the internal fuel tank layout (also second generation of Soviet variants), and also carry significantly larger external fuel tanks to counter this issue. Additionally, when more than half the fuel was used up, violent maneuvers prevented fuel from flowing into the engine hereby causing it to shut down in flight. This increased the risk of tank implosions (MiG-21 had tanks pressurized with air from the engine's compressor), a problem inherited from the MiG-15, MiG-17 and MiG-19. The short endurance and low fuel capacity of the MiG-21F, PF, PFM, S/SM and M/MF variants—though each had a somewhat greater fuel capacity than its predecessor—led to the development of the MT and SMT variants. These had an increased range of 250 km (155 mi) compared to the MiG-21SM, but at the cost of worsening all other performance figures, such as a lower service ceiling and slower time to altitude. The delta wing, while excellent for a fast-climbing interceptor, meant any form of turning combat led to a rapid loss of speed. However, the light loading of the aircraft could mean that a climb rate of 235 m/s (46,250 ft/min) was possible with a combat-loaded MiG-21bis, not far short of the performance of the later F-16A. Mig-21's Tumansky R-25 jet engine's specialty was the addition of a second fuel pump in the afterburning stage. Activating the ЧР (rus. "чрезвычайный режим" - emergency mode) booster feature allows the engine to develop 97.4 kilonewtons (21,896 lbf) of thrust under 4,000 meters (13,000 ft) of altitude. The limit of operation is 1 minute for dogfight practice and 3 minutes for an actual wartime emergency, as further use causes the engine to overheat. Use of this "diamond regime" provided a massive 97.4 kN of thrust for no more than 3 minutes in actual wartime use. Use of this temporary power gave the MiG-21bis slightly better than 1:1 thrust-to-weight ratio and a climbing rate of 254 meters/second, equalling the F-16's nominal capabilities in close-quarters dogfight. In air combat practice with the MiG-21bis, use of WEP thrust was limited to 1 minute, to spare on the engines' 800 flight hours lifetime, since every second of super-afterburner use counted as several minutes of regular power run due to extreme thermal stress. When WEP was on, the MiG-21bis's R-25 engine produced a huge 5 meter long blowtorch exhaust - the six or seven brightly glowing rhomboid "shock diamonds" visible inside the flames gave the emergency-power setting its "diamond regime" name. Given a skilled pilot and capable missiles, it could give a good account of itself against contemporary fighters. Its G-limits were increased from +7Gs in initial variants to +8.5Gs in the latest variants. It was replaced by the newer variable-geometry MiG-23 and MiG-27 for ground support duties. However, not until the MiG-29 would the Soviet Union ultimately replace the MiG-21 as a maneuvering dogfighter to counter new American air superiority types. The MiG-21 was exported widely and remains in use. The aircraft's simple controls, engine, weapons, and avionics were typical of Soviet-era military designs. The use of a tail with the delta wing aids stability and control at the extremes of the flight envelope, enhancing safety for lower-skilled pilots; this in turn enhanced its marketability in exports to developing countries with limited training programs and restricted pilot pools. While technologically inferior to the more advanced fighters it often faced, low production and maintenance costs made it a favorite of nations buying Eastern Bloc military hardware. Several Russian, Israeli and Romanian firms have begun to offer upgrade packages to MiG-21 operators, designed to bring the aircraft up to a modern standard, with greatly upgraded avionics and armaments.

Su-7 (Fitter) Russian Ground-Attack Fighter

Tiers:

System

Alternate Designation(s): Su-7; NATO: Fitter

Primary Function / Type: Ground-Attack Fighter

Manufacturer: Sukhoi

Crew: 1

Number of Engines: 1

Number of Hard Points: Hardpoints: 4 × under-wing & 2 × under-fuselage stations for 2,000 kg (4,400 lb) of disposable stores. 2 × reserved for 2,300 l (510 imp gal; 610 US gal) drop tanks with provisions to carry combinations of: *Rockets: UB-16-57U rocket pods for S-5 rockets *Missiles: *Air-to-air missiles: K-13M R-60 R-73A *Air-to-surface missiles: Kh-25ML Kh-29 *Anti-radiation missiles: Kh-27 Kh-58 *Bombs: FAB-250 general-purpose bomb FAB-500 GP bomb FAB-750 GP bomb 8U69 nuclear bomb

Dimensions

Length, with Nose Probe: 17.37 m

Height: 4.70 m

Wingspan: 8.93 m

Wing Area: 27.6 sq. m

Weight, Empty: 8,620 kg

Weight, Maximum Weapons Load: 1,000 kg

Normal Takeoff Weight: 12,000 kg

Maximum Takeoff Weight: 13,500 kg

External Stores: 1,000 kg, including bombs, rocket pods

Automotive

Engine Name: 1 x Lyulka AL-7F-1
Number of Engines: 1
Engine Type: Turbojet
Engine Power, Dry: 7,000 kg
Engine Power, with Afterburner: 10,000 kg
Internal Fuel Capacity: 2,941 liters
Speed, Sea Level with Afterburner: 1,352 km/h, Mach 1.1
Speed, Sea Level without Afterburner: 853 km/h, Mach 0.7
Speed at 11,000 m Clean: 1,700 km/h, Mach 1.6
Speed at 11,000 m with Four Loaded Pylons: 1,268 km/h
Maximum Range: 1,150 km/h
Service Ceiling: 17,600 m
Rate of Climb: 160 m/s

Main Gun System

↳*System*

Name: Nudelman-Rikhter NR-30
Type: Autocannon
Caliber: 30mm
Quantity: 2 × 30 mm Nudelman-Rikhter NR-30
Length: 2,153 mm
Barrel Length: 1,600 mm
Width: 181 mm
Height: 186 mm
Weight: 66 kg
Barrels: 1
Action: Short recoil
Rate of Fire: 850–1,000 rpm
Muzzle Velocity: 780 m/s

↳*Ammunition*

Type: Rifle
Caliber: 30mm
Cartridge: 30x155mm
Basic Load: 70 rounds per gun, 140 rounds total

Main Missile Systems

↳*Main Missile System #1*

Name: K-13; NATO: AA-2 Atoll

Type: Infrared Homing Air-to-Air Missile

Manufacturer: Vympel

Length: 2.830 m

Diameter: 127 mm

Wingspan: 631 mm

Weight: 90 kg

Warhead Weight: 7.4 kg

Engine: solid-fuel rocket engine

Operational Range: 1.0 to 3.5 km

Maximum Speed: Mach 2.5

Guidance System: infrared homing

↳*Main Missile System #2*

Name: R-60

Type: Infrared Homing Air-to-Air Missile

Manufacturer: Vympel

Length: 2,090 mm

Diameter: 120 mm

Wingspan: 390 mm

Warhead: 3 kg

Detonation mechanism: proximity

Operational Range: 8 km

Flight Altitude: 20,000 m

Maximum Speed: Mach 2.7

Guidance System: Infrared homing

Rocket Weapon Systems

Note: UB-16-57U rocket pods for S-5 rockets

Bomb Weapon Systems

Note: *FAB-250 general-purpose bomb *FAB-500 GP bomb *FAB-750 GP bomb *8U69 nuclear bomb

Fire Control / Avionics

Fire Control System Type: INA

Fire Control Radar: INA

Navigation Radar: I-band range-only air intercept

Laser Desingator: INA

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: Sirena 3 radar warning system

Chaffs/Flares: Yes

Notes:

The Sukhoi Su-7 is a single seat ground attack aircraft that was long a standard tactical fighter-bomber with the Soviet Air Force. The development of Su-7 began in the early 1950's. First prototype called S-1 "Strela" made its first flight in 1955. The Su-7 was unveiled to the West at the 1956 Soviet Aviation Day display at Tushino Airport outside Moscow. The prototype came out to be very promising and Su-7 went in production several years later, with modifications including the Su-7B and Su-7BKL. The airplane was exported to Czechoslovakia, Poland, Romania, China, and other countries. The Su-7 is armed with two 30mm NR-30 guns in wing roots, each with 70 rounds. Under-wing pylons allow two 742 kg or two 495 kg of bombs or rocket pods. The wings are mid- to low-mounted (wings are mounted below center of aircraft) with wide wing roots, swept-back, and tapered with blunt tips. There is one engine in the body. There is a circular air intake in the nose and a large, single exhaust. The fuselage is a long, tubular body with a blunt nose and rear. There is a large, bubble canopy. The tail is swept-back and has a tapered tail fin with a blunt tip. It has swept-back and tapered flats mid- to low-mounted on the fuselage.

J-7E (Fishcan) Chinese Fighter Aircraft

Tiers:

Variants:

- **Note:** The Following is a list of the J-7 Variants: Type 1962/62 series J-7 series J-7I series J-7II series J/F-7M Air Guard series F-7MP/P Sky Bolt series J-7III series F-7C series J-7E series J/F-7F series MiG-21 upgrade subcontract J/F-7MG series J/F-7PG series J/F-7G series F-7BGI JJ-7 trainer series FT-7 trainer series

System

Alternative Designations: J-7E; Fishcan
Manufacturer: Chengdu Aircraft Corporation/Guizhou Aircraft Industry Corporation
Crew: 1
Harpoints: 5 in total – 4× under-wing, 1× centreline under-fuselage with a capacity of 2,000 kg maximum (up to 500 kg each
All-Weather Capable: Yes
Note: J-7E series is a series of day time fighter of J-7 that utilizing double delta wing which greatly improved maneuverability.

Dimensions

Length: 14.86 m
Height: 4.10 m
Wingspan: 7.15 m
Wing Area: 23 sq m
Empty Weight: 5,145 kg
Maximum Payload: 1.6 tons
Maximum Takeoff: 7,372 kg

Automotive

Engine Name: 1 x improved WP-13F
Engine Power, Dry: 9,700 lb (4,400 kg) static thrust
Engine Power, with Afterburner: 13,200 lb (6,000 kg)

Internal Fuel Capacity: 2,485 liters

Maximum Speed: 2,175 km/h

Touchdown Speed: 310-330 km/h

Ceiling: 18,800 m

Climb Rate: 29,528 ft/min (9,000 m/min)

Radius: 370 km

Main Gun System

↳*Main Gun System #1*

Name: Gryazev-Shipunov GSh-30-1

Type: Autocannon

Caliber: mm30

Length: 1,978 mm

Barrel Length: 1,500 mm

Width: 156 mm

Height: 185 mm

Weight: 46 kg

Barrels: 1

Action: Short recoil operated

Rate of Fire: 1,800 rounds/min

Muzzle Velocity: 900 m/s

Maximum Firing Range: 1,800m

Effective Firing Range: 200-1,800m

↳*Main Gun System #1 Ammunition*

Type: Autocannon

Caliber: 30

Shell: 30×165mm

Basic Load: 1,000 Rounds

Missile Weapon Systems

↳*Missile Weapon System (Option #1)*

Name: PL-5B

Type: Air-to-Air Missile

Length: 3.128 m

Diameter: 0.127m

Wingspan: 0.657m

Weight: 148 kg

Warhead: 6kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: Active infrared, laser proximity fuse(PL-5EII)

Engine: Solid-fuel rocket

Operational Range: 1.3–16km

Maximum Speed: Mach 2.5

Guidance System: Infrared homing, multi-element, dual band detector(PL-5EII)

↳*Missile Weapon System (Option #2)*

Name: PL-8

Type: Air-to-Air Missile

Manufacturer: Xi'an Eastern Machinery Factory and CATIC

Length: 2.95 m

Diameter: 160 mm

Wingspan: 800 mm

Weight: 115 kg

Warhead: 11 kg high explosive

Detonation Mechansim: Impact / Proximity

Engine: solid rocket

Propellant: solid fuel

Operational Range: 20 km

Flight Ceiling: 21 km

Flight Altitude: 05 km

Maximum Speed: Mach 3.5

Guidance System: passive infrared homing

↳*Missile Weapon System (Option #3)*

Name: PL-9

Type: Air-to-Air Missile

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC), Hanzhong Nanfeng Machine Factory

Length: 2.9m

Diameter: 0.157m

Wingspan: 0.856m

Warhead: 11.8kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: laser proximity fuse

Engine: Solid-fuel rocket

Operational Range: 22km

Flight Altitude: 4.5km

Maximum Speed: Mach 2+

Guidance System: multi-element infrared

Rocket Weapon Systems

Rocket Weapon System (Option #1): 55 mm rocket pod (12 rounds)

Rocket Weapon System (Option #2): 90 mm rocket pod (7 rounds)

Bomb Weapon System

Bomb Capacity: 50 kg to 500 kg unguided bombs

Avionics / Fire Control System

FCS Name: INA

Computerized FCS: No

Ranging Radar: Type 226 ranging radar

Data Link: Type 481 data link

HUD: JT-1 head-up display (HUD)

Autopilot: KJ-11 autopilot

Data Computer: Type 8430 air data computer

Radio Compass: WL-7 radio compass

Radio Altimeter: 64A radio altimeter

Beacon Receiver: XS-6A beacon marker receiver

Navigation System: JD-3 tactical aircraft navigation (TACAN)

HF Radio: Type 506 HF radio

IFF: Type 605A IFF

Radar Warning Receiver: KW8602 radar warning receiver (RWR)

Chaff and Flare Dispencer: Type 941-4AC chaff/flare dispenser

Radar Noise Jammer: KG-8605 internal radar noise jammer

Notes:

J-7E series is a series of day time fighter of J-7 that utilizing double delta wing which greatly improved maneuverability. It was decided that in order to maintain good maneuverability, the series would not be equipped with fire control radar and medium range AAMs. Equipped with only ranging radar and close range AAM, J-7E series are still daytime fighter. New features of this series includes utilization of carbon-carbon composite brake that quadrupled the service life to more than a thousand landings, utilization of aluminum-lithium alloy that reduces weight by 17%, and pressure ground fueling system replaced gravity ground fueling system that drastically reduced the time of fueling by 80% to 6 minutes from the original half an hour. Deletion of the portside gun resulted in increase of fuel capacity by 100 liters, and the ammo for the starboard side gun is reduced to 60 rounds. WP-13F engine increased mean time between overhaul (MTBO) to 300 hours and service life to 900 hours.Maximum payload is increased to 1.6 ton. Newer avionics replaced the older ones on earlier J-7's. J-7E: Renamed production version of J-7IV with problems exposed by prototypes being stamped out, such as aileron flutter, automatic pitching, lateral Dutch roll, and that of HUD. This model is equipped with a Chinese version of Italian Pointer 2500 ranging radar originally used on Q-5M, modified to fit into the nosecone of J-7E. Pointer 2500 ranging radar is a development of Pointer ranging radar used on the

initial production version of AMX International AMX, which in turn, is a licensed Italian copy of Israeli Elta EL/M-2001B pulse Doppler ranging only radar. More than 260 were built when production stopped in 2001.

MiG-15bis (Fagot) Russian Fighter Aircraft

Tiers:

Variants:

- **MiG-15:** This was a developmental/early production model with the RD-45 engine providing 4,850 lb (2,200 kg) of static thrust.
- **MiG-15bis:** This was the basic production version. Some were modified for ground attack and reconnaissance missions. Attack models could carry up to 2,200 lb (1,000 kg) of ordnance on wing pylons.
- **MiG-15UTI Midget:** This was a two-seat trainer version. Most had their guns removed. It was also built in Poland as the Lim-3; in the former Czechoslovakia as the CS-2; and in China as JJ-2 (domestic) and T-2 (export).

System

Alternate Designation(s): MiG-15bis; NATO: Fagot
Primary Function / Type: Fighter Aircraft
Manufacturer: Mikoyan-Gurevich

Notes:

MiG-15bis This was the basic production version. Some were modified for ground attack and reconnaissance missions. Attack models could carry up to 2,200 lb (1,000 kg) of ordnance on wing pylons. The Mikoyan-Gurevich MiG-15 (Russian: Микоян и Гуревич МиГ-15; USAF/DoD designation: Type 14; NATO reporting name: Fagot) is a jet fighter aircraft developed by Mikoyan-Gurevich for the Soviet Union. The MiG-15 was one of the first successful jet fighters to incorporate swept wings to achieve high transonic speeds. In combat over Korea, it outclassed straight-winged jet day fighters, which were largely relegated to ground-attack roles, and was quickly countered by the similar American swept-wing North American F-86 Sabre. When refined into the more advanced MiG-17, the basic design would again surprise the West when it proved effective against supersonic fighters such as the Republic F-105 Thunderchief and McDonnell Douglas F-4 Phantom II in the Vietnam War of the 1960s. The MiG-15 is believed to have been one of the most produced jet aircraft; in excess of 13,000 were manufactured. Licensed foreign production may have raised the production total to almost 18,000. The MiG-15 remains in service with the Korean People's Army Air Force as an advanced trainer. The first turbojet fighter developed by Mikoyan-Gurevich OKB was the Mikoyan-Gurevich MiG-9, which appeared in the years immediately after World War II. It used a pair of reverse-engineered German BMW 003 engines. The MiG-9 was a troublesome design that suffered from weak, unreliable engines and control problems. Categorized as a first-generation jet fighter, it was designed with the straight-style wings common to piston-engined fighters. The Germans had been unable to develop turbojets with thrust over 1,130 kilograms-force (11,100 N; 2,500 lbf) running at the time of the surrender in May 1945, which limited the performance of immediate Soviet postwar jet aircraft designs. They did inherit the technology of the advanced axial-compressor Junkers 012 and BMW 018 engines, in the class of the later Rolls-Royce Avon, that were some years ahead of the then currently available British Rolls-Royce Nene engine. The Soviet aviation minister Mikhail Khrunichev and aircraft designer A. S. Yakovlev suggested to Premier Joseph Stalin that the USSR buy the conservative but fully developed Nene engines from Rolls-Royce (having been alerted to the fact that the U.K. Labour government wanted to improve post-war UK-Russia foreign relations) for the purpose of copying them in a minimum of time. Stalin is said to have replied, "What fool will sell us his secrets?" However, he gave his consent to the proposal and Mikoyan, engine designer Vladimir Klimov, and others travelled to the United Kingdom to request the engines. To Stalin's amazement, the British Labour government and its Minister of Trade, Sir Stafford Cripps, were perfectly willing to provide technical information and a license to manufacture the Rolls-Royce Nene. Sample engines were purchased and delivered with blueprints. Following evaluation and adaptation to Russian conditions, the windfall technology was tooled for mass-production as the Klimov RD-45 to be incorporated into the MiG-15. To take advantage of the new engine, the Council of Ministers ordered the Mikoyan-Gurevich OKB to build two prototypes for an advanced high-altitude daytime interceptor to defend against bombers. It was to have a top speed of 1,000 kilometres per hour (620 mph) and a range of 1,200 kilometres (750 mi). Designers at MiG's OKB-155 started with the earlier MiG-9 jet fighter. The new fighter used Klimov's British-derived engines, swept wings, and a tailpipe going all the way back to a swept tail. The German Me 262 was the first fighter fitted with an 18.5° wing sweep, but it was introduced merely to adjust the center of gravity of its heavy Junkers Jumo 004 pioneering axial-compressor turbojet engines. Further experience and research during World War II later established that swept wings would give better performance at transonic speeds. At the end of World War II, the Soviets seized many of the assets of Germany's aircraft industry. The MiG team studied these plans, prototypes and documents, particularly swept-wing research and designs, even going so far as to produce a flying testbed in 1945 to investigate swept-wing design concepts as the piston-engined "pusher"-layout, MiG-8 Utka (Russian for "duck", from its tail-first canard design). The swept wing later proved to have a decisive performance advantage over straight-winged jet fighters when it was introduced into combat over Korea. The design that emerged had a mid-mounted 35-degree swept wing with a slight anhedral and a tailplane mounted up on the swept tail. Western analysts noted that it strongly resembled Kurt Tank's Focke-Wulf Ta 183, a later design than the Me 262 that never progressed beyond the prototype stage. While the majority of Focke-Wulf engineers (in particular, Hans Multhopp, who led the Ta-183 development team) were captured by Western armies, the Soviets did capture plans and wind-tunnel models for the Ta-183. The MiG-15 bore a much stronger likeness to the Ta-183 than the American F-86 Sabre, which also incorporated German research.[citation needed] The MiG-15 does bear a resemblance in layout, sharing the high tailplane and nose-mounted intake, although the aircraft are

different in structure, details, and proportions. The MiG-15's design understandably shared features, and some appearance commonalities with the MiG design bureau's own 1945–46 attempt at a Soviet-built version of the Messerschmitt Me 263 rocket fighter in the appearance of its fuselage. The new MiG retained the previous straight-winged MiG-9's wing and tailplane placement while the F-86 employed a more conventional low-winged design. To prevent confusion during the height of combat the US painted their aircraft with bright stripes to distinguish them. The resulting prototypes were designated I-310. The I-310 was a swept-wing fighter with 35-degree sweep in wings and tail, with two wing fences fitted to each wing to improve airflow over the wing. The design used a single Rolls-Royce Nene fed by a split-forward air intake. A duct carried intake air around the cockpit area and back together ahead of the engine. Its first flight was 30 December 1947, some two months after the American F-86 Sabre had first flown. It demonstrated exceptional performance, reaching 1,042 kilometres per hour (647 mph) at 3,000 metres (9,800 ft). The Soviet Union's first swept-wing jet fighter had been the underpowered Lavochkin La-160, which was otherwise more similar to the MiG-9. The Lavochkin La-168, which reached production as the Lavochkin La-15, used the same engine as the MiG but used a shoulder mounted wing and t-tail; it was the main competitive design. Eventually, the MiG design was favoured for mass production. Designated MiG-15, the first production example flew on 31 December 1948. It entered Soviet Air Force service in 1949, and subsequently received the NATO reporting name "Fagot". Early production examples had a tendency to roll to the left or to the right due to manufacturing variances, so aerodynamic trimmers called "nozhi" (knives) were fitted to correct the problem, the knives being adjusted by ground crews until the aircraft flew correctly. An improved variant, the MiG-15bis ("second"), entered service in early 1950 with a Klimov VK-1 engine, another version of the Nene with improved metallurgy over the RD-45, plus minor improvements and upgrades. Visible differences were a headlight in the air intake separator and horizontal upper edge airbrakes. The 23 mm cannon were placed more closely together in their undercarriage. Some "bis" aircraft also adopted under-wing hardpoints for unguided rocket launchers or 50–250 kg (110–550 lb) bombs. Fighter-bomber modifications were dubbed "IB", "SD-21", and "SD-5". About 150 aircraft were upgraded to SD-21 specification during 1953–1954. The MiG-15 arguably had sufficient power to dive at supersonic speeds, but the lack of an "all-flying" tail greatly diminished the pilot's ability to control the aircraft as it approached Mach 1. As a result, pilots understood they must not exceed Mach 0.92, where the flight surfaces became ineffective. Additionally, the MiG-15 tended to spin after it stalled, and often the pilot could not recover. Later MiGs incorporated all-flying tails. The MiG-15 was originally intended to intercept American bombers like the B-29. It was even evaluated in mock air-to-air combat trials with a captured U.S. B-29, as well as the later Soviet B-29 copy, the Tupolev Tu-4. To ensure the destruction of such large bombers, the MiG-15 carried autocannons: two 23 mm with 80 rounds per gun and a single 37 mm with 40 rounds. These weapons provided tremendous punch in the interceptor role, but their limited rate of fire and relatively low velocity made it more difficult to score hits against small and maneuverable enemy jet fighters in air-to-air combat. The 23 mm and 37 mm also had radically different ballistics, and some United Nations pilots in Korea had the unnerving experience of 23 mm shells passing over them while the 37 mm shells flew under. The cannon were fitted into a simple pack that could be winched out of the bottom of the nose for servicing and reloading, allowing pre-prepared packs to be rapidly swapped out.

Su-39 (Frogfoot) Russian Attack Aircraft

Tiers:

Variants:

- **Su-25:** The basic version of the aircraft was produced at Factory 31, at Tbilisi, in the Soviet Republic of Georgia. Between 1978 and 1989, 582 single-seat Su-25s were produced in Georgia, not including aircraft produced under the Su-25K export program. This variant of the aircraft represents the backbone of the Russian Air Force's Su-25 fleet, currently the largest in the world. The aircraft experienced a number of accidents in operational service caused by system failures attributed to salvo firing of weapons. In the wake of these incidents, use of its main armament, the 240 mm S-24 rocket, was prohibited. In its place, the FAB-500 500 kg (1,100 lb) general-purpose high-explosive bomb became the primary armament.
- **Su-25K:** The basic Su-25 model was used as the basis for a commercial export variant, known as the Su-25K (Komercheskiy). This model was also built at Factory 31 in Tbilisi, Georgia. The aircraft differed from the Soviet Air Force version in certain minor details concerning internal equipment. A total of 180 Su-25K aircraft were built between 1984 and 1989.
- **Su-25UB:** The Su-25UB trainer (Uchebno-Boyevoy) was drawn up in 1977. The first prototype, called "T-8UB-1", was rolled out in July 1985 and its maiden flight was carried out at the Ulan-Ude factory airfield on 12 August of that year. By the end of 1986, 25 Su-25UBs had been produced at Ulan-Ude before the twin-seater completed its State trials and officially cleared for service with the Soviet Air Force. It was intended for training and evaluation flights of active-duty pilots, and for training pilot cadets at Soviet Air Force flying schools. The performance did not differ substantially from that of the single-seater. The navigation, attack, sighting devices and weapons-control systems of the two-seater enabled it to be used for both routine training and weapons-training missions.
- **Su-25UBK:** From 1986 to 1989, in parallel with the construction of the main Su-25UB combat training variant, the Ulan-Ude plant produced the so-called "commercial" Su-25UBK, intended for export to countries that bought the Su-25K, and with similar modifications to that aircraft.
- **Su-25UBM:** The Su-25UBM is a twin seat variant that can be used as an operational trainer, but also has attack capabilities, and can be used for reconnaissance, target designation and airborne control. Its first flight was on 6 December 2008 and it was certified in December 2010. It will enter operational use with the Russian Air Force later. The variant has a Phazotron NIIR Kopyo radar and Bars-2 equipment on board. Su-25UBM's range is believed to be 1,300 km (810 mi) and it may have protection against infra-red guided missiles (IRGM), a minimal requirement on today's battle fields where IRGMs proliferate.
- **Su-25UTG:** The Su-25UTG (Uchebno-Trenirovochnyy s Gakom) is a variant of the Su-25UB designed to train pilots in takeoff and landing on a land-based simulated carrier deck, with a sloping ski-jump section and arrester wires. The first one flew in September 1988, and approximately 10 were produced. About half remained in Russian service after 1991; they were used on Russia's sole aircraft carrier, Admiral Kuznetsov. This small number of aircraft were insufficient to

meet the training needs of Russia's carrier air group, so a number of Su-25UBs were converted into Su-25UTGs. These aircraft being distinguished by the alternative designation Su-25UBP (Uchebno-Boyevoy Palubny)—the adjective palubnyy meaning "deck", indicating that these aircraft have a naval function. Approximately 10 of these aircraft are currently operational in the Russian Navy as part of the 279th Naval Aviation Regiment.

- **Su-25BM:** The Su-25BM (Buksirovshchik Misheney) is a target-towing variant of the Su-25 whose development began in 1986. The prototype, designated T-8BM1, successfully flew for the first time on 22 March 1990, at Tbilisi. After completion of the test phase, the aircraft was put into production. The Su-25BM target-tower was designed to provide towed target facilities for training ground forces and naval personnel in ground-to-air or naval surface-to-air missile systems. It is powered by an R-195 engine and equipped with an RSDN-10 long-range navigation system, an analogue of the Western LORAN system.
- **Su-25T:** The Su-25T (Tankovy) is a dedicated antitank version, which has been combat-tested with notable success in Chechnya. The design of the aircraft is similar to the Su-25UB. The variant was converted to one-seater, with the rear seat replaced by additional avionics. It has all-weather and night attack capability. In addition to the full arsenal of weapons of the standard Su-25, the Su-25T can employ the KAB-500Kr TV-guided bomb and the semi-active laser-guided Kh-25ML. Its enlarged nosecone houses the Shkval optical TV and aiming system with the Prichal laser rangefinder and target designator. It can also carry Vikhr laser-guided, tube-launched missiles, which is its main antitank armament. For night operations, the low-light TV Merkuriy pod system can be carried under the fuselage. Three Su-25Ts prototypes were built in 1983–86 and 8 production aircraft were built in 1990. With the introduction of a definitive Russian Air Force Su-25 upgrade programme, in the form of Stroyevoy Modernizirovannyi, the Su-25T programme was officially canceled in 2000.
- **Su-25TM (Su-39):** A second-generation Su-25T, the Su-25TM (also designated Su-39), has been developed with improved navigation and attack systems, and better survivability. While retaining the built-in Shkval of Su-25T, it may carry Kopyo (rus. "Spear") radar in the container under fuselage, which is used for engaging air targets (with RVV-AE/R-77 missiles) as well as ships (with Kh-31 and Kh-35 antiship missiles). The Russian Air Force has received 8 aircraft as of 2008. Some of the improved avionics systems designed for T and TM variants have been included in the Su-25SM, an interim upgrade of the operational Russian Air Force Su-25, for improved survivability and combat capability. The Su-25TM, as an all-inclusive upgrade programme has been replaced with the "affordable" Su-25SM programme.
- **Su-25SM:** The Su-25SM (Stroyevoy Modernizirovannyi) is an "affordable" upgrade programme for the Su-25, conceived by the Russian Air Force in 2000. The programme stems from the attempted Su-25T and Su-25TM upgrades, which were evaluated and labeled as over-sophisticated and expensive. The SM upgrade incorporates avionics enhancements and airframe refurbishment to extend the Frogfoot's service life by up to 500 flight hours or 5 years. The Su-25SM's all-new PRnK-25SM "Bars" navigation/attack suite is built around the BTsVM-90 digital computer system, originally planned for the Su-25TM upgrade programme. Navigation and attack precision provided by the new suite is three times better of the baseline Su-25 and is reported to be within 15 m (49 ft) using satellite correction and 200 m (660 ft) without it.
- **Su-25KM:** The Su-25KM (Kommercheskiy Modernizirovannyy), nicknamed "Scorpion", is an Su-25 upgrade programme announced in early 2001 by the original manufacturer, Tbilisi Aircraft Manufacturing in Georgia, in partnership with Elbit Systems of Israel. The prototype aircraft made its maiden flight on 18 April 2001 at Tbilisi in full Georgian Air Force markings. The aircraft uses a standard Su-25 airframe, enhanced with advanced avionics including a glass cockpit, digital map generator, helmet-mounted display, computerised weapons system, complete mission pre-plan capability, and fully redundant backup modes. Performance enhancements include a highly accurate navigation system, pinpoint weapon delivery systems, all-weather and day/night performance, NATO compatibility, state-of-the art safety and survivability features, and advanced onboard debriefing capabilities complying with international requirements. It has the ability to use Mark 82 and Mark 83 laser-guided bombs and air-to-air missiles, the short-range Vympel R-73.
- **Su-28:** The Sukhoi Su-28 (also designated Su-25UT – Uchebno-Trenirovochnyy) is an advanced basic jet trainer, built on the basis of the Su-25UB as a private initiative by the Sukhoi Design Bureau. The Su-28 is a light aircraft designed to replace the Czechoslovak Aero L-39 Albatros. Unlike the basic Su-25UB, it lacks a weapons-control system, built-in cannon, weapons hardpoints, and engine armour.
- **Su-25R (Razvedchik):** a tactical reconnaissance variant designed in 1978, but never built.
- **Su-25U3:** also known as the "Russian Troika", was a three-seat basic trainer aircraft. The project was suspended in 1991 due to lack of funding.
- **Su-25U (Uchebnyy):** a trainer variant of Su-25s produced in Georgia between 1996 and 1998. Three aircraft were built in total, all for the Georgian Air Force.
- **Su-25M1/Su-25UBM1:** Su-25 and Su-25UB exemplars slightly modernized by Ukrainian Air Force, at least nine modernized (eight single-seat and one two-seat). Upgrades include a new navigation system, enhanced survivability, more accurate weapon delivery and other minor changes
- **Ge-31:** is an ongoing Georgian program of Tbilisi Aircraft Manufacturing aiming at producing a renewed version of Su-25 without Russian components and parts.

System

Alternate Designation(s): Su-39; NATO: Frogfoot; (also known as the Su-25T or Su-25TM)
Primary Function / Type: Attack Aircraft

Manufacturer: Sukhoi

Crew: 1

Number of Engines: 2

Number of Hard Points: 11 hardpoints with a capacity of up to 4,400 kg (9,700 lb) of stores

Dimensions

Length: 15.33 m

Height: 5.20 m

Wingspan: 14.52 m

Wing Area: 30.10 m sq

Wing Load: 716.7 kg/m sq

Weight, Empty: 10,600 kg

Weight, Maximum Takeoff: 21,500 kg

Automotive

Engine Name: 2 x R-195

Number of Engines: 2

Engine Type: Turbojet

Engine Power: 9,920 lb (4,500 kg) each

Thrust-to-Weight Ratio: 1.38

Internal Fuel: 1,292 U.S. gal (4,890 liters)

Maximum SPeed: 950 km/h

Cruise Speed: 650 km/h

Ceiling: 18,000 m

Radius: 900 km

Ferry Distance: 2,500 km

Takeoff Roll, Concrete Runway: 600 m

Takeoff Roll, Unpaved Runway: 650 m

Landing Roll, Concrete Runway: 600 m

Landing Roll, Unpaved Runway: 750 m

Maximum G-Load: 6.5 g

Main Gun System

↳***System***

Name: Gryazev-Shipunov GSh-30-2

Type: Autocannon

Caliber: 30mm

Quantity: 1

Length: 2,044 mm

Weight: 105 kg

Barrels: 2

Action: Recoil operated

Rate of Fire: 1,000-3,000 rpm

Muzzle Velocity: 870 m/s

Maximum Firing Range: 1,800m

↳*Ammunition*

Type: Rifle

Caliber: 30mm

Shell: 30×165mm

Basic Load: 200 rounds

Missile Weapon Systems

Armament Load: 6,000 kg

Missile Options: R-27T, R-27ER, AAM-M, R-73E, S-25L, X-31(A), X-25(ML), X-29, Vikhr (up to 16 max), ASM-M, ASM-M2, S-8, S-13, S-25, X-31P, X-58UE

↳*Missile #1*

Name: R-27T/Alamo B; AA-10b

Type: Air-to-Air Missile

Manufacturer: Spetzetekhnika Vympel NPO, Moscow, Russia, in cooperation with Artem, Ukraine

Length: 3.70 m

DIameter: 230 mm

Wingspan: 0.77 m

Weight: 245 kg

Warhead: Conventional high-explosive wrapped by rods

Control Plane Span: 0.97 m

Propulsion: single-stage boost motor

Maximum Speed: supersonic

Maximum Range: 65 km

Guidance System: IR-cooled seeker, all-aspect capability, flare countermeasure filters; semi-active radar J band, CW monopulse seeker; ARM J band, passive IR homing, passive radar seeker

↳*Missile #2*

Name: R-27ER/Alamo C; AA-10c

Type: Air-to-Air Missile

Manufacturer: Spetzetekhnika Vympel NPO, Moscow, Russia, in cooperation with Artem, Ukraine

Length: 4.78 m

DIameter: 260 mm

Wingspan: 0.80 m

Weight: 350 kg

Warhead: 39 kg

Control Plane Span: 0.97 m

Propulsion: single-stage boost motor and sustainer engine

Maximum Speed: supersonic

Maximum Range: 60-63 km

Guidance System: IR-cooled seeker, all-aspect capability, flare countermeasure filters; semi-active radar J band, CW monopulse seeker; ARM J band, passive IR homing, passive radar seeker

↳***Missile #3***

Name: R-73E

Type: Air-to-Air Missile

Length: 2.90 m

Diameter: 170 mm

Wingspan: 0.51 m

Maximum Launch Distance, Front Hemisphere: 30 km

Maximum Launch Distance, Rear Hemisphere: 300 m

Maximum Range: 30 km

Minimum Range: 200 m

Maximum Target Speed: 2,500 km/h, Mach 2.35

Maximum Target Load: 12 g

Warhead: conventional high-explosive expanding rod

Guidance System: cooled IR seeker, probably with all-aspect capability, flare countermeasure filters

Bomb Weapon Systems

Bomb Options: AB-100, AB-250, AB-500, FB-500, RBK-250, RBK-500,KGM-U munitions pods, KAB-500R, BETAB-500

↳***Bomb #1***

Name: BETAB-500

Type: Concrete-Piercing Bomb

Length: 2,200 mm

Diameter: 350 mm

Weight: 477 kg

Explosive Weight: 98 kg

Release Altitude: 30–5,000 m

Release Speed: 600–1,200 km/h

↳***Bomb #2***

Name: RBK-250

Type: Cluster Bomb

Manufacturer: VO GED (General Export for Defense), Moscow, Russia Bazalt State Research and Production Enterprise, Moscow, Russia

Length: 2.12 m

Diameter: 325 mm

Lug Spacing: 250 mm

Weight: 275 kg

Warhead: HE Bomblets

Fuzes: INA

Fire Control / Avionics

Fire Control System Type: INA

Fire Control Radar: 1 x coherent-pulse RLPK Kopyu-25 radar

Fire Control Radar Band: 3-cm band, including cartographic mapping mode

Laser Desingator: INA

IFF: Yes

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: INA

Electronic Recon: SRTR, 1.2-18 GHz range

Chaffs/Flares: INA

Active Jammer: deflecting, noise, scintillating and re-targeting countermeasures, automatic

Optronic Jammer: amplitude-frequency modulation interference against infrared (IR) seekers

IR Decoys: 192 projectiles

Aircraft Decoys: used to detect and deceive enemy air defense systems

Notes:

The Su-39 Frogfoot** is a derivative of the Su-25 Frogfoot **. It resulted in part from the lessons learned in combat by the Su-25 in Afghanistan. However, significant changes have been made not only in capabilities, but also in performance, making it

effectively a different aircraft. The Su-39 (also known as the Su-25T or Su-25TM) is a Frogfoot variant incorporating post-Afghanistan lessons-learned. Considering the combat experience of using the attack aircraft, the Su-25 modification conception was designed and implemented, and realized in Su-39 attack airplane. The conception provided the extension of its combat functions, and high level of effectiveness in achieving the main purpose destruction of single mobile targets of "tank", "armored troop-carrier" and "ship" types. In 1976 Design Bureau started work to produce a "tank buster" version of the attack aircraft Su-25T (T-8M) designed for antitank warfare. In the course of subsequent work, efforts were focused on making the plane capable of round-the-clock deployment. With this end in view, it was equipped with a highly automated electro-optical aiming system Shkval and a sophisticated antitank weapons system Vikhr. The first flight on the prototype aeroplane, T8M-1, was performed on 17th August 1984 by the design bureau's test pilot A.N. Isakov. In the period 1984-87, the three prototype planes were used to perform flight development tests, and official testing of the aeroplane took place in 1988-92. In 1989-91, Tbilisi produced a development batch of planes, with the first production Su-25T flight tested at the plant on 26th July 1990 by test pilot V.P. Korostiyev. At the beginning of the '90s, NPK Shturmoviki Sukhogo, or the Sukhoi Attack Aircraft Research-and-Production Facility, attempted to launch a project to develop a Su-25T-based attack aircraft under the name of Su-39. The Ulan-Ude factory put in place production arrangements and made first two pre-production planes. The Su-39 (also known as the Su-25T or Su-25TM) is a Frogfoot variant incorporating post-Afghanistan lessons-learned. It is based on the Su-25UB two-seat trainder, with the rear seat and cockpit replaced with a fuel cell and extra avionics. The Su-39 carries the Kopyo-25 multi mode radar in a pod under the fuselage. Armament includes ground attack missiles such as the AT-16 Vikhr , anti-ship missiles, and AAMs such as the R-27, R-27ER, R-60, R-73 and R-77. A four-fold reduction in thermal signature has been achieved through cooling intakes on the upper surface of aircraft, and a new center body which masks hot turbine blades. Only a few dozen of these aircraft have been built.

Su-24 (Fencer) Russian Attack Aircraft

Tiers:

Variants:

- **SU-24M/-24MK/FENCER D:** GROUND ATTACK VERSION AND EXPORT MODEL.
- **SU-24MK/FENCER D MODERNIZED:** CURRENTLY MARKETED GROUND ATTACK VARIANT HAS UPGRADES SUCH ASILS-31 HEADS-UP DISPLAY COMPUTER GPS FCS, DIGITAL MAP DISPLAY, KS-418E RADAR JAMMER PODS, AND ACCESS TO RECENT MISSILES (E.G., AS-13, AS-17, S-25LD LASER DESIGNATED ROCKETS AND AA-11 AAM).
- **SU-24MR/FENCER E:** RECONNAISSANCE VARIANT FOR MISSIONS TO 400 KM, WITH BKR-1SENSOR SUITE: A-100 SERIES AND AP- 402M CAMERAS, AIST-MTV CAMERA, SHPIL-2M LASER RADAR SYSTEM, ZIMA IR CAMERA, AND SHTIK SIDE-LOOKING RADAR (24 KM RANGE, 5M ACCURACY).SYSTEM CAN OPERATE DAY OR NIGHT. THE BOK-2 ECM SYSTEM IS USED. OPTIONS INCLUDE EFIR-1M RADIATION DETECTION POD, KADR FILM DROP SYSTEM, AND TANGAZH ELINT POD. DATA OTHER THAN OPTICAL IS TRANSMITTED DIGITALLY. ANOTHER OPTION IS 2 XAA-8/APHID ASMS.
- **SU-24MP/FENCER F:** ELECTRONIC WARFARE/ JAMMING/SIGINT VARIANT. BUKET SERIES JAMMERS ARE AKA SPS-22, -33, -44, OR -55.FASOL SERIES (SPS-5, -5M AND -5- 2X) RADAR NOISE JAMMERS ARE AVAILABLE. GERAN (SPS-161 OR GERAN F) IS A 2ND GENACTIVE JAMMER. GERAN/SPS-162 JAMS 6-12 GHZ, WITH 100 KW. ARMAMENT INCLUDES 23-MM GUN AND (OPTIONAL) 4 X AA- 8 ASMS

System

Alternative Designations: See Variants
Description: All-weather attack aircraft/Interdictor
Crew (pilot, weapons operator): 2
Engines 17,200-shp Lyluka AL- 21F-3A turbojet (24,700-shp with afterburner): 2

↳*Weapon & Ammunition Types*

23-mm 6x barrel Gsh-23 cannon (rnds): 250
Other Loading Options: 2

↳*TN1000 or TN11200 nuclear weapons*

100-kg FAB-100 bombs: 38
TV or laser-guided bombs: 4
AS-7/KERRY ASM: 1

↳*S-25LD 266-mm precision rockets*

Gun pods: 3

AA-8/APHID or AA-11 AAM: 2

External fuel tanks (liters): 2,000 – 3,000

↳*Weight (kg)*

Maximum Gross: kg39,700

Normal Takeoff: kg35,910

Empty: kg22,320

↳*Speed (km/h)*

Maximum (at altitude): km/h2,320

Maximum (sea level): km/h1,530

Maximum Attack Speed: km/h1,200

Cruise: INA

Takeoff/Landing Speed: INA

Max “G” Force: g+6.5 g

↳*Ceiling (m)*

Service (clean): m17,500

With External Stores: mINA

Vertical Climb Rate (m/s): m/s150

↳*Fuel (liters)*

Internal: l11,760

External: l8,000

↳*Range (km)*

Maximum Load: km940

With Aux Fuel: km1,230

Combat Radius: km950

↳*Takeoff Run/Landing Roll (m)*

Prepared Surface: m1,100-1,200/950

↳*Dimensions (m)*

Length: m24.6

↳*Wingspan*

Extended: m17.6

Swept: m10.4

Height (gear extended): m6.2

↳*Standard Payload (kg)*

External: kg8,000
Hardpoints underwing: 9

↳*Survivability/Countermeasures*

Pressurized cockpit with zero/zero ejection seats: Yes
Infrared and radar jammer: Yes
Radar and missile warning Receivers: Yes
Chaff and Flares: Yes

Armament

↳*23-mm 6x barrel Gatling gun, Gsh-6-23*

Range (practical): m2,500
Elevation/Traverse (rigid mount): None
Ammo Type: HEFI
Rate of Fire: rpm9,000

Avionics/Sensor/Optics

Integrated navigation and fire control radars: Yes
Pulse-doppler terrain following radar coupled to autopilot: Yes
Laser/TV targeting and weapon guidance: Yes
Night/Weather Capabilities: Yes

Notes:

The Sukhoi Su-24 (NATO reporting name: Fencer) is a supersonic, all-weather attack aircraft developed in the Soviet Union. The aircraft has a variable-sweep wing, twin-engines and a side-by-side seating arrangement for its crew of two. It was the first of the USSR's aircraft to carry an integrated digital navigation/attack system. It remains in service with the Russian Air Force, Syrian Air Force, Ukrainian Air Force, Azerbaijan Air Force and various air forces to which it was exported. The Su-24 has a shoulder-mounted variable geometry wing outboard of a relatively small fixed wing glove, swept at 69°. The wing has four sweep settings: 16° for take-off and landing, 35° and 45° for cruise at different altitudes, and 69° for minimum aspect ratio and wing area in low-level dashes. The variable geometry wing provides excellent STOL performance, allowing a landing speed of 230 kilometers per hour (140 mph), even lower than the Sukhoi Su-17 despite substantially greater take-off weight. Its high wing loading provides a stable low-level ride and minimal gust response. The Su-24 has two Saturn/Lyulka AL-21F-3A after-burning turbojet engines with 109.8 kN (24,700 lbf) thrust each, fed with air from two rectangular side mounted intakes with splitter plates/boundary-layer diverters. In early Su-24 ("Fencer A" according to NATO) aircraft these intakes had variable ramps, allowing a maximum speed of 2,320 kilometers per hour (1,440 mph), Mach 2.18, at altitude and a ceiling of 17,500 meters (57,400 ft). Because the Su-24 is used almost exclusively for low-level missions, the actuators for the variable intakes were deleted to reduce weight and maintenance. This has no effect on low-level performance, but absolute maximum speed and altitude are cut to Mach 1.35 and 11,000 meters (36,000 ft).[7] The earliest Su-24 had a box-like rear fuselage, which was soon changed in production to a rear exhaust shroud more closely shaped around the engines in order to reduce drag. The revised aircraft also gained three side-by-side antenna fairings in the nose, a repositioned braking chute, and a new ram-air inlet at the base of the tail fin. The revised aircraft were dubbed "Fencer-B" by NATO, but did not merit a new Soviet designation.

Su-25 Grach (Frogfoot) Russian Close Air Support Aircraft

Tiers:

Variants:

- **Su-25:** The basic version of the aircraft was produced at Factory 31, at Tbilisi, in the Soviet Republic of Georgia. Between 1978 and 1989, 582 single-seat Su-25s were produced in Georgia, not including aircraft produced under the Su-25K export program. This variant of the aircraft represents the backbone of the Russian Air Force's Su-25 fleet, currently the largest in the world. The aircraft experienced a number of accidents in operational service caused by system failures attributed to salvo firing of weapons. In the wake of these incidents, use of its main armament, the 240 mm S-24 rocket, was prohibited. In its place, the FAB-500 500 kg (1,100 lb) general-purpose high-explosive bomb became the primary armament.
- **Su-25K:** The basic Su-25 model was used as the basis for a commercial export variant, known as the Su-25K (Komercheskiy). This model was also built at Factory 31 in Tbilisi, Georgia. The aircraft differed from the Soviet Air Force version in certain minor details concerning internal equipment. A total of 180 Su-25K aircraft were built between 1984 and 1989.
- **Su-25UB:** The Su-25UB trainer (Uchebno-Boyevoy) was drawn up in 1977. The first prototype, called "T-8UB-1", was rolled out in July 1985 and its maiden flight was carried out at the Ulan-Ude factory airfield on 12 August of that year. By the end of 1986, 25 Su-25UBs had been produced at Ulan-Ude before the twin-seater completed its State trials and officially cleared for service with the Soviet Air Force. It was intended for training and evaluation flights of active-duty pilots, and for training pilot cadets at Soviet Air Force flying schools. The performance did not differ substantially from that of the single-seater. The navigation, attack, sighting devices and weapons-control systems of the two-seater enabled it to be used for both routine training and weapons-training missions.
- **Su-25UBK:** From 1986 to 1989, in parallel with the construction of the main Su-25UB combat training variant, the Ulan-Ude plant produced the so-called "commercial" Su-25UBK, intended for export to countries that bought the Su-25K, and with similar modifications to that aircraft.
- **Su-25UBM:** The Su-25UBM is a twin seat variant that can be used as an operational trainer, but also has attack capabilities, and can be used for reconnaissance, target designation and airborne control. Its first flight was on 6 December 2008 and it was certified in December 2010. It will enter operational use with the Russian Air Force later. The variant has a Phazotron NIIR Kopyo radar and Bars-2 equipment on board. Su-25UBM's range is believed to be 1,300 km (810 mi) and it may have protection against infra-red guided missiles (IRGM), a minimal requirement on today's battle fields where IRGMs proliferate.
- **Su-25UTG:** The Su-25UTG (Uchebno-Trenirovochnyy s Gakom) is a variant of the Su-25UB designed to train pilots in takeoff and landing on a land-based simulated carrier deck, with a sloping ski-jump section and arrester wires. The first one flew in September 1988, and approximately 10 were produced. About half remained in Russian service after 1991; they were used on Russia's sole aircraft carrier, Admiral Kuznetsov. This small number of aircraft were insufficient to meet the training needs of Russia's carrier air group, so a number of Su-25UBs were converted into Su-25UTGs. These aircraft being distinguished by the alternative designation Su-25UBP (Uchebno-Boyevoy Palubny)—the adjective

palubnyy meaning "deck", indicating that these aircraft have a naval function. Approximately 10 of these aircraft are currently operational in the Russian Navy as part of the 279th Naval Aviation Regiment.

- **Su-25BM:** The Su-25BM (Buksirovshchik Misheney) is a target-towing variant of the Su-25 whose development began in 1986. The prototype, designated T-8BM1, successfully flew for the first time on 22 March 1990, at Tbilisi. After completion of the test phase, the aircraft was put into production. The Su-25BM target-tower was designed to provide towed target facilities for training ground forces and naval personnel in ground-to-air or naval surface-to-air missile systems. It is powered by an R-195 engine and equipped with an RSDN-10 long-range navigation system, an analogue of the Western LORAN system.
- **Su-25T:** The Su-25T (Tankovy) is a dedicated antitank version, which has been combat-tested with notable success in Chechnya. The design of the aircraft is similar to the Su-25UB. The variant was converted to one-seater, with the rear seat replaced by additional avionics. It has all-weather and night attack capability. In addition to the full arsenal of weapons of the standard Su-25, the Su-25T can employ the KAB-500Kr TV-guided bomb and the semi-active laser-guided Kh-25ML. Its enlarged nosecone houses the Shkval optical TV and aiming system with the Prichal laser rangefinder and target designator. It can also carry Vikhr laser-guided, tube-launched missiles, which is its main antitank armament. For night operations, the low-light TV Merkuriy pod system can be carried under the fuselage. Three Su-25Ts prototypes were built in 1983–86 and 8 production aircraft were built in 1990. With the introduction of a definitive Russian Air Force Su-25 upgrade programme, in the form of Stroyevoy Modernizirovannyi, the Su-25T programme was officially canceled in 2000.
- **Su-25TM (Su-39):** A second-generation Su-25T, the Su-25TM (also designated Su-39), has been developed with improved navigation and attack systems, and better survivability. While retaining the built-in Shkval of Su-25T, it may carry Kopyo (rus. "Spear") radar in the container under fuselage, which is used for engaging air targets (with RVV-AE/R-77 missiles) as well as ships (with Kh-31 and Kh-35 antiship missiles). The Russian Air Force has received 8 aircraft as of 2008. Some of the improved avionics systems designed for T and TM variants have been included in the Su-25SM, an interim upgrade of the operational Russian Air Force Su-25, for improved survivability and combat capability. The Su-25TM, as an all-inclusive upgrade programme has been replaced with the "affordable" Su-25SM programme.
- **Su-25SM:** The Su-25SM (Stroyevoy Modernizirovannyi) is an "affordable" upgrade programme for the Su-25, conceived by the Russian Air Force in 2000. The programme stems from the attempted Su-25T and Su-25TM upgrades, which were evaluated and labeled as over-sophisticated and expensive. The SM upgrade incorporates avionics enhancements and airframe refurbishment to extend the Frogfoot's service life by up to 500 flight hours or 5 years. The Su-25SM's all-new PRnK-25SM "Bars" navigation/attack suite is built around the BTsVM-90 digital computer system, originally planned for the Su-25TM upgrade programme. Navigation and attack precision provided by the new suite is three times better of the baseline Su-25 and is reported to be within 15 m (49 ft) using satellite correction and 200 m (660 ft) without it.
- **Su-25KM:** The Su-25KM (Kommercheskiy Modernizirovannyy), nicknamed "Scorpion", is an Su-25 upgrade programme announced in early 2001 by the original manufacturer, Tbilisi Aircraft Manufacturing in Georgia, in partnership with Elbit Systems of Israel. The prototype aircraft made its maiden flight on 18 April 2001 at Tbilisi in full Georgian Air Force markings. The aircraft uses a standard Su-25 airframe, enhanced with advanced avionics including a glass cockpit, digital map generator, helmet-mounted display, computerised weapons system, complete mission pre-plan capability, and fully redundant backup modes. Performance enhancements include a highly accurate navigation system, pinpoint weapon delivery systems, all-weather and day/night performance, NATO compatibility, state-of-the art safety and survivability features, and advanced onboard debriefing capabilities complying with international requirements. It has the ability to use Mark 82 and Mark 83 laser-guided bombs and air-to-air missiles, the short-range Vympel R-73.
- **Su-28:** The Sukhoi Su-28 (also designated Su-25UT – Uchebno-Trenirovochnyy) is an advanced basic jet trainer, built on the basis of the Su-25UB as a private initiative by the Sukhoi Design Bureau. The Su-28 is a light aircraft designed to replace the Czechoslovak Aero L-39 Albatros. Unlike the basic Su-25UB, it lacks a weapons-control system, built-in cannon, weapons hardpoints, and engine armour.
- **Su-25R (Razvedchik):** a tactical reconnaissance variant designed in 1978, but never built.
- **Su-25U3:** also known as the "Russian Troika", was a three-seat basic trainer aircraft. The project was suspended in 1991 due to lack of funding.
- **Su-25U (Uchebnyy):** a trainer variant of Su-25s produced in Georgia between 1996 and 1998. Three aircraft were built in total, all for the Georgian Air Force.
- **Su-25M1/Su-25UBM1:** Su-25 and Su-25UB exemplars slightly modernized by Ukrainian Air Force, at least nine modernized (eight single-seat and one two-seat). Upgrades include a new navigation system, enhanced survivability, more accurate weapon delivery and other minor changes
- **Ge-31:** is an ongoing Georgian program of Tbilisi Aircraft Manufacturing aiming at producing a renewed version of Su-25 without Russian components and parts.

System

Alternate Designation(s): Su-25 Grach; NATO: Frogfoot

Primary Function / Type: Close Air Support Attack Aircraft

Manufacturer: Sukhoi

Crew: 1

Number of Engines: 2

Number of Hard Points: 11 hardpoints with a capacity of up to 4,400 kg (9,700 lb) of stores

:

Dimensions

Length: 15.53 m

Height: 4.80 m

Wingspan: 14.36 m

Wing Area: 33.70 m sq

Weight, Empty: 9,500 kg

Weight, Normal Takeoff: 14,600 kg

Weight, Maximum Takeoff: 17,600 kg

Weight, Maximum Overload: 19,200 kg

Maximum Weapon Load: 4,400 kg

Automotive

Engine Name: 2 x Ryzhov (Tumansky) R-95

Number of Engines: 2

Engine Type: Turbojet

Engine Power: 9,039 lb (4,100 kg) static thrust each

Fuel Capacity: 6,415 liters

Speed, Maximum Low Level: 970 km/h

Speed, Landing: 220 km/h

Takeoff Roll: 930 m with max payload

Landing Roll: 600 m

Rate of Climb: 4,320 m/min

Ceiling: 7,000 m

Turn Radius: 570 m with 3,307-lb (1,500-kg) payload at 4,921 ft (1,500 m) at 248 knots (286 mph, 460 km/h)

Maximum Range at Low Level: 405 nm (466 mi, 740 km) with 9,700-lb (4,400-kg) weapons load

Maximum Range at Altitude: 675 nm (777 mi, 1,250 km) with same load as above

Main Gun System

↳***System***

Name: Gryazev-Shipunov GSh-30-2

Type: Autocannon

Caliber: 30mm

Quantity: 1

Length: 2,044 mm

Weight: 105 kg

Barrels: 2

Action: Recoil operated

Rate of Fire: 1,000-3,000 rpm

Muzzle Velocity: 870 m/s

Maximum Firing Range: 1,800m

↳*Ammunition*

Type: Rifle

Caliber: 30mm

Shell: 30×165mm

Basic Load: 250 rounds

Main Missile Systems

Maximum Weapons Load: 4,400 kg

↳*Main Missile System #1*

Name: Kh-23 Grom; NATO: A S-7 Kerry

Type: Air-to-Air Missile

Manufacturer: Zvezda-Strela

Length: 3.525 m

Diameter: 27.5 cm

Wingspan: 78.5 cm

Weight: 287 kg

Warhead Weight: 111 kg

Engine: Solid fuel rocket

Operational Range: 2–10 km

Maximum Speed: 2,160–2,700 km/h

Guidance System: Radio command guidance

↳*Main Missile System #2*

Name: Kh-25; NATO: AS-10 Karen

Type: Air-to-Ground Missile

Manufacturer: Zvezda-Strela

Length: 370.5 cm

Diameter: 27.5 cm

Wingspan: 75.5 cm

Warhead: High explosive, shell-forming

Warhead Weight: 89.6 kg

Operational Range: 11 km

Maximum Speed: 1,370–2,410 km/h

Guidance System: Laser guidance, passive radar, TV guidance, IIR, Satellite guidance, active radar homing depending on varian

Rocket Weapon Systems

↳*Rocket Weapon System #1*

Name: S-8

Type: HEAT Rocket

Manufacturer: INA

Length: 1.56 m

Diameter: INA

Weight: 11.5 kg

Warhead Weight: 3.6 kg (0.9 kg of Hecphol-5/A-IX-10 explosive)

Effective Range: 1.3 to 4 km

Note: Basic variant. 350 mm versus RHA. Velocity 692 m/s. N-26A fuze. BIK-2D motor powder. During launch of this model may have black smoke.

Bomb Weapon Systems

↳*Bomb #1*

Name: BETAB-500

Type: Concrete-Piercing Bomb

Length: 2,200 mm

Diameter: 350 mm

Weight: 477 kg

Explosive Weight: 98 kg

Release Altitude: 30–5,000 m

Release Speed: 600–1,200 km/h

Fire Control / Avionics

Fire Control System Type: INA

Fire Control Radar: INA

Laser Desingator: INA

IFF: Yes

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The Su-25, which is no longer in serial production, made its first flight in 1979. This single seat ground attack aircraft is a very durable airplane - it is fairly heavily armored -- and easy to service - all service equipment can be stored in a container and transported by the airplane itself. It is armed with one twin barrel 30mm gun in the bottom of the fuselage with 250 rounds. There are 8 pylons under the wings which can carry about 4,000 kg of air-to-ground weapons, including 57mm to 330mm rockets. There are two small outboard pylons for AA-2D/ATOLL or AA-8/APHID AAMs. The wings are high-mounted and back-tapered with straight trailing edges. There are pods mounted at the square tips. There are two turbojets mounted alongside the body under the wings. There are semicircular air intakes forward of the wings' leading edges. There are exhausts to the rear of the wings' trailing edges. The fuselage is long, and slender and has a rounded nose. The body tapers to the rear section that overhangs the exhausts. There is a stepped canopy. The tail is swept-back and fin is tapered with a square tip. The flats mid-mounted on the fuselage, unequally tapered with blunt tips. The Sukhoi Su-25 Grach (Russian: Грач (rook); NATO reporting name: Frogfoot) is a single-seat, twin-engine jet aircraft developed in the Soviet Union by Sukhoi. It was designed to provide close air support for the Soviet Ground Forces. The first prototype made its maiden flight on 22 February 1975. After testing, the aircraft went into series production in 1978 at Tbilisi in the Georgian Soviet Socialist Republic. Early variants included the Su-25UB two-seat trainer, the Su-25BM for target-towing, and the Su-25K for export customers. Some aircraft were being upgraded to Su-25SM standard in 2012. The Su-25T and the Su-25TM (also known as the Su-39) were further developments, not produced in significant numbers. The Su-25, and the Su-34, were the only armoured, fixed-wing aircraft in production in 2007. Su-25s are in service with Russia, other CIS members, and export customers. The type has seen combat in several conflicts during its more than 30 years in service. It was heavily involved in the Soviet–Afghan War, flying counter-insurgency missions against the Mujahideen. The Iraqi Air Force employed Su-25s against Iran during the 1980–88 Iran–Iraq War. Most were later destroyed or flown to Iran in the 1991 Persian Gulf War. The Georgian Air Force used Su-25s during the Abkhazia War from 1992 to 1993. The Macedonian Air Force used Su-25s against Albanian insurgents in the 2001 Macedonia conflict and, in 2008, Georgia and Russia both used Su-25s in the Russo-Georgian War. African states, including the Ivory Coast, Chad, and Sudan have used the Su-25 in local insurgencies and civil wars. Recently the Su-25 has seen service in the Russian intervention in the Syrian Civil War.

Q-5/A-5 (Fantan) Chinese Ground-Attack Aircraft

Tiers:

Variants:

- **Q-5:** Original production version with a total of 6 pylons, two under each wing and two under the fuselage, and was superseded by the Q-5A.
- **Q-5Jia:** Q-5 modified to carry nuclear bombs, only a very limited number were built. 317Jia radar was tested as improvement program. One of such aircraft is currently on display at the aviation museum in Beijing.
- **Q-5Yi:** Torpedo attacker for navy, only few manufactured. YJ-8 anti-ship missile was also being considered, but the program was cancelled due to budget problem even though the missile was well developed, and afterwards missile test launches were conducted from Type 24 missile boat. In eighties, YJ-81 was once mounted for test, but this proposition was soon rejected when it was decided to let JH-7 take the role.
- **Q-5I(Q-5A):** Q-5 with the internal weapon bay replaced by internal fuel tank, increasing fuel capacity over 70%. Like all previous Q-5 variants, navigation was still a bottle neck with the result being that aircraft must fly longer times in more complex search patterns in long range strikes. However, this problem is somewhat reduced by the increased fuel capacity. An indigenous Type 79Y4 laser rangefinder developed by No. 613 Institute was fitted.
- **Q-5IA(Q-5B):** Improved Q-5I, radar warning receiver and flare dispensers added, the original weapon aiming sight of the Q-5 was developed by No. 5311 Factory, and named as SH-1, short for She – Hong (Shoot-Bomb-1 / □□-1), which only had limited capability because attacks could only be carried out at a fixed angle. No. 5311 Factory developed an improved version SH-1I (□□-1□) to allow the attack to be carried out at different angles. Extra outer pylon under each wing added for PL-2/PL-5 air-to-air missiles, bombs or rocket launchers.
- **Q-5II(Q-5C):** Q-5I with omnidirectional radar warning receivers. Later, Type 205 pulse doppler navigation radar was installed on several planes to solve the navigation problem.
- **Q-5III:** Foreign trade variant, export name A-5III/A-5C□ Project Long6(Dragon Six). Total 10 pylons, with 1 extra pylon under each wing for R-550/AIM-9 air-to-air missiles. See also Export variants.
- **Q-5 with indigenous nav/attack system:** Project CC, Q-5I with indigenous Type 205 doppler navigation system, Q5HK-15 laser rangefinder and SH-1IIA sight. One year later, head-up display and air data computer were incorporated into system. The whole system finally got approved in 1992, and relevant technology was applied to Q-5D several years later.
- **Q-5IV(Q-5M, Q-5D(old):** Project CI. Joint Chinese-Italian project to upgrade the Q-5II with Italian avionics from the AMX International AMX attack fighter. Avionics would include a ranging radar, head-up display, inertial navigation system, air data computer and dual central computers all integrated via dual-redundant MIL-STD-1553B databus.
- **Q-5D(C):** Composite material demonstrator for Q-5D(old).
- **Q-5IIGai(Q-5K, Q-5E(old):** Project CF, joint Chinese-French project to upgrade Q-5II with French avionics, such as VE110 head-Up Display, ULIS91 inertial navigation system, TMV630 laser rangefinder and other electro-optics. Like the Q-5M/A-5M, the project was cancelled after the Tiananmen Square protest of 1989. So some indigenous equipment such as doppler radar, jammer etc., were used to achieve further progress. It was terminated in 1993.

- **Q-5D:** Interim attack aircraft introduced during the 1996 Taiwan Strait Crisis, the separate doppler navigation system and GPS of the Q-5C was replaced by the DG-1 integrated doppler navigation/GPS system. Other systems included the ALR-1 Laser rangefinder/Marked Target seeker and QHK-10 Head-Up Display. A new weapon aiming sight, the SH-1II (□□-1□), replaced the older SH-1I (□□-1□), and No. 5311 Factory managed to successfully integrate this sight with the new laser rangefinder and Type 205 navigation radar.
- **Q-5E:** New pylon with ability to mount laser-guided bombs such as LS-500J LGB, fire control system also improved. Laser pod is absent from the plane due to weight issue.
- **Q-5F:** Laser designator pod carrier, special large belly right pylon mounted for laser targeting pod, which is always false recognized as semi-buried electro-optical targeting pod.
- **Q-5G:** Q-5E with belly conformal fuel tank to solve the range problem.
- **JQ-5J:** Tandem two seater of Q-5. The manufacturer claimed that it can be used as forward air control like the OA-10A, and providing targeting information via data links. The rear seat is 286 millimetres higher than the front seat, enables the back-seat pilot to have a 5 degree field of vision, and the canopy opens to the right. When used as a trainer, the rear cockpit control can override that of the front cockpit.
- **Q-5L:** Upgraded Q-5C, with LLLTV/FLIR vision systems for a day/night capability. Infrared imaging and television cameras were mounted on nose orb. Other improvements include Head Up Display, GPS Rx, INS, TACAN, and chaff/flare dispensers. Weapons capability include the Chinese LS-500J laser-guided glide bombs with a 12 km range. Optional belly conformal fuel tank.
- **Q-5N:** Upgraded Q-5D with same upgrade program as Q-5L, main difference is navigation system of Q-5D.
- **A-5:** Export designation for version of the Q-5 to North Korea in 70's that appeared in Chinese media. The designation contains more than one variant since the Chinese military aid to North Korea is protracted, but it's not clear whether this export version is derived from Q-5, Q-5A, Q-5I or Q-5IA.
- **A-5IIA:** Modified version of Q-5II, sold to Sudan.
- **A-5IIK:** Export version of Q-5II sold to Myanmar.
- **A-5III/A-5C:** Export version with western equipment upon customers' requests, such as flight instrumentation made by Rockwell Collins, and western ejection seat made by Martin-Baker. Added the capability to fire western missiles such as the R550 Magic or AIM-9 Sidewinder. Exported to Pakistan.
- **A-5IIIA:** Exported to Bangladesh. Bangladesh Air Force's A-5Cs have been upgraded in 2008 to fire LS-6 and LT-2 ground attack munitions giving them advanced strike capability.
- **A-5IV/A-5M:** Export version of Q-5M with more western equipment such as flight instrumentation made by Rockwell Collins, and western ejection seat made by Martin-Baker. Added the capability to fire western missiles such as the R550 Magic or AIM-9 Sidewinder. Myanmar ordered, but chose IIK instead after program extension. Evaluated by the Pakistan Air Force in 1990.

System

Alternate Designation(s): Q-5; A-5 (Export Version)
Primary Function / Type: Ground-Attack Aircraft
Manufacturer: Nanchang Aircraft Mfg. Co.
Crew: 1
Number of Engines: 2
Number of Hard Points: 10 (4× under-fuselage, 6× under-wing) with a capacity of 2,000 kg (4,400 lb),
Hardpoints External Maximum Load: 2,000 kg

Dimensions

Length: 15.65 m
Width (Wing Span): 9.68 m
Height: 4.33 m
Wing Area: 27.95 m2
Empty Weight: 6,375 kg
Gross Weight: 9,486 kg
Max Takeoff Weight: 11,830 kg

Automotive

Engine Name: 2 × Liming Wopen-6A aftertburning turbojet engines
Number of Engines: 2
Engine Power: 29.42 kN (6,610 lbf) thrust each dry, 36.78 kN (8,270 lbf) with afterburner
Maximum Range: 2,000 km
Maximum Speed: 1,210.23 km/h
Service Ceiling: 15,840 m
Internal Fuel Capacity: 3,648 liters
External Fuel Capacity: 760 liters

Communications

VHF Radio: AR-3201/CT-3 VHF
HF Radio: HF/SSB transceiver

Gun Weapon System

↳*System*

Name: 2 x Nudelman-Rikhter NR-23 Autocannons
Type: Autocannon
Location: 2 x internal Norinco 23-2K 23-mm, one per wing
Caliber: mm23
Length: 1,980 mm
Barrel Length: 1,450 mm
Width: 165 mm
Height: 136 mm
Weight: 39 kg
Barrels: 1
Action: Short recoil
Rate of Fire: 800–850 rpm
Muzzle Velocity: 690 m/s
Maximum Firing Range: INA

↳*Ammunition*

Type: Autocannon
Caliber: 23
Shell: 23×115 mm
Basic Load: 100 rounds each

Rocket Weapon Systems

Rocket Pod (Option #1): 2 x 8-round 57-mm Rocket Pod

Rocket Pod (Option #2): 2 x 8-round 68-mm Rocket Pod

Rocket Pod (Option #3): 2 x 7-round 90-mm Rocket Pod

Missile Weapon Systems

↳*Missile System #1*

Name: PL-2

Type: Air-to-Air Missile

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC)

Length: 2.15 to 2.99 meter

Diameter: 127 mm

Wingspan: 528 to 609 mm

Weight: 60 to 152.3 kg

Warhead: 11.3 kg high explosive

Detonation Mechanism: Impact / Proximity

Engine: rocket 2668dN

Propellant: solid fuel

Operational Range: 6 to 10 km

Flight Ceiling: 15 to 21.5 km

Maximum Speed: Mach 1.6 to 2.5

Guidance System: Nitrogen cooled passive InPb infrared seeker

↳*Missile System #2*

Name: PL-2B

Type: Air-to-Air Missile

Note: The PL-2B is a variant of the PL-2, which is the result of a 1976 improvement program. There is upgraded guidance and an early infrared fuze.

↳*Missile System #3*

Name: PL-7

Type: Air-to-Air Missile

Manufacturer: Factory 331 (Zhuzhou Aeroengine factory)

Length: 2.74 m

Diameter: 157 mm

Wingspan: 0.66 m

Weight: 89 kg

Warhead: 12.5 kg

Speed: Mach 2.5

Range: 0.5 to 14 km

Guidance: Infrared homing

Bombs Weapon Systems

Bomb (Option #1): Durandal anti-runway

Bomb (Option #2): BL755 cluster

Bomb (Option #3): 5-20 kiloton nuclear

Fire Control / Avionics

Navigation: Litton LN-39A inertial system

Computer: 2 x Singer digital

Databus: dual-redundant 1553B

Ranging Radar: Pointer 2500

HUD: Alenia

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: Yes

Anti-Threat Computer: RWR, ECM

Notes:

The Nanchang Q-5 (Chinese: □-5; pinyin: Qiang-5; NATO reporting name: Fantan), also known as the A-5 in its export versions, is a Chinese-built single seat, twin jet engine ground-attack aircraft based off of the Soviet MiG-19. However, the aircraft is primarily used for close air support. The PRC was an enthusiastic user of the MiG-19, which it manufactured locally as the Shenyang J-6 from 1958. In August 1958 the People's Liberation Army requested development of a jet attack aircraft for the air support role. Lu Xiaopeng was appointed chief designer of this project. Lu also designed the J-12 fighter jet. Although based on the MiG-19, the new design, designated Qiangjiji-5 (fifth attack aircraft design), had a longer fuselage, area ruled to reduce transonic drag and accommodate a 4 m (13-ft) long internal weapons bay. The air intakes were moved to the fuselage sides to make space in the nose for a planned target radar (which was never actually fitted). New wings with greater area and reduced sweep were incorporated. The Q-5 shares the J-6's Liming Wopen WP-6 A (Tumansky RD-9) turbojet engines. The redesign cost some high-altitude speed, but the Q-5 is as fast as the MiG-19/J-6 at low level, thanks largely to the area-ruled fuselage. Fixed armament of the Q-5 was reduced to two Type 23-1 23 mm cannon with 100 rounds per gun, mounted in the wing roots. Two pylons under each wing and two pairs of tandem pylons under the engines were provided in addition to the weapons bay. A total of 1,000 kg (2,205 lb) of ordnance could be carried internally, with an additional 1,000 kg externally. On many aircraft the weapons bay is now used primarily for an auxiliary fuel tank. Production drawings were completed in 1960 allowing construction of prototypes to begin, but the political climate in China resulted in the project being canceled in 1961. A small team kept the program alive until it work restarted in earnest at Nanchang.[4] The first flight finally occurred on 10 June 1965. Series production began in 1969, with squadron delivery starting in 1970. About 1,000 aircraft were produced, 600 of them being the updated Q-5A. A small number, perhaps a few dozen, Q-5As were modified to carry nuclear weapons; these are believed to retain their internal weapons bay. A long-range Q-5I, introduced in 1983, added a fuel tank instead of the internal

weapons bay, compensating for that with the provision of two additional underwing pylons. Some of these aircraft serve with the PLA Navy, and have apparently been equipped with radar to guide anti-ship missiles. Subsequent minor upgrades include the Q-5IA, with a new gun/bomb sighting system and avionics, and the Q-5II, with radar warning receiver (RWR). In the 1980s, the aircraft was exported to nations such as Pakistan, Bangladesh, Myanmar, and is often known as the A-5 in those nations. Plans for an upgraded Q-5/A-5 with Western equipment and new navigation and attack (nav/attack) systems were largely aborted following the Tiananmen Square protests of 1989, but the aircraft continues in service. It is a capable light attack aircraft, although its limited navigation and weapons-delivery systems are inferior to more modern aircraft. In more recent years, the PLAAF has begun to field newer models of the Q-5, that incorporate some of the technology developed during the canceled Q-5M and Q-5K projects. The Q-5 introduces a nose-mounted laser rangefinder, and a laser designator is also likely to be fitted since the aircraft is said to be able to deliver laser-guided bombs. The Q-5A variant is believed to be capable of delivering nuclear munitions. The Q-5D is an upgrade with new avionics, including a HUD and a new navigation system. The Q-5E and Q-5F models are reportedly being worked on, though little is known about them at this time. One of them could potentially be the new two-seater that has been seen in a few photographs, although the two-seater could bear the designation Q-5J.

MiG-31 (Foxhound) Russian Attack Aircraft

Tiers:

System

Alternative Designations: MiG-31;
Crew: 2
Takeoff Run/Landing Roll (m): 1,200/800

NOTES

Description: THE MIG-31 IS AN ALL-WEATHER, TWO-SEAT INTERCEPTOR WITH ADVANCED DIGITAL AVIONICS. IT WAS THE FIRST SOVIET FIGHTER TO HAVE A TRUE LOOK-DOWN, SHOOT-DOWN CAPABILITY.

↳*APPEARANCE*

VARIANTS

Description: THE MIG-31 FOXHOUND IS A SUBSTANTIALLY IMPROVED DERIVATIVE OF THE MIG-25 FOXBAT.

↳*MIG-31 FOXHOUND-A INTERCEPTOR*

Description: ORIGINAL PRODUCTION VERSION.

↳*MIG-31B/BS/E FOXHOUND-A INTERCEPTOR*

Description: THE MIG-31B HAS FLASH DANCE A RADAR AND IMPROVED AA-9 AMOS AAMS, IN-FLIGHT REFUELING PROBE, AND NEW NAVIGATION SYSTEM.

↳*MIG-31BS*

Description: SIMILAR TO THE MIG-31B, WITH RADAR ENHANCEMENT AND A-723 NAVIGATION.

↳*MIG-31E*

Description: EXPORT VARIANT OF MIG-31B AIMED AT CHINA, INDIA, AND IRAN. NONE WERE SOLD.

↳*MIG-31BM/FE FOXHOUND-A MULTIROLE FIGHTER*

Description: MID-LIFE UPGRADE FOR INTERCEPTORS. FITTED WITH ASMS, UPGRADED RADAR AND AA-11 AND AA-12 AAMS.MIG-31FE IS EXPORT VARIANT.

↳*MIG-31M FOXHOUND-B MULTIROLE FIGHTER*

Description: UPGRADED LONG RANGE NAVIGATION SYSTEM AND IMPROVED PHASED ARRAY RADAR.

Notes:

The Mikoyan MiG-31 (Russian: Микоян МиГ-31; NATO reporting name: Foxhound) is a supersonic interceptor aircraft developed for use by the Soviet Air Forces. The aircraft was designed by the Mikoyan design bureau as a replacement for the earlier MiG-25 "Foxbat"; the MiG-31 is based on and shares design elements with the MiG-25. The MiG-31 has the distinction of being one of the fastest combat jets in the world. It continues to be operated by the Russian Air Force and the Kazakhstan Air Force following the end of the Cold War and the collapse of the Soviet Union in 1991. The Russian Defence Ministry expects the MiG-31 to remain in service until 2030 or beyond. Like the MiG-25, the MiG-31 is a large twin-engine aircraft with side-mounted air intake ramps, a shoulder-mounted wing with an aspect ratio of 2.94, and twin vertical tail fins. Unlike the MiG-25, it has two seats, with the rear occupied by a dedicated weapon systems officer. The MiG-31 is limited to five g when travelling at supersonic speeds. While flying under combat weight, its wing loading is marginal and its thrust-to-weight ratio is favorable. The MiG-31 is not designed for close combat or rapid turning. The wings and airframe of the MiG-31 are stronger than those of the MiG-25, permitting supersonic flight at low altitudes. Like the MiG-25, its flight surfaces are built primarily of nickel-steel alloy, enabling the aircraft to tolerate kinetic heating at airspeeds approaching Mach 3. The MiG-31 airframe comprises 49% arc-welded nickel steel, 33% light metal alloy, 16% titanium and 2% composites. Its D30-F6 jet engines, each rated at 152 kN thrust, allow a maximum speed of Mach 1.23 at low altitude. High-altitude speed is temperature-redlined to Mach 2.83 – the thrust-to-drag ratio is sufficient for speeds in excess of Mach 3, but such speeds pose unacceptable hazards to engine and airframe life in routine use.

Aero Albatros L-39 Czechoslovakian Light-Ground Attack Aircraft

Tiers:

Variants:

- **L-39X-01 – X-07:** Five prototypes plus two static test airframes.
- **L-39C (C for Cvičná – training):** Standard basic trainer for Soviet Union, Czechoslovakia and export. Originally designated L-39, but renamed L-39C when later variants appeared. Two pylons under wing. Approximately 2,260 built.
- **L-39CM (CM for Cvičná modernizovaná – modernised training):** Slovak upgraded C version.
- **L-39M1:** Ukrainian upgraded C version with AI-25TLSh engines. The conversion is carried out by Odesaviaremservis and the first plane was ready in 2009. The upgrade of a further 7 L-39C's was planned. Only six L-39C were converted into L-39M1 by 2014
- **L-39V (V for Vlečná – tug):** Single-seat target tug version for Czechoslovakia. Equipped to tow KT-04 target on 1,700 m (5,600 ft) cable. Prototype plus eight production aircraft built
- **L-39ZO (Z for Zbraně – weapons):** Interim weapon trainer variant for export. Four pylons stressed for 500 kg (1,100 lb) (inboard) and 250 kg (550 lb) (outboard), with total external load of 1,150 kg (2,500 lb).[21] First flew 25 June 1975, with initial deliveries to Iraq in 1977. 337 built
- **L-39ZA:** Significantly upgraded L-39ZO for armed training and light attack, employing sturdier landing gear, a higher payload (total 1,290 kg (2,844 lb)) and notably provision for a GSh-23L 23-millimeter twin-barreled cannon attached in a conformal pod under the pilots' compartment, having a 150-round magazine within the airframe. Outer pylons wired to carry K-13 or R-60 air-to-air missiles. Two prototypes, with first flying on 29 September 1976. 208 aircraft delivered.
- **L-39ZAM:** Slovak upgraded ZA version.
- **L-39ZA/ART:** Thai version of L-39ZA with Elbit avionics. 40 built.
- **L-39MS/L-59:** The Aero L-39MS is a second generation military trainer aircraft developed from the firm's earlier L-39. Compared to its predecessor, it featured a strengthened fuselage, longer nose, a vastly updated cockpit, and a more powerful (21.6 kN (4,850 lbf)) Lotarev DV-2 engine, allowing operation at higher weights and speeds (max speed 872 km/h (542 mph)). First flight on 30 September 1986. It was later designated as the Aero L-59.[
- **L-139 Albatros 2000:** Revised version with western avionics and 17.99 kN (4,045 lbf) Garrett TFE731-4-1T engine. Single prototype built.
- **L-159:** Further modernised advanced trainer/combat aircraft with more modern, western avionics and Honeywell/ITEC F124 engine
- **L-39NG:** Modernised and upgraded version with Williams FJ44 engine, improved fuel system and avionics, planned to be introduced in 2018.
- **Skyleader UL-39 Albi:** A carbon-fibre ducted-fan powered scale variant first flown in the Czech Republic on 4 April 2016

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The Aero L-39 Albatros is a high-performance jet trainer developed in Czechoslovakia by Aero Vodochody. It was designed during the 1960s as a replacement for the Aero L-29 Delfín as a principal training aircraft. It was the first trainer aircraft to be equipped with a turbofan powerplant. The type was exported to a wide range of countries as a military trainer. The L-39 Albatros later served as the basis for the updated L-59 Super Albatros, as well as the L-139 (prototype L-39 with Garrett TFE731 engine). A further development of the design, designated as the L-159 ALCA, entered production in 1997. To date, more than 2,800 L-39s have served with over 30 air forces around the world. The Albatros is the most widely used jet trainer in the world; in addition to performing basic and advanced pilot training, it has also flown combat missions in a light-attack role. The design never received a NATO reporting name. At the Farnborough Airshow in July 2014, Aero Vodochody announced the launch of the L-39NG, an upgraded and modernised version of the L-39. The L-39 Albatros was designed to be a cost-effective jet-powered trainer aircraft, which is also capable of performing ground attack missions. For operational flexibility, simplicity, and affordability, the majority of onboard systems have been simplified to avoid incurring high levels of maintenance, as well as to minimize damage caused by mishandling when flown by inexperienced air crew. It could be readily flown from austere airstrips such as frozen lake beds, enabled through the rugged design of the landing gear and favourable low landing speeds. The aircraft's flying qualities are reportedly simple, which is made easier by way of a rapid throttle response, making it easier for students who had never previously flown a jet aircraft before to successfully control. As a training platform, the L-39 itself comprised part of a comprehensive system which also used flight simulators and mobile ground test equipment. The low-set, straight wing has a double-taper planform, 2½-deg dihedral from the roots, a relatively low aspect ratio, and 100 litres (26 US gal; 22 imp gal) fuel tanks permanently attached to the wingtips. The trailing edge has double-slotted trailing edge flaps inboard of mass-balanced ailerons; the flaps are separated from the ailerons by small wing fences. An automatic trimming system was present, the flaps and the trim system being connected in order to counteract the potentially large pitch changes that would otherwise be generated by vigorous movements of the flaps. The tall, swept vertical tail has an inset rudder. Variable-incidence horizontal stabilizers with inset elevators are mounted at the base of the rudder and over the exhaust nozzle. Side-by-side airbrakes are located under the fuselage ahead of the wing's leading edge. The flaps, landing gear, wheel brakes and air brakes are powered by a hydraulic system. Controls are pushrod-actuated and have electrically powered servo tabs on the ailerons and rudder. Operational g-force limits at 4,200 kilograms (9,300 lb) are +8/-4 g. A long, pointed nose leads back to the tandem cockpit, in which the student and instructor sit on Czech-built VS-1 ejection seats under individual canopies, which are opened manually and are hinged on the right. The rear seat, typically used by the instructor, is elevated slightly to readily enable observation and guidance of the student's actions in the forward position. The design of the cockpit, panel layout and many of its fittings resemble or are identical in function to those of other commonly-used Soviet aircraft; for example, the procedure for deploying the ejection seat is exactly the same as for the Mikoyan MiG-29. The cockpit is highly pressurized, requiring the air crew to wear oxygen masks only when flying in excess of 23,000 feet. A gyro gunsight for weapon-aiming purposes is typically present in the forward position only. A single turbofan engine, an Ivchenko AI-25TL (made in the Soviet Union) is positioned in the rear fuselage, fed through shoulder-mounted, semi-circular air intakes (fitted with splitter plates) just behind the cockpit and the tailpipe below the horizontal tailplane. The engine has a time between overhaul (TBO) of 1,000 flight hours; however, it is allegedly cheaper than the majority of turbine engines to overhaul. Five rubber bag fuel tanks are located in the fuselage behind the cockpit. Several heavy radio units are typically installed in an aft avionics bay; these are often removed on civilian-operated aircraft and replaced with a 70-gallon fuel tank. Additional fuel tanks can be fitted in the rear cockpit position and externally underneath the wings; the tip-tanks can also be expanded for a greater fuel capacity. The aircraft is fitted with a hydraulically-actuated retractable nose wheel undercarriage which is designed to allow operation from grass airfields. The main landing gear legs retract inward into wing bays while the nose gear retracts forward. The basic L-39C trainer has provision for two underwing pylons for drop tanks or practice weapons, but these are not usually fitted. It can be armed with a pair of K-13 missiles to provide a basic air defense capability. Light-attack variants have four underwing hardpoints for ground attack stores, while the ZA variant also has an under fuselage gun pod. Mock UB-16 rocket pods can also be installed for visual appearance only.

Notes:

The Israel Aircraft Industries Kfir (Hebrew: כְּפִיר, "Lion Cub") is an Israeli-built all-weather multirole combat aircraft based on the French Dassault Mirage 5, with Israeli avionics and an Israeli-built version of the General Electric J79 turbojet engine. The Kfir programme originated in the quest to develop a more capable version of the IAI Nesher, which was already in series production. After General De Gaulle embargoed the sale of arms to Israel, the IAF feared that it might lose qualitative superiority over its adversaries in the future, which were receiving increasingly advanced Soviet aircraft. The main and most advanced type of aircraft available to the IAF was the Mirage, but a severe problem developed due to the Mirage fleet's depletion due to attrition after the Six-Day War. Domestic production would avoid the problem of the embargo completely; efforts to reverse engineer and reproduce components of the Mirage were aided by Israeli espionage efforts to obtain technical assistance and blueprints from third party Mirage operators. Two power plants were initially selected for trials, the General Electric J79 turbojet and the Rolls-Royce Spey turbofan. In the end, the J79 was selected, not least because it was the same engine used on the McDonnell Douglas F-4 Phantom II, which the Israelis began to acquire from the United States in 1969, along with a license to produce the J79 themselves. The J79 was clearly superior to the original French Atar 09, providing a dry thrust of 49 kN (11,000 lbf) and an afterburning thrust of 83.4 kN (18,750 lbf). In order to accommodate the new powerplant on the Mirage III's airframe, and to deliver the added cooling required by the J79, the aircraft's rear fuselage was slightly shortened and widened, its air intakes were enlarged, and a large air inlet was installed at the base of the vertical stabilizer, so as to supply the extra cooling needed for the afterburner. The engine itself was encased in a titanium heat shield. A two-seat Mirage IIIBJ fitted with the GE J79 made its first flight in September 1970, and was soon followed by a re-engined Nesher, which flew in September 1971. An improved prototype of the aircraft, with the name Ra'am B ("Ra'am" means "Thunder"; the "Ra'am A" was the Nesher),[6] made its first flight in June 1973. It had an extensively revised cockpit, a strengthened landing gear, and a considerable amount of Israeli-built avionics. The internal fuel tanks were slightly rearranged, their total capacity being increased to 713 US gal (2,700 l). There were unconfirmed reports that a number of the original Mirage IIICs, re-engined with the J79 and given the name Barak ("Lightning"), took part in the Yom Kippur War of 1973, but some sources point out that there is no evidence that these aircraft ever existed.

FTC-2000G Chinese Multi-Role Aircraft

Tiers:

Variants:

- **JL-9:** The JL-9 Shanying (Mountain Eagle) is a trainer aircraft based on the J-7 fighter. The aircraft has been competing against the JL-15 for China's next-generation trainer program.

System

Alternate Designation(s): FTC-2000G
Primary Function / Type: Multi-Role Aircraft
Manufacturer: Guizhou Aviation Industry Import/Export Company (GAIEC)
Crew: 2
Number of Engines: 1
Number of Hard Points: seven hard-points with a maximum payload of 3,000 kg.
Night-Flying Capabilities: Yes
Note: The jet can be equipped with reconnaissance or electronic warfare pods

Dimensions

Length: 14.555 m
Height: 4.105 m
Width (Wing Span): 8.32 m
Wing Area: 26.15 m2
Gross Weight: 7,800 kg
Maximum Takeoff Weight: 11,000 kg

Automotive

Engine Name: 1 x WP-13F(C)
Number of Engines: 1
Engine Type: Turbojet
Engine Power: Maximum thrust 4,400 kg Afterburner 6,450 kg

Fuel Capacity: Internal 2,660 liters, The aircraft can carry up to three fuel drop tanks under its wings.

Ferry Range: 2,500 km

Maximum Speed: Mach 1.6

Service Ceiling: 16,000 m

Maximum Climb: 260 m/s

G Limit: +8/-3

Main Gun System

Note: 23-mm cannon; Name: INA

Main Missile Systems

Note: typically 2x PL-8 AAMs on inboard pylons + 2x PL-9 AAMs on outboard pylons

Fire Control / Avionics

Fire Control Radar Name: Italian Grifo S-7 pulse-Doppler fire-control radar

Fire Control System Type: The aircraft is equipped with a Chinese pulse-Doppler fire-control radar

HUD: XPS-2 head-up display (HUD

Protection

Stealth Properties: None

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The FTC-2000 is a JJ-7/FT-7 with a new wing, a forward fuselage with side air intakes, and a glass cockpit. The engine, management, and mechanical controls of the JJ-7/FT-7 are retained. The FTC-2000G is a multi-role combat fighter aircraft and one of the cheapest multi role fighters on the market with the aim to replace old legacy fighters like the J-7/F-7. It has 7 hard-points. It also features a diverterless supersonic inlet. It made its first flight in September 2018. Compared to the FTC-2000 trainer variant, the FTC-2000G is heavier, slower due to new wing design, and has less endurance than the FTC-2000.

Su-30K Russian Multirole Fighter Aircraft

Tiers:

Description: VERSION OF THE SU-30MK MADE FOR INDIA. MOST WILL BE PRODUCED BY AN INDIAN FIRM. SOME WESTERN EQUIPMENT REPLACED MUCH OF THE RUSSIAN SYSTEMS.

↳*SU-30MKM*

Description: VERSION FOR USE BY MALAYSIA.

Notes:

Su-30K Export version of the Russian Su-30. India and Irkut renegotiated a deal that would have upgraded the first 18 Su-30K fighters to the Su-30MKI standard. The proposed agreement would limit the modernization to a replacement of the N-001Mech radar with the N-011M Bars and the addition of a glass cockpit with improved avionics. The Sukhoi Su-30 (Russian: Сухой Су-30; NATO reporting name: Flanker-C) is a twin-engine, two-seat supermaneuverable fighter aircraft developed in the Soviet Union by Russia's Sukhoi Aviation Corporation. It is a multirole fighter for all-weather, air-to-air and air-to-surface deep interdiction missions. The Su-30 started out as an internal development project in the Sukhoi Su-27 family by Sukhoi. The design plan was revamped and the name was made official by the Russian Defense Ministry in 1996. Of the Flanker family, the Su-27, Su-30, Su-33, Su-34 and Su-35 have been ordered into limited or serial production by the Defense Ministry. The Su-30 has two distinct version branches, manufactured by competing organisations: KnAAPO and the Irkut Corporation, both of which come under the Sukhoi group's umbrella. KnAAPO manufactures the Su-30MKK and the Su-30MK2, which were designed for and sold to China, and later Indonesia, Uganda, Venezuela, and Vietnam. Due to KnAAPO's involvement from the early stages of developing Su-35, these are basically a two-seat version of the mid-1990s Su-35. The Chinese chose an older but lighter radar so the canards could be omitted in return for increased payload. It is a fighter with both air supremacy and attack capabilities, generally similar to the U.S. F-15E Strike Eagle. Irkut traditionally served the Soviet Air Defense and, in the early years of Flanker development, was given the responsibility of manufacturing the Su-27UB, the two-seat trainer version. When India showed interests in the Su-30, Irkut offered the multirole Su-30MKI, which originated as the Su-27UB modified with avionics appropriate for fighters. Along with its ground-attack capabilities, the series adds features for the air-superiority role, such as canards, thrust-vectoring, and a long-range phased-array radar. Its derivatives include the Su-30MKM, MKA, and SM for Malaysia, Algeria, and Russia, respectively. The Russian Air Force operates several Su-30s and has ordered the Su-30SM version. The integrated aerodynamic configuration, combined with the thrust vectoring control ability, results in high manoeuvrability and unique takeoff and landing characteristics. Equipped with a digital fly-by-wire system, the Su-30 is able to perform some very advanced manoeuvres, including the Pugachev's Cobra and the tailslide. These manoeuvers quickly decelerate the aircraft, causing a pursuing fighter to overshoot, as well as breaking a Doppler radar-lock, as the relative speed of the aircraft drops below the threshold where the signal registers to the radar. The aircraft's powerplant incorporates two Saturn AL-31F afterburning low-bypass turbofan engines, fed through intake ramps. Two AL-31Fs, each rated at 123 kN (28,000 lbf) of full afterburning thrust ensures Mach 2 in level flight, 1,350 km/h speed at low altitude, and a 230 m/s climbing rate. With a normal fuel reserve of 5,270 kg, the Su-30MK is capable of performing a 4.5-hour combat mission with a range of 3,000 km. An aerial refueling system increases the range to 5,200 km (3,200 mi) or flight duration up to 10 hours at cruise altitudes. The aircraft features autopilot ability at all flight stages including low-altitude flight in terrain-following radar mode, and individual and group combat employment against air and ground/sea-surface targets. Automatic control system interconnected with the navigation system ensures route flight, target approach, recovery to airfield and landing approach in automatic mode.

J-16 Chinese Multirole Strike Fighter Aircraft

Tiers:

Variants:

- **J-16:** Strike variant.
- **J-16D:** Electronic warfare variant. Equipped with wingtip electronic warfare pods, and no IRST or 30 mm cannon. It reportedly made its first flight in December 2015.

System

Alternate Designation(s): J-16
Primary Function / Type: Multirole Strike Fighter
Manufacturer: Shenyang Aircraft Corporation
Crew: 2
Number of Engines: 2
Number of Hard Points: Munitions on twelve external hardpoints

Dimensions

Length: 21.9 m
Width (Wing Span): 14.7 m
Height: 6.36 m
Wing Area: 62.04 m2
Empty Weight: 17,700 kg
Gross Weight: 26,000 kg
Maximum Takeoff Weight: 35,000 kg

Automotive

Engine Name: 2 × Shenyang WS-10B afterburning turbofans
Number of Engines: 2
Engine Type: Afterburning turbofans
Engine Power: 96 kN (22,000 lbf) thrust each dry, 145 kN (33,000 lbf) with afterburner
Maximum Speed: Mach 2.4
Maximum Range: 3,000 km
Combat Range: 1,500 km
Ferry Range: 4,500 km
Service Ceiling: 20,000 m
Rate of Climb: 325 m/s

Main Gun System

↳*System*

Name: Gryazev-Shipunov GSh-30-1
Type: Autocannon
Caliber: 30mm
Length: 1,978 mm
Barrel Length: 1,500 mm
Width: 156 mm
Height: 185 mm
Weight: 46 kg
Barrels: 1
Action: Short recoil operated
Rate of FIre: 1,800 rounds/min
Muzzle Velocity: 900 m/s
Maximum Firing Range: 1,800m
Effective Firing Range: 200-1,800m

↳*Ammunition*

Type: Rifle, Autocannon
Caliber: 30mm
Shell: 30×165mm
Basic Load: 150 Rounds

Main Missile Systems

↳*Main Missile System #1*

Name: PL-12

Type: Air-to-Air Missile

Operational Range: 70–100 km

Guidance System: Active radar

Basic Load: 8 x PL-12 Air-to-Air Missiles

↳*Main Missile System #2*

Name: PL-9

Type: Air-to-Air Missile

Operational Range: 22km

Guidance System: multi-element infrared

Basic Load: 4 x PL-9 Air-to-Air Missiles

Bomb Weapon Systems

Note: Various bombs and rockets including BeiDou satellite-guided bombs and laser-guided bombs

Fire Control / Avionics

Fire Control System Type: INA

Fire Control Radar: INA

Navigation Radar: INA

Protection

Stealth Properties: Yes

Heat Signature Reduction: Yes

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: Electronic countermeasure (ECM) pods

Chaffs/Flares: Yes

Notes:

The J-16 is a twin-engine, twin-seat multi-role fighter jet that is also capable of air-to-air combat. It made its debut during the Army Day parade on July 30, 2017 at the Zhurihe military training base in North China's Inner Mongolia Autonomous Region, Before the 30 July 2017 parade, the J-16 was never shown to the public. Developed by the Shenyang Aircraft Corporation, it is based on the J-11B, a modification of Russia’s Sukhoi-30MKK. Almost half of the equipment seen at the parade to mark the PLA’s 90th birthday was being displayed for the first time, and all of it was indigenously made, according to the Ministry of Defence. The fighter is designed for a naval role, and will carry “stand-off” missiles that can attack ships from beyond visual range. Contracry to initial reports, it has a conventional layout, and does nto incorporate notable stealth features. The J-16, built by the Shenyang Aircraft Corporation (SAC), is reportedly a stealthy dedicated attack version of the J-11B (Su-27) multirole fighter featuring active electronically scanned array [AESA] radar and an internal weapons bay. Chinese authorities had not formally released informtion on these developments. It was rumored in November 2010 that SAC was developing a 4.5th generation heavy multi-role fighter with a conventional layout based on J-11B. First flight of this reportedly "Silent Flanker" was rumored at that time to be within 2011. According to Hui Tong, the J-16 is a version of the J-11BS comparable to American

F-15E. Sort of a 'strike flanker'. "The aircraft can be viewed as an upgraded version of Su-30MKK based on its mission and capability, which is comparable to American F-15E. First flight was rumored to be between 2011-2012. J-16 has tandem seats with a WSO sitting in the backseat. It features an enhanced fire-control system with additional AG modes. Besides PL-8 and PL-12 AAMs, it could also carry the same precision guided weapons being carried by JH-7A, such as KD-88 ASM and LS-500J LGB. Compared to JH-7A, J-16 is expected to have a more powerful radar, a greater weapon load (8t) and a longer range (4,000km). " In May 2011 China Military Report stated that "China's new 4.5 generation heavy fighter (Chinese name "Red Eagle"). August 2008 had been officially off the assembly line in Shenyang Aircraft Factory, in October 2008 in Beijing, an Air Force base in the outskirts of the first flight, October 12, 2009 conducted a second test, a complete success. J-18 is the 4.5 generation fighter aircraft are air superiority fighter heavy. Forward-swept wing fighter design using ultra-stealth characteristics, and install a laser active phased array radar, built-in weapons bay and two large thrust-vectoring engines. Service time is expected around 2015. So far there is no any official information about the machine, nor any information to prove the real existence of the aircraft. Only some information from some people speculate, and speculation of official news." In fact, the J-16 fighter's first flight had been pushed and pushed again. The main reason is that the weight of the design is overweight, but the greater headache was the funding constraints.

JF-17 Thunder Pakistani Multirole Combat Aircraft

Tiers:

Variants:

- **JF-17A Block 1:** Single-seat variant. Production in China began in June 2006. The first three Chinese weapons to be integrated are the PL-5E II AAM, the SD-10 AAM, and the C-802A anti-shipping missile. Block 1 aircraft had performed "better than expected" according to PAF Air Commodore Junaid. Production of Block 1 was completed on 18 December when the fiftieth aircraft—58% of which was produced in Pakistan—was delivered. A Block 1 JF-17 had cost approximately US$15 million per unit.
- **JF-17A Block 2:** Single-seat variant. Production began on 18 December 2013 and initial testing began on 9 February 2015. These aircraft have air-to-air refuelling capability, improved avionics, enhanced load carrying capacity, data link, and electronic warfare capabilities. The construction will continue until 2016, after which the manufacture of Block 3 is planned. A Block 2 JF-17 costs approximately US$25 million per unit. Chairman of PAC, Air Marshal Javaid Ahmed said: "We will hand over 16 Block-II JF-17s to the PAF every year", and that the manufacturing plant has the capacity to produce 25 units in a year. According to local media, PAC rolled out the 16th Block 2 aircraft in December 2015 enabling the JF-17's 4th squadron formation. The JF-17B is a tandem two seat version would start testing in September 2016.
- **JF-17A Block 3:** Single-seat variant. Projected to feature further avionics advancements such as helmet-mounted display and sight (HMD/S) system, a new single panel multi-functional display (MFD), an active electronically-scanned array (AESA) radar paired with an infrared search and track (IRST) system, and a cockpit with a flight-control stick on the side, an NRIET KLJ-7A AESA radar, more use of composites, a new engine, and a two-seater cockpit option, with a top speed of 2.0+ Mach. Pakistani Air Force officials have described it as a "fourth generation plus" fighter jet. According to unconfirmed media reports the induction is expected to start around 2019. As of September 2016, the design of the JF-17 Block III has been finalized. The PAF is expected to place an order for 50 JF-17 Block-III fighter jets in the first half of 2017.
- **JF-17B Block 2:** Dual-seat variant, 8 of which were rolled out at PAC Kamra in December 2019. Its multi-roles include use as a (i) JF-17 conversion trainer; (ii) Lead-In Fighter Trainer (LIFT); (iii) ground-attack aircraft; and (iv) reconnaissance aircraft. The production of the first JF-17B was initiated by Pakistan and China in 2016. On 28 April 2017, the JF-17B took its maiden test flight in Chengdu

System

Alternate Designation(s): JF-17 THunder
Primary Function / Type: Multirole Combat Aircraft
Manufacturer: Pakistan Aeronautical Complex
Crew: 1 (single-seat) or 2 (dual-seat)
Number of Engines: 1
Number of Hard Points: 7 (2 × wing-tip, 4 × under-wing, 1 × under-fuselage) with capacity for dual ejector racks on each under-wing hardpoint

Dimensions

Length: 14.93 m

Width (Wing Span): 9.44 m

Height: 4.77 m

Wing Area: 24.43 m2

Empty Weight: 6,586 kg

Max Takeoff Weight: 12,700 kg

Payload: 4,600 kg

Automotive

Engine Name: 1 × Klimov RD-93MA afterburning turbofan with digital electronic engine control (DEEC)

Number of Engines: 1

Engine Type: Afterburning Turbofan

Engine Power: 50.4 kN (11,300 lbf) thrust [197] dry, 85.6 kN (19,200 lbf) with afterburner

Maximum Speed: Mach 1.6

Cruise Speed: 1,359 km/h

Stall Speed: 150 km/h

Maximum Range: 2,500 km

Combat Range: 1,352 km

Ferry Range: 3,500 km

Service Ceiling: 16,930 m

G Limits: +8/-3 (limited by flight control system)

Rate of Climb: 300 m/s

Main Gun System

↳ ***System***

Name: Gryazev-Shipunov GSh-23

Type: Autocannon

Caliber: mm23

Length: 1,387 mm

Barrel Length: 1,000 mm

Weight: 49.2 kg

Barrels: 2

Action: Gas principle

Rate of Fire: 3,400–3,600 rounds/min

Muzzle Velocity: 715 m/s

Ammunition

Type: Rifle, Autocannon

Caliber: mm23

Cartridge: 23x115 mm

Basic Load: INA

Main Missile Systems

↳*Main Missile System #1*

Name: PL-5EII

Type: Short-Range Air-to-Air Missile

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC), Hanzhong Nanfeng Machine Factor

Length: 2.893m

Diameter: 0.127m

Wingspan: 0.617m

Weight: 83kg

Warhead: 6kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: Active infrared, laser proximity fuse

Engine: Solid-fuel rocket

Operational Range: 16~18km

Maximum Speed: Mach 2.5

Guidance System: Infrared homing, multi-element, dual band detector

↳*Main Missile System #2*

Name: PL-9C

Type: Infrared-Homing Air-to-Air Missile

Length: 2.9m

Diameter: 0.157m

Wingspan: 0.856m

Weight: 115kg

Warhead: 11.8kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: laser proximity fuse

Engine: Solid-fuel rocket

Operational Range: 22km (PL-9C, air-to-air), > 8km (surface-to-air)

Flight Altitude: 4.5km (surface-to-air)

Maximum Speed: Mach 2+

↳

Guidance System: multi-element infrared

↳*Main Missile System #3*

Name: AIM-9L
Type: Short-Range Air-to-Air Missile
Manufacturer: Raytheon Company Ford Aerospace Loral Corp.
Length: 3.02 m
Diameter: 127.0 mm
Wingspan: 279.4 mm
Weight: 85.3 kg
Warhead Type: WDU-17/B annular blast-frag
Warhead Weight: 9.4 kg
Detonation Mechanism: IR proximity fuze
Engine: Hercules/Bermite Mk. 36 Solid-fuel rocket
Operational Range: 1.0 to 35.4 km
Maximum Speed: Mach 2.5+
Guidance System: Infrared homing

Bomb Weapon Systems

↳*Bomb #1*

Name: Mark 82
Type: Unguided General-Purpose Bomb
Length: 2.22 m
Diameter: 273 mm
Weight: 227 kg
Filling: Tritonal, Minol (explosive) or Composition H6
Filling Weight: 87 kg
Cook Off Time: approximately 2 minutes 30 seconds.

↳*Bomb #2*

Name: Mark 83
Type: Unguided General-Purpose Bomb
Length: 3000 mm
Diameter: 357 mm
Weight: 459 kg
Filling: Tritonal, Minol or Composition H6
Filling Weight: 202 kg
Note: The Mk 83 is a streamlined steel casing containing 445 lb (202 kg) of tritonal high explosive. When filled with

PBXN-109 thermally insensitive explosive, the bomb is designated BLU-110.

↳***Bomb #3***

Name: Mark 84

Type: General-Purpose Bomb

Length: 3280 mm

Diameter: 458 mm

Weight: 925 kg

Filling: Tritonal, Minol or Composition H6

Filling Weight: 429 kg

Note: It is a streamlined steel casing filled with 945 lb (429 kg) of Tritonal high explosive.

Fire Control / Avionics

Fire Control Radar: KLJ-7 v2 Airborne Pulse Doppler Fire-Control Radar (Range-150 km for 3m2 RCS aircraft.)

Radar Warning Receiver: Northrop Grumman ALR-67 Rader Warning Recever (RWR)

Airborne Missile Approach Warning System: S740 Airborne Missile Approach Warning System (MAWS)

Tactical Data Link: Link-17 Tactical Data Link and the MIL-STD-1760 data-bus

Advanced Targeting Pod Electro-Optical Reconnaissance, Surveillance, and Targeting System: Aselsan ASELPOD Advanced Targeting Pod Electro-Optical Reconnaissance, Surveillance, and Targeting System

Protection

Stealth Properties: INA

Heat Signature Reduction: INA

Add on Armor: INA

EW Counter Measures: Indra ALQ-500P Electronic Countermeasure (ECM)

Chaffs/Flares: Yes

Jamming Pod: KG300G Airborne Self-Protection Jamming Pod and KG600 Airborne Self-Protection Jamming Pod

Notes:

The PAC JF-17 Thunder (Urdu: جے ایف-۱۷ گرج), or CAC FC-1 Xiaolong (pinyin: Xiāo Lóng; lit.: 'Fierce Dragon'), is a lightweight, single-engine, multi-role combat aircraft developed jointly by the Pakistan Aeronautical Complex (PAC) and the Chengdu Aircraft Corporation (CAC) of China. It was designed to replace the A-5C, F-7P/PG, Mirage III, and Mirage V combat aircraft in the Pakistan Air Force. The JF-17 can be used for multiple roles, including interception, ground attack, anti-ship, and aerial reconnaissance. Its designation "JF-17" by Pakistan is short for "Joint Fighter-17", while the designation and name "FC-1 Xiaolong" by China means "Fighter China-1 Fierce Dragon". The JF-17 can deploy diverse ordnance, including air-to-air and air-to-surface missiles, and a 23 mm GSh-23-2 twin-barrel autocannon. Powered by a Guizhou WS-13 or Klimov RD-93 afterburning turbofan, it has a top speed of Mach 1.8. The JF-17 is to become the backbone of the Pakistan Air Force (PAF), complementing the General Dynamics F-16 Fighting Falcon at half the cost. The PAF inducted its first JF-17 squadron in February 2010. In 2015 Pakistan produced 16 JF-17s. As of 2016, Pakistan is believed to have the capacity to produce 25 JF-17 per year. 58% of the airframe is Pakistani and 42% Chinese/Russian-origin. As of December 2016 Pakistan Aeronautical Complex has manufactured 70 jets in the country for use by the Pakistan Air Force of the Block 1 type,and 33 jets of the Block 2 type. The Pakistan Air Force plans, by 2017, to induct a twin-seater version known as the JF-17B for both enhanced operational capability and training. Preparations for a more advanced and technologically sophisticated block III version of the aircraft are underway and the AESA radar, KJ-7A, has been developed, which can track 15 targets and engage 4 targets simultaneously. Since its induction in 2011, the JF-17 Thunder has accumulated 19,000 hours of operational flight. The JF-17 has seen active military service as it is used by

the Pakistan Air Force to bomb militant positions in North Waziristan, using both unguided munitions and guided missiles for precision strike capability. The air frame is of semi-monocoque structure constructed primarily of aluminum alloys. High strength steel and titanium alloys are partially adopted in some critical areas. The air frame is designed for a service life of 4,000 flight hours or 25 years, the first overhaul being due at 1,200 flight hours. Block 2 JF-17s incorporate greater use of composite materials in the air frame to reduce weight. The retractable undercarriage has a tricycle arrangement with a single steerable nose-wheel and two main undercarriages. The hydraulic brakes have an automatic anti-skid system. The position and shape of the inlets is designed to give the required airflow to the jet engine during maneuvers involving high angles of attack. The mid-mounted wings are of cropped-delta configuration. Near the wing root are the LERX, which generate a vortex that provides extra lift to the wing at high angles of attack encountered during combat maneuvers. A conventional tri-plane empennage arrangement is incorporated, with all-moving stabilators, single vertical stabiliser, rudder, and twin ventral fins. The flight control system (FCS) comprises conventional controls with stability augmentation in the yaw and roll axis and a digital fly-by-wire (FBW) system in the pitch axis. The leading edge slats/flaps and trailing edge flaps are automatically adjusted during manoeuvring to increase turning performance. The FCS of serial production aircraft reportedly have a digital quadruplex (quad-redundant) FBW system in the pitch axis and a duplex (dual-redundant) FBW system in the roll and yaw axis. The glass cockpit is covered by a transparent, acrylic canopy that provides the pilot with a good, all-round field of view. It has three large Multifunction Colour Displays (MFD) and smart Heads-Up Display (HUD) with built-in symbol generation capability. A centre stick is used for pitch and roll control while rudder pedals control yaw. A throttle is located to the left of the pilot. The cockpit incorporates hands-on-throttle-and-stick (HOTAS) controls. The pilot sits on a Martin-Baker Mk-16LE zero-zero ejection seat. The cockpit incorporates an electronic flight instrument system (EFIS) and a wide-angle, holographic head-up display (HUD), which has a minimum total field of view of 25 degrees. The EFIS comprises three colour multi-function displays, providing basic flight information, tactical information, and information on the engine, fuel, electrical, hydraulics, flight control, and environment control systems. The HUD and MFD can be configured to show any available information. Each MFD is 20.3 cm (8.0 in) wide and 30.5 cm (12.0 in) tall and is arranged side by side in portrait orientation. The central MFD is placed lowest to accommodate a control panel between it and the HUD. Up to 3,629 kg (8,001 lb) of ordnance, equipment, and fuel can be mounted under the hard points, two of which are on the wing-tips, four are under the wings and one is under the fuselage.

An-2 (Colt) Russian Single-Engine Biplane

Tiers:

Variants:

- **Soviet / Polish production:** Izdeliye F – The in-house designation for the An-2NAK observation aircraft which was later re-designated An-2K and/or An-2F. Izdeliye K – A prototype weather reconnaissance/research aircraft with an observers cockpit immediately forward of the fin above the rear fuselage. First flown on 21 March 1948 'Izdeliye K' was found to be under-powered and unable to carry out its intended mission at high altitude, the aircraft was abandoned after a landing accident in October 1948. The concept was resurrected in 1954 as the 'An-2ZA' / 'An-6 Meteo'. Izdeliye T – The original design concept originated at OKB-153 in Novosibirsk. Izdeliye Sh – The in-house designation for the 'Izdeliye T' (presumably to confuse spies or infiltrators) design project at Novosibirsk. SKh-1 – the original designation of the An-2 used during the design phase of the project before the OKB had been named after Antonov. An-2A – Developed from the An-2A for use as a Balloon interceptor to intercept reconnaissance balloons from, US intelligence assets, over-flying the USSR. The prototype was converted from a Kiev built An-2 (c/n 110347315) using the Turbo-charged Ash-62IR/TK of the 'An-6 Meteo' and a combined searchlight/gun turret mounted on top of the rear fuselage, which mounted either a single Gryazev-Shipunov GSh-23 23 mm calibre twin-barrelled cannon or a single Afanas'yev A-12.7 12.7 mm calibre heavy machine-gun. An-2E (Ekranoplan – wing in ground effect) (first use of the designation) – One of a series of projects from the early 1970s for WIG (Wing In Ground effect) derivatives of the An-2, designed at the TsLST (Tsentral'naya Laboratoriya Spasatel'noy Techniki – central laboratory for new types of rescue equipment). An-2E (second use of the designation) – An Ekranoplan conversion (Russian: Ан-2Э) of an An-2P (RA-84692). The fuselage was retained and a large trapezoidal monoplane wing having extended wingtips with approx 45° dihedral, attached to the lower wing attachment points. The prototype conversion was intended to be a floatplane; however, its first public appearance was as a landplane with the standard An-2 undercarriage. Jointly developed by the Moscow Aviation Institute, MARZ (Moskovskiy Aviaremontnyy Zavod – Moscow Aircraft Overhaul Plant) and The TSZP-Saturn research institute the An-2E was also known as EA-00078. Power was supplied by the standard ASh-62IR radial engine with AV-2 propeller, but production versions were intended to be powered by automotive diesel engines of around 430 kilowatts (580 hp). An-2F – Developed concurrently with the An-2 prototype, 'Izdeliye F' was an experimental artillery-observation aircraft with a twin-tail, ventral observer's position and dorsal defensive machine-gun position. The initial service designation of An-2NAK was changed to An-2F once post test flight modifications had been carried out. Two prototypes were built, with the first completed in the summer of 1948, but flight testing was delayed to April 1949 due to the need to incorporate modifications called up from the standard An-2 flight test programme. The flight test of the An-2F showed that the aircraft met all the requirements of the specification, but helicopters were demonstrating that they could perform the artillery correction role without the need to provide fixed base airstrip for them to operate from, thus the An-2F was not proceeded with and the two prototypes were retained by the Antonov bureau for hack duties with one later serving as a flying wind tunnel to investigate para-dropping from the Antonov An-8 twin-turboprop transport. An-2F (second use of designation) – A VTOL project with vertical thrust to be provided by a Mikulin AM-9 turbojet in the rear fuselage. An-2F (third use of the designation) – A proposed photo-mapping aircraft project, from the early 1990s, similar to the An-2PF

equipped with one of five alternate cameras. Overall control was to have been by IBM 286 computer and the camera could be augmented or replaced by a thermal imaging system, Infra-Red imaging system, AP-6E autopilot,LDI-3 laser rangefinder and/or a GPS global positioning system. An-2G (a.k.a. An-2Geo) – During 1974 WSK-Mielec developed a geo-physical survey aircraft for the Polish State Geophysical Survey Agency (Państwowe Przedsiębiorstwo Poszukiwań Geofizycznych), with equipment for measuring magnetic fields, radiation and other instruments for prospecting. Adapted to fly in tropical latitudes at low altitude the 'An-2G' could fly for six hours and two were used for survey work in Nigeria in 1974. An-2L (Lesozashchita – forestry protection) – A fire bomber variant with three cassettes each holding 120 ampoules, containing 1litre (34 fl.oz.) of fire-retardant which were dropped as required. Trials revealed that this system was inefficient and further work was abandoned. An-2LL (Letayuschaya Laboratoriya – flying laboratory) – Any of a number of An-2s used as testbeds for various equipment. One An-2SKh (RA-70547), modified by the State Research Institute of Aircraft Systems. (GosNII AS – Gosudarstvennyy Nauchno-Issledovatel'skiy Institut Aviatsionnykh Sistem), for environmental research, had a lateral observation blister which has often caused the aircraft to be misidentified as an An-2PF. An-2LP (Lesopozharnyy – forest firefighter) – A single prototype converted from an An-2V floatplane, with 630 litre(139 Imp.Gal.) water tanks in each float for dropping on fires. The water tanks could be re-filled in flight, as the aircraft skimmed the surface of suitable bodies of water. Prior to dropping an alkaline wetting agent (NP-1 Sulphanol) was added to the water which was released through the scoops which also picked up the water to refill the tanks. Ten production aircraft were built seeing service in the Siberian and Far East regions of the USSR. An-2LV (Lesnoj Vodnyj – forest hydroplane) – A firefighting waterbomber. An-2M (Polish:[samolot] Morski – seaplane) – Polish production of the An-2V floatplane, designated An-2M, (not to be confused with the Soviet designation An-2M). Also known as the An-2W. An-2M (Modifitsirovannyy – modified) – The designation An-2M was also used in the USSR for a much improved agricultural crop-sprayer/duster. The An-2M featured an all-duralumin welded and bonded fuselage, lockable tailwheel, enlarged fibre-glass hopper, Shvetsov ASh-62 radial engine with power take off to an auxiliary gearbox to drive the dusting/sprayignequipment, an angular fin of increased area and a hermetically sealed cockpit with no access to the cabin/hopper area. The hopper capacity was increased 42% to 2,000 litres (440 Imp.gal.) delivering product through an outlet enlarged to 400 mm (15 1⁄2 in) with dry product being fed to two dusting outlets at the tips of the lower wings. Due to lack of capacity at the Kiev factory and WSK-Mielec the An-2M was manufactured at DMZ N0.464 (Dolgoproodnyy Machinery Factory No.464) to the north of Moscow. An-2P (Polish: Pasażerski – passenger) (Russian: Passazhirskiy – passenger) – Soviet and Polish production of a standard passenger variant. Soviet production An-2P's had 10 permanently installed seats in a heated insulated cabin. Polish production aircraft had 12–14 seats, two jump seats for children and a baby cot. A total of 837 An-2P's were built. An-2P (Protivopozharnij – fire-fighting with water) – A fire-fighting aircraft with a dumpable hopper filled with water and/or retardant. An-2PD-5 (Polish: Pasażerski [samolot] Dyspozycyjny – executive aircraft's) – The production version of the 'An-2PD-6', featuring almost identical interior furnishings with a work table and reading light replacing one of the chairs. An-2PD-6 (Polish: Pasażerski [samolot] Dyspozycyjny – executive aircraft's) – A prototype six seat VIP variant of the An-2P produced at WSK-Mielec in 1970, featuring a folding table, mini-bar, pantry and toilet. An-2PF – Soviet production An-2 aircraft configured for photo-mapping/survey tasks with camera hatches protected by sliding hatches on the undersurface of the fuselage. An-2PF – A joint request from the Polish State mapping Agency (Państwowe Przedsiębiorstwo Kartografii) led to Polish production of eight 'An-2PF' aircraft configured for photo-mapping/survey tasks with camera hatches protected by sliding hatches on the undersurface of the fuselage. An-2PK – A polar research aircraft developed by WSK-Mielec with heated skis, insulated cabin and an additional cabin heater. An-2PRTV – A single Polish production An-2, (SP-TVN, c/n1G 15944), modified as a television broadcast relay aircraft for the Polish Radio and Television Co. (Polskie Radio i Telewizja). An-2R (Polish: Rolniczy – agricultural) – WSK-Mielec manufactured agricultural variant with tank for 1.300 kg of liquid or powdered chemicals. An-2RA – A projected up-graded Agriculural aircraft, based on the An-2R, developed at WSK-Mielec. An-2RT (ReTranslyator – relay installation) – A single An-2 was converted to a telemetry relay station, for missile development work, relaying telemetry from test missiles to a ground station. An-2TPS (Transportno-Passazhirskiy Sanitarnyy – cargo/passenger medical) – Polish production of ambulance aircraft derived from An-2TP aircraft with three stretchers each side and two medical attendants. An-2S (Sanitarnyy – medical) – The An-2S was an adaptation of the standard An-2T cargo plane with up to six stretcher patients or three stretchers and six walking wounded along with attendants and support equipment. An-2SKh (Sel'skoKhozyaistvennyy – agricultural) – The agricultural version optimised for crop-spraying and crop-dusting. A metal construction chemical hopper was installed in the cabin near the centre of gravity, feeding a spreader through a 300mm orifice. The original spreader was replaced in 1975 by a standardised RTSh-1 three channel spreader which increased distribution width from 18–22 m (59–72 ft) to 34–36 m (112–118 ft). Liquid chemicals could be sprayed using an interchangeable system which delivered chemical to spraybars via a ram air turbine driven regulator pump to give coverage 30 m (98 ft) wide. Powdered or granulated chemicals were loaded through a hatch in the roof of the cabin and liquid chemical through a special connector on the port side of the fuselage. Early An-2SKh's were typically limited to a 6,000-hour life, as opposed to a normal life of 12,000 hours, due to the corrosive effects of the chemicals. The introduction of epoxy based corrosion protection systems partly alleviated the situation, allowing the agricultural An-2s to continue flying for much longer. Five An-2SKh aircraft were converted to firefighters, from 1954, by pressurising the hopper filled with water and/or retardant and ejecting it from a nozzle in place of the dusting/spraying equipment, single aircraft were allocated to Civil Air Directorates across the country but proved relatively ineffectual. An-2T (Transportno – cargo) – The baseline first production model for cargo and mail carriage. An-2TP (Transportno-Passazhirskiy – cargo/passenger) – A convertible passenger/cargo version, with tip-up seats for ten, released in 1949. An-2TD (Transportno-Desantnyy – cargo/paratrooper) – paratrooper version with 12 seats, static line attachment cables and drop signalling lights. An-2V (Vodnyy – water-based) – A seaplane version of the

baseline An-2 fitted with twin floats supported on wire-braced struts at the undercarriage attachment points and rear fuselage. Floatplane An-2s manufactured in Kiev were designated An-4 but there is little evidence that this designation was widely used. At least one An-2V. AN-2V Video An-2V (Vysotnyy – high altitude) – Six aircraft were built, at the Kiev factory, as weather reconnaissance An-2V's for use at high altitude. Powered by the ASh-62IR/TK turbo-charged engine, they differed from the 'An-6 Meteo' by not having the observers cockpit forward of the fin.

System

Alternate Designation(s): Antonov An-2 (Colt); Type 22

Lower Wingspan: 14.2 m

Height: 4.1 m

Wing Area: 71.52 m2 (769.8 sq ft)

Airfoil: TsAGI R-11 (14%)

Empty Weight: 3,300 kg

Gross Weight: 5,440 kg

Fuel Capacity: 1,200 l (320 US gal; 260 imp gal)

Automotive

Engine Name: 1 × Shvetsov ASh-62IR

Number of Engines: 1

Engine Type: 9-cylinder air-cooled supercharge radial piston engine

Engine Power: 1,010 hp

Maximum Range: 845 km (525 mi, 456 nmi)

Maximum Speed: 258 km/h (160 mph, 139 kn)

Cruise Speed: 190 km/h (120 mph, 100 kn)

Stall Speed: 50 km/h (31 mph, 27 kn) circa

Service Ceiling: 4,500 m (14,800 ft)

Rate of Climb: 3.5 m/s (690 ft/min)

Fuel Consumption: 185–200 l/h (49–53 gal/h; 41–44 imp gal/h)

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The Antonov An-2 (Russian nickname: "Annushka" or "Annie"; "kukuruznik"—corn crop duster; USAF/DoD reporting name Type 22, NATO reporting name Colt) is a Soviet mass-produced single-engine biplane utility/agricultural aircraft designed and manufactured by the Antonov Design Bureau beginning in 1946. Its remarkable durability, high lifting power, and ability to take off and land from poor runways have given it a long service life. The An-2 was produced up to 2001 and remains in service with military and civilian operators around the world. The An-2 was designed as a utility aircraft for use in forestry and agriculture. However, the basic airframe is highly adaptable and numerous variants of the type have been developed; these include hopper-equipped versions for crop-dusting, scientific versions for atmospheric sampling, water-bombers for fighting forest-fires, flying ambulances, float-equipped seaplane versions and lightly armed combat versions for dropping paratroops. The most common version is the An-2T 12-seater passenger aircraft. All versions (other than the An-3) are powered by a 750 kW (1,010 hp) nine-cylinder Shvetsov ASh-62 radial engine, which was developed from the Wright R-1820. The An-2 typically consumes 2.5 l/min (0.66 US gal/min; 0.55 imp gal/min). The Antonov An-2 is a mass-produced single-engine biplane that has been commonly used as a utility and agricultural aircraft. It is deliberately furnished with a minimum of complex systems. The crucial wing leading edge slats that give the aircraft its slow flight ability are fully automatic, being held closed by the airflow over the wings. Once the airspeed drops below 64 km/h (40 mph), the slats will extend because they are on elastic rubber springs. Under typical conditions, the take-off is complete within 170 m (560 ft) while the landing run requires 215 m (705 ft); these figures will vary dependent upon various factors, such as the aircraft's take-off/landing weight, the external air temperature, surface roughness, and headwind. The An-2 is equipped with various design features which make it suitable for operation in remote areas with unsurfaced airstrips. It is fitted with a pneumatic brake system (similar to those used on heavy road vehicles) to stop on short runways, along with an air line attached to the compressor, so the pressure in the tires and shock absorbers can be adjusted without the need for installing specialised equipment. The batteries, while sizable, are relatively easy to remove, so the aircraft does not need a ground power unit to supply power for starting the engine. Likewise, there is no need for an external fuel pump to refuel the aircraft as it is provided with an inbuilt onboard pump, which allows the tanks to be filled from simple fuel drums. The An-2 has no stall speed, a fact which is quoted in the operating handbook. A note from the pilot's handbook reads: "If the engine quits in instrument conditions or at night, the pilot should pull the control column full aft and keep the wings level. The leading-edge slats will snap out at about 64 km/h (40 mph) and when the airplane slows to a forward speed of about 40 km/h (25 mph), the airplane will sink at about a parachute descent rate until the aircraft hits the ground." As such, pilots of the An-2 have stated that they are capable of flying the aircraft in full control at 48 km/h (30 mph) (as a contrast, a modern Cessna four-seater light aircraft has a stall speed of around 80 km/h (50 mph)). This slow stall speed makes it possible for the aircraft to fly backwards relative to the ground (if the aircraft is pointed into a headwind of roughly 56 km/h (35 mph), it will travel backwards at 8.0 km/h (5 mph) whilst under full control). The An-2's ability, looks and flying characteristics, and its status as one of the world's biggest single-engined production biplanes, mean that demand for the An-2 is increasing in Western Europe and the United States, where they are prized by collectors of classic aircraft, making it an increasingly common sight at airshows. Many western countries prohibit the use of the An-2 commercially because the aircraft has not been certified by the relevant national aviation authorities. These restrictions vary by country, but all prevent the An-2 being used for any 'for profit' purpose, with the exception of the United States, where An-2s imported since 1993 are limited to experimental certification, but PZL-built An-2s are exempt from this restriction due to a bilateral agreement with Poland.

Su-30MKK (Flanker-G) Russian Multirole Fighter Aircraft

Tiers:

Variants:

- **Su-30MK:** Commercial version of Su-30M first revealed in 1993. Export versions include navigation and communication equipment from Hindustan Aeronautics Limited.
- **Su-30MKI:** MKI for Modernizirovannyi Kommercheskiy Indiski - "Modernized Commercial Indian". An export version for India, jointly developed with Hindustan Aeronautics Limited (HAL). It is the first Su-30 family member to feature thrust vectoring control (TVC) and canards. Equipped with a multinational avionics complex sourced from Russia, India, France and Israel
- **Su-30MKA:** A version of the Su-30MKI, except with French and Russian avionics for Algeria.
- **Su-30MKM:** A derivative of the Russian-Indian Su-30MKI, the MKM is a highly specialised version for Royal Malaysian Air Force. It includes thrust vectoring control (TVC) and canards but with avionics from various countries. It will feature head-up displays (HUD), navigational forward-looking IR system (NAVFLIR) and Damocles Laser Designation pod (LDP) from Thales Group of France, MAW-300 missile approach warning sensor (MAWS), RWS-50 RWR and laser warning sensor (LWS) from SAAB AVITRONICS (South Africa) as well as the Russian NIIP N011M Bars Passive electronically scanned array radar, electronic warfare (EW) system, optical-location system (OLS) and a glass cockpit.
- **Su-30SM:** SM for Serijnyi Modernizirovannyi - "Serial Modernized". A specialised version of the thrust-vectoring Su-30MKI for the Russian Air Force, produced by the Irkut Corporation.
- **Su-30MKK:** MKK for Modernizirovanniy Kommercheskiy Kitayskiy - "Modernized Commercial for China". An export version for China. NATO reporting name Flanker-G
- **Su-30MK2:** Modernized Su-30MKK for China, Indonesia and Uganda with advanced avionics and weapons.
- **Su-30MK2V:** Su-30MK2 variant for Vietnam with minor modifications.
- **Su-30MKV:** Export version of Su-30MK2 for Venezuela.
- **Su-30M2:** A Su-30MK2 version developed by KnAAPO. The Russian Air Force placed an initial order for the variant in 2009. Factory tests were completed in September 2010. Twenty aircraft have been ordered; 4 in 2009 and 16 in 2012. At least 12 have been produced as of August 2014, all four from the first contract in 2009, and eight from the second contract of 2012. They are mostly to be used as combat training aircraft for Su-30SM and Su-35S fighters.
- **Su-30MK3:** A proposed version with Phazotron Zhuk-MSF radar.

System

Alternative Designations: Su-30MKK
Description: Multirole Fighter Aircraft
Crew: 2

Manufacturer: Sukhoi

Dimensions

Length: 21.9 m

Wingspan: 14.7 m

Height: 6.36 m

Gross Weight: 24,900 kg

Max Takeoff Weight: 34,500 kg

Automotive

Engine Name: 2 × Lyulka AL-31F afterburning turbofan engines

Engine Power: 123 kN (28,000 lbf) with afterburner

Maximum Speed: Mach 2

Range: 3,000 km

Service Ceiling: 17,300 m

G Limits: +9g

Rate of Climb: 5.083 m/s

Take-Off Run: 550 m

Fuel Capacity: In addition to the newly added fuel tanks in the rudders capacity totaling 280 kg, there are four main fuel tanks. No. 1 tank with capacity totaling 3,150 kg is in the front, No. 2 tank with capacity totaling 4,150 kg is in the middle, No. 3 tank with capacity totaling 1,053 kg is in the rear, and No. 4 tank with capacity totaling 1,552 kg is located in the wings. During aerial refueling, the maximum capacity of Su-30MKK is receiving up to 2,300 liters per minute. The altitude of refueling is limited to 2 km to 6 km, and the speed is limited to 450–550 km/h. Aerial refueling probe is located in front of cockpit on the left, and the design is capable of night refueling.

Communications

Note: The encrypted VHF/UHF communication radio of Su-30MKK has a maximum range in excess of 400 km, while the encrypted HF communication radio of Su-30MKK has a maximum range in excess of 1,500 km, and all can be used for both air-to-air or air-to-ground two-way communications. Su-30MKK is the first of Flanker family to be equipped with TKS-2 C3 system, which is capable of simultaneously commanding and controlling up to 15 aircraft with such system, and the air-to-air missiles launched by these aircraft. According to the developer of the system, Russkaya Avionika JSC, the encrypted two-way communication Command, control, and communications system can be either commanded or controlled by ground stations, or act as the command/control center for other aircraft. The system is claimed by the Russian developer as a huge leap forward in comparison to the similar rudimentary system on Su-27, which is only capable of one way communication. The new system is also the first among Russian system that is capable of forming a local area network like similar system on American Grumman F-14 Tomcat.

Gun Weapon System

↳*System*

Name: Gryazev-Shipunov GSh-30-1

Type: Autocannon

Caliber: mm30

Length: 1,978 mm

Barrel Length: 1,500 mm

Width: 156 mm

Height: 185 mm

Weight: 46 kg

Barrels: 1

Action: Short recoil operated

Rate of Fire: 1,800 rounds/min

Muzzle Velocity: 900 m/s

Maximum Firing Range: 1,800m

Effective Firing Range: 200-1,800m

↳*Ammunition*

Type: Autocannon

Caliber: 30mm

Shell: 30×165mm

Basic Load: INA

Rocket Weapon System

Note: Various unguided rockets

Missile Weapon Systems

↳*Missile Weapon System #1*

Name: R-27

Type: Air-to-Air Missile

Manufacturer: Vympel

Length: 4.08 m

Diameter: 230 mm

Wingspan: 772 mm

Weight: 253 kg

Warhead Type: blast/fragmentation, or continuous rod

Warhead Weight: 39 kg

Detonation Mechanism: radar-proximity and impact fuzes

Engine: High performance, w. directed-rocket motor Solid-fuel rocket motor

Operational Range: up to 40 km

Flight Altitude: INA

Maximum Speed: Mach 4.5

Guidance System: semi-active radar homing (A/C), active-radar-homing (R-27EA), infrared homing (B/D), passive radar

(E/F)

↳*Missile Weapon System #2*

Name: R-77

Type: Air-to-Air Missile

Manufacturer: Vympel

Length: 3.6 m

Diameter: 200 mm

Wingspan: 700 mm

Weight: 175 kg

Warhead Type: HE fragmenting

Warhead Weight: 22.5 kg

Detonation Mechanism: laser proximity fuse

Engine: Solid fuel rocket motor

Operational Range: 80–100 km

Flight Altitude: 5–25 km

Maximum Speed: Mach 4

Guidance System: Inertial with mid-course update and terminal active radar homing/infrared homing (R-77T)

↳*Missile Weapon System #3*

Name: Kh-29

Type: Air-to-Surface Missile

Manufacturer: Vympel / Tactical Missiles Corporation

Length: 390 cm

Diameter: 38.0 cm

Wingspan: 110 cm

Weight: 660 kg

Warhead Type: HE armour-piercing

Warhead Weight: 320 kg

Detonation Mechanism: Impact

Engine: Fixed thrust solid fuel rocket

Operational Range: 10 km

Maximum Speed: 1,470 km/h

Guidance System: semi-active laser guidance

Bombs Weapon Systems

Bomb Weapon System #1

Name: KAB-500L

Type: Laser-Guided Bomb

Length: 3.05 m

Diameter: INA

Weight: Its warhead makes up 450 kg (990 lb) of the total weight, of which roughly 50% is blast-effect high explosive.

Warhead Type: INA

Warhead Weight: 450 kg

Guidance Sytem: semi-active laser seeker and guidance fins, turning it into an unpowered guided bomb.

CEP: 7 meters

↳*Bomb Weapon System #2*

Name: KAB-1500L

Type: Precision Guided Bomb

Manufacturer: Tactical Missiles Corporation

Length: 4,280 mm

Diameter: 820 mm

Wingspan: 0.58 m

Weight: about 1500 kg

Warhead Type: high explosive (LG-F-E), penetrating (LG-Pr-E), fuel-air (LG-OD-E)

Warhead Weight: INA

Flight Ceiling: 8-10 km

Guidance System: Laser-guided

Accuracy: 4 to 7 m

Avionics

Electronic Warhare System: Russian sources have claimed that the electronic warfare systems of Su-30MKK utilizes the latest technologies available in Russia and the radar warning receivers are so effective that the information provided by RWR alone would be enough to provide targeting information for Kh-31P anti-radiation missile without using other detection systems on board, though information can also be provided by L-150 ELINT system, which can be used in conjunction with Kh-31P. The maximum range of the RWR is termed at several hundred kilometers, and based on the 200 km maximum range of the Kh-31P anti-radiation missile, the maximum should be at least that much. The threat information obtained from RWRs can be either provided on the LCD MFDs (showing the most dangerous four targets) for the pilot in the manual mode, or be used automatically. The active jamming pods are mounted on the wing tips, and the APP-50 decoy launcher is mounted near the tail cone with 96 decoys of different kinds. Domestic Chinese electronic warfare systems including BM/KG300G and KZ900 can also be carried after modification of onboard system, but such modification was neither part of the original deal nor the upgrade deal with Russians, instead, this was implemented indigenously by Chinese themselves during the incremental upgrades.

Flight Control: The fly by wire (FBW) control with quadruple redundancy designed by Russkaya Avionika is the same system used for the Su-30MKI. Russian sources have confirmed the claims of domestic Chinese sources that an indigenous Chinese system developed is near its completion and it will be used to replace the original Russian system. However, this has yet to be confirmed by western sources and official Chinese governmental sources, which only acknowledged in the 6th Zhuhai Airshow that domestic fly-by-wire (FBW) control with quadruple redundancy is developed to accommodate domestic engines, but nothing was mentioned about whether the domestic system and engines would be used on future Su-30MKK

↳

upgrades.

Flight Instruments: The Su-30MKK features a glass cockpit of Russkaya Avionika JSC, with each pilot having two large multi-function displays, rear pilot displays arranged in a rather unconventional way: one atop of the other. Two 178 mm × 127 mm (7.0 in × 5.0 in) MFI-9 colour LCD MFDs are located in the front seat, a single MFI-9 and a 204 mm × 152 mm (8.0 in × 6.0 in) MFI-10 color LCD MFDs are located in the rear seat. The head-up display (HUD) is also developed by Russkaya Avonika JSC, designated as SILS-30.

Helmet Mounted Sight: The original ASP-PVD-21 series helmet mounted sight (HMS) with only limited field of view (FoV) was replaced by more advanced Sura-K HMS system, but Chinese have been replacing the Russian HMS with more advanced domestic system. Publicized photos and video clips from the official Chinese governmental sources such as CCTV-7 in 2007 and PLA pictorial magazine have confirmed the western claims of Chinese is replacing the original Russian helmet mounted sights (HMS) with more capable domestic ones.

Mission Computer: The new mission computer was jointly developed by the Russian National Aeronautical System Science Research Academy and Russkaya Avionika JSC, designated as MVK, capable of performing ten billion FLOPS. All avionics on board is built to MIL-STD-1553 standard. There are four computers based on Baguet-55 series processor, one for central avionics control, two for information display, and one for fire control.

Navigation: The integrated navigational systems designated as PNS-10, incorporating the A737 subsystem. The system is capable of utilizing both the GPS and GLONASS, but it is rumored that Chinese is developing a similar system to add the capability to utilize domestic BeiDou Navigation Satellite System

Airborne Radar: Airborne radar on board Su-30MKK has been continuously upgraded and a total of three were confirmed so far, all of which are controlled by the RLPK-27VE integrated radar targeting system, developed from the RLPK-27 system of the single seat Su-27. Both systems are designed by Viktor Grishin of the Tikhomirov Scientific Research Institute of Instrument Design (NIIP), and is compatible with various radar and weaponry systems. N001VEP radar: The first 20 Su-30MKK have an N001VEP Passive electronically scanned array (PESA) fire-control radar by the Chief designer Viktor Grishin of the Tikhomirov Scientific Research Institute of Instrument Design (NIIP) with a range up to 100 km, able to concurrently track 10 targets, and engage four air targets or two ground targets of the 10 tracked. The N001VEP is developed from the earlier N001VE radar designed by the same designer, which was used on the Chinese J-11A. The original Baguet series processor of the N001VE radar is replaced by its successor Baguet-55 series. Like its predecessor, the new radar has incorporated the moving target indication (MTI) and mapping capabilities, and the capability to detect low flying or hovering helicopters. The scan sector of it is 120 degrees while the elevation is 110 degrees. Zhuk (radar)-MS radar: From the 21st Su-30MKK on, the N001VEP radar is replaced by the Zhuk-MS (Beetle-MS) fire control radar of Tikhomirov (NIIP)'s competitor, Phazotron (NIIR), which also adopts a slotted planar array antenna like N001VEP radar. The new radar has longer range coverage (up to 150 km) and is able to guide a greater variety of weapons systems. The number of targets that can be engaged is identical to that of the N001VEP radar, but the number that can be simultaneously tracked has been doubled to 20. The Zhuk (Beetle)-MS radar is an improvement of the earlier Zhuk (Beetle) radar designed for Su-27 and MiG-29 upgrades, and in comparison to the original Zhuk radar, the Zhuk-MS has the following improvements in addition to increased range and number of targets tracked/engaged: The antenna diameter is increased to 960 mm from the original 680 mm of Zhuk (Beetle) radar The peak power is increased to 6 kW from the original 5 kW of Zhuk (Beetle) radar The average power is increased to 1.5 kW from the original 1 kW of Zhuk (Beetle) radar Contrary to many erroneous claims, Zhuk-MS is not a phased array radar, but a slotted planar array antenna. Zhuk-MSE radar: The Zhuk-MS has been replaced by its successor, Zhuk-MSE in the incremental upgrades of Su-30MKK, and previous Zhuk-MS are being upgraded to the Zhuk-MSE level. In comparison to the predecessor most performance parameters remain the same, but the number of ground targets that can be simultaneously engaged is increased to four from the original two. Like Zhuk-MS, this radar has also been erroneously reported to be a phased array radar when in fact, it utilizes a slotted planar array antenna. The designer Phazotron has claimed the new radar has better ECCM capabilities than earlier models.

FIre Control System: The fire control system on board integrates the radar, optronics, helmet-mounted sight, electronic warfare gears including radar warning receivers, and data links. The system consists of two subsystems: the SUV-VEP air-to-air subsystem and the SUV-P air-to-ground subsystem. SUV-VEP: this air-to-air subsystem is capable of controlling six air-to-air missiles, which is greater than the maximum number of targets the airborne radar on board Su-30MKK can simultaneously engage, thus leaving rooms for radar improvement, which would be later exploited when the new passive electronically scanned array radars have been installed on Su-30MK2. The SUV-VEP subsystem is also capable of controlling air-to-sea missions, and the fire control of Kh-31A and Kh-35 anti-ship missiles are usually provided by SUV-VEP air-to-air subsystem instead of SUV-P air-to-ground subsystem. The subsystem of SUV-VEP system includes four major portions: SEI-31-10 Integrated Display system: Used to control LCD MFDs. OEPS-30 optronic (electro-optical) detection system: Chinese call this system optronic radar system, and it consists of two major components: OLS-30 (52Sh) Infra-red search and track weighing 200 kg includes laser and IR sensors. In comparison to its predecessor OLS-27 (Izdeliye 36Sh) on Su-27, the IR detection range nearly doubled to > 90 km from the original 50 km. The range of laser range finder is increased to > 10 km from the original 6 km. Sura-K helmet mounted system (HMS): The field of view (FoV) is greatly increased to +/- 60 degrees in comparison to the +/- 8 degrees of the ASP-PVD-21 HMS originally used on Su-27. IFF and airborne radar are also controlled by SUV-VEP system. SUV-P: this air-to-ground subsystem utilizes identical hardware of SUV-VEP air-to-air

subsystem, but with a different processing requirement. This subsystem is mainly used for air-to-surface missiles such as Kh-59, and acts as an interface between the system on board the aircraft and the designated targeting pods of the air-to-surface missiles that can not be controlled directly by the onboard avionics. The primary subsystem of SUV-P system is SUO-30PK subsystem and A-737 satellite navigational subsystem. SUO-30PK weaponry control subsystem: though Kh-31 is often controlled by SUV-VEP air-to-air system, it can also be controlled via SUV-P system via SUO-30PK subsystem, which can also control L-150 ELINT system. SUO-30PK system also controls other missiles such as Kh-59, an air-to-ground missiles that is controlled via Tekon targeting system in the APK-9E pod. Other SUO-30PK subsystem is developed by Aviation Automation Design bureau at Kursk, and it can be used to control unguided air-to-ground weaponry. Both the SUV-VEP and SUV-P systems were adopted to upgrade the single seat Su-27SK in Chinese inventory, and a joint team of Tikhomirov Scientific Research Institute of Instrument Design (NIIP) and State Instrumentation Plant at Ryazan was named as the primary contractor. The modified SUV-VEP system adopted to upgrade Chinese Su-27SK was designated as SUV-VE, while the modified SUV-P system adopted to upgrade Chinese Su-27SK was designated as SUV-PE. The original analog dial indicator on flight dashboard of Su-27SK were replaced by two 6 in x 6 in MFI-10-6M and a MFIP-6 LCD MFDs. According to Russian claim, over 60 Chinese Su-27SK have been upgraded by the end of 2006.

Notes:

The Sukhoi Su-30MKK (NATO reporting name: Flanker-G) is a modification of the Sukhoi Su-30, incorporating advanced technology from the Sukhoi Su-35 variant. The Su-30MKK was developed by Sukhoi in 1997, as a result of a direct Request for tender between the Russian Federation and China. It is a heavy class, all-weather, long-range strike fighter, and like the Sukhoi Su-30, comparable to the American McDonnell Douglas F-15E Strike Eagle. Su-30MK2 is a further improvement to Su-30MKK with upgraded avionics and maritime strike capabilities. The MKK and MK2 are currently operated by the People's Liberation Army Air Force, Indonesian Air Force, Vietnam People's Air Force, Venezuelan Air Force and the Ugandan Air Force. Su-30MKK shares compatibility with Su-35 in terms of hardware, but in terms of software, Su-30MKK differs from Su-35 (Flanker-E) on a much greater scale in comparison to Indian Su-30MKI because of different mission requirements by China. The Flanker family aircraft has the problem of the reduction of maximum g-force level being decreased to 7g from the 9g at speed between Mach 0.7 to Mach 0.9, and this problem was completely solved on Su-30MKK by adopting new measures. According to the Sukhoi Design Bureau, Su-30MKK is the first of the Flanker family to achieve it after Su-35 / 37 (Flanker-E/F) and Sukhoi Su-30MKI. Higher percentage of composite material is used for Su-30MKK in comparison to the original Su-30MK. In addition, new aluminum alloy were used to replace the old type used on Su-30MK for weight reduction. The twin rudders mainly made of carbon fiber composite material were larger on Su-30MKK in comparison to that of the original Su-30MK, but contrary to what was once erroneously claimed by some western sources, Sukhoi Design Bureau revealed later that the increased space in the rudders were used for additional fuel tanks, instead of larger communication UHF antenna. The capacity of the fuel tanks in the wings is also increased. A twin nose landing gear of size 620 mm x 180 mm has replaced the single nose landing gear of size 680 mm x 260 mm used on Su-30MK to accommodate the increased weight. The maximum take-off weight and weapon load are increased to 38 tons and 12 tons respectively, but this extreme limit is often avoided by taking off at lighter weight. It was rumored that the Chinese pilots were not as experienced as Russian test pilots when operating at this extreme limits, which contributed to the crashes at least partially. The original K-36 ejection seat on Su-30MK is replaced by K-36M ejection seat for Su-30MKK.

Rafale French Multirole Fighter Aircraft

Tiers:

Variants:

- **Variants:** Rafale A Technology demonstrator, first flew in 1986. Rafale D Dassault used this designation (D for discrète) in the early 1990s to emphasise the new semi-stealthy design features. Rafale B F3-R Two-seater version for the French Air Force.[39] "It can operate with the Talios targeting pod (45 ordered by French army will delivered between 2019 and 2023)." Rafale C F3-R Same as Rafale B F3-R but Single-seat version for the French Air Force. Rafale M F3-R Same as Rafale C F3-R but Carrier-borne version for the French Naval Aviation, which entered service in 2001. For carrier operations, the M model has a strengthened airframe, longer nose gear leg to provide a more nose-up attitude, larger tailhook between the engines, and a built-in boarding ladder. Consequently, the Rafale M weighs about 500 kg (1,100 lb) more than the Rafale C. It is the only non-US fighter type cleared to operate from the decks of US carriers, using catapults and their arresting gear, as demonstrated in 2008 when six Rafales from Flottille 12F integrated into the USS Theodore Roosevelt Carrier Air Wing interoperability exercise. Rafale N Originally called the Rafale BM, was a planned missile-only two-seater version for the Aéronavale. Budgetary and technical constraints have been cited as grounds for its cancellation. Rafale R Proposed reconnaissance-oriented variant. Rafale DM Two-seater version for the Egyptian Air Force. Rafale EM Single-seat version for the Egyptian Air Force. Rafale DH Two-seater version for the Indian Air Force. Rafale EH Single-seat version for the Indian Air Force. Rafale B, C, M F4 (first step 4.1, second step 4.2) It will upgrade radar (F4.1), as well as improved capabilities in the Helmet-Mounted Display and AASM 1000 kg, OSF (long range optoelectronics system) will be receive an IRST(Infrared Search and Track) for detecting and identifying airborne stealth targets at long range (F4.1), it will be more effective in network-centric warfare, more data exchange and satellite communication and will launch small (F4.2) . It as be ordered in 2019.:All 180 French Rafale B,C,M will be upgraded to F4.1 in 2022 and F4.2 in 2027, moreover a further 30 aircraft at the full F4 standard (F4.2) will be ordered in 2023 and delivered between 2027 and 2030.

NOTES

Description: RAFALE IS A TWIN-JET COMBAT AIRCRAFT CAPABLE OF CARRYING OUT A WIDE RANGE OF SHORT- AND LONG-RANGE MISSIONS INCLUDING GROUND AND SEA ATTACK, AIR DEFENSE AND AIR SUPERIORITY, RECONNAISSANCE, AND HIGH-ACCURACY STRIKE OR NUCLEAR STRIKE DETERRENCE.

↳*APPEARANCE*

Notes:

The Dassault Rafale (French pronunciation: [ʁafal], literally meaning "gust of wind", and "burst of fire" in a more military sense) is a French twin-engine, canard delta wing, multirole fighter aircraft designed and built by Dassault Aviation. Equipped with a wide range of weapons, the Rafale is intended to perform air supremacy, interdiction, aerial reconnaissance, ground support, in-depth strike, anti-ship strike and nuclear deterrence missions. The Rafale is referred to as an "omnirole" aircraft by Dassault. In the late 1970s, the French Air Force and Navy were seeking to replace and consolidate their current fleets of aircraft. In order to reduce development costs and boost prospective sales, France entered into an arrangement with UK, Germany, Italy and Spain to produce an agile multi-purpose fighter, the Eurofighter Typhoon. Subsequent disagreements over workshare and differing requirements led to France's pursuit of its own development programme. Dassault built a technology demonstrator which first flew in July 1986 as part of an eight-year flight-test programme, paving the way for the go-ahead of the project. The Rafale is distinct from other European fighters of its era in that it is almost entirely built by one country, involving most of France's major defence contractors, such as Dassault, Thales and Safran. Many of the aircraft's avionics and features, such as direct voice input, the RBE2 AA active electronically scanned array (AESA) radar and the optronique secteur frontal infra-red search and track (IRST) sensor, were domestically developed and produced for the Rafale programme. Originally scheduled to enter service in 1996, the Rafale suffered significant delays due to post-Cold War budget cuts and changes in priorities. The aircraft is available in three main variants: Rafale C single-seat land-based version, Rafale B twin-seat land-based version, and Rafale M single-seat carrier-based version. Introduced in 2001, the Rafale is being produced for both the French Air Force and for carrier-based operations in the French Navy. The Rafale has been marketed for export to several countries, and was

selected for purchase by the Indian Air Force, the Egyptian Air Force, and the Qatar Air Force. The Rafale has been used in combat over Afghanistan, Libya, Mali, Iraq and Syria. Several upgrades to the weapons and avionics of the Rafale are planned to be introduced by 2018. The Rafale was developed as a modern jet fighter with a very high level of agility; Dassault chose to combine a delta wing with active close-coupled canard to maximize manoeuvrability. The aircraft is capable of withstanding from −3.6g to 9g (10.5g on Rafale solo display and a maximum of 11g can be reached in case of emergency. The Rafale is an aerodynamically unstable aircraft and uses digital fly-by-wire flight controls to artificially enforce and maintain stability.[N 2] The aircraft's canards also act to reduce the minimum landing speed to 115 knots (213 km/h; 132 mph); while in flight, airspeeds as low as 15 knots (28 km/h; 17 mph) have been observed during training missions.[64] According to simulations by Dassault, the Rafale has sufficient low speed performance to operate from STOBAR-configured aircraft carriers, and can take off using a ski-jump with no modifications. The Rafale M features a greatly reinforced undercarriage to cope with the additional stresses of naval landings, an arrestor hook, and "jump strut" nosewheel, which only extends during short takeoffs, including catapult launches. It also features a built-in ladder, carrier-based microwave landing system, and the new fin-tip Telemir system for syncing the inertial navigation system to external equipment. Altogether, the naval modifications of the Rafale M increase its weight by 500 kilograms (1,100 lb) compared to other variants. The Rafale M retains about 95 percent commonality with Air Force variants including, although unusual for carrier-based aircraft, being unable to fold its multi-spar wings to reduce storage space. The size constraints were offset by the introduction of Charles de Gaulle, France's first nuclear-powered carrier, which was considerably larger than previous carriers, Foch and Clemenceau.

Su-27SK (Flanker-B) Russian Multirole Fighter

Tiers:

Variants:

- **T10 ("Flanker-A"):** Initial prototype configuration.
- **T10S:** Improved prototype configuration, more similar to production spec.
- **P-42:** Special version built to beat climb time records. The aircraft had all armament, radar and paint removed, which reduced weight to 14,100 kg. It also had improved engines. Similar to the US F-15 Streak Eagle project. Between 1986–1988, it established and took several climb records from the Streak Eagle. Several of these records (such as time to climb to 3000m, 6000m, 9000m, 12000m) still stands current as of 2019.
- **Su-27:** Pre-production series built in small numbers with AL-31 engine.
- **Su-27S (Su-27 / "Flanker-B"):** Initial production single-seater with improved AL-31F engine. The "T10P".
- **Su-27P (Su-27 / "Flanker-B"):** Standard version but without air-to-ground weapons control system and wiring and assigned to Soviet Air Defence Forces units. Often designated Su-27 without -P.
- **Su-27UB ("Flanker-C"):** Initial production two-seat operational conversion trainer.
- **Su-27SK:** Export Su-27S single-seater. Exported to China in 1992-1996 and developed into Shenyang J-11.
- **Su-27UBK:** Export Su-27UB two-seater.
- **Su-27K (Su-33 / "Flanker-D"):** Carrier-based single-seater with folding wings, high-lift devices, and arresting gear, built in small numbers. They followed the "T10K" prototypes and demonstrators.
- **Su-27KUB (Su-33UB):** Two-seat training-and-combat version based on the Su-27K and Su-27KU, with a side-by-side seating same as Su-34. One prototype built.
- **Su-27M (Su-35/Su-37 / "Flanker-E/F"):** Improved demonstrators for an advanced single-seat multi-role Su-27S derivative. These also included a two-seat "Su-35UB" demonstrator.
- **Su-27PU (Su-30):** Two-seat version of the Su-27P interceptor, designed to support with tactical data other single-seat Su-27P, MiG-31 and other interceptor aircraft in PVO service. The model was later renamed to Su-30, and modified into a multi-role fighter mainly for export market, moving away from the original purpose of the aircraft.
- **Su-32 (Su-27IB):** Two-seat dedicated long-range strike variant with side-by-side seating in "platypus" nose. Prototype of Su-32FN and Su-34.

System

Alternate Designation(s): Su-27SK;l NATO: Flanker-B

Primary Function / Type: Multirole Fighter

Manufacturer: Sukhoi

Crew: 1

Number of Engines: 2

Number of Hard Points: 10 external pylons with a capacity of up to 4,430 kg (9,770 lb)

Dimensions

Length: 21.9 m

Width (Wing Span): 14.7 m
Height: 5.92 m
Wing Area: 62 m2
Empty Weight: 16,380 kg
Gross Weight: 23,430 kg
Maximum Takeoff Weight: 30,450 kg

Automotive

Engine Name: 2 × Saturn AL-31F afterburning turbofan engines
Number of Engines: 2
Engine Type: afterburning turbofan engines
Engine Power: 75.22 kN (16,910 lbf) thrust each dry, 122.6 kN (27,600 lbf) with afterburner
Maximum Speed: 2,500 km/h
Range, at Altitude: 3,530 km
Range, at Sea Level: 1,340 km
Service Ceiling: 19,000 m
G Limits: +9
Rate of Climb: 300 m/s
Thrust/Weight: 1.07 with 56% internal fuel; 0.91 with full fuel

Notes:

The Sssn 37 Viggen ("Thunderbolt")[Nb 1] is a retired Swedish single-seat, single-engine, short-medium range combat aircraft. Development work on the type was initiated at Saab in 1952 and, following the selection of a radical delta wing configuration, the resulting aircraft performed its first flight on 8 February 1967 and entered service in 21 June 1971. It was the first canard design produced in quantity. The Viggen was also the most advanced[vague] fighter jet in Europe until the introduction of the Panavia Tornado into operational service in 1981. Several distinct variants of the Viggen were produced to perform the roles of strike fighter (AJ 37), aerial reconnaissance (SF 37), maritime patrol aircraft (SH 37) and a two-seat trainer (SK 37). In the late 1970s, the all-weather fighter-interceptor aircraft JA 37 variant was introduced. In November 2005, the Viggen was retired from service by the Swedish Air Force, the only operator, having been replaced by the newer Saab JAS 39 Gripen. The Viggen was powered by a single Volvo RM8 turbofan This was essentially a licence-built variant of the Pratt & Whitney JT8D engine that powered commercial airliners of the 1960s, with an afterburner added for the Viggen. The airframe also incorporated a thrust reverser to use during landings and land manoeuvres, which, combined with the aircraft having flight capabilities approaching a limited STOL-like performance, enabled operations from 500 m airstrips with minimal support. The thrust reverser could be pre-selected in the air to engage when the nose-wheel strut was compressed after touchdown via a pneumatic trigger. The requirements from the Swedish Air Force dictated Mach 2 capability at high altitude and Mach 1 at low altitude. At the same time, short-field take-off and landing performance was also required. Since the Viggen was developed initially as an attack aircraft instead of an interceptor (the Saab 35 Draken fulfilled this role), some emphasis was given to low fuel consumption at high subsonic speeds at low level for good range. With turbofan engines just emerging and indicating better fuel economy for cruise than turbojet engines, the former was favoured, since the latter were mainly limited by metallurgy development resulting from limitations in turbine temperature. Mechanical simplicity was also favoured, so the air intakes were simple D-section types with boundary layer splitter plates, while the fixed inlet had no adjustable geometry for improved pressure recovery. The disadvantage was that the required engine would be very large. In fact, at the time of introduction, it was the second largest fighter engine, with a length of 6.1 m and 1.35 m diameter; only the Tumansky R-15 was bigger. Saab had originally wanted the Rolls-Royce Medway as the Viggen's power plant. Owing to the cancellation of the Medway, the JT8D was instead chosen as the basis for modification. The RM8 became the second operational afterburning turbofan in the world, and also the first equipped with a thrust reverser. According to aviation author Christopher Chant, the RM8 has the distinction of being the first engine to be fitted with both an afterburner and a thrust reverser. It had a bypass ratio of around 1.07:1 in the RM8A, which reduced to 0.97:1 in the RM8B. The RM8A was the most powerful fighter engine in the late 1960s. The AJ, SF, SH

and SK 37 models of the Viggen had the first version of the RM8A engine with uprated internal components from the JT8D that it was based on. Thrust was 65.6 kN dry and 115.6 kN with afterburner. For the JA 37, the RM8A was developed into the RM8B, achieved by adding a third low-pressure compressor stage over the preceding model, increasing the turbine inlet temperature and fuel diffusion within the combustion chamber. Thrust is 72.1 kN dry and 125.0 kN with afterburner. Owing to the increased length and weight of the RM8B engine over its predecessor, the airframe of the JA 37 was stretched in order to accommodate it. Onboard electrical power was provided by a 60 kVA generator. In the event of an in-flight engine failure, emergency power was provided by an automatically deploying ram air turbine (RAT), capable of generating 6 kVA

Eurofighter Typhoon EF-2000 European Multirole Fighter Aircraft

Tiers:

Variants:

- **Note:** The Eurofighter is produced in single-seat and twin-seat variants. The twin-seat variant is not used operationally, but only for training, though it is combat capable. The aircraft has been manufactured in three major standards; seven Development Aircraft (DA), seven production standard Instrumented Production Aircraft (IPA) for further system development and a continuing number of Series Production Aircraft. The production aircraft are now operational with the partner nation's air forces. The Tranche 1 aircraft were produced from 2000 onwards. Aircraft capabilities are being increased incrementally, with each software upgrade resulting in a different standard, known as blocks. With the introduction of the block 5 standard, the R2 retrofit programme began to bring all Tranche 1 aircraft to that standard.

NOTES

Description: EUROFIGHTER IS A SINGLE-SEAT, TWIN-ENGINE, AGILE COMBAT AIRCRAFT WHICH WILL BE USED IN THE AIR-TO-AIR, AIR-TO-GROUND, AND TACTICAL RECONNAISSANCE ROLES. THE DESIGN OF THE EUROFIGHTER IS OPTIMIZED FOR AIR DOMINANCE PERFORMANCE WITH HIGH INSTANTANEOUS AND SUSTAINED TURN RATES, AND SPECIFIC EXCESS POWER. SPECIAL EMPHASIS HAS BEEN PLACED ON LOW WING LOADING, HIGH THRUST TO WEIGHT RATIO, EXCELLENT ALL ROUND VISION AND CAREFREE HANDLING. THE USE OF STEALTH TECHNOLOGY IS INCORPORATED THROUGHOUT THE AIRCRAFT'S BASIC DESIGN.

Notes:

The Eurofighter Typhoon is a twin-engine, canard–delta wing, multirole fighter. The Typhoon was designed originally as an air superiority fighter and is manufactured by a consortium of Airbus, BAE Systems and Leonardo that conducts the majority of the project through a joint holding company, Eurofighter Jagdflugzeug GmbH formed in 1986. NATO Eurofighter and Tornado Management Agency manages the project and is the prime customer. The aircraft's development effectively began in 1983 with the Future European Fighter Aircraft programme, a multinational collaboration among the UK, Germany, France, Italy and Spain. Disagreements over design authority and operational requirements led France to leave the consortium to develop the Dassault Rafale independently. A technology demonstration aircraft, the British Aerospace EAP, first took flight on 6 August 1986; the first prototype of the finalised Eurofighter made its first flight on 27 March 1994. The aircraft's name, Typhoon, was adopted in September 1998; the first production contracts were also signed that year. Political issues in the partner nations significantly protracted the Typhoon's development: the sudden end of the Cold War, reduced European demand for fighter aircraft, and the debate over the aircraft's cost and work share. The Typhoon entered operational service in 2003; it has entered service with the air forces of Austria, Italy, Germany, the United Kingdom, Spain and Saudi Arabia. The air forces of Oman, Kuwait and Qatar are export customers, bringing the procurement total to 623 aircraft as of 2019. The Eurofighter Typhoon is a highly agile aircraft, designed to be a supremely effective dogfighter in combat. Later production aircraft have been increasingly better equipped to undertake air-to-surface strike missions and to be compatible with an increasing number of different armaments and equipment, including Storm Shadow and the RAF's Brimstone. The Typhoon had its combat debut during the 2011 military intervention in Libya with the UK's Royal Air Force and the Italian Air Force, performing aerial reconnaissance and ground-strike missions. The type has also taken primary responsibility for air-defence duties for the majority of customer nations. The Typhoon is a highly agile aircraft both at supersonic and at low speeds, achieved through having an intentionally relaxed stability design. It has a quadruplex digital fly-by-wire control system providing artificial stability, as manual operation alone could not compensate for the inherent instability. The fly-by-wire system is described as "carefree", and prevents the pilot from exceeding the permitted manoeuvre envelope. Roll control is primarily achieved by use of the ailerons. Pitch control is by operation of the canards and ailerons, because canards disturbs airflow to inner elevons (flaps). The yaw control is done by big single rudder. Control surfaces are moved through two independent hydraulic systems, which also supply various other items, such as the canopy, brakes and undercarriage; powered by a 4,000 psi engine-driven pumps. Engines are fed by a chin double intake ramp situated below a splitter plate. The Typhoon features lightweight construction (82% composites consisting of 70% carbon fibre composite materials and 12% glass fibre reinforced composites) with an estimated lifespan of 6,000 flying hours. The permitted lifespan, as opposed to the estimated lifespan, was 3,000 hours.

Mirage 2000 French Multirole Fighter Aircraft

Tiers:

Variants:

- **Mirage 2000C:** Upgrades include the addition of the Non-Cooperative Target Recognition (NCTR) mode to the RDI Radar to allow identification of airborne targets not responding on identification friend or foe (IFF), and the ability to carry air-to-ground stores such as rocket pods, iron bombs and cluster bombs. Some variants, especially those equipped with the RDM radar (mainly used in export models) have the capability to use the Exocet anti-ship missile.
- **Mirage 2000B:** The Mirage 2000B is a two-seat operational conversion trainer variant which first flew on 11 October 1980. The French Air Force acquired 30 Mirage 2000Bs, and all three AdA fighter wings each obtained several of them for conversion training.
- **Mirage 2000N:** The Mirage 2000N is the nuclear strike variant which was intended to carry the Air-Sol Moyenne Portée nuclear stand-off missile. The variant was retired on 21 June 2018.
- **Mirage 2000D:** The Mirage 2000D is a dedicated conventional attack variant developed from the Mirage 2000N.
- **Mirage 2000-5F:** First major upgrade over the Mirage 2000C. Replaces most cockpit displays with several large multi-function displays, and upgrading the stores-to-aircraft interface for the use of targeting pods and a wide variety of guided air-to-ground weapons, as well as a radar upgrade to provide guidance information for MICA missiles.
- **Mirage 2000-5 Mark 2:** Dassault further improved the Mirage 2000-5, creating the Mirage 2000-5 Mark 2 which is currently the most advanced variant of the Mirage 2000.
- **Mirage 2000E:** "Mirage 2000E" was a blanket designation for a series of export variants of the Mirage 2000. These aircraft were fitted the M53-P2 engine and an enhanced "RDM+" radar, and all can carry the day-only ATLIS II laser targeting pod.
- **Mirage 2000M:** The Mirage 2000M is the version purchased by Egypt. Two-seat Mirage 2000BM trainers were also ordered.
- **Mirage 2000H, 2000TH:** Designation of two-seat trainers and single-seat fighters for India. Indian Mirage 2000s have been integrated to carry the Russian R-73AE Archer missile as of 2007. The Mirage 2000TH is a twin-seat trainer version.
- **Mirage 2000I, 2000TI:** It is an Indian specific version single/twin-seater fighter for Indian Air Force similar to Mirage 2000-5 Mk2 equipped with Indian French and Israeli avionics and weapon packages. Its contract was signed in 2011 and first upgraded aircraft was delivered in 2015. Dassault aviation will upgrade initial few planes Mirage 2000H, 2000TH to 2000I, 2000TI later by Hindustan Aeronautics Limited.
- **Mirage 2000P:** Peru placed an order for 10 single-seat Mirage 2000Ps and 2 Mirage 2000DP trainers.
- **Mirage 2000-5EI:** Of the 60 Mirage 2000s Taiwan ordered in 1992, the Republic of China Air Force (ROCAF) would receive 48 single-seat Mirage 2000-5EI interceptors and 12 Mirage 2000-5DI trainers. This version of Mirage 2000-5 had the mid-air refuel ability as well as its ground attack ability deleted.
- **Mirage 2000-5EDA:** In 1994, Qatar ordered nine single-seat Mirage 2000-5EDAs and three Mirage 2000-5DDA trainers, with initial deliveries starting in late 1997.

- **Mirage 2000EAD/RAD:** In 1983, the United Arab Emirates (UAE) purchased 22 single-seat Mirage 2000EADs, 8 unique single-seat Mirage 2000RAD reconnaissance variants, and 6 Mirage 2000DAD trainers, for a total order of 36 aircraft. The Mirage 2000RAD reconnaissance variant does not have any built-in cameras or sensors, and the aircraft can still be operated in air combat or strike roles. The reconnaissance systems are implemented in pods produced by Thales and Dassault. The UAE is the only nation operating such a specialised reconnaissance variant of the Mirage 2000 at this time.[
- **Mirage 2000EG:** n March 1985, Greece ordered 30 single-seat Mirage 2000EGs and 10 Mirage 2000BG two-seat trainers, equipped with RDM radars and M53P2 engines, mainly for interception/air defence roles, although the ability to use air-to-ground armaments was retained. After the Talos modernisation project, during which variant aircraft received updated sensors and avionics, as well as new anti-ship and air-to-air weapons, and were redesignated Mirage 2000EGM
- **Mirage 2000BR:** A variant of the Mirage 2000-9 for Brazil that did not materialise.
- **Mirage 2000-9:** Mirage 2000-9 is the export variant of Mirage 2000-5 Mk.2. The UAE was the launch customer, ordering 32 new-build aircraft, comprising 20 Mirage 2000-9 single-seaters and 12 Mirage 2000-9D two-seaters. A further 30 of Abu Dhabi's older Mirage 2000s will also be upgraded to Mirage 2000-9 standard.

System

Alternate Designation(s): Mirage 2000

Primary Function / Type: Multirole fighter

Manufacturer: Dassault Aviation

In Service: 1984-Present

Crew: 1 (2 in trainer version)

Number of Engines: 1

Day/Night Capable: Yes

All Weather Capable: Yes

Number of Hard Points: 2 x 661 lb (300 kg) outboard wing pylons for various weapons and stores

Dimensions

Length: 14.36 m

Width (Wing Span): 9.13 m

Wing Area: 40.97 m sq

Height: 5.20 m

Weight, Empty: 16,534 lbs (7,500 kg) (C, E and -5) 16,755 lbs (7,616 kg) (B, N, D, S)

Payload: 6,300 kg

Takeoff, Clean: 10,860 kg

Takeoff, Air-to-Air: 13,000 kg

Takeoff, Ground-Attack: 16,200 kg

Takeoff, Max: 17,000 kg

Automotive

Engine Name: 1 x SNECMA M53-P2 after-burning turbofan or 1 x SNECMA M53-P20 (later aircraft)

Number of Engines: 1

Power, Dry: 14,462 lbs (6,560 kg) static thrust 14,991 lbs (6,800 kg) static thrust for the P20

Afterburner: 9,700 kg

Fuel Capacity: 3,978 liters

Speed, High Altitude: 2,630 km/h, Mach 2.2

Speed, Low Altitude: 1,100 km/h), assuming no afterburner, 8 x 250 kg bombs and 2 x Magic AAM or (2000N) 1 x ASMP cruise missile

Minimum Speed: 185 km/h

Brake Release: 4 min (to 49,200 ft/15,000 m and Mach 2)

Rate of Climb: 17,060 m/min

Ceiling: 18,000 m

Communications

Radio: INA

Cannon Weapon System

↳*System*

Name: DEFA 554 30mm Cannon

Type: Cannon

Caliber: 30mm

In Service: 1954-Present

Manufacturer: CASA, Dassault Aviation, Matra, AEi Systems.

Length: m1.66

Weight: kg85

Barrels: 1

Action: Five-chamber revolver

Rate of Fire: 1,300 rpm

Muzzle Velocity: m/s815

↳*Ammunition*

Type: Rifle, Cannon

Caliber: 30mm

Cartridge: 30 × 113 mm

Basic Load: 125

Weapon Stations

Capacity: 4 x 882 lb (400 kg) capacity; 2 x 3,960 lb (1,800 kg) capacity fuselage (only one in 2000-5)

Pylons: 2 x 661 lb (300 kg) outboard wing pylons for various weapons and stores

Compatible Weapons, Air-to-Air: 2-4 x R550 Magic 2; 2-4 x AIM-9 Sidewinder; 2 x Super 530; 4-6 x MICA (2000-5);

Compatible Weapons, Air-to-Ground: 2 x AS30L; 1-2 x BGL laser-guided rocket/gun pods; 4 x 18-round 68-mm rocket pods; 2 x 100-mm rocket packs; 1 x CC630 twin 30-mm cannon pack

Compatible Weapons, Bombs: 18 x 79 lb (35 kg) BAP-100 anti-runway; 18 x 551 lb (250 kg) conventional; 16 x 441 lb (200 kg) Durandal anti-runway; 5-6 x Belouga cluster; 5-6 x 882 lb (400 kg) BM 400 modular; 1-2 x 2,205 lb (1,000 kg) BGL laser-guided

Compatible Weapons, Anti-Radar: 2 x Armat

Compatible Weapons, Anti-Ship: 2 x AM 39 Exocet

Compatible Weapons, Nuclear: 1 x ASMP cruise missile (2000N)

↳*Missile System (Option 1)*

Name: R550 Magic 2

Type: Short-Range Air-to-Air Missile

Basic Load: 2-4

Manufacturer: Matra, MBDA

In Service: 1986-Present

Proliferation: Brazil India France Greece Jordan Qatar Romania Taiwan

Length: 2.75 m

Diameter: 160 mm

Span, Foreplanes: 0.47 m

Span, Tailplanes: 0.66 m

Weight: 89 kg

Warhead: pre-fragmented with controlled splintering

Warhead Weight: 13 kg

Configuration: thin cylinder with rounded nose 2 sets of cruciform foreplanes, front "cropped delta" non-steering, rear compound sweep steerable rear cruciform "cropped delta" fins mounted on slip ring and rotating freely

Propulsion: Richard single-stage butylene solid-propellant rocket

Speed: Mach 3+

Effective Range: km3

Minimum Distance to Launch: m500

Altitude: 20,000 m

Guidance System: All-aspect, cooled IR seeker proximity fuze detonation

Platforms: Attack Attack A-4 Skyhawk Alpha Jet Jaguar Mirage V Mirage F1 Sea Harrier Super Etendard Fighters F-5 Tiger MiG-21 MiG-23 Mirage III Mirage 2000 Rafale F-16 Trainers Hawk Note: Users may employ the Magic on other aircraft that are capable of firing the AIM-9 Sidewinder

↳*Missile System (Option 2)*

Name: AS-30L

Type: MCLOS with radio command link / laser guided short-to-medium range air-to-ground missile

Basic Load: 2

In Service: 1985-Present

Manufacturer: Aérospatiale

Length: 3.7 m

Diameter: mm340

Weight: kg520

Warhead Type: Impact-fuzed SAPHE (Semi-Armor-Piercing High-Explosive)

Warhead Weight: kg240

Detonation Mechanism: Delayed AP impact fuse (2 m ferroconcrete)

Engine: Two-stage solid propellant rocket motors, composite booster, double-based sustainer

Wingspan: m1

Operational Range: km3-11

Flight Ceiling: m10,000

Speed: 1,700 km/h

Guidance System: semi-active laser homing

Launch Platforms: Mirage 2000D, Mirage 2000-5, F-16, Jaguar, Mirage F1, upgraded Super Etendard, Rafale

↳*Missile System (Option 3)*

Name: AM 39 Exocet

Type: Anti-Ship Missile

Basic Load: 2

In Service: 1974-Present

Manufacturer: 1979–1999: Aérospatiale 1999–2001: Aérospatiale-Matra 2001–present: MBDA

Length: m4.69

Diameter: mm348

Wingspan: m1.10

Weight: kg655

Configuration: slim, pointed cylinder cruciform cropped and swept delta mainplanes indexed in line with small cruciform tail planes

Propulsion: 2 SNPE double-base Nitramite smokeless solid-propellant rockets 1 Dondor booster with 2 sec burn 1 Helios sustainer with 130-150 sec burn

Speed: 1,100 km/h or Mach 0.93

Maximum Range: 50-70 km

Warhead Type: Hexolite blast-fragmentation

Warhead Weight: kg165

Senors /Fire Control: "fire-and-forget" TRT AHV-7 radio altimeter inertial navigation during first part of flight Electronique Marcel Dassault ADAC or Super ADAC I/J-band active radar homing in terminal phase that begins search approximately 5.4 nm (6.2 mi.; 10 km) from target's estimated position

Fire Control / Avionics

Fire Control System Type: INA

Navigation Radar: Thomson-CST RDI pulse Doppler, or Thomson-CSF RDM multi mode, or Thomson-CSF Antilope V ground-

scan (2000N), or Thales RDY multi-mode (2000-5/-5 Mk 2/-9)

Targeting: Atlis laser designator/marked target-seeker.

Note: The Mirage 2000 is available as a single-seat or two-seat multi-role fighter. The pilot flies the aircraft by means of a centre stick and left-hand throttles, with both incorporating hands-on-throttle-and-stick (HOTAS) controls. The pilot sits on a SEM MB Mk10 zero-zero ejection seat (a license-built version of the British Martin-Baker Mark 10). The instrument panel (in the Mirage 2000 C) is dominated by a Sextant VE-130 head-up display which presents data relating to flight control, navigation, target engagement and weapon firing, and a radar screen located centrally below it.

Protection

Stealth Properties: INA

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW Counter Measures: Jammer 1 x Caiman noise/deception and 2 x Remora noise pods

Chaffs/Flares: INA

Notes:

The Mirage 2000 is very similar to the Mirage III/5 and 50, though it is not a variant of the Mirage III/5 or 50 but an entirely new aircraft with advanced interceptor controls. In its secondary ground-attack role, the Mirage 2000 carries laser guided missiles rockets and bombs. There is a two-seat version of this aircraft, the 2000N (Penetration) which has nuclear standoff capability. The wings are low-mounted delta with clipped tips. There is one turbofan engine mounted in the fuselage. There are semicircular air intakes alongside the fuselage forward of the wings. There is a large, single exhaust which protrudes past the tail. The fuselage is tube-shaped with a pointed nose and a bubble canopy. There are no tail flats. The fin is swept-back and tapered with a clipped tip. The Mirage 2000-5 is a multi-role single-seater or two seater fighter. It differs from its predecessors mainly in its avionics; its new multiple target air-to-ground and air-to-air firing procedures linked to the use of RDY radar and its new visualization and control system. As a multi-role combat aircraft with versatile air-to-air mission capabilities, the Mirage 2000-5 integrates the state-of-the-art of the know-how based on the experience gained from the previous Mirage 2000 versions (Mirage 2000 DA, Mirage 2000 E, Mirage 2000 D) and is designed for the most-advanced armaments. The Mirage 2000 D, derived from the Mirage 2000N operated by the French Air Force, is a two-seater air-to-ground attack aircraft. The Mirage 2000D tactical penetration two-seater fighter carries air-to-ground high precision weapons which can be fired at a safe distance, by day or by night. Its navigation and attack system enable it to fly in any weather conditions, hugging the terrain at a very low altitude. Beyond the nuclear-weapons capabilities adopted for the Mirage 2000 N, the Mirage 2000 D armament includes laser-guided weapons, low-drag bombs, and the aircraft can also carry the APACHE cruise missile. The Mirage 2000 D geometrical characteristics and the main performance data are the same as those of the Mirage 2000-5.

Su-30 Russian Multirole Fighter Aircraft

Tiers:

System

Alternative Designations: Su-27PU
Description: Multirole Fighter Aircraft
Crew Su-30MK: 3
Takeoff /Landing Roll: 550/670
Max “G” Force: g+8
Ceiling: m17,500

↳Engines

16,755 lbs. thrust Saturn AL-31F turbofans, 27,558 lbs. thrust with afterburner: 2

↳Weight

Maximum Takeoff: kg38,000
Normal Takeoff: kg24,140
Empty: kg17,900

↳Speed

Maximum (at altitude): km/h2,125, Mach 2.0
Maximum (sea level): km/h1,350

↳Fuel

Internal: liters9,400

↳Range

Unrefueled: km3,000
One refueling: km5,200
With Aux Fuel: km4,390 (SM)

Combat Radius: km1,500

↳*Dimensions*

Length: m21.9

Wingspan: m14.7

Height: m6.4

↳*Standard Payload*

External: kg8,000

Hardpoints pylons: 12

↳*Survivability/Countermeasures*

Zero/zero ejection seat: Yes

Infrared and radar jammer: Yes

Radar and missile warning receivers: Yes

Chaff and flares: Yes

Gaseous oxygen for 10 hours of flight: Yes

ARMAMENT

30-mm gun mounted in the right wing: Yes

↳*30-mm gun, Gsh-30-1*

Range: m(practical) 4,000

Elevation/Traverse: None (rigidly mounted)

Ammo Type: HEFI, APT, CC

Rate of Fire: 1,500 rounds per minute

↳*Weapon & Ammunition Types*

30-mm Gsh-30-1 cannon: 150 rounds

80-mm S-8 rocket pod (20 ea.): Yes

122-mm S-13 rocket pod (5 each): Yes

250-kg, or 500-kg unguided and guided bombs: Yes

KAB-500Kr Bombs: 6

KAB-1500Kr Bombs: 2

AVIONICS/SENSOR/OPTICS

↳*Pulse-Doppler look-down/ shoot-down radar*

Search range: km240

Track range: km185

Multi Target Capability: Yes

IR Sensor: Yes

Laser Designator: yes

Heads Up Display: Yes

NOTES

Description: A SMALL NUMBER OF THE AIR SUPERIORITY FIGHTERS HAVE BEEN PRODUCED. THE GREATER EXPORT MARKET IS FOR MULTI-ROLE VERSIONS

↳*APPEARANCE*

VARIANTS

Description: TWO-SEATER AIRCRAFT IS SIGNIFICANTLY UPGRADED AND DERIVED FROM SU-27 SINGLE-SEAT AIRCRAFT.

↳*SU-30M*

Description: THE FIRST REAL MULTI-ROLE AIRCRAFT IN THE SU-27 FAMILY, WITH ALL NECESSARY SUB-SYSTEMS. THESE WERE CONVERTED INTO DEMONSTRATORS FOR EXPORTS.

↳*SU-30MK*

Description: EXPORT SERIES VERSION. THE SU-30MK2 ANTI-SHIP UPGRADE VERSION HAS BEEN EXPORTED.

↳*SU-30MKK/FLANKER-G*

Description: MULTI-ROLE UPGRADE UTILIZING AIR-TO-GROUND WEAPONS TO A MORE ADVANCED VERSION INCORPORATING NEW RADAR, CANARDS AND THRUST VECTORING.

↳*JJ-11*

Description: CHINESE LICENSE-BUILT VERSION.

↳*SU-30MKI/FLANKER-H*

Description: VERSION OF THE SU-30MK MADE FOR INDIA. MOST WILL BE PRODUCED BY AN INDIAN FIRM. SOME

WESTERN EQUIPMENT REPLACED MUCH OF THE RUSSIAN SYSTEMS.

↳*SU-30MKM*

Description: VERSION FOR USE BY MALAYSIA.

Notes:

The Sukhoi Su-30 (Russian: Сухой Су-30; NATO reporting name: Flanker-C) is a twin-engine, two-seat supermaneuverable fighter aircraft developed in the Soviet Union by Russia's Sukhoi Aviation Corporation. It is a multirole fighter for all-weather, air-to-air and air-to-surface deep interdiction missions. The Su-30 started out as an internal development project in the Sukhoi Su-27 family by Sukhoi. The design plan was revamped and the name was made official by the Russian Defense Ministry in 1996. Of the Flanker family, the Su-27, Su-30, Su-33, Su-34 and Su-35 have been ordered into limited or serial production by the Defense Ministry. The Su-30 has two distinct version branches, manufactured by competing organisations: KnAAPO and the Irkut Corporation, both of which come under the Sukhoi group's umbrella. KnAAPO manufactures the Su-30MKK and the Su-30MK2, which were designed for and sold to China, and later Indonesia, Uganda, Venezuela, and Vietnam. Due to KnAAPO's involvement from the early stages of developing Su-35, these are basically a two-seat version of the mid-1990s Su-35. The Chinese chose an older but lighter radar so the canards could be omitted in return for increased payload. It is a fighter with both air supremacy and attack capabilities, generally similar to the U.S. F-15E Strike Eagle. Irkut traditionally served the Soviet Air Defense and, in the early years of Flanker development, was given the responsibility of manufacturing the Su-27UB, the two-seat trainer version. When India showed interests in the Su-30, Irkut offered the multirole Su-30MKI, which originated as the Su-27UB modified with avionics appropriate for fighters. Along with its ground-attack capabilities, the series adds features for the air-superiority role, such as canards, thrust-vectoring, and a long-range phased-array radar. Its derivatives include the Su-30MKM, MKA, and SM for Malaysia, Algeria, and Russia, respectively. The Russian Air Force operates several Su-30s and has ordered the Su-30SM version. The integrated aerodynamic configuration, combined with the thrust vectoring control ability, results in high manoeuvrability and unique takeoff and landing characteristics. Equipped with a digital fly-by-wire system, the Su-30 is able to perform some very advanced manoeuvres, including the Pugachev's Cobra and the tailslide. These manoeuvers quickly decelerate the aircraft, causing a pursuing fighter to overshoot, as well as breaking a Doppler radar-lock, as the relative speed of the aircraft drops below the threshold where the signal registers to the radar. The aircraft's powerplant incorporates two Saturn AL-31F afterburning low-bypass turbofan engines, fed through intake ramps. Two AL-31Fs, each rated at 123 kN (28,000 lbf) of full afterburning thrust ensures Mach 2 in level flight, 1,350 km/h speed at low altitude, and a 230 m/s climbing rate. With a normal fuel reserve of 5,270 kg, the Su-30MK is capable of performing a 4.5-hour combat mission with a range of 3,000 km. An aerial refueling system increases the range to 5,200 km (3,200 mi) or flight duration up to 10 hours at cruise altitudes. The aircraft features autopilot ability at all flight stages including low-altitude flight in terrain-following radar mode, and individual and group combat employment against air and ground/sea-surface targets. Automatic control system interconnected with the navigation system ensures route flight, target approach, recovery to airfield and landing approach in automatic mode.

JH-7 (Flounder) Chinese Fighter/Bomber

Tiers:

Variants:

- **JH-7:** Initial production version of the PLANAF anti-shipping fighter-bomber.
- **JH-7A:** Later production utilising composite structure to reduce weight, improved flying control system and improved avionics including the JL10A Shan Ying J-band pulse-Doppler radar. Weapon loads increased by the addition of two more wing hardpoints and two hardpoints under the intake trunking for mission pods such as targeting pods.
- **JH-7E:** Possibly export variant, shown at 2018 Zhuhai Airshow.
- **FBC-1 Flying Leopard:** Export version of the JH-7.
- **FBC-1A Flying Leopard II:** Export version of the JH-7A.

System

Alternate Designation(s): Xi'an JH-7; Flounder; FBC-1 Flying Leopard.
Primary Function / Type: Fighter-Bomber
Manufacturer: Xi'an Aircraft Industry Corporation
Crew: 2
Number of Engines: 2
Number of Hard Points: 9 in total (6× under-wing, 2× wing-tip, 1× under-fuselage) with a capacity of 9,000 kg (20,000 lb) external fuel and ordnance,

Dimensions

Length: 21.00 m
Height: 6.22 m
Wingspan: 12.80 m
Wing Area: 52.3 m sq
Wheel Base: 7.80 m

Wheel Track: 3.06 m

Empty Weight: INA

Takeoff Weight: 27,415 kg

Automotive

Engine Name: 2 x Xian WS9 turbofan

Number of Engines: 2

Engine Type: licensed Rolls Royce Spey Mk 202

Engine Power, Dry: 55.83 kN each

Engine Power, Afterburner: 91.26 kN each

Maximum Speed at Altitude: 1,808 km/h at 1,000 m max

Cruise Speed: 903 km/h

Maximum Range: 3,100 km w/full internal fuel, full external fuel, no weapons

Radius: 900 km

Ceiling: 16,000 m

Takeoff Roll: 920 m

Landing Roll: 1,050 m

Main Gun System

↳*System*

Name: Gryazev-Shipunov GSh-23

Type: Autocannon

Caliber: 23mm

Length: 1,537 mm

Barrel Length: 1,000 mm

Weight: 50 kg

Barrels: 2

Action: Gast principle

Rate of Fire: 3,400–3,600 rounds/min

Muzzle Velocity: 715 m/s

↳*Ammunition*

Type: Autocannon

Caliber: 23mm

Cartridge: 23x115 mm

Basic Load: 1,500 Rounds

Main Missile Systems

Air-to-Air Missiles (Options): PL-5; PL-8' PL-9; PL-12

Anti-Ship Missiles (Options): Yingji-8K; Yingji-82K

Air-to-Surface Missiles (Options): CM-802A; KD-88; C-705; C-704

Anti-Radiation Missiles (Options): Yingji-91; LD-10; CM-102

↳*Main Missile System #1*

Name: C-802

Type: Anti-Ship Cruise Missile

Manufacturer: China Aerospace Science and Industry Corporation

Length: INA

Diameter: INA

Weight: INA

Warhead: 190 kg high-explosive fragmentation

Engine: French TRI 60-2 turbojet

Operational Range: 125 km

Maximum Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

↳*Main Missile System #2*

Name: C-801

Type: Anti-Ship Cruise Missile

Length: 5.81 m

Diameter: INA

Weight: 815 kg

Warhead Weight: 165 kg

Engine: Rocket

Propellant: solid rocket

Operational Range: 42 km

Flight Altitude: 5-7 m

Maximum Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Bomb Weapon Systems

Laser Guided Bombs (Options): GB1; GB5

Satellite Guided Bombs: LS-6; FT-12; GB6; FT-2; FT-3; FT-6

Fire Control / Avionics

Radar: Eagle Eye 232H multi-role pulse-Doppler
Fire Control Radar:
Laser Desingator: INA
Autopilot: triplex digital-analog
Air Data Computer: Type 8145
Radio Altimeter: WG-5A
Navigation: 210 Doppler
EW Radar Warning: RW1045 receiver
Active Jamming: 960-2 noise system
Passive Jamming: 914-4G system

Protection

Stealth Properties: INA
Heat Signature Reduction: INA
Add on Armor: INA
NBC Protection: Yes
EW Counter Measures: INA
Chaffs/Flares: INA

Notes:

The Xi'an JH-7 (Jianjiji Hongzhaji – fighter-bomber; NATO reporting name Flounder), also known as the FBC-1 (Fighter/Bomber China-1) Flying Leopard, is a tandem two-seat, twin-engine fighter-bomber in service with the People's Liberation Army Naval Air Force (PLANAF), and the People's Liberation Army Air Force (PLAAF). The main contractors are Xi'an Aircraft Industrial Corporation (XAC) and the 603rd Aircraft Design Institute (later named the First Aircraft Institute of AVIC-I). The first JH-7s were delivered to the PLANAF in the mid-1990s for evaluation, with the improved JH-7A entering service in 2004. In the early 1970s, the PLAAF required a new fighter-bomber to replace the Harbin H-5 and Nanchang Q-5. A request was duly submitted to the Ministry of Aviation Industry (later renamed to the Aviation Industry Corporation of China), which organized a domestic development program when efforts to secure a joint venture with foreign partners failed. The program was authorized on 19 April 1983 by then-paramount leader Deng Xiaoping. The program was also aiming to make use of newly imported British Rolls-Royce Spey turbofan engines at the time. The PLANAF required a similar aircraft and the program set out to develop a variant for each set of requirements. The PLAAF variant would be a two-man all-weather deep strike bomber, with side-by-side cockpit seating, electronic countermeasures (ECM), and terrain following capabilities similar to the General Dynamics F-111. The PLANAF would receive a two-man all-weather, tandem cockpit, strike and reconnaissance aircraft. The PLAAF variant was dropped in the early 1980s, with the PLANAF variant becoming the JH-7. Six prototypes were built by December 1988, and the PLANAF received 12 to 18 aircraft in the early 1990s for evaluation. The first aircraft used imported Rolls-Royce Spey Mk.202 engines, later replaced by a license-built copy, the WS-9. They were equipped with the Type 243H multifunction radar, which could detect ships at a maximum of 175 kilometres (109 mi), and MiG-21-sized aerial targets at 75 kilometres (47 mi). The JH-7 was designed as an anti-shipping fighter-bomber. As with the later JH-7A, its aerial combat capability was insignificant given the large number of specialist aircraft for that role.

JH-7A (Flounder) Chinese Fighter/Bomber

Tiers:

Variants:

- **JH-7:** Initial production version of the PLANAF anti-shipping fighter-bomber.
- **JH-7A:** Later production utilising composite structure to reduce weight, improved flying control system and improved avionics including the JL10A Shan Ying J-band pulse-Doppler radar. Air-to-Air Missiles (Options): PL-5; PL-8' PL-9; PL-12

Anti-Ship Missiles (Options): Yingji-8K; Yingji-82K

Air-to-Surface Missiles (Options): CM-802A; KD-88; C-705; C-704

Anti-Radiation Missiles (Options): Yingji-91; LD-10; CM-102

↳*Main Missile System #1*

Name: C-802

Type: Anti-Ship Cruise Missile

Manufacturer: China Aerospace Science and Industry Corporation

Length: INA

Diameter: INA

Weight: INA

Warhead: 190 kg high-explosive fragmentation

Engine: French TRI 60-2 turbojet

Operational Range: 125 km

Maximum Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

↳*Main Missile System #2*

Name: C-801

Type: Anti-Ship Cruise Missile

Length: 5.81 m

Diameter: INA

Weight: 815 kg

Warhead Weight: 165 kg

Engine: Rocket

Propellant: solid rocket

Operational Range: 42 km

Flight Altitude: 5-7 m

Maximum Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Bomb Weapon Systems

Laser Guided Bombs (Options): GB1; GB5

Satellite Guided Bombs: LS-6; FT-12; GB6; FT-2; FT-3; FT-6

Fire Control / Avionics

Radar: L-10A multi-mode pulse-Doppler radar

Fire Control Radar: Upgraded Fire Control Radar System, name: INA.

Laser Desingator: INA

Autopilot: triplex digital-analog

Air Data Computer: Type 8145

Radio Altimeter: WG-5A

Navigation: the Blue Sky low-altitude navigational pod (similar to LANTIRN)

EW Radar Warning: RW1045 receiver

Active Jamming: 960-2 noise system

Passive Jamming: 914-4G system

Fly-By-Wire Controls: digital fly-by-wire (FBW) controls

Combat Avionics Detection Range: The combat avionics can reportedly detect targets at a range of 54 nm (62 mi, 100 km), simultaneously track 14 targets and attack four to six.

Note: A laser designation pod may be under the port engine intake to pain targets for LGBs.

Protection

Stealth Properties: INA

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

When the PLA examined the future role of air forces, it identified a need for precision air-to-surface capability. An improved JH-7, the JH-7A, was designed to meet this requirement. The JH-7A's general and deputy general designers were Tang Changhong (□□□) and Wu Jieqin (□□□) respectively. The JH-7A had a lighter and stronger airframe than the JH-7, allowing the newer aircraft to carry a maximum ordnance load of 9,000 kg. In PLANAF, this allowed four YJ-82 anti-ship missiles to be carried, compared to the two on the JH-7. The JH-7A is equipped with domestic Chinese helmet mounted sight (HMS) for evaluation, and this HMS currently being tested is developed by Xi'an Optronics Group (Xi Guang Ji Tuan □□□□), a member of Northern Electro-Optic Co. Ltd (□□□□□□□□□□), the wholly owned subsidiary of Norinco, and the HMS on JH-7A was developed from the helicopter HMS manufactured by the same company, thus both share many common components. HMS tested on JH-7A is compatible with air-to-air/surface missiles, and it is also compatible with airborne sensors such as radars and electro-optics so that the sensors are slaved to HMS, enabling the fast tracking and aiming of the weaponry. The cockpit of JH-7A still retains some traditional single function dial indicators, but there are two large color liquid crystal display multi-function displays which can be monochrome if pilots choose. Other avionic upgrades of JH-7 include: replacing Type 960-2 noise jammer with BM/KJ-8605, replacing Type 265A radar altimeter with Type 271 radar altimeter, fully digitized fly-by-wire flight control system, and in addition, Type 232H airborne radar is replaced by JL-10A pulse-Doppler radar, enabling JH-7A to fire laser-guided bombs and Kh-31P anti-radiation missiles. The existing JH-7s were upgraded with JH-7A electronics. Two additional hardpoints increased the total to 6 from the original 4, and one-piece windscreen replaced the original three-piece windscreen. The JH-7A was the first Chinese aircraft to use paperless design, and the software used was CATIA V5.

Su-17 (Fitter) Russian Fighter-Bomber Aircraft

AVIONICS/SENSOR/OPTICS

Description: Simple

NOTES

Description: THE MID-WING PIVOT POINT OF THE SWEEP WINGS ALLOWS FOR POSITIONS OF 28, 45 OR 62 DEGREES. UP TO FOUR EXTERNAL FUEL TANKS CAN BE CARRIED ON WING PYLONS AND UNDER THE FUSELAGE. WHEN UNDER-FUSELAGE TANKS ARE CARRIED, ONLY THE TWO INBOARD WING PYLONS MAY BE USED FOR ORDNANCE. AVAILABLE MUNITIONS ARE SHOWN ABOVE; NOT ALL MAY BE EMPLOYED AT ONE TIME. MISSION DICTATES WEAPONS CONFIGURATION. EXTERNAL STORES ARE MOUNTED ON UNDERWING AND UNDERBODY HARDPOINTS. EACH WING HAS TWO POINTS, AND THE FUSELAGE HAS FOUR ATTACHMENT POINTS FOR A TOTAL OF EIGHT STATIONS. GUN PODS CAN BE MOUNTED TO FIRE REARWARD.

↳*APPEARANCE*

VARIANTS

Description: AIRCRAFT WAS DERIVED FROM SU-7 FITTER A BY INCORPORATING VARIABLE WINGS. MANY VARIANTS ARE IN USE; HOWEVER, THE M3 AND M4 ARE THE MOST PROLIFERATED VERSIONS. DOMESTIC AIRCRAFT USE NOMENCLATURE SU-17. EXPORT VERSIONS USE SU-20 AND SU-22.

↳*SU-17/-17MK/-20/FITTER C*

Description: THE FIRST PRODUCTION VERSION. EXPORT IS CALLED SU-20.

↳*SU-17M/ -17M2/ -17M2D FITTER D*

Description: EXTERNAL DOPPLER-NAV AND INTERNAL LASER RANGEFINDER. RECONNAISSANCE VERSION CALLED SU-17R.

↳*SU-17UM/-22U/FITTER E*

Description: TWO-SEAT TRAINER WITH COMPONENTS OF SU-17M.

↳*SU-17/FITTER G*

Description: COMBAT-READY TWO-SEAT TRAINER VARIANT OF FITTER H. EXPORT VERSION IS SU-22, WITH TUMANSKY ENGINE.

↳*SU-17/-17M3/FITTER H*

Description: INCREASED PILOT VISIBILITY BY DROOPING THE AIRCRAFT NOSE, AND INCORPORATED AN INTERNAL DOPPLER-NAV AND LASER RANGEFINDER. RECONNAISSANCE VERSION CALLED SU-17M3R.

↳*SU-17M4/-22M4/FITTER K*

Description: FIGHTER-BOMBER. ESSENTIALLY SAME AS ABOVE, BUT WITH AN ADDITIONAL AIR INTAKE. EMPLOYS

DIGITAL NAVIGATION AND ATTACK AVIONICS.

↳***SU-22/FITTER F***

Description: EXPORT VERSION OF FITTER D WITH TUMANSKY ENGINE.

↳***SU-22/-22M3/FITTER J***

Description: SIMILAR TO FITTER H, BUT WITH INCREASED INTERNAL FUEL CAPACITY.

Notes:

The Sukhoi Su-17 (NATO reporting name: Fitter) is a Soviet variable-sweep wing fighter-bomber developed from the Sukhoi Su-7. It enjoyed a long career in Soviet, later Russian, service and was widely exported to Eastern Bloc, Arab air forces, Angola and Peru as the Su-20 and Su-22. It is the first variable-sweep wing of Russian/Soviet origin. Seeking to improve low-speed and take-off/landing performance of the Su-7B fighter-bomber, in 1963 the Sukhoi OKB with input from TsAGI created a variable-sweep wing technology demonstrator. The Su-7IG (internal designation S-22I, NATO designation "Fitter-B"), converted from a production Su-7BM, had fixed inner portions of the wing with movable outer segments which could be swept to 28°, 45°, or 62°.

Su-27 (Flanker) Russian Multirole Fighter Aircraft

Tiers:

Variants:

- **Soviet era:** T10 ("Flanker-A") Initial prototype configuration. T10S Improved prototype configuration, more similar to production spec. P-42 Special version built to beat climb time records. The aircraft had all armament, radar and paint removed, which reduced weight to 14,100 kg. It also had improved engines. Similar to the US F-15 Streak Eagle project. Between 1986-1988, it established and took several climb records from the Streak Eagle. Several of these records (such as time to climb to 3000m, 6000m, 9000m, 12000m) still stands current as of 2019. Su-27 Pre-production series built in small numbers with AL-31 engine. Su-27S (Su-27 / "Flanker-B") Initial production single-seater with improved AL-31F engine. The "T10P". Su-27P (Su-27 / "Flanker-B") Standard version but without air-to-ground weapons control system and wiring and assigned to Soviet Air Defence Forces units. Often designated Su-27 without -P. Su-27UB ("Flanker-C") Initial production two-seat operational conversion trainer. Su-27SK Export Su-27S single-seater. Exported to China in 1992-1996 and developed into Shenyang J-11. Su-27UBK Export Su-27UB two-seater. Su-27K (Su-33 / "Flanker-D") Carrier-based single-seater with folding wings, high-lift devices, and arresting gear, built in small numbers. They followed the "T10K" prototypes and demonstrators. Su-27KUB (Su-33UB) Two-seat training-and-combat version based on the Su-27K and Su-27KU, with a side-by-side seating same as Su-34. One prototype built. Su-27M (Su-35/Su-37 / "Flanker-E/F") Improved demonstrators for an advanced single-seat multi-role Su-27S derivative. These also included a two-seat "Su-35UB" demonstrator. Su-27PU (Su-30) Two-seat version of the Su-27P interceptor, designed to support with tactical data other single-seat Su-27P, MiG-31 and other interceptor aircraft in PVO service. The model was later renamed to Su-30, and modified into a multi-role fighter mainly for export market, moving away from the original purpose of the aircraft. Su-32 (Su-27IB) Two-seat dedicated long-range strike variant with side-by-side seating in "platypus" nose. Prototype of Su-32FN and Su-34.
- **Post-Soviet era:** Su-27PD Single-seat demonstrator with improvements such as inflight refuelling probe. Su-30M/MK Next-generation multi-role two-seater. A few Su-30Ms were built for Russian evaluation in the mid-1990s, though little came of the effort. The Su-30MK export variant was embodied as a series of two demonstrators of different levels of capability. Versions include Su-30MKA for Algeria, Su-30MKI for India, Su-30MKK for the People's Republic of China, and Su-30MKM for Malaysia. Shenyang J-11 Chinese version of Su-27SK. Su-27SM (Flanker-B Mod. 1) Mid-life upgraded Russian Su-27S, featuring technology evaluated in the Su-27M demonstrators. Su-27SKM Single-seat multi-role fighter for export. It is a derivative of the Su-27SK but includes upgrades such as advanced cockpit, more sophisticated self-defense electronic countermeasures (ECM) and an in-flight refuelling system.[61] Su-27UBM Comparable upgraded Su-27UB two-seater. Su-27SM2 4+ gen block upgrade for Russian Su-27, featuring some technology of the Su-35BM; it includes Irbis-E radar, and upgraded engines and avionics. Su-27SM3 The same as the Su-27SM but is built new rather than a mid-life upgrade. Su-27KUB Essentially an Su-27K carrier-based twin-seater with a side-by-side cockpit, for use as a naval carrier trainer or multi-role aircraft. Su-35BM/Su-35S Also named the "Last Flanker" is latest development from Sukhoi Flanker family. It features improved thrust vectoring AL-41F1S engines, new avionics, N035 Irbis-E radar and reduced radar cross-section. Su-27UB1M Ukrainian modernized version of the Su-27UB. Su-27UP1M Ukrainian modernized version of the Su-27UP. Su-27S1M Ukrainian modernized version of the Su-27S. Su-27P1M Ukrainian modernized version of the Su-27P.

Multi Target Capability: Yes
IR Sensor: Yes
Laser Designator: Yes
Heads Up Display: Yes

NOTES

Description: THE SU-27 IS PRIMARILY AN ALL-WEATHER INTERCEPTOR/FIGHTER AIRCRAFT USED FOR AIR DEFENSE. LATER VERSIONS ARE CAPABLE OF ALSO PERFORMING GROUND ATTACK MISSIONS. IT IS HIGHLY MANEUVERABLE BECAUSE OF A FLY-BY-WIRE CONTROL SYSTEM, WHICH AUTOMATICALLY RESTRICTS AIRCRAFT ANGLES OF ATTACK AND MAXIMUM G-LOADS DURING FLIGHT. EXTERNAL FUEL TANKS CAN BE CARRIED ON SOME VARIANTS, AND SOME ARE FITTED FOR AERIAL REFUELING, BUT THESE ARE GENERALLY NAVAL VERSIONS RATHER THAN AIR DEFENSE OR STRIKE VERSIONS. AVAILABLE MUNITIONS ARE SHOWN ABOVE--NOT ALL MAY BE EMPLOYED AT ONE TIME. MISSION DICTATES WEAPONS CONFIGURATION. EXTERNAL STORES ARE MOUNTED ON UNDERWING AND UNDERBODY HARDPOINTS. EACH WING HAS TWO POINTS AND AN ADDITIONAL RAIL ON THE WINGTIP. TWO POINTS ARE UNDER THE INTAKES ALONG THE FUSELAGE, AND TWO ARE CENTRALLY LOCATED UNDERNEATH THE FUSELAGE NEAR THE CENTERLINE AND BETWEEN THE INTAKES FOR A TOTAL OF TEN STATIONS.

↳***APPEARANCE***

VARIANTS

↳*SU-27/FLANKER B*

Description: PRODUCTION SINGLE-SEAT AIR SUPERIORITY FIGHTER USED IN RUSSIAN UNITS. THERE ARE DOZENS OF UPGRADE PROGRAMS, MORE THAN A DOZEN FIELDED VARIANTS, AND SEVERAL DEVELOPED AIRCRAFT WITH DIFFERENT DESIGNATORS (SU-30, SU-34, SU-35, AND SU-37).

↳*SU-27SK/-27P/FLANKER B*

Description: VARIANT EXPORTED TO CHINA WITH GROUND ATTACK CAPABILITY.

↳*J-11*

Description: CHINESE BUILT VERSION.

↳*SU-27SM*

Description: MULTI-ROLE VERSION, WITH 12 HARDPOINTS, GREATER INTERNAL FUEL AND PAYLOAD CAPACITY, AND AIR REFUEL CAPABILITY.

↳*SU-27UB/FLANKER C*

Description: TWO-SEAT MODEL (EXPORT -UBK), AS COMMAND AIRCRAFT, TRAINER AND INTERCEPTOR.

↳*JJ-11*

Description: CHINESE BUILT VERSION

↳*SU-27K/FLANKER D*

Description: NAVAL VARIANT, READILY NOTICEABLE BY CANARDS FORWARD OF THE WINGS.

↳*SU-27M/FLANKER E*

Description: MULTI-ROLE UPGRADE WITH HIGHER FINS, UPGRADED AVIONICS, ETC., DEVELOPED IN LATE 1980S. AN EXPORT VERSION CALLED SU-35 WAS MARKETED. IT HAD MORE POWERFUL 28,218-SHP LYLUKA AL-31FM ENGINES, THRUST-VECTORING NOZZLES FOR HIGHER GROSS WEIGHT AND GREATER RANGE. IT ALSO FEATURED BETTER RADAR AND TARGETING SYSTEMS FOR MULTIPLE ENGAGEMENTS. DIMENSIONS SLIGHTLY INCREASED, NOTICEABLE BY CANARDS FORWARD OF WINGS. FIELDING WAS MINIMAL, AND NONE WERE SOLD.SU-35UB WAS A TWO-SEATER UPGRADE VERSION.

↳*SU-37/"SUPER FLANKER"*

Description: SINGLE-SEAT MULTI-ROLE FIGHTER WITH THRUST VECTORING CAPABILITY AND SUFFICIENT MOBILITY FOR THE KULBIT PITCH-UP MANEUVER INTO A TIGHT 360 DEGREE SOMERSAULT, AS WELL AS IMPROVED LONG-RANGE WEAPONS AND FIRE CONTROL. EXPECTED FUTURE PRODUCTION VERSION IS SU-37MR. HOWEVER, AFTER THE ONE SU-27M CONVERSION TO SU-37 CRASHED DURING A FERRY FLIGHT, ALL WORK ON THE AIRCRAFT ENDED IN 2002. PRODUCTION IS UNLIKELY.

↳*SU-27/SU-30 MAJOR/MINOR MODERNIZATION*

Description: UPGRADE PROGRAMS ARE BEING IMPLEMENTED TO BRING SU-27S UP TO SU-30 STANDARD, AND SOME SINGLE-SEAT UPGRADES TO THE STANDARD.

↳*SU-30/FLANKER-F*

Description: PRODUCTION TWO-SEATER AIRCRAFT DEVELOPED FROM SU-27.

↳*SU-34/FULLBACK*

Description: THIS 2-SEAT BOMBER VERSION HAS A SIDE-BY-SIDE COCKPIT, HIGH PAYLOAD FOR USE IN BOMBER MISSIONS AND MANEUVERABILITY SIMILAR TO FIGHTERS. EARLIER DESIGNATIONS INCLUDE: SU-27IB, SU-32, SU-32FN, AND SU-32MF.PRODUCTION AND EARLY FIELDING IS NOW UNDERWAY. THIS AIRCRAFT IS SCHEDULED TO GENERALLY REPLACE SU-24S IN RUSSIAN FORCES FOR THE STRIKE ROLE.

↳*SU-35/SU-27BM*

Description: THIS NEW SINGLE-SEATER MULTI-ROLE FIGHTER IS DEVELOPED TO REPLACE SU-27M. THE 4+++ GENERATION PROTOTYPE FIRST FLEW IN 2008.IT INCLUDES A NEW AIRFRAME, WITH LARGER WINGS AND INTAKES, BUT NO CANARDS. IT HAS BIGGER ENGINES, NEW IRBIS-E PHASED-ARRAY RADAR, NEW IRST, AND 12 HARD POINTS FOR THE LATEST WEAPONS ARE INCLUDED. THE SU-35 EXPORT VERSION IS COMPLETELY DIFFERENT FROM THE PREVIOUS AIRCRAFT WITH THE SAME DESIGNATION. THE AIRCRAFT IS DUE TO BEGIN PRODUCTION IN 2010, WITH FOCUS ON EXPORT CUSTOMERS. AN ATTRACTIVE FEATURE IS NO USE OF WESTERN TECHNOLOGY, WHICH IS VULNERABLE TO EXPLOITATION OR EXPORT RESTRICTIONS. THE RUSSIAN DOMESTIC VERSION IS SU-35S.

Notes:

The Sukhoi Su-27 (Russian: Сухой Су-27; NATO reporting name: Flanker) is a Soviet-origin twin-engine supermaneuverable fighter aircraft designed by Sukhoi. It was intended as a direct competitor for the large United States fourth-generation fighters such as the Grumman F-14 Tomcat and F-15 Eagle, with 3,530-kilometre (1,910 nmi) range, heavy aircraft ordnance, sophisticated avionics and high maneuverability. The Su-27 was designed for air superiority missions, and subsequent variants are able to perform almost all aerial warfare operations. It was designed with the Mikoyan MiG-29 as its complement. The Su-27 entered service with the Soviet Air Forces in 1985. The primary role was long range air defence against American SAC B-1B and B-52G/H bombers, protecting the Soviet coast from aircraft carriers and flying long range fighter escort for Soviet heavy bombers such as the Tu-95 "Bear", Tu-22M "Backfire" and Tu-160 "Blackjack". There are several related developments of the Su-27 design. The Su-30 is a two-seat, dual-role fighter for all-weather, air-to-air and air-to-surface deep interdiction missions. The Su-33 'Flanker-D' is a naval fleet defense interceptor for use on aircraft carriers. Further versions include the side-by-side two-seat Su-34 'Fullback' strike/fighter-bomber variant, and the Su-35 'Flanker-E' improved air superiority and multi-role fighter. The Shenyang J-11 is a Chinese licence-built version of the Su-27. The Su-27's basic design is aerodynamically similar to the MiG-29, but it is substantially larger. The wing blends into the fuselage at the leading edge extensions and is essentially a cross between a swept wing and a cropped delta (the delta wing with tips cropped for missile rails or ECM pods). The fighter is also an example of a tailed delta wing configuration, retaining conventional horizontal tailplanes. The Su-27 had the Soviet Union's first operational fly-by-wire control system, based on the Sukhoi OKB's experience with the T-4 bomber project. Combined with relatively low wing loading and powerful basic flight controls, it makes for an exceptionally agile aircraft, controllable even at very low speeds and high angle of attack. In airshows the aircraft has demonstrated its maneuverability with a Cobra (Pugachev’s Cobra) or dynamic deceleration – briefly sustained level flight at a 120° angle of attack. The naval version of the 'Flanker', the Su-27K (or Su-33), incorporates canards for additional lift, reducing takeoff distances. These canards have also been incorporated in some Su-30s, the Su-35, and the Su-37. The Su-27 is equipped with a Phazotron N001 Myech coherent Pulse-Doppler radar with track while scan and look-down/shoot-down capability. The fighter also has an OLS-27 infrared search and track (IRST) system in the nose just forward of the cockpit with an 80–100 km range. The Su-27 is armed with a single 30 mm Gryazev-Shipunov GSh-30-1 cannon in the starboard wingroot, and has up to 10 hardpoints for missiles and other weapons. Its standard missile armament for air-to-air combat is a mixture of R-73 (AA-11 Archer) and R-27 (AA-10 'Alamo') missiles, the latter including extended range and infrared homing models.

Y-5 (Colt) Chinese Single-Engine Biplane

Tiers:

1 2 3 4

System

Alternate Designation(s):	Y-5
Primary Function / Type:	Single-engine biplane utility/agricultural aircraft
Manufacturer:	Antonov
Crew:	1-2
Number of Engines:	1

Dimensions

Length:	12.4 m
Upper Wingspan:	18.2 m
Lower Wingspan:	14.2 m
Height:	4.1 m
Wing Area:	71.52 m2 (769.8 sq ft)
Airfoil:	TsAGI R-11 (14%)
Empty Weight:	3,300 kg
Gross Weight:	5,440 kg
Fuel Capacity:	1,200 l (320 US gal; 260 imp gal)

Automotive

Engine Name:	1 × Shvetsov ASh-62IR

Number of Engines: 1

Engine Type: 9-cylinder air-cooled supercharge radial piston engine

Engine Power: 1,010 hp

Maximum Range: 845 km (525 mi, 456 nmi)

Maximum Speed: 258 km/h (160 mph, 139 kn)

Cruise Speed: 190 km/h (120 mph, 100 kn)

Stall Speed: 50 km/h (31 mph, 27 kn) circa

Service Ceiling: 4,500 m (14,800 ft)

Rate of Climb: 3.5 m/s (690 ft/min)

Fuel Consumption: 185–200 l/h (49–53 gal/h; 41–44 imp gal/h)

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

Y-5 Colt small general purpose transport Due to the need of domestic airline industry and the actual possibility in production, the aviation industry made a decision of license production of the An-2 aircraft in October 1956. The An-2 is a small general purpose transport developed by the Soviet Union. it is good in flying performance and economics, easy to operate and maintain, safe and reliable. It is a conventional biplane with tail wheel type landing gear. A piston engine drives a four blades metal propeller. It can operate from an airstrip. The Chinese designation of the An-2 is Y-5 [the Y-4 designation for the Douglas/Lisunov C-47 or Li-2 is questionable]. Its prototype production was decided to be undertaken by the Nanchang Aircraft Factory. Although the factory had experience in production of the CJ-5 trainer, it was the first time to build a transport. Prior to the arrival of drawings from the Soviet Union an An-2 transport was borrowed from the Chinese airline for familiarization of its structural and manufacturing features by engineers. They made a plan for prototype production and set up rules for manufacture. After the Soviet drawings arrived at the factory in January 1957, the technical people were organized to study these drawings and documents in Russian. Based on these drawings and their own practice in the prototype production of a new aircraft, engineers in the Nanchang Aircraft Factory prepared themselves 6,960 manufacturing processes and designed and manufactured 3,000 pieces of production tooling. To improve the efficiency in the prototype production they boldly used some new techniques such as a coordination method which used both standard parts and reference holes, and standardization of production tooling designs. It was particularly commendable that the Nanchang Aircraft Factory fulfilled the task of prototype production without expanding its factory floor area and only by addition of seven machines. In October 1957 first Y-5 completed its final assembly and successfully passed static test. On December 7 another Y-5 made its first flight. In March 1958 the Military Products Certification Commission of the State Council certificated Y7-5's design for serial production. In May of the same year the Y-5 was exhibited at a National Farm Tools Exhibition in Beijing. The basic Y-5 was a transport. Based on it a number of derivatives were developed in the process of mass production according to user's different requirements. An agricultural version was produced in 1958 according to the Soviet drawings and 229 aircraft were produced. A passenger version was derived in 1959 and 114 aircraft were produced and were used on regional air lines. Afterwards, the versions for training of navigator-bomber, parachuting and aerial photography were successively produced. A total of 727 Y-5s of all versions were produced by the Nanchang Aircraft Factory from 1958 to 1968. The continued production of the Y-5 was transferred to the Shijiazhuang Aircraft Factory in 1970 and 221 Y-5s were produced there by the end of 1986. In all, 948 Y-5s were turned out. The Y-5 is the first transport produced in China. It is also a transport which was produced in largest quantity and in the longest period of time. Its various versions played remarkable roles in many areas of national economy. It flew over all the places in our motherland. The Y-5s were also supplied to some countries in Asia and Europe and have been a witness to the exchange between China and foreign countries. The long lasting production and operation of the Y-5s showed the existence of a broad market for small transport in China. In the Chinese newspaper Shijiazhuang Daily, information appeared that China

will supply to Russia a batch of Y5B aircraft, which are essentially a licensed copy of the Soviet An-2 aircraft. Judging by the sources of the publication, aircraft are purchased for use by an unnamed company from the Ural region of the Russian Federation. So, back in mid-October 2019, at a general aviation exhibition in China, preliminary agreements were signed between Tupolev PAO and AVIC Tongfei North China Aircraft Industry Company, Ltd. According to the agreement, the Chinese side will have to supply an unknown operator from Russia with a batch of ten Y5B aircraft, which are a licensed copy of the Soviet An-2 aircraft. Russian engineers intend to develop a completely new light multi-functional aircraft, designed to replace the legendary An-2. The development of the aircraft should be undertaken by the Baikal-Engineering company, which was selected as a result of an open tender. According to reports, the first prototype of the new aircraft should be ready by December 2020.

J-10 (Firebird) Chinese Multirole Combat Aircraft

Tiers:

Variants:

- **J-10A:** Single seat multi-role variant. The export designation is F-10A.
- **J-10S:** Tandem-seated trainer variant of J-10A.
- **J-10B:** An upgraded J-10, initially identified as "Super-10". It features a lighter and stealthier diverterless supersonic inlet, a longer nose radome possibly housing an active electronically scanned array radar, an electro-optic targeting sensor (IRST, and laser rangefinder,) and a new electronic warning or countermeasures pod atop the vertical stabiliser. The aircraft is powered by the AL-31FN M1; one unit was flown with a WS-10A in July 2011 but that engine was not selected for the initial production batch. The aircraft's first flight occurred no later than December 2008.
- **J-10C:** An upgraded version of J-10B, it is equipped with an indigenous Active electronically scanned array (AESA) fire-control radar and is equipped with infrared-homing PL-10 and new long range PL-15 air-to-air missile (AAM).
- **FC-20:** Single seat multi-role fighter jet, the export version of the J-10.
- **J-10B TVC Demonstrator:** A prototype fighter based on J-10B that is equipped with WS-10B thrust-vectoring control engine. The fighter has supermaneuverability, capable of performing Pugachev's Cobra.

System

Alternate Designation(s): Chengdu J-10; Firebird

Primary Function / Type: Multirole Combat Aircraft

Manufacturer: Chengdu Aircraft Industry Group

Crew: 1

Number of Engines: 1

Number of Hard Points: 11 in total (6× under-wing, 2× under-intake and 3× under-fuselage) with a capacity of 7,000 kg (15,400 lb) external fuel and ordnance

Dimensions

Length: 16.43 m

Height: 5.43 m

Width (Wing Span): 11.30 m

Wing Area: 45.5 m sq

Canard Span: 5.30 m

Canard Area: 4.7 m sq

Empty Weight: 9,730 kg

Maximum Takeoff Weight: 24,650 kg

Payload: 9,500 kg

Automotive

Engine Name: 1 x Saturn Lyulka AL-31F

Number of Engines: 1

Engine Power: 27,558 lb (12,500 kg) static thrust

Maximum Range: 1,853 km

Maximum Speed: Mach 1.85-2.0 max

Service Ceiling: 18,000 m

Fuel Capacity, Internal: 4,470 kg

Fuel Capacity, External: 5,650 kg

Radius, Hi-Lo-Hi: 2,540 km

Radius, Lo-Lo-Lo: 1,310 km

Main Gun System

↳*System*

Name: Gryazev-Shipunov GSh-23

Type: Autocannon

Caliber: 23mm

Length: 1,387 mm

Barrel Length: 1,000 mm

Weight: 49.2 kg

Barrels: 2

Action: Gast principle

Rate of Fire: 3,400–3,600 rounds/min

Muzzle Velocity: 715 m/s

↳*Ammunition*

Type: Autocannon

Caliber: 23mm

Cartridge: 23x115 mm

Basic Load: 1,500 Rounds

Missile Weapon System

↳*Missile System #1*

Name: PL-10 (ASR)

Type: Air-to-Air Missile

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC)

Length: 3.0 m

Weight: 89 kg

Diameter: INA

Warhead: Blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: Laser proximity fuse and impact

Engine: Solid-propellant rocket

Guidance System: Multi-element imaging infrared

Maximum Range: 60 km

Note: The missile is fitted with a multi-element IIR seeker capable of +/-90 degree off boresight angles. The missile seeker can be slaved to a helmet-mounted display (HMD),allowing the pilot to track a target beyond the aircraft's radar scan envelope using the missile's high off-boresight capability, achieved by the pilot turning his head towards the target to lock-on, better known as "look and shoot". Flight is controlled by a thrust-vector controlled solid rocket motor and free-moving type control wings on the missile's tail. The central portion of the missile has long, thin strakes, which help maintain missile maneuverability in the terminal homing stage after the rocket motor stops firing.

↳*Missile System #2*

Name: PL-11

Type: Air-to-Air Missile

Manufacturer: Shanghai Aerospace Bureau

Length: 3.89 m

Diameter: 0.286 m

Wingspan: 0.68 m

Weight: 310 kg (Some sources claim 220 kg)

Speed: Mach 4

Maximum Range: 40 – 75 km, depending on the size, speed, and heading of the target

Note: PL-11 did not enter Chinese service in very large numbers because it was only used as a stopgap measure until the more advanced PL-12 became available, and there is no confirmed export either.

↳*Missile System #3*

Name: PL-12

Type: Air-to-Air Missile

Manufacturer: People's Republic of China

Length: INA

Diameter: INA

Wingspan: INA

Weight: 180 kg

Operational Range: 100 km

Guidance System: Active Radar

Rocket Weapon System

Note: 90 mm unguided rocket pods

Bomb Weapon System

Fire Control / Avionics

Fire Control Radar: Type 1473H pulse-doppler fire control radar

Laser Desingator: INA

Externally Mounted Avionic Pods: *Type Hongguang-I infra-red search and track pod *BM/KG300G self-protection jamming pod *KZ900 electronic reconnaissance pod *Blue Sky navigation/attack pod *FILAT (Forward-looking Infra-red Laser Attack Targeting) pod

Protection

Stealth Properties: INA

Heat Signature Reduction: INA

Add on Armor: No

NBC Protection: Yes

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The Chengdu J-10 (simplified Chinese: □-10; traditional Chinese: □-10; NATO reporting name: Firebird[dubious – discuss], also known as Vigorous Dragon (Chinese: □□; pinyin: Měnglóng), is a single-engine, lightweight multirole fighter aircraft capable of all-weather operation, configured with a delta wing and canard design, with fly-by-wire flight controls, and produced by the Chengdu Aircraft Corporation (CAC) for the People's Liberation Army Air Force (PLAAF). J-10 was designed and developed by the Chengdu Aircraft Design Institute (CADI), a subsidiary of Chengdu Aircraft Corporation. The airframe is constructed from metal alloys and composite materials for high strength and low weight, the airframe aerodynamic layout adopts a "tail-less canard delta" wing configuration. A large delta wing is mid-mounted towards the rear of the fuselage, while a pair of canards (or foreplanes) are mounted higher up and towards the front of the fuselage, behind and below the cockpit. This configuration provides very high agility, especially at low speeds, and also reduces stall speed, allowing for a lower airspeed during instrument approaches. A large vertical tail is present on top of the fuselage and small ventral fins underneath the fuselage provide further stability. A rectangular air intake ramp and a Splitter plate (only on J-10A) are located underneath the fuselage, providing the air supply to the engine. Newer variants use a diverterless intake that does not require a splitter plate, and may reduce radar cross signature. Also under the fuselage and wings are 11 hardpoints, used for carrying various types of weaponry and drop-tanks containing extra fuel. The retractable undercarriage comprises a steerable pair of nose-wheels underneath the air intake and two main gear wheels towards the rear of the fuselage. The cockpit is covered by a two-piece bubble canopy providing 360 degrees of visual coverage for the pilot. The canopy lifts upwards to permit cockpit entry and exit. The Controls take the form of a conventional centre stick and a throttle stick located to the left of the pilot. These also incorporate "hands on throttle and stick" (HOTAS) controls. A zero-zero ejection seat is provided for the pilot, permitting safe ejection in an emergency even at zero altitude and zero speed. Due to the J-10's aerodynamically unstable design, a digital quadruplex-redundant fly-by-wire (FBW) flight control system (FCS) aids the pilot in flying the aircraft. The FCS typically monitors pilot control inputs, preventing the pilot from accidentally exiting the flight envelope from applying too much control input during high performance flight situations. This is critical in canard wing aircraft, as they are capable of turning in a much tighter radius than conventional aircraft. The massive control surfaces are capable of moving so far that they can completely destroy the aircraft in flight at high airspeeds if not kept in check by the FCS.

Tornado European Multirole Aircraft

Tiers:

1 2 **3** 4

Variants:

- **TORNADO IDS :** TORNADO IDS: DESIGNATED GR1 IN RAF SERVICE. GROUND ATTACK/ INTERDICTION VERSION. SOME HAVE BEEN ADAPTED FOR THE ANTI-SHIPPING ROLE.
- **TAC-R TORNADO GR1A:** TAC-R TORNADO GR1A: RAF GR1S MODIFIED AS DEDICATED TACTICAL RECONNAISSANCE AIRCRAFT. FITTED WITH A MARCONI DEFENSIVE SYSTEMS EMITTER LOCATION SYSTEM. BOTH 27-MM CANNONS WERE REMOVED.
- **TORNADO GR1B :** TORNADO GR1B: MODIFIED FOR MARITIME STRIKE MISSIONS WITH SEA EAGLE ANTI-SHIP MISSILES. RAF DISCARDED GR1B DESIGNATION IN JULY 2001.
- **TORNADO ADVAIR DEFENSE VARIAN:** INA
- **TORNADO ECR:** TORNADO ECR: ELECTRONIC COMBAT AND RECONNAISSANCE VARIANT FOR GERMAN AND ITALIAN SERVICE

Notes:

The Panavia Tornado is a family of twin-engine, variable-sweep wing multirole combat aircraft, jointly developed and manufactured by Italy, the United Kingdom, and West Germany. There are three primary Tornado variants: the Tornado IDS (interdictor/strike) fighter-bomber, the suppression of enemy air defences Tornado ECR (electronic combat/reconnaissance) and the Tornado ADV (air defence variant) interceptor aircraft. The Tornado was developed and built by Panavia Aircraft GmbH, a tri-national consortium consisting of British Aerospace (previously British Aircraft Corporation), MBB of West Germany, and Aeritalia of Italy. It first flew on 14 August 1974 and was introduced into service in 1979–1980. Due to its multirole design, it was able to replace several different fleets of aircraft in the adopting air forces. The Royal Saudi Air Force (RSAF) became the only export operator of the Tornado in addition to the three original partner nations. A tri-nation training and evaluation unit operating from RAF Cottesmore, the Tri-National Tornado Training Establishment, maintained a level of international co-operation beyond the production stage. The Tornado was operated by the Royal Air Force (RAF), Italian Air Force, and RSAF during the Gulf War of 1991, in which the Tornado conducted many low-altitude penetrating strike missions. The Tornados of various services were also used in conflicts in the former Yugoslavia during the Bosnian War and Kosovo War, the Iraq War, Libya during the Libyan civil war, as well as smaller roles in Afghanistan, Yemen, and Syria. Including all variants, 992 aircraft were built. The Panavia Tornado is a multirole, twin-engined aircraft designed to excel at low-level penetration of enemy defences. The mission envisaged during the Cold War was the delivery of conventional and nuclear ordnance on the invading forces of the Warsaw Pact countries of Eastern Europe; this dictated several significant features of the design. Variable wing geometry, allowing for minimal drag during the critical low-level dash towards a well-prepared enemy, had been desired from the project's start. Advanced navigation and flight computers, including the then-innovative fly-by-wire system, greatly reduced the workload of the pilot during low-level flight and eased control of the aircraft. For long range bombing missions, the Tornado has a retractable refuelling probe. As a multirole aircraft, the Tornado is capable of undertaking more mission profiles than the anticipated strike mission; various operators replaced multiple aircraft types with the Tornado as a common type – the use of dedicated single role aircraft for specialist purposes such as battlefield reconnaissance, maritime patrol duties, or dedicated electronic countermeasures (ECM) were phased out – either by standard Tornados or modified variants, such as the Tornado ECR. The most extensive modification from the base Tornado design was the Tornado ADV, which was stretched and armed with long range anti-aircraft missiles to serve in the interceptor role. The Tornado operators have chosen to undertake various life extension and upgrade programmes to keep their Tornado fleets as viable frontline aircraft for the foreseeable future. The RAF and RSAF have upgraded their Tornados to the GR4 standard to increase combat effectiveness, while German Tornados have been undergoing periodic upgrades under the multi-stage ASSTA (Avionics System Software Tornado in Ada) programme.

With these upgrades, as of 2011, it is projected that the Tornado shall be in service until 2025, more than 50 years after the first prototype took flight

MiG-29 (Fulcrum) Russian Multirole Fighter Aircraft

Tiers:

Variants:

- **MIG-29/FULCRUM A :** SINGLE SEAT TACTICAL FIGHTER DESIGNED TO OPERATE UNDER GROUND CONTROL.
- **MIG-29UB/FULCRUM B :** OPERATIONAL CONVERSION TRAINER; TWO-SEAT CONFIGURATION. AIR-DEFENSE ROLE.
- **MIG-29S/FULCRUM C :** PRODUCTION MULTI-ROLE VARIANT FITTED WITH DORSAL HUMP HOUSING UPGRADED AVIONICS, AND UPRATED FLIGHT-CONTROL SYSTEM WITH SOME AERODYNAMIC TWEAKING. PRINCIPAL UPGRADE WAS NO-19 FIRE CONTROL RADAR, WHICH CAN ENGAGE TWO TARGETS SIMULTANEOUSLY.
- **MIG-29SD:** FULCRUM AN EXPORT UPGRADE VERSION OF MIG-29 TO FULCRUM C STANDARD. MIG-29SM: CURRENT PRODUCTION UPGRADE WITH ASM CAPABILITY.
- **MIG-29K/FULCRUM D:** A CARRIER BORNE VERSION OF THE FULCRUM.
- **BAAZ (FALCON) :** NAME GIVEN TO THE MIG-29 INDIAN AIR FORCE, WHICH BEGAN OPERATING THE AIRCRAFT IN 1987.
- **MIG-30 :** PROPOSED GROUND-ATTACK VARIANT OFFERED TO INDIA IN 1991 AS SUBSTITUTE FOR THE LIGHT COMBAT AIRCRAFT (LCA). MIG-29SMT: ADVANCED MULTI-ROLE DESIGN, WITH CAPABILITY FOR IMPROVED ASMS, SUCH AS AS-14 AND AS-17.

Speed, Maximum, at altitude : km/h2400.0

Speed, Maximum, low or sea level : km/h1500.0

Takeoff Run/Landing Roll : m550/900

Vertical Climb Rate : m/s330.0

Notes:

The Mikoyan MiG-29 (Russian: Микоян МиГ-29; NATO reporting name: Fulcrum) is a twin-engine jet fighter aircraft designed in the Soviet Union. Developed by the Mikoyan design bureau as an air superiority fighter during the 1970s, the MiG-29, along with the larger Sukhoi Su-27, was developed to counter new U.S. fighters such as the McDonnell Douglas F-15 Eagle and the General Dynamics F-16 Fighting Falcon. The MiG-29 entered service with the Soviet Air Forces in 1982. While originally oriented towards combat against any enemy aircraft, many MiG-29s have been furnished as multirole fighters capable of performing a number of different operations, and are commonly outfitted to use a range of air-to-surface armaments and precision munitions. The MiG-29 has been manufactured in several major variants, including the multirole Mikoyan MiG-29M and the navalised Mikoyan MiG-29K; the most advanced member of the family to date is the Mikoyan MiG-35. Later models frequently feature improved engines, glass cockpits with HOTAS-compatible flight controls, modern radar and IRST sensors, and considerably increased fuel capacity; some aircraft have also been equipped for aerial refuelling. Following the dissolution of the Soviet Union, the militaries of a number of former Soviet republics have continued to operate the MiG-29, the largest of which is the Russian Air Force. The Russian Air Force wanted to upgrade its existing fleet to the modernised MiG-29SMT configuration, but financial difficulties have limited deliveries. The MiG-29 has also been a popular export aircraft; more than 30 nations either operate or have operated the aircraft to date, India being one of the largest export operators of the type. In 2013 the MiG-29 was still in production by Mikoyan, a subsidiary of United Aircraft Corporation (UAC) since 2006. Sharing its origins in the original PFI requirements issued by TsAGI, the MiG-29 has broad aerodynamic similarities to the Sukhoi Su-27, however, there are some notable differences. The MiG-29 has a mid-mounted swept wing with blended leading-edge root extensions (LERXs) swept at around 40°; there are swept tailplanes and two vertical fins, mounted on booms outboard of the engines. Automatic slats are mounted on the leading edges of the wings; they are four-segment on early models and five-segment on some later variants. On the trailing edge, there are maneuvering flaps and wingtip ailerons. The MiG-29 has hydraulic controls and a SAU-451 three-axis autopilot but, unlike the Su-27, no fly-by-wire control system. Nonetheless, it is very agile, with excellent instantaneous and sustained turn performance, high-alpha capability, and a general resistance to spins. The airframe consists primarily of aluminum with some composite materials,[specify] and is stressed for up to 9 g (88 m/s²) maneuvers. The controls have "soft" limiters to prevent the pilot from exceeding g and alpha limits, but the limiters can be disabled manually.

FC-1 Xiaolong Chinese Multirole Combat Aircraft

Tiers:

1 **2** 3 4

System

Alternate Designation(s): FC-1 Xiaolong
Primary Function / Type: Multirole Combat Aircraft
Manufacturer: Chengdu Aircraft Industry Group
Crew: 1 (single-seat) or 2 (dual-seat)
Number of Engines: 1
Number of Hard Points: 7 (2 × wing-tip, 4 × under-wing, 1 × under-fuselage) with capacity for dual ejector racks on each under-wing hardpoint

Dimensions

Length: 14.93 m
Width (Wing Span): 9.44 m
Height: 4.77 m
Wing Area: 24.43 m2
Empty Weight: 6,586 kg
Max Takeoff Weight: 12,700 kg
Payload: 4,600 kg

Automotive

Engine Name: 1 × Klimov RD-93MA afterburning turbofan with digital electronic engine control (DEEC)
Number of Engines: 1

Engine Type: Afterburning Turbofan

Engine Power: 50.4 kN (11,300 lbf) thrust [197] dry, 85.6 kN (19,200 lbf) with afterburner

Maximum Speed: Mach 1.6

Cruise Speed: 1,359 km/h

Stall Speed: 150 km/h

Maximum Range: 2,500 km

Combat Range: 1,352 km

Ferry Range: 3,500 km

Service Ceiling: 16,930 m

G Limits: +8/-3 (limited by flight control system)

Rate of Climb: 300 m/s

Main Gun System

↳*System*

Name: Gryazev-Shipunov GSh-23

Type: Autocannon

Caliber: mm23

Length: 1,387 mm

Barrel Length: 1,000 mm

Weight: 49.2 kg

Barrels: 2

Action: Gas principle

Rate of Fire: 3,400–3,600 rounds/min

Muzzle Velocity: 715 m/s

Main Missile Systems

↳*Main Missile System #1*

Name: PL-5EII

Type: Short-Range Air-to-Air Missile

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC), Hanzhong Nanfeng Machine Factor

Length: 2.893m

Diameter: 0.127m

Wingspan: 0.617m

Weight: 83kg

Warhead: 6kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: Active infrared, laser proximity fuse

Engine: Solid-fuel rocket

Operational Range: 16~18km

Maximum Speed: Mach 2.5

Guidance System: Infrared homing, multi-element, dual band detector

↳*Main Missile System #2*

Name: PL-9C

Type: Infrared-Homing Air-to-Air Missile

Length: 2.9m

Diameter: 0.157m

Wingspan: 0.856m

Weight: 115kg

Warhead: 11.8kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: laser proximity fuse

Engine: Solid-fuel rocket

Operational Range: 22km (PL-9C, air-to-air), > 8km (surface-to-air)

Flight Altitude: 4.5km (surface-to-air)

Maximum Speed: Mach 2+

Guidance System: multi-element infrared

↳*Main Missile System #3*

Name: AIM-9L

Type: Short-Range Air-to-Air Missile

Manufacturer: Raytheon Company Ford Aerospace Loral Corp.

Length: 3.02 m

Diameter: 127.0 mm

Wingspan: 279.4 mm

Weight: 85.3 kg

Warhead Type: WDU-17/B annular blast-frag

Warhead Weight: 9.4 kg

Detonation Mechanism: IR proximity fuze

Engine: Hercules/Bermite Mk. 36 Solid-fuel rocket

Operational Range: 1.0 to 35.4 km

Maximum Speed: Mach 2.5+

Guidance System: Infrared homing

Bomb Weapon Systems

↳*Bomb #1*

Name: Mark 82

Type: Unguided General-Purpose Bomb

Length: 2.22 m

Diameter: 273 mm

Weight: 227 kg

Filling: Tritonal, Minol (explosive) or Composition H6

Filling Weight: 87 kg

Cook Off Time: approximately 2 minutes 30 seconds.

↳*Bomb #2*

Name: Mark 83

Type: Unguided General-Purpose Bomb

Length: 3000 mm

Diameter: 357 mm

Weight: 459 kg

Filling: Tritonal, Minol or Composition H6

Filling Weight: 202 kg

Note: The Mk 83 is a streamlined steel casing containing 445 lb (202 kg) of tritonal high explosive. When filled with PBXN-109 thermally insensitive explosive, the bomb is designated BLU-110.

↳*Bomb #3*

Name: Mark 84

Type: General-Purpose Bomb

Length: 3280 mm

Diameter: 458 mm

Weight: 925 kg

Filling: Tritonal, Minol or Composition H6

Filling Weight: 429 kg

Note: It is a streamlined steel casing filled with 945 lb (429 kg) of Tritonal high explosive.

Fire Control / Avionics

Fire Control Radar: KLJ-7 v2 Airborne Pulse Doppler Fire-Control Radar (Range-150 km for 3m2 RCS aircraft.)

Radar Warning Receiver: Northrop Grumman ALR-67 Rader Warning Recever (RWR)

Airborne Missile Approach Warning System: S740 Airborne Missile Approach Warning System (MAWS)

Tactical Data Link: Link-17 Tactical Data Link and the MIL-STD-1760 data-bus

Advanced Targeting Pod Electro-Optical Reconnaissance, Surveillance, and Targeting System: Aselsan ASELPOD Advanced Targeting Pod Electro-Optical Reconnaissance, Surveillance, and Targeting System

Protection

Stealth Properties: INA

Heat Signature Reduction: INA

Add on Armor: INA

EW Counter Measures: Indra ALQ-500P Electronic Countermeasure (ECM)

Chaffs/Flares: Yes

Jamming Pod: KG300G Airborne Self-Protection Jamming Pod and KG600 Airborne Self-Protection Jamming Pod

Notes:

The PAC JF-17 Thunder (Urdu: جے ایف-۱۷ گرج), or CAC FC-1 Xiaolong (pinyin: Xiāo Lóng; lit.: 'Fierce Dragon'), is a lightweight, single-engine, multi-role combat aircraft developed jointly by the Pakistan Aeronautical Complex (PAC) and the Chengdu Aircraft Corporation (CAC) of China. It was designed to replace the A-5C, F-7P/PG, Mirage III, and Mirage V combat aircraft in the Pakistan Air Force. The JF-17 can be used for multiple roles, including interception, ground attack, anti-ship, and aerial reconnaissance. Its designation "JF-17" by Pakistan is short for "Joint Fighter-17", while the designation and name "FC-1 Xiaolong" by China means "Fighter China-1 Fierce Dragon". The JF-17 can deploy diverse ordnance, including air-to-air and air-to-surface missiles, and a 23 mm GSh-23-2 twin-barrel autocannon. Powered by a Guizhou WS-13 or Klimov RD-93 afterburning turbofan, it has a top speed of Mach 1.8. The JF-17 is to become the backbone of the Pakistan Air Force (PAF), complementing the General Dynamics F-16 Fighting Falcon at half the cost. The PAF inducted its first JF-17 squadron in February 2010. In 2015 Pakistan produced 16 JF-17s. As of 2016, Pakistan is believed to have the capacity to produce 25 JF-17 per year. 58% of the airframe is Pakistani and 42% Chinese/Russian-origin. As of December 2016 Pakistan Aeronautical Complex has manufactured 70 jets in the country for use by the Pakistan Air Force of the Block 1 type,and 33 jets of the Block 2 type. The Pakistan Air Force plans, by 2017, to induct a twin-seater version known as the JF-17B for both enhanced operational capability and training. Preparations for a more advanced and technologically sophisticated block III version of the aircraft are underway and the AESA radar, KJ-7A, has been developed, which can track 15 targets and engage 4 targets simultaneously. Since its induction in 2011, the JF-17 Thunder has accumulated 19,000 hours of operational flight. The JF-17 has seen active military service as it is used by the Pakistan Air Force to bomb militant positions in North Waziristan, using both unguided munitions and guided missiles for precision strike capability. The air frame is of semi-monocoque structure constructed primarily of aluminum alloys. High strength steel and titanium alloys are partially adopted in some critical areas. The air frame is designed for a service life of 4,000 flight hours or 25 years, the first overhaul being due at 1,200 flight hours. Block 2 JF-17s incorporate greater use of composite materials in the air frame to reduce weight. The retractable undercarriage has a tricycle arrangement with a single steerable nose-wheel and two main undercarriages. The hydraulic brakes have an automatic anti-skid system. The position and shape of the inlets is designed to give the required airflow to the jet engine during maneuvers involving high angles of attack. The mid-mounted wings are of cropped-delta configuration. Near the wing root are the LERX, which generate a vortex that provides extra lift to the wing at high angles of attack encountered during combat maneuvers. A conventional tri-plane empennage arrangement is incorporated, with all-moving stabilators, single vertical stabiliser, rudder, and twin ventral fins. The flight control system (FCS) comprises conventional controls with stability augmentation in the yaw and roll axis and a digital fly-by-wire (FBW) system in the pitch axis. The leading edge slats/flaps and trailing edge flaps are automatically adjusted during manoeuvring to increase turning performance. The FCS of serial production aircraft reportedly have a digital quadruplex (quad-redundant) FBW system in the pitch axis and a duplex (dual-redundant) FBW system in the roll and yaw axis. The glass cockpit is covered by a transparent, acrylic canopy that provides the pilot with a good, all-round field of view. It has three large Multifunction Colour Displays (MFD) and smart Heads-Up Display (HUD) with built-in symbol generation capability. A centre stick is used for pitch and roll control while rudder pedals control yaw. A throttle is located to the left of the pilot. The cockpit incorporates hands-on-throttle-and-stick (HOTAS) controls. The pilot sits on a Martin-Baker Mk-16LE zero-zero ejection seat. The cockpit incorporates an electronic flight instrument system (EFIS) and a wide-angle, holographic head-up display (HUD), which has a minimum total field of view of 25 degrees. The EFIS comprises three colour multi-function displays, providing basic flight

information, tactical information, and information on the engine, fuel, electrical, hydraulics, flight control, and environment control systems. The HUD and MFD can be configured to show any available information. Each MFD is 20.3 cm (8.0 in) wide and 30.5 cm (12.0 in) tall and is arranged side by side in portrait orientation. The central MFD is placed lowest to accommodate a control panel between it and the HUD. Up to 3,629 kg (8,001 lb) of ordnance, equipment, and fuel can be mounted under the hard points, two of which are on the wing-tips, four are under the wings and one is under the fuselage.

Notes:

The Tupolev Tu-22M (also known as Backfire) is a long-range strategic and maritime strike bomber developed by Tupolev for the Soviet Air Force. The aircraft is currently in service with the Russian Air Force and Russian Naval Aviation. The Tu-22M was based on the design of the Tu-22 aircraft. The first Tu-22M-0 prototype completed its maiden flight in August 1969. The Tu-22M-1 first flew in July 1971 and the Tu-22M was first deployed in combat missions in Afghanistan between 1987 and 1989. The Tu-22M3 was used by Russia for combat operations in Chechnya in 1995. The aircraft is primarily used to conduct nuclear strike and conventional attack operations. It can also be deployed in anti-ship and maritime reconnaissance missions. The earliest pre-production aircraft produced was the Tu-22M0. Its production was limited to small numbers due to inadequate performance. It was followed by the Tu-22M1 pilot-production aircraft for the Soviet Naval Aviation. Production on the first major production version, Tu-22M2 began in 1972. It was equipped with extended wings and a redesigned fuselage, twin engines and a new undercarriage. The Tu-22M3 was introduced with upgraded features to overcome the shortfalls of its predecessor. The aircraft completed its first flight in June 1977 and was inducted into the inventory in 1983. Some of the Tu-22Ms were also modified to Tu-22MR and Tu-22ME standard. The Tupolev Tu-22M incorporates a long variable sweep wing fuselage design. The aircraft features a stepped cockpit and variable-geometry outer wing panels. The tail fin is swept-back and tapered with a square tip. The flats mounted on the centre of body are pointed with blunt tips and each wing includes a centre section and two outer panels. The outer wings are attached to the centre section through hinged joints. Tu-22M3 has a length of 42.4m, maximum wing span of 34.2m, and a height of 11.05m. The empty weight and maximum takeoff weights of the aircraft are 53,500kg and 126,400kg respectively. The semi-glass cockpit accommodates a crew of four on upward-firing ejection seats. It is equipped with dedicated panels for pilots, navigator-operator and commander, with entry provided through individual doors. The pressurised cockpit is equipped with climate control systems. The aircraft is provided with hard points to carry Kh-22 stand-off missiles, Kh-15 nuclear or Kh-15P anti-radar missiles and FAB-250 or FAB-1500 free fall bombs. The wing and fuselage pylons and internal weapons bay are provided with a capacity to carry 24,000kg of weapons payload. The aircraft

is also armed with a double-barrelled GSH-23 (23mm) gun in remotely controlled tail turret. The aircraft is fitted with PN-A/PN-AD bombing-navigation radar system, Argon-2 radar fire-control system and a TV-based backup optical bomb sight. The countermeasures are provided by a radar warning receiver, radio-frequency jammers, and updated defensive countermeasures gear. The Tu-22M3 is powered by two Kuznetsov NK-25 turbofan engines installed in the body with large air intakes and dual exhausts. Each engine produces a maximum thrust of 25,000kg and delivers an improved fuel economy. The aircraft is equipped with tricycle landing gear to support operations on unprepared runways. The nose gear includes backward retractable twin wheels. Each main landing gear unit consists of six wheels in a 2×3 bogie arrangement. These are retracted straight in to the fuselage. The Tu-22M2 was equipped with twin brake slides and a runway arresting hook. Performance of the Tu-22M3 The Tu-22M3 can fly at a maximum altitude of 14,000m and the rate of climb of the aircraft is 15m/s. The aircraft has a cruise speed of 900km/h and maximum speed of 2,300km/h. The operational range of the aircraft is 7,000km. The aircraft can be equipped with refuelling probes to allow in-flight refuelling for extended range.

H-6 Chinese Strategic Bomber

Tiers:

Variants:

- **Production Variants:** Xian H-6 – Conventional bomber. Tupolev Tu-16 produced under license in China, first flew in 1959. A prototype conducted China's first aerial nuclear weapon test at Lop Nor on 14 May 1965. Xian H-6A – Nuclear bomber. Xian H-6B – Aerial reconnaissance variant. Xian H-6C – Conventional bomber with improved counter-measures suite. Initially designated H-6III. Xian H-6D – Anti-ship missile carrier introduced in early 1980s, armed with two air-launched C-601 missiles, one mounted under each wing. Fitted with larger radome under the nose and various improved systems. Later upgraded to either two C-301 supersonic anti-ship missiles, or four C-101 supersonic anti-ship missiles. An upgraded version, capable of carrying four YJ-8 (C-801) anti-ship missiles is currently under development. Initially designated H-6IV. Xian H-6E – Strategic nuclear bomber with improved counter-measures suite, entered service in 1980s. Xian H-6F – New designation for upgraded H-6A and H-6C. Many aircraft upgraded in the 1990s with new inertial navigation systems, doppler navigation radar and GPS receiver. Xian H-6G – Provides targeting data to ground-launched cruise missiles, built in the 1990s. No internal bomb bay or defensive armament. Electronic-warfare aircraft with underwing electronic countermeasures pods.[28] Xian H-6H – Land-attack cruise missile carrier armed with two missiles, built in the 1990s. No internal bomb bay or defensive armament. Xian H-6K – Latest H-6 variant, re-engined with D-30KP turbofan engines of 12,000 kg thrust replacing the original Chinese turbojets. Other modifications include larger air intakes, re-designed flight deck with smaller/fewer transparencies and large dielectric nose radome. Xian H-6J – Version of H-6K for use by the People's Liberation Army Navy Air Force (PLANAF) to replace the H-6G; has greater payload and range with performance similar to H-6K. Xian H-6M – Cruise missile carrier, fitted with terrain-following system and four under-wing hardpoints for weapons carriage. No internal bomb bay or defensive armament. Production of this variant is believed to have resumed in early 2006. Xian H-6N/H-6X1 – Air-launched ballistic missile carrier in service as of 2019. This variant has a semi-recessed area hard point underneath its fuselage. It is capable of mounting an air-derivative of the Dongfeng-21D anti-ship ballistic missile or the CJ-100 supersonic cruise missile, with an added 3,700 mile range including aerial refueling or a variety of other oversized payloads - including those with nuclear warheads.[36] It may be also possible that the modification is to enable carriage of the WZ-8 high-speed, high-altitude reconnaissance unmanned aerial vehicle. Xian HD-6 (Hongzhaji Dian-6) – Electronic warfare version with solid nose and canoe fairing believed to contain electronic counter-measures equipment.
- **Aerial refuelling versions:** Xian HY-6 (Hongzhaji You-6) – First successful in-flight refuelling tanker variant in Chinese service. Retained PV-23 fire control system of H-6 and thus can still be deployed as a missile launcher. Xian HY-6U – Modified HY-6 tanker in service with the PLAAF, with PV-23 fire control system and Type 244 radar deleted, and thus a dedicated refueling aircraft Also referred as H-6U Xian HY-6D – First aerial refueling tanker for PLANAF, converted from H-6D. The most distinct difference between HY-6U and HY-6D is that HY-6U has a metal nose cone, while HY-6D still has the transparent class nose. Like the original HY-6, PV-23 fire control system is also retained on HY-6D, which enables the aircraft also to serve as a missile carrying and launching platform. Xian HY-6DU – Aerial refuelling tanker for the PLANAF, modified HY-6D, also referred as H-6DU. Similar to HY-6U, HY-6DU is a dedicated aerial refueling tanker when its PV-23 fire control system is removed from the aircraft.

System

Alternate Designation(s): Xian H-6

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The Xian H-6 (Chinese: □-6; pinyin: Hōng-6) is a licence-built version of the Soviet Tupolev Tu-16 twin-engine jet bomber, built for China's People's Liberation Army Air Force (PLAAF). Delivery of the Tu-16 to China began in 1958, and the Xi'an Aircraft Industrial Corporation (XAC) signed a licence production agreement with the USSR to build the type in the late 1950s. The first Chinese Tu-16, or "H-6" as it was designated in Chinese service, flew in 1959. Production was performed by the plant at Xian, with at least 150 built into the 1990s. China is estimated to currently operate around 120 of the aircraft. The latest version is the H-6N, a heavily redesigned version capable of aerial refueling and carrying air-launched cruise missiles. According to United States Department of Defense, this will give the PLAAF a long-range standoff offensive air capability with precision-guided munitions. The first domestically produced H-6 was completed in 1968 and evidence of bombing training was recorded by U.S. spy satellites on August 13, 1971. By March of the following year, the CIA estimated that the PRC had 32 aircraft operational with an additional 19 awaiting completion. The H-6 was used to drop nine nuclear devices at the Lop Nur test site. However, with the increased development in ballistic missile technology, the nuclear delivery capabilities that the H-6 offered diminished in importance. The CIA estimated in 1976 that the H-6 had moved over to a dual nuclear/conventional bombing role. Along with the H-6 free-fall bomber, an "H-6A" nuclear bomber was built, as well as an "H-6B" reconnaissance variant, "H-6C" conventional bomber and "H-6E" nuclear bomber with improved countermeasures, the "H-6D" anti ship missile carrier, and the "HY-6" series capable of acting as an in-flight fuel tanker. The H-6D was introduced in the early 1980s and carried a C-601 anti shipping missile (NATO codename "Silkworm"), an air-launched derivative of the Soviet P-15 Termit ("Styx") under each wing. The H-6D featured various modernized systems and sports an enlarged radome with a Type 245 Kobalt I-band surveillance radar under the nose. The Type 245 radar was based on the Soviet PSBN-M-8 NATO codename Mushroom radar used on the Tupolev Tu-16. Earlier versions (Type 241, 242 and 244) were installed on the early models of the H-6. The H-6 has also been used as a tanker and drone launcher. Later H-6 production featured extended curved wingtips. Many H-6A and H-6C aircraft were updated in the 1990s to the "H-6F" configuration, the main improvement being a modern navigation system, with a Global Positioning System (GPS) satellite constellation receiver, Doppler navigation radar, and inertial navigation system. New production began in the 1990s as well, with Xian building the "H-6G", which is a director for ground-launched cruise missiles; the "H-6H", which carries two land-attack cruise missiles. In terms of land attack cruise missiles five immediate possibilities were considered by PLAAF - the indigenous HN-1, HN-2 and HN-3, DH-10/CJ-10, and a variant of Russian designed cruise missile. It is believed CJ-10 is chosen to be the main land attack missile for H-6 bombers, and now the "H-6M" cruise missile carrier, which has four pylons for improved cruise missiles and is fitted with a terrain-following system. Apparently these variants have no internal bomb capability, and most or all of their defensive armament has been deleted.

H-5 (Hongzhaji-5) Chinese Twin-Engine Light Bomber

Tiers:

Variants:

- **Il-28 Beagle:** This was the original Soviet light bomber from which the H-5 is derived. See separate database entry.
- **H-5:** This is the basic bomber in a three-seat configuration.
- **HD-5 electronic warfare aircraft:** This variant was designed for electronic warfare missions. The twin 23-mm cannon turret was removed to make room for the electronic warfare/electronic countermeasures suite. The EW/ECM suite, which reportedly utilized only analog technology, could intercept, identify and jam hostile land-based or shipborne radar emitters. The HD-5 usually operated in groups of three to cover all frequency spectrums. Despite its aging technology, the powerful jammer onboard the aircraft was said to be very effective. The HD-5 was replaced by a more capable EW/electronic intelligence platform based on the Y-8 airframe.
- **HJ-5 Mascot:** This was a two-seat trainer version. First flight occurred in December 1970, and it entered service in 1972. The type was retired in 1986.
- **HZ-5:** This was a three-seat reconnaissance version.

System

Alternate Designation(s): H-5 (Hongzhaji-5)
Primary Function / Type: Light Bomber Aircraft
Manufacturer: Harbin Aircraft Manufacturing Corp., Harbin, China
Crew: 3 (pilot, navigator/bombardier, radio operator/gunner)
Number of Engines: 2
Number of Hard Points: 4

Stealth Properties: None

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

H-5 Light Bomber The reports of the demise of the H-5 seem somewhat exaggerated. It was asserted without citation in 1995 that the H-5 had been withdrawn from service, but the continued presence of the H-5 in the PLAAF inventory is widely attested by subsequent sources. The light bomber is a kind of tactical bomber and is used for close air support to the ground troop operations. Its bomb load is small but it is light, manoeuvrable and agile and has some peculiarities which make it irreplaceable by medium bombers. The Il 28 was the Soviet Union's standard light bomber, and was in use in all air forces of the Soviet Bloc. The 11-28 aircraft is a light bomber designed and produced in the Soviet Union. It flew for its first time in 1947 and entered into service in 1950. It was put into production in large quantities and was widely used in 1950s and 1960s because of its simple structure and low price. This aircraft was produced in China under the nomenclature H-5. The H-5 was a light subsonic bomber with a cantilever high set wing. The high-mounted wings have a straight leading edge and forward-tapered trailing edge with blunt tips. Two turbojets are mounted beneath the wings in pods. Pods extend beyond wings' leading and trailing edges. The fuselage is tubular and cigar-shaped tapering to the rear with a rounded, glassed-in nose and bubble canopy. The tail fin is swept-back and tapered with a blunt tip. Flats are low-mounted on the fin, swept-back, and tapered with blunt tips. A glassed-in tail gunner compartment is to the rear of the tail. The prototype production of the H-5 was different from that of the H-6. It was not a complete licenced production, because a great number of design modifications were incorporated according to the military Services' operational requirements. The design modifications were made possible by the following: China imported a number of 11-28 bombers and a lot of suggestions were made by the military Services based on a long period of operation; the Harbin Aircraft Factory had repaired the I1-28s since the mid-1950s, manufactured main parts and components for the purpose of repairing and, therefore, mastered necessary manufacturing techniques, the factory was expanded and reconstructed on a large-scale for purpose of the H-6's prototype production and had capabilities for manufacturing production tooling, assembling a complete aircraft and then testing it in flight; and finally the factory had experienced prototype productions of the Z-5 helicopter and the H-6 medium bomber. The Chinese built H-5 light bomber is an equivalent of the 11-28 aircraft but with some local improvement in design. Forty per cent of the original I1-28 design was modified. Main modifications were: A conventional structure wing was used to replace the wing which was spliced at the central line and, therefore, 110 kg of weight was saved. Major airborne equipment were in common with that of the H-6. One example was use of H-6's tail turret. Of course it introduced corresponding structure changes. The operational performance was remarkably improved by use of a great number of new airborne equipment: a new radar with significantly increased operational range, a new sight which increased aiming angle and observation angle and hence bombing precision, the new turrent with an electrical control system which was good in the follow-up behavior, an increased ammunition capacity, higher rate of fire and longer effective firing range; and a new and

improved friend-or-foe identification. The Harbin Aircraft Factory initiated their preparation for the trial-production of the H-5 in 1963. They first corrected the drawings used for aircraft repair, and then supplemented with some drawings and data of stress analysis and aerodynamic computation and prepared a complete set of processing documents. The manufacturing of production tooling and aircraft parts began in 1964. Two prototype aircraft were completed in 1966 and one of them was used for static test. The static test was carried out from July to September and it proved that the structure strength was in conformity with the technical requirement. Another prototype flew for its first time on September 25, 1966. The H-5 aircraft was formally put into production in April, 1967. Hu Xichuan, chief engineer, Qi Zhikun, vice chief engineer, Xiong Wenjie and Li Guangshu who were in charge of the design work, made active contributions to the development of the H-5. Sun Zhaoqing who was in charge of manufacturing techniques and his colleagues made bold innovations in managing manufacturing techniques. They applied some new techniques such as the plastic molds, combined fixtures and explosive forming, etc. so that the product quality was improved and the prototype production was completed in a shorter period of time. With support from various departments and agencies all over the country most of the necessary 3,200 materials and 334 vendor furnished equipment could be manufactured in China. The success in partial redesign of the H-5 marked the breaking away from the yoke of pure licenced production in area of bomber technology and the beginning of transition from modification and derivation to independent development. Several derivatives were developed on the basis of the requirement of the military Services after the H-5 aircraft was certified and put into production. The PLA Air Force is equipped with several dozen of special-purpose electronic aircraft, including a few specially modified Hongdian-5 light bombers which have been equipped to support electronic warfare operations. However, the PLAAF remains some 15 years behind world standards in this field.

Il-28 (Beagle) Russian Twin-Engine Light Bomber

Tiers:

Variants:

- **Il-28:** Basic three-seat bomber version, powered by two VK-1 engines.
- **Il-28U:** Unarmed training version fitted with new nose housing cockpit for instructor, while the trainee sat in the normal cockpit. First flown 18 March 1950.
- **Il-28R:** Three-seat tactical photo reconnaissance version, with extra fuel in bomb bay and tip-tanks, and with one forward firing cannon removed. Fitted with revised undercarriage to deal with heavier weights. First flew 19 April 1950.
- **Il-28RTR:** ELINT version of Il-28R
- **Il-28REB:** Electronic warfare, electronic jamming version, fitted with wingtip electronic pods, that were in the former wing tanks.
- **Il-28T:** Torpedo bomber version for the Soviet Naval Aviation able to accommodate two small or one large torpedo (including RAT-52 rocket propelled torpedoes) in a lengthened weapons bay.
- **Il-28N:** Nuclear bomber for the Soviet Air Force with modified bomb-bay and revised avionics. (N - Nositel - carrier, also known as Il-28A - Atomnyy - atomic).
- **Il-28P:** Unarmed civil conversion for Aeroflot, used as jet conversion trainer and to carry high priority cargo (i.e. newspaper matrices to allow simultaneous printing of Pravda and Izvestia in Moscow, Sverdlovsk and Novosibirsk). Also designated Ilyushin Il-20.
- **Il-28S:** Proposed swept-wing version with more powerful Klimov VK-5 engines. Unbuilt.
- **Il-28RM:** Modified Il-28R with VK-5 engine. One prototype built plus two similarly converted bombers (which carried no special designation) but no production.
- **Il-28TM:** Il-28T with VK-5. One converted, no production.
- **Il-28PL:** High-speed anti-submarine conversion of Il-28 bomber or Il-28T torpedo bomber. Capable of carrying dropping sonobuoys or acoustic homing torpedoes on direction of other anti-submarine assets.
- **Il-28Sh:** Ground attack (Shturmovik) conversion of Il-28 with 12 underwing pylons for rocket pods. Small number converted which saw limited service.
- **Il-28ZA:** Atmospheric sampling version.
- **Il-28M:** Target drone conversion of Il-28. Also known as M-28.

System

Alternate Designation(s): Il-28; NATO: Beagle
Primary Function / Type: Light Bomber Aircraft
Manufacturer: Ilyushin

Notes:

The Ilyushin Il-28 (Russian: Ильюшин Ил-28; NATO reporting name: Beagle) is a jet bomber of the immediate postwar period that was originally manufactured for the Soviet Air Forces. It was the Soviet Union's first such aircraft to enter large-scale production. It was also licence-built in China as the Harbin H-5. Total production in the USSR was 6,316 aircraft, and over 319 H-5s were built. Only 187 examples of the HJ-5 training variant were manufactured. In the 1990s hundreds remained in service with various air forces over 50 years after the Il-28 first appeared. The only H-5s in service currently are approximately 80 aircraft which operate with the Korean People's Air Force. The Il-28 has the USAF/DoD reporting name "Type 27" and NATO reporting name "Beagle", while the Il-28U trainer variant has the USAF/DoD reporting name "Type 30" and NATO reporting name Mascot. After a number of attempts at a four-engined bomber (the Lyulka TR-1 powered Ilyushin Il-22 and the unbuilt Rolls-Royce Derwent powered Ilyushin Il-24), the Ilyushin Design Bureau began development of a new jet-powered tactical bomber in late 1947. Western Intelligence focused on the four-engine developments while the twin-engine Ilyushin Il-28 was created to meet a requirement for a bomber to carry a 3,000 kilograms (6,600 lb) bombload at 800 kilometres per hour (500 mph). The new design took advantage of the sale of a number of Rolls-Royce Nene jet engines by Great Britain to the Soviet Union, which allowed Soviet engineers to quickly produce an unlicensed copy of the Nene, the RD-45, with Ilyushin designing the new bomber around two RD-45s. The Il-28 was smaller than the previous designs and carried a crew of only three (pilot, navigator and gunner). It was also smaller than the competing design from the Tupolev design bureau, the three-engined (i.e. two Nenes and a Rolls-Royce Derwent) Tupolev Tu-73, which had been started long before the Ilyushin project, and flew before

the design of the Il-28 was approved. The Il-28 design was conventional in layout, with high, unswept wings and a swept horizontal tail and fin. The engines were carried in bulky nacelles slung directly under the wings. The nosewheel retracted rearwards, while the main wheels retracted forwards into the engine nacelles. The crew of three were accommodated in separate, pressurised compartments. The navigator, who also acted as bombardier, was accommodated in the glazed nose compartment and was provided with an OPB-5 bombsight based on the American Norden bombsight of the Second World War, while the pilot sat under a sideways opening bubble canopy with an armoured windscreen. The gunner sat in a separate compartment at the rear of the fuselage, operating a power driven turret armed with two Nudelman-Suranov NS-23 23 mm cannons with 250 rounds each. In service, the turret was sometimes removed as a weight saving measure. While the pilot and navigator sat on ejector seats, the gunner had to parachute out of a hatch in the floor in the event of an emergency. Two more fixed, forward-firing 23 mm cannon with 100 rounds each were mounted under the nose and fired by the pilot, while a bomb bay was located in the fuselage, capable of holding four 100 kg (220 lb) bombs in individual containers, or single large bombs of up to 3,000 kg (6,600 lb) slung from a beam in the bomb bay. One unusual design feature of the Il-28 was that the wings and tail were split horizontally through the centre of the wing, while the fuselage was split vertically at the centreline, allowing the separate parts to be built individually and fitted out with systems before being bolted together to complete assembly of the aircraft. This slightly increased the weight of the aircraft structure, but eased manufacture and proved to be more economical. The first prototype, powered by two imported Nenes, made its maiden flight on 8 July 1948, with Vladimir Kokkinaki at the controls. Testing was successful, with the Il-28 demonstrating good handling and reaching a speed of 833 km/h (518 mph). It was followed on 30 December 1948 by the second prototype, with Soviet built RD-45 engines replacing the Nenes. After the completion of state tests in early 1949 the aircraft was ordered into large scale production on 14 May 1949, with the Klimov VK-1, an improved version of the RD-45 to be used in order to improve the aircraft's performance. The first pre-production aircraft with VK-1 engines flew on 8 August 1949, and featured reshaped engine nacelles to reduce drag, while the radome for the navigation radar was moved from the rear fuselage to just aft of the nosewheel. Full production in three factories started in September 1949, with service deliveries starting in early 1950, allowing 25 Il-28s to be displayed at the Moscow May Day parade of 1950 (as ordered by Joseph Stalin when it was ordered into production in 1949). The Il-28 soon became the standard tactical bomber in the Soviet forces and was widely exported.

Tu-95 (Bear) Russian Strategic Bomber Aircraft

Tiers:

Variants:

- **Tu-95/1:** The first prototype powered by Kuznetsov 2TV-2F coupled turboprop engines.
- **Tu-95/2:** The second prototype powered by Kuznetsov NK-12 turboprops.
- **Tu-95:** Basic variant of the long-range strategic bomber and the only model of the aircraft never fitted with a nose refuelling probe. Known to NATO as the Bear-A.
- **Tu-95K:** Experimental version for air-dropping a MiG-19 SM-20 jet aircraft.
- **Tu-95K22:** Conversions of the older Bear bombers, reconfigured to carry the Raduga Kh-22 missile and incorporating modern avionics. Known to NATO as the Bear-G.
- **Tu-95K/Tu-95KD:** Designed to carry the Kh-20 air-to-surface missile. The Tu-95KD aircraft were the first to be outfitted with nose probes. Known to NATO as the Bear-B.
- **Tu-95KM:** Modified and upgraded versions of the Tu-95K, most notable for their enhanced reconnaissance systems. These were in turn converted into the Bear-G configuration. Known to NATO as the Bear-C.
- **Tu-95LAL:** Experimental nuclear-powered aircraft project.
- **Tu-95M:** Modification of the serial Tu-95 with the NK-12M engines. 19 were built.
- **Tu-95M-55:** Missile carrier.
- **Tu-95MR:** Bear-A modified for photo-reconnaissance and produced for Naval Aviation. Known to NATO as the Bear-E.
- **Tu-95MS/Tu-95MS6/Tu-95MS16:** Completely new cruise missile carrier platform based on the Tu-142 airframe. This variant became the launch platform of the Raduga Kh-55 cruise missile and put into serial production in 1981. Known to NATO as the Bear-H and was referred to by the U.S. military as a Tu-142 for some time in the 1980s before its true designation became known. Currently being modernized to carry the Kh-101/102 stealth cruise missiles. 21 aircraft have been modernized as of April 2019.
- **Tu-95MS6:** Capable of carrying six Kh-55, Kh-55SM or Kh-555 cruise missiles on a rotary launcher in the aircraft's weapons bay. 32 were built.
- **Tu-95MS16:** Fitted with four underwing pylons in addition to the rotary launcher in the fuselage, giving a maximum load of 16 Kh-55s or 14 Kh-55SMs. 56 were built.
- **Tu-95MSM:** Modernization of the "Tu-95MS16" bombers, equipped with the new Novella-NV1.021 radar, SOI-021 information display system, Meteor-NM2 airborne defense complex and upgraded Kuznetsov NK-12MPM turboprop engines. First flight scheduled for end of 2019.
- **Tu-95N:** Experimental version for air-dropping an RS ramjet powered aircraft.
- **Tu-95RT:** Variant of the basic Bear-A configuration, redesigned for maritime reconnaissance and targeting as well as electronic intelligence for service in the Soviet Naval Aviation. Known to NATO as the Bear-D.
- **Tu-95U:** Training variant, modified from surviving Bear-As but now all have been retired. Known to NATO as the Bear-T.
- **Tu-95V:** Special carrier aircraft to test-drop the largest thermonuclear weapon ever designed, the Tsar Bomba.
- **Tu-96:** Long-range intercontinental high-altitude strategic bomber prototype, designed to climb up to 16,000–17,000

m.[51] It was a high-altitude version of the Tupolev Tu-95 aircraft with high-altitude augmented turboprop TV-16 engines and with a new, enlarged-area wing. Plant tests of the aircraft were performed with non-high altitude TV-12 engines in 1955–1956.

- **Tu-95 derivatives:** Tu-114 Airliner derivative of Tu-95. Tu-116 Tu-95 fitted with passenger cabins as a stop-gap while the Tu-114 was being developed. 2 were converted.[53] Tu-126 AEW&C derivative of Tu-114, itself derived from the Tu-95. Tu-142 Maritime reconnaissance/anti-submarine warfare derivative of Tu-95. Known to NATO as the Bear-F. Several other modifications of the basic Tu-95/Tu-142 airframe have existed, but these were largely unrecognized by Western intelligence or else never reached operational status within the Soviet military.

System

Alternate Designation(s): Tupolev Tu-95; Bear

Primary Function / Type: Strategic Bomber

Manufacturer: Tupolev

In Service: 1956-Present

Crew: ea7 (pilot, copilot, navigator, navigator/weapons officer, defense systems operator, flight engineer, tail gunner)

Number of Engines: 4

Day/Night Capable: Yes

All Weather Capable: Yes

Number of Pylons: None (Tu-95MS Bear H) 4 (Tu-95MS16 Bear H); two inner pylons on fuselage, one outer pylon on each wing between engines)

Combat Radius: 6 400 km

Propeller: 8-blade AV-60 K propeller units each with 2 x 4-blade co-axial contra-rotating reversible-pitch props

Fuel, Internal: 84,000 kg

Maximum Speed at Altitude: 830 km/h

Maximum Speed at Sea-Level: 550 km/h

Cruising Speed: 735 km/h

Takeoff Speed: 300 km/h at max weight

Landing Speed: 275 km/h at max weight

Takeoff Roll: 2,450 m

Load Limit: +2 G

Range, No Refueling: 5,670 nm (6,524 mi, 10,500 km) normal combat load. 3,507 nm (4,039 mi, 6,500 km) max combat load.

Range, one Refueling: 7,613 nm (8,761 mi, 14,100 km)

Communications

Cannon System

↳*System*

Name: Gryazev-Shipunov GSh-23

Type: 23mm Autocannon

Caliber: mm23

Basic Load: INA

Location: Tail Turret

Length: GSh-23: 1,387 mm (4 ft 7 in) GSh-23L: 1,537 mm (5 ft 1 in)

Barrel Length: 1,000 mm

Barrels: 2

Weight: GSh-23: 49.2 kg (108 lb) GSh-23L: 50 kg (110 lb)

Action: Gast principle

Rate of Fire: 3,400–3,600 rounds/min (alleged)

Muzzle Velocity: 715 m/s

Effective Firing Range: INA

↳*Ammunition*

Type: Rifle

Caliber: mm23

Cartridge: 23x115 mm

Missile System

↳*Missile System (Option 1)*

Name: Kh-101 / Kh-102

Type: Air-Launched Cruise Missile

Basic Load: 10

Country: Russia

Proliferation: Widely Proliferated

In Service: 2012-Present

Basing: Tu-160 Blackjack, Tu-22M3/5 Backfire C, Tu-95MS16 Bear-H, and Su-27IB

Length: 7.45 m

Diameter: 0.51 m

Payload: 450 kg

Warhead: HE, fragmentation, submunition (Kh-101), 250 kt nuclear (Kh-102)

Propulsion: Turbofan

Range: 2,500-2800 km

↳*Missile System (Option 2)*

Name: AS-15 Kent (Also known as the Kh-55)

Type: Transonic air-launched Long-Range Cruise Missile

Country: Russia

Basic Load: 8

Length: 7.00 m

Diameter: 510 mm

Span: 3.25 m

Weight: 1,700 kg

Configuration: Similar to the U.S. Tomahawk with a torpedo- shaped body, pop-out unswept wings and tail group, probably a dorsal engine intake.

Propulsion: 1 turbofan

Speed: Mach 0.7

Maximum Range: 1,350 nm

Warhead: 200 kt nuclear (information on warhead yield varies from Russian sources, which claim a 100 kt warhead, and Western sources, which has the AS-15 Russian designated Kh-55A with a 250-kt warhead)

CEP: 0.08 nm (152 m; 500 ft) est.

Flight: Inertial

Launch: Terrain contour matching (TERCOM) until impact

↳*Missile System (Option 3)*

Name: Kh-65 missiles

Type: Transonic air-launched Long-Range Cruise Missile

Basic Load: 14

Note: The Kh-65 missiles, which are believed to be derivatives of the AS-15 Kent.

Internal Bay

Normal Load: 9,000 kg

Maximum Load: 20,000 kg

Rotary Launcher: MKU-6, containing 6 x AS-15 Kent missiles

Fire Control / Avionics

Fire Control System Type: PRS-4 box tail gun warning and fire control radar

Fire Control Radar: Clam Pipe (Obozor-MS) navigation/attack

Navigation Radar: Toadstool terrain following. BAND I (8-10 GHz)

Laser Desingator: INA

Radar Warning: Beryoza system at nose and tail

Infrared Warning: Mak system under nose

Protection

Defense System: Meteor-NM system

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW Counter Measures: Jammer, Geran at nose and rear fuselage

Chaffs/Flares: APP-50 50-mm dispensers in undercarriage fairings

Notes:

The Tupolev Tu-95 (Russian: Туполев Ту-95; NATO reporting name: "Bear") is a large, four-engine turboprop-powered strategic bomber and missile platform. First flown in 1952, the Tu-95 entered service with the Soviet Union in 1956 and is expected to serve the Russian Aerospace Forces until at least 2040. A development of the bomber for maritime patrol is designated Tu-142, while a passenger airliner derivative was called Tu-114. The aircraft has four Kuznetsov NK-12 engines with contra-rotating propellers. It is the only propeller-powered strategic bomber still in operational use today. The Tu-95 is one of the loudest military aircraft, particularly because the tips of the propeller blades move faster than the speed of sound. Its distinctive swept-back wings are set at an angle of 35°. The Tu-95 is unique as a propeller-driven aircraft with swept wings that has been built in large numbers. The design bureau, led by Andrei Tupolev, designed the Soviet Union's first intercontinental bomber, the 1949 Tu-85, a scaled-up version of the Tu-4, a Boeing B-29 Superfortress copy. A new requirement was issued to both Tupolev and Myasishchev design bureaus in 1950: the proposed bomber had to have an un-refueled range of 8,000 km (4,970 mi)—far enough to threaten key targets in the United States. Other goals included the ability to carry an 11,000 kg (24,200 pounds) load over the target. Tupolev was faced with selecting a suitable type of powerplant: the Tu-4 showed that piston engines were not powerful enough for such a large aircraft, and the AM-3 jet engines for the proposed T-4 intercontinental jet bomber used too much fuel to give the required range. Turboprop engines were more powerful than piston engines and gave better range than the turbojets available at the time, and gave a top speed between the two. Turboprops were also initially selected for the Boeing B-52 Stratofortress to meet its long range requirement,[6] and for the British long-range transport aircraft, the Saunders-Roe Princess, the Bristol Brabazon and the Bristol Britannia. Tupolev proposed a turboprop installation and Tu-95

design with this configuration was officially approved by the government on 11 July 1951. It used four Kuznetsov coupled turboprops, each fitted with two contra-rotating propellers with four blades each, with a nominal 8,948 kW (12,000 effective shaft horse power [eshp]) power rating. The engine, advanced for its time, was designed by a German team of ex-Junkers prisoner-engineers under Ferdinand Brandner. The fuselage was conventional with a mid-mounted wing with 35 degrees of sweep, an angle which ensured that the main wing spar passed through the fuselage in front of the bomb bay. Retractable tricycle landing gear was fitted, with all three gear strut units retracting rearwards, with the main gear units retracting rearwards into extensions of the inner engine nacelles. The Tu-95/I, with 2TV-2F engines, first flew in November 1952 with test pilot Alexey Perelet at the controls.After six months of test flights this aircraft suffered a propeller gearbox failure and crashed, killing Perelet. The second aircraft, Tu-95/II used four 12,000 eshp Kuznetsov NK-12 turboprops which proved more reliable than the coupled 2TV-2F. After a successful flight testing phase, series production of the Tu-95 started in January 1956. For a long time, the Tu-95 was known to U.S./NATO intelligence as the Tu-20. While this was the original Soviet Air Force designation for the aircraft, by the time it was being supplied to operational units it was already better known under the Tu-95 designation used internally by Tupolev, and the Tu-20 designation quickly fell out of use in the USSR. Since the Tu-20 designation was used on many documents acquired by U.S. intelligence agents, the name continued to be used outside the Soviet Union. Initially the United States Department of Defense evaluated the Tu-95 as having a maximum speed of 644 km/h (400 mph) with a range of 12,500 km (7,800 mi). These numbers had to be revised upward numerous times. Like its American counterpart, the Boeing B-52 Stratofortress, the Tu-95 has continued to operate in the Russian Air Force while several subsequent iterations of bomber design have come and gone. Part of the reason for this longevity was its suitability, like the B-52, for modification to different missions. Whereas the Tu-95 was originally intended to drop free-falling nuclear weapons, it was subsequently modified to perform a wide range of roles, such as the deployment of cruise missiles, maritime patrol (Tu-142), and even civilian airliner (Tu-114). An AWACS platform (Tu-126) was developed from the Tu-114. An icon of the Cold War, the Tu-95 has served, not only as a weapons platform, but as a symbol of Soviet and later Russian national prestige. Russia's air force has received the first examples of a number of modernised strategic bombers in Tu-95MSs following upgrade work. Enhancements have been confined to the bomber's electronic weapons and targeting systems. Modernization Currently ongoing modernization of the Russia's Tu-95MS bombers is aimed primarily on the aircraft armament, namely adaptation of the new Kh-101/102 stealth cruise missile. The modernization includes installation of four underwing pylons for up to 8 Kh-101/102 cruise missiles as well as adjusting aircraft's main weapons bay for cruise missiles of size the Kh-101/102 (7.5 meters). Besides, the modernized Tu-95MS aircraft use radio-radar equipment and target-acquiring/navigation system based on GLONASS. The first Tu-95 modernized to carry the Kh-101/102 missiles was the Tu-95MS Saratov, rolled out at the Beriev aircraft plant in Taganrog in early 2015. It was transferred to the Russian Air Force in March 2015. Since 2015, the serial modernization is carried out also by the Aviakor aircraft plant in Samara at a rate of three aircraft per year. The first Tu-95 modernized by the Aviakor was the Tu-95MS Dubna, transferred to the Russian Air Force on 18 November 2015. In the future, Tu-95MSs are to be upgraded also with the new Kuznetsov NK-12MPM turboprop engines for increased flight range, combat load and reduced noise and vibrations and with the SVP-24 sighting and computing system from the Russian company Gefest & T. More complex modernization of the Tu-95MS16 bombers, known as "Tu-95MSM", is currently under development by Tupolev under a contract issued by the Russian Defence Ministry on 23 December 2009. This modernization is to include installation of the new Novella-NV1.021 radar, instead of the current Obzor-MS, installation of the SOI-021 information display system and the Meteor-NM2 airborne defense complex. In addition, the aircraft modernized to the "MSM" variant will be equipped with the upgraded Kuznetsov NK-12MPM turboprop engines. A contract for first modernized aircraft was signed in February 2018 with first flight scheduled for end of 2019.

Notes:

The Tupolev Tu-134 (NATO reporting name: Crusty) is a twin-engined, narrow-body, jet airliner built in the Soviet Union from 1966 to 1989. It is the world's most-produced twinjet of its class. The original version featured a glazed-nose design and, like certain other Russian airliners (including its sister model the Tu-154), it can operate from unpaved airfields. One of the most widely used aircraft in former Comecon countries, the number in active service is decreasing because of operational safety concerns and noise restrictions. The model has seen long-term service with some 42 countries, with some European airlines having scheduled as many as 12 daily takeoffs and landings per plane. In addition to regular passenger service, it has also been used in various air force, army and navy support roles; for pilot and navigator training; and for aviation research and test projects. In recent years, a number of Tu-134s have been converted for use as VIP transports and business jets. A total of 854 Tu-134s were built of all versions (including test bed examples) with Aeroflot as the largest user; by 1995, the Tu-134 had carried 360 million passengers for that airline. Following the introduction of engines mounted on pylons on the rear fuselage by the French Sud Aviation Caravelle, airliner manufacturers around the world rushed to adopt the new layout. Its advantages included clean wing airflow without disruption by nacelles or pylons and decreased cabin noise. At the same time, placing heavy engines that far back created challenges with the location of the centre of gravity in relation to the centre of lift, which was at the wings. To make room for the engines, the tailplanes had to be relocated to the tail fin, which had to be stronger and therefore heavier, further compounding the tail-heavy arrangement. During a 1960 visit to France, Soviet leader Nikita Khrushchev was so impressed by the quiet cabin of the Caravelle, that on 1 August 1960 the Tupolev OKB received an official directive to create the Tu-124A with a similar engine arrangement. The requirement was also driven by the need to replace slow, aging piston-engined Il-14s on domestic routes. In 1961, the Soviet state airline, Aeroflot, updated its requirement specifications to include greater payload and passenger capacity. The first Tu-124A prototype, SSSR-45075, first flew on 29 July 1963. On 22 October 1963, the prototype British BAC One-Eleven, which had a similar layout, crashed with the loss of all crew while testing its stalling properties. The aircraft had entered pitch-up: the high-mounted tailplane became trapped in the turbulent wake produced by the wings (deep stall), which prevented recovery from the stall. As a result, the tailplane on Tu-124A was enlarged by 30% for greater control authority. Since Aeroflot's requirements dictated a larger aircraft than initially planned, the Soloviev Design Bureau developed the more powerful D-30 low-bypass turbofan engines. On 20 November 1963, the new airliner was designated Tu-134. Design curiosities of the Tu-134 included a sharp wing sweepback of 35 degrees, compared to 25–28 degrees in its counterparts. The engines on early production Tu-134s lacked thrust reversers, which made the aircraft one of the few airliners to use a brake parachute for landing. The majority of onboard electronics operated on direct current. The lineage of early Soviet airliners could be traced directly to the Tupolev Tu-16 strategic bomber, and the Tu-134 carried over the glass nose for the navigator and the landing gear fitted with low-pressure tires to permit operation from unpaved airfields. Serial production began in 1966 at the Kharkov Aviation Production Association, and production of the Tu-124 was discontinued. The Tu-134 was designed for short-haul lines with low passenger traffic. Originally the aircraft had 56 seats

in a single class configuration, or 50 seats in a two-class configuration. In 1968, Tupolev began work on an improved Tu-134 variant with a 72-seat capacity. The fuselage received a 2.1-meter (6 ft 11 in) plug for greater passenger capacity and an auxiliary power unit in the tail. As a result, the maximum range was reduced from 3,100 kilometers to 2,770 kilometers. The upgraded D-30 engines now featured thrust reversers, replacing the parachute. The first Tu-134A, converted from a production Tu-134, flew on 22 April 1969. The first airline flight was on 9 November 1970. An upgraded version, the Tu-134B began production in 1980, with the navigator position abandoned, and seating capacity increased to 96 seats. Efforts subsequently began to develop a Tu-134D with increased engine thrust, but the project was cancelled.

An-24 (Coke) Russian Transport/Passenger Aircraft

Tiers:

Variants:

- **Variants:** An-24 Original design and prototypes. Twin-engined 44-seat transport aircraft. An-24A (first use) Airliner project powered by Kuznetsov NK-4 turboprops, discontinued when the NK-4 was cancelled. An-24A (second use) Production 50-seat airliners built at Kiev with the APU exhaust moved to the tip of the starboard nacelle. An-24ALK (Avtomatizeerovannaya [sistema] Lyotnovo Kontrolya – automatic flight check system) Several An-24s were converted for navaids calibration tasks, with one An-24LR 'Toros' re-designated An-24ALK after conversion. This aircraft was fitted with a photo-theodolite and powerful light sources for the optical sensors. An-24AT A 1962 project for a Tactical transport with rear loading ramp and powered by Isotov TV2-117DS coupled turboprops.[1] An-24AT-RD (RD – Reaktivnyye Dvigateli – jet engines) The An-24AT tactical transport project with two turbojet boosters pod-mounted under the outer wings and a wider loading ramp. An-24AT-U (Uskoriteli – boosters) A projected Tactical transport from 1966 with three or five PRD-63 (Porokhovoy Raketnyy Dvigatel – gunpowder rocket engine) JATO bottles, wider cargo ramp and provision for up to three brake parachutes. An-24B The second 50-seat airliner version with one extra window each side, single-slotted flaps replacing the double-slotted flaps and extended chord of the centre-section to compensate for the lower performance flaps. Some aircraft were delivered with four extra fuel bladders in the wing centre-section. An-24D A projected long-range airliner version of the An-24B with a single RU-19 booster jet engine in the starboard nacelle, stretched fuselage with seating for 60, strengthened structure and increased fuel capacity. An-24LL (Letyushchaya Laboratoriya – flying laboratory) The generic suffix LL can be applied to any test-bed, but in the An-24's case seems to refer to a single aircraft equipped for metrology (science of measurement), to be used for checking the airworthiness of production aircraft. An-24LP (LesoPozharnyy – forest fire fighter) Three An-24RV aircraft converted into fire bombers/cloud seeders by installing a tank in the cabin, optical smoke and flame detectors, provision for a thermal imager, racks for carrying flare dispensers and the ability to carry firefighters for para-dropping. An-24LR 'Toros' (Ice Hummock)(Ledovyy Razvedchik – ice reconnaissance) At least two An-24Bs converted to carry the 'Toros' SLAR (sideways looking airborne radar) either side of the lower fuselage, for ice reconnaissance, guiding icebreakers, convoys and other shipping. An-24LR 'Nit' (Thread) One An-24B was converted to with 'Nit' SLAR in large pods along the lower fuselage sides. An-24PRT (Poiskovo-spasahtel'nyy Reaktivnyy [Uskoritel'] Transportnyy – SAR boosted transport) The production search and rescue aircraft based on the An-24RT, eleven built. An-24PS (Poiskovo-Spasahtel'nyy – SAR) A single An-24B aircraft converted for search and rescue duties, rejected after acceptance trials in favour of a derivative of the An-24RT. An-24RR ([samolyot] Radiotsionnyy Razvedchik – radiation reconnaissance [aircraft]) Four aircraft converted as Nuclear, biological and chemical warfare reconnaissance versions of the An-24B, carrying RR8311-100 air sampling pods low on the forward fuselage and a sensor pod on a pylon on the port fuselage side. An-24RT (Reaktivnyy [Uskoritel'] Transportnyy – boosted transport) Similar to the AN-24T, fitted with an auxiliary turbojet engine. An-24RT (Retranslyator – relay installation) A few An-24T and An-24RT aircraft converted to Communications relay aircraft. Sometimes referred to as An-24Rt to differentiate from the An-24RT. An-24RV (Reaktivnyy [Uskoritel'] V – boosted V) Turbojet boosted export version, similar to the An-24V but fitted with a 1,985-lb (8830 N) thrust auxiliary turbojet

engine in the starboard nacelle. An-24ShT (Shtabnoy Transportnyy – Staff/HQ transport) A tactical Airborne Command Post for use by commanders, also capable of forming ground-based communications and HQ. An-24T (Transportnyy – transport) (first use) Tactical transport version, rejected due to poor field performance during acceptance testing. An-24T (Transportnyy – transport) (second use) A tactical transport version with a ventral loading hatch, cargo winch and escape hatch aft of the nose landing gear. An-24T 'Troyanda' (Ukrainian – rose) From the 1960s the Soviet Union was faced with nuclear submarine threats that were virtually undetectable with the technology available. To assist in the development of advanced optical, chemical, sonic, infra-red and electromagnetic detection systems, several aircraft were built or modified as test-beds. One significant aircraft was the An-24T 'Troyanda' which was built new, for the development of sonobuoy and infra-red detection systems. As well as equipment inside the cabin, sensors could be mounted in large teardrop fairings either side of the lower forward fuselage, and extra equipment could be carried in extended wing centre-section fairings. An-24TV (Transportnyy V – transport V) The export cargo version of the An-24T. An-24USh (Uchebno-Shturmanskiy (samolyot) – Navigator training aircraft) Seven An-24Bs were converted to An-24USh navigator/air traffic controller trainers with five training stations and four standard rows of seats for trainees in waiting. Outwardly the USh was distinguishable by the bulged windows at each training station. An-24V-I The initial export version of the An-24B 50-seat airliner with the early narrow chord inner wings, double-slotted flaps, single ventral fin, powered by two 2,550 hp (1,902 kW) Ivchenko AI-24A turboprop engines. An-24V-II Export late production 50-seat mixed passenger, cargo and freight aircraft with extended chord inner wing, single-slotted flaps, twin ventral fins and powered by AI-24T(SrsII) engines. An-26 Tactical transport with cargo ramp. An-30 Survey/Photo-mapping aircraft. An-32 Designed to withstand adverse weather conditions better than the standard An-26. An-34 The initial designation of the An-24T production tactical transport, discarded shortly after production began. An-50 A mid-1960s project for a jet-powered An-24, with four Ivchenko AI-25 turbofan engines in podded pairs, pylon mounted forward of the wings. Not proceeded with due to competition from the Yak-40. Xian Y-7 The Y-7 is a Chinese reverse-engineered version of the An-24/An-26 family. MA60 Upgraded and Westernised Y-7. An-24 In the early 1990s, North Korea installed N-019 Topaz pulse-Doppler radars on at least one of its An-24 aircraft in an attempt to achieve a rudimentary Airborne Early Warning capability.

System

Alternate Designation(s): AN-24; NATO: Coke

Primary Function / Type: Transport/Cargo Aircraft

Manufacturer: Antonov

Crew: 2 (pilot, co-pilot)

Passengers: 50 passengers

Number of Engines: 2

Number of Hard Points: INA

Dimensions

Length: 23.53 m

Height: 8.32 m

Wingspan: 29.20 m

Cabin Length: 9.69 m

Cabin Width: 2.76 m

Cabin Height: 1.91 m

Wing Area: 74.98 sq m

Weight, Empty: 13,300 kg

Weight, Maximum Payload: 5,500 kg

Weight, Maximum Takeoff: 21,000 kg

Automotive

Engine Name: 2 x Ivchenko AI-24V

Number of Engines: 2

Engine Type: Turboprop

Engine Power: 2,550 equivalent shp each

Internal Fuel Capacity: 5,550 liters

Maximum Speed: 500 km/h

Cruise Speed: 450 km/h

Landing Speed: 165 km/h

Climb Rate: 114 m/min

Ceiling: 8,400 m

Range, Maximum Payload: 550 km

Range, Maximum Fuel, with 30 Passengers: 2,400 km

Notes:

The Antonov An-24 (Russian/Ukrainian: Антонов Ан-24) (NATO reporting name: Coke) is a 44-seat twin turboprop transport/passenger aircraft designed in 1957 in the Soviet Union by the Antonov Design Bureau and manufactured by Kiev, Irkutsk and Ulan-Ude Aviation Factories. First flown in 1959, the An-24 was produced in some 1,000 units of various versions; in 2019 there are 109 still in service worldwide, mostly in the CIS and Africa. It was designed to replace the veteran piston Ilyushin Il-14 transport on short to medium haul trips, optimised for operating from rough strips and unprepared airports in remote locations. The high-wing layout protects engines and blades from debris, the power-to-weight ratio is higher than that of many comparable aircraft and the machine is rugged, requiring minimal ground support equipment. Due to its rugged airframe and good performance, the An-24 was adapted to perform many secondary missions such as ice reconnaissance and engine/propeller test-bed, as well as further development to produce the An-26 tactical transport, An-30 photo-mapping/survey aircraft and An-32 tactical transport with more powerful engines. Various projects were envisaged such as a four jet short/medium haul airliner and various iterations of power plant. The main production line was at the Kiev-Svyatoshino (now "Aviant") aircraft production plant which built 985, with 180 built at Ulan Ude and a further 197 An-24T tactical transport/freighters at Irkutsk. Production in the USSR was shut down by 1978. Production continues at China's Xi'an Aircraft Industrial Corporation which makes licensed, reverse-engineered and redesigned aircraft as the Xian Y-7, and its derivatives. Manufacture of the Y-7, in civil form, has now been supplanted by the MA60 derivative with western engines and avionics, to improve performance and economy, and widen the export appeal.

Il-76 (Candid) Russian Multi-Purpose Strategic Airlifter

Tiers:

Variants:

- **Prototypes and developmental variants:** Il-76TD-90 / Il-76MD-90 Engine upgrades to Perm PS-90s. Il-76 fire bomber Firefighting aircraft to drop exploding capsules filled with fire retardant. Il-76PSD SAR version of Il-76MF Il-96 Early development of convertible passenger/cargo aircraft, (project only, designation re-used later) Il-150 proposed Beriev A-50 with Perm PS-90 engines. Beriev A-60 Airborne laser weapon testbed. (Il-76 version 1A)
- **Special purpose / research variants:** Il-76LL with reinforced wing (at least 3 aircraft) to be used as test-bed aeroplane for engine prototypes flight testing in Gromov Flight Research Institute. Izdeliye-176 prototype Il-76PP. Izdeliye-576 Izdeliye-676 Telemetry and communications relay aircraft, for use during trial programmes (prototype). Izdeliye-776 Telemetry and communications relay aircraft, for use during trial programmes (prototype). Izdeliye-976 ("SKIP", Il-976, or Il-76SK) – (СКИП – Самолетный Контрольно-Измерительный Пункт, Airborne Check-Measure-and-Control Center) Il-76/A-50 based Range Control and Missile tracking platform. Initially built to support Raduga Kh-55 cruise missile tests. Izdeliye-1076 Special mission aircraft for unknown duties. Izdeliye-1176 ELINT electronic intelligence aircraft, or Il-76-11
- **Military variants:** Il-76-Tu160 tailplane transporter One-off temporary conversion to support Tu-160 emergency modification programme. Il-76D ('D' for "Desantnyi", Десантный – "Paratrooper transport") has a gun turret in the tail for defensive purposes. Il-76K/Il-76MDK/Il-76MDK-II Zero-g cosmonaut trainer (dlya podgotovki kosmonavtov), for Yuri Gagarin Cosmonauts Training Center. Il-76LL Engine testbed, (ooniversahl'naya letayuschchaya laboratoriya). Il-76M Military transport version, (modifitseerovannyy – modified). Il-76MD Improved military transport version, (modifitseerovannyy Dahl'ny – modified, long-range). Il-76MD Skal'pel-MT Mobile Hospital Il-76M / Il-76MD Built without military equipment but designated as Ms and MDs (Gordon – 'Falsies') Il-76MD-90 An Il-76MD with quieter and more economical Aviadvigatel PS-90 high-bypass turbofan engines. Il-76MF Stretched military version with a 6.6 m longer fuselage, PS-90A-76 engines, maximum takeoff weight of 210 tonnes and a lift capability of 60 tonnes. First flew in 1995, not built in series so far just built for Jordan. Il-76PP ECM aircraft, major problems with ECM equipment on the Izdeliye-176 only. Il-76MD-M Modernized Il-76MD for the Russian Air Force. Il-76MD-90A An upgraded version with a new glass cockpit, upgraded avionics, new internal wing structure and Aviadvigatel PS-90A-76 engines. It was also known as Il-476 while in development. Il-76T/Il-76TD Built as military aircraft but given civilian designations. (Gordon – 'Falsie') Ilyushin Il-78/Il-78M/Il-78MD-90A Aerial refuelling tanker. Il-78 MKI A customized version of the Il-78 developed for the Indian Air Force. Il-82 Airborne Command Post/communications relay aircraft, (alternative designation – Il-76VKP-'version65S'). Il-84 Maritime Search and Rescue aircraft, (alternative designation – Il-76PS-poiskovo-spasahtel'nyy), not produced. Beriev A-50/Beriev A-50M/Beriev A-50I/Beriev A-50E Airborne Early Warning & Control aircraft. Beriev given control over the program. Beriev A-100 An AEW&C version of the Il-76MD-90A.
- **Civil variants:** Il-76MGA Initial Commercial freighter. (two prototypes and 12 production) equipped with Soloviev D-30 Turbofan engines. Il-76MD to Il-76TD conversions Complete removal of military equipment, identified by crude cover over OBIGGS inlet in Starboard Sponson. Il-76P / Il-76TP / Il-76TDP / Il-76MDP Firefighting aircraft. The Il-76 waterbomber is a VAP-2 1.5-hour install/removal tanking kit conversion. The Il-76 can carry up to 13,000 U.S. gallons (49,000 liters) of water; 3.5 times the capacity of the C-130 Hercules. Since this kit can be installed on any Il-76, the designation Il-76TP, Il-76TDP are also used when those versions of the Il-76 are converted into water bombers. The Il-76P was first unveiled in 1990. Il-76T ('T' for Transport, Транспортный) unarmed civil cargo transport version. NATO code-name "Candid-A". It first flew on November 4, 1978. Il-76TD The civil equivalent of the Il-76MD, first flew in 1982, equipped with Soloviev D-30 Turbofan engines. Il-76TD-90 An Il-76TD with Aviadvigatel PS-90 engines and a partial glass cockpit. Il-76TD-90VD An Il-76TD with Aviadvigatel PS-90 engines and a partial glass cockpit. It was developed specially for Volga-Dnepr cargo company, which operates four aircraft as of 2012. Il-76TD-S Civilian mobile Hospital, similar to Il-76MD Skal'pel-MT. Il-76TF Civil transport stretched version with Aviadvigatel PS-90 engines. It is the civil version of the Il-76MF (none produced).

- **Foreign variants:** Beriev A-50E/I For the Indian Air Force. Hosts Israeli Phalcon radar for AEW&C and Aviadvigatel PS-90 engines. Il-76MD tanker Iraqi Air Force tanker conversions. KJ-2000 Domestic Chinese airborne early warning and control conversion of Il-76, developed after A-50I was cancelled and currently in service with the armed forces of China. CFTE engine testbed The China Flight Test Establishment (CFTE) currently operates a flying testbed converted from a Russian-made Il-76MD jet transport aircraft to serve as a flying testbed for future engine development programmes. The first engine to be tested on the aircraft is the WS-10A "Taihang" turbofan, currently being developed as the powerplant for China's indigenous J-10 and J-11 fighter aircraft. Il-76MD #76456, acquired by the AVIC 1 from Russia in the 1990s, is currently based at CFTE's flight test facility at Yanliang, Shaanxi Province. Baghdad-1 Iraqi development with a radar mounted in the cargo hold enabling it to serve as AEW&C, used in the Iran–Iraq War. Baghdad-2 Iraqi development (with French assistance) with fibreglass-reinforced plastic radome over the antenna of the Thomson-CSF Tiger G surveillance radar with a maximum detection range of 350 km (189 nmi, 217.5 mi). One was destroyed on the ground during the 1991 Persian Gulf War; two others were flown to Iran where they remained. At least one went into service with the IRIAF. One aircraft crashed following a midair collision with a HESA Saeqeh fighter, during the annual Iranian military parade in Teheran. It can be distinguished from the Beriev A-50 by having the Il-76 navigator windows in the nose, which the A-50 does not.

System

Alternate Designation(s): Il-76; NATO: Candid

Primary Function / Type: Multi-Purpose Strategic Airlifter

Notes:

The Ilyushin Il-76 (Russian: Илью́шин Ил-76; NATO reporting name: Candid) is a multi-purpose four-engine turbofan strategic airlifter designed by the Soviet Union's Ilyushin design bureau. It was first planned as a commercial freighter in 1967, as a replacement for the Antonov An-12. It was designed to deliver heavy machinery to remote, poorly served areas. Military versions of the Il-76 have been widely used in Europe, Asia and Africa, including use as an aerial refueling tanker or command center. The Il-76 has seen extensive service as a commercial freighter for ramp-delivered cargo, especially for outsized or heavy items unable to be otherwise carried. It has also been used as an emergency response transport for civilian evacuations as well as for humanitarian aid and disaster relief around the world. Because of its ability to operate from unpaved runways, it has been useful in undeveloped areas. Specialized models have also been produced for aerial firefighting and zero-G training. The aircraft was first conceived by Ilyushin in 1967 to meet a requirement for a freighter able to carry a payload of 40 tons (88,000 lb) over a range of 5,000 km (2,700 nmi; 3,100 mi) in less than six hours, able to operate from short and unprepared airstrips, and capable of coping with the worst weather conditions likely to be experienced in Siberia and the Soviet Union's Arctic regions. It was intended to replace the Antonov An-12. Another intended version was a double-decked 250-passenger airliner but that project was cancelled. The Il-76 first flew in March 1971. Production of Il-76s was allocated to the Tashkent

Aviation Production Association in Tashkent, Uzbekistan, then a republic of the Soviet Union. Some 860 of the basic transport variants were manufactured. In the 1990s, modernized variants also equipped with Soloviev D-30 turbofan engines were developed (MF, TF), with a cargo compartment 20 m (66 ft) long by 3.4 m (11 ft) wide by 3.4 m (11 ft) tall; these larger variants were not produced in significant quantity due to the financial difficulties being experienced by the Russian Air Force, which was the primary operator of the type. The prototype of the Il-76MF, conducted its first flight on 1 August 1995. From 2004 onwards, a number of aircraft in commercial service were modernized to the Il-76TD-90VD version; this involved the adoption of the newly developed PS-90 engine to comply with European noise limitations. In 2005, the People's Republic of China placed an order for 34 new Il-76MDs and four Il-78 tankers. In June 2013, Russian military export agency Rosoboronexport announced an order by China for 12 Il-76MD aircraft. The Il-76 has also been modified into an airborne refuelling tanker, designated the Il-78, around 50 aircraft having been produced. A variant of the Il-76 also serves as a firefighting water bomber. Its airframe was used as a base for the Beriev A-50 'Mainstay' AEW&C (airborne early warning and control) aircraft; around 25 aircraft were made. Another application for the type was found in Antarctic support flights and for conducting simulated weightlessness training for cosmonauts (akin to the "Vomit Comet" used by NASA). Beriev and NPO Almaz also developed an airborne laser flying laboratory designated A-60, of which two were built, much of this project's details remaining classified.

CRJ100 Canadian Transport Aircraft

Tiers:

1 **2** 3 4

Variants:

- **CRJ100:** The CRJ100 is the original 50-seat version. It is equipped with General Electric CF34-3A1 engines. Operators include RwandAir, among others.
- **CRJ100SF:** Passenger-to-freighter conversion of CRJ100.
- **CRJ100LR:** Long range version of CRJ100.
- **CRJ100SE:** Executive passenger conversion of CRJ100.
- **CRJ200:** The CRJ200 is identical to the CRJ100 except for its engines, which were upgraded to the CF34-3B1 model, offering improved efficiency.
- **CRJ200PF:** Package freighter version of CRJ200.
- **CRJ200LR:** Long range version of CRJ200.
- **CRJ200SF:** Passenger-to-freighter conversion of CRJ200.
- **CRJ440:** Certified up to 44-seat, this version was designed with fewer seats in order to meet the needs of some major United States airlines.
- **Challenger 800/850:** A business jet variant of the CRJ200
- **CRJ500:** Proposed 50-seat version with wing and cabin improvements based on the CRJ700/900. Cancelled in 2001.

Notes:

The Bombardier CRJ100 and CRJ200 (formerly known as the Canadair CRJ100 and CRJ200) is a family of regional airliners that was designed and manufactured by Bombardier Aerospace between 1991 and 2006. The CRJ was Canada's second civil jet airliner after the single prototype of the Avro Canada C102 Jetliner (which never entered commercial service). It was based on the Bombardier Challenger 600 series business jets. An initial effort to produce an enlarged 36-seat version of the aircraft, known as the Challenger 610E, was terminated during 1981. Shortly after Canadair's privatization and sale to Bombardier, work on a stretched derivative was reinvigorated; during early 1989, the Canadair Regional Jet program was formally launched. On 10 May 1991, the first of three CRJ100 prototypes conducted its maiden flight. The type first entered service during the following year with its launch customer, German airline Lufthansa. The initial variant, the CRJ100, was soon joined by another model, designated as the CRJ200. It was largely identical to the CRJ100, except for the installation of more efficient turbofan engines, which gave the aircraft lower fuel consumption, increased cruise altitude and cruise speed. During the 1990s, various additional versions and models of the type were developed and put into service. During the late 1990s, a substantially enlarged derivative of the airliner, referred to as the CRJ700, was developed; it was soon joined by the even larger CRJ900 and CRJ1000.

During 2006, production of both the CRJ100 and CRJ200 came to an end; the majority of produced airliners have remained in revenue service to date. Additionally, several airlines have modernized their fleets to support extended service. The Bombardier CRJ100 and CRJ200 are a family of jet-propelled regional airliners, based upon the design of the Challenger CL-600 business jet. Roughly, the CL-600 was stretched 5.92 metres (19 feet 5 inches), which was achieved using fuselage plugs fore and aft of the wing, and was matched with the adoption of a reinforced and modified wing, an expanded fuel capacity, improved landing gear to handle the higher weights, and an additional pair of emergency exit doors. When installed in a typical seating configuration, the CRJ100 would accommodate 50 passengers; while in a maximum configuration, 52 passengers could be accommodated. It was powered by a pair of General Electric CF34-3A1 turbofan engines, each of which was capable of generating up to 41.0 kN (4,180 kgp / 9,220 lbf) of thrust. The CRJ100 featured a Collins-built ProLine 4 avionics suite, including a weather radar.

CRJ1000 Canadian Regional Jet

Tiers:

Variants:

- **CRJ700:** Design work on the CRJ700 by Bombardier started in 1995 and the program was officially launched in January 1997. The CRJ700 is a stretched derivative of the CRJ200. The CRJ700 features a new wing with leading edge slats and a stretched and slightly widened fuselage, with a lowered floor. Its first flight took place on 27 May 1999. The aircraft's FAA Type Certificate designation is the CL-600-2C10. The CRJ700 first entered commercial service with Brit Air in 2001.
- **CRJ550:** On 6 February 2019, Bombardier launched the CRJ550, based on the CRJ700, with 50 seats in three classes. The launch customer, United Airlines, ordered 50 aircraft configured with 10 first class, 20 Economy Plus and 20 economy seats. The aircraft were to be operated under the United Express brand by regional partner GoJet Airlines. The CRJ550 has a lower maximum takeoff weight (MTOW) than the CRJ700, to comply with scope clauses in US pilot contracts, and a lower maximum landing weight (MLW). It received type certification in the second half of 2019. The initial 50 aircraft will be sourced from existing CRJ700s, rather than being newly constructed. On 7 August 2019, United Airlines' regional partner GoJet Airlines took delivery of the aircraft and began with a crew familiarization flight to Chicago-O'Hare International Airport (ORD).
- **CRJ900:** The CRJ900 is a stretched 76–90 seat version of the CRJ700. The first CRJ900 (C-FRJX) was modified from the prototype CRJ700 by adding longer fuselage plugs fore and aft of the wings. It was later converted into the prototype CRJ1000 by replacing the fuselage plugs with longer plugs. The CRJ900 also features strakes located at the rear of the plane. The CRJ900 competes with the Embraer 175, and is more efficient per seat-mile, according to Bombardier. Mesa Air Group was the launch customer for the CRJ900 painted in America West livery. The FAA Type Certificate designation of the CRJ900 is the CL-600-2D24.
- **CRJ705:** The CRJ700 Series 705 is based on the CRJ900, featuring a business class cabin and a reduced maximum seating capacity to allow operation with regional airlines. The Series 705 seats 75 passengers. Some regional airlines have scope clauses with their major airlines that limit the maximum passenger capacity of aircraft they operate. The Air Canada Pilots Association negotiated a scope agreement with Air Canada limiting the maximum seating capacity of any jet aircraft at Air Canada Express to 75 seats. Air Canada Jazz was the launch customer for this aircraft in 2005 with 10 Executive Class and 65 Economy Class seats, all fitted with personal audio/video-on-demand systems. The FAA Type Certificate designation of the CRJ705 is the CL-600-2D15. Jazz Aviation, a subsidiary of Chorus Aviation, operated 16 CRJ705s on behalf of Air Canada and was the only operator of this version. On 26 April 2016, Jazz Aviation announced that existing CRJ705 aircraft in operation will be converted to CRJ900 with 76 seats. As of late February 2018, all CRJ-705s have been reconfigured with 12 Executive Class and 64 Economy Class seats, which changed their FAA Type Certificate to CL-600-2D24.
- **CRJ1000:** On 19 February 2007, Bombardier launched the development of the CRJ1000, previously designated CRJ900X, as a stretched CRJ900, with up to 100 seats. The CRJ1000 completed its first production flight on 28 July 2009 in Montreal; the entry into service was planned then for the first quarter of 2010. A month after the first flight, however, a fault in the rudder controls forced the flight-test program to be grounded : the program was not resumed until

February 2010, and deliveries were projected to begin by January 2011. Brit Air and Air Nostrum were the launch customers for the CRJ1000.

System

Alternate Designation(s): CRJ1000

Primary Function / Type: Transport Aircraft

Manufacturer: Bombardier Aerospace

Crew: 3–4 : 2 Flight Crew + 1–2 cabin crew

Seating Capacity: 97 to 104

Number of Engines: 2

Number of Hard Points: INA

Maximum Payload: 11,966 kg

Dimensions

Length: 39.1 m

Width (Wing Span): 26.2 m

Height: 7.5 m

Wing area: 77.4 m2

Fuselage Diameter: 2.7 m

Notes:

On 19 February 2007, Bombardier launched the development of the CRJ1000, previously designated CRJ900X, as a stretched CRJ900, with up to 100 seats. The CRJ1000 completed its first production flight on 28 July 2009 in Montreal; the entry into service was planned then for the first quarter of 2010. A month after the first flight, however, a fault in the rudder controls forced the flight-test program to be grounded : the program was not resumed until February 2010, and deliveries were projected to begin by January 2011. Brit Air and Air Nostrum were the launch customers for the CRJ1000. Bombardier Aerospace announced on 10 November 2010 that its 100-seat CRJ1000 was awarded Aircraft Type Certificates from Transport Canada and European Aviation Safety Agency, allowing for deliveries to begin. On 14 December 2010, Bombardier began CRJ1000 deliveries to Brit Air and Air Nostrum. On 23 December 2010, it was announced that the Federal Aviation Administration had also awarded a type certificate, allowing the CRJ1000 to operate in US airspace. It has a separate type rating. Bombardier states that it offers better performance and a higher profit per seat than the competing Embraer E-190. The FAA Type Certificate designation of the CRJ1000 is the CL-600-2E25. In 2018, a new CRJ1000 discounted price is $24.8M, a 2015 model is valued $22.0M, a 2010 one is worth $15.5M for a $155,000 monthly lease, and it will be $12.0M in 2021 for a $145,000 monthly lease while its D Check costs $800,000 and its engine overhaul costs $0.9 to 2.4M. The Bombardier CRJ700, CRJ900, and CRJ1000 (after June 2020, the Mitsubishi CRJ) are a family of regional jet airliners designed and manufactured by Canadian transportation conglomerate Bombardier; this aircraft trio has been collectively marketed by the company as the CRJ Series. Their design was derived from the smaller CRJ100 and 200 airliners. During the 1990s, Bombardier initiated development on the CRJ-X, a program to produce enlarged derivatives of its popular CRJ100/200 family. Officially launched in 1997, the CRJ700's maiden flight took place on 27 May 1999; it was soon followed by the stretched CRJ900 variant. Several additional variants of the type were subsequently introduced, including the CRJ550 and the elongated CRJ1000. While production of the smaller CRJ100/200 range was discontinued during 2006, the larger CRJ Series models have continued to be produced into the 2010s. Competitors have included the Fokker 70/Fokker 100, the BAe 146 family, and the Embraer E-Jet family. In Bombardier's lineup, the CRJ Series was formerly marketed alongside a family of larger jets, the C Series (now majority-owned by Airbus and marketed as the Airbus A220) and a twin-turboprop, the Q Series (now owned by De Havilland Canada and marketed as the Dash 8). During the late 2010s, Bombardier sought to sell off several of its aircraft programs. The CRJ program was acquired by Japanese corporation Mitsubishi Heavy Industries in a deal that closed 1 June 2020. The CRJ900 is a stretched 76–90 seat version of the CRJ700. The first CRJ900 (C-FRJX) was modified from the prototype CRJ700 by adding longer fuselage plugs fore and aft of the wings. It was later converted into the prototype CRJ1000 by replacing the fuselage plugs with longer plugs. The CRJ900 also features strakes located at the rear of the plane. The CRJ900 competes with the Embraer 175, and is more efficient per seat-mile, according to Bombardier. Mesa Air Group was the launch customer for the CRJ900 painted in America West livery. The FAA Type Certificate designation of the CRJ900 is the CL-600-2D24. The wing is wider with added leading edge slats, the tail is redesigned. The cabin floor has been lowered 2 inches which gains outward visibility from the windows in the cabin as the windows become closer to eye level height. The cabin has a re-circulation fan which aids in cooling and heating. The environmental packs have a target temperature instead of a hot-cold knob. The APU is a Honeywell RE220 unit,[68] which supplies much more air to the AC packs and has higher limits for starting and altitude usage. The aircraft features two GE CF34-8C5 engines, 59.4 kN (13,400 lbf) thrust with APR. The engines are controlled by FADEC digital engine control instead of control cables and a fuel control unit. In typical service, the CRJ900 can cruise 8–10,000 ft higher with a slightly higher fuel burn and an average true airspeed of 450–500 knots, a significant improvement over its predecessor. Its maximum ground takeoff weight is 84,500 pounds. In 2018, the CRJ900's list price was $48 million while its market value was $24M; reportedly, most customers are paying around $20–22M and the American Airlines order for 15 was at below $20M. A 2012 aircraft was worth less than $14M and it was to fall by 30% in 2021.

Challenger 601 (CL-601) Canadian Transport Aircraft

Tiers:

Variants:

- **Challenger 600 (CL-600):** The was the initial production version with Avco Lycoming ALF 502L-2 engines and without winglets at the wingtips.
- **CE-144 Electronic Support and Training (EST):** Seven CL-600s were converted as EW simulators; fitted with radar, jamming systems, communications equipment; the first service entry was in 1990.
- **Challenger 601 (CL-601):** The 601 is a production version with uprated engines and winglets. At one point, there were 18 in military service, most as VIP transports: six in Canada, five in China and seven in Germany. One German aircraft was configured for combined passenger/cargo operations; another operated as an air ambulance with a 4-litter capacity.
- **Challenger 601-3A (CL-601-3A):** This is an improved 601 with flat-rated CF-34-3A engines for better hot-day performance; integrated digital flight management and guidance system including automatic flight control system (AFCS) and electronic flight instrumentation system (EFIS).
- **Challenger 604 (CL-604):** The CL-604 is the latest version of this type of aircraft by Bombardier Aerospace. It has a range of 4,077 nm (4,696 mi; 7,556 km). It also utilizes advanced transonic wing design, a damage-tolerant airframe (FAR 25), triple-redundant hydraulic systems and quadruple-redundant electrical systems.
- **CL-605:** Initial operating capability (IOC) of this version was reached in 2006. It upgrades the avionics and structure of the 604 design. Features include larger cabin windows, new avionics displays and "electronic flight bag" capability. The version can be identified by its new, rounded tailcone. See separate record for more information.

System

Alternate Designation(s): Challenger 601; CL-601
Primary Function / Type: Transport Aircraft
Manufacturer: Canadair, St Laurent, Quebec, Canada (part of Bombardier Aerospace)

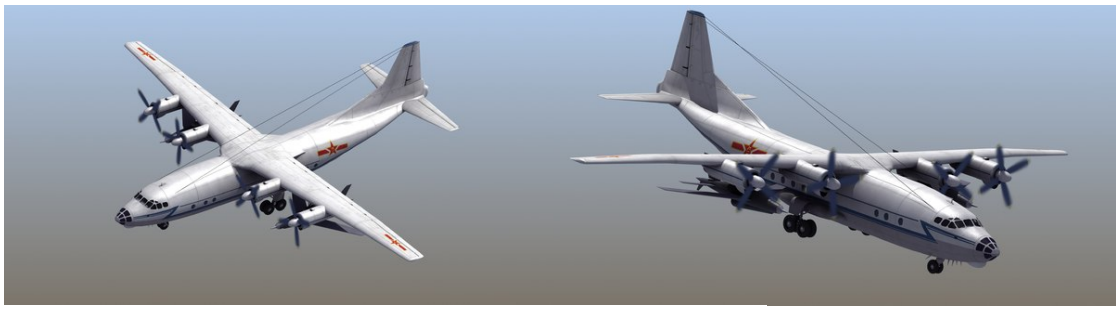
Notes:

Challenger 601 (CL-601) The 601 is a production version with updated engines and winglets. At one point, there were 18 in military service, most as VIP transports: six in Canada, five in China and seven in Germany. One German aircraft was configured for combined passenger/cargo operations; another operated as an air ambulance with a 4-litter capacity. The Bombardier Challenger 600 series is a family of business jets developed by Canadair and then produced from 1986 by its new

owner, Bombardier Aerospace. At the end of 1975, Canadair backed the LearStar 600 concept by Bill Lear, and acquired the large business jet or freighter project in April 1976. On 29 October, the program was launched, backed by the Canadian federal government, and designed to comply with new FAR part 25 standards. In March 1977, it was renamed the Challenger 600 after Bill Lear was phased out, as the original conventional tail was changed for a T-tail among other developments. The first prototype was rolled out on 25 May 1978, and performed its maiden flight on 8 November. The flight test program saw a deadly crash on 3 April 1980, but Transport Canada approved the CL-600 type certification on 10 August 1980. In 1986, Canadair was close to bankruptcy and was bought by Bombardier. The jet was stretched into the Bombardier CRJ regional airliner, introduced on 19 October 1992, and the longer range Global Express, introduced in July 1999. The 500th Challenger was rolled out in May 2000, and the 1000th was delivered to NetJets in December 2015. By October 2018, 1,066 aircraft have been built. The Challenger is a low-wing jet powered by two turbofans mounted in aft fuselage pods, it has a supercritical wing and a stand-up cabin with two seating sections. The original Lycoming ALF 502 turbofans were replaced by a pair of General Electric CF34s on the CL-601, which also gained winglets, and first flew on 10 April 1982. Subsequent variants have updated systems, avionics, and higher weights.

Y-8E Chinese Unmanned Aerial Vehicle (UAV) Launch and Control Aircraft



Tiers:

Variants:

- **Note:** Y-8 This was the original version. It was little different from the An-12 with a slightly modified glass nose copied from the design of the H-6 bomber. The cargo hold was not pressurized. Early production variants inherited the An-12 's tail turret, which mounts a twin 23-mm cannon, but this was later removed. Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. Y-8B This is the civilian version. First flight took place in 1990 and it was certified in 1993. Y-8C This variant has the pressurized cabin volume increased from 1,000 cu ft (28.3 cu m) to 7,500 cu ft (212.4 cu m). Landing gear and air conditioning are upgraded. The original inward-open two-piece cargo loading doors were replaced by a single-piece flat loading ramp similar to that of the C-130 . First flight occurred on Dec. 17, 1990. Shaanxi has also developed the Y-8CA radar testbed and Y-8CI export variant transport, the latter with Western avionics. Y-8D This is the export variant, fitted with Western avionics to meet the requirements for commercial flights. Onboard avionics include Collins flight director system (FDS), air data computer, VOR/ILS, comparing warning, TDR-90 air-traffic control receiver, VHF radio, Honeywell P-400 color weather radar, Litton LTN-311 Omega navigation system, Bendix/King HF communication, Sundsstrand universal flight data recorder (UFDR) and cockpit voice recorder (CVR). It is in service in Burma (Myanmar), Sri Lanka and Sudan. Y-8D II This is the latest export variant with avionics similar to those in the Y-8C. Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. Y-8F This is a livestock transport. It was certified on Jan. 26, 1994. Y-8F100 This is a commercial freighter version of the Y-8, featuring improved avionics. The aircraft features a redesigned cargo compartment, which can carry four international standard pallets of 88 in x 108 in, or eight pallets of 88 in x 54 in, or three pallets of 96 in x 125 in. The cargo compartment is also fitted with a modernized cargo handling system, allowing fast loading/unloading. Y-8F200 This is a commercial freighter version of the Y-8C, with upgraded avionics and a redesigned cargo compartment. The cargo handling system and large flat ramp enable rapid loading and unloading. Y-8F200W This variant features a fuselage that is 7 ft 3 in (2.2 m) longer than the baseline aircraft. The aircraft can take off from gravel or snow-covered runways at altitudes up to 9,840 ft (3,000 m) above sea level. It can also operate from unprepared runways. Y-8F400 This is a modernized freighter variant with upgraded avionics. It requires a three-man flight crew instead of the original five-man crew. The original glass nose was replaced by a solid nose. The cargo compartment is equipped with a 2,000-lb (1,000-kg) payload overhead cargo system, where the cargo can be suspended from an electrically powered rail. Rollers in the floor of the cargo compartment enable quick and easy handling of cargo pallets and can be removed to leave a flat surface. The compartment is fully pressurized. Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14,

2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system.The transport is powered by four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the undernose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. Y-8H This is an aerial survey and photography variant. Y-8J maritime surveillance aircraft These are Y-8C transports fitted with British Skymaster radars for maritime surveillance missions. China procured six to eight of the radars from Racal (now Thales) in 1996 deal worth US$66 million. At least two of the aircraft remain in Chinese naval service and are deployed at Dachang naval air base near Shanghai. The original glass nose on the Y-8 is replaced by a large radome to accommodate the radar antenna on the Y-8J. The rear cargo door and loading ramp are also removed. Y-8JB This is an electronic intelligence (ELINT) variant first seen in mid-2004 near Shanghai. A prototype first flew on Aug. 26, 2003, and four aircraft are in service with the Chinese navy. The aircraft has a large chin-mounted radome that could house a large ELINT antenna. Another SATCOM antenna may be installed inside a large semi-spherical dorsal fairing forward of the vertical tailfin providing real-time transmission to the ground base. Numerous smaller fairings can be seen on top of the cabin and along the upper sections of the aft fuselage, as well as at the nose tip. The loading ramp appears to have been sealed. The aircraft has been fitted with a BM/KZ800 ELINT system. Y-8X maritime patrol aircraft (MPA) This Y-8X is fitted with a Litton Canada APS-504 search radar, dual Litton LTN-72R inertial navigational system and a single LTN-211 Omega navigation set. The first example was delivered to the Chinese navy in late 1984, and the aircraft received national design certification in 1985. A small number have been in service since the mid-1980s. The aircraft is equipped with search radar, navigation system, self-defense electronic countermeasures (ECM) suite, optical/infrared cameras, sonobuoys and sonar receiver. The rear cargo door was removed and replaced by a large mission equipment window for sonobuoys racks and cameras. The rear turret was also removed and replaced by the sonar operator seat. A canoe-shaped fairing plus a couple of blade antennas appear to have been attached to the bottom of the middle and aft fuselage, suggesting the aircraft's electronic intelligence mission has been enhanced with a new synthetic aperture radar (SAR) capability. Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. KJ-200 This is an airborne early warning and control aircraft based on the Y-8F600 airframe. See separate record for more information. Y-8 tanker Flight Refueling Ltd. of the U.K. studied the possibility of converting the Y-8 into an in-flight refueling aircraft. No Y-8Ts are known to be in service. Y-8 airborne early warning aircraft This is a third Chinese airborne early warning aircraft program, following the KJ-2000 and KJ-200 (see separate records); it was revealed in 2005. Based on the Shaanxi Y-8F400 airframe, the aircraft features a conventional rotodome mounted above the fuselage. At least one prototype has been built and the program may be aimed at the export market. Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. ZDK-03 This variant, based on the Y-8F600, was designed specifically for the Pakistani air force for airborne early warning missions. It features an active electronically scanned array (AESA) radar. Islamabad has ordered four of the aircraft. The first unit was scheduled to be delivered by the end of 2010. See separate record for more information. GX-7 This is a Y-8 aircraft modified for psychological warfare missions. It is designed to broadcast messages over radio and television signals and can jam enemy communications. The GX-7 was first made public by Chinese media in July 2013. Y-8Q/Y-8GX6 This variant was first revealed in November 2011 and was reported in service in mid-2015. The Y-8Q features a redesigned wing and pressurized fuselage with composite structures; WJ-6C turboshaft

engines; and high-efficiency, six-bladed propellers. It is distinguishable from other Y-8/Y-9 variants by a large chin-mounted sea search radar; electro-optical system behind the nose wheel; and a weapons bay just ahead of the main wheels. There is also a magnetic anomaly detector (MAD) boom and domed windows in the aft fuselage for observation. A fuselage weapons bay, located ahead of the main landing gear, would likely carry torpedoes. It has been speculated that the Y-8Q has fuselage sonobuoy dispensers and hardpoints on the wings for anti-ship missiles.

Notes:

Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. The Shaanxi Y-8 or Yunshuji-8 (Chinese: □-8) aircraft is a medium size medium range transport aircraft produced by Shaanxi Aircraft Corporation in China, based on the Soviet Antonov An-12. It has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. Although the An-12 is no longer made in Ukraine, the Chinese Y-8 continues to be upgraded and produced. An estimated 169 Y-8 aircraft had been built by 2010. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with license to assemble the aircraft locally. However, due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance. The Xi'an Aircraft Company and Xi'an Aircraft Design Institute worked to reverse engineer the An-12 for local production. Design of the aircraft was completed by February 1972. Major features of the Y-8 included a glazed nose and tail turret derived from that of the H-6 bomber, a roller-type palletized-cargo-handling device instead of the overhead conveyor, and a gaseous oxygen system as opposed to a liquid oxygen system. The original Y-8 inherited the An-12's twin 23mm cannon tail turret, but this was removed on subsequent variants. The Y-8 equipped with four turboprop engines mounted under the leading edges of non-swept wings. The wings are attached high on the fuselage, and the tricycle landing gear is equipped with low pressure tires. The earliest versions used for the transportation of freight or troops had two side-hinged, inward-opening doors, while later variants used a rearward-facing ramp to facilitate loading and unloading of the payload. Some specialized versions omit the cargo ramp entirely. The Y-8 is capable of carrying troops, dropping supplies, parachute drops, and functioning as an air ambulance. It also can be used for commercial uses as a freighter. It is capable of hauling 20 tons of cargo, approximately 96 soldiers, or about 82 paratroopers in the cargo compartment which is 13.5 metres long, 3 metres wide and 2.4 metres high. It can also carry 60 severely wounded soldiers with their stretchers, 20 slightly injured soldiers and 3 medical attendants. Many variants for specialized roles have been built, but information on them can be vague or difficult to obtain due to the secretive nature of the Chinese military. The Y-8 transport aircraft was put into trial production in the Xi'an Aircraft Factory in June 1972. By December 1974, the first Chinese-assembled Y-8 conducted its maiden flight. Following trial production of the first Y-8s, operations were transferred to the Shaanxi Aircraft Factory. The Shaanxi-produced Y-8s conducted their test flights in December 1975. After a regime of 66 test flights the Y-8 was officially certified for use by the Chinese government. By 1981, the Y-8 entered serial production.[2] Mr. Ouyang Shaoxiu (□□□□) would eventually become the general designer, designing many variants of Y-8, including KJ-2000. In the early 1980s, Chinese officials saw US Army recruiting advertisements featuring parachute extraction of an Army jeep along with troops. The PLA was told to develop this kind of capability. But there were two design problems. One, Y-8 wings have very sharp leading edges, so one wing tends to stall before the other, causing the aircraft to roll inverted as it stalls. The second design flaw as that the cargo deck of the Y-8 had a 10 degree downward slope starting at the landing gear. When the PLA Air Force started to test parachute extraction, these two design flaws caused a near disaster. The aircraft was flying too fast, and when the parachute started to extract cargo from the hold, the cargo rolled on the deck until it got to the 10 degree downward slope, and there it became airborne while still inside the aircraft. The cargo hit the top of the cargo door on the way out, making it clear that the Y-8 could not do parachute cargo extraction. In 1986, two engineers from Beijing's Ministry of Aviation visited Lockheed. They could not speak very much English, and the Lockheed-Georgia sales person who met them could not speak Chinese. So for half a day, they did a point-and-grunt tour until they were lucky enough to find a Lockheed employee who could speak Chinese. The Chinese wanted to purchase Lockheed wind tunnel testing on the Y-8 in order to address the stall problem. As a result of these wind tunnel tests, conducted in 1986, Lockheed was given a contract to do a flight test series on the Y-8. Lockheed was told that flight test data was not provided by the Soviets when they helped China build the Y-8 factory. The flight test series was flown by Lockheed test pilot Hank Dees. Hank had flown the test flight series for the Lockheed L-1011 and later for China's Y-12 in Harbin. During this flight

test series, Hank Dees flew the aircraft to stall speed and taught Chinese pilots how to anticipate a stall in order to prevent letting the aircraft go inverted. As a result of this test flight series, Chinese pilots started to use the 45 degree flap position. Lockheed's motive for doing flight tests was to demonstrate that China would be better off buying the C-130 rather than trying to improve the Y-8. China did buy C-130's, but the flight test series actually demonstrated that the Y-8 was a more capable aircraft than previously believed. In the late 1980s, Lockheed Martin, the American manufacturer of the C-130 Hercules, helped China to develop a pressurized cabin for the passenger version of Y-8, resulting in two versions: the first had half of the cabin pressurized and later, the second version in which the complete cabin was pressurized. In 2001 and 2002, new consulting arrangements between Antonov and Shaanxi resulted in modernized redesigns to the Y-8's wing and fuselage. As a consequence the redesign allows the Y-8's fuel capacity to be increased by 50 percent.

Il-76MD (Candid-B) Russian Multi-Purpose Strategic Airlifter

Tiers:

Variants:

- **Prototypes and developmental variants:** Il-76TD-90 / Il-76MD-90 Engine upgrades to Perm PS-90s. Il-76 fire bomber Firefighting aircraft to drop exploding capsules filled with fire retardant. Il-76PSD SAR version of Il-76MF Il-96 Early development of convertible passenger/cargo aircraft, (project only, designation re-used later) Il-150 proposed Beriev A-50 with Perm PS-90 engines. Beriev A-60 Airborne laser weapon testbed. (Il-76 version 1A)
- **Special purpose / research variants:** Il-76LL with reinforced wing (at least 3 aircraft) to be used as test-bed aeroplane for engine prototypes flight testing in Gromov Flight Research Institute. Izdeliye-176 prototype Il-76PP. Izdeliye-576 Izdeliye-676 Telemetry and communications relay aircraft, for use during trial programmes (prototype). Izdeliye-776 Telemetry and communications relay aircraft, for use during trial programmes (prototype). Izdeliye-976 ("SKIP", Il-976, or Il-76SK) – (СКИП – Самолетный Контрольно-Измерительный Пункт, Airborne Check-Measure-and-Control Center) Il-76/A-50 based Range Control and Missile tracking platform. Initially built to support Raduga Kh-55 cruise missile tests. Izdeliye-1076 Special mission aircraft for unknown duties. Izdeliye-1176 ELINT electronic intelligence aircraft, or Il-76-11
- **Military variants:** Il-76-Tu160 tailplane transporter One-off temporary conversion to support Tu-160 emergency modification programme. Il-76D ('D' for "Desantnyi", Десантный – "Paratrooper transport") has a gun turret in the tail for defensive purposes. Il-76K/Il-76MDK/Il-76MDK-II Zero-g cosmonaut trainer (dlya podgotovki kosmonavtov), for Yuri Gagarin Cosmonauts Training Center. Il-76LL Engine testbed, (ooniversahl'naya letayuschchaya laboratoriya). Il-76M Military transport version, (modifitseerovannyy – modified). Il-76MD Improved military transport version, (modifitseerovannyy Dahl'ny – modified, long-range). Il-76MD Skal'pel-MT Mobile Hospital Il-76M / Il-76MD Built without military equipment but designated as Ms and MDs (Gordon – 'Falsies') Il-76MD-90 An Il-76MD with quieter and more economical Aviadvigatel PS-90 high-bypass turbofan engines. Il-76MF Stretched military version with a 6.6 m longer fuselage, PS-90A-76 engines, maximum takeoff weight of 210 tonnes and a lift capability of 60 tonnes. First flew in 1995, not built in series so far just built for Jordan. Il-76PP ECM aircraft, major problems with ECM equipment on the Izdeliye-176 only. Il-76MD-M Modernized Il-76MD for the Russian Air Force. Il-76MD-90A An upgraded version with a new glass cockpit, upgraded avionics, new internal wing structure and Aviadvigatel PS-90A-76 engines. It was also known as Il-476 while in development. Il-76T/Il-76TD Built as military aircraft but given civilian designations. (Gordon – 'Falsie') Ilyushin Il-78/Il-78M/Il-78MD-90A Aerial refuelling tanker. Il-78 MKI A customized version of the Il-78 developed for the Indian Air Force. Il-82 Airborne Command Post/communications relay aircraft, (alternative designation – Il-76VKP-'version65S'). Il-84 Maritime Search and Rescue aircraft, (alternative designation – Il-76PS-poiskovo-spasahtel'nyy), not produced. Beriev A-50/Beriev A-50M/Beriev A-50I/Beriev A-50E Airborne Early Warning & Control aircraft. Beriev given control over the program. Beriev A-100 An AEW&C version of the Il-76MD-90A.
- **Civil variants:** Il-76MGA Initial Commercial freighter. (two prototypes and 12 production) equipped with Soloviev D-30 Turbofan engines. Il-76MD to Il-76TD conversions Complete removal of military equipment, identified by crude cover over OBIGGS inlet in Starboard Sponson. Il-76P / Il-76TP / Il-76TDP / Il-76MDP Firefighting aircraft. The Il-76 waterbomber

is a VAP-2 1.5-hour install/removal tanking kit conversion. The Il-76 can carry up to 13,000 U.S. gallons (49,000 liters) of water; 3.5 times the capacity of the C-130 Hercules. Since this kit can be installed on any Il-76, the designation Il-76TP, Il-76TDP are also used when those versions of the Il-76 are converted into water bombers. The Il-76P was first unveiled in 1990. Il-76T ('T' for Transport, Транспортный) unarmed civil cargo transport version. NATO code-name "Candid-A". It first flew on November 4, 1978. Il-76TD The civil equivalent of the Il-76MD, first flew in 1982, equipped with Soloviev D-30 Turbofan engines. Il-76TD-90 An Il-76TD with Aviadvigatel PS-90 engines and a partial glass cockpit. Il-76TD-90VD An Il-76TD with Aviadvigatel PS-90 engines and a partial glass cockpit. It was developed specially for Volga-Dnepr cargo company, which operates four aircraft as of 2012. Il-76TD-S Civilian mobile Hospital, similar to Il-76MD Skal'pel-MT. Il-76TF Civil transport stretched version with Aviadvigatel PS-90 engines. It is the civil version of the Il-76MF (none produced).

- **Foreign variants:** Beriev A-50E/I For the Indian Air Force. Hosts Israeli Phalcon radar for AEW&C and Aviadvigatel PS-90 engines. Il-76MD tanker Iraqi Air Force tanker conversions. KJ-2000 Domestic Chinese airborne early warning and control conversion of Il-76, developed after A-50I was cancelled and currently in service with the armed forces of China. CFTE engine testbed The China Flight Test Establishment (CFTE) currently operates a flying testbed converted from a Russian-made Il-76MD jet transport aircraft to serve as a flying testbed for future engine development programmes. The first engine to be tested on the aircraft is the WS-10A "Taihang" turbofan, currently being developed as the powerplant for China's indigenous J-10 and J-11 fighter aircraft. Il-76MD #76456, acquired by the AVIC 1 from Russia in the 1990s, is currently based at CFTE's flight test facility at Yanliang, Shaanxi Province. Baghdad-1 Iraqi development with a radar mounted in the cargo hold enabling it to serve as AEW&C, used in the Iran–Iraq War. Baghdad-2 Iraqi development (with French assistance) with fibreglass-reinforced plastic radome over the antenna of the Thomson-CSF Tiger G surveillance radar with a maximum detection range of 350 km (189 nmi, 217.5 mi). One was destroyed on the ground during the 1991 Persian Gulf War; two others were flown to Iran where they remained. At least one went into service with the IRIAF. One aircraft crashed following a midair collision with a HESA Saeqeh fighter, during the annual Iranian military parade in Teheran. It can be distinguished from the Beriev A-50 by having the Il-76 navigator windows in the nose, which the A-50 does not.

System

Alternate Designation(s): Il-76MD; NATO: Candid-B

Primary Function / Type: Multi-Purpose Strategic Airlifter

Manufacturer: Tashkent Aviation Production Association Aviastar-SP

Crew: 7 (pilot, co-pilot, navigator, flight engineer, communications officer, 2 cargo handlers)

Passengers: 140 regular troops; or 125 paratroops

Number of Engines: 4

Number of Hard Points: Some military models have 2 hardpoints under each outer wing capable of supporting 500 kg bombs.

Dimensions

Length: 53.19 m

Width (Wing Span): 50.5 m

Height: 14.76 m

Wing Area: 300 m2

Tailplane Span: 17.40 m

Tailplane Area: 63.0 m sq

Fin Height: 7.25 m

Fin Area: 50.0 m sq

Wheelbase: 14.17 m

Wheel Track: 8.16 m

Hatch Height: 3.40 m

Hatch Width: 3.45 m

Cargo Hold, Length to Ramp: 20.00 m

Cargo Hold, Length with Ramp: 24.50 m

Cargo Hold, Height: 3.46 m

Cargo Hold, Width: 3.40 m

Empty Operating Weight: 89,000 kg

Maximum Payload Capacity: 48,000 kg

Maximum Takeoff Weight: 190,000 kg

Unprepared Runway Weight: 157,500 kg

Maximum Landing Weight: 155,000 kg

Automotive

Engine Name: 4 x Rybinsk D-30KP II

Number of Engines: 4

Engine Type: Turbofans

Engine Power: 26,455 lb (117.68 kN) each at takeoff

Fuel Capactiy: 28,922 gal (109,480 liters) max in 12 tanks

Maximum Speed: 496 knots (571 mph, 919 km/h)

Cruise Speed: 421 knots (485 mph, 780 km/h)

Ceiling: 12,100 m

Range with Maximum Fuel: 4,212 nm (4,847 mi, 7,800 km)

Range with a Small Load: 3,942 nm (4,536 mi, 7,300 km) with 44,092 lb (20,000 kg) payload

Range with a Medium Load: 2,270 nm (2,610mi, 4,200 km) with 88,184 lb (40,000 kg) payload

Range with Maximum Load: 2,052 nm (2,361 mi, 3,800 km)

Takeoff Run: 5,580 ft (1,700 m)

Landing Run: 3,050 ft (930 m)

Main Gun System

↳*System*

Name: GSh-23L

Type: Autocannon

Caliber: 23mm

Quantity: 2 x GSh-23L twin-barreled in manned tail turret on several military and some civilian planes

Length: 1,537 mm

Barrel Length: 1,000 mm

Weight: 50 kg

Barrels: 2

Action: Gast principle

Rate of Fire: 3,400–3,600 rounds/min

Muzzle Velocity: 715 m/s

↳*Ammunition*

Type: Rifle

Caliber: 23mm

Cartridge: 23x115 mm

Basic Load: INA

Bomb Weapon Systems

Note: Some military models have 2 hardpoints under each outer wing capable of supporting 500 kg bombs.

Fire Control / Avionics

FCS Name: INA

Fire Control Radar: Yes

Navigation Radar: Kupol-3-76

FLight Avionics: SAU-76 automatic control system

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: SPS-5 Fasol Electronic Jammers

Chaffs/Flares: 4 x 500 kg for illuminating landing area

Radar Warning: Receivers in large fairings on side of nose

Notes:

Il-76MD Candid-B This is the military version of the Il-76TD. The additional D designation stands for dal'niy, or long-range. It is covered in the main entry, above. Its max takeoff weight is increased from 170 tons to 190 tons when operating from concrete runways. The Ilyushin Il-76 (Russian: Ильюшин Ил-76; NATO reporting name: Candid) is a multi-purpose four-engine turbofan strategic airlifter designed by the Soviet Union's Ilyushin design bureau. It was first planned as a commercial freighter in 1967, as a replacement for the Antonov An-12. It was designed to deliver heavy machinery to remote, poorly served areas. Military versions of the Il-76 have been widely used in Europe, Asia and Africa, including use as an aerial refueling tanker or command center. The Il-76 has seen extensive service as a commercial freighter for ramp-delivered cargo, especially for outsized or heavy items unable to be otherwise carried. It has also been used as an emergency response transport for civilian evacuations as well as for humanitarian aid and disaster relief around the world. Because of its ability to operate from unpaved runways, it has been useful in undeveloped areas. Specialized models have also been produced for aerial firefighting and zero-G training. The aircraft was first conceived by Ilyushin in 1967 to meet a requirement for a freighter able to carry a payload of 40 tons (88,000 lb) over a range of 5,000 km (2,700 nmi; 3,100 mi) in less than six hours, able to operate from short and unprepared airstrips, and capable of coping with the worst weather conditions likely to be experienced in Siberia and the Soviet Union's Arctic regions. It was intended to replace the Antonov An-12. Another intended version was a double-decked 250-passenger airliner but that project was cancelled. The Il-76 first flew in March 1971. Production of Il-76s was allocated to the Tashkent Aviation Production Association in Tashkent, Uzbekistan, then a republic of the Soviet Union. Some 860 of the basic transport

variants were manufactured. In the 1990s, modernized variants also equipped with Soloviev D-30 turbofan engines were developed (MF, TF), with a cargo compartment 20 m (66 ft) long by 3.4 m (11 ft) wide by 3.4 m (11 ft) tall; these larger variants were not produced in significant quantity due to the financial difficulties being experienced by the Russian Air Force, which was the primary operator of the type. The prototype of the Il-76MF, conducted its first flight on 1 August 1995. From 2004 onwards, a number of aircraft in commercial service were modernized to the Il-76TD-90VD version; this involved the adoption of the newly developed PS-90 engine to comply with European noise limitations. In 2005, the People's Republic of China placed an order for 34 new Il-76MDs and four Il-78 tankers. In June 2013, Russian military export agency Rosoboronexport announced an order by China for 12 Il-76MD aircraft. The Il-76 has also been modified into an airborne refuelling tanker, designated the Il-78, around 50 aircraft having been produced. A variant of the Il-76 also serves as a firefighting water bomber. Its airframe was used as a base for the Beriev A-50 'Mainstay' AEW&C (airborne early warning and control) aircraft; around 25 aircraft were made. Another application for the type was found in Antarctic support flights and for conducting simulated weightlessness training for cosmonauts (akin to the "Vomit Comet" used by NASA). Beriev and NPO Almaz also developed an airborne laser flying laboratory designated A-60, of which two were built, much of this project's details remaining classified.

B737-200 (Boeing 737-200) American Cargo Transport Aircraft

Tiers:

Variants:

- **B737-100:** This is the initial production civil airliner version, with a 94-ft (28.65-m) long fuselage and a maximum passenger capacity of 115. First flight took place on April 9, 1967. Only 30 were built, all of which entered commercial service. One was later acquired by the Mexican air force as a VIP transport.
- **B737-200:** This version features a 6-ft (1.82-m) fuselage stretch and more powerful JT8D engines. There were 1,095 aircraft built.
- **B737-2X9 Surveiller:** This version is a 737-200 with 14 first-class and 88 coach passenger seats as well as a Motorola side-looking airborne modular multi-mission radar (SLAMMR) -- a variant of the AN/APS-131/135 radar -- and two associated 16-ft (5-m) long slotted waveguide antennas on the upper rear fuselage sides. At 30,000 ft (9,144 m), the detection range for small ships is 100 nm (115 mi; 185 km). Three improved Surveillers are in service in Indonesia. Modifications to the Indonesian versions include enhanced side-looking airborne modular radar; a new nose-mounted IR-detection system; as well as radar and GPS. Also installed on the improved version is the Boeing-developed data processing and display system (DPDS).
- **B737-300:** The B737-300 is the extended-range version with stretched fuselage and quieter, more fuel-efficient CFM56-3-B engines. First flight occurred on Aug. 24, 1984; it entered service on Dec. 7, 1984. More than 850 were ordered. One each has been in VIP service with the South Korean and Thai air forces.
- **B737-400:** This variant is similar to the B737-30, but with additional 10-ft (3.05-m) stretch to fuselage, 168-passenger capacity and higher rated engines. First flight occurred on Feb. 19, 1988; the first was delivered on Sept. 15, 1988. More than 170 were ordered.
- **B737-500:** The B737-500 is a short-fuselage (101 ft 9 in/31.01 m) version of the B737-300 with a passenger capacity of 132. First flight took place on June 30, 1989. More than 165 were ordered.
- **B737-600:** The B737-600 was known as the 737-500X prior to 1995. It accommodates 108-140 passengers. It is part of the Next Generation series -- the smallest model. The wings have increased chord and span lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700:** Launched in November 1993, this was the first of the Next Generation series to enter service. It accommodates 128-149 passengers. The aircraft is similar to the B737-600, though the wings have increased chord and span, lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700 Increased Gross Weight Quick Change:** This variant was chosen by the U.S. Navy to replace the C-98s in the Reserves. Its features include continuous double-slotted flaps, new leading-edge slats and a large cargo door fitted to the front fuselage. Two were ordered for delivery by the end of 2001. A commercial version has not been made available.
- **B737-800:** The B737-800 was launched on Sept. 5, 1994. It is the longest variant of this series; it has a seating accommodation of 162-189 passengers.
- **B737-900:** This is a stretched version that can accommodate 18 more passengers than the 737-800. At least 10 orders

have been placed for this aircraft. The eyebrow windows located above the cockpit windscreen were removed in January 2005. Kits are available to remove the eyebrow windows from earlier 737-900s. An increased range version, the 737-900ER, was launched on July 18, 2005. Its maximum takeoff weight rose to 187,800 lb (85,185 kg); maximum zero-fuel weight, 149,500 lb (67,812 kg); maximum landing weight, 157,400 lb (71,395 kg); and range, 3,200 nautical miles (3,682 mi, 5,926 km) with 180 passengers.

- **Boeing Business Jet:** The business jet was launched on July 2, 1996, as a joint venture between Boeing and General Electric. It is a corporate version of the 737-700. While between eight and 63 passengers will be typically accommodated, the plane can be configured to seat as many as 100. There is an integrated GPS and SATCOM. The range is 6,200 nautical mile (nm) (7,139 mi, 4,437 km). Three auxiliary tanks offer an increase in range of 4,830 nm (5,562 mi, 3,456 km).

System

Alternate Designation(s): B737-200; Boeing 737-200

Primary Function / Type: Cargo/Passenger Aircraft

Manufacturer: Boeing Commercial Airplanes

Crew: 2 (pilot, co-pilot)

Passengers: 130 passengers

Number of Engines: 2

Number of Hard Points: INA

Dimensions

Length: 30.53 m

Width (Wing Span): 28.35 m

Wing Area: 102.0 sq m

Height: 11.28 m

Cabin Length: 20.88 m

Cabin Width: 3.53 m

Cabin Height: 2.13 m

Cabin Volume: 131.28 cu m

Empty Weight: 27,445 kg

Maximum Payload: 15,558 kg

Maximum Takeoff Weight: 52,390 kg

Automotive

Engine Name: 2 x Pratt & Whitney JT8D-15A

Number of Engines: 2

Engine Type: Turbofan

Engine Power: 15,500 lb (7,031 kg) static thrust each

Standard Internal Fuel Capacity: 19,532 liters

Maximum Internal Fuel Capacity: 22,596 liters

Maximum Normal Operating Speed: 555 knots (639 mph, 1,027 km/h)

Maximum Cruise Speed: 485 knots (558 mph, 899 km/h)

Economical Cruise Speed: 412 knots (474 mph, 763 km/h)

Long Range Cruise Speed: 420 knots (484 mph, 778 km/h)

Takeoff Safety Speed at Max Takeoff Weight: 147 knots (169 mph, 272 km/h)

Speed at Threshold at Maximum Landing Weight: 131 knots (151 mph, 243 km/h)

Climb Rate: at 100,000 lb (43,359 kg) 3,760 ft/min (1,146 m/min)

Maximum Range at Economical Cruise Speed: 1,550 nm (1,785 mi, 2,872 km)

Maximum Fuel at Long-Range Cruise Speed: w/20,400-lb (9,277-kg) payload 2,890 nm (3,328 mi, 5,355 km)

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The 737-200 had its maiden flight on August 8, 1967. It was certified by the FAA on December 21, 1967, and the inaugural flight for United was on April 28, 1968, from Chicago to Grand Rapids, Michigan. The lengthened -200 was widely preferred over the -100 by airlines. The 737-200 was a 737-100 with an extended fuselage, launched by an order from United Airlines in 1965. The -200 was rolled out on June 29, 1967, and entered service with United in April 1968. The 737-200 Advanced is an improved version of the -200, introduced into service by All Nippon Airways on May 20, 1971. The -200 Advanced has improved aerodynamics, automatic wheel brakes, more powerful engines, more fuel capacity, and longer range than the -100.[35] Boeing also provided the 737-200C (Combi), which allowed for conversion between passenger and cargo use and the 737-200QC (Quick Change), which facilitated a rapid conversion between roles. The 1,095th and last delivery of a -200 series aircraft was in August 1988 to Xiamen Airlines. With a gravel kit modification (features preventing foreign object damage), the 737-200 can use unimproved or unpaved landing strips, such as gravel runways, that other similarly-sized jet aircraft cannot. Gravel-kitted 737-200 Combis are currently used by Canadian North, First Air, Air Inuit, Nolinor, and Air North in northern Canada where gravel runways are common. For many years, Alaska Airlines made use of gravel-kitted 737-200s to serve Alaska's many unimproved runways across the state. Nineteen 737-200s, designated T-43, were used to train aircraft navigators for the U.S. Air Force. Some were modified into CT-43s, which are used to transport passengers, and one was modified as the NT-43A Radar Test Bed. The first was delivered on July 31, 1973 and the last on July 19, 1974. The Indonesian Air Force ordered three modified 737-200s, designated Boeing 737-2x9 Surveiller. They were used as Maritime reconnaissance (MPA)/transport aircraft, fitted with SLAMMAR (Side-looking Multi-mission Airborne Radar). The aircraft were delivered between May 1982 and October 1983. Many 737-200s have been phased out or replaced by newer 737 versions. After 40 years, in March 2008, the final 737-200 aircraft in the U.S. flying scheduled passenger service were phased out, with the last flights of Aloha Airlines. The variant still sees regular service through North American charter operators such as Sierra Pacific. In July 2019, there were a combined 46 Boeing 737-200s in service, mostly with "second and third tier" airlines, and those of developing nations. In 1970, Boeing received only 37 orders. Facing financial difficulties, Boeing considered closing the 737 production-line and selling the design to Japanese aviation companies.[15] After the cancellation of the Boeing Supersonic Transport, and scaling back of 747 production, enough funds were freed up to continue the project. In a bid to increase sales by offering a variety of options, Boeing offered a 737C (Convertible) model in both -100 and -200 lengths. This model featured a 134 in × 87 in (340 cm × 221 cm) freight door just behind the cockpit, and a strengthened floor with rollers, which allowed for palletized cargo. A 737QC

(Quick Change) version with palletized seating allowed for faster configuration changes between cargo and passenger flights. With the improved short-field capabilities of the 737, Boeing offered the option on the -200 of the gravel kit, which enables this aircraft to operate on remote, unpaved runways. Until retiring its -200 fleet in 2007, Alaska Airlines used this option for some of its combi aircraft rural operations in Alaska. Northern Canadian operators Air Inuit, Air North, Canadian North, First Air and Nolinor Aviation still operate the gravel kit aircraft in Northern Canada, where gravel runways are common. In 1988, the initial production run of the -200 model ended after producing 1,114 aircraft. The last one was delivered to Xiamen Airlines on August 8, 1988.

Y-12G Chinese Utility Aircraft

Tiers:

Variants:

- **Y-12 (I):** Twin-engined STOL utility transport aircraft, powered by two 500-shp (373-kW) Pratt & Whitney Canada PT6A-11 turboprop engines. Prototype version.
- **Y-12 (II):** Fitted with more powerful PT6A-27 engines.
- **Y-12 (III):** Planned version to be fitted with WJ-9 turboprop. Evolved to Y-12C because of IV's success when WJ-9 development was completed.
- **Y-12 (IV):** Improved version. Revised wingtips (span increased to 19.2 m (63 ft)) and increased takeoff weight. 19 passenger seats. This version is the first aircraft in the series certified by the FAA in 1995.
- **Y-12C:** Basically a (IV) version with WJ-9 turboprop, used by PLAAF for aerial survey.
- **Y-12D:** Domestically deployed military version with upgraded engines driving four-bladed propellers, used by PLA Airborne Corps for parachute training.
- **Y-12E:** Variant with 18 passenger seats. PT6A-135A engines of equal horsepower but increased torque driving four-bladed propellers. This version was certified by the FAA in 2006.
- **Y-12F:** The latest development with almost everything redesigned: wider fuselage, new wings, retractable landing gear and more powerful PT6A-65B engines. The Y-12F has higher cruise speed, longer range and can accommodate 19 passengers or 3x LD3 containers. Design started in April 2005 and the maiden flight was on 29 December 2010. CAAC type certification was received on 10 December 2015 and FAA certification on 22 February 2016. The Y-12F passed flight tests for its automatic flight control system by the FAA on 30 June 2018. It was demonstrated during the 2012 Zhuhai Airshow.
- **Y-12G:** Proposed cargo version of Y-12F.
- **Turbo Panda:** Export name for (II) version, marketed by England and Japanese companies. No real order due to airworthiness certification.
- **Twin Panda:** Originally (II) version for export. Later a modified Y-12 (IV) powered by two Pratt & Whitney Canada PT6A-34 turboprop engines and fitted with uprated undercarriage, upgraded avionics and interior. Thirty-five orders reportedly received by 2000 but production not proceeded with.

System

Alternate Designation(s): Y-12G

Primary Function / Type: Utility Aircraft

Manufacturer: Harbin Aircraft Industry Group

Crew: 2 (pilot, co-pilot)

Passengers: 19 passengers

Number of Engines: 2

Number of Hard Points: INA

Note: This is a freighter transport variant with a side cargo door and a windowless cabin. The aircraft can accommodate three LD3 standard containers.

Dimensions

Length: 14.86 m
Height: 5.58 m
Width (Wing Span): 19.20 m
Wing Area: 36.90 sq m
Cabin Length: 4.93 m
Cabin Width: 1.46 m
Cabin Height: 1.70 m
Volume: 12.9 cu m
Empty Weight: 3,000 kg
Payload Weight: 1,700 kg
Maximum Takeoff Weight: 5,300 kg

Automotive

Engine Name: 2 x Pratt & Whitney Canada PT6A-135
Number of Engines: 2
Engine Type: Turboprop
Engine Power: 750-shp shp each
Fuel Capacity: 1,616 liters
Maximum Cruise Speed: 328 km/h
Economy Cruise Speed: 271 km/h
Range with Maximum Payload at 146 knots: 189 km
Ceiling: 7,000 m
Climb Rate, Both Engines: 504 m/min
Climb Rate, One Engine: 101 m/min

Protection

Stealth Properties: None
Heat Signature Reduction: No
Add on Armor: No
NBC Protection: INA
EW Counter Measures: INA

Notes:

The Harbin Y-12 (Chinese: □-12; pinyin: Yùn-12) is a high wing twin-engine turboprop utility aircraft built by Harbin Aircraft Industry Group (HAIG). Y-12G This is a freighter transport variant with a side cargo door and a windowless cabin. The aircraft can accommodate three LD3 standard containers. The Y-12 started as a development of the Harbin Y-11 airframe called Y-11T in 1980. The design featured numerous improvements including a redesigned wing with a new low drag section, a larger

fuselage and bonded rather than riveted construction. It also replaced the radial piston engines with turboprops. The prototype was followed by about 30 production Y-12 (I) aircraft before a revised version was produced. This was designated the Y-12 (II), which featured more powerful engines and removal of leading edge slats, first flying on 16 August 1984 and receiving Chinese certification in December of the following year. The power plants are two Pratt & Whitney Canada PT6A-27 turboprops with Hartzell propellers. The Y-12 has a maximum takeoff weight of 5,700 kg (12,600 lb) with seating for 17 passengers and two crew. The aircraft is operated as a light commuter and transport aircraft. The latest development is the Y-12F, which is almost a new design with many improvements: new wings, new landing gear, new fuselage, with more powerful engines from Pratt & Whitney Canada and extended payload and range. The Y-12F made its maiden flight on December 29, 2010, received CAAC type certification on December 10, 2015, and FAA type certification on February 22, 2016. In 2015 Kenmore Air announced that they would begin development of floats for the Y-12 for FAA certification. The Y-12 completed the FAA evaluation flight tests for its automatic flight control system on June 30, 2018, with its performance meeting the requirements, said AVIC Harbin Aircraft Industry Company Ltd (AVIC HAFEI).

Challenger 600 (CL-600) Canadian Transport Aircraft

Tiers:

Variants:

- **Challenger 600 (CL-600):** The was the initial production version with Avco Lycoming ALF 502L-2 engines and without winglets at the wingtips.
- **CE-144 Electronic Support and Training (EST):** Seven CL-600s were converted as EW simulators; fitted with radar, jamming systems, communications equipment; the first service entry was in 1990.
- **Challenger 601 (CL-601):** The 601 is a production version with uprated engines and winglets. At one point, there were 18 in military service, most as VIP transports: six in Canada, five in China and seven in Germany. One German aircraft was configured for combined passenger/cargo operations; another operated as an air ambulance with a 4-litter capacity.
- **Challenger 601-3A (CL-601-3A):** This is an improved 601 with flat-rated CF-34-3A engines for better hot-day performance; integrated digital flight management and guidance system including automatic flight control system (AFCS) and electronic flight instrumentation system (EFIS).
- **Challenger 604 (CL-604):** The CL-604 is the latest version of this type of aircraft by Bombardier Aerospace. It has a range of 4,077 nm (4,696 mi; 7,556 km). It also utilizes advanced transonic wing design, a damage-tolerant airframe (FAR 25), triple-redundant hydraulic systems and quadruple-redundant electrical systems.
- **CL-605:** Initial operating capability (IOC) of this version was reached in 2006. It upgrades the avionics and structure of the 604 design. Features include larger cabin windows, new avionics displays and "electronic flight bag" capability. The version can be identified by its new, rounded tailcone. See separate record for more information.

System

Alternate Designation(s): Challenger 600; CL-600
Primary Function / Type: Transport Aircraft
Manufacturer: Canadair, St Laurent, Quebec, Canada (part of Bombardier Aerospace)
Crew: 2 (pilot, co-pilot)
Passengers: 19 passengers
Number of Engines: 2
Number of Hard Points: INA

Dimensions

Length: 20.85 m
Height: 6.30 m
Width (Wing Span): 18.85 m
Wing Area: 48.31 sq m
Cabin Length: 8.61 m
Cabin Width: 2.49 m
Cabin height: 1.85 m
Cabin Volume: 32.6 cu m
Empty Weight: 8,464 kg
Maximum Payload: 2,365 kg
Maximum Takeoff Weight: 18,642 kg

Automotive

Engine Name: 2 x Avco Lycoming Textron ALF 502L-2
Number of Engines: 2
Engine Type: Turbofan
Engine Power: 3,402 kg static thrust each
Maximum Cruise Speed: 851 kph
Normal Cruise Speed: 819 kph
Long-Range Cruise Speed: 743 kph
Climb Rate: 1,097 m/min
Ceiling, 2 Engines: 12,500 m
Ceiling, 1 Engine: 7,315 m
Maximum Range: 5,186 km

Protection

Stealth Properties: None
Heat Signature Reduction: No
Add on Armor: No
NBC Protection: INA
EW Counter Measures: INA
Chaffs/Flares: INA

Notes:

CL-600 Original production version, powered by Lycoming ALF 502 turbofans of 7500 lbf (33.6 kN) thrust each. Built from 1978 to 1982 (81 built). The Bombardier Challenger 600 series is a family of business jets developed by Canadair and then produced from 1986 by its new owner, Bombardier Aerospace. At the end of 1975, Canadair backed the LearStar 600 concept by Bill Lear, and acquired the large business jet or freighter project in April 1976. On 29 October, the program was launched, backed

by the Canadian federal government, and designed to comply with new FAR part 25 standards. In March 1977, it was renamed the Challenger 600 after Bill Lear was phased out, as the original conventional tail was changed for a T-tail among other developments. The first prototype was rolled out on 25 May 1978, and performed its maiden flight on 8 November. The flight test program saw a deadly crash on 3 April 1980, but Transport Canada approved the CL-600 type certification on 10 August 1980. In 1986, Canadair was close to bankruptcy and was bought by Bombardier. The jet was stretched into the Bombardier CRJ regional airliner, introduced on 19 October 1992, and the longer range Global Express, introduced in July 1999. The 500th Challenger was rolled out in May 2000, and the 1000th was delivered to NetJets in December 2015. By October 2018, 1,066 aircraft have been built. The Challenger is a low-wing jet powered by two turbofans mounted in aft fuselage pods, it has a supercritical wing and a stand-up cabin with two seating sections. The original Lycoming ALF 502 turbofans were replaced by a pair of General Electric CF34s on the CL-601, which also gained winglets, and first flew on 10 April 1982. Subsequent variants have updated systems, avionics, and higher weights.

Y-7-100 (Yunshuji-7-100) Chinese Cargo Transport Aircraft

Tiers:

1 2 3 4

Variants:

- **Variants:** Xian Y-7E Speculative designation for a 'Hot and High" version with more powerful engines. Xian Y-7G A military variant of the MA60 produced for the PLAAF. Xian Y-7H (Huo -cargo) A reverse-engineered An-26 with rear loading ramp for the PLAAF, entering production in 1992. Xian Y7H-500 Civil variant of the Y-7H certified in 1994. Xian Y-14 The original designation for the An-26 copy/Y-7H. Xian Y-7-100 Improved version, developed in co-operation with HAECO (Hong Kong Aircraft Engineering Company), with redesigned cockpit and cabin, as well as winglets. This variation has an upgraded passenger cabin interior, with new avionics sourced from western providers. Flight crew reduced to three, it is capable of carrying 52 passengers. Xian Y-7-100C1 Five-crew variant with equipment changes. Xian Y-7-100C2 Five-crew variant with equipment changes. Xian Y-7-100C3 Five-crew variant with equipment changes. Xian Y-7-200 Fitted with new avionics; without winglets. Xian Y-7-200A Powered by two Pratt & Whitney PW127C turboprop engines. Xian Y-7-200B Stretched version (74cm (29in)) with WJ5A-1G engines, built for the Chinese domestic market. Xian HYJ-7 (Hongzhaji Yunshuji Jiaolianji - Bomber/transport/trainer) A pilot and crew trainer for H-6 heavy bombers fitted with a stabilised HM-1A bombsight, bomb-aiming radar and a TNL-7880 combined navigation system. Xian MA60 (Y-7-MA60) (Modern Ark 60 seats) A westernised variant of the Y-7 intended to attract more western customers and meet Joint Airworthiness Requirements. Xian JZY-01 experimental aircraft / Y-7 AWACS Carrier-based airborne early warning and control (AEW&C) variant. JZY stands for Jian (□) Zai (□) Yu (□), meaning carrier borne AEW&C, has 4 rudders like E-2 AEW It is being used as a testbed for Xian KJ-600.

System

Alternate Designation(s): Y-7-100; Yunshuji-7-100
Primary Function / Type: Cargo Transport Aircraft
Manufacturer: Xi'an Aircraft Industrial Corporation
Crew: 3 or 5

Notes:

Y-7-100 This is an improved version developed with the assistance of the Hong Kong Aircraft Engineering Co. (HAECO). This version has greater wing span and winglets, Hamilton Standard environmental control system, three-man flight deck, updated avionics and revised Noordam cabin layout with reclining seats. The Xian Y-7 (Chinese: □-7; pinyin: Yùn-qī) is a transport/passenger aircraft built in China. It is based on the Soviet-designed Antonov An-24 series. China imported the

Antonov An-24 from early in its production run and also negotiated licences for production of the aircraft and its engines. In 1966, Xi'an aircraft factory started the project of local production of An-24. The first Chinese-assembled An-24T had its maiden flight on 25 December 1970. Production was launched in 1977 at the Xi'an aircraft factory but progress was slow due to the deleterious effects of the Cultural Revolution, with a pre-production aircraft displayed to the public at Nanyuan air base, near Beijing, on 17 April 1982. The WJ-5A1 turboprop engine was chosen as the Y-7's power source. The first production aircraft was not flown until February 1984, illustrating the slow progress (eighteen years from licence to production). The Chinese aircraft equated to the An-24RV, having a full complement of windows and the booster jet engine. The majority of early deliveries were to the People's Liberation Army Air Force (PLAAF), mostly as transports, with a few in 52-seat airliner configuration for the Civil Aviation Administration of China (CAAC). After the initial licensed production run, the Y-7 was developed separately from the An-24 with a succession of upgrades culminating in the Xian MA60 (Modern Ark) series. A tactical transport derivative was copied, unlicensed, from the Antonov An-26 and emerged as the Y-7H, incorporating the cargo ramp door and military equipment of the An-26.

IL-62 (Classic) Russian Jet Airliner

Tiers:

Variants:

- **Il-62:** Initial production version, powered by four 23,150-lb (103.0 kN) Kuznetsov NK-8 turbofan engines, accommodation for a crew of five and 186 passengers.
- **Il-62M:** Improved version, powered by four 24,250-lb (107.9 kN) Soloviev D-30KU turbofan engines, accommodation for a crew of five and 174 passengers, equipped with containerised baggage and freight system, modified wing spoilers and a revised flight deck, plus increased fuel capacity.
- **Il-62MK:** Medium-range version, powered by four 24,250-lb (107.9 kN) Soloviev D-30KU turbofan engines, accommodation for a crew of five and 195 passengers, equipped with strengthened wings and landing gear for operations at higher gross weights.
- **Il-62MGr:** Cargo version of Il-62M

System

Alternate Designation(s): Il-62; NATO: Classic
Primary Function / Type: Narrow-Body Jet Airliner
Manufacturer: Ilyushin
Crew: 3 to 5 (a captain, a first officer, and a flight engineer, plus optionally a navigator and a radio officer on long overwater and/or VIP services to operator specification) plus a four to eight-person cabin crew to operator specifications
Passengers: 168-186 passengers
Number of Engines: 4
Number of Hard Points: INA

Dimensions

Length: 53.12 m
Wingspan: 43.2 m
Height: 12.35 m
Wing Area: 279.55 m2

Chaffs/Flares: INA

Notes:

The Ilyushin IL-62 (Russian: Илью́шин Ил-62; NATO reporting name: Classic) is a Soviet long-range narrow-body jetliner conceived in 1960 by Ilyushin. As successor to the popular turboprop Il-18 and with capacity for almost 200 passengers and crew, the Il-62 was the world's largest jet airliner when first flown in 1963. One of four pioneering long-range designs (the others being Boeing 707, Douglas DC-8, and Vickers VC10), it was the first such type to be operated by the Soviet Union and a number of allied nations. The Il-62 entered Aeroflot civilian service on 15 September 1967 with an inaugural passenger flight from Moscow to Montreal, and remained the standard long-range airliner for the Soviet Union (and later, Russia) for several decades. It was the first Soviet pressurised aircraft with non-circular cross-section fuselage and ergonomic passenger doors, and the first Soviet jet with six-abreast seating (the turboprop Tu-114 shared this arrangement) and international-standard position lights. Over 30 nations operated the Il-62 with over 80 examples exported and others having been leased by Soviet-sphere and several Western airlines. The Il-62M variant became the longest-serving model in its airliner class (average age of examples in service as of 2016 is over 32 years). Special VIP (salon) and other conversions were also developed and used as head-of-state transport by some 14 countries. However, because it is expensive to operate compared to newer generation airliners, the number in service was greatly reduced after the 2008 Great Recession. The Il-62's successors include the wide-bodied Il-86 and Il-96, both of which were made in much smaller numbers and neither of which was widely exported. The Il-62 is a conventional all-metal low-wing monoplane of riveted sectional semi-monocoque construction to fail-safe design principles (a structure designed so that failure of one major member does not cause immediate failure of the whole). Its service life was initially set at 30,000 flight hours and subject to extensions and curtailments according to the quality of service procedures, inspection and manufacturer's bulletins. The aircraft features pressurised cabin and freight holds (with fuselage dimensions of 3.8 m width x 4.1 m height), duplex all-mechanical flight controls, though with twin electric motors for tailplane incidence control; hydraulic nosewheel steering, landing gear and tail strut actuation, and wheel brakes. The Il-62M has spoilers and lift dumpers which extend automatically upon landing and are hydraulically operated. Control surfaces include a variable-incidence tailplane with dynamically and weight-compensated elevators with trim tabs, triple-section tabbed ailerons (outermost for low

speed and innermost for high speed) which are interlinked with a torsion bar, spoilerons (Il-62M), spoilers and lift dumpers, and pneumatically actuated thrust reversers on the two outboard engines (the reversers are flight-rated on the Il-62M). 27 V AC electrics are used throughout with a TA-6 auxiliary power unit (a turbine generator which supplies electric power and air conditioning on the ground) in the lower tailcone plus backup lead-zinc batteries. The aircraft uses conventional hot air de-icing using engine bleed air. Its sea level is equivalent to 2,400 m (8,000 ft) above mean sea level and thereafter reducing to the equivalent of 2,400 m (8,000 ft) to cruise altitude. It was originally built with no automatic oxygen masks; emergency supply comprises hatrack-housed oxygen bottles and masks for manual distribution to passengers by cabin crew. Since 1997, most aircraft have been retrofitted with automatic oxygen supply systems with drop-down masks. Its avionics include a Polyot-1 automatic flight control system (a "super autopilot," able to be programmed with a set route which it can fly without human intervention but under constant flight crew monitoring; ICAO Cat. 1 approaches standard, Cat. 2 optional), Doppler navigational radar replaced by triplex INSS (Inertial Navigation System Sets) on Il-62M after 1978 and by GPS (Global Positioning System) navigation sets on many aircraft after 1991, triple VHF and HF flightdeck radios, automatic direction finders, Soviet and Western instrument landing system receivers, vertical omnidirectional radio range and radio beacon receivers, duplex radio altimeters, automatic radio transponders, a full ICAO-standard navigation lights fit, cabin tannoy and intercom systems. Soviet/Russian and Warsaw Pact sovereign examples are additionally fitted with triplex "Odd Rods" (NATO code name) IFF (identification friend or foe) air defence transponders identifiable by three closely spaced short aerials. Emergency evacuation systems include inflatable life rafts and manually extendable canvas evacuation slides. Most aircraft are now retrospectively fitted with emergency floor lighting strips and some aircraft equipped with automatically inflatable evacuation slides. Fire extinguishers are sited in engine nacelles, flightdeck compartment, cabin crew rest areas and toilets. The Il-62 offers accommodation for up to 198 passengers in a single-class layout, seated six-abreast at 84 cm (33 in) seat pitch in two cabins separated by a vestibule, galley/pantry and cabin crew rest area. There are three toilets, forward, midships, and aft. It has a buffet/bar and a further cabin crew rest area in a vestibule forward, with a further optional cabin crew rest area aft. Typical mixed-class accommodation ranges between 128 and 144, seated four or six abreast, and a common single aisle configuration for long distance Aeroflot examples was first class (2-abreast) 3 rows, business class (3-abreast) 4 rows, economy class (3-abreast) 17 rows (Thiel, 2001). In this configuration, the central aisle in business and economy classes is quite narrow. A first class compartment is optionally sited aft of forward entry door or just forward of midships entry door, with an economy compartment further forward in the latter case. "Skycot" fitments are located in hatracks, while later Il-62Ms (1978 onwards) feature enclosed hatracks. Customer-optionable interior fitments. No in-flight entertainment systems are available except a public-address system that may be coupled to an open-reel or audio cassette player. Individual aircraft were experimentally fitted with television sets for Soviet-standard videotape entertainment during the 1970s. Some aircraft were retrospectively fitted with Western in-flight entertainment (solely audio) systems after 1991.

Y-11 (Chan) Chinese Utility Aircraft

Tiers:

Variants:

- **Y-11:** Twin-engined STOL utility transport aircraft, designed for agriculture and geological survey.
- **Y-11B:** (I) is Fitted with advanced avionics and powered by 350 hp Teledyne -Continental TSIO-550-B air-cooled flat six piston engines. Type (II) was canceled. Later, the only flyable one was used for geological survey.
- **Y-11 agricultural aircraft:** Fitted with a hopper or tank in the cabin on the center of gravity, dispensing chemicals through a dust spreader, spraybars or atomisers on the wing trailing edges.
- **Y-11 Geological Survey aircraft:** At least one aircraft fitted with a large toroidal sensor on the port wing-tip and a cigar shaped sensor on the starboard wing-tip.
- **Y-11T:** The initial designation of the Prototype Harbin Y-12, a redesigned plane fitted with Pratt & Whitney PT6A-11 turboprop engines driving three-bladed Hartzell HC-B3TN-3B propellers.

Notes:

The Harbin Y-11 (NATO reporting name Chan) is a high wing twin-engine piston utility and geological survey aircraft built by Harbin Aircraft Manufacturing Corporation (HAMC). A requirement for a twin-engined light utility transport was issued by the Chinese government in November 1974. The Y-11 was proposed in April 1974, and the design was begun in January 1975. Design of the Y-11, under Xiong Wenjie, was completed at Harbin in June 1975 and prototype construction started immediately. The static test article completed its test cycle on 19 December 1975 and the first flight of the prototype followed soon after on 30 December 1975. Production started on 3 April 1977 with at least fifty aircraft known to have been built before production stopped in favour of the Harbin Y-12

Twin Panda Canadian Utility Aircraft

Tiers:

Variants:

- **Y-12 (I):** Twin-engined STOL utility transport aircraft, powered by two 500-shp (373-kW) Pratt & Whitney Canada PT6A-11 turboprop engines. Prototype version.
- **Y-12 (II):** Fitted with more powerful PT6A-27 engines.
- **Y-12 (III):** Planned version to be fitted with WJ-9 turboprop. Evolved to Y-12C because of IV's success when WJ-9 development was completed.
- **Y-12 (IV):** Improved version. Revised wingtips (span increased to 19.2 m (63 ft)) and increased takeoff weight. 19 passenger seats. This version is the first aircraft in the series certified by the FAA in 1995.
- **Y-12C:** Basically a (IV) version with WJ-9 turboprop, used by PLAAF for aerial survey.
- **Y-12D:** Domestically deployed military version with upgraded engines driving four-bladed propellers, used by PLA Airborne Corps for parachute training.
- **Y-12E:** Variant with 18 passenger seats. PT6A-135A engines of equal horsepower but increased torque driving four-bladed propellers. This version was certified by the FAA in 2006.
- **Y-12F:** The latest development with almost everything redesigned: wider fuselage, new wings, retractable landing gear and more powerful PT6A-65B engines. The Y-12F has higher cruise speed, longer range and can accommodate 19 passengers or 3x LD3 containers. Design started in April 2005 and the maiden flight was on 29 December 2010. CAAC type certification was received on 10 December 2015 and FAA certification on 22 February 2016. The Y-12F passed flight tests for its automatic flight control system by the FAA on 30 June 2018. It was demonstrated during the 2012 Zhuhai Airshow.
- **Y-12G:** Proposed cargo version of Y-12F.
- **Turbo Panda:** Export name for (II) version, marketed by England and Japanese companies. No real order due to airworthiness certification.
- **Twin Panda:** Originally (II) version for export. Later a modified Y-12 (IV) powered by two Pratt & Whitney Canada PT6A-34 turboprop engines and fitted with uprated undercarriage, upgraded avionics and interior. Thirty-five orders reportedly received by 2000 but production not proceeded with.

System

Alternate Designation(s): Twin Panda
Primary Function / Type: Utility Aircraft
Manufacturer: Canadian Aerospace Group
Crew: 2 (pilot, co-pilot)
Passengers: 19 passengers
Number of Engines: 2
Number of Hard Points: INA

Dimensions

Length: 14.86 m
Height: 5.58 m
Width (Wing Span): 19.20 m
Wing Area: 36.90 sq m
Cabin Length: 4.93 m
Cabin Width: 1.46 m
Cabin Height: 1.70 m
Volume: 12.9 cu m
Empty Weight: 3,000 kg
Payload Weight: 1,700 kg
Maximum Takeoff Weight: 5,300 kg

Automotive

Engine Name: 2 x Pratt & Whitney Canada PT6A-34
Number of Engines: 2
Engine Type: Turboprop
Engine Power: 750 shp each
Fuel Capacity: 1,616 liters
Maximum Cruise Speed: 328 km/h
Economy Cruise Speed: 271 km/h
Range with Maximum Payload at 146 knots: 189 km
Ceiling: 7,000 m
Climb Rate, Both Engines: 504 m/min
Climb Rate, One Engine: 101 m/min

Notes:

Twin Panda: Originally (II) version for export. Later a modified Y-12 (IV) powered by two Pratt & Whitney Canada PT6A-34 turboprop engines and fitted with unrated undercarriage, upgraded avionics and interior. Thirty-five orders reportedly received by 2000 but production not proceeded with. The Y-12 started as a development of the Harbin Y-11 airframe called Y-11T in 1980. The design featured numerous improvements including a redesigned wing with a new low drag section, a larger fuselage

and bonded rather than riveted construction. It also replaced the radial piston engines with turboprops. The prototype was followed by about 30 production Y-12 (I) aircraft before a revised version was produced. This was designated the Y-12 (II), which featured more powerful engines and removal of leading edge slats, first flying on 16 August 1984 and receiving Chinese certification in December of the following year. The power plants are two Pratt & Whitney Canada PT6A-27 turboprops with Hartzell propellers. The Y-12 has a maximum takeoff weight of 5,700 kg (12,600 lb) with seating for 17 passengers and two crew. The aircraft is operated as a light commuter and transport aircraft. The latest development is the Y-12F, which is almost a new design with many improvements: new wings, new landing gear, new fuselage, with more powerful engines from Pratt & Whitney Canada and extended payload and range. The Y-12F made its maiden flight on December 29, 2010, received CAAC type certification on December 10, 2015, and FAA type certification on February 22, 2016. In 2015 Kenmore Air announced that they would begin development of floats for the Y-12 for FAA certification. The Y-12 completed the FAA evaluation flight tests for its automatic flight control system on June 30, 2018, with its performance meeting the requirements, said AVIC Harbin Aircraft Industry Company Ltd (AVIC HAFEI).

B737-400 (Boeing 737-400) American Cargo Transport Aircraft

Tiers:

Variants:

- **B737-100:** This is the initial production civil airliner version, with a 94-ft (28.65-m) long fuselage and a maximum passenger capacity of 115. First flight took place on April 9, 1967. Only 30 were built, all of which entered commercial service. One was later acquired by the Mexican air force as a VIP transport.
- **B737-200:** This version features a 6-ft (1.82-m) fuselage stretch and more powerful JT8D engines. There were 1,095 aircraft built.
- **B737-2X9 Surveiller:** This version is a 737-200 with 14 first-class and 88 coach passenger seats as well as a Motorola side-looking airborne modular multi-mission radar (SLAMMR) -- a variant of the AN/APS-131/135 radar -- and two associated 16-ft (5-m) long slotted waveguide antennas on the upper rear fuselage sides. At 30,000 ft (9,144 m), the detection range for small ships is 100 nm (115 mi; 185 km). Three improved Surveillers are in service in Indonesia. Modifications to the Indonesian versions include enhanced side-looking airborne modular radar; a new nose-mounted IR-detection system; as well as radar and GPS. Also installed on the improved version is the Boeing-developed data processing and display system (DPDS).
- **B737-300:** The B737-300 is the extended-range version with stretched fuselage and quieter, more fuel-efficient CFM56-3-B engines. First flight occurred on Aug. 24, 1984; it entered service on Dec. 7, 1984. More than 850 were ordered. One each has been in VIP service with the South Korean and Thai air forces.
- **B737-400:** This variant is similar to the B737-30, but with additional 10-ft (3.05-m) stretch to fuselage, 168-passenger capacity and higher rated engines. First flight occurred on Feb. 19, 1988; the first was delivered on Sept. 15, 1988. More than 170 were ordered.
- **B737-500:** The B737-500 is a short-fuselage (101 ft 9 in/31.01 m) version of the B737-300 with a passenger capacity of 132. First flight took place on June 30, 1989. More than 165 were ordered.
- **B737-600:** The B737-600 was known as the 737-500X prior to 1995. It accommodates 108-140 passengers. It is part of the Next Generation series -- the smallest model. The wings have increased chord and span lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700:** Launched in November 1993, this was the first of the Next Generation series to enter service. It accommodates 128-149 passengers. The aircraft is similar to the B737-600, though the wings have increased chord and span, lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700 Increased Gross Weight Quick Change:** This variant was chosen by the U.S. Navy to replace the C-98s in the Reserves. Its features include continuous double-slotted flaps, new leading-edge slats and a large cargo door fitted to the front fuselage. Two were ordered for delivery by the end of 2001. A commercial version has not been made available.
- **B737-800:** The B737-800 was launched on Sept. 5, 1994. It is the longest variant of this series; it has a seating accommodation of 162-189 passengers.
- **B737-900:** This is a stretched version that can accommodate 18 more passengers than the 737-800. At least 10 orders

have been placed for this aircraft. The eyebrow windows located above the cockpit windscreen were removed in January 2005. Kits are available to remove the eyebrow windows from earlier 737-900s. An increased range version, the 737-900ER, was launched on July 18, 2005. Its maximum takeoff weight rose to 187,800 lb (85,185 kg); maximum zero-fuel weight, 149,500 lb (67,812 kg); maximum landing weight, 157,400 lb (71,395 kg); and range, 3,200 nautical miles (3,682 mi, 5,926 km) with 180 passengers.

- **Boeing Business Jet:** The business jet was launched on July 2, 1996, as a joint venture between Boeing and General Electric. It is a corporate version of the 737-700. While between eight and 63 passengers will be typically accommodated, the plane can be configured to seat as many as 100. There is an integrated GPS and SATCOM. The range is 6,200 nautical mile (nm) (7,139 mi, 4,437 km). Three auxiliary tanks offer an increase in range of 4,830 nm (5,562 mi, 3,456 km).

System

Alternate Designation(s): B737-400; Boeing 737-400

Primary Function / Type: Cargo/Passenger Aircraft

Manufacturer: Boeing Commercial Airplanes

Crew: 2 (pilot, co-pilot)

Passengers: 146-168 passengers

Number of Engines: 2

Number of Hard Points: INA

Dimensions

Length: 36.45 m

Width (Wing Span): 28.88 m

Wing Area: 105.4 sq m

Height: 11.13 m

Cabin Length: 27.18 m

Cabin Width: 3.53 m

Cabin Height: 2.13 m

Cabin Volume: 131.28 cu m

Empty Weight: 34,382 kg

Maximum Payload: 15,998 kg

Maximum Takeoff Weight: 62,822 kg

Automotive

Engine Name: 2 x CFM International CFM56-3C-1

Number of Engines: 2

Engine Type: Turbofan

Engine Power: 20,000 lb (9,072 kg) static thrust each

Standard Internal Fuel Capacity: 20,104 liters

Maximum Internal Fuel Capacity: 23,829 liters

Maximum Normal Operating Speed: 542 knots (624 mph, 1,003 km/h)

Maximum Cruise Speed: 491 knots (565 mph, 910 km/h)

Economical Cruise Speed: 419 knots (482 mph, 776 km/h)

Long Range Cruise Speed: 429 nokts (494 mph, 795 km/h)

Takeoff Safety Speed at Max Takeoff Weight: 148 knots (170 mph, 274 km/h)

Speed at Threshold at Maximum Landing Weight: 133 knots (153 mph, 246 km/h)

Climb Rate: at 100,000 lb (43,359 kg) 3,760 ft/min (1,146 m/min)

Maximum Range at Economical Cruise Speed: 2,075 nm (2,390 mi, 3,846 km)

Maximum Fuel at Long-Range Cruise Speed: w/19,150-lb (8,705-kg) payload 3,190 nm (3,673 mi, 5,911 km)

Notes:

737-400 In June 1986, Boeing announced the development of the 737-400, which stretched the fuselage a further 10 ft (3.0 m), increasing the passenger load to 188. The -400s first flight was on February 19, 1988, and, after a seven-month/500-hour flight-testing run, entered service with Piedmont Airlines that October. The Boeing 737 is a narrow-body aircraft produced by Boeing Commercial Airplanes at its Renton Factory in Washington. Developed to supplement the 727 on short and thin routes, the twinjet retains the 707 fuselage cross-section and nose with two underwing turbofans. Envisioned in 1964, the initial 737-100 made its first flight in April 1967 and entered service in February 1968 with Lufthansa. The lengthened 737-200 entered service in April 1968. It evolved through four generations, offering several variants for 85 to 215 passengers. The -100/200 original variants were powered by Pratt & Whitney JT8D low-bypass engines and offered seating for 85 to 130 passengers. Launched in 1980 and introduced in 1984, the 737 Classic -300/400/500 variants were re-engined with CFM56-3 turbofans and offered 110 to 168 seats. Introduced in 1997, the 737 Next Generation (NG) -600/700/800/900 variants have updated CFM56-7s, a larger wing and an upgraded glass cockpit, and seat 108 to 215 passengers. The latest generation, the 737 MAX -7/8/9/10, powered by improved CFM LEAP high bypass turbofans and accommodating 138 to 204 people, entered service in 2017. Boeing Business Jet versions are produced since the 737NG, as well as military models. As of December 2019, 15,156 Boeing 737s have been ordered and 10,571 delivered. Actual backlog stands at 4,398 when including "additional criteria for recognizing contracted backlog with customers beyond the existence of a firm contract". Initially, its main competitor was the McDonnell Douglas DC-9, followed by its MD-80/MD-90 derivatives. It remained the highest-selling commercial jetliner until surpassed in total orders by the Airbus A320 family in October 2019. The current 737 MAX, designed to compete with the A320neo was grounded worldwide in March 2019 following two fatal crashes.

Y-8 Chinese Transport Aircraft

Tiers:

Variants:

- **Note:** Y-8 This was the original version. It was little different from the An-12 with a slightly modified glass nose copied from the design of the H-6 bomber. The cargo hold was not pressurized. Early production variants inherited the An-12 's tail turret, which mounts a twin 23-mm cannon, but this was later removed. Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. Y-8B This is the civilian version. First flight took place in 1990 and it was certified in 1993. Y-8C This variant has the pressurized cabin volume increased from 1,000 cu ft (28.3 cu m) to 7,500 cu ft (212.4 cu m). Landing gear and air conditioning are upgraded. The original inward-open two-piece cargo loading doors were replaced by a single-piece flat loading ramp similar to that of the C-130 . First flight occurred on Dec. 17, 1990. Shaanxi has also developed the Y-8CA radar testbed and Y-8CI export variant transport, the latter with Western avionics. Y-8D This is the export variant, fitted with Western avionics to meet the requirements for commercial flights. Onboard avionics include Collins flight director system (FDS), air data computer, VOR/ILS, comparing warning, TDR-90 air-traffic control receiver, VHF radio, Honeywell P-400 color weather radar, Litton LTN-311 Omega navigation system, Bendix/King HF communication, Sundsstrand universal flight data recorder (UFDR) and cockpit voice recorder (CVR). It is in service in Burma (Myanmar), Sri Lanka and Sudan. Y-8D II This is the latest export variant with avionics similar to those in the Y-8C. Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. Y-8F This is a livestock transport. It was certified on Jan. 26, 1994. Y-8F100 This is a commercial freighter version of the Y-8, featuring improved avionics. The aircraft features a redesigned cargo compartment, which can carry four international standard pallets of 88 in x 108 in, or eight pallets of 88 in x 54 in, or three pallets of 96 in x 125 in. The cargo compartment is also fitted with a modernized cargo handling system, allowing fast loading/unloading. Y-8F200 This is a commercial freighter version of the Y-8C, with upgraded avionics and a redesigned cargo compartment. The cargo handling system and large flat ramp enable rapid loading and unloading. Y-8F200W This variant features a fuselage that is 7 ft 3 in (2.2 m) longer than the baseline aircraft. The aircraft can take off from gravel or snow-covered runways at altitudes up to 9,840 ft (3,000 m) above sea level. It can also operate from unprepared runways. Y-8F400 This is a modernized freighter variant with upgraded avionics. It requires a three-man flight crew instead of the original five-man crew. The original glass nose was replaced by a solid nose. The cargo compartment is equipped with a 2,000-lb (1,000-kg) payload overhead cargo system, where the cargo can be suspended from an electrically powered rail. Rollers in the floor of the cargo compartment enable quick and easy handling of cargo pallets and can be removed to leave a flat surface. The compartment is fully pressurized. Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14,

2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system.The transport is powered by four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the undernose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. Y-8H This is an aerial survey and photography variant. Y-8J maritime surveillance aircraft These are Y-8C transports fitted with British Skymaster radars for maritime surveillance missions. China procured six to eight of the radars from Racal (now Thales) in 1996 deal worth US$66 million. At least two of the aircraft remain in Chinese naval service and are deployed at Dachang naval air base near Shanghai. The original glass nose on the Y-8 is replaced by a large radome to accommodate the radar antenna on the Y-8J. The rear cargo door and loading ramp are also removed. Y-8JB This is an electronic intelligence (ELINT) variant first seen in mid-2004 near Shanghai. A prototype first flew on Aug. 26, 2003, and four aircraft are in service with the Chinese navy. The aircraft has a large chin-mounted radome that could house a large ELINT antenna. Another SATCOM antenna may be installed inside a large semi-spherical dorsal fairing forward of the vertical tailfin providing real-time transmission to the ground base. Numerous smaller fairings can be seen on top of the cabin and along the upper sections of the aft fuselage, as well as at the nose tip. The loading ramp appears to have been sealed. The aircraft has been fitted with a BM/KZ800 ELINT system. Y-8X maritime patrol aircraft (MPA) This Y-8X is fitted with a Litton Canada APS-504 search radar, dual Litton LTN-72R inertial navigational system and a single LTN-211 Omega navigation set. The first example was delivered to the Chinese navy in late 1984, and the aircraft received national design certification in 1985. A small number have been in service since the mid-1980s. The aircraft is equipped with search radar, navigation system, self-defense electronic countermeasures (ECM) suite, optical/infrared cameras, sonobuoys and sonar receiver. The rear cargo door was removed and replaced by a large mission equipment window for sonobuoys racks and cameras. The rear turret was also removed and replaced by the sonar operator seat. A canoe-shaped fairing plus a couple of blade antennas appear to have been attached to the bottom of the middle and aft fuselage, suggesting the aircraft's electronic intelligence mission has been enhanced with a new synthetic aperture radar (SAR) capability. Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. KJ-200 This is an airborne early warning and control aircraft based on the Y-8F600 airframe. See separate record for more information. Y-8 tanker Flight Refueling Ltd. of the U.K. studied the possibility of converting the Y-8 into an in-flight refueling aircraft. No Y-8Ts are known to be in service. Y-8 airborne early warning aircraft This is a third Chinese airborne early warning aircraft program, following the KJ-2000 and KJ-200 (see separate records); it was revealed in 2005. Based on the Shaanxi Y-8F400 airframe, the aircraft features a conventional rotodome mounted above the fuselage. At least one prototype has been built and the program may be aimed at the export market. Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. ZDK-03 This variant, based on the Y-8F600, was designed specifically for the Pakistani air force for airborne early warning missions. It features an active electronically scanned array (AESA) radar. Islamabad has ordered four of the aircraft. The first unit was scheduled to be delivered by the end of 2010. See separate record for more information. GX-7 This is a Y-8 aircraft modified for psychological warfare missions. It is designed to broadcast messages over radio and television signals and can jam enemy communications. The GX-7 was first made public by Chinese media in July 2013. Y-8Q/Y-8GX6 This variant was first revealed in November 2011 and was reported in service in mid-2015. The Y-8Q features a redesigned wing and pressurized fuselage with composite structures; WJ-6C turboshaft

engines; and high-efficiency, six-bladed propellers. It is distinguishable from other Y-8/Y-9 variants by a large chin-mounted sea search radar; electro-optical system behind the nose wheel; and a weapons bay just ahead of the main wheels. There is also a magnetic anomaly detector (MAD) boom and domed windows in the aft fuselage for observation. A fuselage weapons bay, located ahead of the main landing gear, would likely carry torpedoes. It has been speculated that the Y-8Q has fuselage sonobuoy dispensers and hardpoints on the wings for anti-ship missiles.

System

Alternate Designation(s): Y-8

Notes:

The Shaanxi Y-8 or Yunshuji-8 (Chinese: □-8) aircraft is a medium size medium range transport aircraft produced by Shaanxi Aircraft Corporation in China, based on the Soviet Antonov An-12. It has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. Although the An-12 is no longer made in Ukraine, the Chinese Y-8 continues to be upgraded and produced. An estimated 169 Y-8 aircraft had been built by 2010. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with license to assemble the aircraft locally. However, due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance. The Xi'an Aircraft Company and Xi'an Aircraft Design Institute worked to reverse engineer the An-12 for local production. Design of the aircraft was completed by February 1972. Major features of the Y-8 included a glazed nose and tail turret derived from that of the H-6 bomber, a roller-type palletized-cargo-handling device instead of the overhead conveyor, and a gaseous oxygen system as opposed to a liquid oxygen system. The original Y-8 inherited the An-12's twin 23mm cannon tail turret, but this was removed on subsequent variants. The Y-8 equipped with four turboprop engines mounted under the leading edges of non-swept wings. The wings are attached high on the fuselage, and the tricycle landing gear is equipped with low pressure tires. The earliest versions used for the transportation of freight or troops had two side-hinged, inward-opening doors, while later variants used a rearward-facing ramp to facilitate loading and unloading of the payload. Some specialized versions omit the cargo ramp entirely. The Y-8 is capable of carrying troops, dropping supplies, parachute drops, and functioning as an air ambulance. It also can be used for commercial uses as a freighter. It is capable of hauling 20 tons of cargo, approximately 96 soldiers, or about 82 paratroopers in the cargo compartment which is 13.5 metres long, 3 metres wide and 2.4 metres high. It can also carry 60 severely wounded soldiers with their stretchers, 20 slightly injured soldiers and 3 medical attendants. Many variants for specialized roles have been built, but information on them can be vague or difficult to obtain due to the secretive nature of the Chinese military. The Y-8 transport aircraft was put into trial production in the Xi'an Aircraft Factory in June 1972. By December 1974, the first Chinese-assembled Y-8 conducted its maiden flight. Following trial production of the first Y-8s, operations were transferred to the Shaanxi Aircraft Factory. The Shaanxi-produced Y-8s conducted their test flights in December 1975. After a regime of 66 test flights the Y-8 was officially certified for use by the Chinese government. By 1981, the Y-8 entered serial production.[2] Mr. Ouyang Shaoxiu (□□□□) would eventually become the general designer, designing many variants of Y-8, including KJ-2000. In the early 1980s, Chinese officials saw US Army recruiting advertisements featuring parachute extraction of an Army jeep along with troops. The PLA was told to develop this kind of capability. But there were two design problems. One, Y-8 wings have very sharp leading edges, so one wing tends to stall before the other, causing the aircraft to roll inverted as it stalls. The second design flaw as that the cargo deck of the Y-8 had a 10 degree downward slope starting at the landing gear. When the PLA Air Force started to test parachute extraction, these two design flaws caused a near disaster. The aircraft was flying too fast, and when the parachute started to extract cargo from the hold, the cargo rolled on the deck until it got to the 10 degree downward slope, and there it became airborne while still inside the aircraft. The cargo hit the top of the cargo door on the way out, making it clear that the Y-8 could not do parachute cargo extraction. In 1986, two engineers from Beijing's Ministry of Aviation visited Lockheed. They could not speak very much English, and the Lockheed-Georgia sales person who met them could not speak Chinese. So for half a day, they did a point-and-grunt tour until they were lucky enough to find a Lockheed employee who could speak Chinese. The Chinese wanted to purchase Lockheed wind tunnel testing on the Y-8 in order to address the stall problem. As a result of these wind tunnel tests, conducted in 1986, Lockheed was given a contract to do a flight test series on the Y-8. Lockheed was told that flight test data was not provided by the Soviets when they helped China build the Y-8 factory. The flight test series was flown by Lockheed test pilot Hank Dees. Hank had flown the test flight series for the Lockheed L-1011 and later for China's Y-12 in Harbin. During this flight test series, Hank Dees flew the aircraft to stall speed and taught Chinese pilots how to anticipate a stall in order to prevent letting the aircraft go inverted. As a result of this test flight series, Chinese pilots started to use the 45 degree flap position. Lockheed's motive for doing flight tests was to demonstrate that

China would be better off buying the C-130 rather than trying to improve the Y-8. China did buy C-130's, but the flight test series actually demonstrated that the Y-8 was a more capable aircraft than previously believed. In the late 1980s, Lockheed Martin, the American manufacturer of the C-130 Hercules, helped China to develop a pressurized cabin for the passenger version of Y-8, resulting in two versions: the first had half of the cabin pressurized and later, the second version in which the complete cabin was pressurized. In 2001 and 2002, new consulting arrangements between Antonov and Shaanxi resulted in modernized redesigns to the Y-8's wing and fuselage. As a consequence the redesign allows the Y-8's fuel capacity to be increased by 50 percent.

Tu-154M (Careless) Russian Jet Airliner

Tiers:

Variants:

- **Tu-154:** Tu-154 production started in 1970, and the first passenger flight was performed on 9 February 1972. Powered by Kuznetsov NK-8-2 turbofans, it carried 164 passengers. About 42 were built.
- **Tu-154A:** The first upgraded version of the original Tu-154, the A model, in production since 1974, added center-section fuel tanks and more emergency exits, while engines were upgraded to higher-thrust Kuznetsov NK-8-2U. Other upgrades include automatic flaps/slats and stabilizer controls and modified avionics. Max. takeoff weight – 94,000 kg (207,235 lb). There were 15 different interior layouts for the different domestic and international customers, seating between 144 and 152 passengers. To discern the A model from the base model note the spike at the junction of the fin and tail. This is a fat bullet on the A model, and a slender spike on the base model.
- **Tu-154B:** As the original Tu-154 and Tu-154A suffered wing cracks after a few years in service, a version with a new, stronger wing, designated Tu-154B, went into production in 1975. It also had an additional fuselage fuel tank, additional emergency exits in the tail. Also, the maximum takeoff weight increased to 98,000 kg (216,053 lb). Important to Aeroflot was the increased passenger capacity, hence lower operating costs. With the NK-8-2U engines the only way to improve the economics of the airplane was to spread costs across more seats. The autopilot was certified for ICAO Category II automatic approaches. Most previously built Tu-154 and Tu-154A were also modified into this variant, with the replacement of the wing. Maximum takeoff weight increased to 96,000 kg (211,644 lb). 111 were built.
- **Tu-154B-1:** Aeroflot wanted this version for increased revenue on domestic routes. It carried 160 passengers. This version also had some minor modifications to the fuel system, avionics, air conditioning, and landing gear. 64 were built from 1977 to 1978.
- **Tu-154B-2:** A minor modernization of Tu-154B-1. The airplane was designed to be converted from the 160 passenger version to a 180 passenger version by removing the galley. The procedure took about 2 1/2 hours. Some of the earlier Tu-154Bs were modified to that standard. Maximum takeoff weight increased to 98,000 kg (216,053 lb), later to 100,000 kg (220,462 lb). Some 311 aircraft were built, including VIP versions. A few remain in service.
- **Tu-154S:** The Tu-154S is an all-cargo or freighter version of the Tu-154B, using a strengthened floor, and adding a forward cargo door on the port side of the fuselage. The aircraft could carry nine Soviet PAV-3 pallets. Maximum payload – 20,000 kg (44,092 lb). There were plans for 20 aircraft, but only nine were converted, two from Tu-154 models and seven from Tu-154B models. Trials were held in the early 1980s and the aircraft was authorized regular operations in 1984. By 1997 all had been retired.
- **Tu-154M:** The Tu-154M and Tu-154M Lux are the most highly upgraded versions, which first flew in 1982 and entered mass production in 1984. It uses more fuel-efficient Soloviev D-30KU-154 turbofans. Together with significant aerodynamic refinement, this led to much lower fuel consumption hence longer range, as well as lower operating costs. The aircraft has new double-slotted (instead of triple-slotted) flaps, with an extra 36-degree position (in addition to existing 15, 28 and 45-degree positions on older versions), which allows reduction of noise on approach. It also has a relocated auxiliary power unit and numerous other improvements. Maximum takeoff weight increased first to 100,000

kg (220,462 lb), then to 102,000 kg (224,872 lb). Some aircraft are certified to 104,000 kg (229,281 lb). About 320 were manufactured. Mass production ended in 2006, though limited manufacturing continued as of January 2009. No new airframes have been built since the early 1990s, and production since then involved assembling aircraft from components on hand. Chinese Tu-154MD electronic intelligence aircraft carry a large-size synthetic aperture radar (SAR) under their mainframe.

- **Tu-154M-LK-1:** Cosmonaut trainer. This was a salon VIP aircraft modified to train cosmonauts to fly the Buran reusable spacecraft, the Soviet equivalent of the US Space Shuttle. The Tu-154 was used because the Buran required a steep descent, which the Tu-154 was capable of replicating. The cabin featured trainee workstations, one of which was identical to the Buran's flightdeck. The forward baggage compartment was converted into a camera bay, as the aircraft was used to train cosmonauts in observation and photographic techniques.
- **Tu-154M-ON monitoring aircraft:** Germany modified one of the Tu-154s it inherited from the former East German Air Force into an observation airplane. This aircraft was involved with the Open Skies inspection flights. It was converted at the Elbe Aircraft Plant (Elbe Flugzeugwerke) in Dresden, and flew in 1996. After 24 monitoring missions, it was lost in a mid-air collision in 1997. The Russians also converted a Tu-154M to serve as an Open Skies monitoring aircraft. They used the Tu-154M-LK-1, and converted it to a Tu-154M-ON. When not flying over North America, it is used to ferry cosmonauts. China is believed to have converted one Tu-154 to an electronic countermeasures aircraft.
- **Tu-154M-100:** Design of this variant started in 1994, but the first aircraft were not delivered until 1998. It is an upgraded version with Western avionics, including the Flight Management Computer, GPS, EGPWS, TCAS, and other modern systems. The airplane could carry up to 157 passengers. The cabin featured an automatic oxygen system and larger overhead bins. Three were produced, as payment of debts owed by Russia to Slovakia. Three aircraft were delivered in 1998 to Slovak Airlines, and sold back to Russia in 2003.
- **Tu-155:** A Tu-154 converted into a testbed for alternative fuels. It first flew in 1988 and was used until the fall of the Soviet Union, when it was placed in storage.
- **Tu-164:** Initial designation of the Tu-154M.
- **Tu-174:** Proposed stretched version of Tu-154.
- **Tu-194:** Proposed shortened version of Tu-154.

System

Alternate Designation(s): Tu-154M; NATO: Careless

Primary Function / Type: Jet Airliner

Manufacturer: Tupolev

Crew: 3 flight crew + 5 cabin crew

Passengers: 144-168 passengers

Number of Engines: 3

Number of Hard Points: INA

Dimensions

Length: 48.00 m

Height: 11.40 m

Wingspan: 37.55 m

Wing Area: 201.45 sq m

Cabin Volume: 163.2 cu m

Weight, Empty: 55,300 kg

Weight, Maximum Takeoff: 102,000 kg

Payload: 18,000 kg

Automotive

Engine Name: 3 x Soloviev D-30KU-154 Turbofans

Number of Engines: 3

Engine Type: Turbofan

Engine Power: 10,500 kg static thrust each

Maximum Internal Fuel Capacity: 47,000 liters

Maximum Speed: 950 km/h

Economical Speed: 900 km/h

Long-Range Speed: 850 km/h

Takeoff Safety Speed: 255 km/h

Landing at Threshold Speed: 225 km/h

Notes:

Tu-154M The Tu-154M and Tu-154M Lux are the most highly upgraded versions, which first flew in 1982 and entered mass production in 1984. It uses more fuel-efficient Soloviev D-30KU-154 turbofans. Together with significant aerodynamic refinement, this led to much lower fuel consumption hence longer range, as well as lower operating costs. The aircraft has new double-slotted (instead of triple-slotted) flaps, with an extra 36-degree position (in addition to existing 15, 28 and 45-degree positions on older versions), which allows reduction of noise on approach. It also has a relocated auxiliary power unit and numerous other improvements. Maximum takeoff weight increased first to 100,000 kg (220,462 lb), then to 102,000 kg (224,872 lb). Some aircraft are certified to 104,000 kg (229,281 lb). About 320 were manufactured. Mass production ended in 2006, though limited manufacturing continued as of January 2009. No new airframes have been built since the early 1990s, and production since then involved assembling aircraft from components on hand. Chinese Tu-154MD electronic intelligence aircraft carry a large-size synthetic aperture radar (SAR) under their mainframe. The Tupolev Tu-154 (Russian: Туполев Ту-154; NATO reporting name: "Careless") is a three-engine medium-range narrow-body airliner designed in the mid-1960s and manufactured by Tupolev. A workhorse of Soviet and (subsequently) Russian airlines for several decades, it carried half of all passengers flown by Aeroflot and its subsidiaries (137.5 million/year or 243.8 billion passenger km in 1990), remaining the standard domestic-route airliner of Russia and former Soviet states until the mid-2000s. It was exported to 17 non-Russian airlines and used as a head-of-state transport by the air forces of several countries. With a cruising speed of 850 kilometres per hour (530 mph) the Tu-154 is one of the fastest civilian aircraft in use and has a range of 5,280 kilometres (3,280 mi). Capable of operating from unpaved and gravel airfields with only basic facilities, it was widely used in the extreme Arctic conditions of Russia's northern/eastern regions where other airliners were unable to operate. Originally designed for a 45,000-hour service life (18,000 cycles) but capable of 80,000 hours with upgrades, it was expected to continue in service until 2016, although noise regulations have restricted flights to western Europe and other regions. Since 1968 there have been 39 fatal incidents involving the Tu-154, most of which were caused either by factors unrelated to the aircraft, incorrect maintenance, or by its extensive use in demanding conditions. Few of the Tu-154 accidents appear to have involved technical failure. The Tu-154 is

powered by three rear-mounted low-bypass turbofan engines arranged similarly to those of the Boeing 727, but it is slightly larger than its American counterpart. Both the 727 and the Tu-154 use an S-duct for the middle (Number 2) engine. The original model was equipped with Kuznetsov NK-8-2 engines, which were replaced with Soloviev D-30KU-154 in the Tu-154M. All Tu-154 aircraft models have a relatively high thrust-to-weight-ratio which give excellent performance, at the expense of lower fuel efficiency. This became an important factor in later decades as fuel costs grew. The cockpit is fitted with conventional dual yoke control columns. Flight control surfaces are hydraulically operated. The cabin of the Tu-154, although of the same six-abreast seating layout, gives the impression of an oval interior, with a lower ceiling than is common on Boeing and Airbus airliners. The passenger cabin accommodates 128 passengers in a two-class layout and 164 passengers in single-class layout, and up to 180 passengers in high-density layout. The layout can be modified to what is called a winter version where some seats are taken out and a wardrobe is installed for passenger coats. The passenger doors are smaller than on its Boeing and Airbus counterparts. Luggage space in the overhead compartments is very limited. Like the Tupolev Tu-134, the Tu-154 has a wing swept back at 35° at the quarter-chord line. The British Hawker Siddeley Trident has the same sweepback angle, while the Boeing 727 has a slightly smaller sweepback angle of 32°. The wing also has anhedral (downward sweep) which is a distinguishing feature of Russian low-wing airliners designed during this era. Most Western low-wing airliners such as the contemporary Boeing 727 have dihedral (upward sweep). The anhedral means that Russian airliners have poor lateral stability compared to their Western counterparts, but also are more resistant to Dutch roll tendencies. Considerably heavier than its predecessor Soviet-built airliner the Ilyushin Il-18, the Tu-154 was equipped with an oversized landing gear to reduce ground load, enabling it to operate from the same runways. The aircraft has two six-wheel main bogies fitted with large low-pressure tires that retract into pods extending from the trailing edges of the wings (a common Tupolev feature), plus a two-wheel nose gear unit. Soft oleo struts (shock absorbers) provide a much smoother ride on bumpy airfields than most airliners, which very rarely operate on such poor surfaces. The original requirement was to have a three-person flight crew – captain, first officer and flight engineer – as opposed to a four- or five-person crew, as on other Soviet airliners. It became evident that a fourth crew member, a navigator, was still needed, and a seat was added on production aircraft, although their workstation was compromised due to the limitations of the original design. Navigators are no longer trained and this profession is becoming obsolete with the retirement of the oldest Soviet-era planes. The latest variant (Tu-154M-100, introduced 1998) includes an NVU-B3 Doppler navigation system, a triple autopilot, which provides an automatic ILS approach according to ICAO category II weather minima, an autothrottle, a Doppler drift and speed measure system (DISS), and a "Kurs-MP" radio navigation suite. A stability and control augmentation system improves handling characteristics during manual flight. Modern upgrades normally include modernised TCAS, GPS, and other systems (mostly American-made or EU-made). Early versions of the Tu-154 cannot be modified to meet the current Stage III noise regulations and are no longer allowed to fly into airspace where such regulations are enforced, such as the European Union. However, the Tu-154M's D-30 engines can be fitted with hush kits, allowing them to meet noise regulations.

Il-18 (Coot-D) Russian Cargo Transport Aircraft

Tiers:

1 2 3 4

System

Alternate Designation(s): Il-18D; NATO: Coot-D
Primary Function / Type: Turboprop Airliner
Manufacturer: Ilyushin
Crew: 9
Passengers: 65-120 passengers
Number of Engines: 4
Number of Hard Points: INA

Dimensions

Length: 35.90 m
Height: 10.17 m

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

Il-18D This is a transport/cargo version with more powerful AI-20M engines, center-section fuel tank for greater range, lengthened pressurized section of fuselage. Some are still in military and civilian service. The "D" stands for dal'niy, Russian for long-range. The Ilyushin Il-18 (Russian: Илью́шин Ил-18; NATO reporting name: Coot) is a large turboprop airliner that first flew in 1957 and became one of the best known and durable Soviet aircraft of its era. The Il-18 was one of the world's principal airliners for several decades and was widely exported. Due to the aircraft's airframe durability, many examples achieved over 45,000 flight hours and the type remains operational in both military and (to a lesser extent) civilian capacities. The Il-18's successor was the long range Il-62 jet airliner. Two Soviet aircraft shared the designation Ilyushin Il-18. The first Il-18 was a propeller-driven airliner of 1946 but after a year of test flights that programme was abandoned. In the early 1950s with a need to replace older designs and increase the size of the Soviet civil transport fleet, a Soviet Council of Ministers directive was issued on 30 December 1955 to the chief designers Kuznetsov and Ivchenko to develop new turboprop engines and to Ilyushin and Antonov to design an aircraft to use these engines. The two aircraft designs were developed as the Ilyushin Il-18 and the Antonov An-10 and the engine chosen was the Kuznetsov NK-4 rather than the Ivchenko AI-20. The Il-18 design had started in 1954 before the directive was issued and experience with the piston-engined Il-18 was used although the aircraft was a new design. The design was for a four-engined low-wing monoplane with a circular pressurised fuselage and a conventional tail. The forward retracting tricycle landing gear had four wheels fitted on the main leg bogies, the main legs bogies rotated 90 degrees and retracted into the rear of the inboard engines. A new feature at the time was the fitting of a weather radar in the nose and it was the first Soviet airliner to have an automatic approach system. The aircraft has two entry doors on the port-side before and after the wing and two overwing emergency exits on each side. The prototype SSSR-L5811 was rolled out in June 1957 and after ground-testing it began taxi test and high-speed runs on 1 July 1957. On 4 July 1957 the prototype first flew from Khodynka. On 10 July 1957 the aircraft was flown to Moscow-Vnukovo Airport to be presented to a Soviet government commission; also present was the prototype Antonov An-10 and the Tupolev Tu-114. The Il-18 type was formally named Moskva and this was painted on the fuselage, although the name was not used when the aircraft entered production. The Moscow Machinery Plant No. 30 located at Khodynka, near where the Ilyushin design office and the prototype had been built, was chosen to manufacture the aircraft. During 1957 the plant began to reduce its production of the Ilyushin Il-14 and prepare to build the production aircraft designated IL-18A. The Il-18A was only different from the prototype in minor details, mainly internal configuration to increase the seating from 75 to 89. Malev Il-18 in Sweden, 1972 The first production aircraft were powered by the Kuznetsov NK-4 but the engines were plagued with problems so the Council of Ministers decreed in July 1958 that all production from November 1958 would use the Ivchenko AI-20 and earlier production would be re-engined. Only 20 IL-18As were built before production changed to the improved Il-18B, this new variant had a higher gross weight and the nose was re-designed with a larger radome which increased the length by 20 cm. The first Il-18B flew on 30 September 1958 powered by the AI-20; a VIP variant was also built as the IL-18S for the Soviet Air Force. From April 1961 a TG-18 Auxiliary Power Unit was fitted for ground starting rather than the bank of lead-acid batteries. Some aircraft were modified to allow the APU to be run in flight. With experience of the earlier aircraft a further improvement was the Il-18V variant. The Il-18V was structurally the same but the interior was re-designed including moving the galley and some minor system changes. The first Il-18V appeared in December 1959 and was to continue into production until 1965 after 334 had been built. Specialised variants of the aircraft also appeared, including aircraft modified for flight calibration and a long-range polar variant. Military variants also appeared including the anti-submarine Ilyushin Il-38.

Challenger 650 Canadian Transport Aircraft

Notes:

The Challenger 650 is the latest member of Bombardier's Challenger 600 family of business jets designed for executive transport and special missions. Spacious cabins provide excellent passenger comfort as well as sufficient space for operator consoles and mission system electronics. Numerous cabin configurations can be implemented. Our best-selling large aircraft platform combines world-class interior design with the ultimate value proposition. Widest-in-class cabin, worldwide reach, and the lowest direct operating costs make the Challenger 650 aircraft the winning choice.

Challenger 604 (CL-604) Canadian Transport Aircraft

Tiers:

Variants:

- **Challenger 600 (CL-600):** The was the initial production version with Avco Lycoming ALF 502L-2 engines and without winglets at the wingtips.
- **CE-144 Electronic Support and Training (EST):** Seven CL-600s were converted as EW simulators; fitted with radar, jamming systems, communications equipment; the first service entry was in 1990.
- **Challenger 601 (CL-601):** The 601 is a production version with uprated engines and winglets. At one point, there were 18 in military service, most as VIP transports: six in Canada, five in China and seven in Germany. One German aircraft was configured for combined passenger/cargo operations; another operated as an air ambulance with a 4-litter capacity.
- **Challenger 601-3A (CL-601-3A):** This is an improved 601 with flat-rated CF-34-3A engines for better hot-day performance; integrated digital flight management and guidance system including automatic flight control system (AFCS) and electronic flight instrumentation system (EFIS).
- **Challenger 604 (CL-604):** The CL-604 is the latest version of this type of aircraft by Bombardier Aerospace. It has a range of 4,077 nm (4,696 mi; 7,556 km). It also utilizes advanced transonic wing design, a damage-tolerant airframe (FAR 25), triple-redundant hydraulic systems and quadruple-redundant electrical systems.
- **CL-605:** Initial operating capability (IOC) of this version was reached in 2006. It upgrades the avionics and structure of the 604 design. Features include larger cabin windows, new avionics displays and "electronic flight bag" capability. The version can be identified by its new, rounded tailcone. See separate record for more information.

Chaffs/Flares: INA

Notes:

CL-604 advanced GE CF34-3B engines; increased fuel capacity including saddle tanks in the rear of the aircraft; new undercarriage for a higher takeoff and landing weight; structural improvements to wings and tail; and a new Rockwell Collins ProLine 4 avionics system.. The Bombardier Challenger 600 series is a family of business jets developed by Canadair and then produced from 1986 by its new owner, Bombardier Aerospace. At the end of 1975, Canadair backed the LearStar 600 concept by Bill Lear, and acquired the large business jet or freighter project in April 1976. On 29 October, the program was launched, backed by the Canadian federal government, and designed to comply with new FAR part 25 standards. In March 1977, it was renamed the Challenger 600 after Bill Lear was phased out, as the original conventional tail was changed for a T-tail among other developments. The first prototype was rolled out on 25 May 1978, and performed its maiden flight on 8 November. The flight test program saw a deadly crash on 3 April 1980, but Transport Canada approved the CL-600 type certification on 10 August 1980. In 1986, Canadair was close to bankruptcy and was bought by Bombardier. The jet was stretched into the Bombardier CRJ regional airliner, introduced on 19 October 1992, and the longer range Global Express, introduced in July 1999. The 500th Challenger was rolled out in May 2000, and the 1000th was delivered to NetJets in December 2015. By October

2018, 1,066 aircraft have been built. The Challenger is a low-wing jet powered by two turbofans mounted in aft fuselage pods, it has a supercritical wing and a stand-up cabin with two seating sections. The original Lycoming ALF 502 turbofans were replaced by a pair of General Electric CF34s on the CL-601, which also gained winglets, and first flew on 10 April 1982. Subsequent variants have updated systems, avionics, and higher weights.

CRJ200 Canadian Transport Aircraft

Tiers:

Variants:

- **CRJ100:** The CRJ100 is the original 50-seat version. It is equipped with General Electric CF34-3A1 engines. Operators include RwandAir, among others.
- **CRJ100SF:** Passenger-to-freighter conversion of CRJ100.
- **CRJ100LR:** Long range version of CRJ100.
- **CRJ100SE:** Executive passenger conversion of CRJ100.
- **CRJ200:** The CRJ200 is identical to the CRJ100 except for its engines, which were upgraded to the CF34-3B1 model, offering improved efficiency.
- **CRJ200PF:** Package freighter version of CRJ200.
- **CRJ200LR:** Long range version of CRJ200.
- **CRJ200SF:** Passenger-to-freighter conversion of CRJ200.
- **CRJ440:** Certified up to 44-seat, this version was designed with fewer seats in order to meet the needs of some major United States airlines.
- **Challenger 800/850:** A business jet variant of the CRJ200
- **CRJ500:** Proposed 50-seat version with wing and cabin improvements based on the CRJ700/900. Cancelled in 2001.

Notes:

The Bombardier CRJ100 and CRJ200 (formerly known as the Canadair CRJ100 and CRJ200) is a family of regional airliners that was designed and manufactured by Bombardier Aerospace between 1991 and 2006. The CRJ was Canada's second civil jet

airliner after the single prototype of the Avro Canada C102 Jetliner (which never entered commercial service). It was based on the Bombardier Challenger 600 series business jets. An initial effort to produce an enlarged 36-seat version of the aircraft, known as the Challenger 610E, was terminated during 1981. Shortly after Canadair's privatization and sale to Bombardier, work on a stretched derivative was reinvigorated; during early 1989, the Canadair Regional Jet program was formally launched. On 10 May 1991, the first of three CRJ100 prototypes conducted its maiden flight. The type first entered service during the following year with its launch customer, German airline Lufthansa. The initial variant, the CRJ100, was soon joined by another model, designated as the CRJ200. It was largely identical to the CRJ100, except for the installation of more efficient turbofan engines, which gave the aircraft lower fuel consumption, increased cruise altitude and cruise speed. During the 1990s, various additional versions and models of the type were developed and put into service. During the late 1990s, a substantially enlarged derivative of the airliner, referred to as the CRJ700, was developed; it was soon joined by the even larger CRJ900 and CRJ1000. During 2006, production of both the CRJ100 and CRJ200 came to an end; the majority of produced airliners have remained in revenue service to date. Additionally, several airlines have modernized their fleets to support extended service. The Bombardier CRJ100 and CRJ200 are a family of jet-propelled regional airliners, based upon the design of the Challenger CL-600 business jet. Roughly, the CL-600 was stretched 5.92 metres (19 feet 5 inches), which was achieved using fuselage plugs fore and aft of the wing, and was matched with the adoption of a reinforced and modified wing, an expanded fuel capacity, improved landing gear to handle the higher weights, and an additional pair of emergency exit doors. When installed in a typical seating configuration, the CRJ100 would accommodate 50 passengers; while in a maximum configuration, 52 passengers could be accommodated. It was powered by a pair of General Electric CF34-3A1 turbofan engines, each of which was capable of generating up to 41.0 kN (4,180 kgp / 9,220 lbf) of thrust. The CRJ100 featured a Collins-built ProLine 4 avionics suite, including a weather radar.

CRJ900 Canadian Regional Jet

Tiers:

Variants:

- **CRJ700:** Design work on the CRJ700 by Bombardier started in 1995 and the program was officially launched in January 1997. The CRJ700 is a stretched derivative of the CRJ200. The CRJ700 features a new wing with leading edge slats and a stretched and slightly widened fuselage, with a lowered floor. Its first flight took place on 27 May 1999. The aircraft's FAA Type Certificate designation is the CL-600-2C10. The CRJ700 first entered commercial service with Brit Air in 2001.
- **CRJ550:** On 6 February 2019, Bombardier launched the CRJ550, based on the CRJ700, with 50 seats in three classes. The launch customer, United Airlines, ordered 50 aircraft configured with 10 first class, 20 Economy Plus and 20 economy seats. The aircraft were to be operated under the United Express brand by regional partner GoJet Airlines. The CRJ550 has a lower maximum takeoff weight (MTOW) than the CRJ700, to comply with scope clauses in US pilot contracts, and a lower maximum landing weight (MLW). It received type certification in the second half of 2019. The initial 50 aircraft will be sourced from existing CRJ700s, rather than being newly constructed. On 7 August 2019, United Airlines' regional partner GoJet Airlines took delivery of the aircraft and began with a crew familiarization flight to Chicago-O'Hare International Airport (ORD).
- **CRJ900:** The CRJ900 is a stretched 76–90 seat version of the CRJ700. The first CRJ900 (C-FRJX) was modified from the prototype CRJ700 by adding longer fuselage plugs fore and aft of the wings. It was later converted into the prototype CRJ1000 by replacing the fuselage plugs with longer plugs. The CRJ900 also features strakes located at the rear of the plane. The CRJ900 competes with the Embraer 175, and is more efficient per seat-mile, according to Bombardier. Mesa Air Group was the launch customer for the CRJ900 painted in America West livery. The FAA Type Certificate designation of the CRJ900 is the CL-600-2D24.
- **CRJ705:** The CRJ700 Series 705 is based on the CRJ900, featuring a business class cabin and a reduced maximum seating capacity to allow operation with regional airlines. The Series 705 seats 75 passengers. Some regional airlines have scope clauses with their major airlines that limit the maximum passenger capacity of aircraft they operate. The Air Canada Pilots Association negotiated a scope agreement with Air Canada limiting the maximum seating capacity of any jet aircraft at Air Canada Express to 75 seats. Air Canada Jazz was the launch customer for this aircraft in 2005 with 10 Executive Class and 65 Economy Class seats, all fitted with personal audio/video-on-demand systems. The FAA Type Certificate designation of the CRJ705 is the CL-600-2D15. Jazz Aviation, a subsidiary of Chorus Aviation, operated 16 CRJ705s on behalf of Air Canada and was the only operator of this version. On 26 April 2016, Jazz Aviation announced that existing CRJ705 aircraft in operation will be converted to CRJ900 with 76 seats. As of late February 2018, all CRJ-705s have been reconfigured with 12 Executive Class and 64 Economy Class seats, which changed their FAA Type Certificate to CL-600-2D24.
- **CRJ1000:** On 19 February 2007, Bombardier launched the development of the CRJ1000, previously designated CRJ900X, as a stretched CRJ900, with up to 100 seats. The CRJ1000 completed its first production flight on 28 July 2009 in Montreal; the entry into service was planned then for the first quarter of 2010. A month after the first flight, however, a fault in the rudder controls forced the flight-test program to be grounded : the program was not resumed until February 2010, and deliveries were projected to begin by January 2011. Brit Air and Air Nostrum were the launch customers for the CRJ1000.

Notes:

The Bombardier CRJ700, CRJ900, and CRJ1000 (after June 2020, the Mitsubishi CRJ) are a family of regional jet airliners designed and manufactured by Canadian transportation conglomerate Bombardier; this aircraft trio has been collectively marketed by the company as the CRJ Series. Their design was derived from the smaller CRJ100 and 200 airliners. During the 1990s, Bombardier initiated development on the CRJ-X, a program to produce enlarged derivatives of its popular CRJ100/200 family. Officially launched in 1997, the CRJ700's maiden flight took place on 27 May 1999; it was soon followed by the stretched CRJ900 variant. Several additional variants of the type were subsequently introduced, including the CRJ550 and the elongated CRJ1000. While production of the smaller CRJ100/200 range was discontinued during 2006, the larger CRJ Series models have continued to be produced into the 2010s. Competitors have included the Fokker 70/Fokker 100, the BAe 146 family, and the Embraer E-Jet family. In Bombardier's lineup, the CRJ Series was formerly marketed alongside a family of larger jets, the C Series (now majority-owned by Airbus and marketed as the Airbus A220) and a twin-turboprop, the Q Series (now owned by De Havilland Canada and marketed as the Dash 8). During the late 2010s, Bombardier sought to sell off several of its aircraft programs. The CRJ program was acquired by Japanese corporation Mitsubishi Heavy Industries in a deal that closed 1 June 2020. The CRJ900 is a stretched 76–90 seat version of the CRJ700. The first CRJ900 (C-FRJX) was modified from the prototype CRJ700 by adding longer fuselage plugs fore and aft of the wings. It was later converted into the prototype CRJ1000 by replacing the fuselage plugs with longer plugs. The CRJ900 also features strakes located at the rear of the plane. The CRJ900 competes with the Embraer 175, and is more efficient per seat-mile, according to Bombardier. Mesa Air Group was the launch customer for the CRJ900 painted in America West livery. The FAA Type Certificate designation of the CRJ900 is the CL-600-2D24. The wing is wider with added leading edge slats, the tail is redesigned. The cabin floor has been lowered 2 inches which gains outward visibility from the windows in the cabin as the windows become closer to eye level height. The cabin has a re-circulation fan which aids in cooling and heating. The environmental packs have a target temperature instead of a hot-cold knob. The APU is a Honeywell RE220 unit,[68] which supplies much more air to the AC packs and has higher limits for starting and altitude usage. The aircraft features two GE CF34-8C5 engines, 59.4 kN (13,400 lbf) thrust with APR. The engines are controlled by FADEC digital engine control instead of control cables and a fuel control unit. In typical service, the CRJ900 can cruise 8–10,000 ft higher with a slightly higher fuel burn and an average true airspeed of 450–500 knots, a significant improvement over its predecessor. Its maximum ground takeoff weight is 84,500 pounds. In 2018, the CRJ900's list price was $48 million while its market value was $24M; reportedly, most customers are paying around $20–22M and the American Airlines order for 15 was at below $20M. A 2012 aircraft was worth less than $14M and it was to fall by 30% in 2021.

B737-500 (Boeing 737-500) American Cargo Transport Aircraft

Tiers:

1 2 3 4

Variants:

- **B737-100:** This is the initial production civil airliner version, with a 94-ft (28.65-m) long fuselage and a maximum passenger capacity of 115. First flight took place on April 9, 1967. Only 30 were built, all of which entered commercial service. One was later acquired by the Mexican air force as a VIP transport.
- **B737-200:** This version features a 6-ft (1.82-m) fuselage stretch and more powerful JT8D engines. There were 1,095 aircraft built.
- **B737-2X9 Surveiller:** This version is a 737-200 with 14 first-class and 88 coach passenger seats as well as a Motorola side-looking airborne modular multi-mission radar (SLAMMR) -- a variant of the AN/APS-131/135 radar -- and two associated 16-ft (5-m) long slotted waveguide antennas on the upper rear fuselage sides. At 30,000 ft (9,144 m), the detection range for small ships is 100 nm (115 mi; 185 km). Three improved Surveillers are in service in Indonesia. Modifications to the Indonesian versions include enhanced side-looking airborne modular radar; a new nose-mounted IR-detection system; as well as radar and GPS. Also installed on the improved version is the Boeing-developed data processing and display system (DPDS).
- **B737-300:** The B737-300 is the extended-range version with stretched fuselage and quieter, more fuel-efficient CFM56-3-B engines. First flight occurred on Aug. 24, 1984; it entered service on Dec. 7, 1984. More than 850 were ordered. One each has been in VIP service with the South Korean and Thai air forces.
- **B737-400:** This variant is similar to the B737-30, but with additional 10-ft (3.05-m) stretch to fuselage, 168-passenger capacity and higher rated engines. First flight occurred on Feb. 19, 1988; the first was delivered on Sept. 15, 1988. More than 170 were ordered.
- **B737-500:** The B737-500 is a short-fuselage (101 ft 9 in/31.01 m) version of the B737-300 with a passenger capacity of 132. First flight took place on June 30, 1989. More than 165 were ordered.
- **B737-600:** The B737-600 was known as the 737-500X prior to 1995. It accommodates 108-140 passengers. It is part of the Next Generation series -- the smallest model. The wings have increased chord and span lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700:** Launched in November 1993, this was the first of the Next Generation series to enter service. It accommodates 128-149 passengers. The aircraft is similar to the B737-600, though the wings have increased chord and span, lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700 Increased Gross Weight Quick Change:** This variant was chosen by the U.S. Navy to replace the C-98s in the Reserves. Its features include continuous double-slotted flaps, new leading-edge slats and a large cargo door fitted to the front fuselage. Two were ordered for delivery by the end of 2001. A commercial version has not been made available.
- **B737-800:** The B737-800 was launched on Sept. 5, 1994. It is the longest variant of this series; it has a seating accommodation of 162-189 passengers.
- **B737-900:** This is a stretched version that can accommodate 18 more passengers than the 737-800. At least 10 orders have been placed for this aircraft. The eyebrow windows located above the cockpit windscreen were removed in January 2005. Kits are available to remove the eyebrow windows from earlier 737-900s. An increased range version, the 737-900ER, was launched on July 18, 2005. Its maximum takeoff weight rose to 187,800 lb (85,185 kg); maximum zero-fuel weight, 149,500 lb (67,812 kg); maximum landing weight, 157,400 lb (71,395 kg); and range, 3,200 nautical miles (3,682 mi, 5,926 km) with 180 passengers.
- **Boeing Business Jet:** The business jet was launched on July 2, 1996, as a joint venture between Boeing and General Electric. It is a corporate version of the 737-700. While between eight and 63 passengers will be typically accommodated, the plane can be configured to seat as many as 100. There is an integrated GPS and SATCOM. The range is 6,200 nautical mile (nm) (7,139 mi, 4,437 km). Three auxiliary tanks offer an increase in range of 4,830 nm (5,562 mi, 3,456 km).

System

Alternate Designation(s): B737-500; Boeing 737-500

Notes:

737-500 The -500 series was offered, due to customer demand, as a modern and direct replacement of the 737-200. It incorporated the improvements of the 737 Classic series, allowing longer routes with fewer passengers to be more economical than with the 737-300. The fuselage length of the -500 is 1 ft 7 in (48 cm) longer than the 737-200, accommodating up to 140 passengers. Both glass and older-style mechanical cockpits arrangements were available. Using the CFM56-3 engine also gave a 25% increase in fuel efficiency over the older -200s P&W engines. The 737-500 was launched in 1987 by Southwest Airlines, with an order for 20 aircraft, and flew for the first time on June 30, 1989.[58] A single prototype flew 375 hours for the certification process, and on February 28, 1990, Southwest Airlines received the first delivery. After the introduction of the −600/700/800/900 series, the −300/400/500 series was called the 737 Classic series. The price of jet fuel reached a peak in 2008, when airlines devoted 40% of the retail price of an air ticket to pay for fuel, versus 15% in 2000. Consequently, in that year carriers retired Classic 737 series aircraft to reduce fuel consumption; replacements consisted of more efficient Next Generation 737s or Airbus A320/A319/A318 series aircraft. On June 4, 2008, United Airlines announced it would retire all 94 of its Classic 737 aircraft (64 737-300 and 30 737-500 aircraft), replacing them with Airbus A320 jets taken from its Ted subsidiary, which has been shut down. The Boeing 737 is a narrow-body aircraft produced by Boeing Commercial Airplanes at its Renton Factory in Washington. Developed to supplement the 727 on short and thin routes, the twinjet retains the 707 fuselage cross-section and nose with two underwing turbofans. Envisioned in 1964, the initial 737-100 made its first flight in April 1967 and entered service in February 1968 with Lufthansa. The lengthened 737-200 entered service in April 1968. It evolved through four generations, offering several variants for 85 to 215 passengers. The -100/200 original variants were powered by Pratt & Whitney JT8D low-bypass engines and offered seating for 85 to 130 passengers. Launched in 1980 and introduced in 1984, the 737 Classic -300/400/500 variants were re-engined with CFM56-3 turbofans and offered 110 to 168 seats. Introduced in 1997, the 737 Next Generation (NG) -600/700/800/900 variants have updated CFM56-7s, a larger wing and an upgraded glass cockpit, and seat 108 to 215 passengers. The latest generation, the 737 MAX -7/8/9/10, powered by improved CFM LEAP high bypass turbofans and accommodating 138 to 204 people, entered service in 2017. Boeing Business Jet versions are produced since the 737NG, as well as military models. As of December 2019, 15,156 Boeing 737s have been ordered and 10,571 delivered. Actual backlog stands at 4,398 when including "additional criteria for recognizing contracted backlog with customers beyond the existence of a firm contract". Initially, its main competitor was the McDonnell Douglas DC-9, followed by its MD-80/MD-90 derivatives. It remained the highest-selling commercial jetliner until surpassed in total orders by the Airbus A320 family in October 2019. The current 737 MAX, designed to compete with the A320neo was grounded worldwide in March 2019 following two fatal crashes.

Y-12 (IV) Chinese Utility Aircraft

Tiers:

Variants:

- **Y-12 (I):** Twin-engined STOL utility transport aircraft, powered by two 500-shp (373-kW) Pratt & Whitney Canada PT6A-11 turboprop engines. Prototype version.
- **Y-12 (II):** Fitted with more powerful PT6A-27 engines.
- **Y-12 (III):** Planned version to be fitted with WJ-9 turboprop. Evolved to Y-12C because of IV's success when WJ-9 development was completed.
- **Y-12 (IV):** Improved version. Revised wingtips (span increased to 19.2 m (63 ft)) and increased takeoff weight. 19 passenger seats. This version is the first aircraft in the series certified by the FAA in 1995.
- **Y-12C:** Basically a (IV) version with WJ-9 turboprop, used by PLAAF for aerial survey.
- **Y-12D:** Domestically deployed military version with upgraded engines driving four-bladed propellers, used by PLA Airborne Corps for parachute training.
- **Y-12E:** Variant with 18 passenger seats. PT6A-135A engines of equal horsepower but increased torque driving four-bladed propellers. This version was certified by the FAA in 2006.
- **Y-12F:** The latest development with almost everything redesigned: wider fuselage, new wings, retractable landing gear and more powerful PT6A-65B engines. The Y-12F has higher cruise speed, longer range and can accommodate 19 passengers or 3x LD3 containers. Design started in April 2005 and the maiden flight was on 29 December 2010. CAAC type certification was received on 10 December 2015 and FAA certification on 22 February 2016. The Y-12F passed flight tests for its automatic flight control system by the FAA on 30 June 2018. It was demonstrated during the 2012 Zhuhai Airshow.
- **Y-12G:** Proposed cargo version of Y-12F.
- **Turbo Panda:** Export name for (II) version, marketed by England and Japanese companies. No real order due to airworthiness certification.
- **Twin Panda:** Originally (II) version for export. Later a modified Y-12 (IV) powered by two Pratt & Whitney Canada PT6A-34 turboprop engines and fitted with uprated undercarriage, upgraded avionics and interior. Thirty-five orders reportedly received by 2000 but production not proceeded with.

System

Alternate Designation(s): Y-12 (IV)
Primary Function / Type: Utility Aircraft
Manufacturer: Harbin Aircraft Industry Group

Crew: 2 (pilot, co-pilot)

Passengers: 19 passengers

Number of Engines: 2

Number of Hard Points: INA

Dimensions

Length: 14.86 m

Height: 5.58 m

Width (Wing Span): 19.20 m

Wing Area: 36.90 sq m

Cabin Length: 4.93 m

Cabin Width: 1.46 m

Cabin Height: 1.70 m

Volume: 12.9 cu m

Empty Weight: 3,000 kg

Payload Weight: 1,700 kg

Maximum Takeoff Weight: 5,300 kg

Automotive

Engine Name: 2 x Pratt & Whitney Canada PT6A-27

Number of Engines: 2

Engine Type: Turboprop

Engine Power: 620 shp each

Fuel Capacity: 1,616 liters

Maximum Cruise Speed: 328 km/h

Economy Cruise Speed: 271 km/h

Range with Maximum Payload at 146 knots: 189 km

Ceiling: 7,000 m

Climb Rate, Both Engines: 504 m/min

Climb Rate, One Engine: 101 m/min

Protection

Stealth Properties: None

Heat Signature Reduction: No

Add on Armor: No

Notes:

The Harbin Y-12 (Chinese: □-12; pinyin: Yùn-12) is a high wing twin-engine turboprop utility aircraft built by Harbin Aircraft Industry Group (HAIG). Y-12(IV) This is a 19-passenger development of the Y-12(II) variant. "Shearing" wingtips increase takeoff weight to 12,500 lb (5,670 kg). The Y-12 started as a development of the Harbin Y-11 airframe called Y-11T in 1980. The design featured numerous improvements including a redesigned wing with a new low drag section, a larger fuselage and bonded rather than riveted construction. It also replaced the radial piston engines with turboprops. The prototype was followed by about 30 production Y-12 (I) aircraft before a revised version was produced. This was designated the Y-12 (II), which featured more powerful engines and removal of leading edge slats, first flying on 16 August 1984 and receiving Chinese certification in December of the following year. The power plants are two Pratt & Whitney Canada PT6A-27 turboprops with Hartzell propellers. The Y-12 has a maximum takeoff weight of 5,700 kg (12,600 lb) with seating for 17 passengers and two crew. The aircraft is operated as a light commuter and transport aircraft. The latest development is the Y-12F, which is almost a new design with many improvements: new wings, new landing gear, new fuselage, with more powerful engines from Pratt & Whitney Canada and extended payload and range. The Y-12F made its maiden flight on December 29, 2010, received CAAC type certification on December 10, 2015, and FAA type certification on February 22, 2016. In 2015 Kenmore Air announced that they would begin development of floats for the Y-12 for FAA certification. The Y-12 completed the FAA evaluation flight tests for its automatic flight control system on June 30, 2018, with its performance meeting the requirements, said AVIC Harbin Aircraft Industry Company Ltd (AVIC HAFEI).

Y-7 (Yunshuji-7) Chinese Cargo Transport Aircraft

Tiers:

Variants:

- **Variants:** Xian Y-7E Speculative designation for a 'Hot and High" version with more powerful engines. Xian Y-7G A military variant of the MA60 produced for the PLAAF. Xian Y-7H (Huo -cargo) A reverse-engineered An-26 with rear loading ramp for the PLAAF, entering production in 1992. Xian Y7H-500 Civil variant of the Y-7H certified in 1994. Xian Y-14 The original designation for the An-26 copy/Y-7H. Xian Y-7-100 Improved version, developed in co-operation with HAECO (Hong Kong Aircraft Engineering Company), with redesigned cockpit and cabin, as well as winglets. This variation has an upgraded passenger cabin interior, with new avionics sourced from western providers. Flight crew reduced to three, it is capable of carrying 52 passengers. Xian Y-7-100C1 Five-crew variant with equipment changes. Xian Y-7-100C2 Five-crew variant with equipment changes. Xian Y-7-100C3 Five-crew variant with equipment changes. Xian Y-7-200 Fitted with new avionics; without winglets. Xian Y-7-200A Powered by two Pratt & Whitney PW127C turboprop engines. Xian Y-7-200B Stretched version (74cm (29in)) with WJ5A-1G engines, built for the Chinese domestic market. Xian HYJ-7 (Hongzhaji Yunshuji Jiaolianji - Bomber/transport/trainer) A pilot and crew trainer for H-6 heavy bombers fitted with a stabilised HM-1A bombsight, bomb-aiming radar and a TNL-7880 combined navigation system. Xian MA60 (Y-7-MA60) (Modern Ark 60 seats) A westernised variant of the Y-7 intended to attract more western customers and meet Joint Airworthiness Requirements. Xian JZY-01 experimental aircraft / Y-7 AWACS Carrier-based airborne early warning and control (AEW&C) variant. JZY stands for Jian (□) Zai (□) Yu (□), meaning carrier borne AEW&C, has 4 rudders like E-2 AEW It is being used as a testbed for Xian KJ-600.

Notes:

The Xian Y-7 (Chinese: □-7; pinyin: Yùn-qī) is a transport/passenger aircraft built in China. It is based on the Soviet-designed Antonov An-24 series. China imported the Antonov An-24 from early in its production run and also negotiated licences for production of the aircraft and its engines. In 1966, Xi'an aircraft factory started the project of local production of An-24. The first Chinese-assembled An-24T had its maiden flight on 25 December 1970. Production was launched in 1977 at the Xi'an aircraft factory but progress was slow due to the deleterious effects of the Cultural Revolution, with a pre-production aircraft displayed to the public at Nanyuan air base, near Beijing, on 17 April 1982. The WJ-5A1 turboprop engine was chosen as the Y-7's power source. The first production aircraft was not flown until February 1984, illustrating the slow progress (eighteen years from licence to production). The Chinese aircraft equated to the An-24RV, having a full complement of windows and the booster jet engine. The majority of early deliveries were to the People's Liberation Army Air Force (PLAAF), mostly as transports, with a few in 52-seat airliner configuration for the Civil Aviation Administration of China (CAAC). After the initial licensed production run, the Y-7 was developed separately from the An-24 with a succession of upgrades culminating in the Xian MA60 (Modern Ark) series. A tactical transport derivative was copied, unlicensed, from the Antonov An-26 and emerged as the Y-7H, incorporating the cargo ramp door and military equipment of the An-26.

An-26 (Curl) Russian Military Transport Aircraft

Tiers:

Variants:

- **Variants:** An-26 "Curl-A" : Twin-engine tactical transport aircraft. An-26-100 Convertible passenger/cargo aircraft modified from 'An-26' aircraft at the Kiev plant from 1999. An-26 Nel'mo An arctic surveillance and reconnaissance aircraft retrofitted with Nel'mo equipment. An-26 Pogoda (Weather) Another aircraft for weather control duties, similar to the 'An-26 Tsiklon ', with a simplified equipment test lab. An-26 Polyot (Flight) A single aircraft retrofitted for the purpose of research of unified air traffic control and monitoring system throughout the USSR, with a comprehensive navigation test lab including precision compasses and Doppler speed/shift sensors. An-26 Sfera (Sphere) A single production aircraft built as a laboratory for atmospheric research. An-26 Shtabnoy (Shtab: or Headquarters) some 'An-26's delivered to the Soviet and DDR air forces for use as staff transports/mobile command posts. An-26 Vitauk (Life) A single mobile operating room, surgery and intensive care unit ('25 Blue', c/n5406), for the Ukrainian Air Force. An-26A A one-off assault transport prototype with higher performance due to removal of some military equipment.[1] An-26ASLK (Avtomatizirovannaya sistema lyotnogo kontrolya – automated flight control and monitoring system) : A modern flight control and monitoring system equipped with automatic calibration and navigation systems. Recognizable by the distinctive pod low on the forward fuselage side. An-26B A civil cargo version equipped with roller gangsways which can be swung up against the cabin walls when not in use. It was also equipped with two ZMDB Progress (Ivchyenko) Al-24VT turboprop powerplants to deliver higher thrust. An-26B 'Mobile Hospital' : The prototype 'An-26B' retrofitted as a mobile civilian emergency hospital. An-26B Tsiklon (Cyclone) A weather research/control and cloud-seeding aircraft for the Central Aerologic Laboratory. This aircraft was used for rain induction and protection using cloud-seeding chemicals dropped from slab-sided pods hung from pylons. An-26B-100 Convertible passenger/cargo aircraft modified from 'An-26B' aircraft at the Kiev plant from 1999. An-26BL Alternative designation for the 'An-26L'. An-26BRL Alternative designation of the 'An-26RL' Arctic surveillance and reconnaissance aircraft. An-26D (Dal'niy – long-range) An extended range version with extra fuel in wing tanks and additional external tanks attached to the airframe of the fuselage. One aircraft ('21 Yellow', c/n 13806) was retrofitted and delivered, but no further orders were forthcoming. An-26K Kaira (Great Auk) A single An-26 aircraft converted to a Kaira test airframe for the development of airborne LASER guided systems. An-26K Kaplya (Drop [of liquid]) After completion of the LASER designator trials the 'An-26K Kaira' was retrofitted to search or optically guided weapons as the navigation systems. During a night test flight at low level, in March 1989, the An-26K Kaplya suffered a massive bird strike, which consequently destroyed the windshield and injured the pilot, who involuntarily downed the aircraft into the Azov Sea. An-26KPA (Kontrol'no-Poverochnaya Apparatura – Testing and calibration equipment) : A navigation aids inspecting aircraft with comprehensive navigation equipment and calibration equipment. An-26L A single 'An-26', (14 Orange, c/n 00607), used at Sperenberg Airfield near Berlin, for airfield and NAVAID calibration. An-26LL-PLO (Letayuschaya Laboratoriya – Protivolodochnoy Oborony – ASW (Anti-Submarine Warfare) testbed) : A single 'An-26A' aircraft, (c/n 0901), retrofitted and modified to accommodate range of sophisticated laboratory for surveillance systems, detecting and tracking stealthy nuclear submarines. An-26LP Firefighting version, for delivery of field equipment and para-dropping firefighters in lieu of water-bombing (any more info?). An-26M Spasatel (Rescue worker) Flying hospital with an emergency surgery facility and consultation conference room. An-26P (Protivopozharnyy – firefighting) : Aircraft fire engine fighter, retrofitted with water lifting vessels in pods on either side of the lower fuselage. An-26P Prozhektor (Projector or Searchlight) A single conversion of an An-26 as a guided missile system airframe. An-26REP (RadioElektronnoye Protivodeystviye – ECM (Electronic Counter-Measures) [aircraft]) : Electronic countermeasures aircraft fitted with active jammers in cylindrical pods on either side of the lower fuselage sides, as well as chaff and I/R flares for self-defense. An-26RL (Razvedchik Ledovyy – An arctic surveillance, reconnaissance and monitoring) : An arctic surveillance, reconnaissance and monitoring aircraft used to monitor the icebergs and ice formations at arctic circle fitted with SLAR (Sideways Looking Airborne Radar) in long pods on either side of the lower fuselage, extra fuel in a cargo hold fuel tank, provision for surveyors and radar operators. An-26RR Alternative unit designation of the 'An-26RT' ELINT(ELectronic

INTelligence) aircraft. An-26RT "Curl-B": (First use of the designation) A basic designation for a series of ELINT aircraft fitted with a wide range of electromagnetic surveillance equipment. At least one aircraft, (tactical code '152'), retrofitted with the Tarahn (Ramming Attack) ELINT suite for use in Afghanistan. An-26RT (ReTranslyator – Interpreter -Translator): (Substitute of designation) Battlefield communications relay aircraft, fitted with powerful Inzheer (Fig) radio relay system, for connecting forward units to headquarters units. An-26RTR Alternative unit designation of the 'An-26RT' ELINT aircraft. An-26S (Salon – [VIP] Lounge) : A new VIP Lounge aircraft for the Ukrainian Ministry of Defense delivered about 1997. An-26Sh (Shturmanskiy – Navigator) : Navigator trainer for the VVS, 36 built at Kiev. An-50 A proposed jet-powered variant of the An-26.

System

Alternate Designation(s): An-26; NATO: Curl

Primary Function / Type: Military Transport Aircraft

Manufacturer: Antonov

In Service: 1970-Present

Crew: 5 (pilot, co-pilot, navigator, flight engineer, radio operator)

Passengers: 38 to 40 seats in pressurized cargo bay; or 24 litters and attendants

Number of Engines: 2 x Ivchenko AI-24VT turboprop; and 1 x RU19A-300 auxiliary turbojet for takeoff assist

Day/Night Capable: Yes

All Weather Capable: Yes

Number of Hard Points: INA

Dimensions

Notes:

The Antonov An-26 (NATO reporting name: Curl) is a twin-engined turboprop civilian and military transport aircraft, designed and produced in the Soviet Union from 1969 to 1986. After successful operations of the An-24T tactical transport in austere locations, interest in a version with a retractable cargo ramp increased. Initial studies for the retractable ramp were carried out as part of the projected An-40 medium transport. When given the go-ahead for the An-26 in March 1968, the Antonov OKB adapted the ramp design of the An-40 to the An-24 fuselage, resulting in the An-26. Particular attention was given to the military mission, and the majority of early An-26 production was delivered to the VTA (voyenno-transportnaya aviatsiya). Using the majority of the An-24 airframe, with its high-set cantilevered wings, twin turboprops and stalky main undercarriage, the An-26 included military equipment, such as tip-up paratroop canvas seats, an overhead traveling hoist, bulged observation windows and parachute static line attachment cables. The An-26 made its public debut at the 27th Paris Air Show at Le Bourget where the second prototype, CCCP-26184 (c/n00202), was shown in the static aircraft park. The An-26 is also manufactured without a license agreement in China by the Xian Aircraft factory as the Y-14, later changed to be included in the Xian Y7 series. The Antonov An-26 was developed from the An-24 of 1962 for the airliner passenger / general transport role. First flight of the An-26 product was on May 21st, 1969 and production spanned from then until 1986 to which 1,403 examples were ultimately realized. A plethora of variants then emerged and operators have ranged the globe with many airframes still in active service today (2014). The original An-24 proved a design that was robust for the most harshest of conditions available across the vast Soviet empire - particularly in hard to reach areas of the frontier where few services were available. This propelled a new, modified form to gain traction, one in particular that included a powered loading ramp for ease of moving cargo pallets to and from the aircraft to awaiting bays or transport trucks. With a new ramp design finishing its testing phase, the installation commenced to produce the new working designation of An-26. As finalized, the An-26 carried over much of the same form and function of the preceding An-24 model including its high-wing design and twin engine layout. The tail unit remained a single vertical fin with low-set horizontal planes. The flight deck was held at the extreme front end of the fuselage aft of a short nose cone. The cargo hold then made up a bulk of the available internal space remaining. Initial production models were recognized simply as "An-26" and were identified in NATO nomenclature as "Curl-A". A combo passenger/cargo-hauler form then became the An-26-100. The local Chinese variant became the Xian Y-7H military transport. Other limited production variants followed including an Arctic reconnaissance platform with special mission equipment, an atmospheric air lab, an assault transport prototype, various testbeds, a fire-fighting platform, and other proposed (some unrealized) designs. Operators have gone on to range from Angola and Belarus to Yemen and Zambia. Many military operators have since abandoned the type including Afghanistan, Pakistan, Poland, and Somalia. The United States operated An-26s through the 6th Special Operations Squadron of the United States Air Force from the period of 2003 to 2007. Soviet An-26s were passed on to

the emerging states after the fall of the Soviet empire. Most current operators remain civilian in nature including fifteen operating in the Ukraine.

B737-800 (Boeing 737-800) American Cargo Transport Aircraft

Tiers:

Variants:

- **B737-100:** This is the initial production civil airliner version, with a 94-ft (28.65-m) long fuselage and a maximum passenger capacity of 115. First flight took place on April 9, 1967. Only 30 were built, all of which entered commercial service. One was later acquired by the Mexican air force as a VIP transport.
- **B737-200:** This version features a 6-ft (1.82-m) fuselage stretch and more powerful JT8D engines. There were 1,095 aircraft built.
- **B737-2X9 Surveiller:** This version is a 737-200 with 14 first-class and 88 coach passenger seats as well as a Motorola side-looking airborne modular multi-mission radar (SLAMMR) -- a variant of the AN/APS-131/135 radar -- and two associated 16-ft (5-m) long slotted waveguide antennas on the upper rear fuselage sides. At 30,000 ft (9,144 m), the detection range for small ships is 100 nm (115 mi; 185 km). Three improved Surveillers are in service in Indonesia. Modifications to the Indonesian versions include enhanced side-looking airborne modular radar; a new nose-mounted IR-detection system; as well as radar and GPS. Also installed on the improved version is the Boeing-developed data processing and display system (DPDS).
- **B737-300:** The B737-300 is the extended-range version with stretched fuselage and quieter, more fuel-efficient CFM56-3-B engines. First flight occurred on Aug. 24, 1984; it entered service on Dec. 7, 1984. More than 850 were ordered. One each has been in VIP service with the South Korean and Thai air forces.
- **B737-400:** This variant is similar to the B737-30, but with additional 10-ft (3.05-m) stretch to fuselage, 168-passenger capacity and higher rated engines. First flight occurred on Feb. 19, 1988; the first was delivered on Sept. 15, 1988. More than 170 were ordered.
- **B737-500:** The B737-500 is a short-fuselage (101 ft 9 in/31.01 m) version of the B737-300 with a passenger capacity of 132. First flight took place on June 30, 1989. More than 165 were ordered.
- **B737-600:** The B737-600 was known as the 737-500X prior to 1995. It accommodates 108-140 passengers. It is part of the Next Generation series -- the smallest model. The wings have increased chord and span lending more fuel capacity, better fuel efficiency and a longer range.

- **B737-700:** Launched in November 1993, this was the first of the Next Generation series to enter service. It accommodates 128-149 passengers. The aircraft is similar to the B737-600, though the wings have increased chord and span, lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700 Increased Gross Weight Quick Change:** This variant was chosen by the U.S. Navy to replace the C-98s in the Reserves. Its features include continuous double-slotted flaps, new leading-edge slats and a large cargo door fitted to the front fuselage. Two were ordered for delivery by the end of 2001. A commercial version has not been made available.
- **B737-800:** The B737-800 was launched on Sept. 5, 1994. It is the longest variant of this series; it has a seating accommodation of 162-189 passengers.
- **B737-900:** This is a stretched version that can accommodate 18 more passengers than the 737-800. At least 10 orders have been placed for this aircraft. The eyebrow windows located above the cockpit windscreen were removed in January 2005. Kits are available to remove the eyebrow windows from earlier 737-900s. An increased range version, the 737-900ER, was launched on July 18, 2005. Its maximum takeoff weight rose to 187,800 lb (85,185 kg); maximum zero-fuel weight, 149,500 lb (67,812 kg); maximum landing weight, 157,400 lb (71,395 kg); and range, 3,200 nautical miles (3,682 mi, 5,926 km) with 180 passengers.
- **Boeing Business Jet:** The business jet was launched on July 2, 1996, as a joint venture between Boeing and General Electric. It is a corporate version of the 737-700. While between eight and 63 passengers will be typically accommodated, the plane can be configured to seat as many as 100. There is an integrated GPS and SATCOM. The range is 6,200 nautical mile (nm) (7,139 mi, 4,437 km). Three auxiliary tanks offer an increase in range of 4,830 nm (5,562 mi, 3,456 km).

Notes:

B737-800 The B737-800 was launched on Sept. 5, 1994. It is the longest variant of this series; it has a seating accommodation of 162-189 passengers. The Boeing 737 is a narrow-body aircraft produced by Boeing Commercial Airplanes at its Renton Factory in Washington. Developed to supplement the 727 on short and thin routes, the twinjet retains the 707 fuselage cross-section and nose with two underwing turbofans. Envisioned in 1964, the initial 737-100 made its first flight in April 1967 and entered service in February 1968 with Lufthansa. The lengthened 737-200 entered service in April 1968. It evolved through four generations, offering several variants for 85 to 215 passengers. The -100/200 original variants were powered by Pratt & Whitney JT8D low-bypass engines and offered seating for 85 to 130 passengers. Launched in 1980 and introduced in 1984, the 737 Classic -300/400/500 variants were re-engined with CFM56-3 turbofans and offered 110 to 168 seats. Introduced in 1997, the 737 Next Generation (NG) -600/700/800/900 variants have updated CFM56-7s, a larger wing and an upgraded glass cockpit, and seat 108 to 215 passengers. The latest generation, the 737 MAX -7/8/9/10, powered by improved CFM LEAP high bypass turbofans and accommodating 138 to 204 people, entered service in 2017. Boeing Business Jet versions are produced since the 737NG, as well as military models. As of December 2019, 15,156 Boeing 737s have been ordered and 10,571 delivered. Actual backlog stands at 4,398 when including "additional criteria for recognizing contracted backlog with customers beyond the existence of a firm contract". Initially, its main competitor was the McDonnell Douglas DC-9, followed by its MD-80/MD-90 derivatives. It remained the highest-selling commercial jetliner until surpassed in total orders by the Airbus A320 family in October 2019. The current 737 MAX, designed to compete with the A320neo was grounded worldwide in March 2019 following two fatal crashes.

CRJ700 Canadian Regional Jet

Tiers:

Variants:

- **CRJ700:** Design work on the CRJ700 by Bombardier started in 1995 and the program was officially launched in January 1997. The CRJ700 is a stretched derivative of the CRJ200. The CRJ700 features a new wing with leading edge slats and a stretched and slightly widened fuselage, with a lowered floor. Its first flight took place on 27 May 1999. The aircraft's FAA Type Certificate designation is the CL-600-2C10. The CRJ700 first entered commercial service with Brit Air in 2001.
- **CRJ550:** On 6 February 2019, Bombardier launched the CRJ550, based on the CRJ700, with 50 seats in three classes. The launch customer, United Airlines, ordered 50 aircraft configured with 10 first class, 20 Economy Plus and 20 economy seats. The aircraft were to be operated under the United Express brand by regional partner GoJet Airlines. The CRJ550 has a lower maximum takeoff weight (MTOW) than the CRJ700, to comply with scope clauses in US pilot contracts, and a lower maximum landing weight (MLW). It received type certification in the second half of 2019. The initial 50 aircraft will be sourced from existing CRJ700s, rather than being newly constructed. On 7 August 2019, United Airlines' regional partner GoJet Airlines took delivery of the aircraft and began with a crew familiarization flight to Chicago-O'Hare International Airport (ORD).
- **CRJ900:** The CRJ900 is a stretched 76–90 seat version of the CRJ700. The first CRJ900 (C-FRJX) was modified from the prototype CRJ700 by adding longer fuselage plugs fore and aft of the wings. It was later converted into the prototype CRJ1000 by replacing the fuselage plugs with longer plugs. The CRJ900 also features strakes located at the rear of the plane. The CRJ900 competes with the Embraer 175, and is more efficient per seat-mile, according to Bombardier. Mesa Air Group was the launch customer for the CRJ900 painted in America West livery. The FAA Type Certificate designation of the CRJ900 is the CL-600-2D24.
- **CRJ705:** The CRJ700 Series 705 is based on the CRJ900, featuring a business class cabin and a reduced maximum seating capacity to allow operation with regional airlines. The Series 705 seats 75 passengers. Some regional airlines have scope clauses with their major airlines that limit the maximum passenger capacity of aircraft they operate. The Air Canada Pilots Association negotiated a scope agreement with Air Canada limiting the maximum seating capacity of any jet aircraft at Air Canada Express to 75 seats. Air Canada Jazz was the launch customer for this aircraft in 2005 with 10 Executive Class and 65 Economy Class seats, all fitted with personal audio/video-on-demand systems. The FAA Type Certificate designation of the CRJ705 is the CL-600-2D15. Jazz Aviation, a subsidiary of Chorus Aviation, operated 16 CRJ705s on behalf of Air Canada and was the only operator of this version. On 26 April 2016, Jazz Aviation announced that existing CRJ705 aircraft in operation will be converted to CRJ900 with 76 seats. As of late February 2018, all CRJ-705s have been reconfigured with 12 Executive Class and 64 Economy Class seats, which changed their FAA Type Certificate to CL-600-2D24.
- **CRJ1000:** On 19 February 2007, Bombardier launched the development of the CRJ1000, previously designated CRJ900X, as a stretched CRJ900, with up to 100 seats. The CRJ1000 completed its first production flight on 28 July 2009 in Montreal; the entry into service was planned then for the first quarter of 2010. A month after the first flight, however, a fault in the rudder controls forced the flight-test program to be grounded : the program was not resumed until

February 2010, and deliveries were projected to begin by January 2011. Brit Air and Air Nostrum were the launch customers for the CRJ1000.

System

Alternate Designation(s): CRJ700

Primary Function / Type: Transport Aircraft

Manufacturer: Bombardier Aerospace

Crew: 3–4 : 2 Flight Crew + 1–2 cabin crew

Seating Capacity: 66 to 78

Number of Engines: 2

Number of Hard Points: INA

Maximum Payload: 8,190 kg

Dimensions

Length: 32.3 m

Width (Wing Span): 23.2 m

Height: 7.6 m

Wing area: 70.6 m2

Fuselage Diameter: 2.7 m

Maximum Payload: 8,190 kg

Cabin Capacity: 15.5 m3 / 2,438 kg

Operating Empty Weight: 20,069 kg

MTOE Weight: 34,019 kg

Automotive

Engine Name: GE CF34-8C5B1

Number of Engines: 2

Engine Type: Turbofan

Engine Power: 13,790 lbf / 61.3 kN

Maximum Fuel Capacity: 8,888 kg

Maximum Range: 2,553 km

Maximum Speed: 876 km/h

Normal Cruise Speed: 829 km/h

Service Ceiling: 12,496 m

Takoff: 1,605 m

Landing: 1,536 m

Fire Control / Avionics

Navigation Radar: INA

Protection

Stealth Properties: None

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

Design work on the CRJ700 by Bombardier started in 1995 and the programe was officially launched in January 1997. The CRJ700 is a stretched derivative of the CRJ200. The CRJ700 features a new wing with leading edge slats and a stretched and slightly widened fuselage, with a lowered floor. Its first flight took place on 27 May 1999. The aircraft's FAA Type Certificate designation is the CL-600-2C10. The CRJ700 first entered commercial service with Brit Air in 2001. Seating ranges from 63 to 78. The CRJ700 comes in three versions: Series 700, Series 701, and Series 702. The Series 700 is limited to 68 passengers, the 701 to 70 passengers, and the 702 to 78 passengers. The CRJ700 also has three fuel/weight options: standard, ER, and LR. The ER version has an increase in fuel capacity as well as maximum weight, which in turn increases the range. The LR increases those values further. The executive version is marketed as the Challenger 870. The CRJ700 directly competes with the Embraer 170, which typically seats 70 passengers. The early build aircraft were equipped with two General Electric CF34-8C1 engines. However, later-build aircraft are now equipped as standard with the -8C5 model, which is essentially an uprated 8C1. Most airlines have replaced the older engines with the newer model, while a few have kept the older -8C1 in their fleet. Maximum speed is Mach 0.85 (903 km/h; 488 kn) at a maximum altitude of 12,500 m (41,000 ft). Depending upon payload, the CRJ700 has a range of up to 3,620 km (2,250 mi) with original engines, and a new variant with CF34-8C5 engines will have a range of up to 4,660 km (2,900 mi). The Bombardier CRJ700, CRJ900, and CRJ1000 (after June 2020, the Mitsubishi CRJ) are a family of regional jet airliners designed and manufactured by Canadian transportation conglomerate Bombardier; this aircraft trio has been collectively marketed by the company as the CRJ Series.[4] Their design was derived from the smaller CRJ100 and 200 airliners. During the 1990s, Bombardier initiated development on the CRJ-X, a program to produce enlarged derivatives of its popular CRJ100/200 family. Officially launched in 1997, the CRJ700's maiden flight took place on 27 May 1999; it was soon followed by the stretched CRJ900 variant. Several additional variants of the type were subsequently introduced, including the CRJ550 and the elongated CRJ1000. While production of the smaller CRJ100/200 range was discontinued during 2006, the larger CRJ Series models have continued to be produced into the 2010s. Competitors have included the Fokker 70/Fokker 100, the BAe 146 family, and the Embraer E-Jet family. In Bombardier's lineup, the CRJ Series was formerly marketed alongside a family of larger jets, the C Series (now majority-owned by Airbus and marketed as the Airbus A220) and a twin-turboprop, the Q Series (now owned by De Havilland Canada and marketed as the Dash 8). During the late 2010s, Bombardier sought to sell off several of its aircraft programs. The CRJ program was acquired by Japanese corporation Mitsubishi Heavy Industries in a deal that closed 1 June 2020.

Challenger 605 (CL-605) Canadian Transport Aircraft

Tiers:

System

Alternate Designation(s): Challenger 605
Primary Function / Type: Transport Aircraft
Manufacturer: Bombardier Aerospace (1986-present)
Crew: 2
Passengers: 12
Number of Engines: 2
Number of Hard Points: INA

Dimensions

Length: 20.90 m
Height: 6.30 m
Width (Wing Span): 19.60 m
Wing Area: 45.4 sq m
Cabin Length: 7.80 m
Cabin Width: 2.41 m
Cabin Height: 1.85 m
Cabin Volume: INA
Maximum Takeoff Weight: 21,910 kg
Maximum Landing Weight: 17,237 kg
Payload Capacity: 2,200 kg

Automotive

Engine Name: 2 x GE CF34-3B
Number of Engines: 2
Engine Type: Turbofan

Engine Power: 8,730 lb (38.8 kN) thrust

High-Speed Cruise Speed: Mach 0.82

Maximum Range: 7,470 km

Takeoff Run: 1,780 m

Landing Distance: 720 m

Protection

Stealth Properties: None

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

CL-605 Introduced in early 2006, air frame updated with larger cabin windows and a new tailcone, cockpit updated with the Collins Proline 21 avionics and "electronic flight bag" capability.

Y-12E Chinese Utility Aircraft

Tiers:

1 2 **3** 4

Variants:

- **Y-12 (I):** Twin-engined STOL utility transport aircraft, powered by two 500-shp (373-kW) Pratt & Whitney Canada PT6A-11 turboprop engines. Prototype version.
- **Y-12 (II):** Fitted with more powerful PT6A-27 engines.
- **Y-12 (III):** Planned version to be fitted with WJ-9 turboprop. Evolved to Y-12C because of IV's success when WJ-9 development was completed.
- **Y-12 (IV):** Improved version. Revised wingtips (span increased to 19.2 m (63 ft)) and increased takeoff weight. 19 passenger seats. This version is the first aircraft in the series certified by the FAA in 1995.
- **Y-12C:** Basically a (IV) version with WJ-9 turboprop, used by PLAAF for aerial survey.
- **Y-12D:** Domestically deployed military version with upgraded engines driving four-bladed propellers, used by PLA Airborne Corps for parachute training.
- **Y-12E:** Variant with 18 passenger seats. PT6A-135A engines of equal horsepower but increased torque driving four-bladed propellers. This version was certified by the FAA in 2006.
- **Y-12F:** The latest development with almost everything redesigned: wider fuselage, new wings, retractable landing gear and more powerful PT6A-65B engines. The Y-12F has higher cruise speed, longer range and can accommodate 19 passengers or 3x LD3 containers. Design started in April 2005 and the maiden flight was on 29 December 2010. CAAC type certification was received on 10 December 2015 and FAA certification on 22 February 2016. The Y-12F passed flight tests for its automatic flight control system by the FAA on 30 June 2018. It was demonstrated during the 2012 Zhuhai Airshow.
- **Y-12G:** Proposed cargo version of Y-12F.
- **Turbo Panda:** Export name for (II) version, marketed by England and Japanese companies. No real order due to airworthiness certification.
- **Twin Panda:** Originally (II) version for export. Later a modified Y-12 (IV) powered by two Pratt & Whitney Canada PT6A-34 turboprop engines and fitted with uprated undercarriage, upgraded avionics and interior. Thirty-five orders reportedly received by 2000 but production not proceeded with.

System

Alternate Designation(s): Y-12E
Primary Function / Type: Utility Aircraft
Manufacturer: Harbin Aircraft Industry Group
Crew: 2 (pilot, co-pilot)
Passengers: 19 passengers
Number of Engines: 2
Number of Hard Points: INA

Dimensions

Length: 14.86 m
Height: 5.58 m
Width (Wing Span): 19.20 m
Wing Area: 36.90 sq m
Cabin Length: 4.93 m
Cabin Width: 1.46 m
Cabin Height: 1.70 m
Volume: 12.9 cu m
Empty Weight: 3,000 kg
Payload Weight: 1,700 kg
Maximum Takeoff Weight: 5,300 kg

Automotive

Engine Name: 2 x Pratt & Whitney Canada PT6A-135
Number of Engines: 2
Engine Type: Turboprop
Engine Power: 750-shp shp each
Fuel Capacity: 1,616 liters
Maximum Cruise Speed: 328 km/h
Economy Cruise Speed: 271 km/h
Range with Maximum Payload at 146 knots: 189 km
Ceiling: 7,000 m
Climb Rate, Both Engines: 504 m/min
Climb Rate, One Engine: 101 m/min

Protection

Stealth Properties: None
Heat Signature Reduction: No
Add on Armor: No

EW Counter Measures: INA
Chaffs/Flares: INA

Notes:

The Harbin Y-12 (Chinese: □-12; pinyin: Yùn-12) is a high wing twin-engine turboprop utility aircraft built by Harbin Aircraft Industry Group (HAIG). Y-12E This development of the Y-12(IV) has 750-shp Pratt & Whitney Canada PT6A-135 turboprops with four-blade Hartzell propellers. Cruise rating is 700 shp at 1,900 rpm. This aircraft offers slightly lower specific fuel consumption and better "hot and high" performance with the single-engine ceiling rising to 4,900 meters (16,076 ft). The Y-12 started as a

development of the Harbin Y-11 airframe called Y-11T in 1980. The design featured numerous improvements including a redesigned wing with a new low drag section, a larger fuselage and bonded rather than riveted construction. It also replaced the radial piston engines with turboprops. The prototype was followed by about 30 production Y-12 (I) aircraft before a revised version was produced. This was designated the Y-12 (II), which featured more powerful engines and removal of leading edge slats, first flying on 16 August 1984 and receiving Chinese certification in December of the following year. The power plants are two Pratt & Whitney Canada PT6A-27 turboprops with Hartzell propellers. The Y-12 has a maximum takeoff weight of 5,700 kg (12,600 lb) with seating for 17 passengers and two crew. The aircraft is operated as a light commuter and transport aircraft. The latest development is the Y-12F, which is almost a new design with many improvements: new wings, new landing gear, new fuselage, with more powerful engines from Pratt & Whitney Canada and extended payload and range. The Y-12F made its maiden flight on December 29, 2010, received CAAC type certification on December 10, 2015, and FAA type certification on February 22, 2016. In 2015 Kenmore Air announced that they would begin development of floats for the Y-12 for FAA certification. The Y-12 completed the FAA evaluation flight tests for its automatic flight control system on June 30, 2018, with its performance meeting the requirements, said AVIC Harbin Aircraft Industry Company Ltd (AVIC HAFEI).

Y-9 Chinese Medium Transport Aircraft

Tiers:

Variants:

- **Y-9:** The Shaanxi Y-9 (Chinese: □-9; pinyin: Yùn-9) is a medium military transport aircraft produced by Shaanxi Aircraft Company in China. It is a stretched and upgraded development of the Shaanxi Y-8F.
- **Y-9E:** Export version
- **Y-9G (GX-11):** Electronic warfare variant
- **GX-8:** Electronic intelligence variant
- **KJ-500:** Airborne early warning and control variant. Five hour endurance, and fitted with lighter version of KJ-2000 AESA radar.

System

Notes:

The Shaanxi Y-9 (Chinese: □-9; pinyin: Yùn-9) is a medium military transport aircraft produced by Shaanxi Aircraft Company in China. It is a stretched and upgraded development of the Shaanxi Y-8F. Development of the Y-9 may have begun as early as 2002 as the Y-8X program. The program was a collaborative effort with Antonov - the designers of the An-12 that it was ultimately derived from - and was aimed at competing with the Lockheed Martin C-130J Super Hercules. By September 2005, the Y-9 designation was being used. The Y-9 received design features originally intended for the Y-8F600; the Y-8F600 was cancelled in 2008. Shaanxi had hoped to conduct the first flight as early as 2006, but it was delayed. Design changes were made in 2006,[3] with the design being frozen by January 2010. After the design freeze, it was suggested that the first flight would depend on securing a launch customer; construction had also not yet commenced. The aircraft finally flew in November 2010. The Y-9 entered People's Liberation Army Air Force (PLAAF) service in 2012, with full operating capability being announced in December 2017. The Y-9 is powered by four WoJiang WJ-6C turboprop engines. The propellers are six-bladed and made with Chinese JL-4 composites, and closely resemble the Dowty R406. The WJ-6C is replaced by the Pratt & Whitney Canada PW150B in the Y-9E export variant. The cruise speed is 300 knots (560 km/h; 350 mph) with an endurance of around 10.5 hours. The Y-9 may carry 25 tons of cargo or about 100 paratroopers.

Y-8A Chinese Helicopter Transport Aircraft

Tiers:

Variants:

- **Note:** Y-8 This was the original version. It was little different from the An-12 with a slightly modified glass nose copied from the design of the H-6 bomber. The cargo hold was not pressurized. Early production variants inherited the An-12 's tail turret, which mounts a twin 23-mm cannon, but this was later removed. Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. Y-8B This is the civilian version. First flight took place in 1990 and it was certified in 1993. Y-8C This variant has the pressurized cabin volume increased from 1,000 cu ft (28.3 cu m) to 7,500 cu ft (212.4 cu m). Landing gear and air conditioning are upgraded. The original inward-open two-piece cargo loading doors were replaced by a single-piece flat loading ramp similar to that of the C-130 . First flight occurred on Dec. 17, 1990. Shaanxi has also developed the Y-8CA radar testbed and Y-8CI export variant transport, the latter with Western avionics. Y-8D This is the export variant, fitted with Western avionics to meet the requirements for commercial flights. Onboard avionics include Collins flight director system (FDS), air data computer, VOR/ILS, comparing warning, TDR-90 air-traffic control receiver, VHF radio, Honeywell P-400 color weather radar, Litton LTN-311 Omega navigation system, Bendix/King HF communication, Sundsstrand universal flight data recorder (UFDR) and cockpit voice recorder (CVR). It is in service in Burma (Myanmar), Sri Lanka and Sudan. Y-8D II This is the latest export variant with avionics similar to those in the Y-8C. Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. Y-8F This is a livestock transport. It was certified on Jan. 26, 1994. Y-8F100 This is a commercial freighter version of the Y-8, featuring improved avionics. The aircraft features a redesigned cargo compartment, which can carry four international standard pallets of 88 in x 108 in, or eight pallets of 88 in x 54 in, or three pallets of 96 in x 125 in. The cargo compartment is also fitted with a modernized cargo handling system, allowing fast loading/unloading. Y-8F200 This is a commercial freighter version of the Y-8C, with upgraded avionics and a redesigned cargo compartment. The cargo handling system and large flat ramp enable rapid loading and unloading. Y-8F200W This variant features a fuselage that is 7 ft 3 in (2.2 m) longer than the baseline aircraft. The aircraft can take off from gravel or snow-covered runways at altitudes up to 9,840 ft (3,000 m) above sea level. It can also operate from unprepared runways. Y-8F400 This is a modernized freighter variant with upgraded avionics. It requires a three-man flight crew instead of the original five-man crew. The original glass nose was replaced by a solid nose. The cargo compartment is equipped with a 2,000-lb (1,000-kg) payload overhead cargo system, where the cargo can be suspended from an electrically powered rail. Rollers in the floor of the cargo compartment enable quick and easy handling of cargo pallets and can be removed to leave a flat surface. The compartment is fully pressurized. Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14,

2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system.The transport is powered by four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the undernose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. Y-8H This is an aerial survey and photography variant. Y-8J maritime surveillance aircraft These are Y-8C transports fitted with British Skymaster radars for maritime surveillance missions. China procured six to eight of the radars from Racal (now Thales) in 1996 deal worth US$66 million. At least two of the aircraft remain in Chinese naval service and are deployed at Dachang naval air base near Shanghai. The original glass nose on the Y-8 is replaced by a large radome to accommodate the radar antenna on the Y-8J. The rear cargo door and loading ramp are also removed. Y-8JB This is an electronic intelligence (ELINT) variant first seen in mid-2004 near Shanghai. A prototype first flew on Aug. 26, 2003, and four aircraft are in service with the Chinese navy. The aircraft has a large chin-mounted radome that could house a large ELINT antenna. Another SATCOM antenna may be installed inside a large semi-spherical dorsal fairing forward of the vertical tailfin providing real-time transmission to the ground base. Numerous smaller fairings can be seen on top of the cabin and along the upper sections of the aft fuselage, as well as at the nose tip. The loading ramp appears to have been sealed. The aircraft has been fitted with a BM/KZ800 ELINT system. Y-8X maritime patrol aircraft (MPA) This Y-8X is fitted with a Litton Canada APS-504 search radar, dual Litton LTN-72R inertial navigational system and a single LTN-211 Omega navigation set. The first example was delivered to the Chinese navy in late 1984, and the aircraft received national design certification in 1985. A small number have been in service since the mid-1980s. The aircraft is equipped with search radar, navigation system, self-defense electronic countermeasures (ECM) suite, optical/infrared cameras, sonobuoys and sonar receiver. The rear cargo door was removed and replaced by a large mission equipment window for sonobuoys racks and cameras. The rear turret was also removed and replaced by the sonar operator seat. A canoe-shaped fairing plus a couple of blade antennas appear to have been attached to the bottom of the middle and aft fuselage, suggesting the aircraft's electronic intelligence mission has been enhanced with a new synthetic aperture radar (SAR) capability. Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. KJ-200 This is an airborne early warning and control aircraft based on the Y-8F600 airframe. See separate record for more information. Y-8 tanker Flight Refueling Ltd. of the U.K. studied the possibility of converting the Y-8 into an in-flight refueling aircraft. No Y-8Ts are known to be in service. Y-8 airborne early warning aircraft This is a third Chinese airborne early warning aircraft program, following the KJ-2000 and KJ-200 (see separate records); it was revealed in 2005. Based on the Shaanxi Y-8F400 airframe, the aircraft features a conventional rotodome mounted above the fuselage. At least one prototype has been built and the program may be aimed at the export market. Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. ZDK-03 This variant, based on the Y-8F600, was designed specifically for the Pakistani air force for airborne early warning missions. It features an active electronically scanned array (AESA) radar. Islamabad has ordered four of the aircraft. The first unit was scheduled to be delivered by the end of 2010. See separate record for more information. GX-7 This is a Y-8 aircraft modified for psychological warfare missions. It is designed to broadcast messages over radio and television signals and can jam enemy communications. The GX-7 was first made public by Chinese media in July 2013. Y-8Q/Y-8GX6 This variant was first revealed in November 2011 and was reported in service in mid-2015. The Y-8Q features a redesigned wing and pressurized fuselage with composite structures; WJ-6C turboshaft

engines; and high-efficiency, six-bladed propellers. It is distinguishable from other Y-8/Y-9 variants by a large chin-mounted sea search radar; electro-optical system behind the nose wheel; and a weapons bay just ahead of the main wheels. There is also a magnetic anomaly detector (MAD) boom and domed windows in the aft fuselage for observation. A fuselage weapons bay, located ahead of the main landing gear, would likely carry torpedoes. It has been speculated that the Y-8Q has fuselage sonobuoy dispensers and hardpoints on the wings for anti-ship missiles.

System

Alternate Designation(s): Y-8A

Primary Function / Type: Helicopter Transport Aircraft

Manufacturer: Shaanxi Aircraft Corporation

Crew: 6

Passengers: 96

Number of Engines: 4

Number of Hard Points: INA

Dimensions

Length: 34.02 m

Height: 11.16 m

Width (Wing Span): 38.00 m

Wing Area: 121.86 sq m

Cargo Area, Length: 13.5 m

Cargo Area, Width: 3.0 m

Cargo Area, Height: 2.4 m

Empty Weight: 35,500 kg

Maximum Payload Weight: 20,000 kg

Maximum Takeoff Weight: 61,000 kg

Automotive

Engine Name: 4 x Wojiang-6 turboprop

Number of Engines: 4

Engine Type: Turboprop

Engine Power: 4,250 equivalent hp each

Maximum Range: 5,615 km

Cruise Range: 550 km/h

Maximum Speed: 662 km/h

Service Ceiling: 10,400 m

Rate of Climb: 600 m/min

Endurance: 10.5 hours

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. The Shaanxi Y-8 or Yunshuji-8 (Chinese: □-8) aircraft is a medium size medium range transport aircraft produced by Shaanxi Aircraft Corporation in China, based on the Soviet Antonov An-12. It has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. Although the An-12 is no longer made in Ukraine, the Chinese Y-8 continues to be upgraded and produced. An estimated 169 Y-8 aircraft had been built by 2010. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with license to assemble the aircraft locally. However, due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance. The Xi'an Aircraft Company and Xi'an Aircraft Design Institute worked to reverse engineer the An-12 for local production. Design of the aircraft was completed by February 1972. Major features of the Y-8 included a glazed nose and tail turret derived from that of the H-6 bomber, a roller-type palletized-cargo-handling device instead of the overhead conveyor, and a gaseous oxygen system as opposed to a liquid oxygen system. The original Y-8 inherited the An-12's twin 23mm cannon tail turret, but this was removed on subsequent variants. The Y-8 equipped with four turboprop engines mounted under the leading edges of non-swept wings. The wings are attached high on the fuselage, and the tricycle landing gear is equipped with low pressure tires. The earliest versions used for the transportation of freight or troops had two side-hinged, inward-opening doors, while later variants used a rearward-facing ramp to facilitate loading and unloading of the payload. Some specialized versions omit the cargo ramp entirely. The Y-8 is capable of carrying troops, dropping supplies, parachute drops, and functioning as an air ambulance. It also can be used for commercial uses as a freighter. It is capable of hauling 20 tons of cargo, approximately 96 soldiers, or about 82 paratroopers in the cargo compartment which is 13.5 metres long, 3 metres wide and 2.4 metres high. It can also carry 60 severely wounded soldiers with their stretchers, 20 slightly injured soldiers and 3 medical attendants. Many variants for specialized roles have been built, but information on them can be vague or difficult to obtain due to the secretive nature of the Chinese military. The Y-8 transport aircraft was put into trial production in the Xi'an Aircraft Factory in June 1972. By December 1974, the first Chinese-assembled Y-8 conducted its maiden flight. Following trial production of the first Y-8s, operations were transferred to the Shaanxi Aircraft Factory. The Shaanxi-produced Y-8s conducted their test flights in December 1975. After a regime of 66 test flights the Y-8 was officially certified for use by the Chinese government. By 1981, the Y-8 entered serial production. Mr. Ouyang Shaoxiu (□□□□) would eventually become the general designer, designing many variants of Y-8, including KJ-200. In the early 1980s, Chinese officials saw US Army recruiting advertisements featuring parachute extraction of an Army jeep along with troops. The PLA was told to develop this kind of capability. But there were two design problems. One, Y-8 wings have very sharp leading edges, so one wing tends to stall before the other, causing the aircraft to roll inverted as it stalls. The second design flaw as that the cargo deck of the Y-8 had a 10 degree downward slope starting at the landing gear. When the PLA Air Force started to test parachute extraction, these two design flaws caused a near disaster. The aircraft was flying too fast, and when the parachute started to extract cargo from the hold, the cargo rolled on the deck until it got to the 10 degree downward slope, and there it became airborne while still inside the aircraft. The cargo hit the top of the cargo door on the way out, making it clear that the Y-8 could not do parachute cargo extraction. In 1986, two engineers from Beijing's Ministry of Aviation visited Lockheed. They could not speak very much English, and the Lockheed-Georgia sales person who met them could not speak Chinese. So for half a day, they did a point-and-grunt tour until they were lucky enough to find a Lockheed employee who could speak Chinese. The Chinese wanted to purchase Lockheed wind tunnel testing on the Y-8 in order to address the stall problem. As a result of these wind tunnel tests, conducted in 1986, Lockheed was given a contract to do a flight test series on the Y-8. Lockheed was told that flight test data was not provided by the Soviets when they helped China build the Y-8 factory. The flight test series was flown by Lockheed test pilot Hank Dees. Hank had flown the test flight series for the Lockheed L-1011 and later

for China's Y-12 in Harbin. During this flight test series, Hank Dees flew the aircraft to stall speed and taught Chinese pilots how to anticipate a stall in order to prevent letting the aircraft go inverted. As a result of this test flight series, Chinese pilots started to use the 45 degree flap position. Lockheed's motive for doing flight tests was to demonstrate that China would be better off buying the C-130 rather than trying to improve the Y-8. China did buy C-130's, but the flight test series actually demonstrated that the Y-8 was a more capable aircraft than previously believed. In the late 1980s, Lockheed Martin, the American manufacturer of the C-130 Hercules, helped China to develop a pressurized cabin for the passenger version of Y-8, resulting in two versions: the first had half of the cabin pressurized and later, the second version in which the complete cabin was pressurized. In 2001 and 2002, new consulting arrangements between Antonov and Shaanxi resulted in modernized redesigns to the Y-8's wing and fuselage. As a consequence the redesign allows the Y-8's fuel capacity to be increased by 50 percent.

Y-12C North Korean Utility Aircraft

Tiers:

Variants:

- **Y-12 (I):** Twin-engined STOL utility transport aircraft, powered by two 500-shp (373-kW) Pratt & Whitney Canada PT6A-11 turboprop engines. Prototype version.
- **Y-12 (II):** Fitted with more powerful PT6A-27 engines.
- **Y-12 (III):** Planned version to be fitted with WJ-9 turboprop. Evolved to Y-12C because of IV's success when WJ-9 development was completed.
- **Y-12 (IV):** Improved version. Revised wingtips (span increased to 19.2 m (63 ft)) and increased takeoff weight. 19 passenger seats. This version is the first aircraft in the series certified by the FAA in 1995.
- **Y-12C:** Basically a (IV) version with WJ-9 turboprop, used by PLAAF for aerial survey.
- **Y-12D:** Domestically deployed military version with upgraded engines driving four-bladed propellers, used by PLA Airborne Corps for parachute training.
- **Y-12E:** Variant with 18 passenger seats. PT6A-135A engines of equal horsepower but increased torque driving four-bladed propellers. This version was certified by the FAA in 2006.
- **Y-12F:** The latest development with almost everything redesigned: wider fuselage, new wings, retractable landing gear and more powerful PT6A-65B engines. The Y-12F has higher cruise speed, longer range and can accommodate 19 passengers or 3x LD3 containers. Design started in April 2005 and the maiden flight was on 29 December 2010. CAAC type certification was received on 10 December 2015 and FAA certification on 22 February 2016. The Y-12F passed flight tests for its automatic flight control system by the FAA on 30 June 2018. It was demonstrated during the 2012 Zhuhai Airshow.
- **Y-12G:** Proposed cargo version of Y-12F.
- **Turbo Panda:** Export name for (II) version, marketed by England and Japanese companies. No real order due to airworthiness certification.
- **Twin Panda:** Originally (II) version for export. Later a modified Y-12 (IV) powered by two Pratt & Whitney Canada PT6A-34 turboprop engines and fitted with uprated undercarriage, upgraded avionics and interior. Thirty-five orders reportedly received by 2000 but production not proceeded with.

Notes:

The Harbin Y-12 (Chinese: □-12; pinyin: Yùn-12) is a high wing twin-engine turboprop utility aircraft built by Harbin Aircraft Industry Group (HAIG). Y-12C This military variant is primarily in service with the People's Liberation Army and PLA Air Force. It is powered by a WJ-9 turboprop engine). The Y-12 started as a development of the Harbin Y-11 airframe called Y-11T in 1980. The design featured numerous improvements including a redesigned wing with a new low drag section, a larger fuselage and

bonded rather than riveted construction. It also replaced the radial piston engines with turboprops. The prototype was followed by about 30 production Y-12 (I) aircraft before a revised version was produced. This was designated the Y-12 (II), which featured more powerful engines and removal of leading edge slats, first flying on 16 August 1984 and receiving Chinese certification in December of the following year. The power plants are two Pratt & Whitney Canada PT6A-27 turboprops with Hartzell propellers. The Y-12 has a maximum takeoff weight of 5,700 kg (12,600 lb) with seating for 17 passengers and two crew. The aircraft is operated as a light commuter and transport aircraft. The latest development is the Y-12F, which is almost a new design with many improvements: new wings, new landing gear, new fuselage, with more powerful engines from Pratt & Whitney Canada and extended payload and range. The Y-12F made its maiden flight on December 29, 2010, received CAAC type certification on December 10, 2015, and FAA type certification on February 22, 2016. In 2015 Kenmore Air announced that they would begin development of floats for the Y-12 for FAA certification. The Y-12 completed the FAA evaluation flight tests for its automatic flight control system on June 30, 2018, with its performance meeting the requirements, said AVIC Harbin Aircraft Industry Company Ltd (AVIC HAFEI).

Tu-154-2 (Careless) Chinese Jet Airliner

Tiers:

Variants:

- **Tu-154:** Tu-154 production started in 1970, and the first passenger flight was performed on 9 February 1972. Powered by Kuznetsov NK-8-2 turbofans, it carried 164 passengers. About 42 were built.
- **Tu-154A:** The first upgraded version of the original Tu-154, the A model, in production since 1974, added center-section fuel tanks and more emergency exits, while engines were upgraded to higher-thrust Kuznetsov NK-8-2U. Other upgrades include automatic flaps/slats and stabilizer controls and modified avionics. Max. takeoff weight – 94,000 kg (207,235 lb). There were 15 different interior layouts for the different domestic and international customers, seating between 144 and 152 passengers. To discern the A model from the base model note the spike at the junction of the fin and tail. This is a fat bullet on the A model, and a slender spike on the base model.
- **Tu-154B:** As the original Tu-154 and Tu-154A suffered wing cracks after a few years in service, a version with a new, stronger wing, designated Tu-154B, went into production in 1975. It also had an additional fuselage fuel tank, additional emergency exits in the tail. Also, the maximum takeoff weight increased to 98,000 kg (216,053 lb). Important to Aeroflot was the increased passenger capacity, hence lower operating costs. With the NK-8-2U engines the only way to improve the economics of the airplane was to spread costs across more seats. The autopilot was certified for ICAO Category II automatic approaches. Most previously built Tu-154 and Tu-154A were also modified into this variant, with the replacement of the wing. Maximum takeoff weight increased to 96,000 kg (211,644 lb). 111 were built.
- **Tu-154B-1:** Aeroflot wanted this version for increased revenue on domestic routes. It carried 160 passengers. This version also had some minor modifications to the fuel system, avionics, air conditioning, and landing gear. 64 were built from 1977 to 1978.
- **Tu-154B-2:** A minor modernization of Tu-154B-1. The airplane was designed to be converted from the 160 passenger version to a 180 passenger version by removing the galley. The procedure took about 2 1/2 hours. Some of the earlier Tu-154Bs were modified to that standard. Maximum takeoff weight increased to 98,000 kg (216,053 lb), later to 100,000 kg (220,462 lb). Some 311 aircraft were built, including VIP versions. A few remain in service.
- **Tu-154S:** The Tu-154S is an all-cargo or freighter version of the Tu-154B, using a strengthened floor, and adding a forward cargo door on the port side of the fuselage. The aircraft could carry nine Soviet PAV-3 pallets. Maximum payload – 20,000 kg (44,092 lb). There were plans for 20 aircraft, but only nine were converted, two from Tu-154 models and seven from Tu-154B models. Trials were held in the early 1980s and the aircraft was authorized regular operations in 1984. By 1997 all had been retired.
- **Tu-154M:** The Tu-154M and Tu-154M Lux are the most highly upgraded versions, which first flew in 1982 and entered mass production in 1984. It uses more fuel-efficient Soloviev D-30KU-154 turbofans. Together with significant aerodynamic refinement, this led to much lower fuel consumption hence longer range, as well as lower operating costs. The aircraft has new double-slotted (instead of triple-slotted) flaps, with an extra 36-degree position (in addition to existing 15, 28 and 45-degree positions on older versions), which allows reduction of noise on approach. It also has a relocated auxiliary power unit and numerous other improvements. Maximum takeoff weight increased first to 100,000 kg (220,462 lb), then to 102,000 kg (224,872 lb). Some aircraft are certified to 104,000 kg (229,281 lb). About 320 were manufactured. Mass production ended in 2006, though limited manufacturing continued as of January 2009. No new airframes have been built since the early 1990s, and production since then involved assembling aircraft from components on hand. Chinese Tu-154MD electronic intelligence aircraft carry a large-size synthetic aperture radar (SAR) under their mainframe.
- **Tu-154M-LK-1:** Cosmonaut trainer. This was a salon VIP aircraft modified to train cosmonauts to fly the Buran reusable spacecraft, the Soviet equivalent of the US Space Shuttle. The Tu-154 was used because the Buran required a steep descent, which the Tu-154 was capable of replicating. The cabin featured trainee workstations, one of which was identical to the Buran's flightdeck. The forward baggage compartment was converted into a camera bay, as the aircraft was used to train cosmonauts in observation and photographic techniques.

- **Tu-154M-ON monitoring aircraft:** Germany modified one of the Tu-154s it inherited from the former East German Air Force into an observation airplane. This aircraft was involved with the Open Skies inspection flights. It was converted at the Elbe Aircraft Plant (Elbe Flugzeugwerke) in Dresden, and flew in 1996. After 24 monitoring missions, it was lost in a mid-air collision in 1997. The Russians also converted a Tu-154M to serve as an Open Skies monitoring aircraft. They used the Tu-154M-LK-1, and converted it to a Tu-154M-ON. When not flying over North America, it is used to ferry cosmonauts. China is believed to have converted one Tu-154 to an electronic countermeasures aircraft.
- **Tu-154M-100:** Design of this variant started in 1994, but the first aircraft were not delivered until 1998. It is an upgraded version with Western avionics, including the Flight Management Computer, GPS, EGPWS, TCAS, and other modern systems. The airplane could carry up to 157 passengers. The cabin featured an automatic oxygen system and larger overhead bins. Three were produced, as payment of debts owed by Russia to Slovakia. Three aircraft were delivered in 1998 to Slovak Airlines, and sold back to Russia in 2003.
- **Tu-155:** A Tu-154 converted into a testbed for alternative fuels. It first flew in 1988 and was used until the fall of the Soviet Union, when it was placed in storage.
- **Tu-164:** Initial designation of the Tu-154M.
- **Tu-174:** Proposed stretched version of Tu-154.
- **Tu-194:** Proposed shortened version of Tu-154.

Notes:

Tu-154B-2 A minor modernization of Tu-154B-1. The airplane was designed to be converted from the 160 passenger version to a 180 passenger version by removing the galley.[13] The procedure took about 2 1/2 hours. Some of the earlier Tu-154Bs were modified to that standard. Maximum takeoff weight increased to 98,000 kg (216,053 lb), later to 100,000 kg (220,462 lb). Some 311 aircraft were built, including VIP versions. A few remain in service. The Tupolev Tu-154 (Russian: Туполев Ту-154; NATO reporting name: "Careless") is a three-engine medium-range narrow-body airliner designed in the mid-1960s and manufactured by Tupolev. A workhorse of Soviet and (subsequently) Russian airlines for several decades, it carried half of all passengers flown by Aeroflot and its subsidiaries (137.5 million/year or 243.8 billion passenger km in 1990), remaining the standard domestic-route airliner of Russia and former Soviet states until the mid-2000s. It was exported to 17 non-Russian airlines and used as a head-of-state transport by the air forces of several countries. With a cruising speed of 850 kilometres per hour (530 mph) the Tu-154 is one of the fastest civilian aircraft in use and has a range of 5,280 kilometres (3,280 mi). Capable of operating from unpaved and gravel airfields with only basic facilities, it was widely used in the extreme Arctic conditions of Russia's northern/eastern regions where other airliners were unable to operate. Originally designed for a 45,000-hour service life (18,000 cycles) but capable of 80,000 hours with upgrades, it was expected to continue in service until 2016, although noise regulations have restricted flights to western Europe and other regions. Since 1968 there have been 39 fatal incidents involving the Tu-154, most of which were caused either by factors unrelated to the aircraft, incorrect maintenance, or by its extensive use in demanding conditions. Few of the Tu-154 accidents appear to have involved technical failure. The Tu-154 is powered by three rear-mounted low-bypass turbofan engines arranged similarly to those of the Boeing 727, but it is slightly larger than its American counterpart. Both the 727 and the Tu-154 use an S-duct for the middle (Number 2) engine. The original model was equipped with Kuznetsov NK-8-2 engines, which were replaced with Soloviev D-30KU-154 in the Tu-154M. All Tu-154 aircraft models have a relatively high thrust-to-weight-ratio which give excellent performance, at the expense of lower fuel efficiency. This became an important factor in later decades as fuel costs grew. The cockpit is fitted with conventional dual yoke control columns. Flight control surfaces are hydraulically operated. The cabin of the Tu-154, although of the same six-abreast seating layout, gives the impression of an oval interior, with a lower ceiling than is common on Boeing and Airbus airliners. The passenger cabin accommodates 128 passengers in a two-class layout and 164 passengers in single-class layout, and up to 180 passengers in high-density layout. The layout can be modified to what is called a winter version where some seats are taken out and a wardrobe is installed for passenger coats. The passenger doors are smaller than on its Boeing and Airbus counterparts. Luggage space in the overhead compartments is very limited. Like the Tupolev Tu-134, the Tu-154 has a wing swept back at 35° at the quarter-chord line. The British Hawker Siddeley Trident has the same sweepback angle, while the Boeing 727 has a slightly smaller sweepback angle of 32°. The wing also has anhedral (downward sweep) which is a

distinguishing feature of Russian low-wing airliners designed during this era. Most Western low-wing airliners such as the contemporary Boeing 727 have dihedral (upward sweep). The anhedral means that Russian airliners have poor lateral stability compared to their Western counterparts, but also are more resistant to Dutch roll tendencies. Considerably heavier than its predecessor Soviet-built airliner the Ilyushin Il-18, the Tu-154 was equipped with an oversized landing gear to reduce ground load, enabling it to operate from the same runways. The aircraft has two six-wheel main bogies fitted with large low-pressure tires that retract into pods extending from the trailing edges of the wings (a common Tupolev feature), plus a two-wheel nose gear unit. Soft oleo struts (shock absorbers) provide a much smoother ride on bumpy airfields than most airliners, which very rarely operate on such poor surfaces. The original requirement was to have a three-person flight crew – captain, first officer and flight engineer – as opposed to a four- or five-person crew, as on other Soviet airliners. It became evident that a fourth crew member, a navigator, was still needed, and a seat was added on production aircraft, although their workstation was compromised due to the limitations of the original design. Navigators are no longer trained and this profession is becoming obsolete with the retirement of the oldest Soviet-era planes. The latest variant (Tu-154M-100, introduced 1998) includes an NVU-B3 Doppler navigation system, a triple autopilot, which provides an automatic ILS approach according to ICAO category II weather minima, an autothrottle, a Doppler drift and speed measure system (DISS), and a "Kurs-MP" radio navigation suite. A stability and control augmentation system improves handling characteristics during manual flight. Modern upgrades normally include modernised TCAS, GPS, and other systems (mostly American-made or EU-made). Early versions of the Tu-154 cannot be modified to meet the current Stage III noise regulations and are no longer allowed to fly into airspace where such regulations are enforced, such as the European Union. However, the Tu-154M's D-30 engines can be fitted with hush kits, allowing them to meet noise regulations.

Y-8F600 Chinese Transport Aircraft

Tiers:

Variants:

- **Note:** Y-8 This was the original version. It was little different from the An-12 with a slightly modified glass nose copied from the design of the H-6 bomber. The cargo hold was not pressurized. Early production variants inherited the An-12 's tail turret, which mounts a twin 23-mm cannon, but this was later removed. Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. Y-8B This is the civilian version. First flight took place in 1990 and it was certified in 1993. Y-8C This variant has the pressurized cabin volume increased from 1,000 cu ft (28.3 cu m) to 7,500 cu ft (212.4 cu m). Landing gear and air conditioning are upgraded. The original inward-open two-piece cargo loading doors were replaced by a single-piece flat loading ramp similar to that of the C-130 . First flight occurred on Dec. 17, 1990. Shaanxi has also developed the Y-8CA radar testbed and Y-8CI export variant transport, the latter with Western avionics. Y-8D This is the export variant, fitted with Western avionics to meet the requirements for commercial flights. Onboard avionics include Collins flight director system (FDS), air data computer, VOR/ILS, comparing warning, TDR-90 air-traffic control receiver, VHF radio, Honeywell P-400 color weather radar, Litton LTN-311 Omega navigation system, Bendix/King HF communication, Sundsstrand universal flight data recorder (UFDR) and cockpit voice recorder (CVR). It is in service in Burma (Myanmar), Sri Lanka and Sudan. Y-8D II This is the latest export variant with avionics similar to those in the Y-8C. Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. Y-8F This is a livestock transport. It was certified on Jan. 26, 1994. Y-8F100 This is a commercial freighter version of the Y-8, featuring improved avionics. The aircraft features a redesigned cargo compartment, which can carry four international standard pallets of 88 in x 108 in, or eight pallets of 88 in x 54 in, or three pallets of 96 in x 125 in. The cargo compartment is also fitted with a modernized cargo handling system, allowing fast loading/unloading. Y-8F200 This is a commercial freighter version of the Y-8C, with upgraded avionics and a redesigned cargo compartment. The cargo handling system and large flat ramp enable rapid loading and unloading. Y-8F200W This variant features a fuselage that is 7 ft 3 in (2.2 m) longer than the baseline aircraft. The aircraft can take off from gravel or snow-covered runways at altitudes up to 9,840 ft (3,000 m) above sea level. It can also operate from unprepared runways. Y-8F400 This is a modernized freighter variant with upgraded avionics. It requires a three-man flight crew instead of the original five-man crew. The original glass nose was replaced by a solid nose. The cargo compartment is equipped with a 2,000-lb (1,000-kg) payload overhead cargo system, where the cargo can be suspended from an electrically powered rail. Rollers in the floor of the cargo compartment enable quick and easy handling of cargo pallets and can be removed to leave a flat surface. The compartment is fully pressurized. Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14, 2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system.The transport is powered by four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport

noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the undernose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. Y-8H This is an aerial survey and photography variant. Y-8J maritime surveillance aircraft These are Y-8C transports fitted with British Skymaster radars for maritime surveillance missions. China procured six to eight of the radars from Racal (now Thales) in 1996 deal worth US$66 million. At least two of the aircraft remain in Chinese naval service and are deployed at Dachang naval air base near Shanghai. The original glass nose on the Y-8 is replaced by a large radome to accommodate the radar antenna on the Y-8J. The rear cargo door and loading ramp are also removed. Y-8JB This is an electronic intelligence (ELINT) variant first seen in mid-2004 near Shanghai. A prototype first flew on Aug. 26, 2003, and four aircraft are in service with the Chinese navy. The aircraft has a large chin-mounted radome that could house a large ELINT antenna. Another SATCOM antenna may be installed inside a large semi-spherical dorsal fairing forward of the vertical tailfin providing real-time transmission to the ground base. Numerous smaller fairings can be seen on top of the cabin and along the upper sections of the aft fuselage, as well as at the nose tip. The loading ramp appears to have been sealed. The aircraft has been fitted with a BM/KZ800 ELINT system. Y-8X maritime patrol aircraft (MPA) This Y-8X is fitted with a Litton Canada APS-504 search radar, dual Litton LTN-72R inertial navigational system and a single LTN-211 Omega navigation set. The first example was delivered to the Chinese navy in late 1984, and the aircraft received national design certification in 1985. A small number have been in service since the mid-1980s. The aircraft is equipped with search radar, navigation system, self-defense electronic countermeasures (ECM) suite, optical/infrared cameras, sonobuoys and sonar receiver. The rear cargo door was removed and replaced by a large mission equipment window for sonobuoys racks and cameras. The rear turret was also removed and replaced by the sonar operator seat. A canoe-shaped fairing plus a couple of blade antennas appear to have been attached to the bottom of the middle and aft fuselage, suggesting the aircraft's electronic intelligence mission has been enhanced with a new synthetic aperture radar (SAR) capability. Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. KJ-200 This is an airborne early warning and control aircraft based on the Y-8F600 airframe. See separate record for more information. Y-8 tanker Flight Refueling Ltd. of the U.K. studied the possibility of converting the Y-8 into an in-flight refueling aircraft. No Y-8Ts are known to be in service. Y-8 airborne early warning aircraft This is a third Chinese airborne early warning aircraft program, following the KJ-2000 and KJ-200 (see separate records); it was revealed in 2005. Based on the Shaanxi Y-8F400 airframe, the aircraft features a conventional rotodome mounted above the fuselage. At least one prototype has been built and the program may be aimed at the export market. Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. ZDK-03 This variant, based on the Y-8F600, was designed specifically for the Pakistani air force for airborne early warning missions. It features an active electronically scanned array (AESA) radar. Islamabad has ordered four of the aircraft. The first unit was scheduled to be delivered by the end of 2010. See separate record for more information. GX-7 This is a Y-8 aircraft modified for psychological warfare missions. It is designed to broadcast messages over radio and television signals and can jam enemy communications. The GX-7 was first made public by Chinese media in July 2013. Y-8Q/Y-8GX6 This variant was first revealed in November 2011 and was reported in service in mid-2015. The Y-8Q features a redesigned wing and pressurized fuselage with composite structures; WJ-6C turboshaft engines; and high-efficiency, six-bladed propellers. It is distinguishable from other Y-8/Y-9 variants by a large chin-mounted sea search radar; electro-optical system behind the nose wheel; and a weapons bay just ahead of the main wheels. There is also a magnetic anomaly detector (MAD) boom and domed windows in the aft fuselage for observation. A fuselage weapons bay, located ahead of the main landing gear, would likely carry torpedoes. It has been speculated that the Y-8Q has fuselage sonobuoy dispensers and hardpoints on the wings for anti-ship missiles.

Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14, 2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system. The transport is powered by four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. The Shaanxi Y-8 or Yunshuji-8 (Chinese: □-8) aircraft is a medium size medium range transport aircraft produced by Shaanxi Aircraft Corporation in China, based on the Soviet Antonov An-12. It has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. Although the An-12 is no longer made in Ukraine, the Chinese Y-8 continues to be upgraded and produced. An estimated 169 Y-8 aircraft had been built by 2010. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with license to assemble the aircraft locally. However, due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance. The Xi'an Aircraft Company and Xi'an Aircraft Design Institute worked to reverse engineer the An-12 for local production. Design of the aircraft was completed by February 1972. Major features of the Y-8 included a glazed nose and tail turret derived from that of the H-6 bomber, a roller-type palletized-cargo-handling device instead of the overhead conveyor, and a gaseous oxygen system as opposed to a liquid oxygen system. The original Y-8 inherited the An-12's twin 23mm cannon tail turret, but this was removed on subsequent variants. The Y-8 equipped with four turboprop engines mounted under the leading edges of non-swept wings. The wings are attached high on the fuselage, and the tricycle landing gear is equipped with low pressure tires. The earliest versions used for the transportation of freight or troops had two side-hinged, inward-opening doors, while later variants used a rearward-facing ramp to facilitate loading and unloading of the payload. Some specialized versions omit the cargo ramp entirely. The Y-8 is capable of carrying troops, dropping supplies, parachute drops, and functioning as an air ambulance. It also can be used for commercial uses as a freighter. It is capable of hauling 20 tons of cargo, approximately 96 soldiers, or about 82 paratroopers in the cargo compartment which is 13.5 metres long, 3 metres wide and 2.4 metres high. It can also carry 60 severely wounded soldiers with their stretchers, 20 slightly injured soldiers and 3 medical attendants. Many variants for specialized roles have been built, but information on them can be vague or difficult to obtain due to the secretive nature of the Chinese military. The Y-8 transport aircraft was put into trial production in the Xi'an Aircraft Factory in June 1972. By December 1974, the first Chinese-assembled Y-8 conducted its maiden flight. Following trial production of the first Y-8s, operations were transferred to the Shaanxi Aircraft Factory. The Shaanxi-produced Y-8s conducted their test flights in December 1975. After a regime of 66 test flights the Y-8 was officially certified for use by the Chinese government. By 1981, the Y-8 entered serial production.[2] Mr. Ouyang Shaoxiu (□□□□) would eventually become the general designer, designing many variants of Y-8, including KJ-2000. In the early 1980s, Chinese officials saw US Army recruiting advertisements featuring parachute extraction of an Army jeep along with troops. The PLA was told to develop this kind of capability. But there were two design problems. One, Y-8 wings have very sharp leading edges, so one wing tends to stall before the other, causing the aircraft to roll inverted as it stalls. The second design flaw as that the cargo deck of the Y-8 had a 10 degree downward slope starting at the landing gear. When the PLA Air Force started to test parachute extraction, these two design flaws caused a near disaster. The aircraft was flying too fast, and when the parachute started to extract cargo from the hold, the cargo rolled on the deck until it got to the 10 degree downward slope, and there it became airborne while still inside the aircraft. The cargo hit the top of the cargo door on the way out, making it clear that the Y-8 could not do parachute cargo extraction. In 1986, two engineers from Beijing's Ministry of Aviation visited Lockheed. They could not speak very much English, and the Lockheed-Georgia sales person who met them could not speak Chinese. So for half a day, they did a point-and-grunt tour until they were lucky enough to find a Lockheed employee who could speak Chinese. The Chinese wanted to purchase Lockheed wind tunnel testing on the Y-8 in order to address the stall problem. As a result of these wind tunnel tests, conducted in 1986, Lockheed was given a contract to do a flight test series on the Y-8. Lockheed was told that flight test data was not provided by the Soviets when they helped China build the Y-8

factory. The flight test series was flown by Lockheed test pilot Hank Dees. Hank had flown the test flight series for the Lockheed L-1011 and later for China's Y-12 in Harbin. During this flight test series, Hank Dees flew the aircraft to stall speed and taught Chinese pilots how to anticipate a stall in order to prevent letting the aircraft go inverted. As a result of this test flight series, Chinese pilots started to use the 45 degree flap position. Lockheed's motive for doing flight tests was to demonstrate that China would be better off buying the C-130 rather than trying to improve the Y-8. China did buy C-130's, but the flight test series actually demonstrated that the Y-8 was a more capable aircraft than previously believed. In the late 1980s, Lockheed Martin, the American manufacturer of the C-130 Hercules, helped China to develop a pressurized cabin for the passenger version of Y-8, resulting in two versions: the first had half of the cabin pressurized and later, the second version in which the complete cabin was pressurized. In 2001 and 2002, new consulting arrangements between Antonov and Shaanxi resulted in modernized redesigns to the Y-8's wing and fuselage. As a consequence the redesign allows the Y-8's fuel capacity to be increased by 50 percent.

Tu-204 Russian Jet Airliner

Tiers:

Variants:

- **Tu-204/204C:** The Tu-204 is the basic passenger airline model, and the Tu-204C is the basic freight or cargo model. The most-used models are the -100C and the -120C.
- **Tu-204-100/200:** Certified in January 1995, this initial version is powered by Soloviev (now Aviadvigatel) PS90 turbofans with 157 kN (35,300 lbf) of thrust, and uses Russian avionics in addition to its Russian engines. The Tu-204-200 is a heavier version with extra fuel for more range. Only one was built by Aviastar-SP in Ulyanovsk but has not yet been delivered (RA-64036). Now this version is only produced by KAPO in Kazan, marketed under the designation Tu-214. The Tu-204-100C and Tu-204-200C are cargo versions of the −100 and −200 respectively, fitted with a forward main deck freight door. Currently, the Tu-204-100/200 is offered with the option of an up-rated Aviadvigatel PS90A2 turbofan, which promises 40% more service between overhauls.
- **Tu-204-120/220/120C/220C:** To broaden product appeal, the Tu-204-120/220 offers non-Russian avionics and engines. It is powered by two Rolls-Royce RB211-535 engines, each with thrust of 192 kN (43,100 lbf). Egypt's Cairo Aviation became the debut operator in November 1998 when it took delivery of a Tu-204-120 and its cargo version the Tu-204-120C. The Tu-204-220 and Tu-204-220C cargo version, are a higher gross weight variants of the basic Tu-204-120.
- **Tu-204-300:** A shortened, longer-range and more efficient derivative of the Tu-204, the Tu-204-300 is also known as Tu-234. About six meters (20 ft) shorter than the basic Tu-204, this variant is available in two versions: the longer-ranged, heavier version, powered by Aviadvigatel PS 90-A2 turbofans, has a maximum take-off weight of 107.5 metric tons and range (with 166 passengers) increased to 9,300 kilometres (5,000 nmi); and the lighter, shorter-ranged version, with a maximum take-off weight of 89 metric tons and range of 3,500 kilometres (1,900 nmi) with 166 passengers. The Russian airline Vladivostok Air is the debut customer. This airline's aircraft are in a two-class seating configuration, with a 142-passenger capacity. Average numbers of flight hours during each 24-hour period is 9.35 hours, for year 2009. It is also operated by Air Koryo which currently operates one Tu-204-100B and one Tu-204-300. The Tu-204s operate on the Pyongyang-Beijing, Bangkok, Vladivostok, Shenyang and Kuala Lumpur routes.
- **Tu-204-500:** This is a version of the Tu-204-300 optimized for shorter routes, featuring smaller wings and an increased cruising speed (to Mach 0.84), which makes it a competitor to the Next Generation Boeing 737. It is ETOPS rated, and fitted with a Honeywell 331-200ER APU.
- **Tu-206:** This variant is a company-funded testbed for alternative fuels, flying on liquefied natural gas.[
- **Tu-214:** The Tu-214 is also a variation of the Tu-204 first flown on 21 March 1996. It is technically a Tu-204-200, one of the differences being that it is built by a different factory. Planes designated Tu-204 are produced in Ulyanovsk by Aviastar-SP; Tu-214 in Kazan by the Kazan Aircraft Production Association (KAPO).[17][18] Both factories are independent from the Tupolev design bureau and have some control over the design of the variant they produce.
- **Tu-214ON:** The Tu-214ON is an observation version of the Tu-204-200, equipped for Treaty on Open Skies missions and built by Kazan Aircraft Production Association. Vega Radio Engineering Corporation was contracted for the development of airborne surveillance system, ground-based complex and other mission equipment for the aircraft. It is equipped with one A-84ON panoramic camera, one AK-111 topographic camera and two perspective AK-112 digital aerial cameras to capture high-resolution aerial photography. Two video cameras, a Raduga infrared thermographic camera and Ronsard Side looking airborne radar are also fitted
- **Tu-214PU:** Airborne command post version. Two operated for the Russian President.
- **Tu-214SR:** Communications relay version. 5 operated by Special Flight Unit Rossiya for the Russian government.
- **Tu-214SUS:** Communications relay version for the Russian President. Two delivered.
- **Tu-214R:** Special-mission versions of the Tu-214 commercial transport aircraft, developed under the codename 'Project 141', to replace the Il-20 Coot ELINT platform. The aircraft are configured to carry the MRC-411 multi-intelligence payload, to include electronic intelligence (ELINT) sensors, side-looking Synthetic Aperture Radar (SAR) and other

Signals Intelligence (SIGINT). In addition, the aircraft will carry multi-spectral electro-optical systems. The aircraft has conducted test flights over the Sea of Japan but the programme experienced problems in January 2013. (Jane's Defence Weekly 16 January 2013)

- **Tu-214PU-SBUS:** Special-purpose aircraft-control point equipped with a special onboard communication unit SBUS-214 intended for the Ministry of Defence of Russia. The aircraft is built with Russian-made components only, meeting the requirements of the state customers and has a range of at least 7,200 km (4,500 mi). The main purpose of the aircraft is to provide additional communication capabilities to the user. The Russian MoD placed an order for two aircraft in November 2015. The first aircraft was delivered in March 2018 while the second in June the same year.
- **Tu-214LMK:** A flying laboratory based on a serial Tu-214 passenger plane (registration number RA-64507) equipped with a multifunctional flight complex LMK-214. The aircraft is intended for an in-flight testing of a new radar complex and other on-board aviation equipment for the modernized Tupolev Tu-160M2 and the future Tupolev PAK DA strategic bombers. It began flight testing on 29 December 2018.
- **Tu-204SM:** The Tu-204SM, alternatively Tu-204CM, a medium-range airliner, is an upgraded version of the Tu-204-100/300. While the Tu-204SM will retain key design and aerodynamic features of the Tu-204-100/100E/100V series, there are numerous upgrades, largely aimed at meeting the current and near-future Russian and international standards, including those of ICAO and Eurocontrol. The new cockpit features allow the Tu-204SM to be flown by a two-pilot crew (as compared with the three-pilot arrangement of the original Tu-204 series). These features include a new computer (VSUPT-85-2040), a new flight management system (ASO-204/FMS), wide LCD displays (KSEIS-204E), head-up displays (HUD), and an automated board system maintenance and diagnostic system. The electronic flight bag concept will be implemented and all controls and displays will be in English.
- **Tu-204SM orders:** Red Wings Airlines was the first airline to operate the Tu-204SM. Ilyushin Finance Co. (IFC) said it would complete negotiations with Red Wings for 44 Tu-204SM aircraft in February, to sign a firm order in March 2011. Red Wings already operates a fleet of Tu-204-100 and Tu-204-100V jetliners, to which it added one airframe in 2010. Russia's largest aircraft lessor, Ilyushin Finance, has previously placed Tu-204-100 aircraft with Cubana, Air Koryo and Red Wings, and Tu-204-300s with Vladivostok Avia and Air Koryo. Additionally, IFC leases three Tu-214s (Tu-204-200s) to Transaero. Faced with low production rates for the Tu-204 models, Tupolev asked component providers to lower their prices in order to cut the plane's overall price by 27–30%. These suppliers agreed, on condition that 44 more firm orders be secured for the Tu-204SM through 2016.

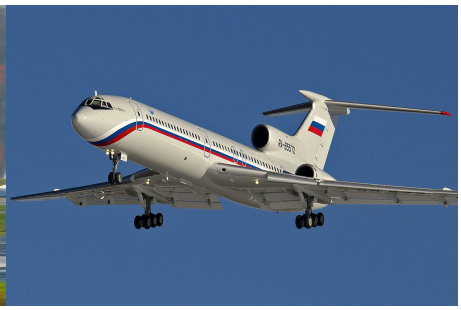
Notes:

The Tupolev Tu-204 (Russian: Туполев Ту-204) is a twin-engined medium-range jet airliner capable of carrying 210 passengers, designed by Tupolev and produced by Aviastar-SP and Kazan Aircraft Production Association. First introduced in 1989, it is intended to be broadly equivalent to the Boeing 757, with slightly lower range and payload, and has competitive performance and fuel efficiency in its class. It was developed for Aeroflot as a replacement for the medium-range Tupolev Tu-154 trijet. The latest version, with significant upgrades and improvements, is the Tu-204SM, which made its maiden flight on 29 December 2010. The Tu-204 was designed as a family of aircraft incorporating passenger, cargo, combi and quick-change variants. It is powered by either two Aviadvigatel PS-90 or Rolls-Royce RB211 engines. The Tu-204 is produced at two of the largest Russian aircraft manufacturing plants in Ulyanovsk (Tu-204 series) and Kazan (Tu-214). The Tu-204 cabin is available in several layouts, including the baseline single-class layout seating for 210 passengers and a two- or three-class layout designed for 164–193 passengers. A cargo version of the Tu-204 is being successfully operated by several airlines in Europe and Egypt. Seating configuration is 3–3 in economy and 2–2 in Business class. The business class cabin has a seat pitch of 810 millimetres (31.9 in). The passenger cabin can be divided into compartments according to class with removable bulkheads and curtains. Compartments are illuminated by reflected light. Overhead bins for passenger baggage and coats are of the closed type. The volume of baggage per passenger is 0.052 cubic metres (1.8 cu ft). In 1994, the first certificate for Tu-204 aircraft (with PS-90A engines) was issued. Subsequently, issued certificates have extended estimated operational conditions. The Tu-204-120 variant, certified with Rolls-Royce RB211-535E4 engines, complies with noise regulations described in Chapter 3 of Supplement 16 to ICAO, hence meeting all current European and ICAO requirements.[6] It is currently undergoing the certification process with JAA. The Tu-204-100 variant, certified with PS-90A engines, complies with noise regulations described in Chapter 4 of

Supplement 16 to ICAO which means it is quieter. The aircraft was certified to Russian standards AP-25 (harmonized with FAR-25 and JAR-25). The Tu-204 is part of a new generation of Russian aircraft, including other recent developments such as the Ilyushin Il-96. The Tu-204 features many technological innovations such as fly-by-wire control systems, a glass cockpit, supercritical wings with winglets, and is available with Russian or foreign avionics. The wings and tails are relatively resistant to ice build-up, and as such anti-icing systems are not equipped. Among today's airliners the Tu-204 is the only one which does not require wing anti-icing systems. During the test flight safety has been confirmed without the anti-icing system on the bearing surfaces and the aircraft obtained Russian and European certificates.

Tu-154 (Careless) Russian Jet Airliner



Tiers:

Variants:

- **Tu-154:** Tu-154 production started in 1970, and the first passenger flight was performed on 9 February 1972. Powered by Kuznetsov NK-8-2 turbofans, it carried 164 passengers. About 42 were built.
- **Tu-154A:** The first upgraded version of the original Tu-154, the A model, in production since 1974, added center-section fuel tanks and more emergency exits, while engines were upgraded to higher-thrust Kuznetsov NK-8-2U. Other upgrades include automatic flaps/slats and stabilizer controls and modified avionics. Max. takeoff weight – 94,000 kg (207,235 lb). There were 15 different interior layouts for the different domestic and international customers, seating between 144 and 152 passengers. To discern the A model from the base model note the spike at the junction of the fin and tail. This is a fat bullet on the A model, and a slender spike on the base model.
- **Tu-154B:** As the original Tu-154 and Tu-154A suffered wing cracks after a few years in service, a version with a new, stronger wing, designated Tu-154B, went into production in 1975. It also had an additional fuselage fuel tank, additional emergency exits in the tail. Also, the maximum takeoff weight increased to 98,000 kg (216,053 lb). Important to Aeroflot was the increased passenger capacity, hence lower operating costs. With the NK-8-2U engines the only way to improve the economics of the airplane was to spread costs across more seats. The autopilot was certified for ICAO Category II automatic approaches. Most previously built Tu-154 and Tu-154A were also modified into this variant, with the replacement of the wing. Maximum takeoff weight increased to 96,000 kg (211,644 lb). 111 were built.
- **Tu-154B-1:** Aeroflot wanted this version for increased revenue on domestic routes. It carried 160 passengers. This version also had some minor modifications to the fuel system, avionics, air conditioning, and landing gear. 64 were built from 1977 to 1978.
- **Tu-154B-2:** A minor modernization of Tu-154B-1. The airplane was designed to be converted from the 160 passenger version to a 180 passenger version by removing the galley. The procedure took about 2 1/2 hours. Some of the earlier Tu-154Bs were modified to that standard. Maximum takeoff weight increased to 98,000 kg (216,053 lb), later to 100,000 kg (220,462 lb). Some 311 aircraft were built, including VIP versions. A few remain in service.
- **Tu-154S:** The Tu-154S is an all-cargo or freighter version of the Tu-154B, using a strengthened floor, and adding a forward cargo door on the port side of the fuselage. The aircraft could carry nine Soviet PAV-3 pallets. Maximum payload – 20,000 kg (44,092 lb). There were plans for 20 aircraft, but only nine were converted, two from Tu-154 models and seven from Tu-154B models. Trials were held in the early 1980s and the aircraft was authorized regular operations in 1984. By 1997 all had been retired.
- **Tu-154M:** The Tu-154M and Tu-154M Lux are the most highly upgraded versions, which first flew in 1982 and entered mass production in 1984. It uses more fuel-efficient Soloviev D-30KU-154 turbofans. Together with significant aerodynamic refinement, this led to much lower fuel consumption hence longer range, as well as lower operating costs. The aircraft has new double-slotted (instead of triple-slotted) flaps, with an extra 36-degree position (in addition to existing 15, 28 and 45-degree positions on older versions), which allows reduction of noise on approach. It also has a relocated auxiliary power unit and numerous other improvements. Maximum takeoff weight increased first to 100,000

kg (220,462 lb), then to 102,000 kg (224,872 lb). Some aircraft are certified to 104,000 kg (229,281 lb). About 320 were manufactured. Mass production ended in 2006, though limited manufacturing continued as of January 2009. No new airframes have been built since the early 1990s, and production since then involved assembling aircraft from components on hand. Chinese Tu-154MD electronic intelligence aircraft carry a large-size synthetic aperture radar (SAR) under their mainframe.

- **Tu-154M-LK-1:** Cosmonaut trainer. This was a salon VIP aircraft modified to train cosmonauts to fly the Buran reusable spacecraft, the Soviet equivalent of the US Space Shuttle. The Tu-154 was used because the Buran required a steep descent, which the Tu-154 was capable of replicating. The cabin featured trainee workstations, one of which was identical to the Buran's flightdeck. The forward baggage compartment was converted into a camera bay, as the aircraft was used to train cosmonauts in observation and photographic techniques.
- **Tu-154M-ON monitoring aircraft:** Germany modified one of the Tu-154s it inherited from the former East German Air Force into an observation airplane. This aircraft was involved with the Open Skies inspection flights. It was converted at the Elbe Aircraft Plant (Elbe Flugzeugwerke) in Dresden, and flew in 1996. After 24 monitoring missions, it was lost in a mid-air collision in 1997. The Russians also converted a Tu-154M to serve as an Open Skies monitoring aircraft. They used the Tu-154M-LK-1, and converted it to a Tu-154M-ON. When not flying over North America, it is used to ferry cosmonauts. China is believed to have converted one Tu-154 to an electronic countermeasures aircraft.
- **Tu-154M-100:** Design of this variant started in 1994, but the first aircraft were not delivered until 1998. It is an upgraded version with Western avionics, including the Flight Management Computer, GPS, EGPWS, TCAS, and other modern systems. The airplane could carry up to 157 passengers. The cabin featured an automatic oxygen system and larger overhead bins. Three were produced, as payment of debts owed by Russia to Slovakia. Three aircraft were delivered in 1998 to Slovak Airlines, and sold back to Russia in 2003.
- **Tu-155:** A Tu-154 converted into a testbed for alternative fuels. It first flew in 1988 and was used until the fall of the Soviet Union, when it was placed in storage.
- **Tu-164:** Initial designation of the Tu-154M.
- **Tu-174:** Proposed stretched version of Tu-154.
- **Tu-194:** Proposed shortened version of Tu-154.

Notes:

The Tupolev Tu-154 (Russian: Туполев Ту-154; NATO reporting name: "Careless") is a three-engine medium-range narrow-body airliner designed in the mid-1960s and manufactured by Tupolev. A workhorse of Soviet and (subsequently) Russian airlines for several decades, it carried half of all passengers flown by Aeroflot and its subsidiaries (137.5 million/year or 243.8 billion passenger km in 1990), remaining the standard domestic-route airliner of Russia and former Soviet states until the mid-2000s. It was exported to 17 non-Russian airlines and used as a head-of-state transport by the air forces of several countries. With a cruising speed of 850 kilometres per hour (530 mph) the Tu-154 is one of the fastest civilian aircraft in use and has a range of 5,280 kilometres (3,280 mi). Capable of operating from unpaved and gravel airfields with only basic facilities, it was widely used in the extreme Arctic conditions of Russia's northern/eastern regions where other airliners were unable to operate. Originally designed for a 45,000-hour service life (18,000 cycles) but capable of 80,000 hours with upgrades, it was expected to continue in service until 2016, although noise regulations have restricted flights to western Europe and other regions. Since 1968 there have been 39 fatal incidents involving the Tu-154, most of which were caused either by factors unrelated to the aircraft, incorrect maintenance, or by its extensive use in demanding conditions. Few of the Tu-154 accidents appear to have involved technical failure. The Tu-154 is powered by three rear-mounted low-bypass turbofan engines arranged similarly to those of the Boeing 727, but it is slightly larger than its American counterpart. Both the 727 and the Tu-154 use an S-duct for the middle (Number 2) engine. The original model was equipped with Kuznetsov NK-8-2 engines, which were replaced with Soloviev D-30KU-154 in the Tu-154M. All Tu-154 aircraft models have a relatively high thrust-to-weight-ratio which give excellent performance, at the expense of lower fuel efficiency. This became an important factor in later decades as fuel costs grew. The cockpit is fitted with conventional dual yoke control columns. Flight control surfaces are hydraulically operated. The cabin of the Tu-154, although of the same six-abreast seating layout, gives the impression of an oval interior, with a lower ceiling than is common on Boeing and Airbus airliners. The passenger cabin accommodates 128 passengers in a two-class layout and 164 passengers in single-class layout, and up to 180 passengers in high-density layout. The layout can be modified to what is called a winter version where some seats are taken out and a wardrobe is installed for passenger coats. The

passenger doors are smaller than on its Boeing and Airbus counterparts. Luggage space in the overhead compartments is very limited. Like the Tupolev Tu-134, the Tu-154 has a wing swept back at 35° at the quarter-chord line. The British Hawker Siddeley Trident has the same sweepback angle, while the Boeing 727 has a slightly smaller sweepback angle of 32°. The wing also has anhedral (downward sweep) which is a distinguishing feature of Russian low-wing airliners designed during this era. Most Western low-wing airliners such as the contemporary Boeing 727 have dihedral (upward sweep). The anhedral means that Russian airliners have poor lateral stability compared to their Western counterparts, but also are more resistant to Dutch roll tendencies. Considerably heavier than its predecessor Soviet-built airliner the Ilyushin Il-18, the Tu-154 was equipped with an oversized landing gear to reduce ground load, enabling it to operate from the same runways. The aircraft has two six-wheel main bogies fitted with large low-pressure tires that retract into pods extending from the trailing edges of the wings (a common Tupolev feature), plus a two-wheel nose gear unit. Soft oleo struts (shock absorbers) provide a much smoother ride on bumpy airfields than most airliners, which very rarely operate on such poor surfaces. The original requirement was to have a three-person flight crew – captain, first officer and flight engineer – as opposed to a four- or five-person crew, as on other Soviet airliners. It became evident that a fourth crew member, a navigator, was still needed, and a seat was added on production aircraft, although their workstation was compromised due to the limitations of the original design. Navigators are no longer trained and this profession is becoming obsolete with the retirement of the oldest Soviet-era planes. The latest variant (Tu-154M-100, introduced 1998) includes an NVU-B3 Doppler navigation system, a triple autopilot, which provides an automatic ILS approach according to ICAO category II weather minima, an autothrottle, a Doppler drift and speed measure system (DISS), and a "Kurs-MP" radio navigation suite. A stability and control augmentation system improves handling characteristics during manual flight. Modern upgrades normally include modernised TCAS, GPS, and other systems (mostly American-made or EU-made). Early versions of the Tu-154 cannot be modified to meet the current Stage III noise regulations and are no longer allowed to fly into airspace where such regulations are enforced, such as the European Union. However, the Tu-154M's D-30 engines can be fitted with hush kits, allowing them to meet noise regulations.

IL-62M (Classic-M) Russian Jet Airliner

Tiers:

Variants:

- **Il-62:** Initial production version, powered by four 23,150-lb (103.0 kN) Kuznetsov NK-8 turbofan engines, accommodation for a crew of five and 186 passengers.
- **Il-62M:** Improved version, powered by four 24,250-lb (107.9 kN) Soloviev D-30KU turbofan engines, accommodation for a crew of five and 174 passengers, equipped with containerised baggage and freight system, modified wing spoilers and a revised flight deck, plus increased fuel capacity.
- **Il-62MK:** Medium-range version, powered by four 24,250-lb (107.9 kN) Soloviev D-30KU turbofan engines, accommodation for a crew of five and 195 passengers, equipped with strengthened wings and landing gear for operations at higher gross weights.
- **Il-62MGr:** Cargo version of Il-62M

IL-62M Improved version, powered by four 24,250-lb (107.9 kN) Soloviev D-30KU turbofan engines, accommodation for a crew of five and 174 passengers, equipped with containerised baggage and freight system, modified wing spoilers and a revised flight deck, plus increased fuel capacity. The Ilyushin IL-62 (Russian: Ильюшин Ил-62; NATO reporting name: Classic) is a Soviet long-range narrow-body jetliner conceived in 1960 by Ilyushin. As successor to the popular turboprop Il-18 and with capacity for almost 200 passengers and crew, the Il-62 was the world's largest jet airliner when first flown in 1963. One of four pioneering long-range designs (the others being Boeing 707, Douglas DC-8, and Vickers VC10), it was the first such type to be operated by the Soviet Union and a number of allied nations. The Il-62 entered Aeroflot civilian service on 15 September 1967 with an inaugural passenger flight from Moscow to Montreal, and remained the standard long-range airliner for the Soviet Union (and later, Russia) for several decades. It was the first Soviet pressurised aircraft with non-circular cross-section fuselage and ergonomic passenger doors, and the first Soviet jet with six-abreast seating (the turboprop Tu-114 shared this arrangement) and international-standard position lights. Over 30 nations operated the Il-62 with over 80 examples exported and others having been leased by Soviet-sphere and several Western airlines. The Il-62M variant became the longest-serving model in its

airliner class (average age of examples in service as of 2016 is over 32 years). Special VIP (salon) and other conversions were also developed and used as head-of-state transport by some 14 countries. However, because it is expensive to operate compared to newer generation airliners, the number in service was greatly reduced after the 2008 Great Recession. The Il-62's successors include the wide-bodied Il-86 and Il-96, both of which were made in much smaller numbers and neither of which was widely exported. The Il-62 is a conventional all-metal low-wing monoplane of riveted sectional semi-monocoque construction to fail-safe design principles (a structure designed so that failure of one major member does not cause immediate failure of the whole). Its service life was initially set at 30,000 flight hours and subject to extensions and curtailments according to the quality of service procedures, inspection and manufacturer's bulletins. The aircraft features pressurised cabin and freight holds (with fuselage dimensions of 3.8 m width x 4.1 m height), duplex all-mechanical flight controls, though with twin electric motors for tailplane incidence control; hydraulic nosewheel steering, landing gear and tail strut actuation, and wheel brakes. The Il-62M has spoilers and lift dumpers which extend automatically upon landing and are hydraulically operated. Control surfaces include a variable-incidence tailplane with dynamically and weight-compensated elevators with trim tabs, triple-section tabbed ailerons (outermost for low speed and innermost for high speed) which are interlinked with a torsion bar, spoilerons (Il-62M), spoilers and lift dumpers, and pneumatically actuated thrust reversers on the two outboard engines (the reversers are flight-rated on the Il-62M). 27 V AC electrics are used throughout with a TA-6 auxiliary power unit (a turbine generator which supplies electric power and air conditioning on the ground) in the lower tailcone plus backup lead-zinc batteries. The aircraft uses conventional hot air de-icing using engine bleed air. Its sea level is equivalent to 2,400 m (8,000 ft) above mean sea level and thereafter reducing to the equivalent of 2,400 m (8,000 ft) to cruise altitude. It was originally built with no automatic oxygen masks; emergency supply comprises hatrack-housed oxygen bottles and masks for manual distribution to passengers by cabin crew. Since 1997, most aircraft have been retrofitted with automatic oxygen supply systems with drop-down masks. Its avionics include a Polyot-1 automatic flight control system (a "super autopilot," able to be programmed with a set route which it can fly without human intervention but under constant flight crew monitoring; ICAO Cat. 1 approaches standard, Cat. 2 optional), Doppler navigational radar replaced by triplex INSS (Inertial Navigation System Sets) on Il-62M after 1978 and by GPS (Global Positioning System) navigation sets on many aircraft after 1991, triple VHF and HF flightdeck radios, automatic direction finders, Soviet and Western instrument landing system receivers, vertical omnidirectional radio range and radio beacon receivers, duplex radio altimeters, automatic radio transponders, a full ICAO-standard navigation lights fit, cabin tannoy and intercom systems. Soviet/Russian and Warsaw Pact sovereign examples are additionally fitted with triplex "Odd Rods" (NATO code name) IFF (identification friend or foe) air defence transponders identifiable by three closely spaced short aerials. Emergency evacuation systems include inflatable life rafts and manually extendable canvas evacuation slides. Most aircraft are now retrospectively fitted with emergency floor lighting strips and some aircraft equipped with automatically inflatable evacuation slides. Fire extinguishers are sited in engine nacelles, flightdeck compartment, cabin crew rest areas and toilets. The Il-62 offers accommodation for up to 198 passengers in a single-class layout, seated six-abreast at 84 cm (33 in) seat pitch in two cabins separated by a vestibule, galley/pantry and cabin crew rest area. There are three toilets, forward, midships, and aft. It has a buffet/bar and a further cabin crew rest area in a vestibule forward, with a further optional cabin crew rest area aft. Typical mixed-class accommodation ranges between 128 and 144, seated four or six abreast, and a common single aisle configuration for long distance Aeroflot examples was first class (2-abreast) 3 rows, business class (3-abreast) 4 rows, economy class (3-abreast) 17 rows (Thiel, 2001). In this configuration, the central aisle in business and economy classes is quite narrow. A first class compartment is optionally sited aft of forward entry door or just forward of midships entry door, with an economy compartment further forward in the latter case. "Skycot" fitments are located in hatracks, while later Il-62Ms (1978 onwards) feature enclosed hatracks. Customer-optionable interior fitments. No in-flight entertainment systems are available except a public-address system that may be coupled to an open-reel or audio cassette player. Individual aircraft were experimentally fitted with television sets for Soviet-standard videotape entertainment during the 1970s. Some aircraft were retrospectively fitted with Western in-flight entertainment (solely audio) systems after 1991.

IL-76 (Candid) Russian Cargo Transport Aircraft

Tiers:

Variants:

- **IL-76 Candid-A::** First production model.
- **IL-76M Candid-B::** Added rear turret with two 23-mm NR-23 guns and small ECM fairings each side of navigator's windows.
- **IL-76MD Candid-B::** Military version of IL-76T.
- **IL-76MF::** Military variant with stretched fuselage and more powerful engine.
- **IL-76MF-100::** A derivative of the IL-76M with CFM56-5C turbofans. Range increased to 7,000 km with 40,000 kg load.
- **IL-76PP::** Electronic countermeasures aircraft
- **IL-76PS/IL-84::** Search and rescue capable of 3-hour patrol with radius of 3,000 km.
- **IL-76VPK/IL-82 airborne command post::** Variant of IL-76MD. Fitted with specialized communications equipment.
- **A-50 Mainstay::** AWACS version.
- **Midas::** Aerial tanker version.
- **IL-76: A-60 ASAT Aircraft:** A-60 Anti-Satellite Direct Energy Weapon System.

Notes:

The Ilyushin Il-76 (Russian: Илью́шин Ил-76; NATO reporting name: Candid) is a multi-purpose four-engine turbofan strategic airlifter designed by the Soviet Union's Ilyushin design bureau. It was first planned as a commercial freighter in 1967, as a replacement for the Antonov An-12. It was designed to deliver heavy machinery to remote, poorly served areas. Military versions of the Il-76 have been widely used in Europe, Asia and Africa, including use as an aerial refueling tanker or command center. The Il-76 has seen extensive service as a commercial freighter for ramp-delivered cargo, especially for outsized or heavy items unable to be otherwise carried. It has also been used as an emergency response transport for civilian evacuations as well as for humanitarian aid and disaster relief around the world. Because of its ability to operate from unpaved runways, it has been useful in undeveloped areas. Specialized models have also been produced for aerial firefighting and zero-G training. The aircraft was first conceived by Ilyushin in 1967 to meet a requirement for a freighter able to carry a payload of 40 tons (88,000 lb) over a range of 5,000 km (2,700 nmi; 3,100 mi) in less than six hours, able to operate from short and unprepared airstrips, and capable of coping with the worst weather conditions likely to be experienced in Siberia and the Soviet Union's Arctic regions. It was intended to replace the Antonov An-12. Another intended version was a double-decked 250-passenger airliner but that project was cancelled. The Il-76 first flew in March 1971. Production of Il-76s was allocated to the Tashkent Aviation Production Association in Tashkent, Uzbekistan, then a republic of the Soviet Union. Some 860 of the basic transport variants were manufactured.[6] In the 1990s, modernized variants also equipped with Soloviev D-30 turbofan engines were developed (MF, TF), with a cargo compartment 20 m (66 ft) long by 3.4 m (11 ft) wide by 3.4 m (11 ft) tall; these larger variants were not produced in significant quantity due to the financial difficulties being experienced by the Russian Air Force, which was the primary operator of the type. The prototype of the Il-76MF, conducted its first flight on 1 August 1995.

Notes:

The Ilyushin Il-18 (Russian: Илью́шин Ил-18; NATO reporting name: Coot) is a large turboprop airliner that first flew in 1957 and became one of the best known and durable Soviet aircraft of its era. The Il-18 was one of the world's principal airliners for several decades and was widely exported. Due to the aircraft's airframe durability, many examples achieved over 45,000 flight hours and the type remains operational in both military and (to a lesser extent) civilian capacities. The Il-18's successor was the long range Il-62 jet airliner. Two Soviet aircraft shared the designation Ilyushin Il-18. The first Il-18 was a propeller-driven airliner of 1946 but after a year of test flights that programme was abandoned. In the early 1950s with a need to replace older designs and increase the size of the Soviet civil transport fleet, a Soviet Council of Ministers directive was issued on 30 December 1955 to the chief designers Kuznetsov and Ivchenko to develop new turboprop engines and to Ilyushin and Antonov to design an aircraft to use these engines. The two aircraft designs were developed as the Ilyushin Il-18 and the Antonov An-10 and the engine chosen was the Kuznetsov NK-4 rather than the Ivchenko AI-20. The Il-18 design had started in 1954 before the directive was issued and experience with the piston-engined Il-18 was used although the aircraft was a new design. The design was for a four-engined low-wing monoplane with a circular pressurised fuselage and a conventional tail. The forward retracting tricycle landing gear had four wheels fitted on the main leg bogies, the main legs bogies rotated 90 degrees and retracted into the rear of the inboard engines. A new feature at the time was the fitting of a weather radar in the nose and it was the first

Soviet airliner to have an automatic approach system. The aircraft has two entry doors on the port-side before and after the wing and two overwing emergency exits on each side. The prototype SSSR-L5811 was rolled out in June 1957 and after ground-testing it began taxi test and high-speed runs on 1 July 1957. On 4 July 1957 the prototype first flew from Khodynka. On 10 July 1957 the aircraft was flown to Moscow-Vnukovo Airport to be presented to a Soviet government commission; also present was the prototype Antonov An-10 and the Tupolev Tu-114. The Il-18 type was formally named Moskva and this was painted on the fuselage, although the name was not used when the aircraft entered production. The Moscow Machinery Plant No. 30 located at Khodynka, near where the Ilyushin design office and the prototype had been built, was chosen to manufacture the aircraft. During 1957 the plant began to reduce its production of the Ilyushin Il-14 and prepare to build the production aircraft designated IL-18A. The Il-18A was only different from the prototype in minor details, mainly internal configuration to increase the seating from 75 to 89. Malev Il-18 in Sweden, 1972 The first production aircraft were powered by the Kuznetsov NK-4 but the engines were plagued with problems so the Council of Ministers decreed in July 1958 that all production from November 1958 would use the Ivchenko AI-20 and earlier production would be re-engined. Only 20 IL-18As were built before production changed to the improved Il-18B, this new variant had a higher gross weight and the nose was re-designed with a larger radome which increased the length by 20 cm. The first Il-18B flew on 30 September 1958 powered by the AI-20; a VIP variant was also built as the IL-18S for the Soviet Air Force. From April 1961 a TG-18 Auxiliary Power Unit was fitted for ground starting rather than the bank of lead-acid batteries. Some aircraft were modified to allow the APU to be run in flight. With experience of the earlier aircraft a further improvement was the Il-18V variant. The Il-18V was structurally the same but the interior was re-designed including moving the galley and some minor system changes. The first Il-18V appeared in December 1959 and was to continue into production until 1965 after 334 had been built. Specialised variants of the aircraft also appeared, including aircraft modified for flight calibration and a long-range polar variant. Military variants also appeared including the anti-submarine Ilyushin Il-38.

Vertical Climb Rate : m/s10.0

Notes:

The Antonov An-12 (Russian: Антонов Ан-12; NATO reporting name: Cub) is a four-engined turboprop transport aircraft

designed in the Soviet Union. It is the military version of the Antonov An-10 and has many variants. For more than three decades the An-12 was the standard medium-range cargo and paratroop transport aircraft of the Soviet air forces. A total of 1,234 were eventually built. Developed from the Antonov An-8, the An-12 was a military version of the An-10 passenger transport. The first prototype An-12 flew in December 1957 and entered Soviet military service in 1959. Initially, the aircraft was produced at the State Aviation Factory in Irkutsk. From 1962, production was transferred to Tashkent, where 830 were built. Later, production moved to Voronezh and Kazan. In military use, the An-12 has capacity for up to 100 fully equipped paratroopers or 20,000 kg (44,090 lb) of cargo, which is loaded through the rear loading ramp/door. In terms of configuration, size, and capability, the aircraft is similar to the United States-built Lockheed C-130 Hercules. Soviet military and former-Soviet An-12s have a defensive tail gun turret. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with a license to assemble the aircraft locally. Due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance and the first flight of a Chinese-assembled An-12 was delayed until 1974. After USSR ceased production in 1973, the Xi'an Aircraft Company and Xi'an Aircraft Design Institute reverse-engineered the An-12 for local production. In 1981, the Chinese version of the An-12, designated Y-8, entered production. Since then, the Y-8 has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. A Tu-16/H-6 bomber navigator cockpit design was chosen for the Y-8 instead of the original An-12 shorter navigator cockpit design, as the H-6 bomber had been in serial production for some time. Although the An-12 is no longer in use either in Russia or in Ukraine, the Y-8 is upgraded and produced in China. The latest Y8-F600 is a joint venture between the Shaanxi Aircraft Company, Antonov Aeronautical Scientific Technical Complex (ASTC), and Pratt & Whitney Canada. The Y8-F600 has a redesigned fuselage, western avionics, PW150B turboprop engines with an R-408 propeller system, and a two-crew glass cockpit.

B737-600 (Boeing 737-600) American Cargo Transport Aircraft

Tiers:

Variants:

- **B737-100:** This is the initial production civil airliner version, with a 94-ft (28.65-m) long fuselage and a maximum passenger capacity of 115. First flight took place on April 9, 1967. Only 30 were built, all of which entered commercial service. One was later acquired by the Mexican air force as a VIP transport.
- **B737-200:** This version features a 6-ft (1.82-m) fuselage stretch and more powerful JT8D engines. There were 1,095 aircraft built.
- **B737-2X9 Surveiller:** This version is a 737-200 with 14 first-class and 88 coach passenger seats as well as a Motorola side-looking airborne modular multi-mission radar (SLAMMR) -- a variant of the AN/APS-131/135 radar -- and two associated 16-ft (5-m) long slotted waveguide antennas on the upper rear fuselage sides. At 30,000 ft (9,144 m), the detection range for small ships is 100 nm (115 mi; 185 km). Three improved Surveillers are in service in Indonesia. Modifications to the Indonesian versions include enhanced side-looking airborne modular radar; a new nose-mounted IR-detection system; as well as radar and GPS. Also installed on the improved version is the Boeing-developed data processing and display system (DPDS).
- **B737-300:** The B737-300 is the extended-range version with stretched fuselage and quieter, more fuel-efficient CFM56-3-B engines. First flight occurred on Aug. 24, 1984; it entered service on Dec. 7, 1984. More than 850 were ordered. One each has been in VIP service with the South Korean and Thai air forces.
- **B737-400:** This variant is similar to the B737-30, but with additional 10-ft (3.05-m) stretch to fuselage, 168-passenger capacity and higher rated engines. First flight occurred on Feb. 19, 1988; the first was delivered on Sept. 15, 1988. More than 170 were ordered.
- **B737-500:** The B737-500 is a short-fuselage (101 ft 9 in/31.01 m) version of the B737-300 with a passenger capacity of 132. First flight took place on June 30, 1989. More than 165 were ordered.
- **B737-600:** The B737-600 was known as the 737-500X prior to 1995. It accommodates 108-140 passengers. It is part of the Next Generation series -- the smallest model. The wings have increased chord and span lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700:** Launched in November 1993, this was the first of the Next Generation series to enter service. It accommodates 128-149 passengers. The aircraft is similar to the B737-600, though the wings have increased chord and span, lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700 Increased Gross Weight Quick Change:** This variant was chosen by the U.S. Navy to replace the C-98s in the Reserves. Its features include continuous double-slotted flaps, new leading-edge slats and a large cargo door fitted to the front fuselage. Two were ordered for delivery by the end of 2001. A commercial version has not been made available.
- **B737-800:** The B737-800 was launched on Sept. 5, 1994. It is the longest variant of this series; it has a seating accommodation of 162-189 passengers.
- **B737-900:** This is a stretched version that can accommodate 18 more passengers than the 737-800. At least 10 orders have been placed for this aircraft. The eyebrow windows located above the cockpit windscreen were removed in January 2005. Kits are available to remove the eyebrow windows from earlier 737-900s. An increased range version, the 737-900ER, was launched on July 18, 2005. Its maximum takeoff weight rose to 187,800 lb (85,185 kg); maximum zero-fuel weight, 149,500 lb (67,812 kg); maximum landing weight, 157,400 lb (71,395 kg); and range, 3,200 nautical miles (3,682 mi, 5,926 km) with 180 passengers.
- **Boeing Business Jet:** The business jet was launched on July 2, 1996, as a joint venture between Boeing and General Electric. It is a corporate version of the 737-700. While between eight and 63 passengers will be typically accommodated, the plane can be configured to seat as many as 100. There is an integrated GPS and SATCOM. The range is 6,200 nautical mile (nm) (7,139 mi, 4,437 km). Three auxiliary tanks offer an increase in range of 4,830 nm (5,562 mi, 3,456 km).

System

Alternate Designation(s): B737-600; Boeing 737-600

Primary Function / Type: Cargo/Passenger Aircraft

B737-600 The B737-600 was known as the 737-500X prior to 1995. It accommodates 108-140 passengers. It is part of the Next Generation series -- the smallest model. The wings have increased chord and span lending more fuel capacity, better fuel efficiency and a longer range. The Boeing 737 is a narrow-body aircraft produced by Boeing Commercial Airplanes at its Renton Factory in Washington. Developed to supplement the 727 on short and thin routes, the twinjet retains the 707 fuselage cross-section and nose with two underwing turbofans. Envisioned in 1964, the initial 737-100 made its first flight in April 1967 and entered service in February 1968 with Lufthansa. The lengthened 737-200 entered service in April 1968. It evolved through four generations, offering several variants for 85 to 215 passengers. The -100/200 original variants were powered by Pratt & Whitney JT8D low-bypass engines and offered seating for 85 to 130 passengers. Launched in 1980 and introduced in 1984, the 737 Classic -300/400/500 variants were re-engined with CFM56-3 turbofans and offered 110 to 168 seats. Introduced in 1997, the 737 Next Generation (NG) -600/700/800/900 variants have updated CFM56-7s, a larger wing and an upgraded glass cockpit, and seat 108 to 215 passengers. The latest generation, the 737 MAX -7/8/9/10, powered by improved CFM LEAP high bypass turbofans and accommodating 138 to 204 people, entered service in 2017. Boeing Business Jet versions are produced since the 737NG, as well as military models. As of December 2019, 15,156 Boeing 737s have been ordered and 10,571 delivered. Actual backlog stands at 4,398 when including "additional criteria for recognizing contracted backlog with customers beyond the existence of a firm contract". Initially, its main competitor was the McDonnell Douglas DC-9, followed by its MD-80/MD-90 derivatives. It remained the highest-selling commercial jetliner until surpassed in total orders by the Airbus A320 family in October 2019. The current 737 MAX, designed to compete with the A320neo was grounded worldwide in March 2019 following two fatal crashes.

Y-20 Kunpeng (Chubby Girl) Chinese Strategic Transport Aircraft

Notes:

The Xi'an Y-20 (Chinese: □-20; pinyin: Yùn-20; lit.: 'transport-20') is a large military transport aircraft. The project is being developed by Xi'an Aircraft Industrial Corporation and was officially launched in 2006. The official codename of the aircraft is Kunpeng (Chinese: □□), After the mythical bird that can fly for thousands of miles described in the ancient Chinese Taoist classic Zhuangzi. However, within the Chinese aviation industry itself, the aircraft is more commonly known by its nickname Chubby Girl (Chinese: □□), because its fuselage is much wider compared to other Chinese aircraft previously developed in China. The Y-20 uses components made of composite materials. The composites are produced in China, whereas in the past they had to be imported. The Y-20's cabin incorporates flame-retardant composites developed by the 703 Institute of the China Aerospace Science and Technology Corporation (CASC). The 703 Institute was created in March 2009 with development taking three years. The performance of the composites is reportedly comparable to those that fulfill FAR Part 25.835. The 703 Institute achieved another milestone by establishing a comprehensive Chinese evaluation and certification system for aircraft composite materials based on international standards. The Y-20 is the first cargo aircraft to use 3D printing technology to speed up its development and to lower its manufacturing cost. Model-based definition (MBD) is also used, and it's the third aircraft to utilize MBD technology in the world, after Airbus A380 (2000) and Boeing 787 (2005). A project team to implement MBD for Y-20 program was formally formed in October 2009, and after the initial success in application on the main landing gear, MBD application was expanded to the entire aircraft and became mandatory for all contractors and sub contractors of the Y-20 program. The implementation of MBD was initially met with strong resistance, with only a third of suppliers agreeing to implement MBD. However, the general designer of Y-20 declared that those who refused to implement MBD will be banned from participating in the Y-20 program, thus forcing everyone to comply, resulting in increases in productivity. The implementation of MBD greatly shortened the time required, for example, without MBD, installation of wings takes a month or two, but with MBD adopted, the time is drastically shortened to just a few hours, and in general, the design work reduced by 40%, preparation for production reduced by 75%, and manufacturing cycle reduced by 30%. In addition to 3D printing, the Y-20 is also the first aircraft in China adopting associative design technology (ADT) in its development. Headed by the deputy general designer of structural design, Mr. Feng Jun (□□), the initial attempt to implement ADT actually failed after two months spent on application on the nose section. It was only after the second attempt that took another three months on the application on wings did ADT became successful. The adaptation of ADT greatly shortened the development time by at least eight months, and modification of wing design that previously took a week is shortened to half a day. Cargo is loaded through a large aft ramp that accommodates rolling stock. The Y-20 incorporates a shoulder wing, T-tail, rear cargo-loading assembly and heavy-duty retractable landing gear, consists of three rows, with a pair of wheels for each row, totaling six wheels for each side. The structural test was completed in 194 days as opposed to the 300 days originally planned, thanks to the successful development and application of an automated structural strength analysis system. In comparison, similar work for the Xian JH-7 took a year. According to the deputy general designer, the shortest take-off distance of the Y-20 is 600 to 700 meters. Y-20 incorporates a total of four LCD EFIS, and the development of EFIS for Y-20 utilizes virtual reality via helmet mounted display.

Eight types of different relays used on Y-20 are developed by Guilin Aerospace Co., Ltd. a wholly own subsidiary of China Tri-River Aerospace Group Co., Ltd.(□□□□□□□□), which is also known as the 9th Academy of the China Aerospace Science and Industry Corporation (CASIC). It was reported that the Y-20 started ground testing in December 2012, including runway taxi tests. The aircraft made its maiden flight lasting one hour on January 26, 2013. During landing in first flight, it was reported that the Y-20 prototype bounced once before finally settling on runway due to high landing speed. In December 2013, a new Y-20 prototype took to the sky. On 6 February 2016 the Y-20 was flown for the first time and pictures of the fifth prototype (serial number 788) in flight appeared on Chinese military web pages. Other known prototypes carry identification numbers 781, 783 and 785. On 27 January 2016, former Chinese test pilot, Xu Yongling, had reported in a Xinhua article that Chinese aviation industry officials had stated that the Y-20 "had completed development" at the end of 2015. In June 2016, the first two Xian Y-20 aircraft were delivered to the People's Liberation Army Air Force (PLAAF)

Y-12 (II) Chinese Utility Aircraft

Tiers:

Variants:

- **Y-12 (I):** Twin-engined STOL utility transport aircraft, powered by two 500-shp (373-kW) Pratt & Whitney Canada PT6A-11 turboprop engines. Prototype version.
- **Y-12 (II):** Fitted with more powerful PT6A-27 engines.
- **Y-12 (III):** Planned version to be fitted with WJ-9 turboprop. Evolved to Y-12C because of IV's success when WJ-9 development was completed.
- **Y-12 (IV):** Improved version. Revised wingtips (span increased to 19.2 m (63 ft)) and increased takeoff weight. 19 passenger seats. This version is the first aircraft in the series certified by the FAA in 1995.
- **Y-12C:** Basically a (IV) version with WJ-9 turboprop, used by PLAAF for aerial survey.
- **Y-12D:** Domestically deployed military version with upgraded engines driving four-bladed propellers, used by PLA Airborne Corps for parachute training.
- **Y-12E:** Variant with 18 passenger seats. PT6A-135A engines of equal horsepower but increased torque driving four-bladed propellers. This version was certified by the FAA in 2006.
- **Y-12F:** The latest development with almost everything redesigned: wider fuselage, new wings, retractable landing gear and more powerful PT6A-65B engines. The Y-12F has higher cruise speed, longer range and can accommodate 19 passengers or 3x LD3 containers. Design started in April 2005 and the maiden flight was on 29 December 2010. CAAC type certification was received on 10 December 2015 and FAA certification on 22 February 2016. The Y-12F passed flight tests for its automatic flight control system by the FAA on 30 June 2018. It was demonstrated during the 2012 Zhuhai Airshow.
- **Y-12G:** Proposed cargo version of Y-12F.
- **Turbo Panda:** Export name for (II) version, marketed by England and Japanese companies. No real order due to airworthiness certification.
- **Twin Panda:** Originally (II) version for export. Later a modified Y-12 (IV) powered by two Pratt & Whitney Canada PT6A-34 turboprop engines and fitted with uprated undercarriage, upgraded avionics and interior. Thirty-five orders reportedly received by 2000 but production not proceeded with.

System

Alternate Designation(s): Y-12 (II); Export: Turbo Panda
Primary Function / Type: Utility Aircraft
Manufacturer: Harbin Aircraft Industry Group
Crew: 2 (pilot, co-pilot)
Passengers: 17-19 passengers

Notes:

The Harbin Y-12 (Chinese: □-12; pinyin: Yùn-12) is a high wing twin-engine turboprop utility aircraft built by Harbin Aircraft Industry Group (HAIG). Y-12(II) This variant features PT6A-27 engines; a Nordam interior; Western avionics options; and a Hamilton Standard environmental control system. The Y-12(II) entered production in 1984. The Y-12 started as a development of the Harbin Y-11 airframe called Y-11T in 1980. The design featured numerous improvements including a redesigned wing

with a new low drag section, a larger fuselage and bonded rather than riveted construction. It also replaced the radial piston engines with turboprops. The prototype was followed by about 30 production Y-12 (I) aircraft before a revised version was produced. This was designated the Y-12 (II), which featured more powerful engines and removal of leading edge slats, first flying on 16 August 1984 and receiving Chinese certification in December of the following year. The power plants are two Pratt & Whitney Canada PT6A-27 turboprops with Hartzell propellers. The Y-12 has a maximum takeoff weight of 5,700 kg (12,600 lb) with seating for 17 passengers and two crew. The aircraft is operated as a light commuter and transport aircraft. The latest development is the Y-12F, which is almost a new design with many improvements: new wings, new landing gear, new fuselage, with more powerful engines from Pratt & Whitney Canada and extended payload and range. The Y-12F made its maiden flight on December 29, 2010, received CAAC type certification on December 10, 2015, and FAA type certification on February 22, 2016. In 2015 Kenmore Air announced that they would begin development of floats for the Y-12 for FAA certification. The Y-12 completed the FAA evaluation flight tests for its automatic flight control system on June 30, 2018, with its performance meeting the requirements, said AVIC Harbin Aircraft Industry Company Ltd (AVIC HAFEI).

Y-12 (I) Chinese Utility Aircraft

- **Y-12 (II):** Fitted with more powerful PT6A-27 engines.
- **Y-12 (III):** Planned version to be fitted with WJ-9 turboprop. Evolved to Y-12C because of IV's success when WJ-9 development was completed.
- **Y-12 (IV):** Improved version. Revised wingtips (span increased to 19.2 m (63 ft)) and increased takeoff weight. 19 passenger seats. This version is the first aircraft in the series certified by the FAA in 1995.
- **Y-12C:** Basically a (IV) version with WJ-9 turboprop, used by PLAAF for aerial survey.
- **Y-12D:** Domestically deployed military version with upgraded engines driving four-bladed propellers, used by PLA Airborne Corps for parachute training.
- **Y-12E:** Variant with 18 passenger seats. PT6A-135A engines of equal horsepower but increased torque driving four-bladed propellers. This version was certified by the FAA in 2006.
- **Y-12F:** The latest development with almost everything redesigned: wider fuselage, new wings, retractable landing gear and more powerful PT6A-65B engines. The Y-12F has higher cruise speed, longer range and can accommodate 19 passengers or 3x LD3 containers. Design started in April 2005 and the maiden flight was on 29 December 2010. CAAC type certification was received on 10 December 2015 and FAA certification on 22 February 2016. The Y-12F passed flight tests for its automatic flight control system by the FAA on 30 June 2018. It was demonstrated during the 2012 Zhuhai Airshow.
- **Y-12G:** Proposed cargo version of Y-12F.
- **Turbo Panda:** Export name for (II) version, marketed by England and Japanese companies. No real order due to airworthiness certification.
- **Twin Panda:** Originally (II) version for export. Later a modified Y-12 (IV) powered by two Pratt & Whitney Canada PT6A-34 turboprop engines and fitted with uprated undercarriage, upgraded avionics and interior. Thirty-five orders reportedly received by 2000 but production not proceeded with.

System

Alternate Designation(s): Y-12 (I)
Primary Function / Type: Utility Aircraft
Manufacturer: Harbin Aircraft Industry Group
Crew: 2 (pilot, co-pilot)
Passengers: 17-19 passengers
Number of Engines: 2
Number of Hard Points: INA

Dimensions

Length: 14.86 m
Height: 5.58 m
Width (Wing Span): 17.24 m
Wing Area: 34.27 sq m
Cabin Length: 4.93 m
Cabin Width: 1.46 m
Cabin Height: 1.70 m
Volume: 12.9 cu m
Empty Weight: 3,000 kg
Payload Weight: 1,700 kg
Maximum Takeoff Weight: 5,300 kg

Automotive

Engine Name: 2 x Pratt & Whitney Canada PT6A-11
Number of Engines: 2
Engine Type: Turboprop
Engine Power: 500 shaft hp each
Fuel Capacity: 1,616 liters
Maximum Cruise Speed: 320 km/h
Economy Cruise Speed: 271 km/h
Range with Maximum Payload at 146 knots: 189 km
Ceiling: 7,000 m
Climb Rate, Both Engines: 390 m/min
Climb Rate, One Engine: 36 m/min

Protection

Stealth Properties: None
Heat Signature Reduction: No
Add on Armor: No
NBC Protection: INA
EW Counter Measures: INA
Chaffs/Flares: INA

Notes:

The Harbin Y-12 (Chinese: □-12; pinyin: Yùn-12) is a high wing twin-engine turboprop utility aircraft built by Harbin Aircraft Industry Group (HAIG). Y-12(I) This is the initial production version with PT6A-11 engines. The Y-12 started as a development of the Harbin Y-11 airframe called Y-11T in 1980. The design featured numerous improvements including a redesigned wing with a new low drag section, a larger fuselage and bonded rather than riveted construction. It also replaced the radial piston engines

with turboprops. The prototype was followed by about 30 production Y-12 (I) aircraft before a revised version was produced. This was designated the Y-12 (II), which featured more powerful engines and removal of leading edge slats, first flying on 16 August 1984 and receiving Chinese certification in December of the following year. The power plants are two Pratt & Whitney Canada PT6A-27 turboprops with Hartzell propellers. The Y-12 has a maximum takeoff weight of 5,700 kg (12,600 lb) with seating for 17 passengers and two crew. The aircraft is operated as a light commuter and transport aircraft. The latest development is the Y-12F, which is almost a new design with many improvements: new wings, new landing gear, new fuselage, with more powerful engines from Pratt & Whitney Canada and extended payload and range. The Y-12F made its maiden flight on December 29, 2010, received CAAC type certification on December 10, 2015, and FAA type certification on February 22, 2016. In 2015 Kenmore Air announced that they would begin development of floats for the Y-12 for FAA certification. The Y-12 completed the FAA evaluation flight tests for its automatic flight control system on June 30, 2018, with its performance meeting the requirements, said AVIC Harbin Aircraft Industry Company Ltd (AVIC HAFEI).

B737-700 (Boeing 737-700) American Cargo Transport Aircraft

Tiers:

Variants:

- **B737-100:** This is the initial production civil airliner version, with a 94-ft (28.65-m) long fuselage and a maximum passenger capacity of 115. First flight took place on April 9, 1967. Only 30 were built, all of which entered commercial service. One was later acquired by the Mexican air force as a VIP transport.
- **B737-200:** This version features a 6-ft (1.82-m) fuselage stretch and more powerful JT8D engines. There were 1,095 aircraft built.
- **B737-2X9 Surveiller:** This version is a 737-200 with 14 first-class and 88 coach passenger seats as well as a Motorola side-looking airborne modular multi-mission radar (SLAMMR) -- a variant of the AN/APS-131/135 radar -- and two associated 16-ft (5-m) long slotted waveguide antennas on the upper rear fuselage sides. At 30,000 ft (9,144 m), the detection range for small ships is 100 nm (115 mi; 185 km). Three improved Surveillers are in service in Indonesia. Modifications to the Indonesian versions include enhanced side-looking airborne modular radar; a new nose-mounted IR-detection system; as well as radar and GPS. Also installed on the improved version is the Boeing-developed data processing and display system (DPDS).
- **B737-300:** The B737-300 is the extended-range version with stretched fuselage and quieter, more fuel-efficient CFM56-3-B engines. First flight occurred on Aug. 24, 1984; it entered service on Dec. 7, 1984. More than 850 were ordered. One each has been in VIP service with the South Korean and Thai air forces.
- **B737-400:** This variant is similar to the B737-30, but with additional 10-ft (3.05-m) stretch to fuselage, 168-passenger capacity and higher rated engines. First flight occurred on Feb. 19, 1988; the first was delivered on Sept. 15, 1988. More than 170 were ordered.
- **B737-500:** The B737-500 is a short-fuselage (101 ft 9 in/31.01 m) version of the B737-300 with a passenger capacity of 132. First flight took place on June 30, 1989. More than 165 were ordered.
- **B737-600:** The B737-600 was known as the 737-500X prior to 1995. It accommodates 108-140 passengers. It is part of the Next Generation series -- the smallest model. The wings have increased chord and span lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700:** Launched in November 1993, this was the first of the Next Generation series to enter service. It accommodates 128-149 passengers. The aircraft is similar to the B737-600, though the wings have increased chord and span, lending more fuel capacity, better fuel efficiency and a longer range.
- **B737-700 Increased Gross Weight Quick Change:** This variant was chosen by the U.S. Navy to replace the C-98s in the Reserves. Its features include continuous double-slotted flaps, new leading-edge slats and a large cargo door fitted to the front fuselage. Two were ordered for delivery by the end of 2001. A commercial version has not been made available.
- **B737-800:** The B737-800 was launched on Sept. 5, 1994. It is the longest variant of this series; it has a seating accommodation of 162-189 passengers.
- **B737-900:** This is a stretched version that can accommodate 18 more passengers than the 737-800. At least 10 orders

have been placed for this aircraft. The eyebrow windows located above the cockpit windscreen were removed in January 2005. Kits are available to remove the eyebrow windows from earlier 737-900s. An increased range version, the 737-900ER, was launched on July 18, 2005. Its maximum takeoff weight rose to 187,800 lb (85,185 kg); maximum zero-fuel weight, 149,500 lb (67,812 kg); maximum landing weight, 157,400 lb (71,395 kg); and range, 3,200 nautical miles (3,682 mi, 5,926 km) with 180 passengers.

- **Boeing Business Jet:** The business jet was launched on July 2, 1996, as a joint venture between Boeing and General Electric. It is a corporate version of the 737-700. While between eight and 63 passengers will be typically accommodated, the plane can be configured to seat as many as 100. There is an integrated GPS and SATCOM. The range is 6,200 nautical mile (nm) (7,139 mi, 4,437 km). Three auxiliary tanks offer an increase in range of 4,830 nm (5,562 mi, 3,456 km).

System

Alternate Designation(s): B737-700; Boeing 737-700

Primary Function / Type: Cargo/Passenger Aircraft

Manufacturer: Boeing Commercial Airplanes

Crew: 2 (pilot, co-pilot)

Passengers: 128-149 passengers

Number of Engines: 2

Number of Hard Points: INA

Dimensions

Length: 33.63 m

Width (Wing Span): 34.32 m

Wing Area: 124.5 sq m

Height: 12.55 m

Cabin Length: 24.13 m

Cabin Width: 3.53 m

Cabin Height: 2.13 m

Cabin Volume: 131.28 cu m

Empty Weight: 37,920 kg

Maximum Payload: 15,998 kg

Maximum Takeoff Weight: 60,700 kg

Automotive

Engine Name: 2 x CFM International CFM56-7B

Notes:

B737-700 Launched in November 1993, this was the first of the Next Generation series to enter service. It accommodates 128-149 passengers. The aircraft is similar to the B737-600, though the wings have increased chord and span, lending more fuel capacity, better fuel efficiency and a longer range. The Boeing 737 is a narrow-body aircraft produced by Boeing Commercial Airplanes at its Renton Factory in Washington. Developed to supplement the 727 on short and thin routes, the twinjet retains the 707 fuselage cross-section and nose with two underwing turbofans. Envisioned in 1964, the initial 737-100 made its first flight in April 1967 and entered service in February 1968 with Lufthansa. The lengthened 737-200 entered service in April 1968. It evolved through four generations, offering several variants for 85 to 215 passengers. The -100/200 original variants were powered by Pratt & Whitney JT8D low-bypass engines and offered seating for 85 to 130 passengers. Launched in 1980 and introduced in 1984, the 737 Classic -300/400/500 variants were re-engined with CFM56-3 turbofans and offered 110 to 168 seats. Introduced in 1997, the 737 Next Generation (NG) -600/700/800/900 variants have updated CFM56-7s, a larger wing and an upgraded glass cockpit, and seat 108 to 215 passengers. The latest generation, the 737 MAX -7/8/9/10, powered by improved CFM LEAP high bypass turbofans and accommodating 138 to 204 people, entered service in 2017. Boeing Business Jet versions are produced since the 737NG, as well as military models. As of December 2019, 15,156 Boeing 737s have been ordered and 10,571 delivered. Actual backlog stands at 4,398 when including "additional criteria for recognizing contracted backlog with customers beyond the existence of a firm contract". Initially, its main competitor was the McDonnell Douglas DC-9, followed by its MD-80/MD-90 derivatives. It remained the highest-selling commercial jetliner until surpassed in total orders by the Airbus A320 family in October 2019. The current 737 MAX, designed to compete with the A320neo was grounded worldwide in March 2019 following two fatal crashes.

B737-300 (Boeing 737-300) American Cargo Transport Aircraft

Tiers:

Variants:

- **B737-100:** This is the initial production civil airliner version, with a 94-ft (28.65-m) long fuselage and a maximum passenger capacity of 115. First flight took place on April 9, 1967. Notes:

Boeing engineer Mark Gregoire led a design team, which cooperated with CFM International to select, modify and deploy a new engine and nacelle that would make the 737-300 into a viable aircraft. They chose the CFM56-3B-1 high-bypass turbofan engine to power the aircraft, which yielded significant gains in fuel economy and a reduction in noise, but also posed an engineering challenge, given the low ground clearance of the 737 and the larger diameter of the engine over the original Pratt & Whitney engines. Gregoire's team and CFM solved the problem by reducing the size of the fan (which made the engine slightly less efficient than it had been forecast to be), placing the engine ahead of the wing, and by moving engine accessories to the sides of the engine pod, giving the engine a distinctive non-circular "hamster pouch" air intake. Earlier customers for the CFM56 included the U.S. Air Force with its program to re-engine KC-135 tankers. The passenger capacity of the aircraft was increased to 149 by extending the fuselage around the wing by 9 feet 5 inches (2.87 m). The wing incorporated several changes for improved aerodynamics. The wingtip was extended 9 in (23 cm), and the wingspan by 1 ft 9 in (53 cm). The leading-edge slats and trailing-edge flaps were adjusted. The tailfin was redesigned, the flight deck was improved with the optional EFIS (Electronic Flight Instrumentation System), and the passenger cabin incorporated improvements similar to those developed on the Boeing 757. The prototype −300, the 1,001st 737 built, first flew on February 24, 1984 with pilot Jim McRoberts. It and two production aircraft flew a nine-month-long certification program.

Tu-154B (Careless-B) Russian Jet Airliner

Tiers:

Variants:

- **Tu-154:** Tu-154 production started in 1970, and the first passenger flight was performed on 9 February 1972. Powered by Kuznetsov NK-8-2 turbofans, it carried 164 passengers. About 42 were built.
- **Tu-154A:** The first upgraded version of the original Tu-154, the A model, in production since 1974, added center-section fuel tanks and more emergency exits, while engines were upgraded to higher-thrust Kuznetsov NK-8-2U. Other upgrades include automatic flaps/slats and stabilizer controls and modified avionics. Max. takeoff weight – 94,000 kg (207,235 lb). There were 15 different interior layouts for the different domestic and international customers, seating between 144 and 152 passengers. To discern the A model from the base model note the spike at the junction of the fin and tail. This is a fat bullet on the A model, and a slender spike on the base model.
- **Tu-154B:** As the original Tu-154 and Tu-154A suffered wing cracks after a few years in service, a version with a new, stronger wing, designated Tu-154B, went into production in 1975. It also had an additional fuselage fuel tank, additional emergency exits in the tail. Also, the maximum takeoff weight increased to 98,000 kg (216,053 lb). Important to Aeroflot was the increased passenger capacity, hence lower operating costs. With the NK-8-2U engines the only way to improve the economics of the airplane was to spread costs across more seats. The autopilot was certified for ICAO Category II automatic approaches. Most previously built Tu-154 and Tu-154A were also modified into this variant, with the replacement of the wing. Maximum takeoff weight increased to 96,000 kg (211,644 lb). 111 were built.
- **Tu-154B-1:** Aeroflot wanted this version for increased revenue on domestic routes. It carried 160 passengers. This version also had some minor modifications to the fuel system, avionics, air conditioning, and landing gear. 64 were built from 1977 to 1978.
- **Tu-154B-2:** A minor modernization of Tu-154B-1. The airplane was designed to be converted from the 160 passenger version to a 180 passenger version by removing the galley. The procedure took about 2 1/2 hours. Some of the earlier Tu-154Bs were modified to that standard. Maximum takeoff weight increased to 98,000 kg (216,053 lb), later to 100,000 kg (220,462 lb). Some 311 aircraft were built, including VIP versions. A few remain in service.
- **Tu-154S:** The Tu-154S is an all-cargo or freighter version of the Tu-154B, using a strengthened floor, and adding a forward cargo door on the port side of the fuselage. The aircraft could carry nine Soviet PAV-3 pallets. Maximum payload – 20,000 kg (44,092 lb). There were plans for 20 aircraft, but only nine were converted, two from Tu-154 models and seven from Tu-154B models. Trials were held in the early 1980s and the aircraft was authorized regular operations in 1984. By 1997 all had been retired.
- **Tu-154M:** The Tu-154M and Tu-154M Lux are the most highly upgraded versions, which first flew in 1982 and entered mass production in 1984. It uses more fuel-efficient Soloviev D-30KU-154 turbofans. Together with significant aerodynamic refinement, this led to much lower fuel consumption hence longer range, as well as lower operating costs. The aircraft has new double-slotted (instead of triple-slotted) flaps, with an extra 36-degree position (in addition to existing 15, 28 and 45-degree positions on older versions), which allows reduction of noise on approach. It also has a relocated auxiliary power unit and numerous other improvements. Maximum takeoff weight increased first to 100,000 kg (220,462 lb), then to 102,000 kg (224,872 lb). Some aircraft are certified to 104,000 kg (229,281 lb). About 320 were manufactured. Mass production ended in 2006, though limited manufacturing continued as of January 2009. No new airframes have been built since the early 1990s, and production since then involved assembling aircraft from components on hand. Chinese Tu-154MD electronic intelligence aircraft carry a large-size synthetic aperture radar (SAR) under their mainframe.
- **Tu-154M-LK-1:** Cosmonaut trainer. This was a salon VIP aircraft modified to train cosmonauts to fly the Buran reusable spacecraft, the Soviet equivalent of the US Space Shuttle. The Tu-154 was used because the Buran required a steep descent, which the Tu-154 was capable of replicating. The cabin featured trainee workstations, one of which was identical to the Buran's flightdeck. The forward baggage compartment was converted into a camera bay, as the aircraft was used to train cosmonauts in observation and photographic techniques.

- **Tu-154M-ON monitoring aircraft:** Germany modified one of the Tu-154s it inherited from the former East German Air Force into an observation airplane. This aircraft was involved with the Open Skies inspection flights. It was converted at the Elbe Aircraft Plant (Elbe Flugzeugwerke) in Dresden, and flew in 1996. After 24 monitoring missions, it was lost in a mid-air collision in 1997. The Russians also converted a Tu-154M to serve as an Open Skies monitoring aircraft. They used the Tu-154M-LK-1, and converted it to a Tu-154M-ON. When not flying over North America, it is used to ferry cosmonauts. China is believed to have converted one Tu-154 to an electronic countermeasures aircraft.
- **Tu-154M-100:** Design of this variant started in 1994, but the first aircraft were not delivered until 1998. It is an upgraded version with Western avionics, including the Flight Management Computer, GPS, EGPWS, TCAS, and other modern systems. The airplane could carry up to 157 passengers. The cabin featured an automatic oxygen system and larger overhead bins. Three were produced, as payment of debts owed by Russia to Slovakia. Three aircraft were delivered in 1998 to Slovak Airlines, and sold back to Russia in 2003.
- **Tu-155:** A Tu-154 converted into a testbed for alternative fuels. It first flew in 1988 and was used until the fall of the Soviet Union, when it was placed in storage.
- **Tu-164:** Initial designation of the Tu-154M.
- **Tu-174:** Proposed stretched version of Tu-154.
- **Tu-194:** Proposed shortened version of Tu-154.

System

Alternate Designation(s): Tu-154B; NATO: Careless-B

Primary Function / Type: Jet Airliner

Manufacturer: Tupolev

Crew: 3 flight crew + 5 cabin crew

Passengers: 144-168 passengers

Number of Engines: 3

Number of Hard Points: INA

Dimensions

Length: 48.00 m

Height: 11.40 m

Wingspan: 37.55 m

Wing Area: 201.45 sq m

Cabin Volume: 163.2 cu m

Weight, Empty: 55,300 kg

Weight, Maximum Takeoff: 100,000 kg

Payload: 18,000 kg

Automotive

Engine Name: 3 x Kuznetsov NK-8-2U

Number of Engines: 3

Engine Type: Turbofan

Engine Power: 10,500 kg static thrust each

Maximum Internal Fuel Capacity: 47,000 liters

Maximum Speed: 950 km/h

Economical Speed: 900 km/h

Long-Range Speed: 850 km/h

Takeoff Safety Speed: 255 km/h

Landing at Threshold Speed: 225 km/h

Laser Desingator: INA

Navigation Radar: INA

Protection

Stealth Properties: None

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

Tu-154B As the original Tu-154 and Tu-154A suffered wing cracks after a few years in service, a version with a new, stronger wing, designated Tu-154B, went into production in 1975. It also had an additional fuselage fuel tank, additional emergency exits in the tail. Also, the maximum takeoff weight increased to 98,000 kg (216,053 lb). Important to Aeroflot was the increased passenger capacity, hence lower operating costs. With the NK-8-2U engines the only way to improve the economics of the airplane was to spread costs across more seats. The autopilot was certified for ICAO Category II automatic approaches. Most previously built Tu-154 and Tu-154A were also modified into this variant, with the replacement of the wing. Maximum takeoff weight increased to 96,000 kg (211,644 lb). 111 were built. The Tupolev Tu-154 (Russian: Туполев Ту-154; NATO reporting name: "Careless") is a three-engine medium-range narrow-body airliner designed in the mid-1960s and manufactured by Tupolev. A workhorse of Soviet and (subsequently) Russian airlines for several decades, it carried half of all passengers flown by Aeroflot and its subsidiaries (137.5 million/year or 243.8 billion passenger km in 1990), remaining the standard domestic-route airliner of Russia and former Soviet states until the mid-2000s. It was exported to 17 non-Russian airlines and used as a head-of-state transport by the air forces of several countries. With a cruising speed of 850 kilometres per hour (530 mph) the Tu-154 is one of the fastest civilian aircraft in use and has a range of 5,280 kilometres (3,280 mi). Capable of operating from unpaved and gravel airfields with only basic facilities, it was widely used in the extreme Arctic conditions of Russia's northern/eastern regions where other airliners were unable to operate. Originally designed for a 45,000-hour service life (18,000 cycles) but capable of 80,000 hours with upgrades, it was expected to continue in service until 2016, although noise regulations have restricted flights to western Europe and other regions. Since 1968 there have been 39 fatal incidents involving the Tu-154, most of which were caused either by factors unrelated to the aircraft, incorrect maintenance, or by its extensive use in demanding conditions. Few of the Tu-154 accidents appear to have involved technical failure. The Tu-154 is powered by three rear-mounted low-bypass turbofan engines arranged similarly to those of the Boeing 727, but it is slightly larger than its American counterpart. Both the 727 and the Tu-154 use an S-duct for the middle (Number 2) engine. The original model was equipped with Kuznetsov NK-8-2 engines, which were replaced with Soloviev D-30KU-154 in the Tu-154M. All Tu-154 aircraft models have a relatively high thrust-to-weight-ratio which give excellent performance, at the expense of lower fuel efficiency. This became an important factor in later decades as fuel costs grew. The cockpit is fitted with conventional dual yoke control columns. Flight control surfaces are hydraulically operated. The cabin of the Tu-154, although of the same six-abreast seating layout, gives the impression of an oval interior, with a lower ceiling than is common on Boeing and Airbus airliners. The passenger cabin accommodates 128 passengers in a two-class layout and 164 passengers in single-class layout, and up to 180 passengers in high-density layout. The layout can be modified to what is called a winter version where some seats are taken out and a wardrobe is installed for passenger coats. The passenger doors are smaller than on its Boeing and Airbus counterparts. Luggage space in the overhead compartments is very limited. Like the Tupolev Tu-134, the Tu-154 has a wing swept back at 35° at the quarter-chord line. The British Hawker Siddeley Trident has the same sweepback angle, while the Boeing 727 has a slightly smaller sweepback angle of 32°. The wing also has anhedral (downward sweep) which is a distinguishing feature of Russian low-wing airliners designed during this era. Most Western low-wing airliners such as the

contemporary Boeing 727 have dihedral (upward sweep). The anhedral means that Russian airliners have poor lateral stability compared to their Western counterparts, but also are more resistant to Dutch roll tendencies. Considerably heavier than its predecessor Soviet-built airliner the Ilyushin Il-18, the Tu-154 was equipped with an oversized landing gear to reduce ground load, enabling it to operate from the same runways. The aircraft has two six-wheel main bogies fitted with large low-pressure tires that retract into pods extending from the trailing edges of the wings (a common Tupolev feature), plus a two-wheel nose gear unit. Soft oleo struts (shock absorbers) provide a much smoother ride on bumpy airfields than most airliners, which very rarely operate on such poor surfaces. The original requirement was to have a three-person flight crew – captain, first officer and flight engineer – as opposed to a four- or five-person crew, as on other Soviet airliners. It became evident that a fourth crew member, a navigator, was still needed, and a seat was added on production aircraft, although their workstation was compromised due to the limitations of the original design. Navigators are no longer trained and this profession is becoming obsolete with the retirement of the oldest Soviet-era planes. The latest variant (Tu-154M-100, introduced 1998) includes an NVU-B3 Doppler navigation system, a triple autopilot, which provides an automatic ILS approach according to ICAO category II weather minima, an autothrottle, a Doppler drift and speed measure system (DISS), and a "Kurs-MP" radio navigation suite. A stability and control augmentation system improves handling characteristics during manual flight. Modern upgrades normally include modernised TCAS, GPS, and other systems (mostly American-made or EU-made). Early versions of the Tu-154 cannot be modified to meet the current Stage III noise regulations and are no longer allowed to fly into airspace where such regulations are enforced, such as the European Union. However, the Tu-154M's D-30 engines can be fitted with hush kits, allowing them to meet noise regulations.

JZ-6 Chinese Reconnaissance Fighter Aircraft

Tiers:

1 2 3 4

System

Alternative Designations: JZ-6
Crew: 1 (pilot)
Vertical Climb Rate (m/s): 152+
Max “G” Force (g): 8
Ceiling (m): 19870
Note: Dedicated reconnaissance version with fuselage camera pack replacing cannon.

↳*Engines*

5,732 lbs. thrust Shenyang Wopen-6 turbojets (7,165 lbs. thrust with afterburner): 2

↳*Weight (kg)*

↳*Speed (km/h)*

Cruise: 950

↳*Fuel (liters)*

Internal: 2170
External (2 drop tanks): 800 or 1,520

↳*Range (km)*

Normal: 1390
With 2 x 760 L drop tanks: 2200

↳*Dimensions (m)*

Wingspan: 9.2
Height: 3.9

↳*Hardpoints*

Underwing: 6

↳*Survivability/Countermeasures*

Martin-Baker zero/zero ejection seats: Yes
Cockpit is pressurized: Yes
Fluid anti-icing system for windscreen: Yes
Tail warning system: Yes

ARMAMENT

30-mm automatic cannons: 3
250 kg Bombs, or: 2
400-L drop tanks, or: 2
760-L drop tanks, or: 2
CAA-1B AAM: 2

↳*Inboard Stations*

8 x 57-mm rockets, or: 4
16 x 57-mm rockets, or: 4
7 x 90-mm rockets, or: 4
Gun pods, or: 4
Practice bomb: 4

AVIONICS/SENSOR/OPTICS

Airborne interception radar: Yes
VHF transceiver: Yes
Blind-flying equipment,: Yes
Radio compass: Yes
Radio altimeter: Yes
Night/Weather Capabilities: No

VARIANTS

↳*J-6*

Description: EQUIVALENT OF THE MIG-19S/SF DAYTIME FIGHTER WITH 3 X 30 MM GUNS, ONE AT EACH WING ROOT AND ONE ON THE FUSELAGE.

↳*J-6A*

Description: EQUIVALENT OF THE MIG-19PF ALL-WEATHER FIGHTER. ARMED WITH STANDARD J-6 GUNS AND ROCKETS.

↳*J-6B*

Description: EQUIVALENT OF THE MIG-19PM ALL-WEATHER FIGHTER. ARMED WITH THE AA-1 ALKALI RADAR HOMING MISSILES, NO GUNS.

↳*J-6C*

Description: SIMILAR TO THE J-6, BUT WITH BRAKE CHUTE HOUSED IN BULLET-FARING AT THE BASE OF TAILFIN. SAME GUNS AS THE J-6A. EXPORT VARIANT WITH MARTIN-BAKER EJECTION SEATS AND AIM-9 SIDEWINDER MISSILES.

↳*J-6XIN*

Description: SIMILAR TO J-6A, BUT WITH NOSE-MOUNTED INTERCEPTION RADAR. SAME GUNS AS THE J-6A.

↳*JJ-6*

Description: TRAINER VERSION WITH TANDEM TWO-SEAT COCKPIT. EXPORT VERSIONS ARE FT-6. ARMED WITH ONLY THE FUSELAGE GUN.

↳*JZ-6*

Description: A TACTICAL PHOTO-RECONNAISSANCE VERSION, ARMED WITH WING ROOT GUNS ONLY.

↳*F-6*

Description: EXPORT VERSIONS.

Notes:

Shenyang JZ-6 – (Jianjiji Zhenchaji – reconnaissance fighter) Dedicated reconnaissance version with fuselage camera pack replacing cannon. As of April 2006, it was reported that the PLAAF 3rd Recon Regiment, 26 Air Division based in Nanjing MR, is the last regiment to actively fly the JZ-6 refusing to convert to JZ-8F. Exported as the Shenyang FR-6. The Shenyang J-6 (Chinese: □-6; designated F-6 for export versions; NATO reporting name: Farmer) is the Chinese-built version of the Soviet MiG-19 'Farmer' fighter aircraft, the world's first mass-produced supersonic aircraft. Although the MiG-19 had a comparatively short life in Soviet service, the Chinese came to value its agility, turning performance, and powerful cannon armament, and produced it for their own use between 1958 and 1981. While the basic Soviet-built MiG-19 has been retired from all nations, the Shenyang J-6 still flies for nine of its original 15 operators, however, in a very limited capacity. The J-6 airframe contributed to the Chinese ground attack version, the Q-5, which still flies for numerous nations. The J-6 was considered "disposable" and was intended to be operated for only 100 flight hours (or approximately 100 sorties) before being overhauled. The Pakistan Air Force was often able to extend this to 130 hours with diligent maintenance. The J-6 has a maximum speed at altitude of 1,540 km/h (960 mph), Mach 1.45. Service ceiling is 17,900 m (58,700 ft). Combat radius with two drop tanks is about 640 km (400 mi). Powerplant is two Liming Wopen-6A (Tumansky R-9) turbojet engines. In addition to the internal cannon armament, most have provision for four wing pylons for up to 250 kg (550 lb) each, with a maximum ordnance load of 500 kg (1,100 lb). Typical stores include unguided bombs, 55 mm rocket pods, or PL-2/PL-5 (Chinese versions of Soviet K-13 (NATO AA-2 'Atoll') air-to-air missiles.

JZ-8F (Finback-B) Chinese Reconnaissance Fighter Aircraft

Tiers:

1 2 3 4

Variants:

- **J-8 (Finback-A) Series:** J-8 First flew on 5 July 1969. Initial day fighter variant, resembles an enlarged MiG-21. Equipped with 2 x WP-7A turbojet engines, SR-4 ranging radar 2 x Type 30-I 30mm cannon (200 rounds each), and 2 x PL-2 IR-guided AAMs. Limited production. J-8I First flew on 24 April 1981. Improved all-weather version with SL-7A fire-control radar (40 km range), twin-barrel Type 23-III 23 mm cannon, & up to 4 AAMs (or rockets/bombs). Limited production. J-8E Final version of the J-8I series. J-8E is equipped with a type 204 (JL-7) mono-pulse fire-control radar with look down shot down capability, SM-8A aeronautical optical gun-sight, onboard computer, new cockpit panel, and redesign ejection escape system and oxygen supply system. The original two Type 30-I 30mm cannons were replaced by two Type 23-III 23mm cannons. The four under-wing stores stations are capable of carrying the more advanced PL-5 series short-range AAM. These aircraft were also fitted with an improved electronic countermeasures (ECM) suite including KJ-8602B all-aspect radar warning receiver (RWR). JZ-8 (J-8R) Reconnaissance version of J-8 or J-8I. J-8ACT First flew on 24 June 1990, fly-by-wire testbed aircraft.
- **J-8II (Finback-B) Series:** J-8II (Finback-B) First flown on 12 June 1984, the improved J-8I prototype with redesigned nose/front section and fuselage. replacing the nose air inlet with a solid nose and lateral air intakes, similar to those of the MiG-23. China received several MiG-23s in the late 1970s from Egypt and the hinged ventral fin and lateral intakes indicate probable reverse engineering from the MiG-23. Equipped with Type 208 (SL-4A) monopulse radar (40 km range). J-8II Batch 02 (J-8IIB) First flew in November 1989, improved J-8II with SL-8A (Type 208?) PD radar (70 km range). Powered by 2 x WP-13AII turbojet engines. Armed with twin-barrel 23mm Type 23-III cannon (copy of GSh-23L) and up to 4 PL-5 or PL-8 AAMs (or rockets/bombs). No BVR capability. Peace Pearl J-8 (J-8II) During the Sino-US cooperation era, up to 50 J-8IIs were to be delivered to the US for upgrades and installation of AN/APG-66(v) radar and fire control system for US$500 million, under the Peace Pearl programme. However, the project was cancelled and only about 24 J-8II were produced. USAF Air Force Flight Test Center (6510 Squadron) took the task of test flight of modified J-8II. -8IIACT (J-8II-BW2. First flew in 1988, fly-by-wire testbed and technology demonstrator. J-8IID (J-8D) First flew on 21 November 1990, modified J-8B with fixed refuelling probe and updated avionics such as TACAN navigation system. F-8IIM Unveiled in Zhuhai Air Show 1996, export version of J-8B with Russian Phazotron Zhuk-8II PD radar (75 km range, and able to track up to ten airborne targets and attack two of them simultaneously), R-27R1 (AA-10) AAM and Kh-31P anti-radiation missile. The F-8IIM was to be powered by two, more powerful WP-13B turbojet engines. This aircraft is often mistakenly referred to as the "J-8IIM" with Kh-31A anti-ship missile (ASM) capability, but its radar lacked sea search mode for anti-shipping role. The F-8IIM failed to attract any export customers and no domestic orders. Conversion from older airframe was reportedly much fewer than the 100 units of Zhuk-8II radar delivered, and the conversion might have only been an experimental programme with none entering service. The F-8IIM fighter will probably be equipped with Russia's or China's helmet sight and advanced PL-9 and P-73 missiles. Phazotron, a Russian firm, has signed contracts with China to provide 150–200 improved Zhuk radars mainly in support of China's new F-8II fighter. J-8III (J-8C) Upgraded J-8II with FBW system and 2 x WP-14 power plants. Compared to the J-8II, the J-8C had a number of improvements including a new multi-mode pulse Doppler radar which was reportedly based on the Israeli Elta EL/M 2035 radar technology. The aircraft was also equipped with a digital fire-control system and a new 'glass' cockpit with multifunctional displays (MFD). The J-8C programme entered full scale development around 1991 and the aircraft first flew successfully on 12 December 1993. Development halted in favour of other version described below, but was used to test new radars such as Type 1471 (KLJ-1) and other avionics associated with FBW system. From this version on, electronic warfare pods such as BM/KG300G and KZ900, as well as navigational / targeting pods including Blue Sky navigation pod and FILAT become operational on J-8II. Canceled after 2nd testbed had crashed. J-8IIF (J-8F) It is reported that during 2006–2008, J-8II production suffered major setback due to engine problem. J-8IIG Modified J-8II with tail hook and other improvements for developmental work on ship-borne aircraft for carrier operations, such as in April 1987, evaluating & testing the Chinese reverse-engineered steam catapult from that of HMAS Melbourne (R21), which

was finally confirmed 27 years later in April 2014 by CCTV-13. Both the take-off and landing were conducted on land with the reverse engineered steam catapult installed on the beach, and the test pot was PLANAF pilot Li Guoqiang (□□□). Experience gained was applied to Shenyang J-15. J-8G An advanced modified variant of the J-8II tasked with the suppression of enemy air defence (SEAD) mission was said to have been developed by the SAC in the 2000s. The aircraft, reportedly designated J-8G, was said to be capable of carrying two indigenous YJ-91 anti-radiation missile and electronic warfare suite to attack enemy radar stations. J-8IIM (2006) At Zhuhai Air Show 2006, a new variant "J-8IIM" was put on display with upgraded systems similar to the J-8H. The most significant improvement is the radar upgrade with a new Type 1471 domestic radar used by the J-8H. In comparison to F-8IIM's Russian Zhuk-8II radar, the Type 1471 radar has a number of performance enhancements: Type 1471 radar has 75 km maximum range for targets with 3 square meters RCS, in comparison to Zhuk-8II's 70 km maximum range against target of 5 square meters RCS. Additional ability to handle sea-borne targets that Zhuk-8II does not have. For sea targets with 50 square metres RCS, the max range is greater than 100/80 km for sea state 1/2. Simultaneously tracking 10 targets and display 8 most threatening ones out of the 10 on displays, engaging 2 out the 8. Air-to-Air modes: VS (Velocity Search), RWS (Recon./Search while Scan), TWS (Track While Scan), STT (Single Target Tracking), Air Combat Mode (ACM). AMTI, (aerial moving target indication) mode which is used to discover hovering helicopters can be added upon customer request, though this does not come as standard feature. Air-to-Ground modes: Mapping (Real Beam Mapping RBM), Mapping Expansion/Freezing (EXP/FRZ), Doppler Beam Sharpening (DBS), Ground Moving Target Indication (GMTI), Sea Single Target Tracking (SSTT), Air-to-Ground Ranging (AGR). An improved beacon navigation (BCN) and weather (WX) capability. JZ-8F A reconnaissance version of the J-8F with internal camera in the forward fuselage replacing the cannon. J-8T Upgraded J-8 with JL-10A X-band radar. Export variant, F-8T, has WP-13B-II engines. China National Aero-Technology Import & Export Corporation claims J-8T is equipped with improved integrate avionic and various guided weapons. J-8T can carry out air-to-air BVR intercepting mission, air-to-ground precise attacking mission and stand-off attacking mission. J-8DF J-8D upgraded to J-8F standard. Lack of cooling duct below intake. Can fire PL-12 and PL-8 missiles.

System

Notes:

JZ-8F A reconnaissance version of the J-8F with internal camera in the forward fuselage replacing the cannon. The Shenyang J-8 (Chinese: □-8; NATO reporting name: Finback) is a high-speed, high-altitude Chinese-built single-seat interceptor fighter aircraft. The effort to develop an all-weather interceptor began in full in 1964 and this produced the first Chinese-designed and built jet fighter to combat new, high altitude threats such as the B-58 Hustler bomber, F-105 Thunderchief fighter-bomber and Lockheed U-2 spy plane. In 1964 the People's Liberation Army Air Force requested an aircraft from Shenyang Aircraft Corporation and the 601 Institute to develop a fighter/interceptor to counter bombers and spy planes as the newly introduced Chengdu J-7 (a reverse-engineered MiG-21) was incapable of doing so. The prototype took its maiden flight in 1969. Despite the mid-1960s origins of the J-8, due to the political turmoil of the Great Proletarian Cultural Revolution, the J-8 was not produced until 1979 and entered service in 1980. Its basic configuration resembles an enlargement of the delta-winged J-7, utilizes two Liyang (LMC) Wopen-7A turbojet engines, and features a maximum speed of Mach 2.2. The twin-engined J-8 competed with rival Chengdu Aircraft Industry Group's single turbofan engine, canard-delta J-9 project and ultimately emerged as the victor largely due to the existing availability of the former's MiG-21 based powerplant and proven layout, while the J-9 project was cancelled in 1980 due to difficulty in creating a suitably powerful engine. In order to house a large radar set, the design called for a solid nose and variable geometry side air intakes. However, the lack of familiarity with this type of intake meant the J-8 had to settle for a MiG-21 style nose intake. The solid nose J-8 was finally realized in the J-8II (Finback-B), which was based on the layout of the J-8I (same improvement is like the J-6 to Q-5). The radar chosen for the J-8 was the Type 204 mono-pulse fire-control radar, a primitive ranging radar for daylight within-visual-range operations. The performance of the radar fell well short of the PLAAF's requirements as research into a more capable fire control radar and power source proved difficult and time-

consuming. The aircraft was originally armed with cannons and seven hardpoints for missiles, bombs, rockets or fuel tanks. The original weapons layout of the J-8 was two 30 mm Type 30-1 cannons after initial problems with the 30 mm Type 30-II four-barrel Gatling gun. The J-8 was also planned to be armed with the experimental PL-4 medium ranged missile but technical issues and political upheavals prevented any in-depth development and the project was cancelled in 1985 citing unsatisfactory performance. Therefore, the PL-2 IR-homing short-range air-to-air missile (SRAAM) was used instead. Unguided bombs and rockets can also be carried on the J-8. And nowadays with the development of light-weight military nuclear weaponry, the J-8II will now be able to carry missiles with nuclear warheads. Despite entering service relatively recently, it was comparable to many older Soviet fighter designs, with limited maneuverability. The original combat avionics package was soon replaced with an all-weather capability in aircraft designated J-8I (Finback-A). The J-8I (later redesignated as the J-8A) received a new gun sight, onboard computer, new cockpit design and redesigned ejection escape system and oxygen supply system. The gun armament was also changed from two 30 mm cannons to a single 23 mm twin-barreled cannon and the PL-5 short ranged AAM was also equipped. The later J-8E featured improved electronic warfare systems. The unsatisfactory performance of the J-8I led to a very short production run of 20–50 aircraft and the J-8I has slowly began being phased out as early as the 1990s. A tactical reconnaissance variant of the J-8, known as the JZ-8 was developed in the mid 1980s to take advantage of the J-8s few favourable qualities, most notably its capability of reaching high speeds and altitudes to replace the Shenyang JZ-6 in the tactical reconnaissance role. Using an under-fuselage reconnaissance pod with a KA-112A long focal-length optical camera, the JZ-8 usually operates at heights ranging from ~9,500m-15,000m during reconnaissance missions. By 1982 work began to replace the unimpressive J-8I type with a new design known as the J-8II. The new 1982 requirements from the PLAAF demanded being capable of beyond visual range combat (BVR) with the use medium ranged missiles (MRAAM) and secondary ground attack capabilities. In terms of performance, the aircraft was expected to have better aerodynamic performance at medium to low altitudes and at transonic speeds.

HZ-5 Chinese Reconnaissance Aircraft

Tiers:

Variants:

- **Il-28 Beagle:** This was the original Soviet light bomber from which the H-5 is derived. See separate database entry.
- **H-5:** This is the basic bomber in a three-seat configuration.
- **HD-5 electronic warfare aircraft:** This variant was designed for electronic warfare missions. The twin 23-mm cannon turret was removed to make room for the electronic warfare/electronic countermeasures suite. The EW/ECM suite, which reportedly utilized only analog technology, could intercept, identify and jam hostile land-based or shipborne radar emitters. The HD-5 usually operated in groups of three to cover all frequency spectrums. Despite its aging technology, the powerful jammer onboard the aircraft was said to be very effective. The HD-5 was replaced by a more capable EW/electronic intelligence platform based on the Y-8 airframe.
- **HJ-5 Mascot:** This was a two-seat trainer version. First flight occurred in December 1970, and it entered service in 1972. The type was retired in 1986.
- **HZ-5:** This was a three-seat reconnaissance version.

System

Alternate Designation(s): HZ-5
Primary Function / Type: Photographic Reconnaissance Aircraft
Manufacturer: Harbin Aircraft Manufacturing Corp., Harbin, China
Crew: 3 (pilot, navigator, radio operator/gunner)
Number of Engines: 2
Number of Hard Points: 4

Dimensions

Length: 17.65 m
Height: 6.68 m
Width (Wing Span): 21.45 m
Wing Area: 60.87 m sq
Weight, Empty: 12,890 kg
Weight, Maximum Takeoff: 21,200 kg
Weight, Maximum Weapons Load: 3,000 kg
Weight, Normal Weapons Load: 1,000 kg

Automotive

Engine Name: 2 x Wopen-5
Number of Engines: 2
Engine Type: Turbojet
Engine Power: 5,952 lb (2,700 kg) static thrust each
Fuel Capacity: 7,910 liters
Maximum Speed: 900 km/h
Cruising Speed: 769 km/h
Ceiling: 12,500 m
Rate of Climb: 900 m/min
Maximum Range: 3,550 km
Radius: 1,100 km

Main Gun System

↳*System*

Name: Nudelman-Rikhter NR-23
Type: Autocannon
Caliber: 23mm
Quantity: 4 x 23-mm NR-23 cannon (2 fixed in nose and two in tail position)
Length: 1,980 mm
Barrel Length: 1,450 mm
Width: 165 mm
Height: 136 mm
Weight: 39 kg
Barrels: 1
Action: Short recoil
Rate of Fire: 800–850 rpm
Muzzle Velocity: 690 m/s

↳*Ammunition*

Type: Rifle
Caliber: 23mm
Cartridge: INA
Basic Load: 650 Rounds

Bombing System

Note: The fuselage Bomb Bay has been modified to support 2 large medium-High Altitude day and night aerial cameras.

Fire Control / Avionics

Fire Control System Type: INA

Fire Control Radar: INA

Laser Desingator: INA

Photo Reconnaissance System: The main modifications were the addition of 2 large medium-high altitude day and night, aerial cameras inside the fuselage bomb bay and wing integral fuel tanks.

Protection

Stealth Properties: None

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

HZ-5 This was a photographic reconnaissance aircraft retrofitted from a H-5 prototype aircraft. Its design was started in December 1970 and was certificated in 1977. The main modifications were the addition of 2 large medium-high altitude day and night, aerial cameras inside the fuselage bomb bay and wing integral fuel tanks. Compared with the prototype aircraft its range was increased by 47 per cent, combat radius by 50 per cent and endurance by 1 hour and 23 minutes. The success of the HZ-5 filled a gap in the field of short / medium reconnaissance aircraft.

MiG-25 (Foxbat) Russian Supersonic Interceptor and Reconnaissance Aircraft

Tiers:

Variants:

- **MIG-25 FOXBAT-A:** STANDARD INTERCEPTOR VERSION. WITHDRAWN FROM SERVICE IN RUSSIA IN THE 1990S.
- **MIG-25R FOXBAT-B:** RECONNAISSANCE VERSION.
- **MIG-25RB FOXBAT-B:** RECONNAISSANCE-BOMBER VERSION BUILT IN 1970.
- **MIG-25U FOXBAT-C:** TWO-SEAT TRAINER VERSION.
- **MIG-25RBK FOXBAT-D::** RECONNAISSANCE-BOMBER VERSION WITH SLAR.
- **MIG-25P/PD FOXBAT-E:** INTERCEPTOR WITH IMPROVED RADAR THAT HAS LIMITED LOOK-DOWN/SHOOT-DOWN CAPABILITY, IR SENSOR UNDER THE NOSE, AND UPGRADED ENGINE.
- **MIG-25BM FOXBAT-F:** FIGHTER/ATTACK VERSION WITH AS-11 KILTER ANT-RADAR MISSILES AND FREE-FALL BOMBS TO ATTACK GROUND BASED AIR DEFENSE FROM HIGH ALTITUDES.

System

Alternative Designation: Mig-25 RB FOXBAT-B/ MiG-25PD FOXBAT-E
Crew: 1.0
Weight, Empty : kg20000.0
Weight, Maximum Gross : kg4120 (R Series version); 36720 (P Series version)
Weight, Normal Takeoff : kg35060.0

↳*Avionics/Sensor/Optics*

Type 1: Fire control radar in the nose, range 100 km, tracking 75 km

↳*Dimensions*

Height : m6 (R Series version); 6.1 P Series version)
Length : m21.6 (R Series version); 23.8 (P Series version)
Width, Wingspan : m13.4 (R Series version); 14 (P Series version)

↳*Fuel and Load*

Fuel Capacity, External : liters5300.0
Fuel Capacity, Internal : liters17470.0
Weight, Standard Payload, External : kg2000-5000

↳*Survivability/Countermeasures*

Type 1: pressurized cockpit with zero/130 – 1,250 km hour ejection seats

Type 2: Decoys:

Type 3: Radar jammer:

Type 4: radar and missile warning receivers:

Performance

Ceiling : m2300 (R Series version); 20700 (P Series version)

Power Plant/Engine: 19,400 lbs (2 ea.) thrust Soyuz/ Tumansky R-15BD-300 turbojet (24,692 lbs. thrust with afterburner)

Speed, Cruising : km/h2500 (R Series version); 3000 (P Series version)

Speed, Landing : km/h360 (R Series version); 290 (P Series version)

Speed, Maximum "G" Force : g4.5

Speed, Maximum, at altitude : km/h3000 (R Series version); 3390 (P Series version)

Speed, Maximum, low or sea level : km/h1200 (R Series version); 1050 (P Series version)

Takeoff Run/Landing Roll : m1250/800 (P Series)

Vertical Climb Rate : m/s208 (P Series version)

Armament

↳*Hardpoint/Weapon Station 1*

Location: wing

Quantity : ea4.0

↳*Hardpoint/Weapon Station 2*

Location: fuselage

Quantity : ea6.0

Type: AAM

↳***Mixed Ordnance 4***

Combat Load : rds2 and 4

Name: AA-7 APEX w/ AA-8 APHID/AA-11 ARCHER

Type: AAM

Notes:

The Mikoyan-Gurevich MiG-25 (Russian: Микоян и Гуревич МиГ-25; NATO reporting name: Foxbat) is a supersonic interceptor and reconnaissance aircraft that was among the fastest military aircraft to enter service. It was designed by the Soviet Union's Mikoyan-Gurevich bureau and is one of the few combat aircraft built primarily using stainless steel. It was the last plane designed by Mikhail Gurevich before his retirement. The first prototype flew in 1964, and the aircraft entered service in 1970. It has an operational top speed of Mach 2.83 (Mach 3.2 is possible but at risk of significant damage to the engines) and features a powerful radar and four air-to-air missiles. When first seen in reconnaissance photography, the large wing suggested an enormous and highly maneuverable fighter, at a time when U.S. design theories were also evolving towards higher maneuverability due to combat performance in the Vietnam War. The appearance of the MiG-25 sparked serious concern in the West and prompted dramatic increases in performance for the McDonnell Douglas F-15 Eagle then under development in the late 1960s. The capabilities of the MiG-25 were better understood in 1976 when Soviet pilot Viktor Belenko defected in a MiG-25 to the United States via Japan. It turned out that the aircraft's weight necessitated its large wings. Production of the MiG-25 series ended in 1984 after completion of 1,186 aircraft. A symbol of the Cold War, the MiG-25 flew with Soviet allies and former Soviet republics, remaining in limited service in several export customers. It is one of the highest-flying military aircraft, one of the fastest serially produced interceptor aircraft, and the second-fastest serially produced aircraft after the SR-71 reconnaissance aircraft that was built in very small series compared to the MiG-25. As of 2018, the MiG-25 remains the fastest manned serially produced aircraft in operational use and the fastest plane that was offered for supersonic flights and edge-of-space flights to civilian customers.

Y-8H1 Chinese Reconnaissance Aircraft

Tiers:

Variants:

- **Note:** Y-8 This was the original version. It was little different from the An-12 with a slightly modified glass nose copied from the design of the H-6 bomber. The cargo hold was not pressurized. Early production variants inherited the An-12 's tail turret, which mounts a twin 23-mm cannon, but this was later removed. Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. Y-8B This is the civilian version. First flight took place in 1990 and it was certified in 1993. Y-8C This variant has the pressurized cabin volume increased from 1,000 cu ft (28.3 cu m) to 7,500 cu ft (212.4 cu m). Landing gear and air conditioning are upgraded. The original inward-open two-piece cargo loading doors were replaced by a single-piece flat loading ramp similar to that of the C-130 . First flight occurred on Dec. 17, 1990. Shaanxi has also developed the Y-8CA radar testbed and Y-8CI export variant transport, the latter with Western avionics. Y-8D This is the export variant, fitted with Western avionics to meet the requirements for commercial flights. Onboard avionics include Collins flight director system (FDS), air data computer, VOR/ILS, comparing warning, TDR-90 air-traffic control receiver, VHF radio, Honeywell P-400 color weather radar, Litton LTN-311 Omega navigation system, Bendix/King HF communication, Sundsstrand universal flight data recorder (UFDR) and cockpit voice recorder (CVR). It is in service in Burma (Myanmar), Sri Lanka and Sudan. Y-8D II This is the latest export variant with avionics similar to those in the Y-8C. Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. Y-8F This is a livestock transport. It was certified on Jan. 26, 1994. Y-8F100 This is a commercial freighter version of the Y-8, featuring improved avionics. The aircraft features a redesigned cargo compartment, which can carry four international standard pallets of 88 in x 108 in, or eight pallets of 88 in x 54 in, or three pallets of 96 in x 125 in. The cargo compartment is also fitted with a modernized cargo handling system, allowing fast loading/unloading. Y-8F200 This is a commercial freighter version of the Y-8C, with upgraded avionics and a redesigned cargo compartment. The cargo handling system and large flat ramp enable rapid loading and unloading. Y-8F200W This variant features a fuselage that is 7 ft 3 in (2.2 m) longer than the baseline aircraft. The aircraft can take off from gravel or snow-covered runways at altitudes up to 9,840 ft (3,000 m) above sea level. It can also operate from unprepared runways. Y-8F400 This is a modernized freighter variant with upgraded avionics. It requires a three-man flight crew instead of the original five-man crew. The original glass nose was replaced by a solid nose. The cargo compartment is equipped with a 2,000-lb (1,000-kg) payload overhead cargo system, where the cargo can be suspended from an electrically powered rail. Rollers in the floor of the cargo compartment enable quick and easy handling of cargo pallets and can be removed to leave a flat surface. The compartment is fully pressurized. Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14, 2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system.The transport is powered by four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport

noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the undernose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. Y-8H This is an aerial survey and photography variant. Y-8J maritime surveillance aircraft These are Y-8C transports fitted with British Skymaster radars for maritime surveillance missions. China procured six to eight of the radars from Racal (now Thales) in 1996 deal worth US$66 million. At least two of the aircraft remain in Chinese naval service and are deployed at Dachang naval air base near Shanghai. The original glass nose on the Y-8 is replaced by a large radome to accommodate the radar antenna on the Y-8J. The rear cargo door and loading ramp are also removed. Y-8JB This is an electronic intelligence (ELINT) variant first seen in mid-2004 near Shanghai. A prototype first flew on Aug. 26, 2003, and four aircraft are in service with the Chinese navy. The aircraft has a large chin-mounted radome that could house a large ELINT antenna. Another SATCOM antenna may be installed inside a large semi-spherical dorsal fairing forward of the vertical tailfin providing real-time transmission to the ground base. Numerous smaller fairings can be seen on top of the cabin and along the upper sections of the aft fuselage, as well as at the nose tip. The loading ramp appears to have been sealed. The aircraft has been fitted with a BM/KZ800 ELINT system. Y-8X maritime patrol aircraft (MPA) This Y-8X is fitted with a Litton Canada APS-504 search radar, dual Litton LTN-72R inertial navigational system and a single LTN-211 Omega navigation set. The first example was delivered to the Chinese navy in late 1984, and the aircraft received national design certification in 1985. A small number have been in service since the mid-1980s. The aircraft is equipped with search radar, navigation system, self-defense electronic countermeasures (ECM) suite, optical/infrared cameras, sonobuoys and sonar receiver. The rear cargo door was removed and replaced by a large mission equipment window for sonobuoys racks and cameras. The rear turret was also removed and replaced by the sonar operator seat. A canoe-shaped fairing plus a couple of blade antennas appear to have been attached to the bottom of the middle and aft fuselage, suggesting the aircraft's electronic intelligence mission has been enhanced with a new synthetic aperture radar (SAR) capability. Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. KJ-200 This is an airborne early warning and control aircraft based on the Y-8F600 airframe. See separate record for more information. Y-8 tanker Flight Refueling Ltd. of the U.K. studied the possibility of converting the Y-8 into an in-flight refueling aircraft. No Y-8Ts are known to be in service. Y-8 airborne early warning aircraft This is a third Chinese airborne early warning aircraft program, following the KJ-2000 and KJ-200 (see separate records); it was revealed in 2005. Based on the Shaanxi Y-8F400 airframe, the aircraft features a conventional rotodome mounted above the fuselage. At least one prototype has been built and the program may be aimed at the export market. Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. ZDK-03 This variant, based on the Y-8F600, was designed specifically for the Pakistani air force for airborne early warning missions. It features an active electronically scanned array (AESA) radar. Islamabad has ordered four of the aircraft. The first unit was scheduled to be delivered by the end of 2010. See separate record for more information. GX-7 This is a Y-8 aircraft modified for psychological warfare missions. It is designed to broadcast messages over radio and television signals and can jam enemy communications. The GX-7 was first made public by Chinese media in July 2013. Y-8Q/Y-8GX6 This variant was first revealed in November 2011 and was reported in service in mid-2015. The Y-8Q features a redesigned wing and pressurized fuselage with composite structures; WJ-6C turboshaft engines; and high-efficiency, six-bladed propellers. It is distinguishable from other Y-8/Y-9 variants by a large chin-mounted sea search radar; electro-optical system behind the nose wheel; and a weapons bay just ahead of the main wheels. There is also a magnetic anomaly detector (MAD) boom and domed windows in the aft fuselage for observation. A fuselage weapons bay, located ahead of the main landing gear, would likely carry torpedoes. It has been speculated that the Y-8Q has fuselage sonobuoy dispensers and hardpoints on the wings for anti-ship missiles.

System

Alternate Designation(s): Y-8H1

Primary Function / Type: Reconnaissance Aircraft

Manufacturer: Shaanxi Aircraft Corporation

Crew: 6

Passengers: 96

Number of Engines: 4

Number of Hard Points: INA

Dimensions

Length: 34.02 m

Height: 11.16 m

Width (Wing Span): 38.00 m

Wing Area: 121.86 sq m

Cargo Area, Length: 13.5 m

Cargo Area, Width: 3.0 m

Cargo Area, Height: 2.4 m

Empty Weight: 35,500 kg

Maximum Payload Weight: 20,000 kg

Maximum Takeoff Weight: 61,000 kg

Automotive

Engine Name: 4 x Wojiang-6 turboprop

Number of Engines: 4

Engine Type: Turboprop

Engine Power: 4,250 equivalent hp each

Maximum Range: 5,615 km

Cruise Speed: 550 km/h

Maximum Speed: 662 km/h

Service Ceiling: 10,400 m

Rate of Climb: 600 m/min

Endurance: 10.5 hours

Fire Control / Avionics

FCS Name: INA

Computerized FCS: No

Navigation Radar: INA

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

Y-8H This is an aerial survey and photography variant. The Shaanxi Y-8 or Yunshuji-8 (Chinese: □-8) aircraft is a medium size medium range transport aircraft produced by Shaanxi Aircraft Corporation in China, based on the Soviet Antonov An-12. It has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. Although the An-12 is no longer made in Ukraine, the Chinese Y-8 continues to be upgraded and produced. An estimated 169 Y-8 aircraft had been built by 2010. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with license to assemble the aircraft locally. However, due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance. The Xi'an Aircraft Company and Xi'an Aircraft Design Institute worked to reverse engineer the An-12 for local production. Design of the aircraft was completed by February 1972. Major features of the Y-8 included a glazed nose and tail turret derived from that of the H-6 bomber, a roller-type palletized-cargo-handling device instead of the overhead conveyor, and a gaseous oxygen system as opposed to a liquid oxygen system. The original Y-8 inherited the An-12's twin 23mm cannon tail turret, but this was removed on subsequent variants. The Y-8 equipped with four turboprop engines mounted under the leading edges of non-swept wings. The wings are attached high on the fuselage, and the tricycle landing gear is equipped with low pressure tires. The earliest versions used for the transportation of freight or troops had two side-hinged, inward-opening doors, while later variants used a rearward-facing ramp to facilitate loading and unloading of the payload. Some specialized versions omit the cargo ramp entirely. The Y-8 is capable of carrying troops, dropping supplies, parachute drops, and functioning as an air ambulance. It also can be used for commercial uses as a freighter. It is capable of hauling 20 tons of cargo, approximately 96 soldiers, or about 82 paratroopers in the cargo compartment which is 13.5 metres long, 3 metres wide and 2.4 metres high. It can also carry 60 severely wounded soldiers with their stretchers, 20 slightly injured soldiers and 3 medical attendants. Many variants for specialized roles have been built, but information on them can be vague or difficult to obtain due to the secretive nature of the Chinese military. The Y-8 transport aircraft was put into trial production in the Xi'an Aircraft Factory in June 1972. By December 1974, the first Chinese-assembled Y-8 conducted its maiden flight. Following trial production of the first Y-8s, operations were transferred to the Shaanxi Aircraft Factory. The Shaanxi-produced Y-8s conducted their test flights in December 1975. After a regime of 66 test flights the Y-8 was officially certified for use by the Chinese government. By 1981, the Y-8 entered serial production.[2] Mr. Ouyang Shaoxiu (□□□□) would eventually become the general designer, designing many variants of Y-8, including KJ-2000. In the early 1980s, Chinese officials saw US Army recruiting advertisements featuring parachute extraction of an Army jeep along with troops. The PLA was told to develop this kind of capability. But there were two design problems. One, Y-8 wings have very sharp leading edges, so one wing tends to stall before the other, causing the aircraft to roll inverted as it stalls. The second design flaw as that the cargo deck of the Y-8 had a 10 degree downward slope starting at the landing gear. When the PLA Air Force started to test parachute extraction, these two design flaws caused a near disaster. The aircraft was flying too fast, and when the parachute started to extract cargo from the hold, the cargo rolled on the deck until it got to the 10 degree downward slope, and there it became airborne while still inside the aircraft. The cargo hit the top of the cargo door on the way out, making it clear that the Y-8 could not do parachute cargo extraction. In 1986, two engineers from Beijing's Ministry of Aviation visited Lockheed. They could not speak very much English, and the Lockheed-Georgia sales person who met them could not speak Chinese. So for half a day, they did a point-and-grunt tour until they were lucky enough to find a Lockheed employee who could speak Chinese. The Chinese wanted to purchase Lockheed wind tunnel testing on the Y-8 in order to address the stall problem. As a result of these wind tunnel tests, conducted in 1986, Lockheed was given a contract to do a flight test series on the Y-8. Lockheed was told that flight test data was not provided by the Soviets when they helped China build the Y-8 factory. The flight test series was flown by Lockheed test pilot Hank Dees. Hank had flown the test flight series for the Lockheed L-1011 and later for China's Y-12 in Harbin. During this flight test series, Hank Dees flew the aircraft to stall speed and taught Chinese pilots how to anticipate a stall in order to prevent letting the aircraft go inverted. As a result of this test flight series, Chinese pilots started to use the 45 degree flap position. Lockheed's motive for doing flight tests was to demonstrate that China would be better off buying the C-130 rather than trying to improve the Y-8. China did buy C-130's, but the flight test series actually demonstrated that the Y-8 was a more capable aircraft than previously believed. In the late 1980s, Lockheed Martin, the American manufacturer of the C-130 Hercules, helped China to develop a pressurized cabin for the passenger version of Y-8, resulting in two versions: the first had half of the cabin pressurized and later, the second version in which the complete cabin was pressurized. In 2001 and 2002, new consulting arrangements between Antonov and Shaanxi resulted in modernized redesigns to the Y-8's wing and fuselage. As a consequence the redesign allows the Y-8's fuel capacity to be increased by 50 percent.

JZ-8 (J-8R) Chinese Reconnaissance Fighter Aircraft

Tiers:

Variants:

- **J-8 (Finback-A) Series:** J-8 First flew on 5 July 1969. Initial day fighter variant, resembles an enlarged MiG-21. Equipped with 2 x WP-7A turbojet engines, SR-4 ranging radar 2 x Type 30-I 30mm cannon (200 rounds each), and 2 x PL-2 IR-guided AAMs. Limited production. J-8I First flew on 24 April 1981. Improved all-weather version with SL-7A fire-control radar (40 km range), twin-barrel Type 23-III 23 mm cannon, & up to 4 AAMs (or rockets/bombs). Limited production. J-8E Final version of the J-8I series. J-8E is equipped with a type 204 (JL-7) mono-pulse fire-control radar with look down shot down capability, SM-8A aeronautical optical gun-sight, onboard computer, new cockpit panel, and redesign ejection escape system and oxygen supply system. The original two Type 30-I 30mm cannons were replaced by two Type 23-III 23mm cannons. The four under-wing stores stations are capable of carrying the more advanced PL-5 series short-range AAM. These aircraft were also fitted with an improved electronic countermeasures (ECM) suite including KJ-8602B all-aspect radar warning receiver (RWR). JZ-8 (J-8R) Reconnaissance version of J-8 or J-8I. J-8ACT First flew on 24 June 1990, fly-by-wire testbed aircraft.
- **J-8II (Finback-B) Series:** J-8II (Finback-B) First flown on 12 June 1984, the improved J-8I prototype with redesigned nose/front section and fuselage. replacing the nose air inlet with a solid nose and lateral air intakes, similar to those of the MiG-23. China received several MiG-23s in the late 1970s from Egypt and the hinged ventral fin and lateral intakes indicate probable reverse engineering from the MiG-23. Equipped with Type 208 (SL-4A) monopulse radar (40 km range). J-8II Batch 02 (J-8IIB) First flew in November 1989, improved J-8II with SL-8A (Type 208?) PD radar (70 km range). Powered by 2 x WP-13AII turbojet engines. Armed with twin-barrel 23mm Type 23-III cannon (copy of GSh-23L) and up to 4 PL-5 or PL-8 AAMs (or rockets/bombs). No BVR capability. Peace Pearl J-8 (J-8II) During the Sino-US cooperation era, up to 50 J-8IIs were to be delivered to the US for upgrades and installation of AN/APG-66(v) radar and fire control system for US$500 million, under the Peace Pearl programme. However, the project was cancelled and only about 24 J-8II were produced. USAF Air Force Flight Test Center (6510 Squadron) took the task of test flight of modified J-8II. -8IIACT (J-8II-BW2. First flew in 1988, fly-by-wire testbed and technology demonstrator. J-8IID (J-8D) First flew on 21 November 1990, modified J-8B with fixed refuelling probe and updated avionics such as TACAN navigation system. F-8IIM Unveiled in Zhuhai Air Show 1996, export version of J-8B with Russian Phazotron Zhuk-8II PD radar (75 km range, and able to track up to ten airborne targets and attack two of them simultaneously), R-27R1 (AA-10) AAM and Kh-31P anti-radiation missile. The F-8IIM was to be powered by two, more powerful WP-13B turbojet engines. This aircraft is often mistakenly referred to as the "J-8IIM" with Kh-31A anti-ship missile (ASM) capability, but its radar lacked sea search mode for anti-shipping role. The F-8IIM failed to attract any export customers and no domestic orders. Conversion from older airframe was reportedly much fewer than the 100 units of Zhuk-8II radar delivered, and the conversion might have only been an experimental programme with none entering service. The F-8IIM fighter will probably be equipped with Russia's or China's helmet sight and advanced PL-9 and P-73 missiles. Phazotron, a Russian firm, has signed contracts with China to provide 150–200 improved Zhuk radars mainly in support of China's new F-8II fighter. J-8III (J-8C) Upgraded J-8II with FBW system and 2 x WP-14 power plants. Compared to the J-8II, the J-8C had a

number of improvements including a new multi-mode pulse Doppler radar which was reportedly based on the Israeli Elta EL/M 2035 radar technology. The aircraft was also equipped with a digital fire-control system and a new 'glass' cockpit with multifunctional displays (MFD). The J-8C programme entered full scale development around 1991 and the aircraft first flew successfully on 12 December 1993. Development halted in favour of other version described below, but was used to test new radars such as Type 1471 (KLJ-1) and other avionics associated with FBW system. From this version on, electronic warfare pods such as BM/KG300G and KZ900, as well as navigational / targeting pods including Blue Sky navigation pod and FILAT become operational on J-8II. Canceled after 2nd testbed had crashed. J-8IIF (J-8F) It is reported that during 2006–2008, J-8II production suffered major setback due to engine problem. J-8IIG Modified J-8II with tail hook and other improvements for developmental work on ship-borne aircraft for carrier operations, such as in April 1987, evaluating & testing the Chinese reverse-engineered steam catapult from that of HMAS Melbourne (R21), which was finally confirmed 27 years later in April 2014 by CCTV-13. Both the take-off and landing were conducted on land with the reverse engineered steam catapult installed on the beach, and the test pot was PLANAF pilot Li Guoqiang (□□□). Experience gained was applied to Shenyang J-15. J-8G An advanced modified variant of the J-8II tasked with the suppression of enemy air defence (SEAD) mission was said to have been developed by the SAC in the 2000s. The aircraft, reportedly designated J-8G, was said to be capable of carrying two indigenous YJ-91 anti-radiation missile and electronic warfare suite to attack enemy radar stations. J-8IIM (2006) At Zhuhai Air Show 2006, a new variant "J-8IIM" was put on display with upgraded systems similar to the J-8H. The most significant improvement is the radar upgrade with a new Type 1471 domestic radar used by the J-8H. In comparison to F-8IIM's Russian Zhuk-8II radar, the Type 1471 radar has a number of performance enhancements: Type 1471 radar has 75 km maximum range for targets with 3 square meters RCS, in comparison to Zhuk-8II's 70 km maximum range against target of 5 square meters RCS. Additional ability to handle sea-borne targets that Zhuk-8II does not have. For sea targets with 50 square metres RCS, the max range is greater than 100/80 km for sea state 1/2. Simultaneously tracking 10 targets and display 8 most threatening ones out of the 10 on displays, engaging 2 out the 8. Air-to-Air modes: VS (Velocity Search), RWS (Recon./Search while Scan), TWS (Track While Scan), STT (Single Target Tracking), Air Combat Mode (ACM). AMTI, (aerial moving target indication) mode which is used to discover hovering helicopters can be added upon customer request, though this does not come as standard feature. Air-to-Ground modes: Mapping (Real Beam Mapping RBM), Mapping Expansion/Freezing (EXP/FRZ), Doppler Beam Sharpening (DBS), Ground Moving Target Indication (GMTI), Sea Single Target Tracking (SSTT), Air-to-Ground Ranging (AGR). An improved beacon navigation (BCN) and weather (WX) capability. JZ-8F A reconnaissance version of the J-8F with internal camera in the forward fuselage replacing the cannon. J-8T Upgraded J-8 with JL-10A X-band radar. Export variant, F-8T, has WP-13B-II engines. China National Aero-Technology Import & Export Corporation claims J-8T is equipped with improved integrate avionic and various guided weapons. J-8T can carry out air-to-air BVR intercepting mission, air-to-ground precise attacking mission and stand-off attacking mission. J-8DF J-8D upgraded to J-8F standard. Lack of cooling duct below intake. Can fire PL-12 and PL-8 missiles.

Notes:

JZ-8 (J-8R) Reconnaissance version of J-8 or J-8I. The Shenyang J-8 (Chinese: □-8; NATO reporting name: Finback) is a high-speed, high-altitude Chinese-built single-seat interceptor fighter aircraft. The effort to develop an all-weather interceptor began in full in 1964 and this produced the first Chinese-designed and built jet fighter to combat new, high altitude threats such as the B-58 Hustler bomber, F-105 Thunderchief fighter-bomber and Lockheed U-2 spy plane. In 1964 the People's Liberation Army Air Force requested an aircraft from Shenyang Aircraft Corporation and the 601 Institute to develop a fighter/interceptor to counter bombers and spy planes as the newly introduced Chengdu J-7 (a reverse-engineered MiG-21) was incapable of doing so. The prototype took its maiden flight in 1969. Despite the mid-1960s origins of the J-8, due to the political turmoil of the Great Proletarian Cultural Revolution, the J-8 was not produced until 1979 and entered service in 1980. Its basic configuration resembles an enlargement of the delta-winged J-7, utilizes two Liyang (LMC) Wopen-7A turbojet engines, and features a maximum speed of Mach 2.2. The twin-engined J-8 competed with rival Chengdu Aircraft Industry Group's single turbofan engine, canard-delta J-9 project and ultimately emerged as the victor largely due to the existing availability of the former's MiG-21 based powerplant and proven layout, while the J-9 project was cancelled in 1980 due to difficulty in creating a suitably powerful engine. In order to house a large radar set, the design called for a solid nose and variable geometry side air intakes. However, the lack of familiarity with this type of intake meant the J-8 had to settle for a MiG-21 style nose intake. The solid nose J-8 was finally realized in the J-8II (Finback-B), which was based on the layout of the J-8I (same improvement is like the J-6 to Q-5). The radar chosen for the J-8 was the Type 204 mono-pulse fire-control radar, a primitive ranging radar for daylight within-visual-range operations. The performance of the radar fell well short of the PLAAF's requirements as research into a more capable fire control radar and power source proved difficult and time-consuming. The aircraft was originally armed with cannons and seven hardpoints for missiles, bombs, rockets or fuel tanks. The original weapons layout of the J-8 was two 30 mm Type 30-1 cannons after initial problems with the 30 mm Type 30-II four-barrel Gatling gun. The J-8 was also planned to be armed with the experimental PL-4 medium ranged missile but technical issues and political upheavals prevented any in-depth development and the project was cancelled in 1985 citing unsatisfactory performance. Therefore, the PL-2 IR-homing short-range air-to-air missile (SRAAM) was used instead. Unguided bombs and rockets can also be carried on the J-8. And nowadays with the development of light-weight military nuclear weaponry, the J-8II will now be able to carry missiles with nuclear warheads. Despite entering service relatively recently, it was comparable to many older Soviet fighter designs, with limited maneuverability. The original combat avionics package was soon replaced with an all-weather capability in aircraft designated J-8I (Finback-A). The J-8I (later redesignated as the J-8A) received a new gun sight, onboard computer, new cockpit design and redesigned ejection escape system and oxygen supply system. The gun armament was also changed from two 30 mm cannons to a single 23 mm twin-barreled cannon and the PL-5 short ranged AAM was also equipped. The later J-8E featured improved electronic warfare systems. The unsatisfactory performance of the J-8I led to a very short production run of 20–50 aircraft and the J-8I has slowly began being phased out as early as the 1990s. A tactical reconnaissance variant of the J-8, known as the JZ-8 was developed in the mid 1980s to take advantage of the J-8s few favourable qualities, most notably its capability of reaching high speeds and altitudes to replace the Shenyang JZ-6 in the tactical reconnaissance role. Using an under-fuselage reconnaissance pod with a KA-112A long focal-length optical camera, the JZ-8 usually operates at heights ranging from ~9,500m-15,000m during reconnaissance missions. By 1982 work began to replace the unimpressive J-8I type with a new design known as the J-8II. The new 1982 requirements from the PLAAF demanded being capable of beyond visual range combat (BVR) with the use medium ranged missiles (MRAAM) and secondary ground attack capabilities. In terms of performance, the aircraft was expected to have better aerodynamic performance at medium to low altitudes and at transonic speeds.

Skylark IV British Single Seat Sailplane

Tiers:

Winch Launch Speed: 131.5 km/h

G Limits: 222.2 km/h

Rate of Sink: 69.0 km/h

Lift-to-Drag: 75.9 km/h

Wing Loading: 23.35 kg/m2

Armament

Note: There is no armament onboard the Skylark IV.

Notes:

The Slingsby T.50 Skylark 4 was a British single seat competition glider built by Slingsby Sailplanes in the early 1960s. It sold in numbers and had success at national, though not world level competition. The Slingsby Skylark 4 is the final development of the Skylark series of gliders and was first manufactured in 1961 using a wing similar to that of the Skylark 3. About 30 Skylark 4s are still flying today (2010). Slingsby had introduced double curvature fuselage panels made of glass reinforced plastic (GRP) into their previous design, the T.49 Capstan and they remodelled the front of the wooden fuselage of the Skylark 3 in this material for the Skylark 4, introducing a reclining pilot's position and smoother canopy line. Though the previous wing planform, span and area was retained, its ailerons were extended to increase the rate of roll and the outer panels used a different airfoil section, the more cambered NACA 6415, to give a better lift distribution. The Skylark 4 has a high wing with a single inner section of parallel chord extending out almost to mid span, followed by outer sections with taper on the trailing edges. Ailerons filled almost all of the outer sections and airbrakes, operating in pairs above and below the wings, are mounted on the main spar in the inboard section. The wing is wooden, built around a main spar of Spruce and a lighter rear spar and Gaboon ply covered from this rear spar forward. Behind this spar the wing was fabric covered, though the ailerons were ply skinned. The Gaboon ply was applied diagonally across the ribs, which produced a very smooth wing-surface that is claimed to generate a laminar airflow. This in turn gives a best-glide ratio of 1:36 which is comparable with early fibreglass gliders. Behind the cockpit the fuselage is a semi-monocoque, elliptical in cross section and built around spruce frames with a plywood skin. The fuselage line no longer fell away rapidly behind the trailing edge, but continued straight to the tail, where tapered and clipped tailplane and elevators were mounted on top, far enough forward that the rudder hinge was behind the elevators. These surfaces were plywood covered. Fin and rudder together are tapered and flat topped; the fin is also ply-skinned, but the unbalanced rudder is fabric covered. Skylark 4 fuselage prepared for rigging at Borders Gliding Club, The undercarriage was conventional, with a nose skid, fixed monowheel and tail bumper. A simple-friction wheel brake is applied to the mainwheel by pulling on the air brake lever at the end of its furthest travel. The cockpit is immediately ahead of the wing leading-edge, enclosed with a lengthened perspex canopy, and the Skylark 4 was 80 mm (4 in) longer than its predecessor

Notes:

Single-seat single-engine high-wing monoplane with conventional three-axis control. Wing has upswept leading edge, swept forward trailing edge and tapering chord cruciform tail. Pitch control by elevator on tail; yaw control by fully flying rudder with additional fin; roll control by half-span ailerons; control inputs through stick for pitch/roll and pedals for yaw. Wing braced from above by kingpost and cables, from below by cables; wing profile 80% double-surface. Undercarriage has three wheels in tricycle formation with additional tailwheel; no suspension on nose wheel and steel-spring suspension on main wheels. Push-right go-right nose wheel steering connected to yaw control. No brakes. Aluminium-tube framework, with optional pod. Engine mounted below wing driving pusher propeller. Aluminium tubing to British HT3OTF specification. Polyester sailcloth. At the end of 1981, the Pathfinder appeared, and as the first 'fully conventional' British-designed three-axis microlight in quantity production, it found a ready market. By the time production ended in early 1983, some 70 aircraft had been built and the Pathfinder had gained a reputation for durability and good performance, qualities which were underlined by its performance in the 1982 London-Paris, in which nine started and nine finished, seven of them in the first ten. In addition, a Pathfinder piloted by Gerry Breen was joint winner of the speed award. The Pathfinder was normally sold with a 330 cc Robin EC34PM engine, but a number were built with a 440 cc Robin EC44. The 440 version was not intended as a high-performance option (though it was indeed faster) but was designed to provide good take-off and climb characteristics for pilots whose weight was close to the Pathfinder's 220 lb (100 kg) payload. Both versions of the Pathfinder were replaced by the Pathfinder II in early 1983, and as a result the earlier aircraft is now called Pathfinder I.

KJ-2000 (Mainring) Chinese Airborne Early Warning and Control Aircraft

Tiers:

Variants:

- **KJ-3000:** A new variant with a claimed fixed next generation radar was spotted in 2013.
- **KJ-200:** The KongJing-200 (KJ-200) is an airborne early warning and control aircraft based on the Y-8F600 airframe. It features a linear active electronically scanned array (AESA) radar similar to the Swedish PS-890 Erieye.

System

Alternate Designation(s): KJ-2000; NATO: Mainring
Primary Function / Type: Airborne Early Warning and Control Aircraft
Manufacturer: INA
Flight Crew: 5
Mission Crew: 10-15
Number of Engines: 4
Number of Hard Points: INA

Dimensions

Length: 46.6m
Width (Wing Span): 50.5m
Height: 14.8m
Empty Weight: 92,500kg
Maximum Take-Off Weight: 190,000kg.

Automotive

Engine Name: 4 x PS-90A

Number of Engines: 4

Engine Type: Turbofan Engine

Engine Power: Each engine generates a thrust of 16,000 kilogram-force (kgf).

Maximum Range: maximum flight range of approximately 5,000km.

Maximum Speed: 900km/h

Service Ceiling: Service ceiling of the aircraft is 10,200m

Endurance: 8 hours

Fire Control System / Avionics

FCS Name: INA

Computerized FCS: No

Radar System

Name: Type 88

Type: KJ-2000 early warning aircraft is equipped with an advanced, non-rotating, three-sided active electronically scanned array (AESA) radar system on top of the fuselage at the rear.

Frequency: 1,200 MHz to 1,400 MHz

Band: J-Band

Maximum Range: 479 km

Note: Three flat radar antennas are mounted in a triangular configuration and are enclosed in a disc-shaped, fixed round radar dome for protection against wind and other aerodynamic forces. Each radar antenna is steered electronically to provide 120° scan coverage in both azimuth and elevation angles.

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The KJ-2000 (Chinese: □□-2000; pinyin: Kōngjǐng Liǎngqiān; lit.: 'Airwarn-2000'), NATO reporting name: Mainring is a Chinese Airborne early warning and control system comprising domestically designed electronics and radars installed on a modified Ilyushin Il-76 airframe. The KJ-2000 development program started after the cancellation of the A-50I deal with Israel and Russia in July 2000, due to strong U.S. pressure regarding the Israeli radar that was to be mounted. China then went on to develop a domestic AWACS and the first aircraft made its maiden flight in 2003. Four KJ-2000 aircraft have been identified so far, but production of new aircraft will likely be delayed, dependent on the acquisition of IL-76 airframes. Currently, the Russian defense exporter Rosoboronexport has imposed a significant price hike on all future IL-76s delivered to China and India despite previous contracts. Both countries are currently in negotiation with Russia regarding this matter as of early 2008. In March 2011, Russia/China negotiations reached a new agreement to move production of IL-76s to Chinese owned companies, in this way it is

expected production can be run smoothly to supply China with new IL-76 airframes, while delivery of Soloviev D-30KP-2 engines is not affected by recent issues. Due to unreliable external supplier sources, China has developed a backup known as the KJ-200 by installing a simplified system on board the Shaanxi Y-8. This aircraft has a similar configuration to that of the KJ-2000 and is characterized by the triple tail-fin configuration (one large and two small). The Chinese AWACS has a phased array radar (PAR) carried in a round radome. Unlike the US AWACS aircraft, which rotate their rotodomes to give a 360-degree coverage, the radar antenna of the Chinese AWACS does not rotate. Instead, three PAR antenna modules are placed in a triangular configuration inside the round radome to provide a 360-degree coverage. The multi-function, three-dimensional pulse-Doppler radar was developed by NII (Nanjing Electronic Technology Research Institute), and is designed to detect and track airborne and surface targets. It operates in the frequency range of 1200–1400 MHz. The antenna system consists of three phased arrays, located in a 14-metre-diameter (46 ft) disc. In contrast, the Russian Beriev A-50 and American Boeing E-3 Sentry use a 9-metre-diameter (30 ft) disc. Each phased array has a 120-degree field of view. Maximum range of detection of air targets is 470 km (290 mi). A-50I of India made by Israel adopted its design and entered service later than KJ-2000(service 2004) in 2009.

Notes:

The Beriev A-50 (NATO reporting name: Mainstay) is a Soviet airborne early warning and control (AEW&C) aircraft based on the Ilyushin Il-76 transport. The existence of the A-50 was revealed to the Western Bloc in 1980 by Adolf Tolkachev. Developed to replace the Tupolev Tu-126 "Moss", the A-50 first flew in 1978. It entered service in 1984, with about 40 produced by 1992. The mission personnel of the 15-man crew derive data from the large Liana surveillance radar with its antenna in an over-fuselage rotodome, which has a diameter of 9 metres (30 ft). Detection range is 650 kilometres (400 mi) for air targets and 300 kilometres (190 mi) for ground targets. The A-50 can control up to ten fighter aircraft for either air-to-air intercept or air-to-ground attack missions. The A-50 is capable of flying four hours at 1,000 kilometres (620 mi) from its base at a maximum takeoff weight of 190 metric tons (420,000 lb). The aircraft can be refuelled by Il-78 tankers. The radar "Vega-M" is designed by MNIIP, Moscow, and produced by NPO Vega. The "Vega-M" is capable of tracking up to 150 targets simultaneously within 230 kilometres (140 mi). Large targets, like surface ships, can be tracked at a distance of 400 kilometres (250 mi). Development work on the A-50U began in 2003 and state tests started on 10 September 2008, using a Russian Air Force A-50 '37 Krasnyy' as a prototype. The main element of the modernisation involves replacing the outdated analogue equipment with a new, digital avionics suite supplied by Vega Radio Engineering Corporation. Notable improvements include faster data processing, enhanced signal tracking, and improved target detection. Crew rest, toilet and galley facilities are also included in the upgrade. After completing the joint state tests, Beriev has delivered the first A-50U to the Russian Air Force. The aircraft, '47 Krasnyy'/RF-92957, was handed over at Beriev's facility in Taganrog on 31 October 2011.[7] It was accepted by an aircrew serving with the 2457th Aviation Base for Combat Operation of Airborne Early Warning Aircraft (Aviabaza Boevogo Primeneniya Samolyotov Dal'nego Radiolokatsionnogo Obnaruzheniya) at Ivanovo Severny, which is the only base using the A-50 operationally (it operates 16 aircraft). The fourth A-50U, '41 Taganrog', was delivered to the Russian Aerospace Forces on 7 March 2017. The fifth A-50U, '45 Krasnyy', was delivered on 6 December 2018. The A-50U upgrade forms the basis of the concept for Beriev A-100 AEW&C. Its configuration will be similar, but with a new Vega Premier active electronically scanned array radar. In late December 2015, the A-50 started operations over Syria, flying from Russia, in support of the Russian military intervention in the Syrian Civil War. In December 2018, it was deployed to Crimea.

KJ-500 Chinese Airborne Early Warning and Control Aircraft

Tiers:

1 **2** 3 4

System

Alternate Designation(s): KJ-500

Primary Function / Type: Airborne Early Warning and Control Aircraft

Manufacturer: Shaanxi Aircraft Corporation

Crew: 24

Number of Engines: 4

Number of Hard Points: INA

Note #1: this aircraft has the inherent capability to haul up to 106 passengers, 132 airborne troopers or nine complete palettes of cargo

Note #2: The KJ-500 was also required to the core force of the informatized combat system, its equipped technology has four major characteristics which are networking, multi-functionality, high-integration and light weight.

Dimensions

Length: 36 m

Width (Wing Span): 40 m

Height: 11.5 m

Empty Weight: 40,000 kg

Combat Weight: 70,000 kg

Automotive

Engine Name: 4 x Zhuzhou WoJiang-6C (FWJ-6C)

Number of Engines: 4

Engine Type: Turboprop Engines

Engine Power: 5,100 horsepower each and driving six-bladed propeller units.

Maximum Range: 5,700 km

Maximum Speed: 550 kph

Service Ceiling: 10,500 m

Fire Control / Avionics

FCS Name: INA

Computerized FCS: No

Battle Management System (BMS): Yes, Coupled with other current Chinese Air Force capabilities, the KJ-500 series platform certainly adds a much-needed modern potent tracking solution for the service. The onboard systems are completely networked into the Chinese Battle Management System (BMS) and reportedly offers good identification, multi-function, and responsiveness qualities.

Radar

Name: INA

Type: Active Electronically Scanned Array (AESA) Radar

Quantity: The aircraft carries a fixed dorsal radome containing three AESA radar arrays for 360 degree coverage, and is said to be more efficient than the two-planar 'balance beam' array design used on the earlier KJ-200.

Coverage: 360 deg

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The KJ-500 (Chinese: □□-500; pinyin: Kōngjǐng Wǔbǎi; literally: "Air Warning 500") is a third-generation airborne early warning and control (AEW&C) aircraft used by the Chinese People's Liberation Army Air Force. It was built by Shaanxi Aircraft Corporation., and is based on the Y-9 airframe. Since the beginning of the 21st century, the detection range and the accuracy of airborne radars has been increasing, fighters equipped with various types of air-to-air missiles and low-altitude cruise missiles continue to improve in performance, creating a demand for a more capable AEW&C. To address the above issues, China started the development of the KJ-500, its third AEW&C, in the late 2000s. The KJ-500 was required to have three important features, which are good detection capability, good identification ability, and quick responsiveness. The KJ-500 was also required to the core force of the informatized combat system, its equipped technology has four major characteristics which are networking, multi-functionality, high-integration and light weight. The aircraft carries a fixed dorsal radome containing three AESA radar arrays for 360 degree coverage, and is said to be more efficient than the two-planar 'balance beam' array design used on the earlier KJ-200. Production of older AEW&C types have reported ceased in 2018 in response to the KJ-500 reaching full operational capability.

KJ-200 (Moth) Chinese Airborne Early Warning and Control Aircraft

Tiers:

Variants:

- **KJ-2000 (Mainring) Airborne Early Warning and Control (AEW&C) Aircraft:** KJ-2000 (Mainring) is an airborne early warning and control (AEW&C) aircraft designed and developed by AVIC Xi'an Aircraft Industry Company for the People's Liberation Army Air Force (PLAAF). The aircraft can detect, identify and track enemy targets flying at low altitudes and at long ranges. It can also be used to carry out command and control, battle management and airborne surveillance missions in all weather conditions. The aircraft was developed based on the airframe of A-50I (Mainstay) AEW&C aircraft. The first prototype of KJ-2000 performed its maiden flight in November 2003 and the first production aircraft entered into service with the PLAAF in 2004. An additional three aircrafts were delivered by the end of 2007. The aircrafts are operated by the 26th Air Division of the PLAAF. The KJ-2000 aircraft was displayed at the China International Aviation and Aerospace Exhibition 2014 (Airshow China 2014) held in Zhuhai.

System

Alternate Designation(s): KJ-200; NATO:Moth or Y-8 Balance Beam
Primary Function / Type: Airborne Early Warning and Control Aircraft
Manufacturer: Shaanxi Aircraft Corp., Hanzhong, China 14th Electronic Institute, Nanjing, China (radar, electronics)
Crew: 2
Number of Engines: 4
Number of Hard Points: INA

Dimensions

Length: 34.02 m
Width (Wing Span): 38.00 m
Height: 11.60 m
Wing Area: 122 sq m
Empty Weight: 35,500 kg
Maximum Takeoff Weight: 65,000 kg
Payload Weight: 20,000 kg

Automotive

Engine Name: 4 x Pratt & Whitney Canada PW150B

Number of Engines: 4

Engine Type: Turboprops

Engine Power: INA

Maximum Range: 5,560 km

Maximum Speed: 661 km/h

Cruise Speed: 550 km/h

Service Ceiling: 6,100 m

Endurance: 10 hours

Fire Control / Avionics

Fire Control System Type: INA

Fire Control Radar: INA

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The KJ-200 (Chinese: □□-200; pinyin: Kōngjǐng Liǎngběi; literally: "Airwarn-200") NATO reporting name: Moth or Y-8 Balance Beam system, is an Airborne early warning and control (AEW&C) program developed by Shaanxi Aircraft Corporation. (KJ is from the first characters of the Pinyin spelling of □□, (Kōng Jǐng), short for □□□□ (Kōng Zhōng Yù Jǐng), which means Airborne Early Warning). The key component of this aircraft is an AESA radar system, visually similar to the Saab Erieye system, mounted on struts above the rear fuselage, as well as ventral sensor domes. The platform of this aircraft is based on the Shaanxi Y-8F-600 and it has been reported that Pratt & Whitney Canada PW150B turboprops and Honeywell avionics have been incorporated. The general designer of the KJ-200 is Ouyang Shaoxiu (□□□□), the same general designer of the Y-8. According to Ouyang the KJ-200 has been significantly modified (around 80%) from the original Y-8. including the adoption of a glass cockpit.

→→Command and Control Aircraft

Y-8T Chinese Command Post Aircraft

Tiers:

Variants:

- **Note:** Y-8 This was the original version. It was little different from the An-12 with a slightly modified glass nose copied from the design of the H-6 bomber. The cargo hold was not pressurized. Early production variants inherited the An-12 's tail turret, which mounts a twin 23-mm cannon, but this was later removed. Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. Y-8B This is the civilian version. First flight took place in 1990 and it was certified in 1993. Y-8C This variant has the pressurized cabin volume increased from 1,000 cu ft (28.3 cu m) to 7,500 cu ft (212.4 cu m). Landing gear and air conditioning are upgraded. The original inward-open two-piece cargo loading doors were replaced by a single-piece flat loading ramp similar to that of the C-130 . First flight occurred on Dec. 17, 1990. Shaanxi has also developed the Y-8CA radar testbed and Y-8CI export variant transport, the latter with Western avionics. Y-8D This is the export variant, fitted with Western avionics to meet the requirements for commercial flights. Onboard avionics include Collins flight director system (FDS), air data computer, VOR/ILS, comparing warning, TDR-90 air-traffic control receiver, VHF radio, Honeywell P-400 color weather radar, Litton LTN-311 Omega navigation system, Bendix/King HF communication, Sundsstrand universal flight data recorder (UFDR) and cockpit voice recorder (CVR). It is in service in Burma (Myanmar), Sri Lanka and Sudan. Y-8D II This is the latest export variant with avionics similar to those in the Y-8C. Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. Y-8F This is a livestock transport. It was certified on Jan. 26, 1994. Y-8F100 This is a commercial freighter version of the Y-8, featuring improved avionics. The aircraft features a redesigned cargo compartment, which can carry four international standard pallets of 88 in x 108 in, or eight pallets of 88 in x 54 in, or three pallets of 96 in x 125 in. The cargo compartment is also fitted with a modernized cargo handling system, allowing fast loading/unloading. Y-8F200 This is a commercial freighter version of the Y-8C, with upgraded avionics and a redesigned cargo compartment. The cargo handling system and large flat ramp enable rapid loading and unloading. Y-8F200W This variant features a fuselage that is 7 ft 3 in (2.2 m) longer than the baseline aircraft. The aircraft can take off from gravel or snow-covered runways at altitudes up to 9,840 ft (3,000 m) above sea level. It can also operate from unprepared runways. Y-8F400 This is a modernized freighter variant with upgraded avionics. It requires a three-man flight crew instead of the original five-man crew. The original glass nose was replaced by a solid nose. The cargo compartment is equipped with a 2,000-lb (1,000-kg) payload overhead cargo system, where the cargo can be suspended from an electrically powered rail. Rollers in the floor of the cargo compartment enable quick and easy handling of cargo pallets and can be removed to leave a flat surface. The compartment is fully pressurized. Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14, 2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system.The transport is powered by

four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the undernose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. Y-8H This is an aerial survey and photography variant. Y-8J maritime surveillance aircraft These are Y-8C transports fitted with British Skymaster radars for maritime surveillance missions. China procured six to eight of the radars from Racal (now Thales) in 1996 deal worth US$66 million. At least two of the aircraft remain in Chinese naval service and are deployed at Dachang naval air base near Shanghai. The original glass nose on the Y-8 is replaced by a large radome to accommodate the radar antenna on the Y-8J. The rear cargo door and loading ramp are also removed. Y-8JB This is an electronic intelligence (ELINT) variant first seen in mid-2004 near Shanghai. A prototype first flew on Aug. 26, 2003, and four aircraft are in service with the Chinese navy. The aircraft has a large chin-mounted radome that could house a large ELINT antenna. Another SATCOM antenna may be installed inside a large semi-spherical dorsal fairing forward of the vertical tailfin providing real-time transmission to the ground base. Numerous smaller fairings can be seen on top of the cabin and along the upper sections of the aft fuselage, as well as at the nose tip. The loading ramp appears to have been sealed. The aircraft has been fitted with a BM/KZ800 ELINT system. Y-8X maritime patrol aircraft (MPA) This Y-8X is fitted with a Litton Canada APS-504 search radar, dual Litton LTN-72R inertial navigational system and a single LTN-211 Omega navigation set. The first example was delivered to the Chinese navy in late 1984, and the aircraft received national design certification in 1985. A small number have been in service since the mid-1980s. The aircraft is equipped with search radar, navigation system, self-defense electronic countermeasures (ECM) suite, optical/infrared cameras, sonobuoys and sonar receiver. The rear cargo door was removed and replaced by a large mission equipment window for sonobuoys racks and cameras. The rear turret was also removed and replaced by the sonar operator seat. A canoe-shaped fairing plus a couple of blade antennas appear to have been attached to the bottom of the middle and aft fuselage, suggesting the aircraft's electronic intelligence mission has been enhanced with a new synthetic aperture radar (SAR) capability. Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. KJ-200 This is an airborne early warning and control aircraft based on the Y-8F600 airframe. See separate record for more information. Y-8 tanker Flight Refueling Ltd. of the U.K. studied the possibility of converting the Y-8 into an in-flight refueling aircraft. No Y-8Ts are known to be in service. Y-8 airborne early warning aircraft This is a third Chinese airborne early warning aircraft program, following the KJ-2000 and KJ-200 (see separate records); it was revealed in 2005. Based on the Shaanxi Y-8F400 airframe, the aircraft features a conventional rotodome mounted above the fuselage. At least one prototype has been built and the program may be aimed at the export market. Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. ZDK-03 This variant, based on the Y-8F600, was designed specifically for the Pakistani air force for airborne early warning missions. It features an active electronically scanned array (AESA) radar. Islamabad has ordered four of the aircraft. The first unit was scheduled to be delivered by the end of 2010. See separate record for more information. GX-7 This is a Y-8 aircraft modified for psychological warfare missions. It is designed to broadcast messages over radio and television signals and can jam enemy communications. The GX-7 was first made public by Chinese media in July 2013. Y-8Q/Y-8GX6 This variant was first revealed in November 2011 and was reported in service in mid-2015. The Y-8Q features a redesigned wing and pressurized fuselage with composite structures; WJ-6C turboshaft engines; and high-efficiency, six-bladed propellers. It is distinguishable from other Y-8/Y-9 variants by a large chin-mounted sea search radar; electro-optical system behind the nose wheel; and a weapons bay just ahead of the main wheels. There is also a magnetic anomaly detector (MAD) boom and domed windows in the aft fuselage for observation. A fuselage weapons bay, located ahead of the main landing gear, would likely carry torpedoes. It has been speculated that the Y-8Q has fuselage sonobuoy dispensers and hardpoints on the wings for anti-ship missiles.

Notes:

Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. The Shaanxi Y-8 or Yunshuji-8 (Chinese: □-8) aircraft is a medium size medium range transport aircraft produced by Shaanxi Aircraft Corporation in China, based on the Soviet Antonov An-12. It has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. Although the An-12 is no longer made in Ukraine, the Chinese Y-8 continues to be upgraded and produced. An estimated 169 Y-8 aircraft had been built by 2010. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with license to assemble the aircraft locally. However, due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance. The Xi'an Aircraft Company and Xi'an Aircraft Design Institute worked to reverse engineer the An-12 for local production. Design of the aircraft was completed by February 1972. Major features of the Y-8 included a glazed nose and tail turret derived from that of the H-6 bomber, a roller-type palletized-cargo-handling device instead of the overhead conveyor, and a gaseous oxygen system as opposed to a liquid oxygen system. The original Y-8 inherited the An-12's twin 23mm cannon tail turret, but this was removed on subsequent variants. The Y-8 equipped with four turboprop engines mounted under the leading edges of non-swept wings. The wings are attached high on the fuselage, and the tricycle landing gear is equipped with low pressure tires. The earliest versions used for the transportation of freight or troops had two side-hinged, inward-opening doors, while later variants used a rearward-facing ramp to facilitate loading and unloading of the payload. Some specialized versions omit the cargo ramp entirely. The Y-8 is capable of carrying troops, dropping supplies, parachute drops, and functioning as an air ambulance. It also can be used for commercial uses as a freighter. It is capable of hauling 20 tons of cargo, approximately 96 soldiers, or about 82 paratroopers in the cargo compartment which is 13.5 metres long, 3 metres wide and 2.4 metres high. It can also carry 60 severely wounded soldiers with their stretchers, 20 slightly injured soldiers and 3 medical attendants. Many variants for specialized roles have been built, but information on them can be vague or difficult to obtain due to the secretive nature of the Chinese military. The Y-8 transport aircraft was put into trial production in the Xi'an Aircraft Factory in June 1972. By December 1974, the first Chinese-assembled Y-8 conducted its maiden flight. Following trial production of the first Y-8s, operations were transferred to the Shaanxi Aircraft Factory. The Shaanxi-produced Y-8s conducted their test flights in December 1975. After a regime of 66 test flights the Y-8 was officially certified for use by the Chinese government. By 1981, the Y-8 entered serial production.[2] Mr. Ouyang Shaoxiu (□□□□) would eventually become the general designer, designing many variants of Y-8, including KJ-2000. In the early 1980s, Chinese officials saw US Army recruiting advertisements featuring parachute extraction of an Army jeep along with troops. The PLA was told to develop this kind of capability. But there were two design problems. One, Y-8 wings have very sharp leading edges, so one wing tends to stall before the other, causing the aircraft to roll inverted as it stalls. The second design flaw as that the cargo deck of the Y-8 had a 10 degree downward slope starting at the landing gear. When the PLA Air Force started to test parachute extraction, these two design flaws caused a near disaster. The aircraft was flying too fast, and when the parachute started to extract cargo from the hold, the cargo rolled on the deck until it got to the 10 degree downward slope, and there it became airborne while still inside the aircraft. The cargo hit the top of the cargo door on the way out, making it clear that the Y-8 could not do parachute cargo extraction. In 1986, two engineers from Beijing's Ministry of Aviation visited Lockheed. They could not speak very much English, and the Lockheed-Georgia sales person who met them could not speak Chinese. So for half a day, they did a point-and-grunt tour until they were lucky enough to find a Lockheed employee who could speak Chinese. The Chinese wanted to purchase Lockheed wind tunnel testing on the Y-8 in order to address the stall problem. As a result of these wind tunnel tests, conducted in 1986, Lockheed was given a contract to do a flight test series on the Y-8. Lockheed was told that flight test data was not provided by the Soviets when they helped China build the Y-8 factory. The flight test series was flown by Lockheed test pilot Hank Dees. Hank had flown the test flight series for the Lockheed L-1011 and later for China's Y-12 in Harbin. During this flight test series, Hank Dees flew the aircraft to stall speed and taught Chinese pilots how to anticipate a stall in order to prevent letting the aircraft go inverted. As a result of this test flight series, Chinese pilots started to use the 45 degree flap position. Lockheed's motive for doing flight tests was to demonstrate that China would be better off buying the C-130 rather than trying to improve the Y-8. China did buy C-130's, but the flight test series actually demonstrated that the Y-8 was a more capable aircraft than previously believed. In the late 1980s, Lockheed Martin, the American manufacturer of the C-130 Hercules, helped China to develop a pressurized cabin for the passenger version of Y-8, resulting in two versions: the first had half of the cabin pressurized and later, the second version in which the complete cabin was pressurized. In 2001 and 2002, new consulting

arrangements between Antonov and Shaanxi resulted in modernized redesigns to the Y-8's wing and fuselage. As a consequence the redesign allows the Y-8's fuel capacity to be increased by 50 percent.

→→Training Aircraft

Su-27UB (Flanker-C) Russian Two Seat Combat Trainer Aircraft

Tiers:

Variants:

- **T10 ("Flanker-A"):** Initial prototype configuration.
- **T10S:** Improved prototype configuration, more similar to production spec.
- **P-42:** Special version built to beat climb time records. The aircraft had all armament, radar and paint removed, which reduced weight to 14,100 kg. It also had improved engines. Similar to the US F-15 Streak Eagle project. Between 1986–1988, it established and took several climb records from the Streak Eagle. Several of these records (such as time to climb to 3000m, 6000m, 9000m, 12000m) still stands current as of 2019.
- **Su-27:** Pre-production series built in small numbers with AL-31 engine.
- **Su-27S (Su-27 / "Flanker-B"):** Initial production single-seater with improved AL-31F engine. The "T10P".
- **Su-27P (Su-27 / "Flanker-B"):** Standard version but without air-to-ground weapons control system and wiring and assigned to Soviet Air Defence Forces units. Often designated Su-27 without -P.
- **Su-27UB ("Flanker-C"):** Initial production two-seat operational conversion trainer.
- **Su-27SK:** Export Su-27S single-seater. Exported to China in 1992-1996 and developed into Shenyang J-11.
- **Su-27UBK:** Export Su-27UB two-seater.
- **Su-27K (Su-33 / "Flanker-D"):** Carrier-based single-seater with folding wings, high-lift devices, and arresting gear, built in small numbers. They followed the "T10K" prototypes and demonstrators.
- **Su-27KUB (Su-33UB):** Two-seat training-and-combat version based on the Su-27K and Su-27KU, with a side-by-side seating same as Su-34. One prototype built.
- **Su-27M (Su-35/Su-37 / "Flanker-E/F"):** Improved demonstrators for an advanced single-seat multi-role Su-27S derivative. These also included a two-seat "Su-35UB" demonstrator.
- **Su-27PU (Su-30):** Two-seat version of the Su-27P interceptor, designed to support with tactical data other single-seat Su-27P, MiG-31 and other interceptor aircraft in PVO service. The model was later renamed to Su-30, and modified into a multi-role fighter mainly for export market, moving away from the original purpose of the aircraft.
- **Su-32 (Su-27IB):** Two-seat dedicated long-range strike variant with side-by-side seating in "platypus" nose. Prototype of Su-32FN and Su-34.

Notes:

Su-27UB ("Flanker-C") Initial production two-seat operational conversion trainer. The Sukhoi Su-27 (Russian: Сухой Су-27; NATO reporting name: Flanker) is a Soviet-origin twin-engine supermaneuverable fighter aircraft designed by Sukhoi. It was intended as a direct competitor for the large United States fourth-generation fighters such as the Grumman F-14 Tomcat and F-15 Eagle, with 3,530-kilometre (1,910 nmi) range, heavy aircraft ordnance, sophisticated avionics and high maneuverability. The Su-27 was designed for air superiority missions, and subsequent variants are able to perform almost all aerial warfare operations. It was designed with the Mikoyan MiG-29 as its complement. The Su-27 entered service with the Soviet Air Forces in 1985. The primary role was long range air defence against American SAC B-1B and B-52G/H bombers, protecting the Soviet coast from aircraft carriers and flying long range fighter escort for Soviet heavy bombers such as the Tu-95 "Bear", Tu-22M "Backfire" and Tu-160 "Blackjack". There are several related developments of the Su-27 design. The Su-30 is a two-seat, dual-role fighter for all-weather, air-to-air and air-to-surface deep interdiction missions. The Su-33 'Flanker-D' is a naval fleet defense interceptor for use on aircraft carriers. Further versions include the side-by-side two-seat Su-34 'Fullback' strike/fighter-bomber variant, and the Su-35 'Flanker-E' improved air superiority and multi-role fighter. The Shenyang J-11 is a Chinese licence-built version of the Su-27.

CJ-5 Chinese Trainer Aircraft

Tiers:

Variants:

- **Yak-18:** The original production version. Retractable main undercarriage, fixed tailwheel.
- **Yak-18U:** This version was built in small numbers. It had retractable tricycle landing gear.
- **Yak-18A:** Cleaned up version of the Yak-18U, powered by a 194 kW (260 hp) Ivchenko AI-14 FR engine. Built in large numbers.
- **Yak-18P (NATO reporting name Mouse):** Single-seat aerobatic aircraft for use by flying clubs. Adaptation of Yak-18 two-seat trainer.
- **Yak-18PM:** Single-seat aerobatic aircraft with retractable tricycle landing gear.
- **Yak-18PS:** Aerobatic aircraft with retractable tailwheel.
- **Hongzhuan-501 (Red Craftsman):** Probable original designation for early CJ-5 production aircraft.
- **Nanchang CJ-5:** The Yak-18 was built under licence in China as the CJ-5 for use by the PLAAF, PLANAF and civilian flying clubs; 379 CJ-5s had been built when production ended in 1958.

System

Alternate Designation(s): CJ-5
Primary Function / Type: Training Aircraft
Manufacturer: The Nanchang Aircraft Factory
Crew: 2 (pilot, student)
Number of Engines: 1
Number of Hard Points: INA

Dimensions

Length: 8.53 m
Height: 3.35 m
Wingspan: 10.60 m
Wing Area: 17.00 sq m
Weight, Empty: 1,025 kg
Weight, Maximum Takeoff: 1,316 kg
Payload: 306 kg

Automotive

Engine Name: M-11 engine

Number of Engines: 1

Engine Type: INA

Engine Power: 260 hp

Maximum Speed: 262 km/h

Cruise Speed: 227 km/h

Range: 750 km

Climb Rate: 318 m/min

Ceiling: 5,060 m

Takeoff Run: 200 m

Landing Run: 200 m

NBC Protection: INA

EW Counter Measures: No

Chaffs/Flares: No

Notes:

CJ-5 Trainer Aircraft A primary trainer is used for training potential trainees to master primary flying techniques because of its low speed, good controllability and stability. These factors make the task of learning simpler. The CJ-5, manufactured by Nanchang Aircraft Factory, was a licence production of the Soviet primary trainer Yak-18 developed in 1946. It had a frame type fuselage, a wing with one rectangular center panel and two tapered outer panels and a tailwheel type landing gear. A piston engine drove a wooden propeller. The flying instruments, engine instruments, a transceiver, a directional gyro and an interior communication system, etc. were installed to enable the trainees to learn the operational skills of the aircraft after they had finished the primary training program. The Nanchang Aircraft Factory started to repair the Yak-18 aircraft early in 1951 and, the aircraft assembly and test techniques were grasped during the repair period. In 1952, the factory started to expand the scope of repair, and to produce spare parts and to get themselves familiarized with the techniques of producing aircraft parts and assemblies. 1953 was the year of more active preparation for the transition from repair to manufacture. The factory set up the goal of mastering manufacturing techniques of Yak-18 parts and components which could be interchanged and matched on the aircraft. 44 main assemblies of outer wings, flaps, empennages and landing gears etc. were manufactured according to the repair documentation and sample parts. These parts were assembled on one aircraft for test and checkout and good result was witnessed after the aircraft underwent 50 sorties and 78 hours of flying. The method of using lofting, templates and master parts was adopted for the manufacture of aircraft parts from the second half of 1952. With this method correct aircraft configuration, and interchangeability and matching of parts could be ensured, hence the first and most important step was taken towards the manufacture of a complete aircraft. In early 1954 when the factory was formally set to trial produce the primary trainer CJ-5, 235 aircraft had already been repaired. People in the Nanchang Aircraft Factory made all aircraft parts

with the only exception of control system. In accordance with the First Five-year Plan of the aviation industry approved by the government, the trial production of the CJ-5 was to be completed in September, 1955. But it was decided to cut this by 1 year as the Chinese Air Force was in urgent need of a primary trainer and the Nanchang Aircraft Factory had already mastered aircraft repair techniques, and techniques for manufacture of parts and components for 5 types of aircraft including the Yak-18. After the visit to the factory by Minister Zhao Erlu of the Second Ministry of Machine Building at the end of 1953, he believed that the conditions for manufacturing complete aircraft was matured ahead of schedule. An order was issued to the factory after the approval of the State Council, by which the time for formal successful trial production of the CJ-5 primary trainer was changed from the third quarter of 1955 to an earlier time of the third quarter of 1954. After the order had reached the factory, the people of the factory were mobilized immediately and the trial production was carried out day and night. The factory proceeded rapidly under the instruction of some Soviet experts and the organization of chief engineer Li Shaoan and chief technologist Gao Yongshou. First CJ-5 was delivered to the flight test station in June for flight test on June 30 and second full size airframe began its static destructive test on May 12. The first aircraft successfully completed its test flight on July 11, 1954. The State Certification Committee arrived at the conclusion: The performance of the primary trainer CJ-5 manufactured by the Nanchang Aircraft Factory met the requirement of the specification and it could be used by the Air Force as a trainer aircraft. On August 26, the Defence Minister Peng Dehuai approved the batch production of the aircraft. Only more than half a year was used from trial production to batch production. The power-plant of the aircraft M-11 engine was also trial-produced successfully by the Zhuzhou Aero Engine Factory in August of the same year. Aircraft static destructive tests were totally new to the factory at that time and this was the first of its kind ever carried out even in China. There were no Soviet experts for consultation. A project engineer, Zhang Azhou who studied in the United Kingdom and had just returned to China, was put in charge of the test. Zhang Azhou asked all his staff members to study all available Soviet data on static testing and made careful preparation for the test. Under his orderly command load applying, instrument reading and data measuring and recording were carried out as planned. When the load was increased to 105-110 per cent of the ultimate load, a sudden thundering sound came out and the airframe broke at the front spar of outer wing panel. This was a proof that the strength of airframe was in conformity with design criteria and this first destructive static test of a full size airframe was a complete success. Later on the static tests were also successively carried out in 57 design cases on 14 major components, e.g. central wing panel, aileron and fuselage, showing that their strength was in compliance with design criteria. All static tests of CJ-5 had been thus completed and the strength of the aircraft was proven. Zhang Azhou made an outstanding contribution to the static test programme and, therefore, was awarded a special-class merit. The first flight of the first aircraft made in new China, the CJ-5, took place on July 3, 1954. Piloted by Duan Xianglu, the aircraft had a successful flight and made a safe landing. On July 20 the State Flight Test Commission came to the conclusion that the performance of CJ-5 was in conformity with its specification and therefore it was agreed that the aircraft should be put into mass production and be delivered to the Air Force for use in training. A celebration of the successful production of the first CJ-5 was held at the factory on July 26. Zhao Erlu, minister of the Second Ministry of Machine Building, Shao Shiping, the governer of Jiangxi province, Duan Zijun, deputy head of the Aircraft Industry Bureau, and other leaders from the Air Force came to the celebration. Three CJ-5s made a flight demonstration. A telegram reporting the success to Chairman Mao Zedong from all staff and workers of the Nanchang Aircraft Factory was passed during the celebration. After the mass production of CJ-5 was approved in August 1954 a total of 379 CJ-5s were produced from 1954 to 1958 and delivered to the Air Force, the Navy air force and CAAC. The CJ-5 made a great contribution to the training of pilots in the early days of new China. The success in manufacturing CJ-5 Aircraft marked a good start for aircraft manufacture in new China. The Chinese aviation industry had entered a new stage. To celebrate this achievement, Chairman Mao Zedong signed two letters of praise and encouragement to the Nanchang Aircraft Factory and Zhuzhou Aero Engine Factory on August 1 and August 10 of 1954 respectively. In his letter of praise and encouragement to the Nanchang Aircraft Factory, Chairman Mao Zedong said: "Your report of July 26 had been received. Congratulations to the successful trial production of the first Yak-18 aircraft. This is a good start in establishing both aircraft industry and strengthening the national defence of China. I hope the factory will continue their efforts to further master technology and improve quality under the guidance of the Soviet experts and ensure the fulfilment of regular production task." Zhu De, Commander in Chief of PLA, also wrote words of encouragement to the Nanchang Aircraft Factory saying: "Carry on the enthusiasm and creativeness of the working class; strengthen national defence and defend the motherland."

Su-27UBK (Flanker-C) Russian Two Seat Combat Trainer Aircraft

Tiers:

Variants:

- **T10 ("Flanker-A"):** Initial prototype configuration.
- **T10S:** Improved prototype configuration, more similar to production spec.
- **P-42:** Special version built to beat climb time records. The aircraft had all armament, radar and paint removed, which reduced weight to 14,100 kg. It also had improved engines. Similar to the US F-15 Streak Eagle project. Between 1986–1988, it established and took several climb records from the Streak Eagle. Several of these records (such as time to climb to 3000m, 6000m, 9000m, 12000m) still stands current as of 2019.
- **Su-27:** Pre-production series built in small numbers with AL-31 engine.
- **Su-27S (Su-27 / "Flanker-B"):** Initial production single-seater with improved AL-31F engine. The "T10P".
- **Su-27P (Su-27 / "Flanker-B"):** Standard version but without air-to-ground weapons control system and wiring and assigned to Soviet Air Defence Forces units. Often designated Su-27 without -P.
- **Su-27UB ("Flanker-C"):** Initial production two-seat operational conversion trainer.
- **Su-27SK:** Export Su-27S single-seater. Exported to China in 1992-1996 and developed into Shenyang J-11.
- **Su-27UBK:** Export Su-27UB two-seater.
- **Su-27K (Su-33 / "Flanker-D"):** Carrier-based single-seater with folding wings, high-lift devices, and arresting gear, built in small numbers. They followed the "T10K" prototypes and demonstrators.
- **Su-27KUB (Su-33UB):** Two-seat training-and-combat version based on the Su-27K and Su-27KU, with a side-by-side seating same as Su-34. One prototype built.
- **Su-27M (Su-35/Su-37 / "Flanker-E/F"):** Improved demonstrators for an advanced single-seat multi-role Su-27S derivative. These also included a two-seat "Su-35UB" demonstrator.
- **Su-27PU (Su-30):** Two-seat version of the Su-27P interceptor, designed to support with tactical data other single-seat Su-27P, MiG-31 and other interceptor aircraft in PVO service. The model was later renamed to Su-30, and modified into a multi-role fighter mainly for export market, moving away from the original purpose of the aircraft.
- **Su-32 (Su-27IB):** Two-seat dedicated long-range strike variant with side-by-side seating in "platypus" nose. Prototype of Su-32FN and Su-34.

System

Alternate Designation(s): Su-27UBK; NATO: Flanker-C

Primary Function / Type: Two Seat Trainer Aircraft (Export)

Manufacturer: Sukhoi

Crew: 2

Number of Engines: 2

Number of Hard Points: 10 external pylons with a capacity of up to 4,430 kg (9,770 lb)

Dimensions

Length: 21.9 m

Width (Wing Span): 14.7 m
Height: 5.92 m
Wing Area: 62 m2
Empty Weight: 16,380 kg
Gross Weight: 23,430 kg
Maximum Takeoff Weight: 30,450 kg

Automotive

Notes:

Su-27UBK Export Su-27UB two-seater. Su-27UB ("Flanker-C") Initial production two-seat operational conversion trainer. The Sukhoi Su-27 (Russian: Сухой Су-27; NATO reporting name: Flanker) is a Soviet-origin twin-engine supermaneuverable fighter aircraft designed by Sukhoi. It was intended as a direct competitor for the large United States fourth-generation fighters such as the Grumman F-14 Tomcat and F-15 Eagle, with 3,530-kilometre (1,910 nmi) range, heavy aircraft ordnance, sophisticated avionics and high maneuverability. The Su-27 was designed for air superiority missions, and subsequent variants are able to perform almost all aerial warfare operations. It was designed with the Mikoyan MiG-29 as its complement. The Su-27 entered service with the Soviet Air Forces in 1985. The primary role was long range air defence against American SAC B-1B and

B-52G/H bombers, protecting the Soviet coast from aircraft carriers and flying long range fighter escort for Soviet heavy bombers such as the Tu-95 "Bear", Tu-22M "Backfire" and Tu-160 "Blackjack". There are several related developments of the Su-27 design. The Su-30 is a two-seat, dual-role fighter for all-weather, air-to-air and air-to-surface deep interdiction missions. The Su-33 'Flanker-D' is a naval fleet defense interceptor for use on aircraft carriers. Further versions include the side-by-side two-seat Su-34 'Fullback' strike/fighter-bomber variant, and the Su-35 'Flanker-E' improved air superiority and multi-role fighter. The Shenyang J-11 is a Chinese licence-built version of the Su-27.

JL-8 (K-8) Chinese Jet Trainer

Tiers:

1 **2** 3 4

System

Alternate Designation(s): The Hongdu JL-8 (Nanchang JL-8), also known as the Karakorum-8 or K-8 for short.
Primary Function / Type: Jet Trainer
Manufacturer: Hongdu Aviation Industry Corporation Pakistan Aeronautical Complex
Crew: 2 (pilot, student)
Number of Engines: 1
Number of Hard Points: 1 x center line hard point for 23-mm cannon pod or fuel tank and 4 wing hard points

Dimensions

Length: 11.60 m
Height: 4.21 m
Width (Wing Span): 9.63 m
Wing Area: 17.02 sq m
Empty Weight: 2,687 kg
Combat Weight: 700 kg
Payload: 950 kg
Takeoff Clean: 3,557 kg
Takeoff with Stores: 4,235 kg

Automotive

Engine Name: 1 x Garrett TFE-731-2A turbofan; or 1 x Progress AI-25TL turbofan

Number of Engines: 1

Engine Type: Turbofan

Engine Power: 3,500 lb (1,588 kg) static thrust (TFE-731-2A)

Internal Fuel Capacity: 780 kg

Total Fuel Capacity: 1,168 kg

Cruise Speed: 800 km/h

Takeoff Speed: 185 km/h

Landing Speed: 165 km/h

Takeoff Roll: 443 m

Standing Run: 533 m

Load Factor: +7.33/-3.0 g

Rate of Climb: 1,811 m/min

Ceiling: 13,370 m

Range: 2,138 km

Endurance: 4.2 hours

Notes:

The Hongdu JL-8 (Nanchang JL-8), also known as the Karakorum-8 or K-8 for short, is a two-seat intermediate jet trainer and a light attack aircraft designed in the People's Republic of China by China Nanchang Aircraft Manufacturing Corporation. Pakistan is also the co-Partner of this project. The primary contractor is the Hongdu Aviation Industry Corporation. Its export variant, K-8 Karakorum is co-produced by the Pakistan Aeronautical Complex for the Pakistan Air Force. The JL-8 / K-8 has a multi-role capability for training and, with little modification, can also be used for airfield defense. The aircraft is supposed to be as cost-effective as possible, with a short turn-around time and low maintenance requirements. The JL-8 for the domestic Chinese market and its export variants, K-8E and K-8P, have different power plants and avionics.

JJ-7 Chinese Two Seat Combat Trainer Aircraft

System

Alternative Designations: JJ-7
Manufacturer: Chengdu Aircraft Corporation/Guizhou Aircraft Industry Corporation
Crew: 2
Seat Capacity: Two seats, one for the student and one from the instructor.
Harpoints: 5 in total – 4× under-wing, 1× centreline under-fuselage with a capacity of 2,000 kg maximum (up to 500 kg each

Dimensions

Length: 14.86 m
Height: 4.10 m
Wingspan: 7.15 m
Wing Area: 23 sq m
Empty Weight: 5,145 kg
Maximum Payload: 1,800 kg
Maximum Takeoff: 7,372 kg

Automotive

Engine Name: 1 x Liyang Wopen 7 turbojet
Engine Power, Dry: 9,700 lb (4,400 kg) static thrust
Engine Power, with Afterburner: 13,500 lb (6,124 kg) static thrust
Internal Fuel Capacity: 2,385 liters
Maximum Speed: 2,175 km/h

Touchdown Speed: 310-330 km/h

Ceiling: 18,800 m

Climb Rate: 9,000 m/min

Radius: 370 km

Main Gun System

↳*Main Gun System #1*

Name: Gryazev-Shipunov GSh-30-1

Type: Autocannon

Caliber: mm30

Length: 1,978 mm

Barrel Length: 1,500 mm

Width: 156 mm

Height: 185 mm

Weight: 46 kg

Barrels: 1

Action: Short recoil operated

Rate of Fire: 1,800 rounds/min

Muzzle Velocity: 900 m/s

Maximum Firing Range: 1,800m

Effective Firing Range: 200-1,800m

↳*Main Gun System #1 Ammunition*

Type: Autocannon

Caliber: 30

Shell: 30×165mm

Basic Load: 1,000 Rounds

Missile Weapon Systems

↳*Missile Weapon System (Option #1)*

Name: PL-5

Type: Air-to-Air Missile

Length: 3.128 m

Diameter: 0.127m

Wingspan: 0.657m

Weight: 148 kg

Warhead: 6kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: Active infrared, laser proximity fuse(PL-5EII)

Engine: Solid-fuel rocket

Operational Range: 1.3–16km

Maximum Speed: Mach 2.5

Guidance System: Infrared homing, multi-element, dual band detector(PL-5EII)

↳*Missile Weapon System (Option #2)*

Name: PL-8

Type: Air-to-Air Missile

Manufacturer: Xi'an Eastern Machinery Factory and CATIC

Length: 2.95 m

Diameter: 160 mm

Wingspan: 800 mm

Weight: 115 kg

Warhead: 11 kg high explosive

Detonation Mechansim: Impact / Proximity

Engine: solid rocket

Propellant: solid fuel

Operational Range: 20 km

Flight Ceiling: 21 km

Flight Altitude: 05 km

Maximum Speed: Mach 3.5

Guidance System: passive infrared homing

↳*Missile Weapon System (Option #3)*

Name: PL-9

Type: Air-to-Air Missile

Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC), Hanzhong Nanfeng Machine Factory

Length: 2.9m

Diameter: 0.157m

Wingspan: 0.856m

Warhead: 11.8kg blast-frag, or expanding rod (RF-fuse)

Detonation Mechanism: laser proximity fuse

Engine: Solid-fuel rocket

Operational Range: 22km

Flight Altitude: 4.5km

Maximum Speed: Mach 2+

Guidance System: multi-element infrared

Rocket Weapon Systems

Rocket Weapon System (Option #1): 55 mm rocket pod (12 rounds)

Rocket Weapon System (Option #2): 90 mm rocket pod (7 rounds)

Bomb Weapon System

Bomb Capacity: 50 kg to 500 kg unguided bombs

Avionics / Fire Control System

FCS Name: INA

Computerized FCS: Yes

Radar: 1 x Skyranger

Notes:

JJ-7/FT-7 This tandem two-seat trainer version was developed well after the single-seat fighters. It has an additional vertical fin to improve stability. An enlarged dorsal spine carries additional fuel. First flight took place on July 5, 1985. The export model is known as the FT-7. Production of the JJ-7 was launched in late 1987.

Yak-18 (Max) Russian Trainer Aircraft

Tiers:

Variants:

- **Yak-18:** The original production version. Retractable main undercarriage, fixed tailwheel.
- **Yak-18U:** This version was built in small numbers. It had retractable tricycle landing gear.
- **Yak-18A:** Cleaned up version of the Yak-18U, powered by a 194 kW (260 hp) Ivchenko AI-14 FR engine. Built in large numbers.
- **Yak-18P (NATO reporting name Mouse):** Single-seat aerobatic aircraft for use by flying clubs. Adaptation of Yak-18 two-seat trainer.
- **Yak-18PM:** Single-seat aerobatic aircraft with retractable tricycle landing gear.
- **Yak-18PS:** Aerobatic aircraft with retractable tailwheel.
- **Hongzhuan-501 (Red Craftsman):** Probable original designation for early CJ-5 production aircraft.
- **Nanchang CJ-5:** The Yak-18 was built under licence in China as the CJ-5 for use by the PLAAF, PLANAF and civilian flying clubs; 379 CJ-5s had been built when production ended in 1958.

Notes:

The Yakovlev Yak-18 (NATO reporting name Max) is a tandem two-seat military primary trainer aircraft manufactured in the Soviet Union. Originally powered by one 119 kW (160 hp) Shvetsov M-11FR-1 radial piston engine, it entered service in 1946. It was also produced in China as the Nanchang CJ-5. A member of the second generation of Russian aircraft designers, and best known for fighter designs, Alexander Sergeyevich Yakovlev always retained a light aircraft design section. In May 1945, Yakovlev initiated design of the Yak-18 two-seat primary trainer. He designed it to replace the earlier Yakovlev UT-2 and Yakovlev Yak-5 in service with the Soviet Air Forces and DOSAAF (Voluntary Society for Collaboration with the Army, Air Force and Navy, which sponsored aero clubs throughout the USSR). In 1944, an advanced version of the UT-2 had been built with many of the features of the new Yak-18. The new aircraft flew a year later, powered by a 119 kW (160 hp) Shvetsov M-11 five-cylinder radial engine and featuring pneumatically operated retractable main landing gear and a fixed tailwheel. It entered service as a trainer later that year and was built by Yakovlev up until 1956. Examples were exported to China in kit form beginning in 1950. The Chinese began producing license built copies in 1954 with the designation CJ-5. The Yak-18's greatest

claim to fame is its use as a night bomber by the North Korean Air Force during the Korean War. The aircraft were modified with bomb racks on the wing center section and flew over UN troop locations at night to drop bombs and harass UN forces. The single most successful attack of the North Korean aviation during the war was the destruction of a fuel dump with nearly 5.5 million US gallons (21 million l; 4.6 million imp gal) of fuel in the Inchon area in June 1953 by four or five Yak-18s. The five-cylinder engine reminded many of the US troops of the sound made by early gasoline powered washing machines, earning them the name: "Washing Machine Charlie". The name "Bed Check Charlie" was also used for these night intruders. The Yak-18s, along with Polikarpov Po-2s, became quite a nuisance until US night fighters began shooting them down. One night fighter crashed shooting down a Bed Check Charlie and another night fighter rammed its target. Other claims to fame for the Yak-18 are an international speed record for its class in 1951 as well as being the aircraft used for initial flight training by Yuri Gagarin (1st human in space) and Ken Rowe (No Kum-Sok, who defected from North Korea with a Mikoyan-Gurevich MiG-15 jet fighter during the Korean War). Later, as the need for conventional landing gear trainers abated, Yakovlev re-designed the Yak-18 with retractable tricycle landing gear and an Ivchenko AI-14RF radial engine of 224 kW (300 hp); this was designated the Yak-18A. The design proved exceptionally easy to build and maintain. There are an estimated 40 original Yak-18s in existence worldwide. Five are currently flyable in the US, three are flyable in Europe, and the Chinese Air Force has one flyable with several other airframes in storage. Approximately four other aircraft worldwide are currently being restored for flight. Many are found in major aviation museums worldwide including the National Air and Space Museum in the USA. The Nanchang CJ-6, produced in China, is sometimes quoted as a variant but is a completely different aircraft designed in China by Bushi Cheng and built by Nanchang Aircraft Company.

JL-10 (L-15 Falcon) Chinese Supersonic Lead-In Fighter Trainer Aircraft

Tiers:

Variants:

- **L-15B:** This is a more capable lead-in fighter trainer variant of the L-15. It is powered by two afterburning turbofan engines with full authority digital engine control (FADEC), likely the Russian Ivchenko-Progress AI-222-25F, providing a top speed of 750 mph (1,200 kph, Mach 0.98) at sea level.

System

Alternate Designation(s): JL-10; L-15 Falcon
Primary Function / Type: Lead-In Fighter Trainer
Manufacturer: Hongdu Aviation Industry Corporation
Crew: 2
Number of Engines: 2
Number of Hard Points: INA

Dimensions

Length: 12.27 m
Height: 4.81 m
Width (Wing Span): 9.48 m
Wing area: INA
Empty Weight: 4,500 kg
Gross Weight: 6,500 kg
Maximum Takeoff Weight: 9,800 kg

Automotive

Engine Name: 2 × Ivchenko-Progress AI-222K-25
Number of Engines: 2
Engine Type: Turbofan
Engine Power: INA

Maximum Range: 550 km

Maximum Speed: 1,729 km/h

Service Ceiling: 16,000 m

Ferry Range: 3,100 km

Rate of Climb: 200 m/s

Main Gun System

Note: This is a training aircraft

Fire Control / Avionics

Fire Control Radar Name:

Fire Control System Type: INA

Navigation Radar: Unknown type PESA radar, Likely with AESA radars for further updates.

Protection

Stealth Properties: None

Heat Signature Reduction: No

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Notes:

The Hongdu JL-10 also known as the L-15 Falcon (□□) is a supersonic advanced training and light combat aircraft being developed by Nanchang-based Hongdu Aviation Industry Corporation (HAIC) to meet the Chinese People's Liberation Army Air Force (PLAAF) and People's Liberation Army Naval Air Force (PLANAF) lead-in fighter trainer (LIFT) requirements, as well as next-generation training and light combat needs for foreign customers. The JL-10 is an advanced trainer aircraft developed by Nanchang based Hongdu Aviation Industry Corporation. The aircraft made its maiden flight on 13 March 2006. The aircraft's general designer is Mr. Zhang Hong (□□), and development had reportedly been completed alongside Yakovlev OKB of Russia. The JL-10 is a direct rival to the Guizhou Aircraft Industry Corporation (GAIC) JL-9/FTC-2000 Mountain Eagle in competition for the People's Liberation Army Air Force's (PLAAF) next-generation advanced trainer aircraft program. HAIG unveiled a full-scale mock-up of its early prototype the L-15 advanced lead-in fighter trainer (LIFT) in the 2004 Zhuhai Airshow. The two-seat, two-engine L-15 featured the latest advanced technologies developed by China, such as the digital quadruple fly-by-wire (FBW), glass cockpit (two multi-color head down displays for both the front and rear cockpit, and an additional head-up display for the front cockpit) and hands-on-throttle-and-stick (HOTAS) flight control. The look-down field of view for the front cockpit is 18°, and 6° for the rear cockpit, exceeding the US requirement. The aerodynamic performance of the aircraft is enhanced by its large leading edge extensions (LEX) design, which gives a maximum angle of attack of 30°. This is very useful when trying to simulate the maneuvers of advanced fourth-generation fighters such as J-10, JF-17 and J-11, as well as for newest fifth generation fighter like J-20 and J-31. JL-9/FTC-2000 Mountain Eagle trainer jet from Guizhou Aircraft Industry Corporation (GAIC) is a direct competitor of the JL-10. JL-10 has a wide range of more advanced features comparing JL-9, but JL-9 is significant cheaper and its development and production would be fully indigenous, while early batches of JL-10 still rely on AI-222 series turbofan engine from Ukraine before an indigenous update is ready. With the JL-10, student pilots will be able to complete mission flight training and advanced combat training, as well as complete all basic jet flight training courses. The aircraft also has six (four under-wing and two wingtip) pylons to carry various air-to-air and air-to-ground weapons. If necessary, it can serve in the lightweight attack role with minor modifications, carrying up to 3.5 tons of armament. Each of the first two units (#01 & #02) are powered by two Ivchenko-Progress DV-2 engines, which do not have afterburners, and these two aircraft thus do not have the capability to reach supersonic speed. The third unit (#03) is powered by a pair of an improved version of the DV-2, the DV-2F, that has afterburners, so that it can attain supersonic speed. The subsequent production units are expected to be powered by Ukraine's Ivchenko-Progress AI-222K-25F turbofan engines with afterburners once a co-production license is

obtained by the 608 Institute. Ivchenko-Progress was able to increase the thrust of the AI-222-28F (thrust 4500 kg afterburning) and AI-222-30F (5000 kg thrust afterburning) engines. The latter two engines may be used to equip the JL-10 or other Chinese aircraft. Meanwhile, according to various Chinese reports, JL-10s with updated Guizhou FWS-17 engines had already undergone test flights. In June 2013, the AJT condition of L-15 finalized the design and would be operated by PLAAF with a formal name JL-10. On July 1, 2013, the first batch of JL-10 began delivery to the PLAAF. Chinese Air Force and later Naval Air Force are highly satisfied with the aircraft's all-around performance, high reliability, cost-effectiveness, as well as its great multi-role update potentials, easy maintainability, and a service life of over 10,000 flying hours.

→Unmanned Aerial Vehicles (UAVs)

→→Very Low-Cost, Close-Range UAVs (Less than 5 km Range)

Raven RQ-11B American Unmanned Aerial Vehicle (UAV)

Tiers:

System

Alternate Designation: Raven RQ-11B
Type: Unmanned Aerial Vehicle (UAV)
Manufacturer: AeroVironment
Endurance: 60-90 minutes
Payloads: EO/IR Gimbal with IR pointer
GCS: Common GCS with Puma and Wasp® AE
Launch and Recovery Method: Hand-Launched, Deep Stall Landing

Dimensions

Length: 0.9 m
Wingspan: 1.4 m
Weight: 1.9 kg

Automotive

Engine Name: INA
Engine Type: INA

Engine Power: INA
Maximum Speed: 32-81 km/h, 17-44 knots
Maximum Range: 10 km
Maximum Altitude: 100-500 ft (30-152 m) AGL, 14,000 ft MSL max launch altitude
Endurance: 60-90 minutes

Notes:

The Raven system is the most widely deployed unmanned aircraft system in the world, ideal for low-altitude intelligence, surveillance, and reconnaissance missions that depend on rapid deployment and pinpoint maneuverability. Lightweight and simple to operate, the Raven is rucksack portable and can be hand-launched for day or night observation. The Raven has an optional stabilized gimbaled payload, and delivers real-time color and/or infrared imagery to the ground control and remote viewing stations. Thanks to its advanced avionics, Raven can be operated manually or programmed for autonomous navigation. AeroVironment’s common GCS interfaces with all of its tactical ISR air vehicles reducing the level of training required and decreasing the time and cost involved. The Raven® is the most widely used military, small unmanned aircraft system in the world today. The Raven B DDL® system is a lightweight solution designed for rapid deployment and high mobility for military applications requiring low-altitude surveillance and reconnaissance intelligence.

Bird-Eye 400 Israeli Reconnaissance Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Bird Eye 650:** This is a larger version of the Bird Eye featuring additional batteries for an endurance of 12 hours. The system can be carried in three backpacks and operated by two crewmembers. It provides wide coverage with a stabilized day/night sensor payload and moving target tracker. The Bird Eye 650, as does its predecessor, is capable of fully automated and autonomous flight and has an electrical or fuel cell propulsion system. The air vehicle takes off from a folding mini-launcher or bungee system. It utilizes a flip-over recovery concept with parachute descent. The ground-control station is ruggedized and portable. The Bird Eye 650 is powered by an Aeropak integrated hydrogen proton exchange membrane fuel-cell system developed by Hydrogen Energy Systems in Singapore. The system delivers 600 watts of peak power and 900 watt/hour of net usable energy at less than 4.4 lb (2 kg) of weight. It uses hot-swappable cartridges that eliminate the need for battery chargers in the field. Payload options include Tamam's MicroPOP or Controp's Stabilized Miniature Payloads (STAMP). Potential missions include reconnaissance, urban, counterterrorism, law enforcement, patrol and convoy escort.
- **Bird Eye 650D:** Bird Eye 650D This is the latest variant. It is designed for military and paramilitary intelligence, surveillance and reconnaissance missions. Commercial applications include mapping, monitoring oil, gas and electrical distribution lines, water and pollution management and rapid surveillance of disaster areas. The UAV can conduct autonomous missions, including point takeoff and point recovery, at ranges of up to 90 mi (150 km) and with a maximum endurance of 15 hours. The air vehicle has a maximum takeoff weight of 66 lb (30 kg) and can carry a 12-lb (5.5-kg) payload, including an electro-optical infrared sensor. It is powered by a standard fuel engine. The Bird Eye 650D can be integrated with a variety of payloads, including gimbaled electro-optical sensors, passive electronic countermeasures and electronic warfare systems.

System

Alternative Designation: Bird Eye 400
Type of UAV: designed for urban and "over the hill" intelligence, surveillance and damage-assessment operations.
Manufacturer: IAI Malat division.
Primary Function: Reconnaissance UAV
Day/Night Capable:
All Weather Capable:
Man-Portable: Yes, The man-portable system is carried in two backpacks and can be deployed by two crewmembers in 30 minutes.
Takeoff or Landing Limitations: None, the Bird Eye 400 can be launched by hand or with a gungee System
Ground Crew:
Automatic Launch: Yes
Navigation: Yes

Return to Base Capable: Yes

Hold and Auto-Recovery Capable: Yes

Real-Time Imagery: The air vehicle captures real-time imagery and transmits it back to the portable ground control system via a satellite communication data link.

Deployment Time: min30

Camera Type: underbelly camera for optimal coverage with a stabilized picture and high-resolution imagery.

System Package: Each system consists of three air vehicles; electro-optical/infrared payloads; portable ground-control station; data link; and a power source and repair kit.

Ground Control Station: The ground-control station features a portable remote video terminal and ground control equipment. The fitted computer monitor displays planned missions using digital maps and pre-programmed flight coordinates.

Note: The air vehicle utilizes a turn-over landing maneuver to protect the payload.

Proliferation: Israel, Russia and Singapore

Dimensions

Length: m0.8

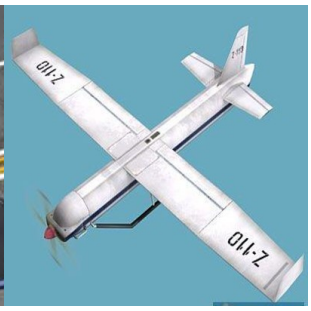
Counter Measures (Chaffs/Flares): No

Notes:

The Bird Eye 400 is a mini unmanned aerial vehicle (UAV) designed for urban and "over the hill" intelligence, surveillance and damage-assessment operations. The air vehicle captures real-time imagery and transmits it back to the portable ground control system via a satellite communication data link. Flight modes include automatic launch, navigation, return to base, hold and auto-recovery. The man-portable system is carried in two backpacks and can be deployed by two crewmembers in 30 minutes. The air vehicle has an underbelly camera for optimal coverage with a stabilized picture and high-resolution imagery. The Bird Eye 400 can be launched by hand or with a bungee system. The air vehicle utilizes a turn-over landing maneuver to protect the payload. The Bird Eye 400 has a flap system that lowers the aircraft's nose into a deep stall before landing on its back. Two elastic "shock absorbers" on the upper part of the UAV hit the ground first and reduce its impact, while its electric motor drives a hinged propeller, which also helps to avoid damage. The electrical propulsion system also minimizes its acoustic signature. Each system consists of three air vehicles; electro-optical/infrared payloads; portable ground-control station; data link; and a power source and repair kit. The ground-control station features a portable remote video terminal and ground control equipment. The fitted computer monitor displays planned missions using digital maps and pre-programmed flight coordinates. The Bird Eye's gimbaled MicroPOP sensor turret features color TV and infrared cameras

ASN-105 Chinese Unmanned Aerial Vehicle (UAV)



Tiers:

Variants:

- **Panghyon-2:** This North Korean variant is based on the ASN-105. It is capable of carrying a combat load of 44 to 55 lb (20 to 25 kg) and reaching an altitude of nearly 9,900 ft (3,000 m).

System

Alternate Designation: ASN 105

Type: UAV

Dimensions

Length: m3.32

Height: m.9

Wingspan: m4.30

Wing Area: 1.85 sq m

Takeoff Weight: kg140

Payload: 30 kg

Automotive

Engine Name: INA

Engine Type: 1 x HS-510 4-cyl, air-cooled piston

Engine Power: 30 hp

Maximum Speed: 250 km/h

Cruise Speed: 150 km/h

Maximum Altitude: 3,200 m

Endurance: 2 hours

Remote Control Maximum Distance: 100 km

Armament

Note: None

Protection

Note: None

Notes:

The ASN-105 is a medium tactical unmanned aerial vehicle (UAV) in service with the Chinese People's Liberation Army. It is designed to perform real-time battlefield surveillance and intelligence collection. Guided by GPS navigation, the ASN-105B is launched by rocket boost and lands with a parachute. An ASN-105 system is made up of six UAVs, a main ground-control station, a mobile ground-control station, an image-processing shelter, a TV/infrared image interpreting shelter and a launcher. The ASN-105B may have a redesigned fuselage and changes to the engine. Models displayed in 2004 had a more square-shaped fuselage, increased wing chord and modified engine exhaust. It has a maximum takeoff weight of 350 lb (160 kg) and a ceiling of 19,700 ft (6,000 m). Status The ASN-105A was first delivered to the PLA in the mid-1990s; the ASN-105B is also in service with China. The ASN-105A also serves with Pakistan.

Vapor 35 American All-Electric Helicopter UAS

Tiers:

Variants:

- **Vapor 55:** INA

System

Alternate Designation: Vapor 35
Type: Unmanned Aircraft Systems (UAS)
Manufacturer: AeroVironment
Payload Capacity: 5 lbs (2.27 kg) – 10 lbs (4.5 kg)
Payload Options: EO/IR, LiDAR, Hyperspectral, PPK Mapping, Drop Mechanism
Data Links: 900 MHz, 2.4 GHz, 5.8 GHz, Satellite

Dimensions

Aircraft Length: 1,941 mm
Aircraft Width: 625 mm
Aircraft Height: 493 mm
Rotor Diameter: 1,704 mm
Gross Weight: 14.5 kg

Automotive

Engine Name: INA
Engine Type: INA
Engine Power: INA
Range: 56 km
Operating Altitude: INA
Max Cruise Endurance: 60 minutes with full payload
Max Hover Endurance: 45 minutes with full payload
Max Wind Peak: 20 kts (23 MPH); Gusts 40 kts (45 MPH)

Operating Altitude: 0-12,000 MSL

Notes:

With advanced autopilot and a variety of available sensors, the all-electric VAPOR 35 Helicopter UAS provides the operational flexibility to meet your most demanding missions. Featuring military-grade components, intelligent HW/SW system design, and high energy density lithium-polymer battery, VAPOR delivers enhanced flight stability and up to one hour of flight time on a single battery charge. Multi-mission capable, VAPOR 35’s modular payload bay provides access to a variety of available integrated sensors and third party payloads including gimbaled EO/IR, survey grade PPK mapping, LiDAR and hyperspectral sensors. VAPOR 35’s economical packout and single case mission configuration enables one-man lift operation. Every VAPOR Helicopter UAS incorporates proprietary HeliSynth™ technology for system level optimization including advanced autopilot, payload control & operation, and mission performance efficiency.

Barracuda European Unmanned Aerial Vehicle (UAV)

Tiers:

System

Alternate Designation: Barracuda

Type: UAV

Dimensions

Length: m8.0

Wingspan: m7.0

Empty Vehicle Weight: kg3,000

Payload: kg300

Max Takeoff Weight: kg3,250

Automotive

Engine Name: 1 P&W Canada JT15D-5C

Engine Type: turbofan engine

Engine Power: 3,190 lb (14.2 kN) static thrust

Maximum Speed: Mach 0.8

Maximum Distance: km200

Maximum Altitude: 40,000 ft (12,200 m)

Armament

Note: None

Protection

Note: The Barracuda uses a specially shaped fuselage, including S-duct air inlet and V-tail, to scatter deflected radar, rendering the UCAV stealthy.

Notes:

The EADS Barracuda is a jet powered European unmanned aerial vehicle (UAV) currently under development by EADS, intended for the role of aerial reconnaissance and also combat (UCAV). The aircraft is a joint venture between Germany and Spain.

Development of the project was stopped after the first prototype crashed at sea while approaching for landing during a test flight. The program was resumed in 2008, with a second prototype being completed in November 2008. The rebuilt Barracuda underwent a series of successful flight tests in Goose Bay, Canada during July 2009, followed by further flight campaigns in 2010 and 2012. The Barracuda is primarily in competition with the Dassault nEUROn for strategic and defensive contracts. Both are stealthy and have a maximum air speed of around Mach 0.85. While Germany and Spain are behind the Barracuda, France, Italy, Sweden, Switzerland, Greece, and Spain are funding the nEUROn. Not much is known about the Barracuda as it is still in development; however, it is thought to have an operating ceiling of around 20,000 ft (6,096 m) and carries a maximum payload of 300 kg. The Barracuda is based on commercially available 'off the shelf' components, but also many refined systems. Its fuselage is constructed entirely from carbon fibre, but also has a greater strength to weight ratio than traditional aircraft materials such as Aluminum (the structure of the Eurofighter Typhoon and Boeing 787 Dreamliner are also made significantly out of it). The only significant metal component is the wing spar, running through the middle and reinforcing the wings. The wing spar allows for easy removal of the wings for transportation. The Barracuda uses a specially shaped fuselage, including S-duct air inlet and V-tail, to scatter deflected radar, rendering the UCAV stealthy.

CAC Fox French Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Fox-AT1:** Short range battlefield reconnaissance variant. The Fox-AT1 has a shorter wingspan of 3.6 metres (11 feet 10 inches); a deeper fuselage; and a sensor payload of 15 kilograms (33 pounds), consisting of day or night imaging systems, chemical sensors, or customer-specified payload. Unlike the Fox-TX, the Fox-AT1 has a skid to permit belly landings. It can carry four small underwing stores. Endurance is only an hour and a half. French forces have used the Fox-AT1 for tactical reconnaissance in the Balkans.
- **Fox-AT2:** Long range battlefield reconnaissance variant. The Fox-AT2 looks much like the Fox-AT1, but has the wider 4-meter wingspan. It can carry a heavier sensor payload of 30 kilograms (66 pounds), but only two wings stores, and uses a long-range radio communications link.
- **Fox-TS1:** Expendable target, with the short 3.6 meter wingspan. It can carry chaff, flares, radar enhancement devices, and other target gear.

System

Alternative designations: None
Engine: Limbach 22 hp L 275 E, 2 cylinder, 2 stroke, air-cooled
Propulsion: 2 blade push propeller
Take-off Weight (kg): kg135
Fuel and Payload (kg): kg60
Maximum (level)(km/h): (km/h216
Cruising Speed (km/h): (km/h145
Endurance (hrs): hours5
Max Ceiling, normal (m): m3,000
Min Ceiling (m): m30
RPV Mode Range (km): km50, 100, 150 (200 as an option)
Programed Mode Range (km): km350
Wing Span (m): m4
Overall Length (m): m2.75
Overall Height (m): m0.25

Flight Control

Launch Method: Hydraulic or sandow ramp

Recovery Method: Parachute

Landing Method: Airbag

PAYLOAD TYPES

Description: Panoramic CCD color camera, low light television (with zoom), IR linescan CAMELIA camera, SAR camera, FLIR, multi-sensor gimball platform (IR and visible), etc.

NOTES

Description: THE FOX AT2 UAV IS ONE OF A FAMILY OF LOW-COST UAVS DESIGNED BY THE FRENCH FIRM CAC SYSTEMES. EACH UAV SYSTEM IS COMPOSED OF A TRANSPORT AND LAUNCHING SYSTEM, A GROUND CONTROL STATION (GCS) MOUNTED ON A 4X4 TRUCK FRAME, AND FOUR UAVS. THE FOX AT2 (LIKE THE FOX AT1) IS LAUNCHED FROM A MOBILE LAUNCHING CATAPULT (TRANSPORTATION AND LAUNCHING SYSTEM) THAT IS MOUNTED ON A TRAILER WITH TRANSPORTATION COMPARTMENTS FOR 4 UAVS. NORMALLY TWO OF THE FOUR UAVS ARE EQUIPPED WITH CCD CAMERAS FOR DAYTIME MISSIONS AND THE REMAINING TWO ARE FLIR EQUIPPED FOR NIGHTTIME MISSIONS. UPON MISSION COMPLETION THE UAV CAN BE RESERVICED AND AVAILABLE FOR ANOTHER MISSION IN LESS THAN 30 MINUTES. THE FOX AT2 IS CAPABLE OF CARRYING 30 KILOGRAMS OF VARIOUS PAYLOADS. ADDITIONALLY, TWO UNDER-WING PODS ALLOW FOR TWO LOADS TO BE CARRIED AND DROPPED. NORMALLY THE GCS CONSIST OF A CREW OF THREE PERSONNEL: PILOT, OBSERVER, AND A TECHNICIAN. HOWEVER, TWO PEOPLE CAN DEPLOY THE UAV SYSTEM AND HAVE IT AVAILABLE FOR OPERATION IN LESS THAN 20 MINUTES. THE GUIDANCE AND CONTROL CONSISTS OF AN UHF DATA LINK WITH FOUR PROPORTIONAL AND EIGHT NUMERIC CHANNELS, OF WHICH FOUR CONTROL THE AUTOPILOT. TELEMETRY IS THROUGH A 12-CHANNEL DATA LINK.

Notes:

The CAC Fox is a small UAV developed in France for use as a reconnaissance aircraft and for electronic warfare. About a thousand have been sold in a number of variants, with generally similar appearance and specifications. The Fox-TX can carry a variety of payloads for radar or radio communications jamming; radar identification and location; communications intercept; or, when fitted with a warhead and a radar-homing seeker, anti-radar attack. The Fox-TX can also carry two small under wing stores.

↳

Aerosky Israeli Unmanned Aerial Vehicle

Tiers:

Variants:

- **Aerosky 2:** The Aerosky 2 variant was designed with a hybrid battery/piston engine developed by Zanzottera Technologies, Italy. The first flight took place on June 2, 2008. Its maximum takeoff weight is 176 lb (80 kg), with a flight endurance of 10 hours. It has a small noise signature at a low-altitude while operating with electrical propulsion, according to Flight International (April 22, 2008).

System

Alternate Designation: Aerosky

Type: UAV

Dimensions

Length: m3.05

Wingspan: m4.50

Takeoff Weight: kg70

Payload Weight: kg40

Automotive

Engine Name: INA

Engine Type: Combustion

Engine Power: hp10

Maximum Speed: 185 km/h

Maximum Distance: 200 km

Maximum Altitude: 3,050 m

Armament

INA:

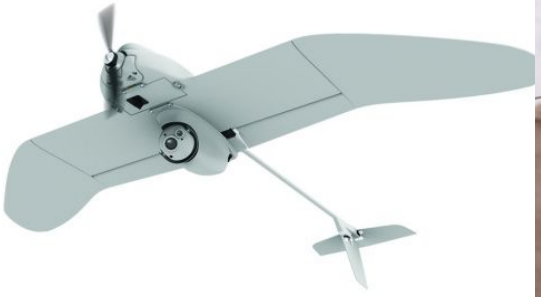
Protection

INA:

Notes:

Description The Aerosky is a short-range Israel-made unmanned aerial vehicle (UAV) that has served with the United States and Israel. It is used for tactical reconnaissance, surveillance and target acquisition. The UAV is used as the baseline vehicle for other Aeronoautics aircraft; the Aerosky has a twin tail-boom and a pusher-propeller. It has two radio frequency command uplinks and a real-time imagery downlink. It carries Tamam's POP 200 EO/IR payload and is controlled by UMAS avionics, including full autonomous navigation, camera-guided navigation and MCS ground enhancement. Status The Aerosky was marketed internationally through IAI and obtained by the U.S. Navy and the Israel Defense Forces. The IDF began operating it in March 2002 on "pay-by-the-hour" basis over the Gaza Strip and West Bank. While the vehicle may still be operational, as suggested in Armada International’s Compendium UAVs: Time to Get Real (2015), there has been little unclassified information regarding the Aerosky since 2008. As of 2017, there was no open-source information available about its status with the U.S. Navy or the IDF. The manufacturer did not respond to inquiries by the time of this update.

Wasp AE (RQ-12A) American Unmanned Aerial Vehicle (UAV)



Tiers:

System

Alternate Designation: Wasp AE RQ-12A
Type: Unmanned Aerial Vehicle (UAV)
Manufactuer: AeroVironment
Payload: Gimbaled payload with pan and tilt stabilized high resolution EO & IR camera in a compact aerodynamic modular payload.
GCS: Common GCS with Raven® and Puma
Launch Method: Hand-launched in a confined area with remote launch capability
Recovery Method: Deep-stall landing in a confined area

Dimensions

Length: 2.5 ft (76 cm)
Wingspan: 3.3 ft (102 cm)
Weight: 2.85 lbs; 1.3 kg

Automotive

Engine Name: INA
Engine Type: 1 × Electric motor, rechargeable lithium ion batteries
Engine Power: INA
Range: 5 km Line-of-Sight, 5+km with DDL relay
Maximum Speed: 20 knots cruise, 45+ knots dash
Endurance: 50 min
Operating Altitude: 500 ft (152 m) AGL

Notes:

Weighing in at just over a kilogram, the Wasp AE delivers best-in-class capabilities for an unmanned aircraft system of its size, including stealth-like maneuverability, superior imagery, encrypted video and exceptional ease of use. Wasp’s gimbaled payload is mechanically stabilized, enabling it to transmit advanced imagery in high-wind conditions, while its advanced avionics allow operators the option of manual or autonomous navigation. The all-environment Wasp combines hand-launch

capabilities with deep-stall landing for operations in confined areas on land or water. The aircraft also includes an integrated landing camera that provides operators with exceptional situational awareness as the aircraft approaches the ground.

RQ-7B Shadow American Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **RQ-7A Shadow:** The RQ-7A was the initial version of the Shadow 200 UAS developed by AAI. The first low-rate initial-production systems were delivered to the US Army in 2002 with the first full-scale production systems being delivered in September 2003. The RQ-7A was 11 ft 2 in (3.40 m) long and had a wingspan of 12 ft 9 in (3.89 m) with a 327 lb (148 kg) max takeoff weight. The aircraft's endurance ranged between 4 and 5.5 hours depending on mission. The "A" model aircraft also had the AR741-1100 engine which could use either 87 octane automotive gasoline or 100LL aviation fuel. The "A" model also featured IAI's POP200 payload.
- **RQ-7B Shadow:** Production of Shadow aircraft shifted to a generally improved RQ-7B variant in the summer of 2004. The RQ-7B features new wings increased in length to 14 ft (4.3 m). The new wings are not only more aerodynamically efficient, they are "wet" to increase fuel storage up to 44 liters for an endurance of up to 6 hours. The payload capability has been increased to 45 kilograms (99 pounds). After reports from Iraq that engines were failing, in 2005, the Army's UAV project manager called for the use of 100LL, an aviation fuel, rather than the conventional 87 octane mogas. Avionics systems have been generally improved, and the new wing is designed to accommodate a communications relay package, which allows the aircraft to act as a relay station. This allows commanders or even the aircraft operators themselves to communicate via radio to the troops on ground in locations that would otherwise be "dead" to radio traffic.
- **Armed Shadow:** On 19 April 2010 the Army issued a "solicitation for sources sought" from defense contractors for a munition for the Shadow system with a deadline for proposals due no later than 10 May 2010. Although no specific munition has been chosen yet, some possible munitions include the Raytheon Pyros bomb, the General Dynamics 81 mm 4.5 kg (10-pound) air-dropped guided mortar, as well as the QuickMEDS system for delivering medical supplies to remote and stranded troops. The Army subsequently slowed work, and the Marine Corps then took the lead on arming the RQ-7 Shadow. Raytheon has conducted successful flight tests with the Small Tactical Munition, and Lockheed Martin has tested the Shadow Hawk glide weapon from an RQ-7. On 1 November 2012, General Dynamics successfully demonstrated their guided 81 mm Air Dropped Mortar, with three launches at 7,000 ft hitting within seven meters of the target grid. As of August 2011, the Marine Corps has received official clearance to experiment with armed RQ-7s, and requires AAI to select a precision munition ready for deployment. AAI was awarded $10 million for this in December 2011, and claims a weapon has already been fielded by the Shadow. In 2014, Textron launched the Fury precision weapon from a Shadow 200. By May 2015, the Marine Corps had run out of funding for weaponizing the RQ-7, and the Army had shown little interest in continuing the effort. The Army's stance is that the Shadow's primary capability is persistent surveillance, while there are many other ways to drop bombs on targets and adding that to the Shadow would add weight and decrease endurance.
- **Nightwarden:** A test version called STTB flew in summer 2011. AAI is developing a bigger version called M2 with a blended wing to include a 3-cylinder 60 hp Lycoming heavy fuel engine, and began flight testing in August 2012. The Shadow M2 has a conformal blended body that reduces drag, wingspan increased to 25 ft (7.6 m), and is 120 lb (54 kg) heavier. It can fly for 16 hours at altitudes up to 18,000–20,000 ft (5,500–6,100 m); its endurance and service ceiling are comparable to Group 4 UASs like the MQ-1 Predator, so the company is pitching the M2 as a budget-conscious alternative to larger unmanned aircraft. It has a greater payload to carry synthetic aperture radar (SAR), wide-area surveillance, navigation, signals intelligence, and electronic warfare packages. It also has the ability to be controlled beyond line-of-sight through a SATCOM link. Although the M2 uses the same internal components as the RQ-7B Shadow 200 and is compatible with existing support equipment and ground infrastructure, its greater weight necessitates changes to the existing launcher. The Shadow M2 uses 80-85 percent of the components of the Shadow V2, while allowing for an additional 100 lb (45 kg) of capability with total airframe weight increased to 720 lb (330 kg).
- **Shadow 600:** AAI has also built a scaled-up Pioneer derivative known as the "Shadow 600". It also resembles a Pioneer, except that the outer panels of the wings are distinctively swept back, and it has a stronger Wankel engine, the UAV EL

801, with 52 hp (39 kW). A number of Shadow 600s are in service in several nations, including Romania.
- **SR/C Shadow:** AAI, in conjunction with Textron sister company Bell Helicopter, intends to modify two Shadows with a Carter rotor on top for vertical take-off and landing, eliminating the need for the recovery and pneumatic launcher systems, while increasing payload and endurance. As of August 2011, it is expected to fly in 2012. AAI also expected to use the SR/C technology for the Shadow Knight, a powered-rotor two-propeller surveillance aircraft for the US Navy MRMUAS program; however, the MRMUAS program was cancelled in 2012.

System

Alternate Designation: RQ-7B Shadow

Type: Unmanned Aerial Vehicle (UAV)

Manufacturer: AAI Corporation

Mission: Tactical reconnaissance UAS for ground maneuver forces Unmanned combat aerial vehicle (optionally)

Payload Capability: 45 kg

Endurance: 9 hours

Communications: Avionics systems have been generally improved, and the new wing is designed to accommodate a communications relay package, which allows the aircraft to act as a relay station. This allows commanders or even the aircraft operators themselves to communicate via radio to the troops on ground in locations that would otherwise be "dead" to radio traffic.

Note: The Shadow can operate up to 125 km (78 mi) from its brigade tactical operations center, and recognize tactical vehicles up to 8,000 ft (2,400 m) above the ground at more than 3.5 km (2.2 mi) slant range.

Dimensions

Length: 3.41 m

Wingspan: 6.1 m

Height: 1.0 m

Airfoil: NACA 4415

Empty Weight: 77 kg

Gross Weight: 170 kg

Automotive

Engine Name: 1 × AR741-1101

Engine Type: INA

Engine Power: 38 hp

Maximum Speed: 200 km/h

Cruise Speed: 130 km/h

Maximum Range: 125 km

Service Ceiling: 4,600 m ELOS (Electronic Line Of Sight)

Endurance: 9 hours

Note: When outfitted with IE (Increased Endurance) Wings, the CRP (Communications Relay Package) and the 1102 engine, endurance time is increased to 9 hours, wing span is increased to approx. 22 feet (6.7 m), and the service ceiling is 18,000 ft (only with authorization).

Notes:

The AAI RQ-7 Shadow is an American unmanned aerial vehicle (UAV) used by the United States Army, Australian Army and Swedish Army for reconnaissance, surveillance, target acquisition and battle damage assessment. Launched from a trailer-mounted pneumatic catapult, it is recovered with the aid of arresting gear similar to jets on an aircraft carrier. Its gimbal-mounted, digitally stabilized, liquid nitrogen-cooled electro-optical/infrared (EO/IR) camera relays video in real time via a C-band line-of-sight data link to the ground control station (GCS). The US Army's 2nd Battalion, 13th Aviation Regiment at Fort Huachuca, Arizona, trains soldiers, Marines, and civilians in the operation and maintenance of the Shadow UAS. The Shadow is operated in the U.S. Army at brigade-level. Production of Shadow aircraft shifted to a generally improved RQ-7B variant in the summer of 2004. The RQ-7B features new wings increased in length to 14 ft (4.3 m). The new wings are not only more aerodynamically efficient, they are "wet" to increase fuel storage up to 44 liters for an endurance of up to 6 hours. The payload capability has been increased to 45 kilograms (99 pounds).[5] After reports from Iraq that engines were failing, in 2005, the Army's UAV project manager called for the use of 100LL, an aviation fuel, rather than the conventional 87 octane mogas. Avionics systems have been generally improved, and the new wing is designed to accommodate a communications relay package, which allows the aircraft to act as a relay station. This allows commanders or even the aircraft operators themselves to communicate via radio to the troops on ground in locations that would otherwise be "dead" to radio traffic. The Shadow can operate up to 125 km (78 mi) from its brigade tactical operations center, and recognize tactical vehicles up to 8,000 ft (2,400 m) above the ground at more than 3.5 km (2.2 mi) slant range. Other incremental improvements to the system include replacing the AR741-1100 engine with the AR741-1101 which increases reliability through the use of dual spark plugs as well as limiting the fuel to 100LL. Also, the older POP200 payload was replaced with the newer POP300 system. In February 2010, AAI began a fleet update program to improve the Shadow system. The improvements include installing the wiring harnesses and software updates for IAI's POP300D payload which includes a designator for guiding laser-guided bombs. Other improvements in the program will include an electronic fuel injection engine and fuel system to replace the AR741-1101's carburetted engine. The most visible improvement to the system will be a wider wing of 20 feet (6.1 m) in span which is designed to increase fuel capacity and allow for mission endurance of almost 9 hours. The new wings will also include hardpoints for external munitions. A joint Army-Marine program is testing IED jamming on a Shadow at MCAS Yuma. Another joint effort is to view a 4 km × 4 km (2.5 mi × 2.5 mi) ground area from 3,650 m (12,000 feet). The Army is now proposing the upgraded Shadow 152A, which includes Soldier Radio Waveform software, which allows both the command post and their troops to see the images that the UAV is projecting, as long as they are on the same frequency. It also increases the distance and area of communication. Preliminary TCDL testing conducted at Dugway Proving Ground was a success. This led to an estimated fielding date of May 2010 for TCDL. In March 2015, the first Shadow unit was equipped with the upgraded RQ-7BV2 Shadow version. New capabilities for the BV2 include the TCDL, encryption of video and control data-links, software that allows interoperability between other UAS platforms, integration of a common control station and control terminal for all Army UAS platforms, an electronic fuel-injection engine, and increased endurance to nine hours through a lengthened wingspan of 20 ft (6.1 m), with weight increased to 204 kg (450 lb). Shadow systems are being upgraded at a rate of 2-3 per month, with all Army Shadows planned to become BV2s by 2019.

Skylark II Israeli Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Skylark II LE:**

System

Alternative Designation : None
Ground Crew: 2

Dimensions

Length, Overall: m3.2
Length, Wing Span: m4.2
Weight, Takeoff: kg35
Weight, Maximum Launch: kg65

Automotive / Performance

Altitude, Operating : m150-1,525
Ceiling, Service : m4,875
Endurance : hr6
Range of Operation: km50
Speed, Cruising : km/h65
Speed, Maximum : km/h129
Engine Name: Bental Industries electric motor
Engine Power: 5.4hp, 4kW
Engine Type: Electric, battery
Ground Control: Skylark dual station ground control, color console
Propulsion: Two blade propeller

Launch and Recovery

Launch Method: HMMWV class vehicle with mounted rail launcher, or can use optional rail launcher trailer

Recovery/Landing Method: Parachute and airbag cushion

Payload

Payload User Image Capabilities: All images can be overlaid on a downlinked integrated map

Notes: Range Finder (optional)

↳*Payload 1*

Description: HD Color CCD 10x zoom lens

Type: Optical Camera

↳*Payload 2*

Description: Night FLIR thermal imaging

Type: IR Camera

↳*Payload 3*

Description: Marker

Type: Laser

Notes:

The Skylark II was unveiled in 2006. It has a range of 60 km and is designed to be operated by a two-person crew and to be deployed using HMMWV class field vehicles. In December 2007, South Korea decided to purchase the Skylark II system. Israel planned to bring the Skylark II into service by mid-2013. Skylark II is designed to support brigades and divisions. The guidance system is a Starlink air terminal with secure digital data links, redundant avionics, and autonomous flight modes. They are interoperable with other Skylarks with real-time video transfer rate of 1.5 mb per second, encrypted UHF uplink, D/E band downlink. Uses a triple sensor payload that provides high definition optical, thermal imager, and laser capabilities.

Puma LE American Unmanned Aerial Vehicle (UAV)

Tiers:

1 2 3 4

System

Alternate Designation: Puma LE

Type: Unmanned Aerial Vehicle (UAV)

Manufacturer: AeroVironment

Endurance: 5.5 hours

Payload Capacity: 2.5 kg

Payloads: Mantis i45 Gimbaled payload with dual 15mp EO cameras, 50xf zoom, IR camera and low light camera for night operations, and high power illuminator. Secondary Payload Bay: integrates multi-mission payloads including Electronic Warfare, Communications Relay and others.

GCS: Common GCS with Puma, Raven and Wasp AE

Launch and Recovery Method: Hand-launched, bungee launch (optional) Autonomous or manual skid landing

Dimensions

Length: 2.1 m

Wingspan: 4.6 m

Weight: 11.8 kg

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: INA

Maximum Speed: 46-76 km/h, 25 knots cruise, 41 knots dash

Range: 20 km, up to 60 km with LRTA

Maximum Altitude: 500 ft (152 ml) AGL Max Launch Alt 10,000 (3048 ml)

Notes:

Puma LE (Long Endurance) reflects AeroVironment’s deep recognition of the features warfighters require from an extended-mission unmanned aircraft system. At just 22.5 pounds, this ultra-lightweight Group 2 aircraft is launchable by hand or bungee and provides up to 5.5 hours flight endurance, delivering Group 2 capabilities in a Group 1 footprint. Puma LE is All

Environment, and provides an operational range of 60 kilometers in land and maritime environments when used with AeroVironment's Long-Range Tracking Antenna. The secondary payload bay contains dedicated power and ethernet, providing 3.4 pounds of payload capacity in addition to the integrated Mantis i45 gimbaled EO/IR sensor and NVG-visible laser illuminator for expanded mission capabilities. Equally important, Puma LE has been designed to maximize our customers' investment. Its plug-and-play, interoperable LRU components can be shared across other AeroVironment Puma AE aircraft, reducing logistical and training costs and enabling customers to optimize their fielded systems. Puma LE joins the Puma All Environment Family to deliver Group 2 capabilities in a Group 1 optimized, two-case mission packout. This ultra-lightweight Group 2 aircraft nearly doubles the time on station of Puma 3, featuring 5.5 hours of flight endurance and a 60+ km range when used with the Long Range Tracking Antenna (LRTA). Puma LE comes equipped with AeroVironment's Mantis™ i45 gimbaled payload featuring dual Electro-Optical (EO) cameras, an Infrared (IR) camera, a low-light camera, and an NVG-visible laser illuminator. The aircraft is multi-mission capable, with a total payload capacity of 5.5 lb. and a secondary payload bay with dedicated power supply and Ethernet. The system was built for the integration of multi-mission payloads such as Electronic Warfare, RF Geolocation or Communications Relay. Puma LE utilizes a precise, waypoint-controlled skid landing and does not require additional equipment for recovery.

DJI-Phantom Chinese Micro Unmanned Aerial Vehicle

Tiers:

System

Alternative Designation: Phantom
Ground Crew: 1
Propulsion: 4 two blade propeller, Vertical Take Off and Landing (VTOL), Electric
Motor: V15.2

Required Operating System:: INA

iOS 8.0 or later: Yes

Android 4.1.2 or later: Yes

Notes:

DJI Phantom and associated applications are compatible with Apple, Samsung, Google, Ascend, Huawei, Nubia, Sony, and MI wireless devices. Thermal imaging can be achieved by adding a separate camera to the UAV payload. The increase in weight can be offset with modifications to the power supply.

Mohajer-1 Iranian Tactical Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Mohajer-2:** Following the successful use of the Mohajer-1, Iran wanted a version with more range and endurance. This version, which would later be named the Mohajer-2, also had an auto pilot system to fly beyond the line-of-control of its command center.
- **Mohajer-2N:** In 2014, Iran introduced the Mohajer-2N, which shares the same design as the Mohajer-2 but has far improved performance.[13] The Mohajer-2N replaces the electronics of the Mohajer-2 with more modern versions and has also has improved flight characteristics. T
- **Mohajer-3:** The Mohajer-3, also known as the Dorna, was designed with a new airframe for better performance. It had a square body and featured a low-mounted horizontal stabilizer flush with the main wing, the only member of the Mohajer family configured this way.
- **Mohajer-4:** The Mohajer-4 was designed for both the Iranian Army and the IRGC and entered service in late 1997.
- **Mohajer-4B:** Also known as the Sadiq, the Mohajer-4B is a significant evolution of the Mohajer-4 platform with a square fuselage, twin tail booms, a top-mounted horizontal stabilizer, uncanted wingtips, new landing skids, and straight wings mounted high and to the mid of the body
- **Sadegh-1:** The Sadegh-1 ("Honest-1"), also known as the QOM-1, is simply a Mohajer-4B with two MANPADS mounted on pylons.It was tested in late 2014
- **Mohajer-6:** The Qods Mohajer-6 is a persistent ISTAR UAV capable of carrying a multispectral surveillance payload and/or up to two precision-guided munitions. Ten have been manufactured as of February 2018 for the IRGC Ground Forces, and 40 are planned for the IRGC Navy.The Mohajer-6 complements the larger Shahed 129 operated by the third IRGC branch, the IRGC-ASF. Three have also been delivered to the Iranian Army.

System

Alternative Designation: Qods Mohajer; Mohajer-1
Type of UAV: Tactical Unmanned Aerial Vehicle (UAV)
Manufacturer: Qods Aviation, Tehran
Family: Mohajer family
In Service: 1986-no longer in service
Flight Control Method: controlled by hobby-class radio, which was easily jammed
Day/Night Capable: INA
All Weather Capable: INA
Takeoff or Landing Limitations: INA
Ground Crew: INA
Autopilot: No

Ceiling, Normal Operations: kmINA

Endurance: houors1.5

Range: km30

Date Transmit Distance: INA

Add on Armor: No

EW: No

EW Counter Measures / CCM: No

Counter Measures (Chaffs/Flares): No

Notes:

The Mohajer was Iran's first drone to enter series production and was used during the Iran–Iraq War. The Mohajer-1 was known simply as "Mohajer" through the 80s and 90s, when it was re-designated "Mohajer-1" as other Mohajer variants had been developed. The Mohajer-1 had a narrow cylindrical fuselage, twin tailbooms, and straight wings mounted high and to the rear of the body. It had a single engine (unknown model) in a pusher configuration, and was guided by ailerons on the wings, an elevator on the horizontal stabilizer, and rudders on the tailbooms. The Mohajer-1 had three fixed landing gear for launch and recovery. It could also be recovered by parachute.The Mohajer-1 was about 8 feet long and had a wingspan of about 10 feet. The Mohajer-1 carried a single still camera, probably carrying photographic film developed after the drone landed. It was controlled by hobby-class radio, which was easily jammed. In addition, Iran attempted to arm it with six RPG-7 rockets, three under each wing, though this was not very successful. This initial variant was used during the later stages of the Iran-Iraq war. It was typically launched from speedboats to provide battlefield surveillance. Unlike later models, the Mohajer-1 featured tricycle landing gear. It had a range of up to 19 mi (30 km) and carried a static nose-mounted camera. The air vehicle could be armed with up to six PG-7 rockets, with three under each wing.

Panghyon-2 North Korean Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **ASN 105:** ASN-105 is a fixed wing UAV in conventional layout with high wing configuration, and propulsion is provided by a two-blade fixed pitch propeller driven two-stroke engine mounted in the nose. ASN-105 is a development of ASN-104, and thus having identical layout. The main improvement of ASN-105 over its predecessor ASN-104 is that its remote control range is increased by two third, from the original 60 km to 100 km. Another improvement of ASN-105 over its predecessor ASN-104 is that its ground control station is fully computerized.

System

Alternate Designation: Panghyon-2

Type: UAV

Dimensions

Length: m3.32

Height: m.9

Wingspan: m4.30

Wing Area: 1.85 sq m

Takeoff Weight: kg140

Payload: 25 kg

Automotive

Engine Name: INA

Engine Type: 1 x HS-510 4-cyl, air-cooled piston

Engine Power: 30 hp

Maximum Speed: 250 km/h

Cruise Speed: 150 km/h

Maximum Altitude: 3,000 m

Endurance: 2 hours

Remote Control Maximum Distance: 100 km

Armament

Note: None

Protection

Note: None

Notes:

This North Korean variant is based on the ASN-105. It is capable of carrying a combat load of 44 to 55 lb (20 to 25 kg) and reaching an altitude of nearly 9,900 ft (3,000 m). The ASN-105 is a medium tactical unmanned aerial vehicle (UAV) in service with the Chinese People's Liberation Army. It is designed to perform real-time battlefield surveillance and intelligence collection. Guided by GPS navigation, the ASN-105B is launched by rocket boost and lands with a parachute. An ASN-105 system is made up of six UAVs, a main ground-control station, a mobile ground-control station, an image-processing shelter, a TV/infrared image interpreting shelter and a launcher. The ASN-105B may have a redesigned fuselage and changes to the engine. Models displayed in 2004 had a more square-shaped fuselage, increased wing chord and modified engine exhaust. It has a maximum takeoff weight of 350 lb (160 kg) and a ceiling of 19,700 ft (6,000 m). Status The ASN-105A was first delivered to the PLA in the mid-1990s; the ASN-105B is also in service with China. The ASN-105A also serves with Pakistan.

Tu-143 Russian Unmanned Reconnaissance Aircraft

Tiers:

Variants:

- **M-143 variant:** A target drone version, the M-143, was introduced in the mid-1980s.
- **Tu-243 variant:** The Tu-143 was followed into service in the late 1990s by the similar but improved "Tu-243 Reys-D", with a 25 cm (10 inch) fuselage stretch, to provide greater fuel capacity and about twice the range; it had an uprated TR3-117 engine with 6.28 kN (640 kgf, 1,410 lbf) thrust; and improved low-altitude guidance.
- **Tu-300 variant:** Since 1995, Tupolev began promoting the further refined "Tu-300 Korshun", which resembles its predecessors but is fitted with a nose antenna dome and nose fairings for modern sensors and electronic systems. It also features a centerline pylon for a sensor pod or munitions. Financial issues forced a halt to development at the end of the 1990s, but work was resumed in 2007.

System

Alternate Designation(s): Tupolev Tu-143

Primary Function / Type: Unmanned Reconnaissance Aircraft

Manufacturer: Tupolev

Status: 1976-Present

Dimensions

Length: 8.06 m

Wingspan: 2.24 m

Height: 1.54 m

Launch Weight: 1,230 kg

Automotive

Engine Name: INA

Engine Type: INA
Engine Power: INA
Maximum Speed: 950 km/h
Maximum Range: 200 km
Service Ceiling: 5,000 m

Notes:

The Tupolev Tu-143 Reys (Flight or Trip, Russian: Рейс) was a Soviet unmanned reconnaissance aircraft in service with the Soviet Army and a number of its Warsaw Pact and Middle East allies during the late 1970s and 1980s. It contained a reconnaissance pod that was retrieved after flight, and from which imagery was contained. The Tu-143 was introduced in 1976 and strongly resembled the Tu-141, but was substantially scaled-down. It was a short-range (60–70 kilometer) tactical reconnaissance system and had low-level flight capability. The Tu-143 was truck-launched with JATO boosting, recovered by parachute, and powered by a TR3-117 turbojet with 5.8 kN (590 kgf, 267 lbf) thrust. The initial version carried film cameras, but later versions carried a TV or radiation detection payload, with data relayed to a ground station over a datalink. Some 950 units were produced in the 1970s and 1980s. The Tu-143 was used by Syria in reconnaissance missions over Israel and Lebanon during the 1982 Lebanon War, as well as by Soviet forces in Afghanistan during the Soviet–Afghan War.

Puma 3 American Unmanned Aerial Vehicle (UAV)

Tiers:

System

Alternate Designation: Puma 3
Type: Unmanned Aerial Vehicle (UAV)
Manufacturer: AeroVironment
Endurance: 2.5 hour flight endurance with an LE battery
Payloads: Mantis i45 Gimbaled Payload with Dual 15mp EO cameras, 50x zoom, IR camera and Low Light camera for night operations, and High Power Illuminator
GCS: Common GCS with Raven® and Wasp® AE
Launch Method: Hand-launched, rail launch (optional)
Recovery Method: Autonomous or manual deep-stall landing

Dimensions

Length: 1.4 m
Wingspan: 2.8 m
Weight: 6.8 kg

Automotive

Engine Name: INA
Engine Type: INA
Engine Power: INA
Maximum Speed: 47–83 km/h, 25–45 knots

Maximum Distance: 20 km standard antenna, 60 km with LRTA
Maximum Altitude: 300–500 ft (91–152 m) AGL
Endurance: 2.5 hour flight endurance with an LE battery

Notes:

AeroVironment’s expertise in UAS technology is epitomized by our third-generation Puma 3 AE (All Environment). We have equipped the Puma 3 AE with the powerful Mantis i45 gimbaled payload for use in day, night, or low-light environments, an array of communication frequencies (M1/M2/M3/M4/M5/M6), all protected with powerful AES-256 bit encryption, and a reinforced airframe with optional under wing transit bay for secondary payloads and third party applications. With both manual and autonomous navigation capability, Puma 3 AE’s newly enhanced propulsion system makes it significantly more efficient and easier to hand-launch. Deep- stall lading capability makes aircraft recovery simple and precise. All these advanced features can be used in land or maritime operations.

Vapor 55 American All-Electric Helicopter UAS

Tiers:

Variants:

- **Vapor 35:** INA

System

Alternate Designation: Vapor 55
Type: Unmanned Aircraft Systems (UAS)
Manufacturer: AeroVironment
Payload Capacity: 10 lbs (4.5 kg)
Payload Options: EO/IR, LiDAR, Hyperspectral, PPK Mapping, Drop Mechanism
Data Links: 900 MHz, 2.4 GHz, 5.8 GHz, Satellite

Dimensions

Aircraft Length: 1,941 mm
Aircraft Width: 672 mm
Aircraft Height: 583 mm
Rotor Diameter: 2,291 mm
Gross Weight: 24.9 kg

Automotive

Engine Name: INA
Engine Type: INA
Engine Power: INA
Range: 56 km
Operating Altitude: INA
Max Cruise Endurance: 60 minutes with full payload
Max Hover Endurance: 45 minutes with full payload
Max Wind Peak: 20 kts (23 MPH); Gusts 40 kts (45 MPH)

Operating Altitude: 0-12,000 MSL

Notes:

The all-electric VAPOR 55 Helicopter UAS delivers flight control performance, endurance, and payload flexibility. Featuring military-grade components, intelligent HW/SW system design, and high energy density lithium-polymer battery, VAPOR delivers enhanced flight stability and up to one hour of flight time on a single battery charge. With an expansive modular payload bay, and up to 10 lbs. useable payload capacity, VAPOR is multi-mission capable, with access to a variety of available integrated sensors and third party payloads including EO/IR, survey grade PPK mapping, LiDAR and hyperspectral sensors, and Drop/Delivery Mechanism. Every VAPOR Helicopter UAS incorporates proprietary HeliSynth™ technology for system level optimization including advanced autopilot, payload control & operation, and mission performance efficiency.

Skylark I Israeli Unmanned Aerial Vehicle (UAV)

Tiers:

1 **2** 3 4

Variants:

- **Skylark I LE Block II:** Hydrogen fueld cell propulstion engine, 7 hrs or greater endurance.
- **Skylark I-LEX Mini Unmanned Aircraft System (UAS):** Skylark I-LEX is a new generation, man-portable, electric-propelled, mini unmanned aircraft system (UAS) manufactured by Elbit Systems.

System

Alternative Designation : None
Engine Type: Electric, battery powered
Flight Control: GPS positioning, autonomous preprogrammed flight
Flight Control Method: Sprectralink data link
Ground Control: Handheld, Mini Ground Control Unit, color console
Ground Crew: 2, backpack (30-40 kg each)
Propulsion: Two blade propeller

Dimensions

Length, Overall: m2.2
Length, Wing Span: m2.4
Weight, Maximum Launch: kg5.5

Launch and Recovery

Launch Method: Hand or bungee launched

Recovery/Landing Method:: One button auto return, steep stall, inflatable cushion

Performance

Ceiling, Maximum (normal) : m455

Ceiling, Service : km5

Endurance : 1 hr, 30 min

Radius of Operation : km10

Speed, Cruising : km/h65

Speed, Maximum : km/h111

Maximum Range: 40 km

Payload

Description: Color CCD 10x zoom lens

Payload Downlink: D/E-band telemetry/video

Payload Uplink: Analog, encrypted, UHF

Payload User Image Capabilities: All images can be overlaid on a downlinked integrated map

Type: Optical Camera

Type: User Image Capabilities

Notes:

The Skylark I is designed as a man-packed system for tactical surveillance and reconnaissance. The Skylark is launched by hand. The payload consists of a daylight CCD or optional FLIR for night operations. During operation, it sends real-time video to a portable ground station. Recovery involves a deep stall maneuver, landing on a small inflatable cushion. It has a range of 40 km. It has been deployed in Afghanistan and Iraq. The Skylark I has also been selected by France's Special Forces in March 2008. Previous operators, who have now retired the system, include Australia and Canada. In total, it has been selected by more than 20 operators worldwide.

Zala 421-12 Russian Unmanned Aerial Vehicle (UAV)

Tiers:

1 2 3 4

System

Alternative designations: 421-4M
Proliferation: INA
Ground Crew: Two

Dimensions

Wing Span: m1.6
Length (fuselage): m0.62
Takeoff Weight: kg3.9
Max Takeoff Weight: kg4.8
Max Payload: kg1

Automotive

Engine: Electric, battery powered
Propulsion: 2-blade propeller
Max Speed: km/h130
Cruise Speed: km/h65-120
Maximum Ceiling: 3,600m Above Sea Level
Minimum Ceiling: m15
Operating Ceiling: m100-700

Endurance: min130

RPV Mode Range: km25

Pre-programmed Mode Range: km40

Launch Method: Elastic or pneumatic catapult

Wind speed at launch: 10 m/s

Recovery Method: Parachute (non-steerable)

Payload

Photo camera: 10 Mpx

Color Video Camera: 550 TVL

Infrared Camera: 320x240 px

Hazard Gas Analysis Module: Hazardous Gas (Optional)

System Components

Number of UAVs: 2 UAVs

Number of transport cases: 2 transport cases

Ground Control Station (GCS): 1 man-pack, ruggedized

GCS Power Supply: 120/220 V, 6 hour battery

Setup Time (min): 5-10 min.

Control Capability: UAV and payload controlled independently by GCS

Video roll-stabilized cameras: 2 Video cameras

Infrared Camera (optional): 1 IR Camera

Elastic or Pneumatic Launcher: 1 (optional)

Notes:

ZALA 421-12 is a micro, miniature, UAV developed and produced by the Izhevsk-based company ZALA Aero. It is a small, portable and reliable UAV platform. ZALA 421-12 is designed for front-line reconnaissance, overground and oversea surveillance. It takes 3 minutes to prepare ZALA for launching. The UAV is operated in the autonomous or semi-autonomous mode. Payloads fit in the standard mounting block that is interchangeable with other payloads and is a dual axis, gyro-stabilized payload. GLONASS/GPS satellite navigation with capability of autonomous operation.

Arpia Venezuela Tactical Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Mohajer-1:** The Mohajer was Iran's first drone to enter series production and was used during the Iran–Iraq War. The Mohajer-1 was known simply as "Mohajer" through the 80s and 90s, when it was re-designated "Mohajer-1" as other Mohajer variants had been developed.
- **Mohajer-2:** Following the successful use of the Mohajer-1, Iran wanted a version with more range and endurance. This version, which would later be named the Mohajer-2, also had an auto pilot system to fly beyond the line-of-control of its command center.
- **Mohajer-2N:** In 2014, Iran introduced the Mohajer-2N, which shares the same design as the Mohajer-2 but has far improved performance. The Mohajer-2N replaces the electronics of the Mohajer-2 with more modern versions and has also has improved flight characteristics. T
- **Mohajer-3:** The Mohajer-3, also known as the Dorna, was designed with a new airframe for better performance. It had a square body and featured a low-mounted horizontal stabilizer flush with the main wing, the only member of the Mohajer family configured this way.
- **Mohajer-4:** The Mohajer-4 was designed for both the Iranian Army and the IRGC and entered service in late 1997.
- **Mohajer-4B:** Also known as the Sadiq, the Mohajer-4B is a significant evolution of the Mohajer-4 platform with a square fuselage, twin tail booms, a top-mounted horizontal stabilizer, uncanted wingtips, new landing skids, and straight wings mounted high and to the mid of the body
- **Sadegh-1:** The Sadegh-1 ("Honest-1"), also known as the QOM-1, is simply a Mohajer-4B with two MANPADS mounted on pylons.It was tested in late 2014
- **Mohajer-6:** The Qods Mohajer-6 is a persistent ISTAR UAV capable of carrying a multispectral surveillance payload and/or up to two precision-guided munitions. Ten have been manufactured as of February 2018 for the IRGC Ground Forces, and 40 are planned for the IRGC Navy.The Mohajer-6 complements the larger Shahed 129 operated by the third IRGC branch, the IRGC-ASF. Three have also been delivered to the Iranian Army.

System

Alternative Designation: CAVIM Arpia, Arpia
Type of UAV: Tactical Unmanned Aerial Vehicle (UAV)
Manufacturer: Qods Aviation, Tehran
Family: Mohajer family

In Service: 2009-Present

Flight Control Method: controlled by hobby-class radio, which was easily jammed

Day/Night Capable: INA

All Weather Capable: INA

Takeoff or Landing Limitations: INA

Ground Crew: Capable of being controlled via land crew or autopilot

Autopilot: Yes, which controls the aircraft via waypoints

Endurance: 90 min

Range: km30

Date Transmit Distance: INA

Location Positioning System: Yes

Launch System: PL3 pneumatic catapult

Recovery System: Skid Landing or Parachute

Number of Hard Points: ea6

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: No

Landing Gear: three fixed landing gear for launch and recovery

Stabilizer: Horizontal stabilizer

Antenna Type: two stub antenna in the under 10 GHz range, one on each wing, for real-time control.

Note #1: Designed for surveillance use

Note #2: the Arpia lacks over-the-horizon guidance

Proliferation: Valenzuela

Dimensions

Length: m2.9

Width (Wing Span): m3.8

Height: INA

Weight, Maximum Takeoff: kg83

Weight, Empty: kg70

Tailbooms: Twin

Wing Type: Mid-mounted, untapered wings

Tail Type: Horizontal tail

Automotive

Engine Name: WAE-342 Engine

Engine Type: Single Engine

Engine Power: hp25

Cruising Range: km30

Speed, Maximum: km/h200

Speed, Average: INA

Endurance: 90 min

Maximum Ceiling: m4,820

Radius: km50

Cargo Capacity (Payload): kg15

Propellers: 2-bladed

Rudders: Twin Rudders

Belly Skid: Yes, The belly skids are non-retractable, but can compress on landing to reduce shock

Notes:

The ZALA-421-08 is a small, hand-launched unmanned aerial vehicle (UAV) designed for short-range surveillance and reconnaissance operations. The air vehicle is of a flying-wing design, propelled by a single electric pusher propeller. The aircraft is equipped with a GPS-based navigation system. Swarming tactics with multiple UAVs can be employed through automatic and ground control systems. Voice-based mission reporting and planning capabilities are also under development. A standard ZALA-421-08 system includes two air vehicles and a portable ground control station, as well as two sets of spare batteries. The ground station offers video resolution of 720 x 756 pixels in an MPEG2 format. Payload includes two cameras. Color, monochrome and infrared cameras can be fitted. The standard layout is a high-resolution monochrome camera facing forward and down, while a color camera faces down and to the side. The air vehicle is launched by hand and recovered by parachute.

Apid 55 Swedish Vertical Takeoff and Landing (VTOL) Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Apid 60:** This is a further development of basic Apid design.
- **Skeldar V-150:** This version is a modified Apid 55.
- **Pelicano:** This is a maritime variant of the Apid 60
- **Apid One:** This is the latest variant of the Apid family of UAVs and builds off of the Apid 60 platform.
- **Tanan rotary-wing UAV:** Developed by Airbus, the Tanan Block 1 UAV is a modified Apid 60.

System

Alternate Designation: Apid 55

Type: Vertical Takeoff and Landing (VTOL) Unmanned Aerial Vehicle (UAV)

Manufacturer: Leonardo(since 2017)

Crew: Unmanned

Dimensions

Length, Fuselage: 4.0 m including rotor disc

Length, Airframe: 3.2 m excluding rotor disc

Width: 0.9 m

Rotor Diameter: 3.3 m

Height: 1.2 m

Weight, Empty: 95 kg

Weight, Maximum Takeoff: 150 kg

Weight Payload and Fuel: 55 kg

Automotive

Engine Name: 1 x Hirith E18H

Engine Type: water-cooled 2-cylinder, 2-stroke fuel-injected starter

Engine Power: 55 hp

Fuel Consumption: 8-12 L/hour

Fuel Capacity: 60 L
Electric Power: 700 W
Maximum Speed: 90 km/h
Cruising Speed: 60 km/h
Radius: 50 km
Endurance: 3-6 hours
Ceiling: 3,000 m
Launch/Recovery: automatic VTOL

Sensors and Electronics

Guidance System: autonomous stabilization and waypoint control
Flight Control Computer: APID FCS-52
Data Link: 380-470 mHz
Data Flow Rate: 19,200 bits/s

Notes:

The Apid 55 is a miniature vertical take-off and landing (VTOL) unmanned aerial vehicle (UAV) system designed and manufactured by CybAero (formerly known as Scandicraft Systems) for the United Arab Emirates Defence Agency (UAEDA). Each system incorporates three major components: Apid 55 aerial vehicle, a ground control station (GCS) and a payload control system. The vehicle can perform intelligence, surveillance, target acquisition and reconnaissance operations in hostile environments even in adverse sight conditions. It captures the real time imagery or videos of the battlefield and transmits to the GCS through a satellite communication data link with in a range of up to 50km. Flying at a maximum altitude of 3,000m, the UAV can provide its operators with real time intelligence data by executing surveillance and reconnaissance missions over a large area. The aircraft can be transported on a pick up transport vehicle. An improved version, the Apid 60 was also built by CybAero. The Apid 60 can fly at a maximum speed of 110km/h. Its cruise speed is 90km/h. It can loiter in air for a maximum of three to six hours. The variant is fitted with a skid type landing gear.

Mohajer-4 (Hodhod) Iranian Tactical Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Mohajer-1:** The Mohajer was Iran's first drone to enter series production and was used during the Iran–Iraq War. The Mohajer-1 was known simply as "Mohajer" through the 80s and 90s, when it was re-designated "Mohajer-1" as other Mohajer variants had been developed.
- **Mohajer-2:** Following the successful use of the Mohajer-1, Iran wanted a version with more range and endurance. This version, which would later be named the Mohajer-2, also had an auto pilot system to fly beyond the line-of-control of its command center.
- **Mohajer-2N:** In 2014, Iran introduced the Mohajer-2N, which shares the same design as the Mohajer-2 but has far improved performance. The Mohajer-2N replaces the electronics of the Mohajer-2 with more modern versions and has also has improved flight characteristics. T
- **Mohajer-3:** The Mohajer-3, also known as the Dorna, was designed with a new airframe for better performance. It had a square body and featured a low-mounted horizontal stabilizer flush with the main wing, the only member of the Mohajer family configured this way.
- **Mohajer-4B:** Also known as the Sadiq, the Mohajer-4B is a significant evolution of the Mohajer-4 platform with a square fuselage, twin tail booms, a top-mounted horizontal stabilizer, uncanted wingtips, new landing skids, and straight wings mounted high and to the mid of the body
- **Sadegh-1:** The Sadegh-1 ("Honest-1"), also known as the QOM-1, is simply a Mohajer-4B with two MANPADS mounted on pylons.It was tested in late 2014
- **Mohajer-6:** The Qods Mohajer-6 is a persistent ISTAR UAV capable of carrying a multispectral surveillance payload and/or up to two precision-guided munitions. Ten have been manufactured as of February 2018 for the IRGC Ground Forces, and 40 are planned for the IRGC Navy.The Mohajer-6 complements the larger Shahed 129 operated by the third IRGC branch, the IRGC-ASF. Three have also been delivered to the Iranian Army. The Mohajer-6 has a rectangular fuselage, an upwards-sloping nose, twin tailbooms, a top-mounted horizontal stabilizer, uncanted wingtips, straight wings mounted high and to the rear of the body, and air intakes on the top and bottom of the engine. The Mohajer-6 is controlled by two elevators on the horizontal stabilizer, rudders on the vertical stabilizers, and two flaps per wing. Unlike other Mohajer variants, it has a three-bladed propeller. The Mohajer-6 has a wingspan of 10 meters and is 5.67 meters long. It is similar in shape to the Selex ES Falco. The Mohajer-6 has fixed tricycle landing gear, which underwent changes between the unveiling ceremony in 2017 and mass production in 2018, perhaps to accommodate more weight. It is launched and recovered via runway takeoff/landing. It has a fixed, forward facing camera for navigation and a gimbal on the chin for a laser range finder and multispectral IR and visible light electro-optical imagery. The Mohajer-6 has three antennas, two on its left wing and one on its right, and a pitot tube on its nose. The Mohajer-6 has two hardpoints, one under each wing, which can each carry one Qaem TV/IR-guided missile. It has an autopilot system capable of automatic takeoff and landing. In addition, Iran describes it as capable of being fitted with electronic support measures, communications jamming, or electronic warfare payloads.

System

Alternative Designation: Mohajer-4; Hodhod

Type of UAV: Tactical Unmanned Aerial Vehicle (UAV)

Manufacturer: Qods Aviation, Tehran

Family: Mohajer family

In Service: 1997-Present

Flight Control Method: The Mohajer-4 has a Hyarat 3 guidance and control system, which includes GPS navigation

Day/Night Capable: INA

All Weather Capable: INA

Takeoff or Landing Limitations: INA

Ground Crew: Crew of 5-7 men, including two operators. Capable of being controlled via land crew or autopilot

Autopilot: Yes, which controls the aircraft via waypoints

Endurance: 7 hours

Range: km150

Date Transmit Distance: INA

Location Positioning System: Yes

Launch System: PL3 pneumatic catapult

Recovery System: Skid Landing or Parachute

Number of Hard Points: ea6

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: No

Landing Gear: three fixed landing gear for launch and recovery

Stabilizer: Horizontal stabilizer

Antenna Type: two stub antenna in the under 10 GHz range, one on each wing, for real-time control.

Note #1: Designed for surveillance use

Proliferation: Iran: IRGC, Islamic Republic Ground Forces, Syria. Non-state Actors: Hezbolla and libyan National Army.

Dimensions

Length: m3.64

Width (Wing Span): m5.3

Height: INA

Weight, Maximum Takeoff: kg175

Weight, Empty: kg70

Tailbooms: Twin

Wing Type: low-mounted trapezoidal wings with upward-canted wingtips to lessen drag

Tail Type: Horizontal tail

Note: The Mohajer-4 has a modular design, and components such as the body, wings, and tailbooms can be detached and

recombined.

Automotive

Engine Name: Limbach L550E four-cylinder, two-stroke 50 hp engine

Engine Type: Four-cylinder, two-stroke 50 hp engine

Engine Power: hp50

Cruising Range: km150

Speed, Maximum: km/h200

Speed, Average: INA

Endurance: 7 hours

Maximum Ceiling: m5,486

Radius: km50

Cargo Capacity (Payload): kg15

Thermal Imaging Sensors: INA

Electro Optical Pod: INA

Forward-Looking Infrared (FLIR) Sensors.: Yes

Onboard Digital Processor: Yes, which can downlink sensor imagery

Navigation Camera: Fixed forward-facing camera for navigation

Surveillanc Camera: Either a downward-facing camera for aerial surveying or a gimbal-mounted video camera for surveillance

GPS Enabled: Yes

Guidance System: Hyarat 3 guidance and control system

Data Link: Yes, data link that can downlink imagery in real time

Note: A line-scanner is provided, which reportedly can provide 3-ft (1-m) resolution at an altitude of 16,400 ft (5,000 m)

Protection

Fuselage: Larger box-like fuselage

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

EW: No

EW Counter Measures / CCM: No

Counter Measures (Chaffs/Flares): No

Notes:

The Mohajer-4 is another evolutionary improvement over the Mohajer-1 and the Mohajer-2. with again improved range, endurance, and surveillance. Also known as the Hodhod, the Mohajer-4 has a larger box-like fuselage. The Mohajer-4 was designed for both the Iranian Army and the IRGC and entered service in late 1997. The wings are tapered with an upward cranked tip. The static skids of the Mohajer-2 are replaced with flexible ones in a tricycle configuration. Composite materials are used in its construction. The Mohajer-4 was designed for both the Iranian Army and the IRGC and entered service in late 1997. It may have entered mass production in 1999. It was first documented in 2003. Sources differ slightly on how many have been built; one sources says that 40 have been built as of 2006, while another says that as of the mid-2000s, 34 had been built. Design The Mohajer-4 features a squarish body and low-mounted trapezoidal wings with upward-canted wingtips to lessen drag. It is powered by a two-bladed Limbach L550E four-cylinder, two-stroke 50 hp engine in a pusher configuration. The Mohajer-4 is constructed of composite material. It is 3.64 m long and has a wingspan of 5.3 m. The Mohajer-4 has a modular design, and components such as the body, wings, and tailbooms can be detached and recombined. It has three landing skids.

The Mohajer-4 can land via landing gear or a parachute. The Mohajer-4 has a Hyarat 3 guidance and control system, which includes GPS navigation. It normally follows a preprogrammed flight path, but its mission profile can also be updated in flight via radio uplink. The Mohajer-4 has a fixed forward-facing camera for navigation and either a downward-facing camera for aerial surveying or a gimbal-mounted video camera for surveillance. Sources disagree on whether the Mojajer-4 can carry an infrared camera. Like the Mohajer-2, it has an onboard digital processor and can downlink sensor imagery. The Mohajer-4 is also reportedly capable of being fitted for communications relay and has an 'impressive' electronic warfare capability. Operational History: On November 7, 2004, Hezbollah flew a UAV over northern Israel for about 5 minutes. The UAV entered Israeli airspace at more than 100 knots and an altitude of about 1,000 feet, flew briefly over the seaside city of Nahariya, and fell into the sea. Some sources have identified the UAV as a Mohajer-4. There are reports that Iran sold eight Mohajer-4s to Hezbollah. Mohajer-4s have been used in the civil wars in Iraq and Syria. On 16 May 2015, the Turkish Air Force shot down a Mohajer-4 that violated its airspace. Mohajer-4s have also crashed, or been shot down, over Islamic State-held territories. A Mohajer-4 in Iraqi markings was downed over Iraq, but it is not clear if the UAV was actually being operated by the Iraqi Armed Forces. Mohajer-4s are located at Iran's Konorak Air Base and at Bandar Jask. There is a designation of the Mohajer-4 called "Shahin", which may be a sub-variant with unknown differences, or a designation for the Mohajer-4 in Iranian Army Ground service. There is also another sub-variant with unknown differences called the "Hodhod A/100". In addition, Mohajer-4s are used by Iran's border guard to interdict drug smuggling.

Notes:

On Tuesday 8st June, 2010 ZALA AERO officially launched its new VTOL ZALA 421-21 with its unique six rotor design. The unmanned complex based on the helicopter UAV ZALA 421-21 is designed for remote landing and monitoring at altitude 10-1000m at a distance of 5km from the ground control station with maximum endurance of 25 minutes. The unique design permits the UAV to be extremely quiet in any environment. UAV transmits real-time video and photographs. The UAV is fully autonomous which requires minimal operator input for any mission and semi-autonomous without GPS mode is available for use inside buildings. The UAV can land on structures to preserve power while still monitoring and listening in on the target. Easy application and transportations are key elements that this platform offers. Payload capacity of 0.5 kilograms offers the VTOL ability to integrate payloads of small UAVs but at much closer range and zero movement. Infrared payloads are currently being implemented for night time reconnaissance. Future developments are being focused on increasing endurance to around 40 minutes and increasing the range to around 15km. Payload modification include combining day video camera and infrared camera for multi-purpose missions. New model is due to be released before the end of the year.

Mohajer-2 Iranian Tactical Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Mohajer-1:** The Mohajer was Iran's first drone to enter series production and was used during the Iran–Iraq War. The Mohajer-1 was known simply as "Mohajer" through the 80s and 90s, when it was re-designated "Mohajer-1" as other Mohajer variants had been developed.
- **Mohajer-2N:** In 2014, Iran introduced the Mohajer-2N, which shares the same design as the Mohajer-2 but has far improved performance.[13] The Mohajer-2N replaces the electronics of the Mohajer-2 with more modern versions and has also has improved flight characteristics. T
- **Mohajer-3:** The Mohajer-3, also known as the Dorna, was designed with a new airframe for better performance. It had a square body and featured a low-mounted horizontal stabilizer flush with the main wing, the only member of the Mohajer family configured this way.
- **Mohajer-4:** The Mohajer-4 was designed for both the Iranian Army and the IRGC and entered service in late 1997.
- **Mohajer-4B:** Also known as the Sadiq, the Mohajer-4B is a significant evolution of the Mohajer-4 platform with a square fuselage, twin tail booms, a top-mounted horizontal stabilizer, uncanted wingtips, new landing skids, and straight wings mounted high and to the mid of the body
- **Sadegh-1:** The Sadegh-1 ("Honest-1"), also known as the QOM-1, is simply a Mohajer-4B with two MANPADS mounted on pylons.It was tested in late 2014
- **Mohajer-6:** The Qods Mohajer-6 is a persistent ISTAR[3 UAV capable of carrying a multispectral surveillance payload and/or up to two precision-guided munitions. Ten have been manufactured as of February 2018 for the IRGC Ground Forces, and 40 are planned for the IRGC Navy.The Mohajer-6 complements the larger Shahed 129 operated by the third IRGC branch, the IRGC-ASF. Three have also been delivered to the Iranian Army.

System

Alternative Designation: Qods Mohajer; Mohajer-2
Type of UAV: Tactical Unmanned Aerial Vehicle (UAV)
Manufacturer: Qods Aviation, Tehran
Family: Mohajer family
In Service: 1996-Present
Flight Control Method: controlled by hobby-class radio, which was easily jammed
Day/Night Capable: INA
All Weather Capable: INA
Takeoff or Landing Limitations: INA
Ground Crew: Capable of being controlled via land crew or autopilot
Autopilot: Yes, which controls the aircraft via waypoints

Endurance: 90 min

Range: km31

Date Transmit Distance: INA

Location Positioning System: Yes

Launch System: PL3 pneumatic catapult

Recovery System: Skid Landing or Parachute

Number of Hard Points: ea6

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: No

Landing Gear: three fixed landing gear for launch and recovery

Stabilizer: Horizontal stabilizer

Antenna Type: two stub antenna in the under 10 GHz range, one on each wing, for real-time control.

Note #1: Designed for surveillance use

Note #2: the Mohajer-2 lacks over-the-horizon guidance

Proliferation: Hezbollah, Iran, Syria and Venezuela

Dimensions

Length: m2.9

Width (Wing Span): m3.8

Height: INA

Weight, Maximum Takeoff: kg83

Weight, Empty: kg70

Tailbooms: Twin

Wing Type: Mid-mounted, untapered wings

Tail Type: Horizontal tail

Automotive

Engine Name: WAE-342 Engine

Engine Type: Single Engine

Engine Power: hp25

Cruising Range: km30

Speed, Maximum: km/h200

Speed, Average: INA

Endurance: 90 min

Maximum Ceiling: m4,820

Radius: km50

Cargo Capacity (Payload): kg15

Propellers: 2-bladed

Rudders: Twin Rudders

Belly Skid: Yes, The belly skids are non-retractable, but can compress on landing to reduce shock

Communications

Radio: INA

Retrans Radio: INA

Main Weapons System

Name: RPG-7

Type: Rocket-propelled grenade launcher[

In Service: 1961-Present

Manufacturer: Bazalt and Degtyarev plant (Russian Federation)

Proliferation: + 9 Million

Length: mm950

Cartridge: mm85

Caliber: mm40

Weight: kg6.3

Muzzle Velocity, Boost: m/s115

Muzzle Velocity, Flight: m/s300

Effective Firing Range: m300

Maximum Firing Range: 700 m (OG-7V) (self detonates at ≈920 m (1,000 yd))

Sights: PGO-7 (2.7×), UP-7V Telescopic sight and 1PN51/1PN58 night vision sights Red dot reflex sight

Basic Load: ea12

Fire Control

Fire Control System Type: INA

Fire Control Radar: No

Radar Type: INA

Radar Designator: INA

Laser Rangefinder: INA

Laser Designator: INA

Full-Motion Video: Yes, video and infrared with 1-m resolution mounted on the forward part of the fuselage

Still Camera: static nose-mounted camera

Thermal Imaging Sensors: No infrared camera installed

Electro Optical Pod: INA

Forward-Looking Infrared (FLIR) Sensors.: Yes

Onboard Digital Processor: Yes, which can downlink sensor imagery

Navigation Camera: fixed forwards-facing camera for navigation

Guidance System: GPS Guidance System

Note: A line-scanner is provided, which reportedly can provide 3-ft (1-m) resolution at an altitude of 16,400 ft (5,000 m)

Protection

Fuselage: Bullet-shaped fuselage

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

EW: No

EW Counter Measures / CCM: No

Counter Measures (Chaffs/Flares): No

Notes:

Following the successful use of the Mohajer-1, Iran wanted a version with more range and endurance. This version, which would later be named the Mohajer-2, also had an auto pilot system to fly beyond the line-of-control of its command center. The Mohajer-2 was developed in the 1990s and first seen in 1996. This variant is basically similar to the Mohajer-1, but has what are described as "carry handles" on either side of the fuselage just ahead and below of the leading edge of the wing. The landing gear is replaced with skids.

Outlaw Seahunter American Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Outlaw G2E:** The Outlaw G2E, aka G2 UAV, is the entry level UAV system from Griffon Aerospace. This aircraft was designed with high value payloads in mind. The shape and size of the G2E was derived from the highly successful Griffon Outlaw G2 RPVT. This aircraft is intended to provide an open and customizable UAV platform for ISR missions, systems testing, and R&D. Griffon G2E uses a proven and reliable engine platform with an upgraded Electronic Fuel Injection (EFI) system. This gives the plane both efficiency and reliability at high altitudes. The G2E is also equipped with an on-board electrical generator that allows customers to provide power to their equipment without the need to add batteries. The aircraft utilizes a high aspect ratio wing to achieve both long duration flights and high aerodynamic efficiency. G2E is equipped with fixed steerable landing gear so it can be recovered more gently than a comparable belly-land, string capture, or net capture aircraft. Customers with access to improved runway surfaces can achieve even more landing finesse thanks to an optional Differential GPS (DGPS) receiver. With this top-level landing configuration, the G2E can be programmed for auto take-off, auto-pilot flight patterns, and auto landing at the end of the mission. The Outlaw G2E allows Griffon to offer exceptional peace of mind at a great value for customers flying very sensitive and highly valuable payloads.
- **Broadsword:** The Broadsword UAS is a much larger derivative of the MQM-170A Outlaw and is currently available for US military operations as the MQM-171A. The Broadsword is a 400-500 lbs. gross weight aircraft in contrast to the Outlaw G1, which is a 120 lbs. gross vehicle. It was developed as a research and test vehicle to evaluate new sensors, payloads, propulsion systems and other UAV components. Broadsword is a large capable aircraft ideal for emerging sensor or payload development missions. The Broadsword is very similar in shape and general layout to the Outlaw G1. Like the G1, it is primarily launched from a larger pneumatic launcher and then recovered by skid landing. Also like its little brother G1, the Broadsword can be equipped with optional landing gear for sensitive payloads. The Broadsword is also used as a test bed for new or upgraded high power propulsion systems. The increased size of the Broadsword allows customers to carry large, heavy payloads that would not have been achievable with the Outlaw G1.
- **Outlaw G1:** The Outlaw G1 was the aircraft that placed Griffon Aerospace on the map as a competitive Unmanned Aerial System manufacturer. The Outlaw was designed to satisfy a proposal for the US Army to produce a low-cost and versatile UAS platform. Griffon won the contract and in 2004 the Outlaw G1 became known to US military as the MQM-170A Remotely Piloted Vehicle Target (RPVT). Outlaw G1 has proven itself to be a tough, reliable, and low-cost platform through extensive operations with the US Army, US Navy, US Marine Corps, US Air Force, and even some Foreign Military Sales customers. Based on the great success as a target, the Outlaw G1 was developed further to fill various roles including ISR and flight training. The shape and material properties of the G1 yield low radar observability characteristics. Payload bays are available for integration of specialized payloads or the standard suite of EO/IR sensors. The bays can be configured interchangeably as fuel or sensor bays thereby exchanging mission endurance for payload capacity. The rugged composite airframe was designed for harsh field conditions and ease of repair. The airframe can be used with or without a landing gear. Outlaw G1 extensively uses readily available, off-the-shelf flight control and system components. The G1 is typically launched from a pneumatic launcher and then it is recovered by skid landing. If equipped with optional landing gear, the Outlaw can be operated from a runway to protect valuable or delicate payloads. Outlaw G1: the original affordable, multi-function UAS platform from Griffon Aerospace.
- **Outlaw G2:** The Outlaw G2, aka MQM-170C, is the successor to the Outlaw G1. It is currently the basic UAS platform for the US military RPVT contracts as well as development in the Griffon Outlaw family. The G2 uses the same reliable engine, radio and autopilot control systems, servos, and other key components from the G1. Griffon has integrated those components into a larger, and more aerodynamically efficient fuselage. The G2 also flies with a brand new, structurally superior wing design. The key benefits of the new aircraft are enhanced visual signature, a 50% increase in payload area, twice the endurance, added maneuverability, and a top speed increase of 20%. The G2 is operated from an inexpensive pneumatic launcher, similar to the launcher for the original Outlaw G1 RPVT. The Outlaw G2 was

designed for all types of customers. G2 can serve as a low-cost, reliable, target vehicle with an enhanced visual signature and increased hit area; or the G2 can be an inexpensive payload development platform offering great endurance, payload size, weight and power. Outlaw G2 is the affordable jack-of-all-trades from Griffon Aerospace.

- **Lionheart:** Lionheart began as the personal, passion-driven project of Larry French. Stemming from his admiration of the vintage Beechcraft Model 17 Staggerwing, Larry set himself on a journey to recreate the 1930's era legend by using modern aircraft production techniques. The maiden flight was on July 27, 1997. Just a few days later Lionheart made its public debut at EAA AirVenture Oshkosh. Within 9 months five kits were sold. A dream-turned-reality coincidentally seated Mr. French firmly in the owner's seat of a brand new company: Griffon Aerospace. Lionheart is a Cabin Class aircraft measuring about 20 feet from firewall to rudder. Due to the compact shape of the stagger wing, it can be constructed in a relatively small space. Interior cabin volume and seating is similar to a Piper Malibu, but wider at the shoulders. The primary structure is made of high-temperature carbon fiber composite molded in precision production tooling. Since the composite build offers so much rigidity Griffon was able to forgo wing uprights, which results in a very slick and eye-catching overall shape. The heartbeat comes from the well-proven and powerful Pratt & Whitney R-985 Wasp Jr. radial engine.

System

Alternate Designation: Outlaw Seahunter

Type: Unmanned Aerial Vehicle (UAV)

Manufacturer: Griffon Aerospace

Crew: Unmanned

Dimensions

Length: 3.0 m

Wingspan: 4.9 m

Weight: 86 kg

Automotive

Engine Name: 2 x 3W Model Engines

Engine Type: 2 x 3W Model 150i two-cylinder two-stroke Reciprocating engine

Engine Power: 17 hp

Maximum Speed: 241 km/h

Maximum Distance: INA

Ceiling: 5,500 m

Endurance: standard: 4 h; max: 8–9 h

Notes:

The newest and most advanced derivative of the Outlaw UAV program, the SeaHunter is the flagship UAV system from Griffon Aerospace. SeaHunter was designed as a larger, cost effective UAV platform for ISR missions, system testing, R&D efforts, and payload development studies. Placed in the 250-300 lbs. max take-off weight (MTOW) UAV class, this airplane offers customers a unique product in the world of UAV systems. SeaHunter is a twin engine design that offers a redundant propulsion and power generation system, as well as redundant aerodynamic controls. This can provide peace of mind to customers that want to fly payloads that are often much more valuable than the airframe itself. In the event of a catastrophic engine failure during flight, the second engine is sufficient to bring the aircraft back home safely. The on-board electrical generation from the twin engines can provide plenty of power for emerging small, but highly power dependent, payloads. SeaHunter is equipped with retractable landing gear for smooth take-off and landing. As with Outlaw G2E, SeaHunter can be configured for auto take-off and auto landing where improved runways are accessible. Reinforced hard points are located in the fuselage and both wings, giving customers the ability to add external payloads or auxiliary fuel pods. Griffon SeaHunter is aimed at a broad and diverse range of customers. It has been optimized for versatility, reliability, and toughness making it a flexible, tactical-class UAV workhorse.

Spylite (Skylite) Israeli Mini Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **SkyLite A:** Briefly called SkyLark, the SkyLite A was a vehicle or shoulder canister launched UAV for use in tactical units.
- **SkyLite B:** Variant upgrade has improved cameras, larger wings, longer endurance, and 1.5-kg added weight. Launched by catapult.

System

Alternative Designation : Skylite
Engine Type: Electric, battery powered
Propulsion: two blade pusher propeller
Weight, Maximum Payload : kg1.3
Weight, Maximum Take: 6.3-8.0
Weight, Total System : kg39.0

↳*Dimensions*

Length : m1.1
Length, Wing Span : m2.4
Width, Body : m0.25

↳*System Composition*

Ground Control Station (GCS): 1, hand-held, ruggedized
Quantity, Transport Cases: ea0.0

Quantity, UAVs: ea2 to 3

Performance

Altitude, Maximum : m0.3048

Ceiling, Operating : m3000.0

Endurance : hr4.0

Range : km50.0

Speed , Cruising : km/h70-100

Launch and Recovery

Launch Method: 4-kg catapult launch

Recovery Method: Combined parachute and inflatable bag

Payload

↳*Payload 1*

Description: Triple axis, gimballed, gyro-stabilized

Type: Combined sensor

↳*Payload 2*

Description: Provides day/night optical zoom lens with auto-tracker, infrared dual field of lens with auto zoom, and laser pointer

Type: Single sensor

↳*Survivability/Countermeasures*

Survivability/Countermeasures: Lightweight, composite structure. Small profile with low radar signature and very quiet engine. Excellent flight dynamics for use in all climates and severe weather, with winds of up to 35 knots, and gusts of up to 55.

Notes:

SpyLite is a multiconfiguration tactical mini unmanned aerial vehicle (UAV) produced by BlueBird Aero Systems. SpyLite is designed for Intelligence, Surveillance, Target Acquisition and Reconnaissance (ISTAR) missions. It has been operational with Israel Defense Forces (IDF) and selected by the Israeli Air Force as well. SpyLite has been deployed in several operations and missions and accumulated thousands of flight hours in Israel and across the world. The UAV is fully automatic, from the time of catapult launch to its recovery. SpyLite international orders and design The Ethiopian Army placed an order with BlueBird Aero for an unspecified number of SpyLite mini UAV systems in April 2011. BlueBird Aero received a contract from an undisclosed African country for SpyLite UAVs in January 2013. The Chilean Army placed an order for six SpyLite UAVs in April 2013. SpyLite is an electrically-powered UAV system designed for covert, over-the-hill and ISTAR operations. The UAV delivers reliable performance in open areas as well as urban warfare scenarios. The compact UAV system measures 270cm from wing to wing. It weighs approximately 9kg and can carry a payload of up to 1.3kg. Unmanned aerial vehicle payloads The SpyLite UAV can carry a range of payloads, including Controp HD-STAMP, Controp M-STAMP, Controp UZ-Stamp and Photogrammetric payloads. The Controp HD-STAMP integrates a charge-coupled device (CCD) camera, providing high resolution images in daylight applications. The Controp M-STAMP payload includes a day camera, uncooled infrared (IR) camera with dual FOV (Field of Vision) and a laser pointer. The gimbaled and gyro stabilized payload can obtain high quality imagery in both day and night conditions. The Controp UZ-Stamp integrates a night uncooled IR thermal camera offering continuous zoom. SpyLite relays GPS-marked imagery by combining stabilised CCD and IR payloads, with advanced ground exploitation software, and provides reliable information to the user for better situational awareness. The sensor software enables the system to follow anything on

the ground as designated by the operator. The system provides users with real time video or tactical mapping of the area under surveillance. The SpyLite supports forces in real-time automatic targeting and tracking, motion detection and battle damage assessment. The SpyLite Photogrammetric payload includes a high resolution Canon EOS-M 18MP professional camera. The gimbaled and gyro stabilised camera is controlled by autopilot. The camera can collect images while transmitting real-time video to the ground control station (GCS). The images are stored in the inbuilt removable memory. Ground control station (GCS) for Israel's SpyLite UAV The SpyLite is controlled by a unified ground control station (GCS). The control station is commonly used for all UAVs of Bluebird as all of them share the same data links and command and control protocols. The GCS for SpyLite is very portable and can be carried by a single operator in a bag. The GCS consists of an integrated control unit (ICU), ground data terminal (GDT) and emergency control unit (ECU). The ICU is a rough compact control unit including control switches and personal computer (PC). The PC displays real-time video and a moving tactical map, while allowing the mission control with the help of external switches and stick. The external switches on the ICU are used in emergencies and in the event of mission termination. SpyLite can be completely controlled by the ICU without using the joystick. The ground data terminal (GDT) can be installed on a 2m tripod. The GDT is equipped with antenna revolving mechanism. The SpyLite can also controlled by using the ECU in case of an emergency. UAV remote video terminal (RVT) and performance The remote video terminal (RVT) provides UAV telemetry and displays real time imagery received from the UAV. It enhances the situational awareness of the front line forces and eliminates the continuous communication between field commanders and GCS staff for status updates. The front line forces can carry the terminal with them, while the flight control is carried out from the GCS. The SpyLite UAV is a stable platform for intelligence, surveillance and reconnaissance (ISR) as it is fully automatic from the launch to recovery. It can be launched in any area, as the system is equipped with parachute and an airbag for safe recovery. The SpyLite UAV can fly in almost any kind of weather, including strong winds of up to 75km/h (40kt) and in cloudy and rainy weathers. The SpyLite can perform operations lasting for four hours and can be controlled over a range of 50km. The range can be extended up to 80km. The system can be modified to support enhanced mission durations just by changing the battery and wing tips. The SpyLite UAV can reach a maximum altitude of 10,000m and stay safe from ground fire. It should, however, be operated at below 1,000m for best results. If the system runs out of battery, it takes just 15 minutes to land it, replace the battery and fly again into the air. The SpyLite can also be operated in maritime environment and can be launched from a boat. The SpyLite system can be used for secret operations as it features low acoustic and visual signatures. It is undetectable at 500m altitude.

→→Short-Range UAVs (51-150 km Range)

Orlan-10 Russian Unmanned Aerial Vehicle (UAV)

Tiers:

System

Alternative Designation: STC Orlan-10
Type of UAV: Medium-range, multi-purpose unmanned aerial vehicle (UAV)
Manufacturer: Special Technology Center LLC
Primary Function: Multi-purpose unmanned aerial vehicle (UAV)
Cost: US $87,000 and US $120,000
Day/Night Capable: Yes
All Weather Capable: Yes
Ground Crew: MP32M1 command and control vehicle. The ground segment can control up to four aerial vehicles simultaneously.
Endurance: hours16
Range: km150
Autopilot Capabile: Yes, operates autonomously based on pre-defined waypoints
Command and Control Modes: Both autonomous and remote control modes
Location Positioning System: Yes
Launch System: Folding catapult
Recovery System: Via Parachute Recovery
Number of Hard Points: INA
Manned-Unmanned Teaming (MUM-T) Capable: No
Automatic Landing and Takeoff Capability: No
Landing Gear: None
Transmit Telemetry Data Range: 120km and 600km from the launch station
Note: The Orlan-10 complex consists of unmanned aerial vehicles, launch and recovery systems, ground control segment, and swappable payloads.

Dimensions

Length (Fuselage): m2.0

Width (Wing Span): m3.1

Height: INA

Weight, Empty: kg12.5

Weight, Maximum Takeoff: kg16.5

Weight, Payload: kg6

Note: The UAV’s modular design is provided with a number of interchangeable payloads allowing for greater mission flexibility.

Automotive

Engine Name: 1 x A-95 Engine

Engine Type: Gasoline-Fueled Engine

Engine Power: INA

Cruising Range: km150

Speed, Maximum: km/h150

Speed, Cruising: km/h110

Ceiling: m5,000

Endurance: hours16

Number of Blades: ea2

Maximum Wind Speed at the Start: m/s10

Operating Temperatures: −30 to +40 °C

Communications

Radio: INA

Retrans Radio: INA

Fire Control

Fire Control System Type: INA

Fire Control Radar: No

Radar Type: INA

Radar Designator: INA

Laser Rangefinder: INA

Day Light Camera: Yes

Video Camera: Yes

Gyro Stabilized Camera Pod: Yes

Thermal Imaging Sensors: Yes

Thermal Imaging Camera: Yes

Real-time Intelligence Capable: Yes

3D Maps: Yes

Note: The imagery, video and other sensor data collected by the payloads is transmitted to the ground control station in real-time, through a data link.

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: No

EW: Equipment Available

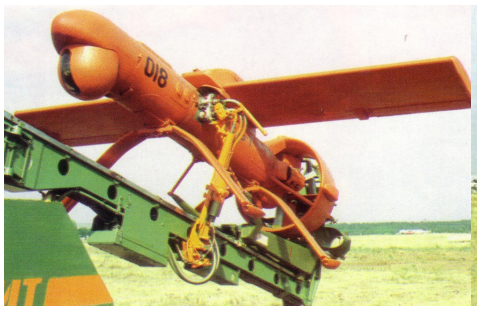
EW Counter Measures / CCM: Equipment Available

Counter Measures (Chaffs/Flares): INa

Notes:

Orlan-10 is a medium-range, multi-purpose unmanned aerial vehicle (UAV) developed by Russian firm Special Technology Center LLC in St Petersburg. The UAV is in service with the Ministry of Defense of the Russian Federation. It is intended for a variety of missions including aerial reconnaissance, observation, monitoring, search and rescue, combat training, jamming, detection of radio signals, and target tracking. The drone is usually used in a group of two or three, where the first one is used for reconnaissance in a height of 1-1.5 km, the second one for electronic warfare and the third one as a transponder that transmits intelligence information to the control center

Pchela-1T Russian Unmanned Aerial Vehicle (UAV)



Tiers:

Variants:

- **Pchela-1IK:** The Pchela -1 with the "IK" designation is an infrared variant of the same system that also incorporates improved electronics and avionics.
- **Pchela-1K:** This variant is designed for round-the-clock operation and improved performance in mountainous terrain. It is fitted with a low-light-level TV camera
- **Pchela-1PP:** The –iPP is a jamming variant of the Pchela UAV. This variant is currently under development.
- **Pchela-1VM:** The Pchela-1VM is a target drone version.
- **Pchela-2:** This variant is designed to be powered by the British 60 hp AR-801 engine and to carry a different payload than the Pchela-1. It is expected to have a communications range of up to 62 miles (100 km).

System

Alternate Designation: Pchela-1T

Type: Unmanned Aerial Vehicle (UAV)

Manufacturer: Yakovlev

Launcher: The Pchela is launched using rocket assist by two solid-propellant booster rocket engines

Landing: Parachute

Time to Deployment: 20 min

Dimensions

Length: 2.78 m

Wingspan: 3.25 m

Takeoff Weight: 138 kg

Payload Weight: INA

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: 32-hp piston prop

Maximum Speed: 180 km/h

Cruise Speed: 120 km/h

Endurance: 2 hours

Rate of Turn: 3 grad/sec

Ceiling: 2,500 m

Optimum Altitude: 100-1,000 m

Uses: 5-10

Main Weapon System

Note: The Pchela-1T is a reconnaissance UAV and has no weapons.

Electronics

Flight Control: automatic flight, programmed; remote, manual

TV Camera Pitch: +5 to -65 deg

Measurement Error of Coordinates, Range: 150 m

Measurement Error of Coordinates, Azimuth: 1 deg

Notes:

The Yakovlev Pchela-1T ("Пчела" meaning bee) is an unmanned aerial vehicle (UAV) manufactured by the Russian Yakovlev Design Bureau. Its primary use is for surveillance and observation in battlefield environments with downlinked video. Other implementations and uses include target designation and as a training target. The Pchela is launched using rocket assist by two solid-propellant booster rocket engines, and it is recovered via parachute. The Pchela-1T has a range of 60 km (37 mi), flies at 100–2,500 m (330–8,200 ft) altitude at 120–180 km/h (75–112 mph). The maximum takeoff weight for the vehicle is 138 kg (304 lb). Yak lists the vehicle endurance at two hours.

DP-14 Hawk American Autonomous Unmanned Helicopter

Tiers:

Variants:

- **DP-6XT Whisper:** This upgraded variant, the present production model, features a most payload of fifteen pound (7 kg). The air vehicle will operate in crosswinds of up to forty knots (74 kmh). The DP-6XT has associate degree endurance of half-hour with a 15-lb payload and a 60-minute endurance with a two.2 pound (1 kg) payload. It may be deployed in quarter-hour. Batteries may be recharged in quarter-hour or swapped in three minutes. The air vehicle may be bound to associate degree surface power supply for constant 24/7 operation. A 200-ft (60-m) tether is out there as associate degree possibility. The air vehicle will give a mobile impromptu Wi-Fi network or close-range stable representational process. The system may be operated by one person and offers easy waypoint navigation. Payload options embody external hardpoints; directional mike and speaker; electro-optical/infrared day or night detector with three-axis stabilization with a optical device illuminator; and a high-bandwidth encrypted communication link. The DP-6XT options exactness management through autonomous flight path programming; nap of the world flight even in complicated terrain; non-line-of-sight flight, together with in GPS-denied environments; autonomous operation; and a little profile.
- **DP-12 Rhino:** This is a bigger version designed to hold payloads of as much as a hundred and fifty lb (70 kg) over distances of as much as 350 mi (560 km). It can fly in crosswinds of as much as 30 knots (fifty six kmh). The unmanned helicopter has an persistence of approximately 1 hour with a a hundred and fifty-lb payload or three hours with a 32-lb (15-kg) payload. The air car functions more than one hardpoints forward, aft, to the edges and at the stomach to hold quite a few payloads. Typical payloads consist of cameras; artificial aperture radar; ultra-wideband radar; LIDAR; electro-optical/infrared sensors; magnetometers; ground-penetrating radar; mapping packages; acoustic and ultrasonic sensors; and steady verbal exchange relays and links. The DP-12 may be released in 5 mins if organized at the touchdown pad and the flight route is already programmed. It can release in 10 mins from a chilly begin and the flight route is programmed. Launch from a chilly begin takes approximately 15 mins if a brand new flight route need to be programmed.
- **DP-14 Hawk:** This is a heavy-raise variation designed for missions inclusive of air deliver to ahead working bases. It is designed to hold as much as 430 lb (195 kg) of payload in its 26 cu ft (0.7 cu m) of shipment area or outside hardpoints. It can reportedly fly for approximately 2.4 hours with a 430-lb payload or four.three hours with a 100-lb (45-kg) payload. The DP-14 can perform in crosswinds of as much as forty knots (seventy four kmh). The air automobile could be powered with the aid of using both an 87-hp Solar T62 engine or a 133-hp Microturbo eAPU turbine and is designed to apply both JP-five or JP-eight heavy fuel. The power plant could generate four.2 kW of strength for avionics and sensors. The DP-14 Hawk makes use of onboard LIDAR and superior algorithms to navigate in complex, restrained environments, inclusive of superior intelligence for course planning, path corrections, perception, impediment avoidance and touchdown-webweb page selection. These competencies permit the air automobile to fly intelligent, self sustaining, non-line-of-sight, nap-of-the-earth missions and dynamically adapt to adjustments in flight situations and terrain, in accordance to Dragonfly Pictures. The machine employs IMU and GPS for takeoff and touchdown and an ultrasonic

sensor as a rangefinder to decide peak from the floor at some point of touchdown. These sensors allow landings even in brownouts or different degraded visible environments. The air automobile may be ready with side-established pods for over-sized items. The unmanned helicopter functions 1 ms autopilot biking and fast pitch correction at some point of self sustaining shipment offloading, which permits precision airdrops with accuracy of higher than 10 ft (three m). It calls for a touchdown webweb page measuring approximately 60 ft (18 m) x 60 ft (18 m). All-terrain touchdown tools helps landings on choppy floor; slopes of up to fifteen degrees; and heaving deliver decks. A relative positioning machine lets in the DP-14 to self-release and self-get better on pitching ships with an eight-in (203-mm) round mistakes probable. The machine may be assembled, readied and released inside 30 minutes.

System

Alternate Designation: DP-14 Hawk

Type: Autonomous Unmanned Helicopter

Manufacturer: Dragonfly Pictures, Essington, Pa.

Dimensions

Length: 4.11 m

Width: 0.61 m

Height: INA

Cargo Length: 1.83 m

Cargo Width: 0.51 m

Cargo Volume: 0.7 cu m

Combat Weight: INA

Payload Capacity: 195 kg

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: INA

Maximum Speed: 190 km/h

Cruising Speed: 130 km/h

Maximum Range: 80 km

Ceiling: 4,570 m

Climb Rate: 150 m/min

Endurance Payload 195 kg: 2.4 Hours

Endurance payload 45.4 kg: 4.3 Hours

Notes:

The DP-14 Hawk is a heavy-lift variant of the DP-6 Whisper designed for missions such as air supply to forward in operation bases. it's designed to hold up to 430 lb (195 kg) of payload in its twenty six cu ft (0.7 copper m) of cargo area or external hardpoints. It will reportedly fly for about 2.4 hours with a 430-lb payload or 4.3 hours with a 100-lb (45-kg) payload. The DP-14 will operate in crosswinds of up to forty knots (74 kmh). The air vehicle would be powered by either AN 87-hp star T62 engine or a 133-hp Microturbo eAPU rotary engine and is intended to use either JP-5 or JP-8 significant fuel. The power plant would generate 4.2 kW of power for avionics and sensors. The DP-14 Hawk uses aboard measuring system and advanced algorithms to navigate in complicated, restricted environments, as well as advanced intelligence for path coming up with, course

corrections, perception, obstacle dodging and landing-site choice. These capabilities permit the air vehicle to fly intelligent, autonomous, non-line-of-sight, nap-of-the-earth missions and dynamically adapt to changes on the wing conditions and terrain, according to Dragonfly Pictures. The system employs imu and GPS for takeoff and landing and an supersonic sensing element as a measuring device to see height from the bottom throughout landing. These sensors allow landings even in brownouts or different degraded visual environments. The air vehicle is equipped with 2 side-mounted pods for over-sized things. The unmanned chopper features one ms autopilot cycling and speedy pitch correction throughout autonomous cargo offloading, that permits precision airdrops with accuracy of higher than 10 ft (3 m). It needs a landing site measurement regarding 60 ft (18 m) x 60 ft (18 m). All-terrain undercarriage supports landings on uneven ground; slopes of up to 15 degrees; and heaving ship decks. A relative positioning system permits the DP-14 to self-launch and self-recover on pitching ships with an 8-in (203-mm) circular error probable. The system is assembled, readied and launched inside half-hour.

Skylark III Israeli Unmanned Aerial Vehicle (UAV)

Tiers:

1 2 3 4

Variants:

- **Skylark 3A:** Skylark 3A first production subtype. 7 built.
- **Skylark 3B:** Skylark 3B cockpit moved forward 76 mm, overall length increase by 80 mm. 24 built
- **Skylark 3C 3A:** Skylark 3C 3A with strengthened spars to meet certification requirements. 2 built.
- **Skylark 3D 3B:** Skylark 3D 3B with strengthened spars to meet certification requirements. 2 built.
- **Skylark 3E modified 3B:** Skylark 3E modified 3B with wing a tip section of NACA 64,2,615 and narrower ailerons. 1 built.
- **Skylark 3F:** Skylark 3F tab assisted ailerons and an increase in tailplane span from 2.88 m to 3.23 m. 30 built including kits.
- **Skylark 3G modified F:** Skylark 3G modified F with increased span, narrower ailerons. 4 built.
- **Slingsby T.47A:** Slingsby T.47A proposed extended span version of the Skylark 3 with 20 metre wings Note:A retrospective alteration increasing the all up weight of the 3A and 3B to 830 lb was incorporated into the 3F and 3G.

System

Alternate Designation: Skylark 3

Manufacturer: Elbit Systems

Note: Skylark 3 enables performance of ongoing covert operations, providing real-time intelligence during day and night.

Dimensions

Length: INA

Width, Wingspan: m4.8 mounted under fuselage

Height: INA

Weight, Maximum Launch: kg45

Automotive / Performance

Engine Name: INA

Engine Type: Electric, battery, rechargeable, rear mounted pusher engine

Engine Power: INA

Propeller: blades2

Ceiling, Maximum: m6,400

Ceiling, Service: m4,600

Radius of Operation: km100

Time Required to Deploy: minutes20

Endurance: hours6

Launch and Recovery

Launch Method: Pneumatic launcher on Humvee class vehicle or launcher trailer

Recovery/Landing Method: Parachute and airbag cushion

Payloads

Note: #1: A payload pod mounted under the nose of the tactical aerial vehicle incorporates state-of-the-art electro optical / infrared (EO/IR) sensor for capturing high-definition imagery and videos under difficult field conditions. An advanced digital encrypted data link facilitates secure data transfer between the aerial vehicle and the ground control station. The real-time imagery, video and intelligence data acquired by the payloads are shown on a LCD screen display, enabling the operator to safely operate the UAV. A single ground control station can control two Skylark 3 unmanned aerial vehicles deployed in the same mission.

Note: #2: Skylark 3’s high-resolution, gimbaled and stabilized dual EO/IR payload facilitate a wide-range of applications including over-the-hill intelligence, force and convoy protection, strategic infrastructure protection, border patrol and security operations.

Notes:

SKYLARK 3 Delivering organic airborne ISTAR capabilities to the division, brigade and battalion levels, Skylark 3 is a tactical mini UAV system (UAS) optimized for both dismounted and vehicle-based operation. Based on the battle-proven Skylark I-LEX – with over 30 international customers and tens of thousands of operational sorties – Skylark 3 enables performance of ongoing covert operations, providing real-time intelligence during day and night. Its effective payload weight capabilities are industry-leading in its class. Skylark 3’s high-resolution, gimbaled and stabilized dual EO/IR payload facilitate a wide-range of applications including over-the-hill intelligence, force and convoy protection, strategic infrastructure protection, border patrol and security operations.

Mini Harpy Israeli Tactical Loitering Munition Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Cutlass:** This variant of the Harpy was evaluated in 1999 with Raytheon for search-and-destroy missions and the ability to attack a wider range of targets. It would have been a sea-launched weapon employing advanced sensors from Raytheon
- **Harop/Harpy 2:** This is a larger, upgraded variant. Designed as a fire-and-forget weapon, the Harop can fly more than 600 mi (1,000 km) to patrol a specific area and attack any hostile radars detected.
- **Harpy NG (new generation):** This is an upgraded variant that uses the Harop airframe. It was developed to counter newer air defense radar threats.
- **Mini-Harpy:** This tactical loitering munition combines the operating characteristics of the Harpy and Harop. It can lock onto radar and other emitting threats via person-in-the-loop electro-optical guidance. Fully autonomous operation is available as an option. It can attack emitting and non-emitting targets.
- **Maritime Harop:** This is a variant of the Harop optimized for operation from naval vessels, from patrol ships to frigates. It features a maritime-configured launcher and modified communications.
- **ASN-301:** This is a Chinese copy of the Harpy. It has a delta wing and pusher propeller configuration that appears virtually identical to the Israeli system. According to the China National Aero-Technology Import & Export Corp. (CATIC), the ASN-301 targets radar frequencies in the 2-16 GHz range and has a radar search range of 16 mi (25 km). The system is said to be able to target up to eight preset radar targets.

System

Alternate Designation: Mini-Harpy
Type: Tactical Loitering Munition Unmanned Aerial Vehicle (UAV)
Manufacturer: Israel Aerospace Industries, Ben Gurion International Airport, Israel
Based: Land and Sea Based
Performance: *Dual EO/IR and Anti-radiation seeker; *Canister launched from ground or naval platforms; *Man in the loop (MITL) or Fully Autonomous operation as an option; *Battle Damage Assessment (BDA); *Mission Execution Even Under Adverse Weather Conditions; *Full range from shallow to vertical attack angles; *Abort and re-attack capability; *Suppression / Destruction Enemy Air Defense Missions; *Silent using electrical propulsion
Note: The world’s only loitering munition with Dual EO/IR and Anti-Radiation seeker.

Dimensions

Length: INA
Wingspan: INA
Takeoff Weight: 40 kg
Warhead Weight: 8 kg

Automotive

Engine Name: INA
Engine Type: Rotary Engine
Engine Power: INA
Operational Range: up to 100 km
Operational Altitude: 305 m to 1,520 m
Loitering Speed: 102-157 kph
Maximum Speed: 370 kph
Endurance: 2 hours

Fire Control and Avionics

Communication Maximum Range: 100 km
Radar Name: INA
Radar Distance: INA
Radar Cross-Section: INA

Notes:

Mini-Harpy This tactical loitering munition combines the operating characteristics of the Harpy and Harop. It can lock onto radar and other emitting threats via person-in-the-loop electro-optical guidance. Fully autonomous operation is available as an option. It can attack emitting and non-emitting targets. Provides tactical forces with the ability to suppress the area of interest for long duration and to strike immediately emitting and non-emitting Targets. The ability to seek and to attack any target from any direction at any angle, gives the Mini HARPY significant advantage in any environment. In addition, long-range communication, long-endurance of loitering time and a deadly warhead enables it to deal with diverse targets in the modern warfare.

Mohajer-2N Iranian Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Mohajer-1:** The Mohajer was Iran's first drone to enter series production and was used during the Iran–Iraq War. The Mohajer-1 was known simply as "Mohajer" through the 80s and 90s, when it was re-designated "Mohajer-1" as other Mohajer variants had been developed.
- **Mohajer-2:** Following the successful use of the Mohajer-1, Iran wanted a version with more range and endurance. This version, which would later be named the Mohajer-2, also had an auto pilot system to fly beyond the line-of-control of its command center.
- **Mohajer-3:** The Mohajer-3, also known as the Dorna, was designed with a new airframe for better performance. It had a square body and featured a low-mounted horizontal stabilizer flush with the main wing, the only member of the Mohajer family configured this way.
- **Mohajer-4:** The Mohajer-4 was designed for both the Iranian Army and the IRGC and entered service in late 1997.
- **Mohajer-4B:** Also known as the Sadiq, the Mohajer-4B is a significant evolution of the Mohajer-4 platform with a square fuselage, twin tail booms, a top-mounted horizontal stabilizer, uncanted wingtips, new landing skids, and straight wings mounted high and to the mid of the body
- **Sadegh-1:** The Sadegh-1 ("Honest-1"), also known as the QOM-1, is simply a Mohajer-4B with two MANPADS mounted on pylons.It was tested in late 2014
- **Mohajer-6:** The Qods Mohajer-6 is a persistent ISTAR UAV capable of carrying a multispectral surveillance payload and/or up to two precision-guided munitions. Ten have been manufactured as of February 2018 for the IRGC Ground Forces, and 40 are planned for the IRGC Navy.The Mohajer-6 complements the larger Shahed 129 operated by the third IRGC branch, the IRGC-ASF. Three have also been delivered to the Iranian Army.

System

Alternative Designation: Mohajer-2N
Type of UAV: Tactical Unmanned Aerial Vehicle (UAV)
Manufacturer: Qods Aviation, Tehran
Family: Mohajer family
In Service: 2014-Present
Flight Control Method: controlled by hobby-class radio, which was easily jammed
Day/Night Capable: INA
All Weather Capable: INA
Takeoff or Landing Limitations: INA
Ground Crew: Capable of being controlled via land crew or autopilot
Autopilot: Yes, which controls the aircraft via waypoints

Endurance: 90 min

Range: km150

Date Transmit Distance: INA

Location Positioning System: Yes

Launch System: PL3 pneumatic catapult

Recovery System: Skid Landing or Parachute

Number of Hard Points: ea6

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: No

Landing Gear: three fixed landing gear for launch and recovery

Stabilizer: Horizontal stabilizer

Antenna Type: two stub antenna in the under 10 GHz range, one on each wing, for real-time control.

Note #1: Designed for surveillance use

Note #2: the Mohajer-2N lacks over-the-horizon guidance

Note #3: The Mohajer-2N replaces the electronics of the Mohajer-2 with more modern versions and has also has improved flight characteristics

Dimensions

Length: m3.0

Width (Wing Span): m3.9

Height: INA

Weight, Maximum Takeoff: kg88

Weight, Empty: kg75

Tailbooms: Twin

Wing Type: Mid-mounted, untapered wings

Tail Type: Horizontal tail

Automotive

Engine Name: WAE-342 Engine

Engine Type: Single Engine

Engine Power: hp25

Maximum Range: km180

Speed, Maximum: km/h200

Speed, Average: INA

Endurance: 6 hours

Maximum Ceiling: m4,820

Radius: km50

Cargo Capacity (Payload): kg15

Propellers: 2-bladed

Rudders: Twin Rudders

Belly Skid: Yes, The belly skids are non-retractable, but can compress on landing to reduce shock

Communications

Radio: INA

Retrans Radio: INA

Main Weapons System

Name: RPG-7

Type: Rocket-propelled grenade launcher[

In Service: 1961-Present

Manufacturer: Bazalt and Degtyarev plant (Russian Federation)

Proliferation: + 9 Million

Length: mm950

Cartridge: mm85

Caliber: mm40

Weight: kg6.3

Muzzle Velocity, Boost: m/s115

Muzzle Velocity, Flight: m/s300

Effective Firing Range: m300

Maximum Firing Range: 700 m (OG-7V) (self detonates at ≈920 m (1,000 yd))

Sights: PGO-7 (2.7×), UP-7V Telescopic sight and 1PN51/1PN58 night vision sights Red dot reflex sight

Basic Load: ea12

Fire Control

Fire Control System Type: INA

Fire Control Radar: No

Radar Type: INA

Radar Designator: INA

Laser Rangefinder: INA

Laser Designator: INA

Full-Motion Video: Yes, video and infrared with 1-m resolution mounted on the forward part of the fuselage

Still Camera: static nose-mounted camera

Thermal Imaging Sensors: No infrared camera installed

Real Time Camera: Yes

Electro Optical Pod: INA

Forward-Looking Infrared (FLIR) Sensors.: Yes

Onboard Digital Processor: Yes, which can downlink sensor imagery

Navigation Camera: fixed forwards-facing camera for navigation

Guidance System: GPS Guidance System

Note: the Mohajer-2N has two cameras; one under the nose for navigation, and a second on a gimbal under the body for surveillance

Protection

Fuselage: Bullet-shaped fuselage

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

EW: No

EW Counter Measures / CCM: No

Counter Measures (Chaffs/Flares): No

Notes:

In 2014, Iran introduced the Mohajer-2N, which shares the same design as the Mohajer-2 but has far improved performance. The Mohajer-2N replaces the electronics of the Mohajer-2 with more modern versions and has also has improved flight characteristics. The Mohajer-2N has a range of 150 km and flight endurance of 6 hours.

DP-6 Whisper American Autonomous Unmanned Helicopter

Tiers:

Variants:

- **DP-6XT Whisper:** This upgraded variant, the present production model, features a most payload of fifteen pound (7 kg). The air vehicle will operate in crosswinds of up to forty knots (74 kmh). The DP-6XT has associate degree endurance of half-hour with a 15-lb payload and a 60-minute endurance with a two.2 pound (1 kg) payload. It may be deployed in quarter-hour. Batteries may be recharged in quarter-hour or swapped in three minutes. The air vehicle may be bound to associate degree surface power supply for constant 24/7 operation. A 200-ft (60-m) tether is out there as associate degree possibility. The air vehicle will give a mobile impromptu Wi-Fi network or close-range stable representational process. The system may be operated by one person and offers easy waypoint navigation. Payload options embody external hardpoints; directional mike and speaker; electro-optical/infrared day or night detector with three-axis stabilization with a optical device illuminator; and a high-bandwidth encrypted communication link. The DP-6XT options exactness management through autonomous flight path programming; nap of the world flight even in complicated terrain; non-line-of-sight flight, together with in GPS-denied environments; autonomous operation; and a little profile.
- **DP-12 Rhino:** This is a bigger version designed to hold payloads of as much as a hundred and fifty lb (70 kg) over distances of as much as 350 mi (560 km). It can fly in crosswinds of as much as 30 knots (fifty six kmh). The unmanned helicopter has an persistence of approximately 1 hour with a a hundred and fifty-lb payload or three hours with a 32-lb (15-kg) payload. The air car functions more than one hardpoints forward, aft, to the edges and at the stomach to hold quite a few payloads. Typical payloads consist of cameras; artificial aperture radar; ultra-wideband radar; LIDAR; electro-optical/infrared sensors; magnetometers; ground-penetrating radar; mapping packages; acoustic and ultrasonic sensors; and steady verbal exchange relays and links. The DP-12 may be released in 5 mins if organized at the touchdown pad and the flight route is already programmed. It can release in 10 mins from a chilly begin and the flight route is programmed. Launch from a chilly begin takes approximately 15 mins if a brand new flight route need to be programmed.
- **DP-14 Hawk:** This is a heavy-raise variation designed for missions inclusive of air deliver to ahead working bases. It is designed to hold as much as 430 lb (195 kg) of payload in its 26 cu ft (0.7 cu m) of shipment area or outside hardpoints. It can reportedly fly for approximately 2.4 hours with a 430-lb payload or four.three hours with a 100-lb (45-kg) payload. The DP-14 can perform in crosswinds of as much as forty knots (seventy four kmh). The air automobile could be powered with the aid of using both an 87-hp Solar T62 engine or a 133-hp Microturbo eAPU turbine and is designed to apply both JP-five or JP-eight heavy fuel. The power plant could generate four.2 kW of strength for avionics and sensors. The DP-14 Hawk makes use of onboard LIDAR and superior algorithms to navigate in complex, restrained environments, inclusive of superior intelligence for course planning, path corrections, perception, impediment avoidance and touchdown-webweb page selection. These competencies permit the air automobile to fly intelligent, self sustaining, non-line-of-sight, nap-of-the-earth missions and dynamically adapt to adjustments in flight situations and terrain, in accordance to Dragonfly Pictures. The machine employs IMU and GPS for takeoff and touchdown and an ultrasonic sensor as a rangefinder to decide peak from the floor at some point of touchdown. These sensors allow landings even in brownouts or different degraded visible environments. The air automobile may be ready with side-established pods for over-sized items. The unmanned helicopter functions 1 ms autopilot biking and fast pitch correction at some point of self sustaining shipment offloading, which permits precision airdrops with accuracy of higher than 10 ft (three m). It calls for a touchdown webweb page measuring approximately 60 ft (18 m) x 60 ft (18 m). All-terrain touchdown tools helps landings on choppy floor; slopes of up to fifteen degrees; and heaving deliver decks. A relative positioning machine lets in the DP-14 to self-release and self-get better on pitching ships with an eight-in (203-mm) round mistakes probable. The machine may be assembled, readied and released inside 30 minutes.

System

Alternate Designation: DP-6 Whisper

Type: Autonomous Unmanned Helicopter

Manufacturer: Dragonfly Pictures, Essington, Pa.

Dimensions

Length: 1.80 m

Width: 0.49 m

Height: 0.76 m

Gross Weight: 23 kg

Empty Weight: 11 kg

Payload Weight: 12 kg

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: INA

Maximum Speed: 130 km/h

Maximum Range: 80 km

Ceiling: 260 m/min

Climb Rate: 260 m/min

Endurance Payload 1.0 kg: 1 Hour

Endurance payload 6.8 kg: 30 Min

Notes:

The DP-6 Whisper is a light-weight self sufficient unmanned helicopter designed for intelligence, surveillance and reconnaissance missions. The plane may be operated and deployed through a unmarried person. The layout is supposed to maximise payload inside a 50-lb (23-kg) gross weight limit. The helicopter has a tandem rotor configuration.

Ababil-2 Iranian Tactical Unmanned Aerial Vehicle (UAV)

Tiers:

1 2 3 4

Variants:

- **Ababil-B:** The Ababil-B is a target drone used for air defense unit training; it features a radar augmentation device.
- **Ababil-S:** This is the reconnaissance configuration, also known as the Ababil 5. It includes an electro-optical (EO) camera in the nose. It also has a real-time imagery downlink.
- **Ababil-T:** This is a strike variant. It comes with a daylight television camera, located underneath the fuselage. The variant can also carry a medium-sized high-explosive warhead. The night-time shootdown of an Ababil during the Israel-Hezbollah conflict in July-August of 2006 suggested that its sensor packag e had been modified to include an infrared system. The Ababil-T has a twin-tail configuration.
- **Ababil Jet/Hadaf 1:** This version was said to be in development in 2007. It is powered by a TEM Toloue-4 840-lb (3.7 kN) static thrust axial jet engine used on the C-802/Noor anti-ship missile and UAV/target drone.
- **Ababil-3:** This variant has a top speed of 124 mph (200 kmh) with a range of 60 mi (100 km), ceiling of 16,400 ft (5,000 m) and endurance of four hours. A night-vision capability is integrated.

System

Alternative Designation: Ababil-2; Ababil-II
Type of UAV: Long-range, low-technology drone
Manufacturer: Iran Aircraft Manufacturing Industrial Company (HESA).
Primary Function: Target Drone, Surveillance
Flight Control Method: INA
Day/Night Capable: INA
All Weather Capable: INA
Takeoff or Landing Limitations: INA
Ground Crew: INA
Endurance: houors2
Date Transmit Distance: INA
Location Positioning System: INA
Launch System: A zero-length JATO platform or a Mercedes Benz 911 pneumatic truck launcher. Additionally, The rocket launch system can be used from a ship deck and can be assembled or broken down for portability.
Recovery System: a parachute provides a descent rate of 4 m/s, or skids can be used for conventional landings on a runway or field
Number of Hard Points: INA

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: INA

Landing Gear: Some variants have been seen with landing gear

Wars: The Ababil has been used in the 2006 Lebanon War, the Iraq War, and the Sudanese, Syrian, Iraqi, and Yemeni civil wars

Note: Rudimentary surveillance capabilities and can be used as a loitering munition, but is mainly used as a target drone

Dimensions

Length: m2.88

Width (Wing Span): m3.25

Height: m0.91

Wing Area: 1.76 m2

EW: No

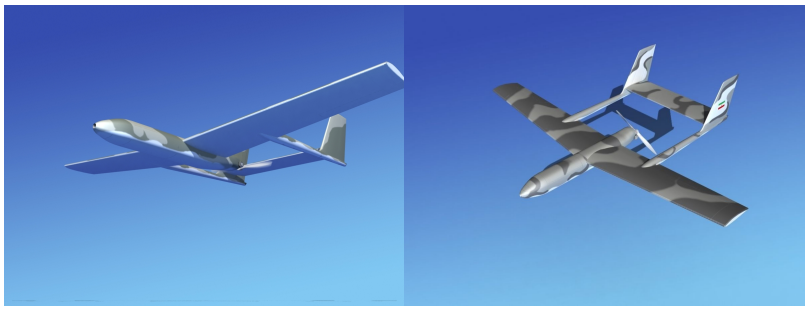
EW Counter Measures / CCM: No

Counter Measures (Chaffs/Flares): No

Notes:

The Ababil-2 has an improved flight-control system. Jane's reports that the Ababil-2 had its first flight in 1997 while Galen Wright writes that it entered production in 1992. Both sources agree the Ababil-2 was publicly revealed in 1999. Some sources also designate the Ababil-2 as the Ababil-II. The most common Ababil-2 variant is a target drone variant used for training air-defense crews. Rudimentary surveillance capabilities and can be used as a loitering munition, but is mainly used as a target drone.

Mohajer-3 (Dorna) Iranian Tactical Unmanned Aerial Vehicle (UAV)



Tiers:

Variants:

- **Mohajer-1:** The Mohajer was Iran's first drone to enter series production and was used during the Iran–Iraq War. The Mohajer-1 was known simply as "Mohajer" through the 80s and 90s, when it was re-designated "Mohajer-1" as other Mohajer variants had been developed.
- **Mohajer-2:** Following the successful use of the Mohajer-1, Iran wanted a version with more range and endurance. This version, which would later be named the Mohajer-2, also had an auto pilot system to fly beyond the line-of-control of its command center.
- **Mohajer-2N:** In 2014, Iran introduced the Mohajer-2N, which shares the same design as the Mohajer-2 but has far improved performance.[13] The Mohajer-2N replaces the electronics of the Mohajer-2 with more modern versions and has also has improved flight characteristics. T
- **Mohajer-3:** The Mohajer-3, also known as the Dorna, was designed with a new airframe for better performance. It had a square body and featured a low-mounted horizontal stabilizer flush with the main wing, the only member of the Mohajer family configured this way.
- **Mohajer-4:** The Mohajer-4 was designed for both the Iranian Army and the IRGC and entered service in late 1997.
- **Mohajer-4B:** Also known as the Sadiq, the Mohajer-4B is a significant evolution of the Mohajer-4 platform with a square fuselage, twin tail booms, a top-mounted horizontal stabilizer, uncanted wingtips, new landing skids, and straight wings mounted high and to the mid of the body
- **Sadegh-1:** The Sadegh-1 ("Honest-1"), also known as the QOM-1, is simply a Mohajer-4B with two MANPADS mounted on pylons.It was tested in late 2014
- **Mohajer-6:** The Qods Mohajer-6 is a persistent ISTAR UAV capable of carrying a multispectral surveillance payload and/or up to two precision-guided munitions. Ten have been manufactured as of February 2018 for the IRGC Ground Forces, and 40 are planned for the IRGC Navy.The Mohajer-6 complements the larger Shahed 129 operated by the third IRGC branch, the IRGC-ASF. Three have also been delivered to the Iranian Army.

System

Alternative Designation: Mohajer-3; Dorna
Type of UAV: Tactical Unmanned Aerial Vehicle (UAV)
Manufacturer: Qods Aviation, Tehran
Family: Mohajer family
In Service: 1999-No longer in service
Flight Control Method: controlled by hobby-class radio, which was easily jammed
Day/Night Capable: INA
All Weather Capable: INA
Takeoff or Landing Limitations: INA
Ground Crew: Capable of being controlled via land crew or autopilot

Autopilot: Yes, which controls the aircraft via waypoints

Endurance: 90 min

Range: km60

Date Transmit Distance: INA

Location Positioning System: Yes

Launch System: Wheels for a conventional launch capability or skids for a JATO launch

Recovery System: Wheels for a conventional landing capability or Parachute

Number of Hard Points: ea6

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: No

Landing Gear: three fixed landing gear for launch and recovery

Stabilizer: low-mounted horizontal stabilizer flush with the main wing

Antenna Type: two stub antenna in the under 10 GHz range, one on each wing, for real-time control.

Autonomous Operation: Yes, for 80% of flight time

GPS Guidance System: No

Note #1: Designed for surveillance use

Note #2: the Mohajer-3 lacks over-the-horizon guidance

Dimensions

Length: m2.9

Width (Wing Span): m3.8

The Mohajer-3, also known as the Dorna, was designed with a new airframe for better performance. It had a square body and featured a low-mounted horizontal stabilizer flush with the main wing, the only member of the Mohajer family configured this way. The Mohajer-3 could be fitted with fixed landing gear, for a runway takeoff, or with skids for a JATO launch. It was recovered by parachute or skid landing. It was powered by an unidentified 25 hp (18.6 kW) piston engine. The Mohajer-3 was announced in 1999. The Mohajer-3, also known as the Dorna, was designed with a new airframe for better performance. It had a square body and featured a low-mounted horizontal stabilizer flush with the main wing, the only member of the Mohajer family configured this way.

Tipchak 1K133 Russian Unmanned Aerial Vehicle (UAV)

Tiers:

1 **2** 3 4

System

Alternative Designation: 1K133, 9M62, BLA-05

Type of UAV: Medium Altitude, Short Duration

Manufacturer: Design Deaurau Lutch, Russia; Electronics developed by Vega

Primary Function: Reconnaissance

Flight Control Method: INA

Day/Night Capable: Yes

All Weather Capable: Yes

Takeoff or Landing Limitations: INA

Ground Crew: INA

Ceiling, Maximum: kmINA

Ceiling, Minimum: kmINA

Ceiling, Normal Operations: kmINA

Endurance: hours4

Range: km70

Data Transmit Distance: INA

Location Positioning System: GLOSNASS / NAVSTAR

Launch System: Pneumatic catapult

Recovery System: Parachute

Number of Hard Points: 0

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: No

Landing Gear: Parachute

Dimensions

Length: m2.4

Width (Wing Span): m3.4

Height: mINA

Weight: kg70

Weight, Maximum Takeoff: kg/mINA

Weight, Payload: INA

Automotive

Engine Name: Hirth, piston

Engine Type: INA

Engine Power: hp12

Cruising Range (mission radius): km70

Speed: km/h90-190

Maximum Range: 70 km

Endurance: hours4

Communications

Radio: Digital uplink

Retrans Radio: No

Armament and Ammunition

Air to Air Missiles: No

Air to Ground Missiles: No

MIssile Types: NA

Bomb Types: NA

Armament Weight Total: NA

Targeting Capability: Can provide targeting for Iskander missiles at distances up to 350 km

Fire Control

Fire Control System Type: NA

Fire Control Radar: NA

Radar Type: NA

Radar Designator: NA

Laser Rangefinder: Yes

Laser Designator: Yes

Full-Motion Video: Yes

Still Camera: Yes

Thermal Imaging Sensors: Yes

Electro Optical Pod: No

SAR/GMTI: INA

SIGINT: INA

ELINT: INA

Digital Data Link: Yes, primarily used to communicate with artillery units for laser-guided targeting. Pairings include the 152mm Krasnopol howitzer shell and the Smerch multiple rocket system.

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

EW: No

EW Counter Measures / CCM: No

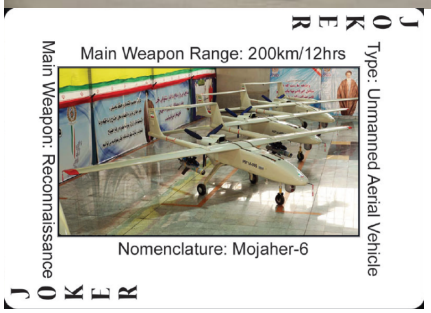
Counter Measures (Chaffs/Flares): No

Notes:

The Tipchak 1K133 is a tactical reconnaissance system developed to replace the Kulon Stroi-P. The platform for the Tipchak is the Rybinsk-based Luch designed 9M62 (BLA-05). The 9M62 is launched by pneumatic catapult, is powered by a single 12hp Hirth piston engine, has an endurance of up to 4 hours, a maximum take off weight of 70kg, a top speed of 200km/h and has an entirely composite structure with a metal frame inside for higher strength and onboard camera protection. A parachute is used for recovery. Primary uses are search, detection, recognition, surface object coordinates determination, area surveillance, and adjustment of fires. The Tipchak system consists of a two-part, vehicle mounted command post, a UAV transport-launch vehicle, a technical maintenance vehicle and six 9M62 UAVs. The deployment time in field conditions is 15-20 minutes. The UAVs operate in pairs. Based upon the operations in South Ossetia, the Russian military has complained about the Tipchak's UAVs stating that they are too noisy and those that use rocket assisted take off give away their launch site. There is also concern about the quality of the reconnaissance as the images provided by the FMV were not of tactical value. A problem with the friend-or-foe system was also reported by the Russian army (Source: TASS-Defense; published May 02, 2017).

→→Mid-Range UAVs (151-300 km Range)

Mohajer-6 Iranian ISTAR Unmanned Aerial Vehicle (UAV)



Tiers:

Variants:

- **Mohajer-1:** The Mohajer was Iran's first drone to enter series production and was used during the Iran–Iraq War. The Mohajer-1 was known simply as "Mohajer" through the 80s and 90s, when it was re-designated "Mohajer-1" as other Mohajer variants had been developed.
- **Mohajer-2:** Following the successful use of the Mohajer-1, Iran wanted a version with more range and endurance. This version, which would later be named the Mohajer-2, also had an auto pilot system to fly beyond the line-of-control of its command center.
- **Mohajer-2N:** In 2014, Iran introduced the Mohajer-2N, which shares the same design as the Mohajer-2 but has far improved performance. The Mohajer-2N replaces the electronics of the Mohajer-2 with more modern versions and has also has improved flight characteristics. T
- **Mohajer-3:** The Mohajer-3, also known as the Dorna, was designed with a new airframe for better performance. It had a square body and featured a low-mounted horizontal stabilizer flush with the main wing, the only member of the Mohajer family configured this way.
- **Mohajer-4:** The Mohajer-4 was designed for both the Iranian Army and the IRGC and entered service in late 1997.
- **Mohajer-4B:** Also known as the Sadiq, the Mohajer-4B is a significant evolution of the Mohajer-4 platform with a square fuselage, twin tail booms, a top-mounted horizontal stabilizer, uncanted wingtips, new landing skids, and straight wings mounted high and to the mid of the body
- **Sadegh-1:** The Sadegh-1 ("Honest-1"), also known as the QOM-1, is simply a Mohajer-4B with two MANPADS mounted on pylons.It was tested in late 2014
- **Mohajer-6:** The Qods Mohajer-6 is a persistent ISTAR UAV capable of carrying a multispectral surveillance payload and/or up to two precision-guided munitions. Ten have been manufactured as of February 2018 for the IRGC Ground Forces, and 40 are planned for the IRGC Navy.The Mohajer-6 complements the larger Shahed 129 operated by the third IRGC branch, the IRGC-ASF. Three have also been delivered to the Iranian Army.

System

Alternative Designation: Mohajer-6
Type of UAV: Intelligence, Surveillance, Target Acquisition, and Reconnaissance (ISTAR) UAV
Manufacturer: Qods Aviation, Tehran

Units Manufactured: Total: +50

Family: Mohajer family

In Service: 2017-Present

Day/Night Capable: Yes

All Weather Capable: INA

Takeoff or Landing Limitations: INA

Ground Crew: Crew of 5-7 men, including two operators. Capable of being controlled via land crew or autopilot

Autopilot: Yes, which controls the aircraft via waypoints

Endurance: 12 hours

Range: km200 km

Date Transmit Distance: INA

Location Positioning System: Yes

Launch System: INA

Recovery System: Launched and recovered via runway takeoff/landing.

Number of Hard Points: ea2

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: Yes

Landing Gear: fixed tricycle landing gear

Stabilizer: Horizontal stabilizer

ISAR Capable: Yes

Proliferation: Iran, Syria, Venezuela, Hezbollah

Dimensions

Length: m5.67

Width (Wing Span): m10

Height: INA

Weight, Maximum Takeoff: kg600

Payload Capacity: kg40

Tailbooms: Twin tail booms

Wing Type: uncanted wingtips, straight wings mounted high and to the rear of the body

Stabilizer: top-mounted horizontal stabilizer

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: INA

Maximum Range: km200

Speed, Maximum: km/h200

Speed, Average: INA

Endurance: 12 hours

Maximum Ceiling: m5,486

Radius: INA

Cargo Capacity (Payload): kg40

Propellers: Three-bladed propeller

Rudders: Twin Rudders

Communications

Radio: INA

Retrans Radio: INA

Main Weapons System

Name: Qaem Air to Ground Bomb

Type: Qaem TV/IR-guided missile

Guidance System: TV/IR-guided

Length: INA

Diameter: INA

Weight: INA

Effective Firing Range: INA

Maximum Firing Range: INA

Speed: INA

Basic Load: ea2

Note: The Qaem A2G glide bomb is related to the Sadid-345 glide bomb, but has different wings and size

Fire Control

Fire Control System Type: INA

Fire Control Radar: No

Radar Type: INA

Radar Designator: INA

Laser Rangefinder: Yes

Laser Designator: INA

Full-Motion Video: Yes, video and infrared with 1-m resolution mounted on the forward part of the fuselage

Still Camera: static nose-mounted camera

Thermal Imaging Sensors: Yes, multispectral IR and visible light electro-optical imagery

Electro Optical Pod: INA

Forward-Looking Infrared (FLIR) Sensors.: Yes

Onboard Digital Processor: Yes, which can downlink sensor imagery

Navigation Camera: Fixed forward-facing camera for navigation

Surveillanc Camera: Either a downward-facing camera for aerial surveying or a gimbal-mounted video camera for surveillance

GPS Enabled: Yes

Guidance System: Hyarat 3 guidance and control system

Data Link: Yes, data link that can downlink imagery in real time

Note: The Mohajer-6 has three antennas, two on its left wing and one on its right, and a pitot tube on its nose

Protection

Fuselage: Rectangular fuselage

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

EW: Yes

EW Counter Measures / CCM: Yes

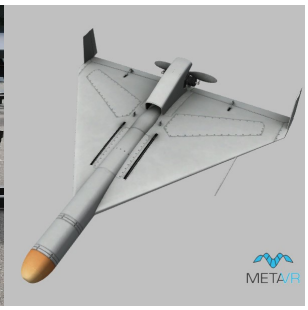
Counter Measures (Chaffs/Flares): No

Communication Jamming: Yes

Notes:

The Qods Mohajer-6 is a Intelligence, Surveillance, Target Acquisition, and Reconnaissance (ISTAR) UAV capable of carrying a multispectral surveillance payload and/or up to two precision-guided munitions. Ten have been manufactured as of February 2018 for the IRGC Ground Forces, and 40 are planned for the IRGC Navy. The Mohajer-6 complements the larger Shahed 129 operated by the third IRGC branch, the IRGC-ASF. Three have also been delivered to the Iranian Army. The Mohajer-6 was unveiled in April 2017 and entered serial production in February 2018. As with other members of the Mohajer family, the Mohajer-6 is made of composite. The Mohajer-6 has a rectangular fuselage, an upwards-sloping nose, twin tail booms, a top-mounted horizontal stabilizer, uncanted wingtips, straight wings mounted high and to the rear of the body, and air intakes on the top and bottom of the engine. The Mohajer-6 is controlled by two elevators on the horizontal stabilizer, rudders on the vertical stabilizers, and two flaps per wing. Unlike other Mohajer variants, it has a three-bladed propeller. The Mohajer-6 has a wingspan of 10 meters and is 5.67 meters long. It is similar in shape to the Selex ES Falco. The Mohajer-6 has fixed tricycle landing gear, which underwent changes between the unveiling ceremony in 2017 and mass production in 2018, perhaps to accommodate more weight. It is launched and recovered via runway takeoff/landing. It has a fixed, forward facing camera for navigation and a gimbal on the chin for a laser range finder and multispectral IR and visible light electro-optical imagery. The Mohajer-6 has three antennas, two on its left wing and one on its right, and a pitot tube on its nose. The Mohajer-6 has two hardpoints, one under each wing, which can each carry one Qaem TV/IR-guided missile. It has an autopilot system capable of automatic takeoff and landing. In addition, Iran describes it as capable of being fitted with electronic support measures, communications jamming, or electronic warfare payloads.

ASN-301 Chinese Anti-Radiation Radar Loitering Munition Unmanned Aerial Vehicle (UAV)



Tiers:

Variants:

- **Cutlass:** This variant of the Harpy was evaluated in 1999 with Raytheon for search-and-destroy missions and the ability to attack a wider range of targets. It would have been a sea-launched weapon employing advanced sensors from Raytheon
- **Harop/Harpy 2:** This is a larger, upgraded variant. Designed as a fire-and-forget weapon, the Harop can fly more than 600 mi (1,000 km) to patrol a specific area and attack any hostile radars detected.
- **Harpy NG (new generation):** This is an upgraded variant that uses the Harop airframe. It was developed to counter newer air defense radar threats.
- **Mini-Harpy:** This tactical loitering munition combines the operating characteristics of the Harpy and Harop. It can lock onto radar and other emitting threats via person-in-the-loop electro-optical guidance. Fully autonomous operation is available as an option. It can attack emitting and non-emitting targets.
- **Maritime Harop:** This is a variant of the Harop optimized for operation from naval vessels, from patrol ships to frigates. It features a maritime-configured launcher and modified communications.
- **ASN-301:** This is a Chinese copy of the Harpy. It has a delta wing and pusher propeller configuration that appears virtually identical to the Israeli system. According to the China National Aero-Technology Import & Export Corp. (CATIC), the ASN-301 targets radar frequencies in the 2-16 GHz range and has a radar search range of 16 mi (25 km). The system is said to be able to target up to eight preset radar targets.

System

Alternate Designation: ASN-301

Type: Anti-Radiation Radar Loitering Munition Unmanned Aerial Vehicle (UAV)

Manufacturer: China; Company: INA

Dimensions

Length: 2.50 m

Wingspan: 2.41 m

Combat Weight: 135 kg

Warhead Weight: 18 kg

Automotive

Engine Name: 1 x UEL AR731

Engine Type: Rotary Engine

Engine Power: 37 hp (28 kW)

Maximum Speed: 220 kph

Maximum Range: 288 km

Ceiling: 4,570 m

Endurance: 4 hours

Fire Control and Avionics

Communication Maximum Range: 200 km

Radar Name: INA

Radar Distance: INA

Radar Cross-Section: <0.5 sq m

Notes:

The ASN-301uav seems to be a near-copy of the Israel Aerospace Industries (IAI) Harpy system that was purchased by China in the 1990s, according to foreign sources. The ASN-301uav is a delta-wing aircraft with a pusher propeller that looks virtually identical to the Harpy.It is designed to fly into hostile airspace and loiter until it detects a radar, at which point it homes in on the target and destroys it.

Hermes 450 Israeli Unmanned Aerial Vehicle (UAV)

Tiers:

System

Alternative Designation: 450S
Propulsion: 2 balde pusher propeller

Description: (digital compact multi-purpose advanced stabilized system). stabilized turret incorporating thermal imager, color TV, dual-band laser designator rangefinder, inertial measurement unit and laser spot tracker

Notes:

The Elbit Hermes 450 is an Israeli medium-sized multi-payload unmanned aerial vehicle (UAV) designed for tactical long endurance missions. It has an endurance of over 20 hours, with a primary mission of reconnaissance, surveillance and communications relay. Payload options include electro-optical/infrared sensors, communications and electronic intelligence, synthetic-aperture radar/ground-moving target indication, electronic warfare, and hyperspectral sensors.

Wing Loong ID Chinese Medium-Altitude Long Endurance (MALE) Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Pterosaur I:** First member of Wing Loong series, with program of Wing Loong begun in May 2005. Maiden flight was completed in October 2007 and payload evaluation flight was completed a year later in October 2008. This first model of Wing Loong series lacked the bulge at the nose tip of the fuselage due to the lack of a satellite antenna, and while the English name used by the developer differed from later models, the Chinese name remains the same, and so is the name Wing Loong for the entire series. he lack of satellite antenna results in cheaper cost, with the reduction of the maximum control range around to 200 km.This model is no longer actively marketed when Pterodactyl I appeared, but is still available as a cheaper alternative up on potential customers' request.
- **Pterodactyl I:** Sky Saker is a derivative of Wing Loong developed by Norinco mainly intended for export. The Chinese name is Rui Ying (□□), meaning Sharp Eagle, but the English name adopted by the developer is Sky Saker. Sky Saker / Rui Ying carries both a miniature synthetic aperture radar and an electro-optical pod to perform reconnaissance in both the visible light and radar spectra. The capability of Sky Saker / Rui Ying has been exaggerated by many Chinese internet sources claiming that it has both scout and strike capabilities at the same time, but this has been proven to the contrary. According to all info released by Norinco itself (as of 2015), the UAV can employ only a single capability at a time: when the UAV carries the reconnaissance payload, no weaponry is carried. Similarly, when weaponry is carried, the reconnaissance payload is absent.
- **WJ-1:** The first land attack version of Pterodactyl I, which is a weapon platform without the reconnaissance/targeting pod under the chin. The designation WJ stands for Wu-Zhuang Wu-Ren-Ji (□□□□□), meaning armed UAV. WJ-1 UAV made its public debut in November 2014 at the 10th Zhuhai Airshow along with its cousin GJ-1.
- **GJ-1:** Another land attack version of Pterodactyl I that combines the capabilities of both Pterodactyl I and WJ-1 so that it can identify and engage targets on its own. GJ-1 can be distinguished from both Pterodactyl I and WJ-1 in that GJ-1 has both the reconnaissance/targeting pod under the chin as well as hardpoints to carry weapons. The designation GJ stands for Gong-Ji Wu-Ren-Ji (□□□□□), meaning "attack UAV." GJ-1 UAV made its public debut in November 2014 at the 10th Zhuhai Airshow along with its cousin WJ-1.
- **Wing Loong II:** An upgraded variant of the Wing Loong, with provisions for up to twelve air-to-surface missiles. Officially entered service with the PLAAF in November 2018. Wing Loong II is known in PLAAF service as the Gongji-2 ('Attack 2' or GJ-2).

System

Alternative Designation: INA
Type UAV: Medium-Altitude Long-Endurance (MALE)
Expected out of Service Date: INA
Manufacturer: Chengdu Aircraft Industrial Group (CAIG)
Cost: INA
Primary Function: The Wing Loong ID can conduct intelligence, surveillance and reconnaissance; electronic warfare; search-and-rescue; strike; peacekeeping; and border patrol missions.

Flight Control Method: Wireless Communication or by Pilot on the ground

Day/Night Capable: Yes

All Weather Capable: INA

Takeoff or Landing Limitations: 1 km Runway needed for Launch

Ground Crew: 1

Complete System Includes: A complete Wing Loong ID system includes air vehicles, a ground-control station, mission payload and an integrated logistics system.

Ceiling, Maximum: m9,000

Ceiling, Minimum: mINA

Range: km200

Endurance: hours35

Data Transmit Distance: kmINA

Location Positioning System: BeiDou Navigation Satellite System (BDS)

Number of Hard Points: ea6 (3 on each wing)

Launch System: Runway,(1 km Runway needed for Launch)

Takeoff Roll: m600

Manned-Unmanned Teaming (MUM-T) Capable: INA

Automatic Landing and Takeoff Capability: Yes

Recovery System: Runway

Landing Gear: The landing gear consists of two main wheels under the fuselage and one single wheel under the nose, facilitates safe take-off and landing.

Dimensions

Length: m8.7

Height: m3.7

Width (Wing Span): m17.6

Gross Weight: kg330

Weight, Maximum Takeoff: kgINA (The Wing Loong II Maximum Takeoff Weight is 4,200 kg)

Weight, Payload: kg400

Automotive

Engine Name: INA. The Wing Loong ID has a updated engine from the engine in the Wing Loong II

Engine Type: Piston engine,

Engine Power: hpINA

Number of Engines: ea1

Cruising Range: INA (More than 1,500 km)

Speed, Maximum: km/h280

Speed, Average: km/h250

Endurance: hour35

Payload: kg400

Propellers Type: 3 Bladed Design

Communications

Radio: Satellite Communications Antenna

Encrypted Data Link: Yes

Armament & Ammunition

Air to Air Missiles: INA

Air to Ground Missiles: Yes, can carry the BA-7 air-to-ground missile, YZ-212 laser-guided bomb, YZ-102A anti-personnel bomb and 50-kilogram

Missile Type: BRM1, AKD-10

Bomb Type: FT-10, FT-9, FT-7, GB7, GB4

Armament Weight Total: kg1,000 (The Wing Loong ID can carry more than double the Armament Weight of the WIng Loong II).

Payload Types: EO/IR, SAR, laser-guided missiles

Fire Control

Fire Control System Type: INA

Fire Control Radar: INA

Radar Type: Digital with Synthesized Antenna Aperture

Radar Designator: Yes

Laser Rangefinder: Yes

Laser Designator: Yes

Full-Motion Video: Yes

Still Camera: Yes

Thermal Imaging Sensors: Yes

Forward Looking Infrared Turret: Yes

Electro Optical Pod: Yes

Protection

Fuselage: Complete Composite Material used for the entire Fuselage

Stealth Properties: INA

Heat Signature Reduction: Yes

Add on Armor: INA

EW: INA

EW Counter Measures / CCM: Yes

Counter Measures (Chaffs/Flares): INA

Notes:

Wing Loong ID: Upgraded variant of the Wing Loong I, with improved aerodynamics and engine enabling greater takeoff weight, service ceiling, and endurance. Other upgrades include both internal and external stores, as well as communications equipment. The variant launched in 2018 with Egypt being the first buyer of 32 systems.The variant achieved its first flight on 23 December 2018

Camcopter S-100 Austrian Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Unmanned Combat Aerial Vehicle (UCAV) attack version :** An Unmanned Combat Aerial Vehicle (UCAV) attack version was developed and displayed in 2008, with 2 x Lightweight Multi-role Missiles (LMMs, see Vol 2, pg6-55). Missiles can engage light armored vehicles, aircraft, and other ground targets. The UCAV version could also mount guided rockets, machineguns, rockets, or automatic grenade launchers as needed for attack roles or self-protection. Small launchers for aerial rockets with homing devices could fit on the S-100 with a LTD for deep attack.

System

Alternative Designation : Al-Saber
Type: Unmanned Aerial Vehicle (UAV)
Manufacturer: Schiebel
Flight Control: Ground Control Station (GCS) inside vehicle Image processing: Real-time UAV video feed can also be routed to other subscribers.
Flight Control Method: Pre-programmed or in-flight re- program.
Hover Capability: Yes
Hardpoints: 2

↳*Dimensions*

Height, Overall : m1.04
Length, Overall : m3.09
Length, Wing Span : m1.24
Weight, Payload: kg55
Weight, Takeoff: kg200

Main Rotor Diameter: m3.4

↳*Survivability/Countermeasures*

Survivability/Countermeasures: Light carbon fiber structure for low radar signature. It is very quiet, with narrow profile for low visual signature. It has auto-return and recovery mode for lost control signal. Inertial and GPS navigation: <1 meter accuracy.

Automotive

Engine Name: 1 × Austro Engine AE50R Wankel engine, 41 kW (55 hp) (basic). or

Engine Type: 1 × Schiebel heavy fuel engine (optional)

Engine Power: 55 hp

Ceiling, Maximum (normal) : m6000.0

Service Ceiling: m5,500

Endurance : hr6.0

Range, Relay/Programmed : km130.0

Range, RPV Mode : km130.0

Maximum Speed: 220 km/h

Cruise Speed: 190 km/h

Never Exceed Speed: 240 km/h

Range: 180 km

G Limits: +3.5 g to –1 g

Launch and Recovery

Landing Method: 3-Vertical to vehicle/ground

Launch Method: DGPS autonomous vertical launch from vehicle/ground base

Recovery Method: DGPS autonomous

Payload

↳*Payload*

Notes: Other options include laser target designator (LTD), CBRN monitors, laser imaging radar (LIDAR), ground-penetrating radar (GPR), and signals intelligence sensors.

↳*Payload 1*

Description: gimbaled ball with TV and FLIR for night use

Type: IAI/Elta POP-3000

↳*Payload 2*

Description: gimbaled ball with FLIR, 3km night acquisition range, (UAE version is projected with TV and high zoom for 20 km daytime acquisition)

Type: IAI/Tamam POP200

↳***Payload 3***

Description: Synthetic aperture radar for MTI surveillance and ground mapping

Type: PicoSAR

Notes:

The Schiebel Camcopter S-100 is an Austrian unmanned aerial vehicle (UAV) using a rotorcraft design. Produced by the Austrian company Schiebel, it was developed from 2003 to 2005. With a maximum take-off weight (MTOW) of 200 kilograms (440 lb), its endurance is 6 hours (extendable to over 10 hours with optional external AVGAS fuel tanks fitted). It has a maximum speed of 220 kilometres per hour (140 mph) and a ceiling of 5,500 metres (18,000 ft). It is powered by a 55 horsepower (41 kW) Diamond engine and can carry various payloads, such as electro-optics and infrared sensors. On 12 March 2012 Schiebel announced that it successfully tested a company-developed heavy-fuel engine interchangeable with the standard Diamond engine. This heavy-fuel engine allows for the use of JP-5, Jet A-1 or JP-8 jet fuels. These fuels, which are standard on marine vessels, are safer to store and handle than gasoline. On 7 February 2013, Schiebel flight tested a Thales Group I-Master surveillance radar system on the Camcopter at its Wiener Neustadt, Austria, facility. The I-Master system, weighing 30 kg (66 lb), provides ground moving target indication and synthetic-aperture radar operations. The launch customer for the S-100 was the UAE Army, which ordered 40 aircraft with an option for 40 more. The aircraft was ordered by three more undisclosed nations, with total orders reaching 200. The Camcopter underwent sea trials on the Indian Navy's INS Sujata (P56) during October 2007. Flight testing occurred aboard a Pakistan Navy Type 21 frigate in the Arabian Sea on 16 March 2008, with further naval testing on 14 April 2008 on the Spanish Guardia Civil vessel Rio Miño off Gran Canaria. The German Navy conducted testing during three weeks in August and September 2008 on the Braunschweig-class corvettes Braunschweig and Magdeburg, respectively. More than 130 takeoffs were conducted, and the UAV maintained unaided on-deck stability in greater than 15° flight deck roll conditions. The French Navy performed test flights during September and October 2008, with a Camcopter spending four days on a barge in the Atlantic Ocean and a further three days on the frigate Montcalm (D642). Libya ordered four Camcopters in 2009, which were placed under command of the Khamis Brigade. Jordan ordered two S-100s with L3Harris Wescam MX-10 EO-IR payloads in July 2010 and accepted delivery in February 2011. In November 2011 the Camcopter demonstrated flights from the French Gowind-class corvette L'Adroit.[12] At the same time, the Gorizont (Horizon) Air S-100, a Russian license-built version of the UAV was successfully tested aboard the Coast Guard patrol cutter Rubin. Russia intends to equip all Rubin-class patrol boats with these UAVs. In 2010 the Chinese Navy purchased 18 of these systems. Two years later, in May 2012, an unmanned UAV believed to be a Camcopter S-100 was photographed operating from the fantail of a Chinese Type 054A frigate by the People's Liberation Army Navy. In April 2012, the Camcopter became the first unmanned helicopter to fly from an Italian Navy vessel when it was flight tested from the MM Bersagliere (F-584). In February 2014, the Italian Navy chose the S-100 as its primary unmanned aerial system for shipboard operations, where it will be used for intelligence, surveillance and reconnaissance (ISR). It will additionally support other activities, such as search and rescue and natural disaster recovery. In December 2014, the Camcopter went through a series of trials in Bizerte, Tunisia, to serve within the Tunisian Army. Schiebel selected the Italian company Leonardo to supply AESA-based SAR radar for the systems which were to enter service in 2017. In February 2017, the Royal Australian Navy awarded a contract to provide an unrevealed number of Camcopter systems, plus three-years support. The type is operated by 822X Squadron RAN, which is responsible for trialling UAVs. In 2018, the Belgian Navy conducted a weeks-long testing of the Camcopter, assessing its utility for maritime surveillance and search and rescue.

ASN-209 Chinese Unmanned Aerial Vehicle (UAV)

Tiers:

1 2 3 4

Variants:

- **Silver Eagle:** Silver Eagle (Yin-Ying or Yinying, is a derivative of ASN-209 deployed by Chinese military. The most obvious visual difference between Silver Eagle and its predecessor ASN-209 is the addition of four vertically installed antenna, two of which are arranged in sequential order atop the fuselage, and one each on the wing, near the wingtip. Estimated range is around 150 km and the estimated endurance is several hours. Maiden flight of Silver Eagle took place in the coastal region of northeastern China on June 1, 2011 and lasted three and half hours. The UAV has since entered service with Chinese navy. Silver Eagle is launched from a 6 x 6 truck, which is both the launching platform and transportation vehicle, and the UAV utilizes rocket assisted take-off. Presumably, there would be at least another vehicle housing the ground control station. Very little information has been publicized by the official Chinese government sources, which only reveal (as of 2014) that Silver Eagle is a shore-based naval UAV. There are postulates that Silver Eagle can either act as a communication relay or electronic intelligence gathering platform, or as an aerial jamming platform, but such claims have yet to be confirmed.

System

Alternative Designation: Aisheng ASN-209 (Silver Eagle)

Type: Unmanned Aerial Vehicle (UAV)

Manufacturer: Xi'an ASN Technology Group / CATIC / AO

In Service: 2012-Present

Crew: None

Cargo Capacity: 50 kg

Dimensions

Length: 4.273 m

Wingspan: 7.5 m

Height: 1.539 m

Maximum Takeoff Weight: 320 kg

Automotive

Engine Name: INA

Engine Type: Rear installed engine disposition

Engine Power: INA

Maximum Speed: 180 km/h

Cruise Speed: 40 km/h

Combat Range: 200 km

Endurance: 10 h

Service Ceiling: 5,000 m

Notes:

The Aisheng ASN-209 from Xi'an Technology is a medium altitude/medium endurance multi-role UAV. ASN-209 Tactical UAV System is composed of Aircraft Platform, Avionics, Airborne Mission Payload, Data Link, Ground Control Station and Launch and Recovery Equipment, ASN-209 UAV can perform aerial reconnaissance, battle field survey, target location, destroy validation and artillery fire adjustment in day and night in real time. ASN-209 uses digital flight control and navigation system, its flight control mode has manual, program and emergency control. In addition, ASN-209 uses rocket booster launch, parachute recovery which render the operating system of ASN-209 flexible due to the fact that no contact with an airport is needed, and the GCS allows multitasking and can be edited in real-time. In civil application, it can be fitted with Synthetic Aperture Radar (SAR), electro-optical payload, and multi-function payload, etc. that can be applied for forest fire prevention, anti-drug action, communication, nature disaster forecast, ground observation, atmosphere measuring, aviation photo, resource detection, climate observation and artificial raining, etc. In military operation, it can be with multiple operational configurations for Ground Moving Target Indication (GMTI), Electronic Intelligence (ELINT), Electronic Warfare (EW), Ground Target Designation (GTD) and Communication Relay. ASN-209 uses twin-boom pusher layout, rear installed engine disposition with high-set wings and a stabilizer linking the twin fins. Excellent overall aerodynamic design and EMC design enable the system to install many different kinds of airborne equipment, such as Electronic countermeasures (ECM), communication relay and weather detection. With a coverage radius is 200 km and endurance of 10 hours, ASN-209 UAV System can supervise big area and frontier within one sortie. In order to overcome with refueling issue, using two UAVs and switching them out when one reaches its 10-hour limit so that they can be used for 24 hours consecutively. The practicality of the ASN-209 system reduces the needs for maintenance or parts from China, as ASN-209 can be deployed using a modified truck and is controlled using electronics equipment installed in a cargo van, which in turn overcomes the disadvantage of comparable US UAVs that depend on US parts and maintenance.

Eleron-3 Russian Reconnaissance Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Eleron-B:** Export Model

System

Alternative Designation: Elron-3; ZAO ENIX Eleron-3 (Aileron-3)
Type of UAV: Short-Ranged Surveillance and Reconnaissance UAV
Manufacturer: ZAO Enix
In Service: 2005-Present
Flight Control Method: INA
Day/Night Capable: Yes
All Weather Capable: INA
Takeoff or Landing Limitations: INA
Ground Crew: No
Ceiling, Maximum: m4,000
Endurance: hours2
Range: the system’s range is planned to be extended to 250 km
Date Transmit Distance: INA
Launch System: launched by throwing it and can land by flying close to the ground and shutting its engine off.
Recovery System: launched by throwing it and can land by flying close to the ground and shutting its engine off.
Number of Hard Points: INA
Manned-Unmanned Teaming (MUM-T) Capable: No
Automatic Landing and Takeoff Capability: Yes
Return to Launch site Autonomously: Yes

Dimensions

Length: mm1,470

Width (Wing Span): mm635

Height: mINA

Weight, Combat: kg5.5

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: hpINA

Maximum Range: the system’s range is planned to be extended to 250 km

Speed, Maximum Road: km/h130

Speed, Average: km/hINA

Endurance: hoursINA

Maximum Takeoff Weight: kg5.3

Payload Weight: up to 1kg

Maximum Altitude: m4,000

Communications

Radio: INA

Retrans Radio: INA

Fire Control

Fire Control System Type: INA

Fire Control Radar: INA

Radar Type: INA

Radar Designator: INA

Laser Rangefinder: Yes

Laser Designator: INA

GPS: Yes

Navigation: Global Navigation Satellite System (GLONASS)

Still Camera: Yes

Thermal Imaging Sensors: Yes

IR Camera: Yes

Low-Light Level TV Camera: YEs

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: No

EW: No

EW Counter Measures / CCM: No

Counter Measures (Chaffs/Flares): No

Notes:

The Eleron-3 is a short-range tactical tail-less delta UAV with a maximum takeoff weight (MTOW) of 5.3kg carrying a 1kg payload. Manufactured by ENICS JSC it has a speed of 56 knots (104 km/h) and operates at a maximum altitude of 13,123 feet (4,000m). The Eleron-3 can perform autonomous, remote-controlled and patrolling flights, and point observation missions. The UAV returns to the launch site autonomously and uses GPS and GLONASS signals for navigation.

Wing Loong II Chinese Medium-Altitude Long Endurance (MALE) Unmanned Aerial Vehicle (UAV)

Tiers:

1 2 3 4

Variants:

- **Pterosaur I:** First member of Wing Loong series, with program of Wing Loong begun in May 2005. Maiden flight was completed in October 2007 and payload evaluation flight was completed a year later in October 2008. This first model of Wing Loong series lacked the bulge at the nose tip of the fuselage due to the lack of a satellite antenna, and while the English name used by the developer differed from later models, the Chinese name remains the same, and so is the name Wing Loong for the entire series.The lack of satellite antenna results in cheaper cost, with the reduction of the maximum control range around to 200 km. This model is no longer actively marketed when Pterodactyl I appeared, but is still available as a cheaper alternative up on potential customers' request.
- **Pterodactyl I::** The second member of Wing Loong series is distinguished from the earlier Pterosaur I in that there is a bulge at the nose tip of the fuselage to house a satellite antenna, and this is the version most widely publicized and actively marketed as a surveillance platform. United Arab Emirates and Uzbekistan were reported to be the first two foreign customers of Pterodactyl I.
- **Sky Saker::** Sky Saker is a derivative of Wing Loong developed by Norinco mainly intended for export. The Chinese name is Rui Ying, meaning Sharp Eagle, but the English name adopted by the developer is Sky Saker. Sky Saker / Rui Ying carries both a miniature synthetic aperture radar and an electro-optical pod to perform reconnaissance in both the visible light and radar spectra. The capability of Sky Saker / Rui Ying has been exaggerated by many Chinese internet sources claiming that it has both scout and strike capabilities at the same time, but this has been proven to the contrary. According to all info released by Norinco itself (as of 2015), the UAV can employ only a single capability at a time: when the UAV carries the reconnaissance payload, no weaponry is carried. Similarly, when weaponry is carried, the reconnaissance payload is absent.
- **WJ1:** The first land attack version of Pterodactyl I, which is a weapon platform without the reconnaissance/targeting pod under the chin. The designation WJ stands for Wu-Zhuang Wu-Ren-Ji, meaning armed UAV. WJ-1 UAV made its public debut in November 2014 at the 10th Zhuhai Airshow along with its cousin GJ-1.
- **GJ-1:** Another land attack version of Pterodactyl I that combines the capabilities of both Pterodactyl I and WJ-1 so that it can identify and engage targets on its own. GJ-1 can be distinguished from both Pterodactyl I and WJ-1 in that GJ-1 has both the reconnaissance/targeting pod under the chin as well as hardpoints to carry weapons. The designation GJ stands for Gong-Ji Wu-Ren-Ji, meaning "attack UAV." GJ-1 UAV made its public debut in November 2014 at the 10th Zhuhai Airshow along with its cousin WJ-1.
- **Wing Loong ID::** Upgraded variant of the Wing Loong I, with improved aerodynamics and engine enabling greater takeoff weight, service ceiling, and endurance. Other upgrades include both internal and external stores, as well as communications equipment. The variant launched in 2018 with Egypt being the first buyer of 32 systems.The variant achieved its first flight on 23 December 2018
- **Wing Loong II SIGINT Variant:** In December 2019, a Jane's article described a image of a Wing Loong II SIGNT Variant

which, "shows shows a GJ-2 featuring several rod-shaped antennas configured in a circular array fitted underneath the fuselage that could serve as a communications band-direction-finding array capable of not only intercepting communication signals but also providing a bearing of the transmitter. A blister is also evident on the side of the forward fuselage, which may house several directional radar-sensing antennas." Souce: https://www.janes.com/article/92973/image-emerges-of-possible-sigint-variant-of-plaaf-s-gj-2-uav

Systems

Alternative Designation: Known in PLAAF service as the Gongji-2 ('Attack 2' or GJ-2), also dubbed the "Air Sniper"

Type UAV: Medium-Altitude Long-Endurance (MALE)

Expected out of Service Date: 2037

Manufacturer: Chengdu Aircraft Industrial Group (CAIG)

Cost: INA

Primary Function: The Wing Loong II can conduct intelligence, surveillance and reconnaissance; electronic warfare; search-and-rescue; strike; peacekeeping; and border patrol missions.

Flight Control Method: Wireless Communication or by Pilot on the ground

Day/Night Capable: Yes

All Weather Capable: INA

Takeoff or Landing Limitations: 1 km Runway needed for Launch

Operator: ea1

Complete Ground Crew System Includes: A complete Wing Loong II system includes air vehicles, a ground-control station, mission payload and an integrated logistics system.

Ceiling, Maximum: m9,000

Ceiling, Minimum: mINA

Line of Sight Range: km200

Satellite Communication Link Range: km2,000

Endurance: hours32

Location Positioning System: BeiDou Navigation Satellite System (BDS)

Guidance Tracking: GP

Propeller: 3 Blade Design

Wing type: Low-Wing Monoplane Design

Wing Sweep: deg10

Number of Hard Points: ea6 (3 on each wing)

Launch System: Runway,(1 km Runway needed for Launch)

Takeoff Roll: m600

Manned-Unmanned Teaming (MUM-T) Capable: INA

Automatic Landing and Takeoff Capability: Yes

Recovery System: Runway

Landing Gear: The landing gear consists of two main wheels under the fuselage and one single wheel under the nose, facilitates safe take-off and landing.

Note: The Wing Loong II has been described as being in the same class as the U.S. MQ-9 Reaper.

Dimensions

Length: m11

Height: m4.1

Width (Wing Span): m20.5

Gross Weight: kg4,200

Weight, Maximum Takeoff: kg4,200

Weight, Payload: kg480

Automotive

Engine Name: Rotax 914 Turbocharged Engine

Engine Type: Four-Stroke, Four-Cylinder, Horizontally Opposed Aircraft Engine

Engine Power: hp100

Number of Engines: ea1

Engine Location: Top of the Airframe

Speed, Maximum: km/h370.4

Maximum Range: km200

Operational Range Radius: km1,500

Endurance: hour32

Payload: kg400

Propellers Type: 3 Bladed Design

Communications

Radio: Satellite Communication System

Encrypted Data Link: Yes

Armament & Ammunition

Payload Types: EO/IR, SAR, laser-guided missiles

Air to Air Missiles: INA

Air to Ground Missiles: Yes

Rockets: Yes

Missile Type: YJ-9E Anti-Ship Missiles, AR-1/HJ-10 Anti-Tank Missiles

Bomb Type: T-9/50 50kg bomb, GB3 250 kg laser-guided bomb, TL-10 bomb, Lan Jian 7 (Blue Arrow 7) laser-guided air-to-surface missiles, TG100 laser/INS/GPS-guided bombs

Armament Weight Total: kg400

Air to Ground Bombs/Missiles Total Capacity: ea10

Fire Control

Fire Control System Type: INA

Fire Control Radar: INA

Radar Type: Synthetic Aperture Radar

Radar Designator: Yes

Laser Rangefinder: Yes

Laser Designator: Yes

Full-Motion Video: Yes

Forward-Looking Infrared (FLIR) Camera: Yes

Still Camera: Yes

Thermal Imaging Sensors: Yes

Electro Optical Pod: Yes, Loong Eye LE380 electro-optical sensor pod

Protection

Fuselage: Slender Design, with a Chine, used to control Radar Reflections

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: No

EW Counter Measures / CCM: Yes

Counter Measures (Chaffs/Flares): INA

Notes:

The Wing Loong II is a medium-altitude, long-endurance unmanned aerial vehicle based on the Wing Loong (Pterodactyl). It is larger and more capable -- with significantly greater payload -- than its predecessor. The Wing Loong II has been described as being in the same class as the U.S. MQ-9 Reaper. The Wing Loong II can conduct intelligence, surveillance and reconnaissance; electronic warfare; search-and-rescue; strike; peacekeeping; and border patrol missions. The air vehicle features six hard points, compared to two on the Wing Loong, with four that can carry double payloads. As a result, the Wing Loong II can carry up to 10 air-to-ground bombs and missiles.

→→Long-Distance UAVs (More than 300 km)

ASN-207 Chinese MALE Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **ASN-206:** An older version of the ASN-207 with less control range, smaller payload capacity, and shorter endurance. The ASN-206 is a medium tactical unmanned aerial vehicle (TUAV) in service with the People's Liberation Army (PLA) in China. The air vehicle is used for day and night reconnaissance; battlefield surveillance; target positioning; artillery shooting adjustment; border patrol; nuclear radiation survey and sample; aerial photography; and disaster surveillance. The system consists of one air vehicle, a powerplant and a launch-and-recovery system. Upgrades may include an electronic support measures capability for self-protection. The air vehicle is launched by rocket and uses a parachute to land. It does not need a runway. The ASN-206 has a twin-boom layout with a high-wing configuration and twin tail. This permits the tail-mounted two-blade propeller to be out of the sight line of the sensor package. The ASN-206's electro-optical observation package is believed to be a derivative of an Israeli system. The air vehicle can be equipped with vertical and panoramic cameras; infrared sensors; television cameras; and positioning correction equipment. It is fitted with a digital control and management system, integrated radio and advanced mission-control equipment. Some ASN-206s appear to have been fitted with a satellite communication antenna. Video can be transmitted in real time to the ground station. The ASN-206 can also determine the position of a ground target in real time to correct artillery firing. For electronic warfare missions, the air vehicle can be equipped with a JN-1102 electronic countermeasures suite, which can scan, intercept, analyze, monitor and jam hostile ground-to-air communications at 20 MHz to 500 MHz. The system consists of a UAV-mounted intercept subsystem, UAV-mounted jamming subsystem and a ground-based intercept and jamming control subsystem. A complete system consists of six to 10 air vehicles and one ground station. The ground station comprises command vehicles, launch vehicles, power supply vehicles, intelligence-processing vehicles, maintenance and transport vehicles.
- **Navalized ASN-206:** The variant is designed to serves as a communication relay between a supporting surface ship and an amphibious force. It was noted in operation during the Chinese navy's first remote communication support drill with drones on July 10, 2011, at a comprehensive training range of a general communication station of the South China Sea Fleet.

System

Alternative Designation: ANS-207
Engine Power: hpINA
Propulsion: INA
Max Launch Weight: kgINA
Maximum (level): km/hINA
Cruising Speed: km/hINA
Endurance: hrsINA
Max Ceiling, Normal: mINA

Ceiling, Service: mINA

Radius of Operation: km600

↳*Dimensions*

Wing Span: mINA

Length, Overall: mINA

Height, Overall: mINA

↳*Flight Control*

Launch Method: Solid rocket booster on a zero length launcher

Recovery Method: Parachute (non-steerable)

Landing Method: 2 spring loaded skids

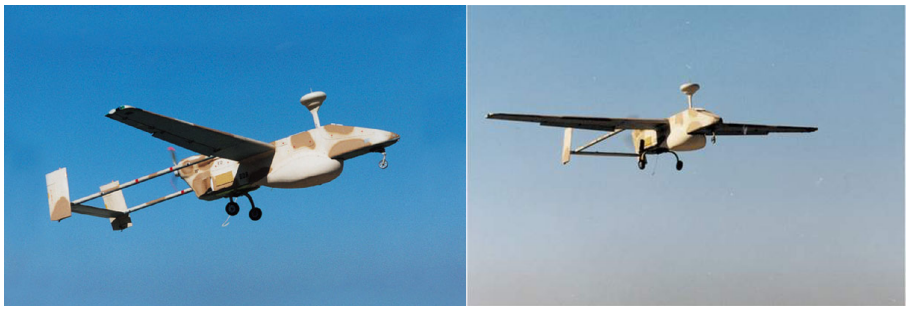
Payload Types

EW / ECM Suite: INA

Notes:

The ASN-207 is an upgraded version, though the specifics about the upgrades are not known. The maximum range is 370 mi (600 km). It is said to have twice the payload and endurance of the ASN-206. The ASN-207 was first seen in public in 2002. The ASN-207 is identifiable by the mushroom-shaped antenna mounted on top of the fuselage. SEE Variant: ASN206 below.

IAI Searcher Mk II Israeli Reconnaissance Unmanned Aerial Vehicle (UAV)



Tiers:

Variants:

- **Searcher Mk II:** The Mk II is the fourth in a line of UAVs that began development as the Scout (the Searcher was the third generation). The Searcher Mk II is slightly larger, measuring 19 ft 2 in (5.85 m) in height and 28 ft 1 in (8.55 m) in diameter; it has higher maximum takeoff weight and payload at 939 lb (426 kg) and 220 lb (100 kg), respectively. The main benefit of these updates is greater flight endurance at higher altitudes.
- **Searcher Mk III:** The most recent variant, the Mk III was launched in 2010 and has over twice the range of the Mk II with two more hours of endurance and a higher ceiling. It is equipped with a four-stroke silent engine, along with a maximum takeoff weight of 961 lb (436 kg) and higher maximum payload weights of 264 lb (120 kg). The Searcher Mk III has an aerial data relay capability for beyond line-of-sight operations. Two simultaneous automatic takeoff and landing systems improve safety.
- **Forpost:** This is the Russian designation for Searcher Mk II UAVs being produced domestically. According to the Urals Civil Aircraft Plant, which builds the systems, the Forpost has a flight endurance of 17.5 hours, maximum takeoff weight of 1,000 lb (454 kg) and a max payload of 130 lb (60 kg). The air vehicle has a top speed of 130 mi (210 kmh) and a ceiling of 11,800 ft (3,600 m).

System

Alternative Designation: IAI Searcher II, Searcher Mk II, Searcher II
Type of UAV: Unmanned Reconnaissance Drone
Manufacturer: IAI
In Service: 1998-Present
Primary Function: Long Endurance Reconnaissance Drone
Day/Night Capable: Yes
All Weather Capable: Yes
Ground Crew: 4 (external pilot, internal pilot, observer and commander)
Endurance: hours16
Launch System: Runway (Fully Automatic)
Recovery System: Runway (Fully Automatic)
Number of Hard Points: INA
Manned-Unmanned Teaming (MUM-T) Capable: No
Automatic Landing and Takeoff Capability: Yes, Automatic Takeoff and Landing (ATOL) systems
Electro-Optical and Infrared Sensors (EO/IR): Yes

Real-Time Imagery: Yes

Synthetic Aperture Radar (SAR): Available and would replace the Electro-Optical and Infrared Sensors (EO/IR)

SAR/GMTI Capable: Yes

SIG/INT Capable: Yes

EO/IR Capable: Yes

Note #1: The IAI Searcher Mk II is built from composite materials to reduce radar detection

Dimensions

Length: m5.15

Width (Wing Span): m7.22

Height: m1.16

Weight, Payload: kg91

Weight, Maximum Takeoff: kg377

Automotive

Engine Name: AR 682 rotary engine

Engine Type: 1 x flat-twin, 2-stroke AR 682 rotary engine

Engine Power: hpINA

Endurance: hours20

Propeller: driving 2-blade pusher propeller

Fuel: liters130

Maximum Speed: km/h104

Dash Speed: km/h185

Cruise Speed: km/h111

Ceiling: m5,639

Endurance: hours16

Maximum Range: km300

Communications

Line of Sight Radio (UAV & Ground Crew): Direct Line-of-Sight (LOS) data link

Beyond Line of Sight Radio (UAV & Ground Crew): UAV airborne data relay for beyond LOS missions & Ground-based data relay for beyond LOS missions

Note: In the event of communications via datalink are lost the air vehicle will return automatically to its base.

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

EW: No

EW Counter Measures / CCM: No

Counter Measures (Chaffs/Flares): No

Notes:

The Searcher is a multi mission tactical Unmanned Air System (UAS) used for surveillance, reconnaissance, target acquisition, artillery adjustment and damage assessment and developed by IAI in the 1990s. It was designed to meet present and future requirements for Unmanned Aerial Vehicles (UAVs) in support of the Israel Air Force as well as export customers. The air vehicle design provides excellent engine and aerodynamics performance and handling qualities while the ground control station was designed to provide compatibility with other UAV systems produced by Israel. So far the Searcher family includes the Mk I, Mk II and Mk III models.

Hermes 900 Israeli Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Hermes 900, attack version:** An attack version of Hermes 900 may be possible. Each wing has two external hardpoints similar to the weaponized Hermes 450. The Mikholit, Israeli 10km variant of Nimrod long-range missile, is designed for launch from the Hermes 450.

System

Alternative designations: INA
Ground Crew: 2
Engine: 105hp gasoline Rotax 914 turbocharged engine
Propulsion: 3 blade pusher propeller
Maximum (level): km/h222
Cruising Speed: km/h130-175
Endurance: hrs36
Max Ceiling, normal: m30,000
Ceiling, Service: m9,100
Radius of Operation: km1,000
Launch Method: Wheeled take-off
Recovery Method: Conventional landing
Landing Method: 3-wheeled, retractable landing gear. independent take-off and landing
Flight Control Method: Preprogrammed/in-flight reprogram. Secure redundant Line of Sight data link and redundant satellite communications beyond line of sight
Flight Control: Ground control station vehicle. can control two Hermes simultaneously

Dimensions

Wing Span: m15.3
Overall Length: m6.1
Overall Height: m2.36

Take-off Weight: kg970

Payload: kg300

Launch and Recovery

Landing Method: Conventional landing

Launch Method: Wheeled take-off

Recovery/Landing Method: 3-wheeled, retractable landing gear.

Wind speed at launch: INA

Payload Types

↳*Gabbiano T200 - Synthetic Aperture Radar*

Description: Long range surveillance radar, x band (8-12.5 GHz), 407km maritime range, MTI and SAr, >200 target Track-While Scan (TWS)

Moving Target Indication: Yes

↳*DSP-1 Electro Optical Camera*

Description: Camera

Detection Range: km25

Recognition Range: km10

Swath: ha400

FLIR Enabled: Yes

Laser Designator: Yes

↳*Tadiran SKYFIX / SKYJAM EW Payload*

Intecept Freq. range: MHz20 - 500

Direction Finding Freq. Range: MHz1.5 - 1000

Jammer Freq. Range: MHz20 - 500

↳*Emerald AES-210V*

Description: ELINT

↳*Elop DCoMPASS*

Description: Digital compact multi-purpose advanced stabilized system. Stabilized turret incorporating thermal imager, color TV, dual-band laser designator rangefinder, inertial measurement unit and laser spot tracker

Survivability / Countermeasures

Description: Light composite structure, low radar signature

Notes:

The Elbit Systems Hermes 900 Kochav (Star) is an Israeli medium-size, multi-payload, medium-altitude long-endurance

unmanned aerial vehicle (UAV) designed for tactical missions. It is a sequel to the Hermes 450 series of drones, one of the most widely used military drones in the world. It has an endurance of over 30 hours and can fly at a maximum altitude of 30,000 feet (9,100 m), with a primary mission of reconnaissance, surveillance and communications relay. The Hermes 900 has a wingspan of 15 m (49 ft) and weighs 970 kg (2,140 lb), with a payload capability of 300 kg (660 lb). Payload options include electro-optical/infrared sensors, synthetic-aperture radar/ground-moving target indication, communications and electronic intelligence, electronic warfare, and hyperspectral sensors.

Wing Loong I Chinese Medium-Altitude Long Endurance (MALE) Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Pterosaur I:** First member of Wing Loong series, with program of Wing Loong begun in May 2005. Maiden flight was completed in October 2007 and payload evaluation flight was completed a year later in October 2008. This first model of Wing Loong series lacked the bulge at the nose tip of the fuselage due to the lack of a satellite antenna, and while the English name used by the developer differed from later models, the Chinese name remains the same, and so is the name Wing Loong for the entire series. he lack of satellite antenna results in cheaper cost, with the reduction of the maximum control range around to 200 km.This model is no longer actively marketed when Pterodactyl I appeared, but is still available as a cheaper alternative up on potential customers' request.
- **Pterodactyl I:** Sky Saker is a derivative of Wing Loong developed by Norinco mainly intended for export. The Chinese name is Rui Ying, meaning Sharp Eagle, but the English name adopted by the developer is Sky Saker. Sky Saker / Rui Ying carries both a miniature synthetic aperture radar and an electro-optical pod to perform reconnaissance in both the visible light and radar spectra. The capability of Sky Saker / Rui Ying has been exaggerated by many Chinese internet sources claiming that it has both scout and strike capabilities at the same time, but this has been proven to the contrary. According to all info released by Norinco itself (as of 2015), the UAV can employ only a single capability at a time: when the UAV carries the reconnaissance payload, no weaponry is carried. Similarly, when weaponry is carried, the reconnaissance payload is absent.
- **SkySaker:** The Sky Saker is a derivative of Wing Loong developed by Norinco mainly intended for export. The Chinese name is Rui Ying, meaning Sharp Eagle, but the English name adopted by the developer is Sky Saker. Sky Saker / Rui Ying carries both a miniature synthetic aperture radar and an electro-optical pod to perform reconnaissance in both the visible light and radar spectra. The capability of Sky Saker / Rui Ying has been exaggerated by many Chinese internet sources claiming that it has both scout and strike capabilities at the same time, but this has been proven to the contrary. According to all info released by Norinco itself (as of 2015), the UAV can employ only a single capability at a time: when the UAV carries the reconnaissance payload, no weaponry is carried. Similarly, when weaponry is carried, the reconnaissance payload is absent.
- **WJ-1:** The first land attack version of Pterodactyl I, which is a weapon platform without the reconnaissance/targeting pod under the chin. The designation WJ stands for Wu-Zhuang Wu-Ren-Ji, meaning armed UAV. WJ-1 UAV made its public debut in November 2014 at the 10th Zhuhai Airshow along with its cousin GJ-1.
- **GJ-1:** Another land attack version of Pterodactyl I that combines the capabilities of both Pterodactyl I and WJ-1 so that it can identify and engage targets on its own. GJ-1 can be distinguished from both Pterodactyl I and WJ-1 in that GJ-1 has both the reconnaissance/targeting pod under the chin as well as hardpoints to carry weapons. The designation GJ stands for Gong-Ji Wu-Ren-Ji, meaning "attack UAV." GJ-1 UAV made its public debut in November 2014 at the 10th Zhuhai Airshow along with its cousin WJ-1.
- **Wing Loong II:** An upgraded variant of the Wing Loong, with provisions for up to twelve air-to-surface missiles. Officially entered service with the PLAAF in November 2018. Wing Loong II is known in PLAAF service as the Gongji-2 ('Attack 2' or GJ-2).
- **Wing Loong ID:** Upgraded variant of the Wing Loong I, with improved aerodynamics and engine enabling greater takeoff weight, service ceiling, and endurance. Other upgrades include both internal and external stores, as well as communications equipment. The variant launched in 2018 with Egypt being the first buyer of 32 systems. The variant achieved its first flight on 23 December 2018

System

Alternative Designation: Pterodactyl I., PLAAF refer to it as Gonji-1 (Attack-1)

Type UAV: Medium-Altitude Long-Endurance (MALE)

Expected out of Service Date: 2038

Manufacturer: Chengdu Aircraft Industry Group

Cost: Less than $:1 Million each

Primary Function: Surveillance and Aerial Reconnaissance Platform

Flight Control Method: Wireless Communication or by Pilot on the ground

Day/Night Capable: Yes

All Weather Capable: INA

Takeoff or Landing Limitations: 1 km Runway needed for Launch

Ground Crew: The ground control station features dedicated consoles for the pilot and weapon/sensors operators. Three workstations are provided, each one equipped with at least two joysticks and a couple of liquid-crystal displays.

Complete System Includes: Four air vehicles; a ground-control station; mission payloads; and an integrated logistic support system.

Ceiling, Maximum: m8,000

Ceiling, Minimum: mINA

Range: km4,000

Endurance: hours20

Data Transmit Distance: km200

Location Positioning System: GPS

Wing type: Fixed Mid-Mounted

Number of Hard Points: ea2

Launch System: Runway,(1 km Runway needed for Launch)

Takeoff Roll: m600

Manned-Unmanned Teaming (MUM-T) Capable: INA

Automatic Landing and Takeoff Capability: Yes

Recovery System: Runway

Landing Gear: Retractable tricycle landing gear, with two main wheels under the fuselage and a single wheel under the nose.

Landing Distance: m800

Proliferation: China: +100, Saudi Arabia: INA, Egypt: 3, Kazakhstan: 2, Pakistan:2 and the UAE: 5.

Dimensions

Length: m9.05

Height: m2.77

Width (Wing Span): m14

Gross Weight: kg1,100

Weight, Maximum Takeoff: kg1,540

Weight, Payload: kg200

Automotive

Engine Name: Rotax 914 Turbocharged Engine

Engine Type: Four-Stroke, Four-Cylinder, Horizontally Opposed Aircraft Engine

Engine Power: hp100

Number of Engines: ea1

Cruising Range: kmINA

Speed, Maximum: km/h280

Speed, Average: km/h222

Endurance: hour20

Payload: kg200

Propellers Type: 3-Blade

Communications

Radio: Satellite Communications Antenna

Encrypted Data Link: Yes

Armament & Ammunition

Air to Air Missiles: INA

Air to Ground Missiles: Yes, can carry the BA-7 air-to-ground missile, YZ-212 laser-guided bomb, YZ-102A anti-personnel bomb and 50-kilogram LS-6 miniature guided bomb.

Missile Type: BRM1, AKD-10

Bomb Type: FT-10, FT-9, FT-7, GB7, GB4

Armament Weight Total: kg1,000

Fire Control

Fire Control System Type: INA

Fire Control Radar: INA

Radar Type: Synthetic Aperture Radar

Notes:

The Chengdu Pterodactyl, also known as Wing Loong, is a Medium-Altitude Long-Endurance (MALE) unmanned aerial vehicle (UAV), developed by the Chengdu Aircraft Industry Group in the People's Republic of China. Intended for use as a surveillance and aerial reconnaissance platform, the Pterodactyl I is capable of being fitted with air-to-surface weapons for use in an unmanned combat aerial vehicle (UCAV) role. It is designed for intelligence, surveillance and reconnaissance missions. The air vehicle can also be equipped with weapons for strike operations and perform civil missions such as disaster assessment, meteorological and environmental protection. The system has been compared, at least in appearance, to the U.S. MQ-1 Predator. Based on official marketing material released by CADI, the Pterodactyl can carry the BA-7 air-to-ground missile, YZ-212 laser-guided bomb, YZ-102A anti-personnel bomb and 50-kilogram LS-6 miniature guided bomb.

Mirach 150 Italian Unmanned Aerial Vehicle (UAV)

Tiers:

1 **2** 3 4

System

Alternate Designation: Mirach 150

Type: Unmanned Aerial Vehicle

Manufacturer: Selex ES Finmeccanica (since 2016) Leonardo(since 2017)

Crew: None

Payload: 60 kg payload, ncluding Electro-optic/infrared (EO/IR) imagers, Signals intelligence (SIGINT) payloads, or Electronic countermeasure (ECM) payloads.

Launch Type: ground or air-launched

Recovery Type: recovered by parachute.

Dimensions

Length: 4.70 m

Wingspan: 2.10 m

Weight: 345 kg

Automotive

Engine Name: 1 × Microturbo TRS-18-1

Engine Type: INA

Engine Power: 1.5 kN (330 lbf) thrust

Maximum Speed: 855 km/h

Range: 380 km

Service Ceiling: 9,200 m

Endurance: 1 hour

Notes:

The Mirach 150 is a reconnaissance Unmanned aerial vehicle (UAV) developed in Italy in the 1990s. A turbojet-powered machine, it is apparently a derivative of the Mirach 100 series of targets, being of the same general size and also powered by a Microturbo TRS-18-1 turbojet. Meteor is now promoting a new derivative of the Meteor 150, named the Nibbio, for tactical reconnaissance and other missions. It has an operational radius of 380 kilometers (240 mi) and can carry a 60 kilogram (122

pound) payload, including Electro-optic/infrared (EO/IR) imagers, Signals intelligence (SIGINT) payloads, or Electronic countermeasure (ECM) payloads. It can be ground or air-launched, and is recovered by parachute.

Forposts Russian Reconnaissance Unmanned Aerial Vehicle (UAV)

Tiers:

Parent:

IAI Searcher Mk I Israeli Reconnaissance Unmanned Aerial Vehicle (UAV)

Variants:

- **Searcher Mk II:** The Mk II is the fourth in a line of UAVs that began development as the Scout (the Searcher was the third generation). The Searcher Mk II is slightly larger, measuring 19 ft 2 in (5.85 m) in height and 28 ft 1 in (8.55 m) in diameter; it has higher maximum takeoff weight and payload at 939 lb (426 kg) and 220 lb (100 kg), respectively. The main benefit of these updates is greater flight endurance at higher altitudes.
- **Searcher Mk III:** The most recent variant, the Mk III was launched in 2010 and has over twice the range of the Mk II with two more hours of endurance and a higher ceiling. It is equipped with a four-stroke silent engine, along with a maximum takeoff weight of 961 lb (436 kg) and higher maximum payload weights of 264 lb (120 kg). The Searcher Mk III has an aerial data relay capability for beyond line-of-sight operations. Two simultaneous automatic takeoff and landing systems improve safety.
- **Forpost:** This is the Russian designation for Searcher Mk II UAVs being produced domestically. According to the Urals Civil Aircraft Plant, which builds the systems, the Forpost has a flight endurance of 17.5 hours, maximum takeoff weight of 1,000 lb (454 kg) and a max payload of 130 lb (60 kg). The air vehicle has a top speed of 130 mi (210 kmh) and a ceiling of 11,800 ft (3,600 m).

System

Alternative Designation: Forpost, Outposts (with updated Russian electronics)
Type of UAV: Unmanned Reconnaissance Drone
Manufacturer: State Factory Russia
In Service: 2014-Present
Primary Function: Long Endurance Reconnaissance Drone
Day/Night Capable: Yes
All Weather Capable: Yes

Ground Crew: 4 (external pilot, internal pilot, observer and commander)

Endurance: hours17.5

Launch System: Runway (Fully Automatic)

Recovery System: Runway (Fully Automatic)

Number of Hard Points: INA

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: Yes, Automatic Takeoff and Landing (ATOL) systems

Electro-Optical and Infrared Sensors (EO/IR): Yes

Real-Time Imagery: Yes

Synthetic Aperture Radar (SAR): Available and would replace the Electro-Optical and Infrared Sensors (EO/IR)

SAR/GMTI Capable: Yes

SIG/INT Capable: Yes

EO/IR Capable: Yes

Dimensions

Length: m5.85

Width (Wing Span): m8.55

Height: m1.25

Weight, Empty: kg350

Weight, MTOE: kg500

Automotive

Engine Name: APD-85 engine

Engine Type: Gasoline

Engine Power: hp47

Endurance: hours17.5

Propeller: driving 2-blade pusher propeller

Fuel: liters130

Maximum Speed: km/h200

Dash Speed: km/h185

Cruise Speed: km/h111

Ceiling: m7

Endurance: hours17.5

Maximum Range: km400

Communications

Line of Sight Radio (UAV & Ground Crew): Direct Line-of-Sight (LOS) data link

Beyond Line of Sight Radio (UAV & Ground Crew): UAV airborne data relay for beyond LOS missions & Ground-based

data relay for beyond LOS missions

Note #1: The Russians have outfitted the Forposts with all new electronics such as the Outpost-R Intergerence-free radio line, which has increased the radious of the drone by 100 km.

Note #2: In the event of communications via datalink are lost the air vehicle will return automatically to its base.

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

EW: No

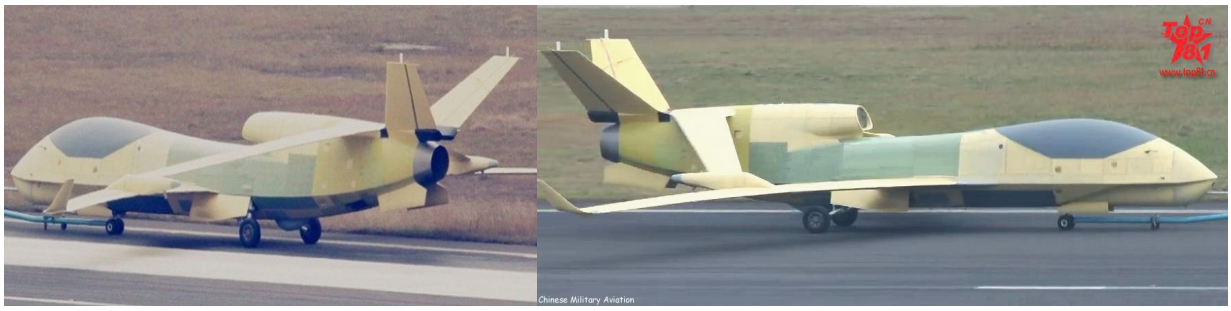
EW Counter Measures / CCM: No

Counter Measures (Chaffs/Flares): No

Notes:

This is the Russian designation for Searcher Mk II UAVs being produced domestically. According to the Urals Civil Aircraft Plant, which builds the systems, the Forpost has a flight endurance of 17.5 hours, maximum takeoff weight of 1,000 lb (454 kg) and a max payload of 130 lb (60 kg). The air vehicle has a top speed of 130 mi (210 kmh) and a ceiling of 11,800 ft (3,600 m).

EA-03 Soar Dragon Chinese High-Altitude Long-Endurance (HALE) Unmanned Aerial Vehicle



Tiers:

System

Alternate Designation: EA-03 Soar Dragon; Xianglong (Chinese for "Soar Dragon")

Type: High-Altitude Long-Endurance (HALE) Unmanned Aerial Vehicle

Manufacturer: Chengdu Aircraft Corp., Chengdu, China

Dimensions

Length: 13.7 m

Wingspan: 22.9 m

Maximum Takeoff Weight: 7,500 kg

Maximum Payload Weight: 650 kg

Automotive

Engine Name: INA

Engine Type: Turbofan or Turbojet

Engine Power: INA

Maximum Speed: 750 km/h

Maximum Distance: 7,040 km

Maximum Altitude: 18,300 m

Notes:

Xianglong/Flying Dragon HALE UAVThe "Xianglong" [Flying Dragon/Soar Dragon] automated observation airplane has a body plan fundamentally the same as the United States, "Worldwide Hawk" high-elevation long flight reconnaissance UAV. The fuselage tail is a dorsal balance furnished with composite motor compartment, the delta shape is semi-oval. The upper aspect of the nose is additionally an immense smoothed out rankle formed.

Shahed-129 Iranian Medium-Altitude Long-Endurance Unmanned Combat Aerial Vehicle (UCAV)

Tiers:

System

Alternative Designation: Shahed-129, S129

Type of UAV: Shahed-129 Iranian Medium-Altitude Long-Endurance Unmanned Combat Aerial Vehicle (UCAV)

Manufacturer: HESA

In Service: 2012-Present

Primary Function: Ground Attack; Reconnaissance (RECCE) Unmanned

Propellers: 3-bladed

Flight Control Method:

Day/Night Capable: Yes, a chin-mounted gimbal electro-optic/infrared sensor

All Weather Capable: Yes

Takeoff or Landing Limitations: INA

Ground Crew: Relies on a ground control station, the drone's reliance on a ground station severely circumscribes its effective range

Date Transmit Distance: km300-400

Location Positioning System: Yes

Launch System: Runway

Recovery System: Runway

Number of Hard Points: two twin hardpoints, for a total of up to four munitions

Manned-Unmanned Teaming (MUM-T) Capable: No

Automatic Landing and Takeoff Capability: INA

Landing Gear: Retractable

Payload Capacity: kg400

Stabilizers: V-tail vertical stabilizers

Combat Range: m1,700

Autopilot: Yes

Endurance: 24 hours

Note: similar to the MQ-1 Predator

Dimensions

Length: m8

Width (Wing Span): m16

Height: m3.1

Weight,: kg990

Weight, Payload: INA

Fuselage: 65–75 cm in diameter, and is fabricated from large panels of composite material with an aluminum alloy superstructure

Automotive

Engine Name: 1 × Rotax 914 four cylinder, four stroke aircraft engine

Engine Type: four stroke aircraft engine

Engine Power: hpINA

Cruising Range: km1,700

Speed, Maximum: INA

Speed, Average: km/h150

Ferry Range: km3,400

Endurance: hours24

Service Ceiling: m7,300

EW: INA

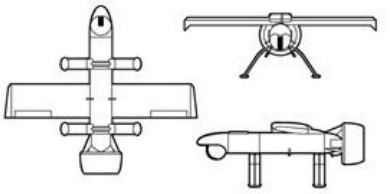
EW Counter Measures / CCM: INA

Counter Measures (Chaffs/Flares): INA

Notes:

The Shahed 129 is an Iranian single-engine medium-altitude long-endurance unmanned combat aerial vehicle (UCAV) designed by Shahed Aviation Industries for the Islamic Revolutionary Guard Corps (IRGC). The Shahed 129 is capable of combat and reconnaissance missions and has an endurance of 24 hours; it is similar in size, shape and role to the American MQ-1 Predator and is widely considered the most capable drone in Iranian service. Similar to the MQ-1 Predator

Shmel-1 (Bumblebee) Russian Close-Range Reconnaissance Unmanned Aerial Vehicle (UAV)



Tiers:

Variants:

- **Shmel-2:** The Shmel-2 is a civil version of the aircraft, with inverted-V tail on short booms in place of annular duct. Its planned missions: pipeline inspection, highway patrol, agricultural and fishery inspection, oceanological and environmental applications.

System

Alternate Designation: Shmel-1; YAK-061; NATO: Bumblebee
Type: Close-Range Reconnaissance Unmanned Aerial Vehicle (UAV)
Manufacturer: A.S. Yakovlev OKB, Moscow, Russia

Dimensions

Length: 2.78 m
Height: 1.10 m
Wingspan: 3.25 m
Maximum Takeoff Weight: 130 kg

Automotive

Engine Name: 1 x Samara/Trud (Kuznetsov) P-032 2-cyl

Engine Type: 2-Stroke Gasoline Engine

Engine Power: 32 hp

Maximum Speed: 180 km/h

Cruising Speed: 140 km/h

Maximum Ceiling: 3,000 m

Minimum Ceiling: 100 m

Range: 60 km

Endurance: 2 hours

Armament

Note: No Armament

Protection

Stealth Properties: None

Heat Signature Reduction: No

Add on Armor: INA

EW Counter Measures: No

Chaffs/Flares: No

Notes:

The Shmel (Bumblebee) has been the Russian army's primary close-range reconnaissance unmanned aerial vehicle (UAV). The Shmel has high mounted straight wings with turned-down tips and ailerons for roll control. A broad-chord ring enshrouds the pusher propeller and the rotable elevator and rudder. According to its manufacturer, the Shmel-1's annular channel ensures: *"an increase in the effective thrust of the propeller; *"an increase in the efficiency of the control surfaces by placing them in the propeller wash and retain efficiency in all flight conditions; *"an improvement in the acoustic characteristics of the propeller; and *"ground maintenance safety while the engine is running." The Shmel's transport/launcher/control vehicle is a tracked, fully amphibious, NBC (nuclear, biological and chemical) protected vehicle adapted from the BMD armored personnel carrier.

IAI Searcher Mk III Israeli Reconnaissance Unmanned Aerial Vehicle (UAV)

Tiers:

Parent:

IAI Searcher Mk I Israeli Reconnaissance Unmanned Aerial Vehicle (UAV)

Variants:

- **Searcher Mk II:** The Mk II is the fourth in a line of UAVs that began development as the Scout (the Searcher was the third generation). The Searcher Mk II is slightly larger, measuring 19 ft 2 in (5.85 m) in height and 28 ft 1 in (8.55 m) in diameter; it has higher maximum takeoff weight and payload at 939 lb (426 kg) and 220 lb (100 kg), respectively. The main benefit of these updates is greater flight endurance at higher altitudes.
- **Searcher Mk III:** The most recent variant, the Mk III was launched in 2010 and has over twice the range of the Mk II with two more hours of endurance and a higher ceiling. It is equipped with a four-stroke silent engine, along with a maximum takeoff weight of 961 lb (436 kg) and higher maximum payload weights of 264 lb (120 kg). The Searcher Mk III has an aerial data relay capability for beyond line-of-sight operations. Two simultaneous automatic takeoff and landing systems improve safety.
- **Forpost:** This is the Russian designation for Searcher Mk II UAVs being produced domestically. According to the Urals Civil Aircraft Plant, which builds the systems, the Forpost has a flight endurance of 17.5 hours, maximum takeoff weight of 1,000 lb (454 kg) and a max payload of 130 lb (60 kg). The air vehicle has a top speed of 130 mi (210 kmh) and a ceiling of 11,800 ft (3,600 m).

System

Alternative Designation: IAI Searcher III, Searcher Mk III, Searcher III

EW Counter Measures / CCM: No

Counter Measures (Chaffs/Flares): No

Electronic Support Measures /Electronic intelligence (ESM/ELINT): Yes

IFF Capable: Yes

Notes:

Searcher Mk III is a multi-mission tactical unmanned aerial system (UAS) used for surveillance, reconnaissance, target acquisition, artillery adjustment and damage assessment. The Searcher Mk III Unmanned Aerial System (UAS) is a compact system designed for use in military, law enforcement, and homeland security missions. The Searcher Mk III enables high quality real-time intelligence gathering and transmission while operating at a distance from the mission region.

Harpy Israeli Loitering Munition Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Cutlass:** This variant of the Harpy was evaluated in 1999 with Raytheon for search-and-destroy missions and the ability to attack a wider range of targets. It would have been a sea-launched weapon employing advanced sensors from Raytheon
- **Harop/Harpy 2:** This is a larger, upgraded variant. Designed as a fire-and-forget weapon, the Harop can fly more than 600 mi (1,000 km) to patrol a specific area and attack any hostile radars detected.
- **Harpy NG (new generation):** This is an upgraded variant that uses the Harop airframe. It was developed to counter newer air defense radar threats.
- **Mini-Harpy:** This tactical loitering munition combines the operating characteristics of the Harpy and Harop. It can lock onto radar and other emitting threats via person-in-the-loop electro-optical guidance. Fully autonomous operation is available as an option. It can attack emitting and non-emitting targets.
- **Maritime Harop:** This is a variant of the Harop optimized for operation from naval vessels, from patrol ships to frigates. It features a maritime-configured launcher and modified communications.
- **ASN-301:** This is a Chinese copy of the Harpy. It has a delta wing and pusher propeller configuration that appears virtually identical to the Israeli system. According to the China National Aero-Technology Import & Export Corp. (CATIC), the ASN-301 targets radar frequencies in the 2-16 GHz range and has a radar search range of 16 mi (25 km). The system is said to be able to target up to eight preset radar targets.

System

Alternate Designation: Harpy

Type: Unmanned Aerial Vehicle (UAV)

Manufacturer: Israel Aerospace Industries, Ben Gurion International Airport, Israel

Dimensions

Length: 2.10 m

Wingspan: 2.41 m

Takeoff Weight: 114 kg

Warhead Weight: 18 kg

Automotive

Engine Name: 1 x UEL AR731

Engine Type: Rotary Engine

Engine Power: 37 hp (28 kW)

Maximum Speed: 417 kph

Maximum Range: 500 km

Ceiling: 4,570 m

Endurance: 9 hours

Fire Control and Avionics

Communication Maximum Range: 200 km

Radar Name: INA

Radar Distance: INA

Radar Cross-Section: <0.5 sq m

Notes:

The IAI Harpy is a loitering munition produced by Israel Aerospace Industries. The Harpy is designed to attack radar systems and is optimised for the suppression of enemy air defence (SEAD) role. It carries a high explosive warhead. HARPY is a lethal UAV designed to detect, attack and destroy radar emitters. Harpy is a "Fire-and-Forget" all-weather, day/night autonomous weapon system, launched from a ground vehicle behind the battle zone or from ship based launchers. HARPY effectively suppresses hostile SAM and radar sites for long duration, by detecting, attacking and destroying radar targets with a very high hit accuracy. HARPY provides the most effective solution to the hostile radar problem, at the lowest price. HARPY is in production, is already operational with several nations Air Forces, and is currently available.

DP-12 Rhino American Autonomous Unmanned Helicopter

Tiers:

Variants:

- **DP-6XT Whisper:** This upgraded variant, the present production model, features a most payload of fifteen pound (7 kg). The air vehicle will operate in crosswinds of up to forty knots (74 kmh). The DP-6XT has associate degree endurance of half-hour with a 15-lb payload and a 60-minute endurance with a two.2 pound (1 kg) payload. It may be deployed in quarter-hour. Batteries may be recharged in quarter-hour or swapped in three minutes. The air vehicle may be bound to associate degree surface power supply for constant 24/7 operation. A 200-ft (60-m) tether is out there as associate degree possibility. The air vehicle will give a mobile impromptu Wi-Fi network or close-range stable representational process. The system may be operated by one person and offers easy waypoint navigation. Payload options embody external hardpoints; directional mike and speaker; electro-optical/infrared day or night detector with three-axis stabilization with a optical device illuminator; and a high-bandwidth encrypted communication link. The DP-6XT options exactness management through autonomous flight path programming; nap of the world flight even in complicated terrain; non-line-of-sight flight, together with in GPS-denied environments; autonomous operation; and a little profile.
- **DP-12 Rhino:** This is a bigger version designed to hold payloads of as much as a hundred and fifty lb (70 kg) over distances of as much as 350 mi (560 km). It can fly in crosswinds of as much as 30 knots (fifty six kmh). The unmanned helicopter has an persistence of approximately 1 hour with a a hundred and fifty-lb payload or three hours with a 32-lb (15-kg) payload. The air car functions more than one hardpoints forward, aft, to the edges and at the stomach to hold quite a few payloads. Typical payloads consist of cameras; artificial aperture radar; ultra-wideband radar; LIDAR; electro-optical/infrared sensors; magnetometers; ground-penetrating radar; mapping packages; acoustic and ultrasonic sensors; and steady verbal exchange relays and links. The DP-12 may be released in 5 mins if organized at the touchdown pad and the flight route is already programmed. It can release in 10 mins from a chilly begin and the flight route is programmed. Launch from a chilly begin takes approximately 15 mins if a brand new flight route need to be programmed.
- **DP-14 Hawk:** This is a heavy-raise variation designed for missions inclusive of air deliver to ahead working bases. It is designed to hold as much as 430 lb (195 kg) of payload in its 26 cu ft (0.7 cu m) of shipment area or outside hardpoints. It can reportedly fly for approximately 2.4 hours with a 430-lb payload or four.three hours with a 100-lb (45-kg) payload. The DP-14 can perform in crosswinds of as much as forty knots (seventy four kmh). The air automobile could be powered with the aid of using both an 87-hp Solar T62 engine or a 133-hp Microturbo eAPU turbine and is designed to apply both JP-five or JP-eight heavy fuel. The power plant could generate four.2 kW of strength for avionics and sensors. The DP-14 Hawk makes use of onboard LIDAR and superior algorithms to navigate in complex, restrained environments, inclusive of superior intelligence for course planning, path corrections, perception, impediment avoidance and touchdown-webweb page selection. These competencies permit the air automobile to fly intelligent, self sustaining, non-line-of-sight, nap-of-the-earth missions and dynamically adapt to adjustments in flight situations and terrain, in accordance to Dragonfly Pictures. The machine employs IMU and GPS for takeoff and touchdown and an ultrasonic

sensor as a rangefinder to decide peak from the floor at some point of touchdown. These sensors allow landings even in brownouts or different degraded visible environments. The air automobile may be ready with side-established pods for over-sized items. The unmanned helicopter functions 1 ms autopilot biking and fast pitch correction at some point of self sustaining shipment offloading, which permits precision airdrops with accuracy of higher than 10 ft (three m). It calls for a touchdown webweb page measuring approximately 60 ft (18 m) x 60 ft (18 m). All-terrain touchdown tools helps landings on choppy floor; slopes of up to fifteen degrees; and heaving deliver decks. A relative positioning machine lets in the DP-14 to self-release and self-get better on pitching ships with an eight-in (203-mm) round mistakes probable. The machine may be assembled, readied and released inside 30 minutes.

System

Alternate Designation: DP-12 Rhino

Type: Autonomous Unmanned Helicopter

Manufacturer: Dragonfly Pictures, Essington, Pa.

Dimensions

Length: 2.04 m

Width: 1.37 m

Height: 1.01 m

Total Weight: 180 kg

Payload Capacity: This is a larger variant designed to hold payloads of up to 150 lb (70 kg) over distances of up to 350 mi (560 km). It will fly in crosswinds of up to 30 knots (56 kmh).

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: INA

Maximum Speed: 207 km/h

Maximum Range: 560 km

Ceiling: INA

Climb Rate: 150 m/min

Endurance Payload 68 kg: 2.4 Hours

Endurance payload 14.6 kg: 4.3 Hours

Notes:

This is a bigger version of the DP-6, designed to hold payloads of as much as a hundred and fifty lb (70 kg) over distances of as much as 350 mi (560 km). It can fly in crosswinds of as much as 30 knots (56 km/h). The unmanned helicopter has an endurance of approximately 1 hour with a a 150-lb payload or three hours with a 32-lb (15-kg) payload. The air car functions more than one hardpoints forward, aft, to the edges and at the stomach to hold quite a few payloads. Typical payloads consist of cameras; artificial aperture radar; ultra-wideband radar; LIDAR; electro-optical/infrared sensors; magnetometers; ground-penetrating radar; mapping packages; acoustic and ultrasonic sensors; and steady verbal exchange relays and links. The DP-12 may be released in 5 mins if organized at the touchdown pad and the flight route is already programmed. It can release in 10 mins from a chilly begin and the flight route is programmed. Launch from a the ground begin takes approximately 15 mins if a brand new flight route need to be programmed.

Harop Israeli Loitering Munition Unmanned Aerial Vehicle (UAV)

Tiers:

System

Alternative Designation: The IAI Harop (or IAI Harpy 2)
Ground Crew: 3-4 (Est)
Engine Power: hp38
Propulsion: Rotary engine driving a 2-blade pusher propeller
Weight, Maximum Launch: kg135
Maximum Speed (level): km/hINA
Cruising Speed: km/h185
Endurance: hours6
Max Ceiling, normal: mINA
Wing Span: m3
Length, Overall: m2.5
Height, Overall: m.3
Flight Control:: Mission Control Shelter (MCS) controls vehicle with a “man-in-the-loop” able to engage or abort the attack in real time. In event of an abort, reverts to loiter mode until attack is restarted.
Lanch Method:: Solid-propellant booster rocket from ground-based storage container
Recovery / Landing Method:: Intentionally expendable, non-recoverable
Launcher Trucks per Battery: INA
Missiles per Launcher: 12
Total Missiles per Battery: INA
Ceiling, Services: m3,000
Range: km1,000

Payload

Passive Rada Seeker Sensor: Wide range of frequencies
Electro Optical: Color CCD, FLIR (IAI Tamam POF-200)

User Image Capabilities: Images recieved via satcom datalink.

Missile: HE-Frag warhead

Max Payload with Warhead: kg23

Notes:

The IAI Harop (or IAI Harpy 2) is a loitering munition developed by the MBT division of Israel Aerospace Industries. It is an anti-radiation drone that can autonomously home in on radio emissions. Rather than holding a separate high-explosive warhead, the drone itself is the main munition. This SEAD-optimised loitering munition is designed to loiter the battlefield and attack targets by self-destructing into them. The drone can either operate fully autonomously, using its anti-radar homing system, or it can take a human-in-the-loop mode. If a target is not engaged, the drone will return and land itself back at base. It has been designed to minimize its radar-signature through stealth (low-observability). This anti-radiation drone is designed to target enemy air-defense systems in a first line of attack, as the small drone (with its small radar cross-section) can evade SAMs and radar detection systems which are designed to target much larger aircraft or to intercept fixed-trajectory missiles. The IAI Harop has a loiter (flying) time of 6 hours and a range of 1000 km both ways. It is a larger version of the IAI Harpy and is launched from ground- or sea-based canisters, but can be adapted for air-launch.The Harop can either operate fully autonomously, or it can take a man-in-the-loop mode, being controlled by a remote operator.The Harop features two guidance modes: it can either home in on radio emissions by itself with its anti-radar homing system, or the operator can select static or moving targets detected by the aircraft's electro-optical sensor. This latter mode allows the Harop to attack radars that are presently shut down and therefore not providing emissions for the aircraft to automatically home in on. If a target is not engaged, the drone will return and land itself back at base. The small drone (with a Radar Cross Section similar to a large bird) can evade SAMs and radar detection systems which are designed to target much larger aircraft or to intercept fixed-trajectory missiles. IAI is developing a smaller version of the Harop for smaller applications, which was unveiled in 2015. The smaller Harop would be one-fifth the size and have a lighter 3–4 kg (6.6–8.8 lb) warhead. It will be cheaper and have a shorter endurance of 2–3 hours to be used tactically against time-critical targets or ones that hide and re-appear

IAI Searcher Mk I Israeli Reconnaissance Unmanned Aerial Vehicle (UAV)

Tiers:

Variants:

- **Searcher Mk II:** The Mk II is the fourth in a line of UAVs that began development as the Scout (the Searcher was the third generation). The Searcher Mk II is slightly larger, measuring 19 ft 2 in (5.85 m) in height and 28 ft 1 in (8.55 m) in diameter; it has higher maximum takeoff weight and payload at 939 lb (426 kg) and 220 lb (100 kg), respectively. The main benefit of these updates is greater flight endurance at higher altitudes.
- **Searcher Mk III:** The most recent variant, the Mk III was launched in 2010 and has over twice the range of the Mk II with two more hours of endurance and a higher ceiling. It is equipped with a four-stroke silent engine, along with a maximum takeoff weight of 961 lb (436 kg) and higher maximum payload weights of 264 lb (120 kg). The Searcher Mk III has an aerial data relay capability for beyond line-of-sight operations. Two simultaneous automatic takeoff and landing systems improve safety.
- **Forpost:** This is the Russian designation for Searcher Mk II UAVs being produced domestically. According to the Urals Civil Aircraft Plant, which builds the systems, the Forpost has a flight endurance of 17.5 hours, maximum takeoff weight of 1,000 lb (454 kg) and a max payload of 130 lb (60 kg). The air vehicle has a top speed of 130 mi (210 kmh) and a ceiling of 11,800 ft (3,600 m).

System

Alternative Designation: IAI Searcher, Searcher Mk I, Searcher I
Type of UAV: Unmanned Reconnaissance Drone
Manufacturer: IAI
In Service: 1992-Present
Primary Function: Long Endurance Reconnaissance Drone
Day/Night Capable: Yes
All Weather Capable: Yes
Ground Crew: 4 (external pilot, internal pilot, observer and commander)
Endurance: hours24
Launch System: Runway (Fully Automatic)
Recovery System: Runway (Fully Automatic)
Number of Hard Points: INA
Manned-Unmanned Teaming (MUM-T) Capable: No
Automatic Landing and Takeoff Capability: Yes, Automatic Takeoff and Landing (ATOL) systems
Electro-Optical and Infrared Sensors (EO/IR): Yes

Real-Time Imagery: Yes

Synthetic Aperture Radar (SAR): Available and would replace the Electro-Optical and Infrared Sensors (EO/IR)

SAR/GMTI Capable: INA

SIG/INT Capable: Yes

EO/IR Capable: Yes

Fuselage: Composite

Gyro-Stabilized TV Camera: Yes

Note #1: The IAI Searcher Mk II is built from composite materials to reduce radar detection

Dimensions

Length: m5.85

Width (Wing Span): m8.54

Height: m1.25

Weight, Empty: kg350

Weight, MTOE: kg500

Automotive

Engine Name: Limbach L550 Engine

Engine Type: 1 X Limbach L550 Engine

Engine Power: hp47

Endurance: hours24

Propeller: driving 2-blade pusher propeller

Fuel: liters130

Maximum Speed: km/h200

Dash Speed: km/h185

Cruise Speed: km/h111

Ceiling: m6,100

Endurance: hours16

Maximum Range: km300

Payload: kg65

Communications

Line of Sight Radio (UAV & Ground Crew): Direct Line-of-Sight (LOS) data link

Beyond Line of Sight Radio (UAV & Ground Crew): UAV airborne data relay for beyond LOS missions & Ground-based data relay for beyond LOS missions

Note: In the event of communications via datalink are lost the air vehicle will return automatically to its base.

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

EW: Yes

EW Counter Measures / CCM: No

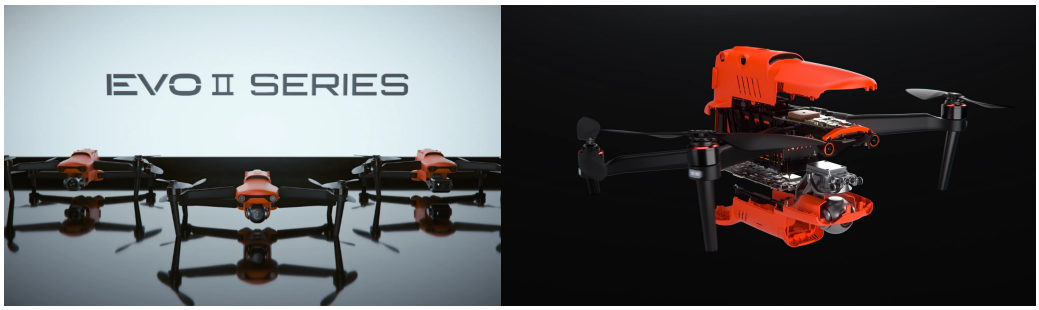
Counter Measures (Chaffs/Flares): No

Notes:

The Searcher is a multi mission tactical Unmanned Air System (UAS) used for surveillance, reconnaissance, target acquisition, artillery adjustment and damage assessment and developed by IAI in the 1990s. It was designed to meet present and future requirements for Unmanned Aerial Vehicles (UAVs) in support of the Israel Air Force as well as export customers. The air vehicle design provides excellent engine and aerodynamics performance and handling qualities while the ground control station was designed to provide compatibility with other UAV systems produced by Israel. So far the Searcher family includes the Mk I, Mk II and Mk III models. The Searcher looks almost identical to the Scout and Pioneer, but is in fact scaled up and is well over twice the size of the Scout. The Searcher is powered by a 35 kW (47 hp) piston engine. The new design features updated avionics and sensor systems with greater flight endurance as well as increased redundancy for improved survivability. In addition to Israel, the system had been exported and is currently in use by Russia, India, South Korea, Sri Lanka, Singapore, Thailand and Turkey

→Remote Controlled Aircraft

Evo II American Remote Controlled Quadcopter



Tiers:

Variants:

- **Evo I:** The Evolution of flight has arrived. EVO is a compact folding unit designed to go wherever your adventure takes you. Equipped on the front EVO offers a powerful camera on a 3-axis stabilize gimbal that records video at 4k resolution up to 60 frames per second and a recording speed up to 100mbps in an H.264 or H.265 codec. Using real-glass optics EVO captures stunning photos at 12 megapixels with a wide dynamic range for more details and color. Integrated advanced computer vision systems provide forward obstacle avoidance, rear obstacle detection and bottom sensors for more accurate landings and stable indoor flights. EVO boasts flight times up to 30 minutes with a range of 4.3 miles (7KM). Additionally, EVO offers failsafe features letting you know when the battery is low and it's time to return to home. EVO includes a remote controller which houses a 3.3-inch OLED screen providing you with critical flight information or a live 720p HD video feed letting you see the camera view without the need for a mobile device.

System

Alternate Designation: EVO II
Type: Remote Controlled Quadcopter
Manufacturer: Autel Robotics
Vision System: Downward, Forward, Backward, Left, Right
Obstacle Sensory Range: 1.6 to 131.2' / 0.5 to 40.0 m
Forward Field of View: 60° (Horizontal) 80° (Vertical)
Backward Field of View: 60° (Horizontal) 80° (Vertical)
Operating Frequency: 2.4 GHz
Maximum Operating Distance: 5.59 Miles / 9 km at 2.4 G
Battery Chemistry: Lithium-Ion Polymer (LiPo)
Battery Capacity: 5000 mAh
Built-In Display Size: 3.3"
Photo Resolution: 4:3: 8000 x 6000
Video Format: 7680 x 4320 (MP4/MOV via H.264/AVC, H.265/HEVC)
Recording Media: SD (up to 128 GB)

Dimensions

Length: INA
Width: INA
Height: INA
Weight: 2.62 lb / 1192 g

Automotive

Engine Name: INA
Engine Type: INA
Number of Rotors: 4
Engine Power: INA
Maximum Horizontal Speed: 44.8 mph / 20 m/s
Flight Ceiling: 4.35 Miles / 7000 m
Maximum Flight Time: 40 Minutes
Maximum Hover Time: 35 Minutes
Number of Axes: 3 (Pitch, Roll, Yaw)

Notes:

Experience the current leading edge of video resolution with the EVO II 8K Drone from Autel. With an 8K camera payload, the EVO II 8K can capture video at up to 7680 x 4320 resolution (8000 x 6000 stills). This lets you make prints up to 100" wide, punch in, crop, and scale images with great detail, and capture stunning hi-res screenshots from your footage. The EVO II drone provides hi-end specifications and abilities well beyond videography and photography. The 7100mAh battery lets it fly for up to 40 minutes at a time, the motors can fly in Ludicrous Speed mode at up to 44.8 mph, and you can transmit HD footage back to the controller's 3.3" OLED screen from up to 5.6 miles away. While flying and tracking, 12-sensor omnidirectional obstacle avoidance is coupled with a dual-core processor and AI machine learning to let the EVO II navigate itself around the environment safely, while still getting the shot. Additional Features *Remote controller with 3.3" OLED screen *Capture 48MP hi-res stills *Record HDR video at up to Ultra HD 4K resolution *Get a clear image with phase detection autofocus *Capture action in dramatic 120 fps slow motion at up to 2K resolution *4x lossless in-camera zoom *Support for 10-bit A-LOG *Defogging mode *Foldable design for a compact and ultra-portable form factor *Battlock system to help prevent accidental battery ejections during hard maneuvers and landings *Radar feature for more environmental information while manually piloting with avoidance turned off

AIM-9 Sidewinder American Short-Range Air-to-Air Missile

Tiers:

Variants:

- **AIM-9C:** As a Semi-Active Radar Homing (SARH) missile, the AIM-9C could be used from the frontal aspect of the target, provided a radar lock of sufficient quality was obtained.
- **AIM-9L:** The next major advance in IR Sidewinder development was the AIM-9L ("Lima") model which was in full production in 1977. This was the first "all-aspect" Sidewinder with the ability to attack from all directions, including head-on, which had a dramatic effect on close-in combat tactics. Its first combat use was by a pair of US Navy F-14s in the Gulf of Sidra in 1981 versus two Libyan Su-22 Fighters, both of the latter being destroyed by AIM-9Ls. Its first use in a large-scale conflict was by the United Kingdom during the 1982 Falklands War. In this campaign the "Lima" reportedly achieved kills from 80% of launches, a dramatic improvement over the 10–15% levels of earlier versions, scoring 17 kills and 2 shared kills against Argentine aircraft.
- **AIM-9M:** The subsequent AIM-9M ("Mike") has the all-aspect capability of the L model while providing all-around higher performance. The M model has improved capability against infrared countermeasures, enhanced background discrimination capability, and a reduced-smoke rocket motor. These modifications increase its ability to locate and lock-on to a target and decrease the chance of missile detection. Deliveries of the initial AIM-9M-1 began in 1982. The only changes from the AIM-9L to the AIM-9M were related to the Guidance Control Section (GCS). Several models were introduced in pairs with even numbers designating Navy versions and odd for USAF: AIM-9M-2/3, AIM-9M-4/5, and AIM-9M-6/7 which was rushed to the Persian Gulf area during Operation Desert Shield (1991) to address specific threats expected to be present.
- **AIM-9R:** The Navy began development of AIM-9R, a Sidewinder seeker upgrade in 1987 that featured a focal-plane array (FPA) seeker using video-camera type charge-coupled device (CCD) detectors and featuring increased off-boresight capability. The technology at the time was restricted to visual (daylight) use only and the USAF did not agree on this requirement, preferring another technology path. AIM-9R reached flight test stage before it was cancelled and subsequently both services agreed to a joint development of the AIM-9X variant.
- **BOA/Boxoffice:** China Lake developed an improved compressed carriage control configuration titled BOA. ("Compressed carriage" missiles have smaller control surfaces to allow more missiles to fit in a given space. The surfaces may be permanently "clipped", or may fold out when the missile is launched.) The BOA design reduced size of control surfaces, eliminating the rollerons, and returned to simple forward-canard design. Although the Navy and Air Force had jointly developed and procured AIM-9L/M, BOA was a Navy-only effort supported by internal China Lake Independent Research & Development (IR&D) funding. Meanwhile, the Air Force was pursuing a parallel effort to develop a compressed carriage version of Sidewinder, called Boxoffice, for the F-22. The Joint Chiefs of Staff directed that the services collaborate on AIM-9X, which ended these separate efforts. The results of BOA and Boxoffice were provided to the industry teams competing for AIM-9X, and elements of both can be found in the AIM-9X design.
- **AIM-9X:** After looking at advanced short range missile designs during the AIM portion of the ACEVAL/AIMVAL Joint Test and Evaluation at Nellis AFB in the 1974–78 timeframe, the Air Force and Navy agreed on the need for the Advanced Medium Range Air-to-Air Missile AMRAAM. However, agreement over development of an Advanced Short Range Air-to-

Air Missile ASRAAM was problematic and disagreement between the Air Force and Navy over design concepts (Air Force had developed AIM-82 and Navy had flight-tested Agile and flown it in AIMVAL). Congress eventually insisted the services work on a joint effort resulting in the AIM-9M, thereby compromising without exploring the improved off boresight and kinematic capability potential offered by Agile. In 1985, the Soviet Union did field a short range missile (SRM) (AA-11 Archer/R-73) that was very similar to Agile. At that point, the Soviet Union took the lead in SRM technology and correspondingly fielded improved infrared countermeasures (IRCM) to defeat or reduce the effectiveness of the latest Sidewinders. With the reunification of Germany and improved relations in the aftermath of the Soviet Union, the West became aware of how potent both the AA-11 and IRCM were and SRM requirements were readdressed.

- **Block II:** Testing work on the AIM-9X Block II version began in September 2008. The Block II adds Lock-on After Launch capability with a datalink, so the missile can be launched first and then directed to its target afterwards by an aircraft with the proper equipment for 360 degree engagements, such as the F-35 and F-22. By January 2013, the AIM-9X Block II was about halfway through its operational testing and performing better than expected. NAVAIR reported that the missile was exceeding performance requirements in all areas, including lock-on after launch (LOAL). One area where the Block II needs improvement is helmetless high off-boresight (HHOBS) performance. It is functioning well on the missile, but performance is below that of the Block I AIM-9X. The HHOBS deficiency does not impact any other Block II capabilities, and is planned to be improved upon by a software clean-up build. Objectives of the operational test were due to be completed by the third quarter of 2013. However, as of May 2014 there have been plans to resume operational testing and evaluation (including surface-to-air missile system compatibility). As of June 2013, Raytheon has delivered 5,000 AIM-9X missiles to the armed services.
- **Block III:** In September 2012, Raytheon was ordered to continue developing the Sidewinder into a Block III variant, even though the Block II had not yet entered service. The USN projected that the new missile would have a 60 percent longer range, modern components to replace old ones, and an insensitive munitions warhead, which is more stable and less likely to detonate by accident, making it safer for ground crews. The need for the AIM-9 to have an increased range was from digital radio frequency memory (DRFM) jammers that can blind the onboard radar of an AIM-120D AMRAAM, so the Sidewinder Block III's passive imaging infrared homing guidance system was a useful alternative. Although it could supplement the AMRAAM for beyond visual range (BVR) engagements, it would still be capable at performing within visual range (WVR). Modifying the AIM-9X was seen as a cost-effective alternative to developing a new missile in a time of declining budgets. To achieve the range increase, the rocket motor would have a combination of increased performance and missile power management. The Block III would "leverage" the Block II's guidance unit and electronics, including the AMRAAM-derived datalink.

AIM-9 Sidewinder Missile

↳***System***

Name: AIM-9 Sidewinder
Type: Short-Range Air-to-Air Missile
Basic Load: INA
Length: 3.02 m
Diameter: 127.0 mm
Warhead: WDU-17/B annular blast-frag
Warhead Weight: 9.4 kg
Detonation mechanism: IR proximity fuze
Engine: Hercules/Bermite Mk. 36 Solid-fuel rocket
Wingspan: 279.4 mm
Operational Range: 1.0 to 35.4 km
Speed: Mach 2.5+
Guidance System: Infrared homing (most models) semi-active radar homing (AIM-9C)
Launch Platform: Aircraft, naval vessels, fixed launchers, and ground vehicles

System

:

:

:

Notes:

The AIM-9 Sidewinder is a short-range air-to-air missile which entered service with the US Navy in 1956 and subsequently was adopted by the US Air Force in 1964. Since then the Sidewinder has proved to be an enduring international success, and its latest variants are still standard equipment in most western-aligned air forces. The Soviet K-13, a reverse-engineered copy of the AIM-9, was also widely adopted by a number of nations. Low-level development started in the late 1940s, emerging in the early 1950s as a guidance system for the modular Zuni rocket. This modularity allowed for the introduction of newer seekers and rocket motors, including the AIM-9C variant, which used semi-active radar homing and served as the basis of the AGM-122 Sidearm anti-radar missile. Originally a tail-chasing system, early models saw extensive use during the Vietnam War but had a low success rate. This led to all-aspect capabilities in the L version which proved to be an extremely effective weapon during combat in the Falklands War and the Operation Mole Cricket 19 ("Bekaa Valley Turkey Shoot") in Lebanon. Its adaptability has kept it in service over newer designs like the AIM-95 Agile and SRAAM that were intended to replace it. The Sidewinder is the most widely used air-to-air missile in the West, with more than 110,000 missiles produced for the U.S. and 27 other nations, of which perhaps one percent have been used in combat. It has been built under license by some other nations including Sweden, and can even equip helicopters, such as the Bell AH-1Z Viper. The AIM-9 is one of the oldest, least expensive, and most successful air-to-air missiles, with an estimated 270 aircraft kills in its history of use. When firing a Sidewinder, NATO pilots use the brevity code FOX-2 The United States Navy hosted a 50th-anniversary celebration for the Sidewinder in 2002. Boeing won a contract in March 2010 to support Sidewinder operations through to 2055, guaranteeing that the weapons system will remain in operation until at least that date. Air Force Spokeswoman Stephanie Powell noted that due to its relatively low cost, versatility, and reliability it is "very possible that the Sidewinder will remain in Air Force inventories through the late 21st century". The AIM-9 is made up of a number of different components manufactured by different companies, including Aerojet and Raytheon. The missile is divided into four main sections: guidance, target detector, warhead, and rocket motor. The guidance and control unit (GCU) contains most of the electronics and mechanics that enable the missile to function. At the very front is the IR seeker head utilizing the rotating reticle, mirror, and five CdS cells or "pan and scan" staring array (AIM-9X), electric motor, and armature, all protruding into a glass dome. Directly behind this are the electronics that gather data, interpret signals, and generate the control signals that steer the missile. An umbilical on the side of the GCU attaches to the launcher, which detaches from the missile at launch. To cool the seeker head, a 5,000 psi (34 MPa) argon bottle (TMU-72/B or A/B) is carried internally in Air Force AIM-9L/M variants, while the Navy uses a rail-mounted nitrogen bottle. The AIM-9X model contains a Stirling cryo-engine to cool the seeker elements. Two electric servos power the canards to steer the missile (except AIM-9X). At the back of the GCU is a gas grain generator or thermal battery (AIM-9X) to provide electrical power. The AIM-9X features high off-boresight capability; together with JHMCS (Joint Helmet-Mounted Cueing System), this missile is capable of locking on to a target that is in its field of regard said to be up to 90 degrees off boresight. The AIM-9X has several unique design features including built-in test to aid in maintenance and reliability, an electronic safe and arm device, an additional digital umbilical similar to the AMRAAM and jet vane control. Next is a target detector with four IR emitters and detectors that detect whether the target is moving farther away. When it detects this action taking place, it sends a signal to the warhead safe and arm device to detonate the warhead. Versions older than the AIM-9L featured an influence fuze that relied on the target's magnetic field as input. Current trends in shielded wires and non-magnetic metals in aircraft construction rendered this obsolete. The AIM-9H model contained a 25 lb (11 kg) expanding rod-blast fragmentary warhead. All other models up to the AIM-9M contained a 22 lb (10.0 kg) annular-blast fragmentary warhead. The missile's warhead rods can break rotor blades (an immediately fatal event for any helicopter). Recent models of the AIM-9 are configured with an annular-blast fragmentation warhead, the WDU-17B by Argotech Corporation. The case is made from spirally wound spring steel filled with 8 lb (3.6 kg) of PBXN-3 explosive. The warhead features a safe/arm device requiring five seconds at 20 g (~200 m/s^2) acceleration before the fuze is armed, giving a minimum range of approximately 2.5 km (1.6 mi). The Mk36 solid-propellant rocket motor provides propulsion for the missile. A reduced-smoke propellant makes it difficult for a target to see and avoid the missile. This section also features the launch lugs used to hold the missile to the rail of the missile launcher. The forward of the three lugs has two contact buttons that electrically activate the motor igniter. The fins provide stability from an aerodynamic point of view, but it is the "rollerons" at the end of the wings providing gyroscopic precession to free-hinging control surfaces in the tail that prevent the missile from spinning in flight. The wings and fins of the AIM-9X are much smaller and control surfaces are reversed from earlier Sidewinders with the control section located in the rear, while the wings up front provide stability. The AIM-9X also features vectored thrust or jet vane control to increase maneuverability and accuracy, with four vanes inside the exhaust that move as the fins move. The last upgrade to the missile motor on the AIM-9X is the addition of a wire harness that allows communication between the guidance section and the control section, as well as a new 1760 bus to connect the guidance section with the launcher's digital umbilical.

PL-7 Chinese Air-to-Air Infrared Homing Missile

↳ ***PL-7 Air-to-Air Missile***

Name: PL-7
Type: Air-to-Air Missile
Manufacturer: Factory 331 (Zhuzhou Aeroengine factory)
Length: 2.74 m
Diameter: 157 mm
Wingspan: 0.66 m
Weight: 89 kg
Warhead: 12.5 kg
Speed: Mach 2.5
Range: 0.5 to 14 km
Guidance: Infrared homing

Notes:

The PL-7 (Chinese: □□-7; pinyin: Pī Lì-7; literally: 'Thunderbolt-7') is the PRC version of the French Magic R.550 air-to-air missile. It is a short-range, Infrared homing missile used by Chinese fighters. It was designed by Wu Shendao, and produced at the Factory 331 (Zhuzhou Aeroengine factory).

R-60 (AA-8 Aphid) Russian Short-Range Infrared Homing Air-to-Air Missile

Tiers:

1 2 **3** 4

System

:
:
:

↳*R-60 Infrared Homing Air-to-Air Missile*

Name: R-60
Type: Infrared Homing Air-to-Air Missile
Manufacturer: Vympel
Length: 2,090 mm
Diameter: 120 mm
Wingspan: 390 mm
Warhead: 3 kg
Detonation mechanism: proximity
Operational Range: 8 km
Flight Altitude: 20,000 m
Maximum Speed: Mach 2.7
Guidance System: Infrared homing

Notes:

The Molniya (now Vympel) R-60 (NATO reporting name: AA-8 "Aphid") is a short-range lightweight infrared homing air-to-air missile designed for use by Soviet fighter aircraft. It has been widely exported, and remains in service with the CIS and many other nations. The R-60 was initially developed for the MiG-23. Work began on the weapon, under the bureau designation K-60 (izdeliye 62), in the late 1960s. Series production began in 1973. It entered service with the designation R-60 (NATO reporting name "Aphid-A"). When introduced, the R-60 was one of the world's lightest air-to-air missiles, with a launch weight of 44 kg (97 lb). It has infrared guidance, with an uncooled Komar (Mosquito) seeker head. Control is by forward rudders with large rear fins. The distinctive canards on the nose, known as "destabilizers," serve to improve the rudders' efficiency at high angles of attack. The R-60 uses a small, 3 kg (6.6 lb) tungsten expanding-rod surrounding a high explosive fragmentation warhead. Two different types of proximity fuze can be fitted: the standard Strizh (Swift) optical fuse, which can be replaced with a Kolibri active radar fuse. Missiles equipped with the latter fuse were designated R-60K.

Tiers:

Variants:

- **Aspide Mk.1:** Similar to AIM-7E, with Selenia monopulse semi-active seeker and SNIA-Viscosa solid-propellant rocket motor. This version was popular with export customers, and sold to 17 countries
- **Aspide Mk.2:** Improved version with active radar-homing seeker. Development was shelved in favor of better missiles, such as the AIM-120 AMRAAM.
- **Aspide 2000:** Surface-to-air version of the Aspide Mk.1, used on Italian Army Skyguard and Spada air-defense systems

Apside Air-to-Air Missile

↳*Missile*

Name: Apside
Type: Air-to-Air Missile
Length: 3.72 m
Diameter: 234 mm
Wingspan: 80 cm
Weight: 220 kg
Speed: 4520 km/h (mach 3.7)
Effective Firing Range: 25 km
Warhead: 35 kg warhead

Notes:

Aspide (the Italian name for the adder) is an Italian medium range air-to-air and surface-to-air missile produced by Selenia (now part of the Alenia consortium). It is provided with semi-active radar homing seeker. It is very similar to the American AIM-7 Sparrow, using the same airframe, but at the moment of its introduction, the Aspide was provided with monopulse guide instead of the conic scan, which made it more resistant to ECM and more precise. This innovation appeared on the Sparrows

only with the late AIM-7M version. Closed-loop hydraulics were also substituted for Sparrow's open-loop type, which gave Aspide better downrange maneuverability. This resemblance, and the fact that Selenia was provided with the technology know-how of the AIM-7 (around 1,000 of which it had produced under license), has generally led non-Italian press to refer to the Aspide as a Sparrow variant. However, the Aspide had original electronics and warhead, and a new and more powerful engine. Even the control surfaces are different, replacing the original triangular wings, fixed in the air-to-air and instead foldable in the surface-to-air version, to a newly designed common cropped delta fixed version. Aspide, in its various versions, was used both in the air-to-air role, carried by Aeritalia F-104s in the apposite versions F-104S and F-104ASA, and in the surface-to-air naval role. In the latter role it has been replaced by the MBDA Aster. Naval Aspide launchers can be adapted to fire the Sparrow by merely switching a single circuit board. In the mid 1980s, China imported a small batch of the Aspide Mk.1 from Italy, then signed an agreement with Alenia to produce the missile locally under license. In 1989, China produced its first batch of Aspide Mk.1 missiles using imported parts from Italy. However, due to the European Union arms embargo imposed after the Tiananmen Square incident, China was unable to purchase additional Aspide kits. China subsequently developed its own missile family based on the Aspide Mk.1, with surface to air versions designated as the LY-60, and an air-to-air version designated as PL-10. The rocket engine of the Aspide is produced by Turkish missile manufacturer Roketsan.

R-27ER (AA-10c) Russian Air-to-Air Missile

Tiers:

Variants:

- **R-27R/Alamo A:** This variant has semi-active radar guidance and a short-burn motor. It has a longer afterbody than other versions and a pointed nose. The 9B-1101K semi-active radar seeker has a lock-on range of 19 mi (30 km) against typical fighter targets and operates in J-band (10-20 GHz) with continuous wave monopulse systems. It has a look angle of +/-50 deg off boresight. The seeker weighs 74 lb (33.5 kg).
- **R-27T/Alamo B:** This version features IR guidance and a short-burn motor. The missile has a cylindrical body, blunt nose, tapered nozzle and a cruciform antenna. There are "ears" forward of the fixed cruciform inverse-tapered foreplanes. "Cropped delta" tail fins are located aft. The R-27T is equipped with a 36T infrared seeker.
- **R-27ER/Alamo C:** The R-27ER missile features semi-active radar guidance and a long-burn motor.
- **R-27ET/Alamo D:** This infrared guided variant has a long-burn motor. It was first seen by Western observers at an August 1989 Soviet air show. The R-27ET features an improved seeker compared to the R-27T with improved protection against IR countermeasures and better performance against low-flying cruise missiles. The seeker has a look angle of +/-55 deg off boresight.
- **R-27AE/R-27A/R-27EA/Alamo E:** This variant has active-radar homing and a long-burn motor. At the 1992 Farnborough Air Show, an R-27AE active-radar variant was unveiled that used the seeker developed by Agat for the R-77 (AA-12 Adder). Weighing 32 lb (15 kg) and measuring 24 in (600 mm) long, the seeker combined an inertial platform with a multimode pulse-Doppler active radar. These were controlled by a 2.2-lb (1-kg) digital computer with a 32-kilobyte read-only memory (ROM) and a 32K random-access memory (RAM) computer. The Agat 9B-1103M multi-function monopulse Doppler seeker has a lock-on range of 12 mi (20 km) against fighter targets. The radome has a distinctive conical shape unlike any other R-27 variant. After a cruise phase during which the missile receives command updates from the launch aircraft, the radar switches on and searches for a target. Against a target with a 53.8-sq ft (5-sq m) RCS, radar lock-on can occur at 10.8 nm (12.4 mi; 20 km). Vympel's chief designer claimed that the seeker could pick a target in a multi-target environment and would pursue a cruise missile. At the time of the 1992 air show, the seeker was described as having just left the design phase and being about to enter the development phase. The R-27AE is said to have superior ballistic performance to the R-77 (AA-12 Adder) and, as a result, more straight-line range.
- **R-27EM:** This missile has a semi-active radar seeker with improved low altitude engagement capability. It is said to be able to intercept targets flying as low as 10 ft (3 m). The R-27EM was modified for use over water and intended for the Su-33 carrier-based fighter.
- **R-27P:** Numerous reports have indicated that the R-27P likely entered service in the 1990s, according to Jane's Air-Launched Weapons for Sept. 15, 2010. The missile has a short, conical nose and Avtomatika's 9B-1032 (PRGS-27) anti-radiation seeker, which homes in on other airborne radars. The 9B-1032 seeker is modular and interchangeable with the R-77/RVV-AE. The R-27P is believed to have a range of 50 mi (80 km).
- **R-27EP/Alamo F:** This variant has a new 9B-1103M active radar seeker from Agat. It is said to be more advanced than the 9B-1348 seeker that equips the R-77/ RVV-AE . The R-27EP is said to have a range of 68 mi (110 km).

↳*R-27ER (AA-10c) Air-to-Air Missile*

Name: R-27ER; Alamo C; AA-10c
Type: Air-to-Air Missile
Manufacturer: Spetzetekhnika Vympel NPO, Moscow, Russia, in cooperation with Artem, Ukraine
Length: 4.78 m
DIameter: 260 mm
Wingspan: 0.80 m
Weight: 350 kg
Warhead: 39 kg
Control Plane Span: 0.97 m
Propulsion: single-stage boost motor and sustainer engine
Maximum Speed: supersonic
Maximum Range: 60-63 km
Guidance System: IR-cooled seeker, all-aspect capability, flare countermeasure filters; semi-active radar J band, CW monopulse seeker; ARM J band, passive IR homing, passive radar seeker

Notes:

R-27ER/Alamo C The R-27ER missile features semi-active radar guidance and a long-burn motor.

PL-9 Chinese Air-to-Air Missile

Tiers:

System

:
:
:

↳ ***PL-9 Air-to-Air Missile***

Name: PL-9
Type: Air-to-Air Missile
Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC), Hanzhong Nanfeng Machine Factory
Length: 2.9m
Diameter: 0.157m
Wingspan: 0.856m
Warhead: 11.8kg blast-frag, or expanding rod (RF-fuse)
Detonation Mechanism: laser proximity fuse
Engine: Solid-fuel rocket
Operational Range: 22km
Flight Altitude: 4.5km
Maximum Speed: Mach 2+
Guidance System: multi-element infrared

Notes:

The PL-9 (Chinese: □□-9; pinyin: Pī Lì-9; literally: 'Thunderbolt-9') is a short-range, infrared-homing air-to-air missile (AAM) developed by the People's Republic of China. It was originally designed by Dong Bingyin (□□□) at the Luoyang Electro Optical Center, which is also known as Institute 612 and renamed in 2002 as the China Air-to-Air Guided Missile Research Institute (□□□ □□□□□□). After Dong Bingyin died, his position was succeeded by Mr. Jin Xianzhong (□□□). The deputy general designer of PL-9 is the same deputy general designer of PL-12, Dr. Liang Xiaogeng (□□□). The PL-9C is one of the latest versions of the PL-9, which also has a surface-to-air variant (DK-9). The PL-9C tactical low-altitude surface-to-air missile (SAM) was first revealed during the 1989 Paris Air Show. The launch unit is available in both towed and self-propelled arrangement. The self-propelled version has a launch complex consisting four-rail launcher and the associated target acquisition and radar and electro-optical director

mounted on a 6X6 WZ551 armored personnel carrier (APC). The towed version has a four-rail launcher mounted on a four-wheel carriage. The launch unit is supported by a range of truck-mounted ground equipment for maintenance and missile testing. The missile is fitted with a cryogenic liquid nitrogen gas-cooled IR seeker capable of +/-40 degree off boresight angles. Flight control is by long span pointed delta fins at the front of the missile with Sidewinder-type slipstream driven rollerons on the aft tail fin surfaces to prevent roll and so enhance the operation of the guidance system. The missile has a maximum effective range of 35 km and an altitude limit of 6.5 km. The single-shot hit probability for a single missile launch at an approaching target is 90%. The missile can be used at a stand-alone system, or as a part of the Type 390 (DK-9) brigade (regiment)-level combined AAA/SAM air defence system. The missile entered production in 1991 and saw limited service with the PLA ground forces.

Super 530F French Medium-Range Air-to-Air Missile

Tiers:

Variants:

- **Super 530D:** Super 530D is carried on the Dassault-Breguet Mirage 2000. It was introduced in 1988.
- **Super 530F:** Super 530F is carried on the Dassault Mirage F1. It was introduced in 1979.

System

:

Super 530F Medium-Range Air-to-Air Missile

↳ ***Missile***

Name: Super 530F
Type: Medium-range air-to-air missile.
Basic Load: 2
Length: Super 530F: 3.54 m Super 530D: 3.80 m
Diameter: mm263
Weight: Super 530F: 245 kg Super 530D: 270 kg
Warhead Type: High-explosive fragmentation
Warhead Weight: kg30
Detonation Mechansim: Super 530F: RF Super 530D: Active Radar
Engine: Solid-fuel rocket motor
Wingspan: Super 530F: 0.88 m Super 530D: 0.62 m
Operational Range: Super 530F: 25 km Super 530D: 40 km
Speed: Super 530F: Mach 4.5 Super 530D: Mach <5.0
Guidance System: Semi-active radar homing (SARH)

Notes:

The Matra Super 530 is a French short to medium-range air-to-air missile. The Super 530 series is an improved type of the R.530 missile. Super 530F is carried on the Dassault Mirage F1. It was introduced in 1979. Super 530D is carried on the Dassault-Breguet Mirage 2000. It was introduced in 1988. The Super 530 is being replaced by the MICA (missile). The Super 530F and Super 530D share the same general aerodynamic features and internal layout with cruciform low aspect ratio wings, cruciform aft controls, and 30 kg high explosive fragmentation warhead. However the 530D has a lengthened stainless steel body. This allows it to accommodate a more powerful dual-thrust solid propellant motor and a new seeker assembly. The new seeker includes doppler filtering for improved low altitude performance and digital micro-processing to enable the seeker to be reprogrammed against new threats. The 530D has a claimed maximum interception altitude of 24,400 m (80,100 ft), with a snap-up capability of 12,200 m (40,000 ft), and a snap-down capability to targets at 60 m (200 ft). The missile has a range of 40 km and a maximum speed of less than Mach 5. During the Iran-Iraq War, during the 1980s, the Iraqi Air Force used them on their Mirage F1 against Iran. On 14 September 1983, in an incident that was revealed thirty years later, two Turkish F-100F violated Iraqi air space and one was shot down by an Iraqi Mirage F1EQ firing a Super 530F missile. The Turkish pilots survived and returned to Turkey. On 15 July 2019, during a police operation in Northern Italy, a functioning Super 530F missile was seized together with firearms. The missile lacked the warhead. The weapons were smuggled by a group of people connected to far-right movements. The missile canister indicated it was originally sold to the Qatari armed forces. The original contract date with Qatar was October 1980.

PL-11 (ASR) Chinese Air-to-Air Missile

Tiers:

Variants:

- **HQ-61:** Because China had not developed any ship-borne SAM system, China decided to first develop a land-based, fixed-site version of HQ-61 SAM, and then progress to the naval version after the development of the land-based version had been matured. The naval version would be based on the expertise gained from the land-based version to reduce costs and risks. The land-based, fixed-site version was designated as HQ-61, while the naval version was designated as HQ-61B. Before 1970, the HQ-61 went through two major redesigns based on the feedback of earlier tests. In September 1970, new problem arose when it was discovered the speed of the missile had dropped drastically after the redesign. Based on the suggestion from staffs of the SAM testing range, the 2nd Electro Mechanical Bureau of Shanghai organized another redesign in 1973, successfully solved problems encountered, including speed reduction and vibration. Meanwhile, new technologies were also adopted, including transistors, gyro accelerometer and measures against salinity and other environmental hazards. From March 1975 through April 1975, four rounds of prototype of HQ-61 missile with independent closed-loop were test-fired, with satisfactory result. In 1976, tests were conducted on subsystem interfacing, including that of radar seekers and ground equipment, and one of the results was that the seeker had successfully locked on the target, proving the design was sound for the time being. The success convinced the developer to extend the test over the sea and beginning in December 1976, 45-day-long sea trials were conducted on 12 sorties completed by frigates of Chinese navy, and 13 sorties completed by Harbin H-5 for supporting. Various tests were conducted during the sea trial, including test launches, tracking of the parachute targets, engaging parachute targets, guidance accuracy, reliability of the launcher, effects of launching in different sea states, noise and vibration caused by the launch. During the sea trial, two duds and two remotely controlled rounds were fired, and the result was less than satisfactory. The two duds were relatively successful, but the two remotely controlled rounds resulted in complete failure, missing the parachute targets. The unsatisfactory result convinced the developer not to rush to the sea, but instead, to keep a prudent pace on land first to stamp out all the problems before going any further. In 1978, a flight test of HQ-61 was conducted on a SAM test range in western Liaoning. This flight test was a mixture of simulation of mathematical modeling and real equipment, with targets being simulated by simulators. A total of nine ballistic trajectories and more than eighty scenarios were tested over four hundred times, providing valuable data and proving the design so far. The prototypes of HQ-61 were also test-fired against Type 381 parachute targets for further evaluation, but the result was not completely satisfactory: although the C3I system developed for HQ-61 worked fine, the first shot missed while the second shot scored a direct hit. In order to resolve problems revealed during these tests, the system of general designer was established, and during the development of HQ-61 and later models, Mr. Wu Zhongying (□□□) and Mr. Liang Jincai (□□□) had been assigned as the general designers of HQ-61 series missiles. However, when the development of the land-based version of fix-site HQ-61 was completed, its service (only with limited numbers) in Chinese military had never gone beyond the evaluation stage, because the need it intended to fill could be filled with HQ-2, and there were no mass production plans for HQ-61 since resources were allocated on concentrating on the development of HQ-61B, the naval version. Furthermore, the fixed-site version was deemed by the Chinese military as not adequate in mobile warfare on the modern battlefield.
- **HQ-61B:** By the end of 1980, the developers were confident enough to move from land to sea, and HQ-61B thus begun its own tests. However, the very first test ended in failure and investigation revealed that the cause of the failure was that the fuse did not activate during the entire test. After rework, the test was moved back to land in the spring next year, but met with two continuous failures again, when the fuse detonated earlier than it should. As a result, in February, 1981, the 2nd Electro Mechanical Bureau of Shanghai concentrated most of its effort on solving the difficulties on fuse, and its staffs came up with three plans to answer the problem: large rework/redesign, intermediate rework/redesign, and minor rework/redesign. After testing samples built according to each plan and comparing result, the intermediate rework/repair plan was adopted, result in a new combined fuse that was reliable. During this time, the 2nd Electro Mechanical Bureau of Shanghai was reorganized as Shanghai Aerospace Bureau, and measures were taken

to address the numerous problems encountered in the development of HQ-61B, totaling more than 410. When these problems were solved, the subsequent test on land in November, 1984 was successful, including downing of two Changkong-1 (□□1□) drones. Meanwhile, the C3I system associated with HQ-61B was also making slow but steady progress. In addition to extra temperature and salinity factors, noise and stability were also challenges of ship-based system, while the space is cramped on board. As a result, developer was forced to adopt new technologies and new means, many of them were first in China. A mono-pulse centimeter wavelength tracking radar was developed for HQ-61B for surveillance / tracking, while a continuous-wave centimeter wavelength illuminating radar was developed for HQ-61B for engagement. Fire control computer of HQ-61B was a newly designed digital computer, incorporating analog – digital and digital – analog conversions. The launching system was hydraulically operated with twin launchers, connecting to ammunition drum below, where additional missile were stored vertically. The control consol of HQ-61B also performs maintenance tests / checks on missiles mounted on the launcher. From November 1986 through December, 1986, tests were resumed at sea, achieving satisfactory results, including downing five Sea Eagle-1 (□□1□) drones and two Changkong-1 drones in a single test. After these successful tests, the HQ-61B entered low-rate production and saw limited service in Chinese military, and the production pickup in November, 1988 when Chinese State Department and the Chinese Central Military Commission certified so. HQ-61B served only in relatively short time with Chinese navy, and it has been converted to air-to-air and anti-radiation versions after it was retired from Chinese service. One of the reasons of its short service time was that as a design originated in the 1960s, it could not adequately meet the modern threats faced by naval ships. For example, the system can only engage a single target at a time and with two launchers on each ship, the maximum number of threat it can face is only two, which is not sufficient enough to defend the ship from saturated attack.

- **HQ-61A:** To improve the land-based air defense for Chinese ground force, Chinese State Department and the Chinese Central Military Commission decided to develop a mobile low-to-medium level surface-to-air missile based on HQ-61B, and named the mobile SAM system as Hongqi-61A (□□-61□), or HQ-61A for short. This would lead to HQ-61A being a later model than HQ-61B, which is an earlier model of HQ-61 series, despite have the A suffix. In August, 1979, the 8th Industrial Bureau of Machinery and the artillery corps of the People's Liberation Army Ground Force jointly redefined the requirement of the mobile SAM system, stating that the C2I system used by HQ-61B should be utilized as much as possible to keep the cost down. The primary contractor remains the same, as the 2nd Electro Mechanical Bureau of Shanghai, which would later be reorganized as Shanghai Aerospace Bureau in the early 1980s. The prime subcontractor was the Shanghai Broadcasting Equipment Factory, which was tasked to develop vehicle-based version of C4I system of HQ-61A. HQ-61A SAM system consists of three vehicles: launcher / transporter, radar vehicle, C2I vehicle, all of which are based on the same SX250 6 x 6 cross country truck to simplify logistics and reducing operational cost. In November, 1984, two initial trials were completed, proving the design was sound. More intensive testing followed, lasting from April, 1986 through June, 1986, which included the successful continuous downing of three drones, and the missile subsequently entered Chinese service, but it was not until two year later, in November, 1988, did the production pickup its pace, when Chinese State Department and the Chinese Central Military Commission finally gave their certifications to do so.
- **HQ-61 ARM (YJ-5):** In addition to SAM versions of HQ-61, an anti radar version is also developed in the 1980s. China was seeking a replacement after the termination of Fenglei-7 anti-radar missile (FL-7), and it was decided to utilize HQ-61 to develop an anti-radiation missile (ARM) to meet the urgent need. Development of most subsystems of FL-7 continued as research projects after the production was shelved, and these subsystems were mated with HQ-61 to create the anti-radar missile needed, and most experience was gained via the reverse engineering attempt of AGM-45 Shrike, and to a much less extend, that of AGM-78 Standard ARM. Samples of both missiles were mainly obtained from down American jets and provided to China by North Vietnam during the Vietnam War, though several unexploded samples launched by American jets failed to detonate were also transferred. HQ-61 ARM is basically a HQ-61 missile equipped with the guidance and control system of FL-7 and thanks to the research development rooted from FL-7, HQ-61ARM was quickly completed. HQ-61 ARM also has a less known name as YJ-5, with YJ is short for Yingji (□□), meaning Eagle Strike. Due to the highly classified nature and small number produced, HQ-61 ARM is relatively unknown to the public and its YJ-5 designation is often erroneously identified as an anti-ship or land attack cruise missile, as most of other YJ series produced by China. In reality, it is a totally different missile with a different mission in comparison to other better known Chinese missiles of YJ series. The first batch of YJ-5/HQ-61 ARM was completed in 1984, and was test-fired by Harbin H-5. The missiles met the original requirements, but also revealed many shortcomings, including poor ECCM capability, narrow frequency band coverage, and not being able to lock on to the target after the targeted radar has been switched off. The second batch was completed in 1986, incorporating improvements to solve these shortcomings. The coverage of frequency band was expanded, and memory circuitry was added to calculate the approximate location of the target after the targeted radar had been switched off. The third and final batch was completed in the early 1990s with a new capability added to counter the frequency-hopping radars, and to a limited degree, phased array radars. Despite these improvements, the Chinese technological and industrial capability at the time was not adequate enough to face modern threats on the battlefields, and only limited number entered Chinese service, with Harbin H-5 modified as the carrier, designated as HD-5. The performance of YJ-5/HQ-61 ARM is better than AGM-45, though not too much, and for this reason, plus the purchase of Kh-31 by China, the missile did not enter mass production, and HD-6, the planned modified Xian H-6 intended as another platform did not materialize as a result, and other planned platforms such as proposed modifications for Shenyang J-8, Xian JH-7 and Nanchang Q-5 were also shelved. After receiving newer ARMs such as Kh-31, YJ-91 and YJ-12 entered Chinese service, the surviving HQ-61 ARMs are believed to have been exhausted in training already.

- **HQ-61C:** HQ-61C is the upgrade of previous version, excluding the ARM. The primary improvement is in the electronics. Fully solid state and highly digitized microelectronics are used to upgrade both the missile itself and the associating C3I system. In addition to simplifying logistics and reducing costs, the upgraded system can also be automatically linked to larger air defense networks, with all information transmitted electronically in real time. Previously, such information could only be transmitted verbally by operators because the older HQ-61 system could not be easily integrated into larger air defense network, and the communication subsystem of the C3I system of HQ-61 was only consisted of wired and wireless vocal communication equipment. Another improvement is the adaptation of new rocket motor which boosted the speed of the missile by a third, from the original Mach 3 of earlier versions of HQ-61 to Mach 4 of HQ-61C. The range is also increased but exactly how much is unknown. Some Chinese enthusiasts have claimed that because of the new rocket motors adopted, the size and the weight of the missile is also reduced slightly, but this has yet to be confirmed by other credible sources.

System

↳***PL-11 Air-to-Air Missile***

Name: PL-11
Type: Air-to-Air Missile
Manufacturer: Shanghai Aerospace Bureau
Length: 3.89 m
Diameter: 0.286 m
Wingspan: 0.68 m
Weight: 310 kg (Some sources claim 220 kg)
Speed: Mach 4
Maximum Range: 40 – 75 km, depending on the size, speed, and heading of the target
Note: PL-11 did not enter Chinese service in very large numbers because it was only used as a stopgap measure until the more advanced PL-12 became available, and there is no confirmed export either.

Notes:

PL-11 is the air-to-air derivative of HQ-61, and it is also developed by the same developer of HQ-61, Shanghai Aerospace Bureau. The first successful flight test of PL-11 was conducted in 1992, and the missile entered Chinese service in the mid-1990s. The latest upgrade of PL-11 was completed in 2002. The first PL-11 was an air-launched HQ-61 armed with a mono-pulse SARH seeker based on Italian Selenia Aspide, and eventually upgraded with an ARH seeker. To meet the airborne requirement, PL-11 is slightly shorter than its SAM counterparts, and has a different set of redesigned control surfaces, which has much smaller wingspans while ensure the same performance. Versions: PL-11: This is the basic version, with HQ-61C armed with the mono-pulse SARH seeker based on Italian Selenia Aspide. PL-11A: PL-11 incorporating inertial guidance so that targets would only need to be illuminated at the final stage of the engagement, as opposed to the entire engagement for PL-11. Depending on the airborne radar, PL-11A can engage two to four targets in the same time it takes for PL-11 to engage a single target. PL-11B: ARH version of PL-11, and the last version of PL-11 family. This is a PL-11A armed with an ARH seeker AMR-1. Also known as PL-11-AMR, named after the ARH seeker AMR-1.

PL-2B Chinese Air-to-Air Missile

Tiers:

Variants:

- **PL-2:** In 1962, China decided to manufacture former-Soviet Vympel K-13 AAM, and works on setting up the production line begun immediately. The main contractor to provide the production equipment was Easter Machinery Factory in Xi'an (□□□□□□□), and over two dozen subcontractors were also involved. In October 1964, Zhuzhou Aero-engine Factory (□□□□□□□□) of the Ministry of Aviation Industry was selected as the main contractor of the AAM, and a month later, in November 1964, work on components of the AAM started. By September 1965, all components were completed and individually tested successfully. In November 1966, the 1st batch of production was completed with 18 missiles, and other soon followed, and tests were conducted. After two major test events both completed successfully, the 1st of which was in March 1967 with firing of 19 missiles and the 2nd of which was in May 1967 with firing of 22 missiles, the missile received state certification in November 1967.
- **PL-3:** PL-3 was the first indigenously developed AAM in China. Originally, the idea was to build an improved version of Vympel K-13 in increasing speed, range, precision, lethality and maneuverability. The main contractor was the 612th Research Institute (later reorganized as Luoyang Electro-Optics Technology Development Centre (EOTDC)). However, after the program begun in June 1962, the original goal proved to be too technologically ambitious for the Chinese industry back then to achieve. Additionally, Cultural Revolution occurred several years later also greatly affected the progress of the PL-3 program. As a result, PL-3 project had borrowed heavily from PL-2 and the program was protracted: after the 1st batch of 20 missiles completed in June 1968 and the 2nd batch of 30 completed in December 1969, the necessary tests was not completed until November 1974, four years after the initial start in 1970. The missile finally received its state certification in April, 1980, and 50 production version missiles was completed by 1981. However, during training and evaluations, it was revealed that PL-3 did not significantly outperform PL-2, and furthermore, all experience gained from PL-3 can be readily incorporated in the PL-2 improvement efforts, so there was no need to have an additional separate AAM program when the requirement could be meet by just one.
- **PL-5:** PL-5 is a further Chinese development of PL-2. Although earlier PL series have been developed from the former-Soviet Vympel K-13, all of them were infrared guided. PL-5 AAM is the first Chinese attempt to follow the former-Soviet practice of develop both Semi-active radar homing (SARH) and infrared guidance for the same missile, and the main contractor was the 612th Research Institute (later reorganized as Luoyang Electro-Optics Technology Development Centre (EOTDC)). Work on the SARH version of PL-5 begun in April, 1966, and first test flight was conducted in July 1971. Live round test fire begun in September 1972, but due to Cultural Revolution that had serious disrupted and delayed production and development, all of the missiles of the first batch of production ran out before the test could be completed. It was not until April, 1984, well after the end of Cultural Revolution, when the 2nd batch was completed and tests were resumed in August 1984, finally completed in March 1982. However, tests and evaluation revealed that the SARH guided version was not adequate enough and this version was consequently cancelled in 1983. The infrared guided version of PL-5 was equally affected by the same political turmoil in China, and its development was delayed even further: it was not until September 1986 when this version finally received its state certification and the missile entered mass production in the same year.
- **PL-6:** Due to the prolonged delay of PL-3 AAM development, PL-3 AAM was already inadequate before its completion. A follow-up was planned to incorporate advance in microelectronics and lessons learned in the aerial combats, which is based on the feedback of Vietnam War. The reason for starting a new AAM was because of the inherit design limitation of PL-3 back then, it was difficult to incorporate the technological advances planned to be incorporated. The program was designated as PL-6 and begun in 1975, before PL-3 program was even completed. The main contractor was the 612th Research Institute (later reorganized as Luoyang Electro-Optics Technology Development Centre (EOTDC)). The first batch of missile was completed in 1978 and tests were successfully completed in 1979. However, PL-6 met the same fate of its predecessor, PL-3 in that during training and evaluations, it was revealed that PL-6 did not significantly outperform PL-3, and furthermore, all experience gained from PL-6 can be readily incorporated in the PL-2 improvement

efforts, so there was no need to have an additional separate AAM program when the requirement could be meet by just one. Consequently, PL-6 program was drastically scaled back in 1981, and after very limited production, PL-6 was terminated in 1983.

:

↳*PL-5 Air-to-Air Missile*

Name: PL-5
Type: Air-to-Air Missile
Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC), Hanzhong Nanfeng Machine Factory
Length: 3.128 m
Diameter: 0.127m
Wingspan: 0.657m
Weight: 148 kg
Warhead: 6kg blast-frag, or expanding rod (RF-fuse)
Detonation Mechanism: Active infrared, laser proximity fuse(PL-5EII)
Engine: Solid-fuel rocket
Operational Range: 1.3–16km
Maximum Speed: Mach 2.5
Guidance System: Infrared homing, multi-element, dual band detector(PL-5EII)

Notes:

The PL-5 (□□-5) air-to-air missile (PL stands for Pi Li, "Thunderbolt" in Chinese, the generic designation for all PRC air-to-air missiles) is a short-range, Infrared homing missile use by Chinese fighters. It is based on AA-2 Atoll technology and resembles the AIM-9 Sidewinder. The PL-5 was designed and developed at China's Luoyang Electro-Optics Technology Development Centre (EOTDC), also known as Institute 612; its design team members included Chen Jiali (□□□), Dong Chunfeng, Hu Rongchao (□□□), Huang Bin, Zhang Ming (□□), and Zheng Zhiwei (□□□). It was reportedly produced at the Hanzhong Nanfeng Machine Factory (also known as the Hanzhong Air-to-Air Missile Factory) of China Aviation Industry Corporation I. The PL-5 have been continuously upgraded by Luoyang and the latest variant, the PL-5EII added a dual band, multi-element detector as well as a laser proximity fuse similar to the PL-9. According to Chinese export/import agency CATIC, the PL5E has an all-aspect capability

with the seeker having a maximum off boresight angle of ±25° before launch, and ±40° after launch. PLAAF J-10 and J-11 fighter jets are mainly using PL-8 missile, which is more advanced comparing PL-5. However, due to greater weight and dimension of PL-8 missile, for F-7 and JH-7, PL-5 is still the preferable air-to-air missile at this stage.

PL-8 Chinese Air-to-Air Missile

Tiers:

Variants:

- **Note:** Unlike the conventional Chinese designation practice where a missile is given a Chinese name after at least 70% of it is made in China, Python 3 received a Chinese name at the very beginning, receiving PL-8 when it was purchased. It was speculated that China did so because it did not want to further reveal its tie with Israel, so that the original Israeli name was replaced with a Chinese one to avoid harming the relationship between Chinese and Muslim countries. As PL-8/Python 3 AAM has wing span much larger than PL-2/PL-5 (which has dimensions close to AIM-9 missiles), Chinese fighter jets were modified to carry extended pylon to carry PL-8 missiles. Wingtip pylon of newly released J-15 carrier based fighter jet is also extended for this purpose, and become a visual signature of J-15 comparing Su-33. PL-8: Python 3 AAM provided by Israel PL-8A: License assembled AAM in China with Israeli supplied components PL-8B: Chinese built AAM with 100% domestic Chinese components PL-8H: Surface-to-air version with slightly smaller warhead weighing 10 kg The surface-to-air version is developed by China National Aero-Technology Import & Export Corporation (CATIC). According to the developers, there are minor improvements incorporated in each version, but they have not specified the exact upgrades.

System

:
:
:

↳*PL-8 Air-to-Air Missile*

Name: PL-8
Type: Air-to-Air Missile
Manufacturer: Xi'an Eastern Machinery Factory and CATIC
Length: 2.95 m
Diameter: 160 mm

Wingspan: 800 mm

Weight: 115 kg

Warhead: 11 kg high explosive

Detonation Mechansim: Impact / Proximity

Engine: solid rocket

Propellant: solid fuel

Operational Range: 20 km

Flight Ceiling: 21 km

Flight Altitude: 05 km

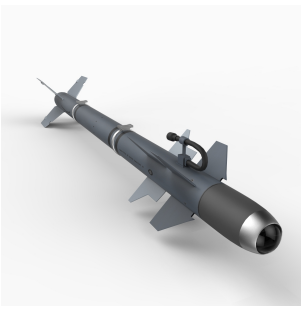
Maximum Speed: Mach 3.5

Guidance System: passive infrared homing

Notes:

The PL-8 (Chinese: □□-8; pinyin: Pī Lì-8; literally: 'Thunderbolt-8') is a Chinese air-to-air missile (AAM) originated from the Israeli Python-3 AAM. Experience gained from PL-8/Python-3 had helped China greatly in developing its next missile, the PL-9. China's PLAAF was quite impressed with this missile, and paid for licensed production as the PL-8 AAM in the 1980s. The program was code named "Number 8 Project" (□□□□) and formally started on September 15, 1983. The major supplier of the missile was Xi'an Eastern Machinery Factory (□□□□□□□) located in Xi'an. From March 1988 to April 1989, technology transfer to China was complete while license assembly and license built parts continued, and by the spring of 1989, the complete domestic Chinese built missile received state certification. China has also developed a helmet-mounted sight (HMS) system for the PL-8. Elbit Systems DASH (Display And Sight Helmet) helmet mounted sight (HMS). However, it's not clear that if this was part of the Python-3 deal or a separate deal instead. The seeker of the original Python-3 AAM was able to be slaved to either the airborne fire control radars or DASH HMS. These capabilities initially did not exist on PL-8 at the earlier stage of its service in Chinese hands, because the missile is only compatible with western radars, but not compatible with Chinese radars. The only exception was that capability of being slaved to airborne fire control radars could be achieved by PL-8 only when it is used in conjunction with the few western radars in Chinese inventory, such as the British GEC-Marconi Skyranger airborne radar and Italian FIAR Grifo series airborne radar on Chengdu J-7, but for most part, the seeker of PL-8 could only be fixed, pointing to the front when deployed on aircraft with domestic Chinese radars. These capabilities would not be fully achieved until the advent of PL-9, the next Chinese AAM, when the missile became compatible not only with western radars, but also Chinese and Russian radars as well, and these capabilities of PL-9 were eventually incorporated to PL-8 AAMs in its upgrades so that PL-8 is fully capable as Python-3.

R550 Magic 2 French Short-Range Air-to-Air Missile



Tiers:

Variants:

- **R.550 Magic:** The R550 Magic is a short-range missile designed in 1968 by French company Matra to compete with the American AIM-9 Sidewinder.The largest single competitor for Sidewinder in Western Europe, the Matra Magic R.550 has better design and performance requirements. It can be fired at any speed (no minimum), meaning that it is a prime candidate for the arming of attack helicopters. Magic is slightly larger in diameter than Sidewinder, but the launch installation components in the carrying aircraft were wisely made interchangeable. The tail fins of the R.550 are free to rotate around the rocket's nozzle, providing of spin-stabilization. The Magic has 8 fixed fins, and 4 movable fins. It has a solid-fuel engine, and can engage the target independently from the firing aircraft with its passive IR guidance system. The warhead is armed 1.8 seconds after launch, giving a minimum engagement distance of 0.30 km, and a maximum range of around 3 km.

System

:

R550 Magic 2 Short-Range Air-to-Air Missile

↳ ***Missile***

Name: R550 Magic 2
Type: Short-Range Air-to-Air Missile
Basic Load: 2-4
Manufacturer: Matra, MBDA
Length: 2.75 m
Diameter: 160 mm
Span, Foreplanes: 0.47 m
Span, Tailplanes: 0.66 m
Weight: 89 kg
Warhead: Pre-fragmented with controlled splintering
Warhead Weight: 13 kg

Configuration: Thin cylinder with rounded nose 2 sets of cruciform foreplanes, front "cropped delta" non-steering, rear compound sweep steerable rear cruciform "cropped delta" fins mounted on slip ring and rotating freely

Propulsion: Richard single-stage butylene solid-propellant rocket

Speed: Mach 3+

Effective Range: km3

Minimum Distance to Launch: m500

Altitude: 20,000 m

Guidance System: All-aspect, cooled IR seeker proximity fuze detonation

Platforms: Attack Attack A-4 Skyhawk Alpha Jet Jaguar Mirage V Mirage F1 Sea Harrier Super Etendard Fighters F-5 Tiger MiG-21 MiG-23 Mirage III Mirage 2000 Rafale F-16 Trainers Hawk Note: Users may employ the Magic on other aircraft that are capable of firing the AIM-9 Sidewinder

Notes:

The R550 Magic 2 replaced the AD3601 seeking head by the AD3633, allowing frontal fire on the target. The R550 Magic 1 could only be fired from the rear on the target due to the lack of sensitivity of the IR detector. R550 Magic 2 also received improved counter-countermeasures including flare rejection. R550 Magic 2 has many more improvements over R550 Magic 1, but principally has an all-aspect engagement capability and it takes far less time to prepare the missiles for launch. The R550 Magic 2 retains the same general aerodynamic and external characteristics as the Magic 1, with double cruciform canards (the aft set acting as control surfaces) and free rotating rear fins. Magic 2 is 2.75 m long, has a body diameter of 157 mm, a wing span of 0.66 m and a weight of 90 kg. However, it has an increased range of up to 5 km compare to the R550 Magic 1 with 3 km. In Pakistan Air Force R550 Magic and R550 Magic 2 short-range missiles can be carried by Mirage III/V, F-16A/B, F-7, and A-5.

PL-2 Chinese Air-to-Air Missile

Tiers:

Variants:

- **PL-2:** In 1962, China decided to manufacture former-Soviet Vympel K-13 AAM, and works on setting up the production line begun immediately. The main contractor to provide the production equipment was Easter Machinery Factory in Xi'an (□□□□□□□), and over two dozen subcontractors were also involved. In October 1964, Zhuzhou Aero-engine Factory (□□□□□□□□) of the Ministry of Aviation Industry was selected as the main contractor of the AAM, and a month later, in November 1964, work on components of the AAM started. By September 1965, all components were completed and individually tested successfully. In November 1966, the 1st batch of production was completed with 18 missiles, and other soon followed, and tests were conducted. After two major test events both completed successfully, the 1st of which was in March 1967 with firing of 19 missiles and the 2nd of which was in May 1967 with firing of 22 missiles, the missile received state certification in November 1967. In August 1970, the AAM entered series production and was formally named as PL-2.
- **PL-3:** PL-3 was the first indigenously developed AAM in China. Originally, the idea was to build an improved version of Vympel K-13 in increasing speed, range, precision, lethality and maneuverability. The main contractor was the 612th Research Institute (later reorganized as Luoyang Electro-Optics Technology Development Centre (EOTDC)). However, after the program begun in June 1962, the original goal proved to be too technologically ambitious for the Chinese industry back then to achieve. Additionally, Cultural Revolution occurred several years later also greatly affected the progress of the PL-3 program. As a result, PL-3 project had borrowed heavily from PL-2 and the program was protracted: after the 1st batch of 20 missiles completed in June 1968 and the 2nd batch of 30 completed in December 1969, the necessary tests was not completed until November 1974, four years after the initial start in 1970. The missile finally received its state certification in April, 1980, and 50 production version missiles was completed by 1981. However, during training and evaluations, it was revealed that PL-3 did not significantly outperform PL-2, and furthermore, all experience gained from PL-3 can be readily incorporated in the PL-2 improvement efforts, so there was no need to have an additional separate AAM program when the requirement could be meet by just one. Consequently, PL-3 was terminated in 1983.
- **PL-5:** PL-5 is a further Chinese development of PL-2. Although earlier PL series have been developed from the former-Soviet Vympel K-13, all of them were infrared guided. PL-5 AAM is the first Chinese attempt to follow the former-Soviet practice of develop both Semi-active radar homing (SARH) and infrared guidance for the same missile, and the main contractor was the 612th Research Institute (later reorganized as Luoyang Electro-Optics Technology Development Centre (EOTDC)). Work on the SARH version of PL-5 begun in April, 1966, and first test flight was conducted in July 1971. Live round test fire begun in September 1972, but due to Cultural Revolution that had serious disrupted and delayed production and development, all of the missiles of the first batch of production ran out before the test could be completed. It was not until April, 1984, well after the end of Cultural Revolution, when the 2nd batch was completed and tests were resumed in August 1984, finally completed in March 1982. However, tests and evaluation revealed that the SARH guided version was not adequate enough and this version was consequently cancelled in 1983. The infrared

guided version of PL-5 was equally affected by the same political turmoil in China, and its development was delayed even further: it was not until September 1986 when this version finally received its state certification and the missile entered mass production in the same year. Despite the delay, this version proved to be more successful and many further upgrades were developed later on, including PL-5E.

- **PL-6:** Due to the prolonged delay of PL-3 AAM development, PL-3 AAM was already inadequate before its completion. A follow-up was planned to incorporate advance in microelectronics and lessons learned in the aerial combats, which is based on the feedback of Vietnam War. The reason for starting a new AAM was because of the inherit design limitation of PL-3 back then, it was difficult to incorporate the technological advances planned to be incorporated. The program was designated as PL-6 and begun in 1975, before PL-3 program was even completed. The main contractor was the 612th Research Institute (later reorganized as Luoyang Electro-Optics Technology Development Centre (EOTDC)). The first batch of missile was completed in 1978 and tests were successfully completed in 1979. However, PL-6 met the same fate of its predecessor, PL-3 in that during training and evaluations, it was revealed that PL-6 did not significantly outperform PL-3, and furthermore, all experience gained from PL-6 can be readily incorporated in the PL-2 improvement efforts, so there was no need to have an additional separate AAM program when the requirement could be meet by just one. Consequently, PL-6 program was drastically scaled back in 1981, and after very limited production, PL-6 was terminated in 1983.

Diameter: 127 mm
Wingspan: 528 to 609 mm
Weight: 60 to 152.3 kg
Warhead: 11.3 kg high explosive
Detonation Mechanism: Impact / Proximity
Engine: rocket 2668dN
Propellant: solid fuel
Operational Range: 6 to 10 km
Flight Ceiling: 15 to 21.5 km
Maximum Speed: Mach 1.6 to 2.5
Guidance System: Nitrogen cooled passive InPb infrared seeker

Notes:

PL-2 (Chinese: □□-2; pinyin: Pī Lì-2; literally: 'Thunderbolt-2') and its derivatives are members of a series of Chinese air-to-air missiles (AAM) originated from the former-Soviet Vympel K-13 AAM. Unlike PL-2 itself, the second Chinese AAM, most of derivatives of PL-2 failed to enter mass production, with the exception of infrared guided PL-5. In 1962, China decided to manufacture former-Soviet Vympel K-13 AAM, and works on setting up the production line begun immediately. The main contractor to provide the production equipment was Easter Machinery Factory in Xi'an (□□□□□□□), and over two dozen subcontractors were also involved. In October 1964, Zhuzhou Aero-engine Factory (□□□□□□□□) of the Ministry of Aviation Industry was selected as the main contractor of the AAM, and a month later, in November 1964, work on components of the

AAM started. By September 1965, all components were completed and individually tested successfully. In November 1966, the 1st batch of production was completed with 18 missiles, and other soon followed, and tests were conducted. After two major test events both completed successfully, the 1st of which was in March 1967 with firing of 19 missiles and the 2nd of which was in May 1967 with firing of 22 missiles, the missile received state certification in November 1967. In August 1970, the AAM entered series production and was formally named as PL-2.

YJ-91 Chinese Anti-Radiation Missile

Tiers:

Variants:

- **YJ-91 Anti-Radiation Missile:** The anti-radiation version of the YJ-91 missile was developed from the Kh-31P, which uses a wide array of seekers to cover the entire radar frequency band. The Chinese were not satisfied with the requirement to include multiple seekers and preferred to have a single seeker capable of covering multiple frequency bands, like the AGM-88 HARM. However, such ambitions proved to be too great for the Chinese microelectronics industry. They could not achieve the goal in a single step within the required timeline originally specified by the Chinese military. Instead, a two-step approach was implemented: The completion of the development of a single seeker covering multiple frequency bands was pushed back, while a stopgap measure was adopted in the meantime. The Kh-31P was modified so that the seekers could be rapidly changed in the forward airstrips (providing the specialized tooling is available), so that missile would not need to be sent back to depots or factories to perform such operation. The resulting anti-radiation version of YJ-91 missile has a slightly increased the range to 120 km in comparison to 110 km of the original Kh-31P. In addition to a seeker that covers multiple frequency bands, additional measures to upgrade the missile are in development, such as, an open software architecture. Additional measures reportedly include prioritizing threats, which could be uploaded to the onboard computer from the ground or by the pilots while in flight. Threats could then be updated in real time. The multi-band seeker is of higher priority.
- **YJ-91 Anti-Ship Missile:** The Chinese have also developed an anti-ship version of the YJ-91 missile. However, this version is an indigenous development of the Chinese from the Kh-31P anti-radiation missile, and not from the Kh-31A anti-ship missile. China did not order any of the Kh-31A. The Chinese felt that the original Kh-31A could not fully satisfy their requirements, because the high-low trajectory of the missile meant early detection, thus it is prone to interception. In contrast, the low-low trajectory usually adopted by subsonic anti-ship missiles better uses the supersonic speed of Kh-31A. Such a trajectory shortens the detection range and the high-speed reduces the target's reaction time, once the missile is detected. As a result, China did not order any Kh-31A anti-ship missiles. The resulting anti-ship version of the YJ-91 is capable of sea-skimming. Its cruising altitude is no more than 20 metre above sea level. At the terminal attack stage (usually after the active radar seeker of the missile is turned on), the missile drops to 7 metre above sea level. This attack altitude can be further reduced to just 1.2 metre above sea level, when the sea state allows. Alternatively, the missile can be programmed to popup-and-dive like that the Boeing Harpoon. However, such sea-skimming capability comes at the expense of maximum range: in comparison to the original 70 km range of the Kh-31A, the maximum range of YJ-91 anti-ship missile was reduced by more than a quarter to 50 km. Like the anti-radiation version, it is reported that many planned upgrades are in development. An application for research grants to develop a submerged launched version of YJ-91 anti-ship missile once appeared on Chinese websites on the Internet, indicating China is attempting to develop a version for its submarine fleet.

↳YJ-91 Anti-Radiation Missile

Name: YJ-91

Type: Anti-Radiation Missile

Manufacturer: Hongdu Aviation Industry Corporation

Length: 4.7 m

Diameter: 0.3602 m

Weight: 0.6 ton

Warhead: 165 kg

Detonation Mechanism: Semi-armor-piercing and other

Engine: Ramjet

Propellant: Liquid fuel

Operational Range: 50-120 km

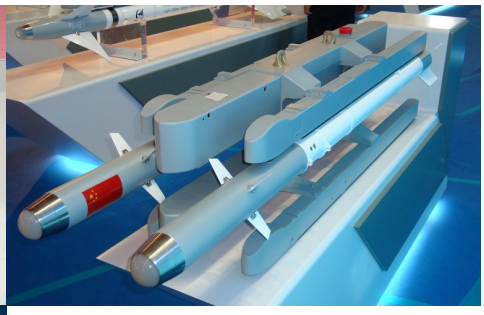
Maximum Speed: Mach 4.5

Guidance System: ARH / PRH

Notes:

YJ-91 is the Chinese version of the Kh-31. YJ is short for Ying Ji (Yingji, □□) meaning eagle strike. After purchasing 200 Kh-31Ps from Russia, China decided to develop its own version, because the original Kh-31 missile did not fully satisfy Chinese requirements. The resulting YJ-91 missile was developed by Hongdu Aviation Industry Corporation, the same manufacturer of the Silkworm missile. The experience gained from YJ-91 also helped the engine development of another supersonic missile indigenously developed in China, YJ-12, which is sometimes confused by non-Chinese sources with the YJ-91, as both share the same origin for their propulsion systems. YJ-91 Anti-radiation missile The anti-radiation version of the YJ-91 missile was developed from the Kh-31P, which uses a wide array of seekers to cover the entire radar frequency band. The Chinese were not satisfied with the requirement to include multiple seekers and preferred to have a single seeker capable of covering multiple frequency bands, like the AGM-88 HARM. However, such ambitions proved to be too great for the Chinese microelectronics industry. They could not achieve the goal in a single step within the required timeline originally specified by the Chinese military. Instead, a two-step approach was implemented: The completion of the development of a single seeker covering multiple frequency bands was pushed back, while a stopgap measure was adopted in the meantime. The Kh-31P was modified so that the seekers could be rapidly changed in the forward airstrips (providing the specialized tooling is available), so that missile would not need to be sent back to depots or factories to perform such operation. The resulting anti-radiation version of YJ-91 missile has a slightly increased the range to 120 km in comparison to 110 km of the original Kh-31P. In addition to a seeker that covers multiple frequency bands, additional measures to upgrade the missile are in development, such as, an open software architecture. Additional measures reportedly include prioritizing threats, which could be uploaded to the onboard computer from the ground or by the pilots while in flight. Threats could then be updated in real time. The multi-band seeker is of higher priority.

TY-90 Chinese Air-to-Air Missile



Tiers:

Variants:

- **SG-II ADS:** In 2004, a land based air defense variant of TY-90 is revealed to Chinese public after entering Chinese service in small numbers for sometime. Shengong (Deity Bow, □□)-II Air Defense System (SG-II ADS) is the upgrade of its predecessor SG ADS, with a quadruple TY-90/DY-90 missile launcher replacing the original Type 80 23mm AAA gun in its predecessor, resulting in the new SG-II ADS. Like its predecessor, SG-II ADS is also a towed system, and utilizes all other subsystems of its predecessor with the exception of the gun. Because TY/DY-90 is a fire and forget weapon, no modification is needed for the fire control system of the original SG ADS.
- **LS ADS:** During the 5th Zhuhai Airshow held at the end of 2004, a mobile land based air defense variant of TY-90 was revealed, dubbed as LS ADS, short for Lie-Shou (□□, meaning Hunter) Air Defense System. Eight TY-90 in two groups of four are mounted in the back of a Dongfeng (□□, East Wind) EQ2050 Iron Armor (Tiejia, □□) High Mobility Multipurpose Wheeled Vehicle (HMMWV), and the fire control system consists of electro-optics including laser, IR & TV, mounted between the two quadruple launchers. The LS ADS is developed by Norinco, with Dongfeng Motor Corporation as the subcontractor to develop chassis (vehicle). LS ADS is capable of being air transported, included being slung under helicopters. The system is operated by a team of two, one driver and one weaponry system officer. The system can also being integrated into larger air defense network. A small number subsequently entered PLA service for evaluation purposes.
- **YT ADS:** In 2005, another mobile land based air defense variant of TY-90 was revealed to the Chinese public, named as YT ADS, short for Yi-Tian (□□, meaning leaning on the sky) Air Defense System. YT ADS is a development of earlier LS ADS designed to specifically address the shortcomings of the latter, namely, the insufficient armor protection, lack of amphibious capability and radar. Like its predecessor LS ADS, the system is also developed by Norinco. Weaponry of YT ADS is similar to that of earlier LS ADS, with the missile configuration remains the same as that of LS ADS, but additionally, there is an extra 12.7 mm heavy machine gun and 3 smoke grenade dischargers as secondary armament for added protection. WZ551 is utilized as the chassis of the YT ADS, giving the system amphibious capability and added protection. Additionally, a light solid state 3-D passive phased array radar is added to the fire control system, just above the original electro-optical fire control system, providing the ADS with greater surveillance range. The radar can be folded down for traveling and transportation.
- **FL-3000N:** The Flying Leopard 3000 Naval (FL-3000N) was first revealed to the public at the 7th Zhuhai Airshow at the end of 2008. Although using the Flying Leopard designation, the FL-3000N is actually a different missile system than the FL-2000(V) shown earlier. In fact, the only commonality shared by both SAM system is the launcher design, and even the launchers differ in size due to the different diameters of the missiles used in the systems. Instead of using QW-1 Vanguard MANPADs, the FL-3000N system uses the HHQ-10 (Red Flag 10) naval surface to air missile developed from TY-90 missile.[citation needed] The diameter of the missile is enlarged by a third, but the most important design difference is its guidance system. The FL-3000N missile utilizes a combined guidance system that incorporates both passive radio frequency (RF) guidance and imaging infrared (ImIR) guidance. There are a pair of horn like protrusions

mounted on the ImIR seeker at the tip of the missile, and these two protrusions are the passive RF seeker. An optional ImIR only guidance is also available and the missile is a fire and forget weapon.

TY-90 Air-to-Air Missiles

↳***Missile***

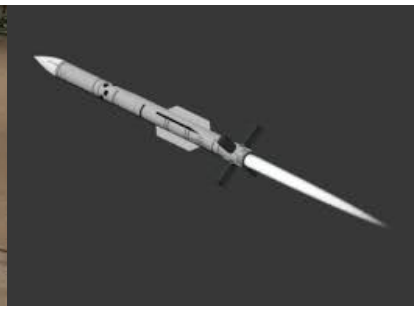
Name: TY-90
Type: Air-to-Air Missiles
Manufacturer: China Aviation Industry Corporation I
Length: m1.9
Diameter: mm90
Weight, Warhead: kg3
Aircraft Capible to Carry: ea16
Detonation Mechansim: Impact/Proximity
Engine Propllant: Solid Fuel
Operational Range: km0.5-6
Flight Ceiling: km6
Flight Alitude: km0-6
Speed: Mach2
Guidance System: ImiR IR

Notes:

TY-90 (Chinese: □□-90; pinyin: Tiān Yàn-90; literally: 'Sky Swallow-90') is the first air-to-air missile specifically developed for military helicopters in dogfights. Contrary to the erroneous claims, the missile is not developed from MANPAD missiles such as QW-1 Vanguard, but instead, it is designed as an air-to-air missile from the start. It is the world first air to air missile that is specifically designed for helicopters. Later, the surface-to-air version was further developed from the air-to-air version. Chinese determined that the MANPAD missiles converted for helicopter use in dogfights was not adequate, so a brand new air-to-air missile specifically for helicopter use was sanctioned, and TY-90 was the resulting product. The 3 kg warhead of the missile is specially designed to sever the rotary wing with a single shot, and the missile has all-aspect attack capability. The missile is designed to ensure a single shot would be sufficient to down an attack helicopter, or at least knock it out of action. At least three additional versions have been developed in addition to the basic version, and two of them being air-to-air versions. The first adopts a dual-band guidance, adding UV to the original IR, while the second adopts an ImIR guidance. During the 5th Zhuhai Airshow held at the end of 2004, a ground-launched air defense version appeared, with designation of DY-90, which was essentially the original TY-90, but with an additional option of incorporating a rocket booster to increase range upon customer's request. A navalized surface-to-air version is also developed, utilizing the FLS-1 system and the basic version with IR guidance, thus providing a fire-and-forget capability in comparison to the case where QW-3 is used. However, this navalized version has not entered service as of 2008, and the reason is reportedly because that the Chinese military wants to wait until the more advanced dual-band or Imaging IR (ImIR) version to be incorporated into the FLS-1 system, which are currently under development. However, at Zhuhai Airshow, AVIC I, the developer of TY-90 only acknowledged the developing and active marketing such systems, but refused to further confirm whether the Chinese military or any foreign customers had placed any orders, and neither did the developer confirm such developmental works were privately funded by the developer or received any funds from the state or foreign customers. Despite marketing efforts, as of 2008, there is no known export of TY-90 of any

kind.

R-77 (AA-12 Adder) Russian Air-to-Air Missile



Tiers:

Variants:

- **R-77 (izdeliye 170):** Standard model
- **RVV-AE (izdeliye 190):** Export model of the R-77
- **R-77P** / **RVV-PE:** Passive homing model
- **R-77T** / **RVV-TE:** Infrared homing model
- **R-77-1 (izdeliye 170-1):** Russian-built variant with a streamlined nose, 9B-1248 (Izdeliye-50-1) active radar seeker head, and new fins
- **RVV-SD:** Export model of the R-77-1
- **R-77-SRK:** Ship-to-air variant
- **R-77-ZRK** / **RVV-AE-ZRK:** RVV-ZRK Surface-to-air variant
- **R-77-PD** / **RVV-AE-PD:** Ramjet model
- **R-77-PD ZRK** / **RVV-AE-ZRK:** RVV-(PD-)ZRK Surface-to-air variant
- **K-77M (izdeliye 180):** Version under development for the Sukhoi Su-57 with AESA seeker, conventional fins, and two-pulse motor
- **K-77ME (izdeliye 180-BD):** Ramjet model of the K-77M

R-77 (AA-12 Adder) Air-to-Air Missile

↳***Missile***

Name: R-77 (AA-12 Adder)
Type: Long-range, active radar homing air-to-air missile.
Basic Load: INA
Length: 3.6 m (R-77), 3.71 m (R-77-1)
DIameter: mm200
Warhead: 22.5 kg HE fragmenting (R-77)
Detonation Mechanism: laser proximity fuse
Engine: Solid fuel rocket motor (R-77), air-breathing ramjet (R-77-PD)

Wingspan: mm700

Operational Range: 80–100 km (R-77), 110 km (R-77-1) 193 km (R-77M)

Flight Altitude: km5-25

Speed: Mach 4,Mach 5 for K-77PD (RVV-AE-PD)[

Guidance System: Inertial with mid-course update and terminal active radar homing/infrared homing (R-77T)

Launch Platforms: Mikoyan-Gurevich MiG-21-93/LanceR/Bison, Mikoyan-Gurevich MiG-23, Mikoyan-Gurevich MiG-25, Mikoyan-Gurevich MiG-27, Mikoyan MiG-29, Mikoyan MiG-31, Mikoyan MiG-35, Sukhoi Su-27, Sukhoi Su-30, Sukhoi Su-33, Sukhoi Su-34, Sukhoi Su-35, HAL Tejas, Yakovlev Yak-141, Chengdu J-10

Notes:

The maximum current Russian R-77 medium-variety missiles (AA-12 "AMRAAMSKI") is just like and in a few respects identical to the American AIM-a hundred and twenty AMRAAM missiles. The R-77 missile has an energetic radar finder and a most variety of 90-100 kilometers (50 km more than AMRAAM) and flies at 4 times the velocity of sound. The AA-12 has square slender span wings and a one of a kind set of 4 rectangular control surfaces on the rear. just like the configuration used at the terminal control fins of the SS-21 'Scarab' and SS-23 'Spider' ballistic missiles. These specific control surfaces function decreased flow separation at excessive angles of attack, producing extra aerodynamic moment force than traditional manage surfaces. The missile's steerage is inertial with mid-direction updates from the release plane, accompanied through a terminal energetic radar section from an acquisition range of approximately 20 kilometers. The Rocket was created particularly to offer the opportunity to apply practically from any aircraft equipped with way of measuring the goal coordinates (radar or optical), and the semi-energetic steerage enabled, if there are suitable skills of the radar, to set up numerous missiles on numerous targets. The R-77 missiles (the export name RVV-AE) belong to the fourth-technology air-to-air missiles. The missile is designed to destroy at all angles day and night, in one of a kind climate conditions, in opposition to the history of land and sea, below the impact of energetic radar jamming the subsequent objectives: notably maneuverable aircraft with an overload of up to 12 units, strategic bombers, helicopters and which include hover mode, missiles for numerous purposes (ground-to-air and air-to-air). Dimensions and mass of the missile, its design (small-extension wings and folding grilles) offer: the opportunity of the use of mild provider plane; massive ammunition carriage on medium and massive plane carriers; and the opportunity of conformal or internal placement. The R-77 is used withinside the armament device of MiG-29 and Su-27 warring parties of all modifications. The R-77 missile (RVV-AE) is made in the normal aerodynamic scheme (the rudders are placed at the back of the wings), with the X-fashioned and symmetrical arrangement of the wings and rudders. It includes 8 cubicles linked with the aid of wedge clamp packages. It makes use of non-detachable wings of ultra-small elongation and folded grating wheels, which may be in positions - folded (in the course of transportation and storage) or uncovered (whilst suspended below a provider plane). Each steerage wheel operates autonomously (kinematically now no longer linked with different steerage wheels) from a separate force motor. The R-seventy seven has a single-mode rocket engine with strong fuel. The aerodynamics are novel, combining vestigial cruciform wings with grid fins used as tail control surfaces (similar devices are used on the OTR-23 Oka, and USAF makes use of them on MOAB). Each floor includes a metallic body containing a blade-like grid meeting which mixes a extra manage area, and for that reason lifting pressure, with decreased weight and size. The improvement for this manage idea took 3 years of theoretical paintings and testing. These surfaces require much less effective actuators than traditional fins.[citation needed] The waft separation which happens at excessive angles of assault complements its turning ability, giving the missile a maximum turn rate of as much as 150° in line with second. However, up to date editions of the R-77, including the izdeliye a hundred and eighty this is destined for the Sukhoi Su-57, will use traditional fins instead. The missile makes use of a multi-characteristic doppler-monopulse energetic radar seeker evolved through OAO Agat. The radar capabilities modes of operation, over quick distances, the missile will release in an energetic "fire-and-forget" mode. Over longer distances the missile is managed through an inertial steerage car pilot with occasional encoded statistics hyperlink updates from the release plane's radar on modifications in spatial function or G of the goal. As the missile comes inside 20 km (12 mi) of its goal, the missile switches to its energetic radar mode. The host radar device keeps computed goal data in case the goal breaks the missile's lock-on.

R-73 (AA-11 Archer) Russian Short-Range Air-to-Air Missile

Tiers:

Variants:

- **R-73:** Standard model with ±40° off-boresight.
- **R-73E:** Export version of the standard model.
- **R-73M:** Improved model.
- **R-74 (izdeliye 740):** Improved model with ±60° off-boresight.
- **RVV-MD:** Export model of the R-74
- **K-74M (izdeliye 750):** Improved model with ±75° off-boresight.
- **K-74M2 (izdeliye 760):** Further improved variant with reduced cross-section for the Sukhoi Su-57. It serves as the Russian equivalent to the AIM-9X and ASRAAM.

System

Alternate Designation: R-73; AA-11 Archer
Manufacturer: Vympel NPO (current), Tbilisi Aircraft Manufacturing (current)
Engine: Solid-fuel rocket engine
Operational Range: R-73E: 30 kilometres (19 mi) R-73M1: 30 kilometres (19 mi) R-74: 40 kilometres (25 mi)
Speed: Mach 2.5
Guidance System: All-aspect infrared homing
Launch Platform: MiG-21(Upgraded), MiG-23-98, MiG-25, MiG-27, MiG-29, MiG-31, MiG-35 Sukhoi Su-24, Su-25, Su-27, Su-30, Su-33, Su-34, Su-35, Sukhoi Su-57 (future) Mil Mi-24, Mil Mi-28, Kamov Ka-50, Kamov Ka-52 Yak-141, Yak-130 HAL Tejas IRIAF F-14 J-10

Dimensions

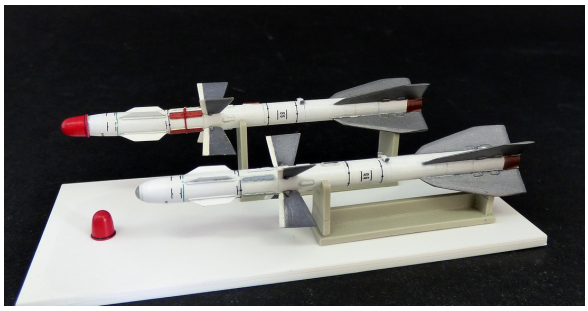
Length: 2.93 m
Diameter: 165 mm
Wingspan: 510 mm
Weight: 105 kg
Warhead: 7.4 kg

Notes:

The Vympel R-73 (NATO reporting name AA-11 Archer) is a short-variety air-to-air missile evolved with the aid of using Vympel NPO that entered service in 1984. The R-73 was evolved to update the sooner R-60 (AA-8 'Aphid') weapon for short-range use with the aid of using Soviet fighter aircraft. Work commenced in 1973, and the primary missiles entered service in 1984. The

R-73 is an infrared homing (heat-seeking) missile with a sensitive, cryogenic cooled seeker with a substantial "off-boresight" capability: the seeker can "see" objectives as much as 40° off the missile's centerline. It may be centered with the aid of using a helmet-mounted sight (HMS) permitting pilots to designate objectives with the aid of using searching at them. Minimum engagement range is ready 300 meters, with most aerodynamic variety of almost 30 km (19 mi) at altitude. The weapon is utilized by the MiG-29, MiG-31, Su-27/33, Su-34 and Su-35, and may be carried with the aid of using more recent variations of the MiG-21, MiG-23, Sukhoi Su-24, and Su-25 aircraft. India is seeking to use the missile on their HAL Tejas. It also can be carried with the aid of using Russian assault helicopters, along with the Mil Mi-24, Mil Mi-28, and Kamov Ka-50/52. From 1994, the R-73 has been upgraded in production to the R-73M standard, which entered CIS carrier in 1997. The R-73M has more variety and a much wider seeker angle (to 60° off-boresight), in addition to advanced IRCCM (Infrared Counter-Counter-Measures). Further tendencies encompass the R-74 (izdeliye 740) and its export variant RVV-MD. Russia presently gets new advanced air-to-air missiles on the idea of the R-73. An advanced model of the R-74, the K-74M (izdeliye 750) features fully digital and re-programmable systems, and is meant to be used at the MiG-35, MiG-29K/M/M2, Su-27SM, Su-30MK and Su-35S. A similarly upgrade, referred to as the K-74M2 (izdeliye 760), is meant for the fifth-generation Sukhoi Su-57 aircraft. This missile has decreased move phase to healthy in inner weapon bays and could suit the overall performance of the AIM-9X and the ASRAAM. A easy sheet design, the K-MD (izdeliye 300), will supersede the K-74M2 in the future

R-27T (AA-10b) Russian Air-to-Air Missile



Tiers:

Variants:

- **R-27R/Alamo A:** This variant has semi-active radar guidance and a short-burn motor. It has a longer afterbody than other versions and a pointed nose. The 9B-1101K semi-active radar seeker has a lock-on range of 19 mi (30 km) against typical fighter targets and operates in J-band (10-20 GHz) with continuous wave monopulse systems. It has a look angle of +/-50 deg off boresight. The seeker weighs 74 lb (33.5 kg).
- **R-27T/Alamo B:** This version features IR guidance and a short-burn motor. The missile has a cylindrical body, blunt nose, tapered nozzle and a cruciform antenna. There are "ears" forward of the fixed cruciform inverse-tapered foreplanes. "Cropped delta" tail fins are located aft. The R-27T is equipped with a 36T infrared seeker.
- **R-27ER/Alamo C:** The R-27ER missile features semi-active radar guidance and a long-burn motor.
- **R-27ET/Alamo D:** This infrared guided variant has a long-burn motor. It was first seen by Western observers at an August 1989 Soviet air show. The R-27ET features an improved seeker compared to the R-27T with improved protection against IR countermeasures and better performance against low-flying cruise missiles. The seeker has a look angle of +/-55 deg off boresight.
- **R-27AE/R-27A/R-27EA/Alamo E:** This variant has active-radar homing and a long-burn motor. At the 1992 Farnborough Air Show, an R-27AE active-radar variant was unveiled that used the seeker developed by Agat for the R-77 (AA-12 Adder). Weighing 32 lb (15 kg) and measuring 24 in (600 mm) long, the seeker combined an inertial platform with a multimode pulse-Doppler active radar. These were controlled by a 2.2-lb (1-kg) digital computer with a 32-kilobyte read-only memory (ROM) and a 32K random-access memory (RAM) computer. The Agat 9B-1103M multi-function monopulse Doppler seeker has a lock-on range of 12 mi (20 km) against fighter targets. The radome has a distinctive conical shape unlike any other R-27 variant. After a cruise phase during which the missile receives command updates from the launch aircraft, the radar switches on and searches for a target. Against a target with a 53.8-sq ft (5-sq m) RCS, radar lock-on can occur at 10.8 nm (12.4 mi; 20 km). Vympel's chief designer claimed that the seeker could pick a target in a multi-target environment and would pursue a cruise missile. At the time of the 1992 air show, the seeker was described as having just left the design phase and being about to enter the development phase. The R-27AE is said to have superior ballistic performance to the R-77 (AA-12 Adder) and, as a result, more straight-line range.
- **R-27EM:** This missile has a semi-active radar seeker with improved low altitude engagement capability. It is said to be able to intercept targets flying as low as 10 ft (3 m). The R-27EM was modified for use over water and intended for the Su-33 carrier-based fighter.
- **R-27P:** Numerous reports have indicated that the R-27P likely entered service in the 1990s, according to Jane's Air-Launched Weapons for Sept. 15, 2010. The missile has a short, conical nose and Avtomatika's 9B-1032 (PRGS-27) anti-radiation seeker, which homes in on other airborne radars. The 9B-1032 seeker is modular and interchangeable with the R-77/RVV-AE. The R-27P is believed to have a range of 50 mi (80 km).
- **R-27EP/Alamo F:** This variant has a new 9B-1103M active radar seeker from Agat. It is said to be more advanced than the 9B-1348 seeker that equips the R-77/ RVV-AE . The R-27EP is said to have a range of 68 mi (110 km).

↳*R-27 (AA-10b) Air-to-Air Missile*

Name: R-27T/Alamo B; AA-10b
Type: Air-to-Air Missile
Manufacturer: Spetzetekhnika Vympel NPO, Moscow, Russia, in cooperation with Artem, Ukraine
Length: 3.70 m
DIameter: 230 mm
Wingspan: 0.77 m
Weight: 245 kg
Warhead: Conventional high-explosive wrapped by rods
Control Plane Span: 0.97 m
Propulsion: single-stage boost motor
Maximum Speed: supersonic
Maximum Range: 65 km
Guidance System: IR-cooled seeker, all-aspect capability, flare countermeasure filters; semi-active radar J band, CW monopulse seeker; ARM J band, passive IR homing, passive radar seeker

Notes:

R-27T/Alamo B This version features IR guidance and a short-burn motor. The missile has a cylindrical body, blunt nose, tapered nozzle and a cruciform antenna. There are "ears" forward of the fixed cruciform inverse-tapered foreplanes. "Cropped delta" tail fins are located aft. The R-27T is equipped with a 36T infrared seeker.

Matra R.530 French Short-Range Air-to-Air Missile

Matra R.530 Short-Range Air-to-Air Missile

↳***Missile***

Name: Matra R.530
Type: Short-range air-to-air missile
Basic Load: 2
Proliferation: Argentina Australia Brazil Cameroon Colombia France Egypt Iraq Israel Jordan Lebanon Morocco Pakistan South Africa Spain Venezuela Qatar
Manufacturer: Matra
In Service: 1962-Present
Length: 3.28 m
Diameter: 263 mm
Weight: 192 kg
Engine: two stage solid rocket, Hotchkiss-Brandt/SNPE Antoinette rocket 83.3 kN for 2.7 s + 6.5 s cruise
Wingspan: m1.1
Operational Range: 1.5 to 20 km
Speed: Mach 2.7
Guidance System: Semi active radar homing and Infrared homing[
Launch Platform: Dassault Mirage F1 Dassault Mirage III [1] F-8 Crusader

Notes:

The Matra R.530 is a French medium to short range air-to-air missile. It was available in infrared homing and semi active radar

homing as the main armament of the Mirage III which was able to carry a single missile in the centerline, the Mirage F1, which carried two (one of each type) under the wings, and the F-8 Crusader in French Navy service. On 29 November 1966, an Israeli Air Force Dassault Mirage III shot down two Egyptian MiG-19s which were trying to intercept an Israeli reconnaissance Piper J-3 Cub in Israeli airspace. The first MiG was destroyed with a R.530 fired from less than a mile away, marking the first aerial kill for the French made missile. The second MiG-19 was destroyed with cannon fire.

R-37M (AA-X-13/AA-13 Arrow) Russian Air-to-Air Missile

Tiers:

1 2 **3** 4

System

:
:
:

Missile

↳*Missile System*

Name: R-37 (AA-X-13/AA-13) Missile
Type: Supersonic Air-to-Air Missile
Manufacturer: Tactical Missiles Corporation
Length: 4.20 m
Diameter: 38 cm
Wingspan: 0.7 m
Weight: 600 kg
Warhead: HE, fragmenting
Propellant: Boost-Sustain Solid Rocket
Warhead Weight: 60 kg
Operational Range: 150-398 km
Speed: Mach 5
Guidance System: Inertial with mid-course update, semi-active and active radar homing

Notes:

The Vympel R-37M (NATO reporting name: AA-X-13/AA-13 Arrow) is a Russian supersonic air-to-air missile with a very long range. The missile and its variants also had the names K-37, izdeliye 610 and R-VD (Ракета Высокой Дальности (Raketa-Vysokoy Dalnosty), "Very Long Range Missile"). It was developed from the R-33. It was designed to shoot down tankers, AWACS and other C4ISTAR aircraft whilst keeping the launch platform out of range of any fighters that might be protecting the target. The R-37 is now in production to equip upgraded Russian MiG-31BM interceptors. Despite the early intent to integrate the weapon on the Flanker family, this has yet to be reported. The R-37 was developed from the R-33. For compatibility with

aircraft that did not have the MiG-31's sophisticated radar, the semi-active seeker was replaced with a variant of the Agat 9B-1388 active seeker; mid-body strakes enhance lift and hence range, and folding tail controls allow semi-conformal carriage on planes that are not as big as the MiG-31. According to Defence Today, the range depends on the flight profile, from 80 nautical miles (150 km) for a direct shot to 215 nautical miles (398 km) for a cruise glide profile. According to Jane's there are two variants, the R-37 and the R-37M; the latter has a jettisonable rocket booster that increases the range to "300-400km" (160–220 nm). The R-37M designation has since been used for a modernized variant of the missile, also known as RVV-BD (Raketa Vozduh-Vozduh Bolyshoy Dalnosty, English for Long-Range Air-to-Air Missile). R-37M is hypersonic and has range exceeding 300km. It will be carried by the modernized MiG-31BM interceptors and Su-35S and Su-57 multirole fighters. It is not known if the long range air-to-air missile for the Su-57, designated as Izdeliye 810, is a derivative of the R-37M. The missile can attack targets ranging in altitude between 15–25,000 meters. Missiles can be guided semi-actively or actively through Agat 9B-1388 system.

PL-15 (Thunderbolt-15) Chinese Active Radar-Guided Very Long Range Air-to-Air Missile

Tiers:

System

:
:
:

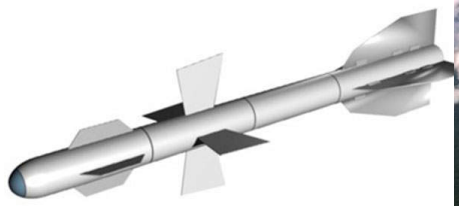
↳*PL-15 Active Radar-Guided Very Long-Range Air-to-Air Missile*

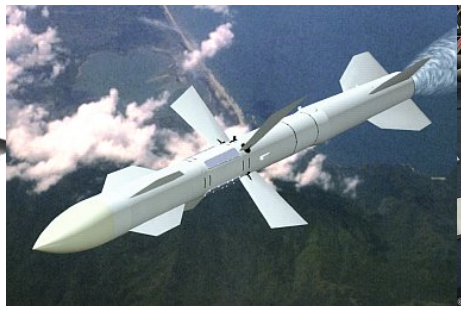
Name: PL-15
Type: Active Radar-Guided Very Long-Range Air-to-Air Missile
Manufacturer: 607 (Air-to-Air Missile Research Institute)
Length: 4.0 m
Diameter: INA
Wingspan: INA
Engine: Pulsed solid-propellant rocket
Operational Range: 300+ km
Maximum Speed: Mach 4
Guidance System: Active Radar-Guided

Notes:

The PL-15 (Chinese: □□-15; pinyin: Pī Lì-15; lit.: 'Thunderbolt-15') is an active radar-guided very long range air-to-air missile developed by the People's Republic of China. The PL-15 entered military service in 2016 and is carried by the Chengdu J-10C, Shenyang J-16 and the Chengdu J-20, aircraft. The missile features an active electronically scanned array radar, and has a range exceeding 200 km – comparable to that of the Russian R-37 missile. It is 4 meters long and incorporates a dual-thrust rocket motor, capable of a speed of Mach 4. Photos show that it has also been fitted to the newest version of the J-11B fighter upgraded with AESA radar. A reported PL-15 missile with a range of over 400 km carried by a J-16 fighter may actually be the PL-21 missile. Compared to the previous generation PL-12, the new and larger PL-15 has a longer radar detection range, increased anti-jamming capability and around twice the range. During the 2018 Airshow China, two J-20 fighters of the PLAAF displayed their internal payload bays, with each carrying four PL-15 and two PL-10E short-range missiles. The PL-15 effectively increases Chinese anti-access/area denial capability by targeting key "enabler" targets, such as aerial refueling and AEW&C aircraft. Military expert Fu Qianshao suggested that China was developing an advanced long-range air-to-air missile capable of hitting targets at a distance of up to 400 km.

R-27 (AA-10 Alamo) Russian Air-to-Air Missile





Tiers:

Variants:

- **R-27R:** AA-10 Alamo-A, semi-active radar homing. Missile can be used at 20 to 25,000 meters altitude (launch platform or target). Effective kill range for a target at same altitude: 2 to 42.5 km head-on, 0.7 to 7.5 km tail-on. Maximum range: 73 km. Maximum allowed vertical separation between target and launch platform: +/− 10 km.
- **R-27T:** AA-10 Alamo-B, infrared homing, passive homing using the Avtomatika 9B-1032 (PRGS-27) IR seeker head. Missile can be used at 20 to 25,000 meters altitude. Effective kill range for a target at same altitude: 2 to 33 km head-on, 0 to 5.5 km tail-on. Maximum range: 63 km. Maximum allowed vertical separation: +/−10 km.
- **R-27ER:** AA-10 Alamo-C, the semi-active-radar homing extended-range version. Missile can be used at 20 to 27,000 meters altitude. Effective kill range for a target at same altitude: 2 to 65.5 km head-on, 0.7 to 16.5 km tail-on. Missile cannot be fired at altitude less than 3 km against a target with background earth, if launch range is less than 6 kilometers. Maximum range: 117 km. Maximum allowed vertical separation: 12 km.[
- **R-27ET:** AA-10 Alamo-D, the infrared-homing extended-range version, Weight 348 kg. Missile can be used at 20 to 27,000 meters altitude. Effective kill range: 2 to 52.5 km head-on, 0.7 to 12.5 tail-on. Maximum range: 104 km. Maximum allowed vertical separation: 12 km.
- **R-27P:** AA-10 Alamo-E, passive radar homing with a range of up to 72 km.
- **R-27EP:** AA-10 Alamo-F, a longer range passive anti-radiation missile with a range of up to 70 nm (110 km)
- **R-27EA:** active radar homing with 9B-1103K active seeker, range of >130 km.
- **R-27EM:** active radar homing with 9B-1103K active seeker, range of >170 km.

System

:

↳*R-27 Missile*

Name: R-27
Type: Air-to-Air Missile
Manufacturer: Vympel
Length: 4.08 m
Diameter: 230 mm
Wingspan: 772 mm
Weight: 253 kg
Warhead Type: blast/fragmentation, or continuous rod

Warhead Weight: 39 kg

Detonation Mechanism: radar-proximity and impact fuzes

Engine: High performance, w. directed-rocket motor Solid-fuel rocket motor

Operational Range: up to 40 km

Flight Altitude: INA

Maximum Speed: Mach 4.5

Guidance System: semi-active radar homing (A/C), active-radar-homing (R-27EA), infrared homing (B/D), passive radar (E/F)

Notes:

The Vympel R-27 missile (NATO reporting name AA-10 Alamo) is a medium-to-long-range air-to-air missile developed by the Soviet Union. It remains in service with the Russian Air Force and air forces of the Commonwealth of Independent States. The R-27 is manufactured in infrared-homing (R-27T), semi-active-radar-homing (R-27R), and active-radar-homing (R-27EA) versions, in both Russia and Ukraine. The R-27 missile is carried by the Mikoyan MiG-29 and Sukhoi Su-27 fighters, and some of the later-model MiG-23MLD fighters have also been adapted to carry it. The R-27 missile is also license-produced in China, though the production license was bought from Ukraine instead of Russia.

PL-5EII Chinese Short-Range Infrared-Homing Air-to-Air Missile

Tiers:

Variants:

- **Pl-5:** The PL-5 (□□-5) air-to-air missile (PL stands for Pi Li, "Thunderbolt" in Chinese, the generic designation for all PRC air-to-air missiles) is a short-range, Infrared homing missile use by Chinese fighters. It is based on AA-2 Atoll technology and resembles the AIM-9 Sidewinder.

System

Length: 2.893m
Diameter: 0.127m
Wingspan: 0.617m
Weight: 83kg
Warhead: 6kg blast-frag, or expanding rod (RF-fuse)
Detonation Mechanism: Active infrared, laser proximity fuse
Engine: Solid-fuel rocket
Operational Range: 16~18km
Maximum Speed: Mach 2.5
Guidance System: Infrared homing, multi-element, dual band detector

Notes:

The PL-5 (□□-5) air-to-air missile (PL stands for Pi Li, "Thunderbolt" in Chinese, the generic designation for all PRC air-to-air missiles) is a short-range, Infrared homing missile use by Chinese fighters. It is based on AA-2 Atoll technology and resembles

the AIM-9 Sidewinder. The PL-5 was designed and developed at China's Luoyang Electro-Optics Technology Development Centre (EOTDC), also known as Institute 612; its design team members included Chen Jiali (□□□), Dong Chunfeng, Hu Rongchao (□□□), Huang Bin, Zhang Ming (□□), and Zheng Zhiwei (□□□). It was reportedly produced at the Hanzhong Nanfeng Machine Factory (also known as the Hanzhong Air-to-Air Missile Factory) of China Aviation Industry Corporation I. The PL-5 have been continuously upgraded by Luoyang and the latest variant, the PL-5EII added a dual band, multi-element detector as well as a laser proximity fuse similar to the PL-9. According to Chinese export/import agency CATIC, the PL5E has an all-aspect capability with the seeker having a maximum off boresight angle of ±25° before launch, and ±40° after launch. PLAAF J-10 and J-11 fighter jets are mainly using PL-8 missile, which is more advanced comparing PL-5. However, due to greater weight and dimension of PL-8 missile, for F-7 and JH-7, PL-5 is still the preferable air-to-air missile at this stage.

R-73E Russian Air-to-Air Missile

Tiers:

Variants:

- **R-73A:** This is the domestic Russian air force variant.
- **R-73E:** The R-73E is the export variant with extended range.
- **R-73M Upgrade/R-74:** The versions includes improvements to the seeker and radar that allow the AA-11 to increase its boresight engagement angle from 60 degrees to as much as 90 degrees. A new algorithm also enhances the missile's resistance to countermeasures and provides automatic precision selection of the aimpoint. This version may have been redesignated as the R-74. Two variants of this upgrade have been identified as the R-73M1 and R-72M2 (R-72 RDM-2).
- **R-73 Rearward-Launched Missile:** This variant was once under experimental development; its final disposition is unknown. Test launches were conducted from the Su-27 Flanker at both sub- and supersonic speeds. It was launched in the rear hemisphere of the aircraft and could be utilized in day or night conditions with high ECM and i ntense ground clutter. Rearward flight was controlled trough "aerogaz dynamic" controls (vectored thrust control). Although similar to the R-73 in many respects, the rearward-launched R-73 had the following characteristics:

System

:
:
:

↳***R-73E Air-to-Air Missile***

Name: R-73E
Type: Air-to-Air Missile
Manufacturer: Molniya, Moscow, Russia (designer) Spetztekhnika Vympel, Moscow, Russia (manufacturer) Arsenal central design office, Kiev, Ukraine (seeker assembly)
Length: 2.90 m
Diameter: 170 mm
Wingspan: 0.51 m
Maximum Launch Distance, Front Hemisphere: 30 km
Maximum Launch Distance, Rear Hemisphere: 300 m
Maximum Range: 30 km
Minimum Range: 200 m

Maximum Target Speed: 2,500 km/h, Mach 2.35

Maximum Target Load: 12 g

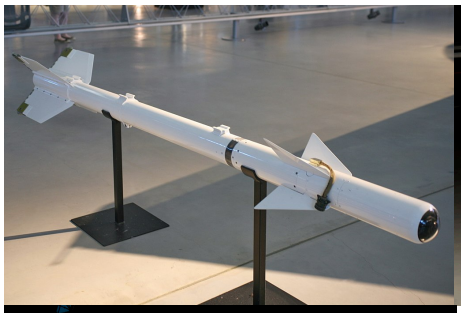
Warhead: conventional high-explosive expanding rod

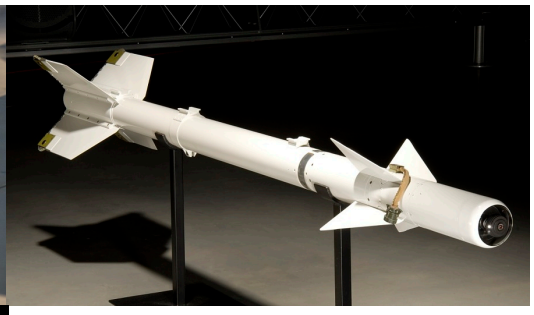
Guidance System: cooled IR seeker, probably with all-aspect capability, flare countermeasure filters

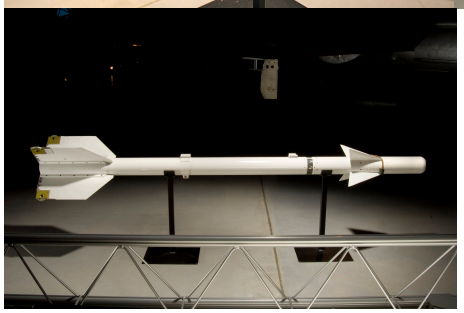
Notes:

R-73E The R-73E is the export variant with extended range. The AA-11 Archer (Russian R-73) is an infrared (IR) seeking air-to-air missile (AAM) that has become the benchmark for all IR missiles under development. It is the best short-range AAM in the Russian arsenal and has been cleared for use on a wide variety of aircraft. The Archer is fitted with four sets of cruciform fins, all indexed in line with one another. The lead set of fins is small and mounted on a small pivot arm. The fin area is behind the pivot point. The second set has four fixed, rhomboid, low-aspect-ratio vanes with a notch cut in the trailing edge to accommodate the leading edge of the third set of larger, movable, delta-wing fins.

K-13 (AA-2 Atoll) Russian Short-Range Infrared Homing Air-to-Air Missile







Tiers:

1 2 3 4

System

:
:
:

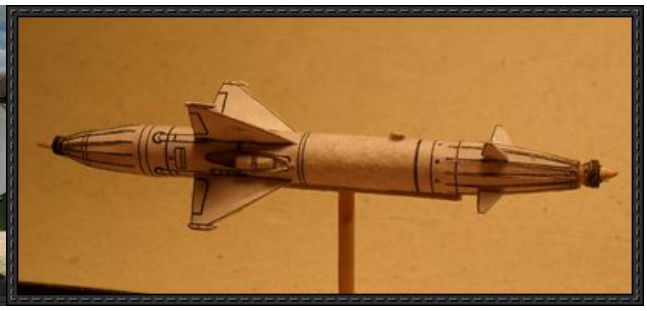
↳ ***K-13 (AA-2 Atoll) Infrared Homing Air-to-Air Missile***

Name: K-13; NATO: AA-2 Atoll
Type: Infrared Homing Air-to-Air Missile
Manufacturer: Vympel
Length: 2.830 m
Diameter: 127 mm
Wingspan: 631 mm
Weight: 90 kg
Warhead Weight: 7.4 kg
Engine: solid-fuel rocket engine
Operational Range: 1.0 to 3.5 km
Maximum Speed: Mach 2.5
Guidance System: infrared homing
Launch Platform: MiG-21, MiG-23, MiG-19 Sukhoi Su-17/20/22

Notes:

The Vympel K-13 (NATO reporting name: AA-2 "Atoll") is a short-range, infrared homing air-to-air missile developed by the Soviet Union. It is similar in appearance and function to the American AIM-9 Sidewinder from which it was reverse-engineered. Although it since has been replaced by more modern missiles in frontline service, it saw widespread service in many nations. The Sidewinder was quickly reverse engineered as the K-13 (also called R-3 or Object 300) and entered limited service only two years later in 1960. This was followed by the improved K-13A (R-3S, Object 310), which entered service in 1962. The R-3S was the first version to enter widespread production, in spite of a very long seeker settling time on the order of 22 seconds, as opposed to 11 seconds for the original version. The R-3S was seen by the West in 1961 and given the NATO reporting name AA-2A 'Atoll'. Minimum engagement range for the R-3S is about one kilometre. All K-13 variants are physically similar to Sidewinder, sharing the 5 inch (127 mm) diameter. Subsequent examination of AA-2 missiles captured by NATO forces showed that parts from an AIM-9 could be interfaced with parts from an AA-2 and either combination would still work.

K-5 (AA-1 Alkali) Russian Short-Range Air-to-Air Missile



Tiers:

1 2 3 4

System

:
:
:

↳*K-5 Air-to-Air Missile*

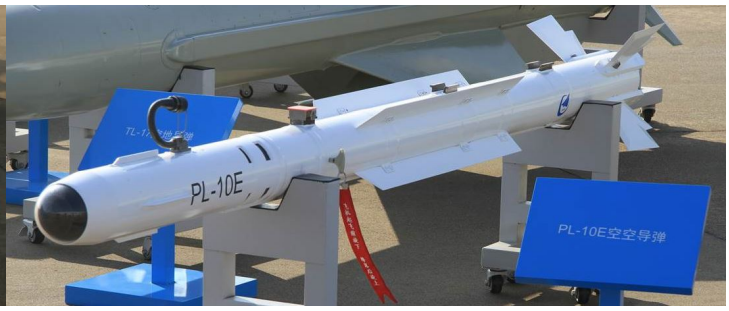
Name: K-5; NATO: AA-1 Alkali
Type: Air-to-Air Missile
Manufacturer: Kaliningrad Series Production Plant
Length: 2.49 m
Diameter: 200 mm
Weight: 82.7 kg
Warhead Type: High explosive
Warhead Weight: 13 kg
Engine: Rocket
Operational Range: 2-6 km
Maximum Speed: 2,880 km/h
Guidance System: Beam riding
Launch Platforms: MiG-17, MiG-19, MiG-21, Su-9

Notes:

The Kaliningrad K-5 (NATO reporting name AA-1 Alkali), also known as RS-1U or product ShM, was an early Soviet air-to-air missile. The development of the K-5 began in 1951. The first test firings were in 1953. It was tested (but not operationally carried) by the Yakovlev Yak-25. The weapon entered service as the Grushin/Tomashevich (Russian: Грушин/Томашевич) RS-2U (also known as the R-5MS or K-5MS) in 1957. The initial version was matched to the RP-2U (Izumrud-2) radar used on the MiG-17PFU, MiG-19PM. An improved variant, K-5M or RS-2US in PVO service, entered production in 1959, matched to the RP-9/RP-9U (Sapfir) radar of the Sukhoi Su-9. The People's Republic of China developed a copy under the designation PL-1, for use by their J-6B fighters. The difficulties associated with beam-riding guidance, particularly in a single-seat fighter aircraft, were substantial, making the 'Alkali' primarily a short-range anti-bomber missile. Around 1967 the K-5 was replaced by the K-55

(R-55 in service), which replaced the beam-riding seeker with the semi-active radar homing or infrared seekers of the K-13 (AA-2 'Atoll'). The weapon was 7.8 kg (17 lb) heavier than the K-5, but had a smaller 9.1 kg (20 lb) warhead. The K-55 remained in service through about 1977, probably being retired with the last of the Sukhoi Su-9 interceptors.

PL-10 Chinese Air-to-Air Missile



Tiers:

1 2 3 4

System

:
:
:

↳ ***PL-10 (ASR) Air-to-Air Missile***

Name: PL-10 (ASR)
Type: Air-to-Air Missile
Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC)
Length: 3.0 m
Weight: 89 kg
Diameter: INA
Warhead: Blast-frag, or expanding rod (RF-fuse)
Detonation Mechanism: Laser proximity fuse and impact
Engine: Solid-propellant rocket
Guidance System: Multi-element imaging infrared
Maximum Range: 60 km
Note: The missile is fitted with a multi-element IIR seeker capable of +/-90 degree off boresight angles. The missile seeker can be slaved to a helmet-mounted display (HMD),allowing the pilot to track a target beyond the aircraft's radar scan envelope using the missile's high off-boresight capability, achieved by the pilot turning his head towards the target to lock-on, better known as "look and shoot". Flight is controlled by a thrust-vector controlled solid rocket motor and free-moving type control wings on the missile's tail. The central portion of the missile has long, thin strakes, which help maintain missile maneuverability in the terminal homing stage after the rocket motor stops firing.

Notes:

The PL-10 (Chinese: □□-10; pinyin: Pī Lì-10; literally: 'Thunderbolt-10') is a short-range, infrared-homing air-to-air missile (AAM) developed by the People's Republic of China. It was designed by Dr. Liang Xiaogeng (□□□) at the Luoyang Electro Optical Center, which is also known as Institute 612 and renamed in 2002 as the China Air-to-Air Guided Missile Research Institute (□□□ □□□□□□). Development of the missile commenced in 2004 for use on stealth fighters such as the J-20. The missile is fitted with a multi-element IIR seeker capable of +/-90 degree off boresight angles. The missile seeker can be slaved to a helmet-mounted

display (HMD), allowing the pilot to track a target beyond the aircraft's radar scan envelope using the missile's high off-boresight capability, achieved by the pilot turning his head towards the target to lock-on, better known as "look and shoot". Flight is controlled by a thrust-vector controlled solid rocket motor and free-moving type control wings on the missile's tail. The central portion of the missile has long, thin strakes, which help maintain missile maneuverability in the terminal homing stage after the rocket motor stops firing.

R-23 (AA-7 Apex) Russian Air-to-Air Missile

Tiers:

1 2 **3** 4

System

:
:
:

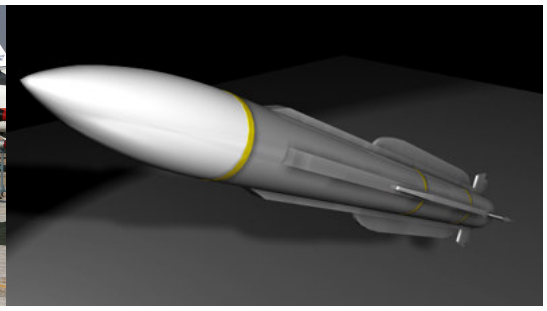
↳ ***R-23 Air-to-Air Missile***

Name: R-23; NATO: AA-7 Apex
Type: Air-to-Air Missile
Manufacturer: Vympel NPO
Length: 4.50 m
Diameter: 223 mm
Weight: 222 kg
Warhead Type: expanding-rod high explosive
Warhead Weight: 25 kg
Engine: solid fuel rocket
Propellant: 1.04 m
Operational Range: 35 km
Maximum Speed: Mach 3
Guidance System: Semi-active radar homing

Notes:

The Vympel R-23 (NATO reporting name AA-7 Apex) is a medium-range air-to-air missile developed by Vympel in the Soviet Union for fighter aircraft. An updated version with greater range, the R-24, replaced it in service. It is comparable to the American AIM-7 Sparrow, both in terms of overall performance as well as role. Design of a new missile to arm the MiG-23 fighter started in the mid-1960s under the direction of V.A. Pustyakov's design team. Known as the K-23 during its design, the new weapon was intended for use against bomber-sized targets, with "snap-up" capability to attack targets at higher altitude than the launch aircraft. It originally was intended to have a dual-mode seeker using both semi-active radar homing and infrared guidance, but this proved unfeasible, and separate SARH and IR models (Izdeliye (Product) 340 and 360, respectively) were developed instead. Test firings were carried out in 1967, although the SARH missile's seeker head proved to be extremely problematic. In 1968 the Soviets acquired an AIM-7 and a Vympel team started copying it as the K-25. A comparison of the two led to the K-23 entering production, based largely on its better range and countermeasures resistance. The K-25 work ended in 1971. Nevertheless, several features of the Sparrow were later used in the Vympel R-27 design. The missile, designated R-23, entered service in January 1974, the SARH version as the R-23R, the IR version R-23T. Both versions used the same motor and warhead, which had a lethal radius of 8 m (26 ft). In the west these were known as the AA-7A and AA-7B, respectively. An inert training round, the R-23UT, was also developed. The airframe featured four delta wings arranged cruciform just behind the midpoint of the fuselage, and cropped-delta control surfaces at the extreme rear in-line with the wings. Smaller cropped-triangular surfaces are mounted in-line near the nose : known as "destabilizers", they serve to improve the rudders' efficiency at high angles of attack (the R-60 missile uses the same feature). The only external difference between the two versions was the nose cone, which was an ogive for the SARH seeker, and shorter (by 30 cm) and more rounded for the IR version. Maximum range for the R-23R is 35 km, and for the infrared version R-23T is 15 km. Large numbers of R-23s were built., both by Molniya (ex OKB-4) as well as Vympel (ex OKB-134). Starting in 1975 an improved version of the weapon was developed to arm the MiG-23ML/MLD. The resultant SARH R-24R had lock-on after launch capability and expanded range (up to 50 km) and altitude capability (up to 25,000 m/82,000 ft), while the IR R-24T had a much improved seeker with greater sensitivity. Both versions had a larger motor, a heavier warhead, and a greatly reduced minimum range of 500 m (1,600 ft) for a rear-quarter engagement. They also could be used by or against aircraft maneuvering at up to 7g. The missiles were known officially as izdeliye (Product) 140 and 160 in the USSR, and AA-7C and AA-7D in the west. The R-23/24 was also produced under license in Romania as the A-911/A901. The R-24 remained in at least limited Russian service until the withdrawal of the last Russian MiG-23s in 1997.

Super 530D French Medium-Range Air-to-Air Missile



Tiers:

Variants:

- **Super 530D:** Super 530D is carried on the Dassault-Breguet Mirage 2000. It was introduced in 1988.
- **Super 530F:** Super 530F is carried on the Dassault Mirage F1. It was introduced in 1979.

Super 530D Medium-Range Air-to-Air Missile

↳ ***Missile***

Name: Super 530D
Type: Medium-range air-to-air missile.
Basic Load: 2
Proliferation: Widely Proliferated. France Egypt India Jordan Qatar Kuwait Peru
Length: Super 530F: 3.54 m Super 530D: 3.80 m
Diameter: mm263
Weight: Super 530F: 245 kg Super 530D: 270 kg
Warhead Type: High-explosive fragmentation
Warhead Weight: kg30
Detonation Mechansim: Super 530F: RF Super 530D: Active Radar
Engine: Solid-fuel rocket motor
Wingspan: Super 530F: 0.88 m Super 530D: 0.62 m
Operational Range: Super 530F: 25 km Super 530D: 40 km
Speed: Super 530F: Mach 4.5 Super 530D: Mach <5.0
Guidance System: Semi-active radar homing (SARH)

Notes:

The Matra Super 530 is a French short to medium-range air-to-air missile. The Super 530 series is an improved type of the R.530 missile. Super 530F is carried on the Dassault Mirage F1. It was introduced in 1979. Super 530D is carried on the Dassault-Breguet Mirage 2000. It was introduced in 1988. The Super 530 is being replaced by the MICA (missile). The Super 530F and Super 530D share the same general aerodynamic features and internal layout with cruciform low aspect ratio wings, cruciform aft controls, and 30 kg high explosive fragmentation warhead. However the 530D has a lengthened stainless steel body. This allows it to accommodate a more powerful dual-thrust solid propellant motor and a new seeker assembly. The new seeker includes doppler filtering for improved low altitude performance and digital micro-processing to enable the seeker to be reprogrammed against new threats. The 530D has a claimed maximum interception altitude of 24,400 m (80,100 ft), with a snap-up capability of 12,200 m (40,000 ft), and a snap-down capability to targets at 60 m (200 ft). The missile has a range of 40 km and a maximum speed of less than Mach 5. During the Iran-Iraq War, during the 1980s, the Iraqi Air Force used them on their Mirage F1 against Iran. On 14 September 1983, in an incident that was revealed thirty years later, two Turkish F-100F violated Iraqi air space and one was shot down by an Iraqi Mirage F1EQ firing a Super 530F missile. The Turkish pilots survived and returned to Turkey. On 15 July 2019, during a police operation in Northern Italy, a functioning Super 530F missile was seized together with firearms. The missile lacked the warhead. The weapons were smuggled by a group of people connected to far-right movements. The missile canister indicated it was originally sold to the Qatari armed forces. The original contract date with Qatar was October 1980.

AIM-9L American Short-Range Air-to-Air Missile

Tiers:

Variants:

- **AIM-9C:** As a Semi-Active Radar Homing (SARH) missile, the AIM-9C could be used from the frontal aspect of the target, provided a radar lock of sufficient quality was obtained.
- **AIM-9L:** The next major advance in IR Sidewinder development was the AIM-9L ("Lima") model which was in full production in 1977. This was the first "all-aspect" Sidewinder with the ability to attack from all directions, including head-on, which had a dramatic effect on close-in combat tactics. Its first combat use was by a pair of US Navy F-14s in the Gulf of Sidra in 1981 versus two Libyan Su-22 Fighters, both of the latter being destroyed by AIM-9Ls. Its first use in a large-scale conflict was by the United Kingdom during the 1982 Falklands War. In this campaign the "Lima" reportedly achieved kills from 80% of launches, a dramatic improvement over the 10–15% levels of earlier versions, scoring 17 kills and 2 shared kills against Argentine aircraft.
- **AIM-9M:** The subsequent AIM-9M ("Mike") has the all-aspect capability of the L model while providing all-around higher performance. The M model has improved capability against infrared countermeasures, enhanced background discrimination capability, and a reduced-smoke rocket motor. These modifications increase its ability to locate and lock-on to a target and decrease the chance of missile detection. Deliveries of the initial AIM-9M-1 began in 1982. The only changes from the AIM-9L to the AIM-9M were related to the Guidance Control Section (GCS). Several models were introduced in pairs with even numbers designating Navy versions and odd for USAF: AIM-9M-2/3, AIM-9M-4/5, and AIM-9M-6/7 which was rushed to the Persian Gulf area during Operation Desert Shield (1991) to address specific threats expected to be present.
- **AIM-9R:** The Navy began development of AIM-9R, a Sidewinder seeker upgrade in 1987 that featured a focal-plane array (FPA) seeker using video-camera type charge-coupled device (CCD) detectors and featuring increased off-boresight capability. The technology at the time was restricted to visual (daylight) use only and the USAF did not agree on this requirement, preferring another technology path. AIM-9R reached flight test stage before it was cancelled and subsequently both services agreed to a joint development of the AIM-9X variant.
- **BOA/Boxoffice:** China Lake developed an improved compressed carriage control configuration titled BOA. ("Compressed carriage" missiles have smaller control surfaces to allow more missiles to fit in a given space.[21] The surfaces may be permanently "clipped", or may fold out when the missile is launched.) The BOA design reduced size of control surfaces, eliminating the rollerons, and returned to simple forward-canard design. Although the Navy and Air Force had jointly developed and procured AIM-9L/M, BOA was a Navy-only effort supported by internal China Lake Independent Research & Development (IR&D) funding. Meanwhile, the Air Force was pursuing a parallel effort to develop a compressed carriage version of Sidewinder, called Boxoffice, for the F-22. The Joint Chiefs of Staff directed that the services collaborate on AIM-9X, which ended these separate efforts. The results of BOA and Boxoffice were provided to the industry teams competing for AIM-9X, and elements of both can be found in the AIM-9X design.
- **AIM-9X:** After looking at advanced short range missile designs during the AIM portion of the ACEVAL/AIMVAL Joint Test and Evaluation at Nellis AFB in the 1974–78 timeframe, the Air Force and Navy agreed on the need for the Advanced Medium Range Air-to-Air Missile AMRAAM. However, agreement over development of an Advanced Short Range Air-to-Air Missile ASRAAM was problematic and disagreement between the Air Force and Navy over design concepts (Air Force had developed AIM-82 and Navy had flight-tested Agile and flown it in AIMVAL). Congress eventually insisted the services work on a joint effort resulting in the AIM-9M, thereby compromising without exploring the improved off boresight and kinematic capability potential offered by Agile. In 1985, the Soviet Union did field a short range missile (SRM) (AA-11 Archer/R-73) that was very similar to Agile. At that point, the Soviet Union took the lead in SRM technology and correspondingly fielded improved infrared countermeasures (IRCM) to defeat or reduce the effectiveness of the latest Sidewinders. With the reunification of Germany and improved relations in the aftermath of the Soviet Union, the West became aware of how potent both the AA-11 and IRCM were and SRM requirements were readdressed.

- **Block II:** Testing work on the AIM-9X Block II version began in September 2008.[26] The Block II adds Lock-on After Launch capability with a datalink, so the missile can be launched first and then directed to its target afterwards by an aircraft with the proper equipment for 360 degree engagements, such as the F-35 and F-22. By January 2013, the AIM-9X Block II was about halfway through its operational testing and performing better than expected. NAVAIR reported that the missile was exceeding performance requirements in all areas, including lock-on after launch (LOAL). One area where the Block II needs improvement is helmetless high off-boresight (HHOBS) performance. It is functioning well on the missile, but performance is below that of the Block I AIM-9X. The HHOBS deficiency does not impact any other Block II capabilities, and is planned to be improved upon by a software clean-up build. Objectives of the operational test were due to be completed by the third quarter of 2013. However, as of May 2014 there have been plans to resume operational testing and evaluation (including surface-to-air missile system compatibility). As of June 2013, Raytheon has delivered 5,000 AIM-9X missiles to the armed services.
- **Block III:** In September 2012, Raytheon was ordered to continue developing the Sidewinder into a Block III variant, even though the Block II had not yet entered service. The USN projected that the new missile would have a 60 percent longer range, modern components to replace old ones, and an insensitive munitions warhead, which is more stable and less likely to detonate by accident, making it safer for ground crews. The need for the AIM-9 to have an increased range was from digital radio frequency memory (DRFM) jammers that can blind the onboard radar of an AIM-120D AMRAAM, so the Sidewinder Block III's passive imaging infrared homing guidance system was a useful alternative. Although it could supplement the AMRAAM for beyond visual range (BVR) engagements, it would still be capable at performing within visual range (WVR). Modifying the AIM-9X was seen as a cost-effective alternative to developing a new missile in a time of declining budgets. To achieve the range increase, the rocket motor would have a combination of increased performance and missile power management. The Block III would "leverage" the Block II's guidance unit and electronics, including the AMRAAM-derived datalink. The Block III was scheduled to achieve initial operational capability (IOC) in 2022, following the increased number of F-35 Lightning II Joint Strike Fighters to enter service.

System

:
:
:

↳ ***AIM-9L Short-Range Air-to-Air Missile***

Name: AIM-9L
Type: Short-Range Air-to-Air Missile
Manufacturer: Raytheon Company Ford Aerospace Loral Corp.
Length: 3.02 m
Diameter: 127.0 mm
Wingspan: 279.4 mm
Weight: 85.3 kg
Warhead Type: WDU-17/B annular blast-frag
Warhead Weight: 9.4 kg
Detonation Mechanism: IR proximity fuze
Engine: Hercules/Bermite Mk. 36 Solid-fuel rocket
Operational Range: 1.0 to 35.4 km
Maximum Speed: Mach 2.5+
Guidance System: Infrared homing

Notes:

The next major advance in IR Sidewinder development was the AIM-9L ("Lima") model which was in full production in 1977. This

was the first "all-aspect" Sidewinder with the ability to attack from all directions, including head-on, which had a dramatic effect on close-in combat tactics. Its first combat use was by a pair of US Navy F-14s in the Gulf of Sidra in 1981 versus two Libyan Su-22 Fighters, both of the latter being destroyed by AIM-9Ls. Its first use in a large-scale conflict was by the United Kingdom during the 1982 Falklands War. In this campaign the "Lima" reportedly achieved kills from 80% of launches, a dramatic improvement over the 10–15% levels of earlier versions, scoring 17 kills and 2 shared kills against Argentine aircraft. In combat uses of the AIM-9L, opponents had not developed tactics for the evasion of head-on missile shots with it, making them more vulnerable. The AIM-9L was also the first Sidewinder that was a joint variant used by both the US Navy and Air Force since the AIM-9B. The "Lima" was distinguished from earlier Sidewinder variants by its double delta forward canard configuration and natural metal finish of the guidance and control section. The Lima was also built under license in Europe by a team headed by Diehl BGT Defence. There are a number of "Lima" variants in operational service at present. First developed was the 9L Tactical, which is an upgraded version of the basic 9L missile. Next was the 9L Genetic, which has increased infra-red counter-counter measures (IRCCM); this upgrade consisted of a removable module in the Guidance Control Section (GCS) which provided flare-rejection capability. Next came the 9L, which had its IRCCM module hardwired into the GCS, providing improved counter-countermeasures as well as an upgraded seeker system. Diehl BGT also markets the AIM-9L-1 which again upgrades the 9L GCS and is considered an operational equivalent to the initially "US only" AIM-9M.

PL-21 Chinese Active Radar-Guided Long Range Air-to-Air Missile

These modifications increase its ability to locate and lock-on to a target and decrease the chance of missile detection. Deliveries of the initial AIM-9M-1 began in 1982. The only changes from the AIM-9L to the AIM-9M were related to the Guidance Control Section (GCS). Several models were introduced in pairs with even numbers designating Navy versions and odd for USAF: AIM-9M-2/3, AIM-9M-4/5, and AIM-9M-6/7 which was rushed to the Persian Gulf area during Operation Desert Shield (1991) to address specific threats expected to be present.
- **AIM-9R:** The Navy began development of AIM-9R, a Sidewinder seeker upgrade in 1987 that featured a focal-plane array (FPA) seeker using video-camera type charge-coupled device (CCD) detectors and featuring increased off-boresight capability. The technology at the time was restricted to visual (daylight) use only and the USAF did not agree on this requirement, preferring another technology path. AIM-9R reached flight test stage before it was cancelled and subsequently both services agreed to a joint development of the AIM-9X variant.
- **BOA/Boxoffice:** China Lake developed an improved compressed carriage control configuration titled BOA. ("Compressed carriage" missiles have smaller control surfaces to allow more missiles to fit in a given space.[21] The surfaces may be permanently "clipped", or may fold out when the missile is launched.) The BOA design reduced size of control surfaces, eliminating the rollerons, and returned to simple forward-canard design. Although the Navy and Air Force had jointly developed and procured AIM-9L/M, BOA was a Navy-only effort supported by internal China Lake Independent Research & Development (IR&D) funding. Meanwhile, the Air Force was pursuing a parallel effort to develop a compressed carriage version of Sidewinder, called Boxoffice, for the F-22. The Joint Chiefs of Staff directed that the services collaborate on AIM-9X, which ended these separate efforts. The results of BOA and Boxoffice were provided to the industry teams competing for AIM-9X, and elements of both can be found in the AIM-9X design.
- **AIM-9X:** After looking at advanced short range missile designs during the AIM portion of the ACEVAL/AIMVAL Joint Test and Evaluation at Nellis AFB in the 1974–78 timeframe, the Air Force and Navy agreed on the need for the Advanced Medium Range Air-to-Air Missile AMRAAM. However, agreement over development of an Advanced Short Range Air-to-Air Missile ASRAAM was problematic and disagreement between the Air Force and Navy over design concepts (Air Force had developed AIM-82 and Navy had flight-tested Agile and flown it in AIMVAL). Congress eventually insisted the services work on a joint effort resulting in the AIM-9M, thereby compromising without exploring the improved off boresight and kinematic capability potential offered by Agile. In 1985, the Soviet Union did field a short range missile (SRM) (AA-11 Archer/R-73) that was very similar to Agile. At that point, the Soviet Union took the lead in SRM technology and correspondingly fielded improved infrared countermeasures (IRCM) to defeat or reduce the effectiveness of the latest Sidewinders. With the reunification of Germany and improved relations in the aftermath of the Soviet Union, the West became aware of how potent both the AA-11 and IRCM were and SRM requirements were readdressed.

- **Block II:** Testing work on the AIM-9X Block II version began in September 2008.[26] The Block II adds Lock-on After Launch capability with a datalink, so the missile can be launched first and then directed to its target afterwards by an aircraft with the proper equipment for 360 degree engagements, such as the F-35 and F-22. By January 2013, the AIM-9X Block II was about halfway through its operational testing and performing better than expected. NAVAIR reported that the missile was exceeding performance requirements in all areas, including lock-on after launch (LOAL). One area where the Block II needs improvement is helmetless high off-boresight (HHOBS) performance. It is functioning well on the missile, but performance is below that of the Block I AIM-9X. The HHOBS deficiency does not impact any other Block II capabilities, and is planned to be improved upon by a software clean-up build. Objectives of the operational test were due to be completed by the third quarter of 2013. However, as of May 2014 there have been plans to resume operational testing and evaluation (including surface-to-air missile system compatibility). As of June 2013, Raytheon has delivered 5,000 AIM-9X missiles to the armed services.
- **Block III:** In September 2012, Raytheon was ordered to continue developing the Sidewinder into a Block III variant, even though the Block II had not yet entered service. The USN projected that the new missile would have a 60 percent longer range, modern components to replace old ones, and an insensitive munitions warhead, which is more stable and less likely to detonate by accident, making it safer for ground crews. The need for the AIM-9 to have an increased range was from digital radio frequency memory (DRFM) jammers that can blind the onboard radar of an AIM-120D AMRAAM, so the Sidewinder Block III's passive imaging infrared homing guidance system was a useful alternative. Although it could supplement the AMRAAM for beyond visual range (BVR) engagements, it would still be capable at performing within visual range (WVR). Modifying the AIM-9X was seen as a cost-effective alternative to developing a new missile in a time of declining budgets. To achieve the range increase, the rocket motor would have a combination of increased performance and missile power management. The Block III would "leverage" the Block II's guidance unit and electronics, including the AMRAAM-derived datalink. The Block III was scheduled to achieve initial operational capability (IOC) in 2022, following the increased number of F-35 Lightning II Joint Strike Fighters to enter service.

↳ ***AIM-9M Short-Range Air-to-Air Missile***

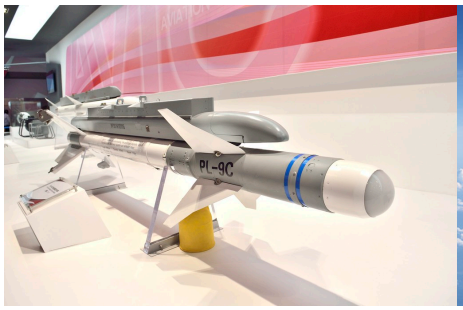
Name: AIM-9M
Type: Short-Range Air-to-Air Missile
Manufacturer: Raytheon Company Ford Aerospace Loral Corp.
Length: 3.02 m
Diameter: 127.0 mm
Wingspan: 279.4 mm
Weight: 85.3 kg
Warhead Type: WDU-17/B annular blast-frag
Warhead Weight: 9.4 kg
Detonation Mechanism: IR proximity fuze
Engine: Hercules/Bermite Mk. 36 Solid-fuel rocket
Operational Range: 1.0 to 35.4 km
Maximum Speed: Mach 2.5+
Guidance System: Infrared homing

Notes:

The subsequent AIM-9M ("Mike") has the all-aspect capability of the L model while providing all-around higher performance. The

M model has improved capability against infrared countermeasures, enhanced background discrimination capability, and a reduced-smoke rocket motor. These modifications increase its ability to locate and lock-on to a target and decrease the chance of missile detection. Deliveries of the initial AIM-9M-1 began in 1982. The only changes from the AIM-9L to the AIM-9M were related to the Guidance Control Section (GCS). Several models were introduced in pairs with even numbers designating Navy versions and odd for USAF: AIM-9M-2/3, AIM-9M-4/5, and AIM-9M-6/7 which was rushed to the Persian Gulf area during Operation Desert Shield (1991) to address specific threats expected to be present. The AIM-9M-8/9 incorporated replacement of five circuit cards and the related motherboard to update infrared counter-countermeasures (IRCCM) capability to improve 9M capability against the latest threat IRCM. The first AIM-9M-8/9 modifications, fielded in 1995, involved deskinning the guidance section and substitution of circuit cards at the depot level, which is labor-intensive and expensive—as well as removing missiles from inventory during the upgrade period. The AIM-9X concept is to use reprogrammable software to permit upgrades without disassembly.

PL-9C Chinese Short-Range Infrared-Homing Air-to-Air Missile



Tiers:

1 **2** 3 4

Variants:

- **PL-9:** The PL-9 (Chinese: □□-9; pinyin: Pī Lì-9; lit.: 'Thunderbolt-9') is a short-range, infrared-homing air-to-air missile (AAM) developed by the People's Republic of China.

System

:
:
:

↳*PL-9C Infrared-Homing Air-to-Air Missile*

Name: PL-9C
Type: Infrared-Homing Air-to-Air Missile
Length: 2.9m
Diameter: 0.157m
Wingspan: 0.856m
Weight: 115kg
Warhead: 11.8kg blast-frag, or expanding rod (RF-fuse)
Detonation Mechanism: laser proximity fuse
Engine: Solid-fuel rocket
Operational Range: 22km (PL-9C, air-to-air), > 8km (surface-to-air)
Flight Altitude: 4.5km (surface-to-air)
Maximum Speed: Mach 2+
Guidance System: multi-element infrared

Notes:

The PL-9 (Chinese: □□-9; pinyin: Pī Lì-9; lit.: 'Thunderbolt-9') is a short-range, infrared-homing air-to-air missile (AAM) developed by the People's Republic of China. It was originally designed by Dong Bingyin (□□□) at the Luoyang Electro Optical Center, which is also known as Institute 612 and renamed in 2002 as the China Air-to-Air Guided Missile Research Institute (□□□□□□□□□). After

Dong Bingyin died, his position was succeeded by Mr. Jin Xianzhong (□□□). The deputy general designer of PL-9 is the same deputy general designer of PL-12, Dr. Liang Xiaogeng (□□□). The PL-9C is one of the latest versions of the PL-9, which also has a surface-to-air variant (DK-9). The PL-9C tactical low-altitude surface-to-air missile (SAM) was first revealed during the 1989 Paris Air Show. The launch unit is available in both towed and self-propelled arrangement. The self-propelled version has a launch complex consisting four-rail launcher and the associated target acquisition and radar and electro-optical director mounted on a 6X6 WZ551 armored personnel carrier (APC). The towed version has a four-rail launcher mounted on a four-wheel carriage. The launch unit is supported by a range of truck-mounted ground equipment for maintenance and missile testing. The missile is fitted with a cryogenic liquid nitrogen gas-cooled IR seeker capable of +/-40 degree off boresight angles. Flight control is by long span pointed delta fins at the front of the missile with Sidewinder-type slipstream driven rollerons on the aft tail fin surfaces to prevent roll and so enhance the operation of the guidance system. The missile has a maximum effective range of 35 km and an altitude limit of 6.5 km. The single-shot hit probability for a single missile launch at an approaching target is 90%. The missile can be used at a stand-alone system, or as a part of the Type 390 (DK-9) brigade (regiment)-level combined AAA/SAM air defence system. The missile entered production in 1991 and saw limited service with the PLA ground forces.

PL-12 Chinese Air-to-Air Missile

Tiers:

Variants:

- **SD-10:** Export version of the PL-12. There is also a SD-10B.
- **DK-10A:** Surface-to-air variant with a range of 3 to 50 km and altitude from 30 m to 20 km.

System

:
:
:

↳***PL-12 Air-to-Air Missile***

Name: PL-12
Type: Air-to-Air Missile
Length: INA
Diameter: INA
Weight: 180 kg
Operational Range: 100 km
Guidance System: Active Radar

Notes:

The PL-12 (Chinese: □□-12; pinyin: Pī Lì-12; literally: 'Thunderbolt-12') is an active radar-guided beyond-visual-range air-to-air missile developed by the People's Republic of China. It is considered comparable to the American AIM-120 AMRAAM and the Russian R-77. The first public information of the Leihua Electronic Technology Research Institute's PL-12 – then called the SD-10 – emerged in 2001. Development was assisted by Vympel NPO and Agat of Russia. Liang Xiaogeng is believed to have been the chief designer. Four successful test firings were made in 2004. By 2005, the missile was also known as the PL-12. The PL-12 may use the radar and data link from the Russian R-77,[13] or otherwise use systems benefiting from technology transfers from Russia. The missile uses a Chinese rocket motor and airframe. The PL-12 may have a passive homing mode for use against jammers and AEW aircraft.

AS-30L French Short-to-Medium Range Air-to-Ground Missile

Tiers:

Variants:

- **AS-30:** Initial production variant using MCLOS guidance via a radio command link.

System

:
:
:

AS-30L French Short-to-Medium Range Air-to-Ground Missile

↳***Missile***

Name: AS-30L
Type: MCLOS with radio command link / laser guided short-to-medium range air-to-ground missile
Basic Load: 2
Manufacturer: Aérospatiale
Length: 3.7 m
Diameter: mm340
Weight: kg520
Warhead Type: Impact-fuzed SAPHE (Semi-Armor-Piercing High-Explosive)
Warhead Weight: kg240
Detonation Mechanism: Delayed AP impact fuse (2 m ferroconcrete)
Engine: Two-stage solid propellant rocket motors, composite booster, double-based sustainer
Wingspan: m1
Operational Range: km3-11
Flight Ceiling: m10,000

Speed: 1,700 km/h

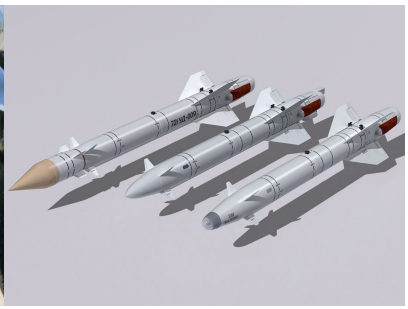
Guidance System: Semi-active laser homing

Launch Platforms: Mirage 2000D, Mirage 2000-5, F-16, Jaguar, Mirage F1, upgraded Super Etendard, Rafale

Notes:

The AS-30L is a French short-to-medium range air-to-ground missile which employs laser homing guidance. The AS-30L was a development of the earlier 1970s AS-30 missile, which uses MCLOS guidance via a radio command link between the aircraft and the missile. The only difference between the AS-30 and AS-30L is their guidance systems. In appearance, the earlier AS-30 has a sharp nose and the AS-30L has a slightly blunted nose. The AS-30L is employed for attacking targets which require a high degree of precision to engage effectively, but are also potentially dangerous enough to necessitate a longer-distance "stand off" attack profile to reduce the danger to the aircraft and pilot to ground-based anti-aircraft defences. The missile has a range of 3 to 11 kilometers, carries a 240 kilogram warhead, and claims a 1-meter CEP with either airborne or ground-based laser designators.

Kh-25 (AS-10 Karen) Russian Air-to-Ground Missile



Tiers:

Variants:

- **Kh-25:** original laser-guided variant
- **Kh-25ML:** semi-active laser guidance with tandem warhead that can penetrate 1 metre (39 in) of concrete
- **Kh-25MA:** active radar guidance, first offered for export in 1999
- **Kh-25MAE:** Kh-25MA update announced for export in August 2005 with Ka-band seeker, probably Phazotron's PSM which can detect a tank at 4,000 m (4,370 yd) and which can also be used on the Kh-25MA
- **Kh-25MS:** satellite navigation (GPS or GLONASS)[
- **Kh-25MSE:** export version of Kh-25MS, announced August 2005
- **Kh-25MT:** TV guidance
- **Kh-25MTP:** infra-red guidance variant of Kh-25MT
- **Kh-25R/Kh-25MR:** Radio-command guidance variant, it has a bigger 140 kg (309 lb) warhead.
- **Kh-27:** original anti-radiation missile
- **Kh-25MP:** modular anti-radiation variant
- **Kh-25MPU:** Updated Kh-25MP

System

:
:
:

↳***Kh-25 Air-to-Ground Missile***

Name: Kh-25; NATO: AS-10 Karen
Type: Air-to-Ground Missile
Manufacturer: Zvezda-Strela
Length: 370.5 cm
Diameter: 27.5 cm
Wingspan: 75.5 cm
Warhead: High explosive, shell-forming
Warhead Weight: 89.6 kg
Operational Range: 11 km
Maximum Speed: 1,370–2,410 km/h

Guidance System: Laser guidance, passive radar, TV guidance, IIR, Satellite guidance, active radar homing depending on varian

Launch Platform: MiG-21, MiG-23/27, MiG-29, Ka-52, Su-17/20/22, Su-24, Su-25, Su-27, Yakovlev Yak-130 Kh-25MP : MiG-23/27, Su-17/22, Su-24, Su-25

Notes:

The Kh-25/Kh-25M (Russian: X-25; NATO:AS-10 'Karen') is a family of Soviet lightweight air-to-ground missiles with a modular range of guidance systems and a range of 10 km. The anti-radar variant (Kh-25MP) is known to NATO as the AS-12 'Kegler' and has a range up to 40 km.[2] Designed by Zvezda-Strela, the Kh-25 is derived from the laser-guided version of the Kh-23 Grom (AS-7 'Kerry'). It has now been succeeded by the Kh-38 family, but the Kh-25 remains in widespread use. Based on an air-to-air missile, the beam-riding Kh-66 had been the Soviet Union's first air-to-ground missile for tactical aircraft, entering service in 1968. However it proved difficult to use in practice as the launch aircraft had to dive towards the target. A version with radio-command guidance, the Kh-23, was first tested in 1968 but problems with the guidance system meant that it would not enter service for another five years. So in 1971 work began on a version with a semi-active laser seeker, which became the Kh-25. This was initially known in the West as the Kh-23L. State testing began on 24 November 1974, and the Kh-25 entered production in 1975. Work began on an anti-radar missile derived from the Kh-66[5] in 1972, using a passive radar seeker and SUR-73 autopilot. The long-range Kh-31 anti-radar missile came out of the same project. The Kh-27 began state testing on a MiG-27 on 8 August 1975 but did not enter service until 2 September 1980. It was assigned the NATO reporting name AS-12 'Kegler' and in effect it replaced the much heavier Kh-28 (AS-9 'Kyle'). In 1973 Victor Bugaiskii was appointed head engineer of the bureau and he started work on combining the Kh-23M, Kh-25 and Kh-27 into a single modular system to reduce costs and improve tactical flexibility. This was completed by the end of 1978, resulting in the Kh-25MP (anti-radar), Kh-25ML (laser-guided) and Kh-25MR (radio-guided) family. NATO continued to refer to these as the AS-12 and AS-10 respectively, even though they could now be switched by a simple change of seeker head.

HJ-9 (Red Arrow 9) Chinese Air-to-Surface Missile

Tiers:

1 2 3 4

System

:
:
:
:

Hong Jian-9 (HJ-9) Air-to-Surface Missile

↳*System*

Manufacturer: Norinco
Length: mm1200
Diameter: mm152
Weight: kg37
Engine: Rocket Motor
Propellant: Solid Fuel
Warhead: Tandem HEAT warhead, 1100-1200 mm penetration RHAe
Detonation Mechanism: Contact Fuse
Guidance System: Laser-beam-riding & MMW Radar
Operational Range: m100-5,500

Notes:

The Hong Jian-9 (Chinese: □□-9; pinyin: Hóng Jiàn-9; literally: 'Red Arrow-9') is an advanced, third-generation anti-tank missile system deployed by the People's Liberation Army. The missile was developed by China North Industries Corporation (Norinco), and one of the chief designers was Yang Chunming (□□□). It is similar in appearance to the Israeli MAPATS (man portable anti-tank system), causing speculation about the link between the two missiles. It is also similar to the South African ZT3 Ingwe anti-tank missile. Like the MAPATS and ZT3, the HJ-9 is guided by laser beam riding. The HJ-9 has a maximum range of 5.5 km (3.4 mi), and a minimum range of 100 m (110 yd). Claimed armor penetration is 1,200mm, which is greater than that of the HJ-8. The missile may be fitted with high-explosive or thermal effect warheads for use against non-armored point targets, bunkers and fortifications. Like the HJ-8, the HJ-9 utilizes a disposable container/launching tube, but the one for HJ-9 is heavier, weighing 37 kg (82 lb) because HJ-9 is larger than HJ-8. The diameter of the HJ-9 is 152 mm (6.0 in) and the missile is compatible with a

variety of thermal imaging sights. In 2005, Norinco revealed in various public events that another version of HJ-9, the HJ-9A was already in service with Chinese armed forces, and this version used semi-active millimetre wave radar guidance. However, only photos of HJ-9A in service with Chinese paratroops were shown to the public. In these photos, the HJ-9A launcher is mounted on a jeep, and Norinco claimed the launcher on vehicles could be rapidly dismounted for foot soldiers. Norinco also revealed a further-developed advanced version of the HJ-9A, designated HJ-9B.

HJ-10 (Red Arrow 10) Chinese Air-to-Surface Missile

Tiers:

Variants:

- **AFT-10:** The AFT-10 (Chinese: □□□□-10; pinyin: Fǎn tǎnkè dǎodàn-10; literally: 'Anti-tank missile-10') is the surface-to-surface variant in the HJ-10 family, receiving designation of AFT-10. AFT-10 is a fiber-optic wire-guided missile that equipped with ZBD-04 Anti-tank platform. AFT-10 was first revealed in its deployment in Peace Mission 2014 joint military exercise.
- **AKD-10:** The AKD-10 is a air-to-surface variant. It weighs 50 kg (110 lb) and is laser guided
- **LJ-7:** The LJ-7 (or "Blue Arrow-7") is an air-to-surface export version. The tandem HEAT warhead can penetrate 1,400 mm (55 in). It has semi-active laser guidance, and an effective range of 2 kilometres (1.2 miles) to 8 km (5.0 mi). The launch weight is 47 kg (104 lb).

System

:
:
:

HJ-10 (Red Arrow 10) Chinese Air-to-Surface Missile

↳***Missile***

Name: HJ-10 (Red Arrow 10)
Alternate Designation: Lan Jian 7 (Blue Arrow 7)
Type: Air-to-Surface Missile
Manufacturer: Norinco
Length: 1,850 mm
Diameter: 170 mm
Weight: kg50
Warhead: Heat and others
Engine Propellant: Solid Fuel
Operational Range: km3-10
Speed: Supersonic
Guidance System: Fiber-optic wire-guided missile (AFT-10) semi-active laser homing and millimeter wave radar seeker

(AKD-10) Infrared homing

Aircraft Capible to Carry: ea16

Launch Platforms: CAIC Z-10 Changhe Z-11WB Harbin Z-19 CASC Rainbow ZBD-04A

Notes:

HJ-10 (or "Red Arrow 10") is a Chinese anti-tank missile developed by Norinco. It has a tandem high-explosive anti-tank (HEAT) warhead, that may penetrate 1,400 mm (55 in) of conventional steel armor protected by explosive reactive armor. The maximum range is 10 km (6.2 mi), with pre- or post-launch lock-on. Air-launched variants for helicopters and drones have also been developed. AFT-10, equipped on the ZBD-04A Anti-tank platform, is the ATGM version of the HJ-10 platform and it is the first one to be developed.

9M120 Ataka (AT-9 Spiral-2) Russian Air-to-Surface Missile

Tiers:

Variants:

- **9M120 Ataka:** 9M120 Ataka "AT-9 Spiral-2" SACLOS radio command guidance missile.
- **9M120:** 9M120 – This variant features a tandem HEAT warhead to defeat current and future armored fighting vehicles equipped with ERA.
- **9M120F:** 9M120F – This variant uses a thermobaric warhead for greater effect against buildings, unarmored targets, and bunkers.
- **9M220O:** This variant is included with an expanding rod warhead for use against helicopters. It is equipped with a proximity fuse to destroy aircraft, and detonates its fragmentation warhead when less than four meters from the target.
- **9M120M:** A modernized variant with an extended range of 8,000 m. The improved warhead can penetrate over 950 mm of RHA after ERA.
- **9M120D:** An improved variant with a range of 10 km
- **9M120-1 Ataka:** Upgraded Ataka missiles used by Ataka-T GWS
- **9M127-1 Ataka-VM:** New air to surface version for helicopters.

System

:
:
:

9M120 Ataka (AT-9 Spiral-2)

↳ ***Missile***

Name: 9M120 Ataka (AT-9 Spiral-2)
Type: Anti-Tank Guided Missile
Manufacturer: Degtyarev plant
Missile Length: m1.83
Missile Diameter: m0.13
Fin Span: m0.36
Missile Weight: kg42.5
Warhead Type: Tandem HEAT, fuel-air explosive, expanding rod
Warhead Weight: kg7.4

Range of Fire: km6

Guidance System: Radio-Guided & Semi-Automatic Command to Line of Sight (SACLOS) guidance

Speed: Supersonic

Notes:

The 9M120 Ataka (Russian: Атака; Attack) is an anti-tank guided missile (ATGM) originating from the Soviet Union. The NATO reporting name of the 9M120 missile is the AT-9 Spiral-2. It is the next major generation in the 9K114 Shturm (AT-6 Spiral) family. The missile has radio command guidance and is also a Beam riding SACLOS. This missile's primary variant was designed to defeat tanks with composite armour and explosive reactive armor. The 9M120 Ataka system is often confused with the 9K121 Vikhr system, despite being different weapons systems developed by different companies. The former was designed by the KBM machine-building design bureau and manufactured by the Degtyarev plant. According to the Stockholm International Peace Research Institute, Russia exported the Ataka ATGM to Iran, Kazakhstan, and Slovenia. The Ataka missile is stored in a glass reinforced plastic tube, which also acts as its launcher. The missile is reported to be considerably faster than the 9K114 Shturm, with longer range than the original version. It still uses radio command guidance, but the system has been improved when compared to the earlier 9K114 Shturm. The system is carried by the multiple kinds of helicopters including the Mi-28 and Mi-35. It is also offered for ground vehicles like the BMPT and the 9P149. There are three main missiles that are compatible with the launch system. The first is a two-stage anti-armour weapon that features a tandem warhead for dealing with add-on armor. The second variant of the missile – designated as 9M120F – has a thermobaric warhead for use against infantry positions and bunkers. The third variant of the 9M120 Ataka is the 9M220, which features a proximity fused expanding rod warhead, providing the missile with air-to-air capability against low- and slow-flying aircraft.

AGM-65 Maverick American Air-to-Surface Missile

Tiers:

Variants:

- **Maverick A:** Maverick A is the basic model and uses an electro-optical television guidance system. No longer in U.S. service.
- **Maverick B:** Maverick B is similar to the A model, although the B model added optical zooming to lock onto small or distant targets.
- **Maverick C:** Maverick C was to be a laser-guided variant for the United States Marine Corps (USMC). It was canceled before production, however its requirement was later met by the Maverick E.
- **Maverick D:** Maverick D replaced the electro-optical guidance with an imaging infrared system which doubled the practical firing distance and allowed for its use at night and during bad weather. A reduced smoke rocket engine was also introduced in this model. It achieved its initial operation capability in 1983.
- **Maverick E:** Maverick E uses a laser designator guidance system optimized for fortified installations and heavier penetrating blast-fragmentation warhead (140 kg (300 lb) vs. 57 kg (125 lb) in older models). It achieved IOC in 1985 and was used mainly by USMC aviation.
- **Maverick F:** Maverick F, designed specially for United States Navy, it uses a modified Maverick D infrared guidance system optimized for tracking ships fitted onto a Maverick-E body and warhead.
- **Maverick G:** Maverick G model essentially has the same guidance system as the D with some software modification that enables the pilot to track larger targets. The G model's major difference is its heavier penetrator warhead taken from the Maverick E, compared to the D model's shaped-charge warhead. It completed tests in 1988.
- **Maverick H:** Maverick H model is an AGM-65B/D missile upgraded with a new charge-coupled device (CCD) seeker better suited for the desert environment.
- **Maverick J:** Maverick J model is a Navy AGM-65F missile upgraded with the new CCD seeker. However, this conversion is not confirmed.
- **Maverick K:** Maverick K model is an AGM-65G upgraded with the CCD seeker; at least 1,200, but possibly up to 2,500 AGM-65G rounds are planned for conversion to AGM-65K standard.
- **Maverick E2/L:** Maverick E2/L model incorporates a laser-guided seeker that allows for designation by the launch aircraft, another aircraft, or a ground source and can engage small, fast moving, and maneuvering targets on land and at sea.

AGM-65 Maverick Missile

↳***Missile***

Name: AGM-65 Maverick
Type: Air-to-Ground Missile
Basic Load: INA
Manufacturer: Raytheon Missile Systems Raytheon
Length: 249 cm (8 ft 2 in)
Diameter: cm30
Warhead: 57 kg (126 lb) WDU-20/B shaped-charge (A/B/C/D/H models) 136 kg (300 lb) WDU-24/B penetrating blast-fragmentation (E/F/G/J/K models) E models utilize FMU-135/B delayed impact fuze
Weight: 210–304 kg
Engine: A/B:Thiokol SR109-TC-1 D/E/F/G/H/J/K: SR114-TC-1 (or Aerojet SR115-AJ-1) Solid propellant rocket motor via a WPU-4/B or WPU-8/B propulsion section
Wingspan: 710 mm
Propellant: Solid propellant
Operational Range: Greater than 22 km
Speed: 1,150 km/h
Guidance System: system A/B/H/J/K:: Electro-optical guidance D/F/G: imaging infrared guidance E: Laser guidance

Notes:

The AGM-65 Maverick is an air-to-ground missile (AGM) designed for close air support. It is the most widely produced precision-guided missile in the Western world, and is effective against a wide range of tactical targets, including armor, air defenses, ships, ground transportation and fuel storage facilities. Development began in 1966 at Hughes as the first missile to use an electronic contrast seeker. It entered service with the United States Air Force in August 1972. Since then, it has been exported to more than 30 countries and is certified on 25 aircraft. The Maverick served during the Vietnam, Yom Kippur, Iran–Iraq, and Persian Gulf Wars, along with other smaller conflicts, destroying enemy forces and installations with varying degrees of success. Since its introduction into service, numerous Maverick versions had been designed and produced using electro-optical, laser, and imaging infrared guidance systems. The AGM-65 has two types of warhead: one has a contact fuze in the nose, the other has a heavyweight warhead fitted with a delayed-action fuze, which penetrates the target with its kinetic energy before detonating. The missile is currently produced by Raytheon Missile Systems. The Maverick shares the same configuration as Hughes's AIM-4 Falcon and AIM-54 Phoenix, and measures more than 2.4 m (8 ft) in length and 30 cm (12 in) in diameter. The Maverick has a modular design, allowing for different combinations of the guidance package and warhead to be attached to the rocket motor to produce a different weapon. It has long-chord delta wings and a cylindrical body, reminiscent of the AIM-4 Falcon and the AIM-54 Phoenix. Different models of the AGM-65 have used electro-optical, laser, and imaging infrared guidance systems. The AGM-65 has two types of warhead: one has a contact fuze in the nose, the other has a heavyweight warhead fitted with a delayed-action fuze, which penetrates the target with its kinetic energy before detonating. The latter is most effective against large, hard targets. The propulsion system for both types is a solid-fuel rocket motor behind the warhead. The Maverick missile is unable to lock onto targets on its own; it has to be given input by the pilot or weapon systems officer (WSO) after which it follows the path to the target autonomously. In an A-10 Thunderbolt II, for example, the video feed from the seeker head is relayed to a screen in the cockpit, where the pilot can check the locked target of the missile before launch. A crosshair on the heads-up display is shifted by the pilot to set the approximate target, where the missile will then automatically recognize and lock on to the target. Once the missile is launched, it requires no further assistance from the launch vehicle and tracks its target automatically. This fire-and-forget property is not shared by the E version that uses semi-active laser homing.

KH-31 (AS-17 Krypton) Russian Air-to-Surface Missile

Tiers:

Variants:

- **Kh-31A:** active seeker head for use as an anti-ship missile against vessels up to destroyer size, range of 25 km–103 km (13.5–55.6 nmi). Missile is sea-skimming as it approaches the target.
- **Kh-31P:** Type 77P) - passive seeker head for use as an anti-radiation missile. Stays at high altitude throughout its flight, allowing higher speeds and increasing range to 110 km (60 nmi; 70 mi). The seeker has three interchangeable modules to cover different radar frequency bands, but they can only be changed at the factory.
- **Kh-31AD/Kh-31PD ("Kh-31 Mod 2"):** increase range through increasing the fuselage from 4.70 m (15 ft 5 in) to 5.3 m (17 ft 5 in) long.[18] As of 2012, the Kh-31PD is serially produced. Kh-31AD is in series production since 2013.
- **Kh-31PK:** installed non-contact fuse, maximum speed 900 m/s, range 120–160 km. Destined for Su-27SM, Su-30MK, Su-35. In serial production since 2009.
- **MA-31:** telemetry and other systems installed by McDonnell Douglas/Boeing for use by the US Navy as a target drone. Tested between 1996-2007; a version upgraded with GPS, the MA-31PG, was offered to the Navy as a replacement for the MQM-8 Vandal but they bought the GQM-163 Coyote. Even with the additional equipment, the MA-31 was capable of Mach 2.7 and 15G manoeuvres in its anti-ship (sea-skimming) flight profile and Mach 3.5 in ARM mode at 48,000 ft (15,000 m).
- **KR-1:** version of the Kh-31P exported to China in 1997. It seems that Zvezda wanted to sell an initial batch of KR-1's to China, before the KR-1 went into production in China. Rather than the original three seeker modules, the KR-1 has a single K-112E "export" seeker targeting D-F band (S band) emissions, and reportedly optimised for specific Taiwanese radars.
- **YJ-91:** Ying Ji 91 - Chinese missile based on the Kh-31P.[citation needed] They are also reported to have developed an anti-shipping version with an indigenous active seeker, and are looking to develop this for use in submarines. The name YJ-91 was already in use by 1997, and may have been a Chinese name for the original Russian missiles designated X-31 by the Russians. By 2005, the name YJ-93 was being applied to missiles made in China, but Western reports generally do not distinguish between YJ-91 and YJ-93.
- **Note:** An active/passive air-to-air version for use against slow-moving support aircraft, a so-called "AWACS killer", was announced at the 1992 Moscow air show with 200 km (110 nmi; 120 mi) range. That would be less than the 300–400 kilometres (160–220 nmi; 190–250 mi) promised by the Vympel R-37 (AA-13 'Arrow') and Novator R-172 missiles, but a Kh-31 derivative could be carried by a wider range of aircraft. However this may have been mere propaganda; in 2004 the Tactical Missiles Corporation "emphatically denied" that it had ever worked on an air-to-air version of the Kh-31. In 2005 rumours persisted of a Russian AWACS killer based on the Kh-31A anti-shipping model, and of the Chinese adapting the YJ-91, derived from the Kh-31P, for the same purpose.

KH-31 (AS-17 Krypton) Russian Air-to-Surface Missile

↳*System*

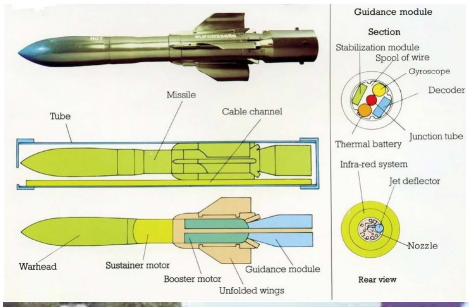
Name: KH-31 (AS-17 Krypton)
Type: Medium-range Air-to-Surface Missile
Basic Load: INA
Manufacturer: Tactical Missiles Corporation (Zvezda-Strela before 2002)

Length: Mod 1 : 4.700 m (15 ft 5.0 in)[3] Mod 2 (AD/PD) : 5.3 m (17 ft 5 in)
Diameter: 360 mm
Weight: Kh-31A :610 kg (1,340 lb) Kh-31P :600 kg (1,320 lb)
Warhead: HE shaped charge
Detonation Mechanism: Impact
Warhead Weight: Kh-31A :94 kg (207 lb) Kh-31P :87 kg (192 lb
Engine: Solid fuel rocket in initial stage, ramjet for rest of trajectory
Wingspan: mm914
Propellant: Kerosene
Operational Range: Kh-31A: 25 km–103 km (13.5–55.6 nmi; Kh-31P: up to 110 km (60 nmi; 70 mi)
Speed: Kh-31A/P: 2,160–2,520 km/h (1,340–1,570 mph) MA-31: Mach 2.7 (low), Mach 3.5 (high)
Guidance System: Kh-31A: inertial guidance with active radar homing Kh-31P: inertial with passive radar
Launch Platform: Both : Su-27SM, Su-30MKI, Su-25, Su-34, Su-35, MiG-29M, HAL Tejas Mk1 and Mk2, MiG-29K Kh-31A only : Su-33 Also : Su-24M

Notes:

New air defense weapon systems of the American Patriot kind have raised the requirements which antiradar missiles must meet. These include first of all higher speed and longer range, then also high interference immunity and radar turn-off when attacked. For the special purpose of meeting these requirements, the "Zvezda" group under the direction of V. Bugayskiy began in 1977 working on the Kh-31 missile (Article) 77P). The first launchings of this missile took place in 1982. The most interesting component of the Kh-31P is its dual propulsion system designed by the "Soyuz" Design Bureau in Turayevo near Moscow (note: there are several "Soyuz" engineering groups in Russia). First the missile is accelerated by its solid-fuel rocket engine to a speed of Mach 1.8, then the engine is discarded and the interior of the missile is converted into the combustion chamber of the missile's jet engine. The latter accelerates the missile to a speed of almost Mach 4.5, while four air intake holes on the sides of the missile body open up. On the basis of the Kh-31P antiradar missile were developed the Kh-31A missile (Article 77A) with an active-radar guidance head and also an M-31 flying target for air defense training exercises. The Kh-31 was for the first time publicly displayed in November 1991, in Dubai (United Arab Emirates). The State Scientific Production Center Zvezda-Strela has upgraded the air-to-surface supersonic ASM Kh-31A NATO: AS-17 Krypton). Recently a variant of the air-to-air class based on the Kh-31 was made available, equipped with a hybrid active-passive guidance head for use against nonmaneuvering airborne targets such as AWACS (passive guidance) from far distances. The range of this missile is 200 km. The unofficial designation of this missile is 'mini-Moskit'. The Kh-31A missile has been developed from the technologies of the 1970-80s. The improved version of the KH-31PM, a missile that is already very well known in the US Navy, was deployed in 2015. The KH-31 was a missile that the American fleet bought from Russia in the 1990s as a target missile for developing ships' anti-aircraft systems. The Americans used the KH-31PM to learn how to hit the Chinese 3M-54 Moskit anti-ship missiles, which had been produced by Russia. In the West the Moskit is codenamed “Sunburn”, due to its speed of over 1,700 mph and its destructive potential. The KH-31, which is very similar to the Moskit, is smaller and cheaper and is used for destroying above-water targets, radar stations and anti-aircraft missile complexes such as the Patriot. It can be installed in all types of Russian destroyers and bombers. The new KH-31PM has an increased range of 160 miles. It also has a new guidance system and engine, which make its flight more unpredictable and deadlier for the adversary. For example, the missile is equipped with the broadband guidance head, which can be used against practically all anti-aircraft systems. The earlier missiles were equipped with selective heads, which could only be used against one type of system.

Hot-3 French Air-to-Ground Missile



Tiers:

Variants:

- **HOT 1:** Designation HOT, Length 1.27 m/ Diameter 136 mm/ Wingspan 0.31 m/ Launch weight 23.5 kg/ Warhead 5 kg HEAT/ Armor penetration (est.) 800 mm/ Range 75–4,000 m/ Speed 864 km/h//
- **HOT 2/-2MP:** Designation HOT-2/-2MP/ Length 1.30 m/ Diameter 150 mm/ Wingspan 0.31 m/ Launch weight 23.5 kg/ Warhead 5 kg HEAT/ Armor penetration (est.) 900 mm/ 350mm (-2MP)/ Range 75–4,000 m/ Speed 864 km/h//

Helicopter Launched Anti-Tank Guided Missile

Name: HOT-3 (French: Haut subsonique Optiquement Téléguidé Tiré d'un Tube)
Type: Anti-tank Guided
Manufacturer: MBDA
Length: 1.3m
Diameter: 0.15m
Missile Weight: 24.5kg
Minimum Range: 75m
Maximum Range: 4,300m
Missile Velocity: 864 km/h
Armor Penetration: 1250mm

Warhead Type: Tandem charge HEAT

Guidance: Semi-automatic command to line of sight (SACLOS)

Engine: Two-stage solid fuel rocket

Notes:

The HOT (French: Haut subsonique Optiquement Téléguidé Tiré d'un Tube, or High Subsonic, Optical, Remote-Guided, Tube-Launched) is a second-generation long-range anti-tank missile system developed originally as an effort to meet a joint German-French Army requirement, by the then German firm Bölkow and the French firm Nord, to replace the older SS.11 wire guided missile which was in service with both nations. A few years later, Bölkow and Nord merged into MBB and Aérospatiale respectively, both of which firms later formed Euromissile to design and produce the MILAN, Roland and HOT. This firm (now MBDA), is a joint corporation of French and German defense firms. The HOT has become one of the most successful missiles of its class, with tens of thousands of missiles produced, used by no fewer than a dozen countries worldwide, and validated in combat in several wars. The missile system is also commonly mounted on light and medium armored vehicles, and attack helicopters. HOT entered limited production in 1976, with mass production of 800 missiles a month reached in 1978. HOT initially became operational with the German and French armies fitted to specialized armored antitank vehicles. In addition, Euromissile was in the enviable position of having large export orders from Middle East nations at the start of mass production. This was likely due to the situation in the late 1970s where many nations did not want to rely solely on arms purchases from the Soviets combined with the U.S. Congress restrictions on the export sales of the TOW antitank missile. In Europe, the end of the service life of the HOT missile system is in sight with the French opting to purchase Hellfire II missiles for their Tiger-HAD attack helicopters and the Germans planning to transition to the PARS 3 LR. Austria has decommissioned its HOT-carrying tank destroyers, while Spain is transitioning to Spike missiles to replace their HOT missile inventory. The HOT missile continues to be in widespread use in other areas of the world.

Kh-38 (Kh-38M) Russian Air-to-Surface Missile

Tiers:

1 **2** 3 4

Variants:

- **Kh-38MAE:** inertial, active radar homing
- **Kh-38MKE:** inertial, satellite guidance
- **Kh-38MLE:** inertial, laser guidance
- **Kh-38MTE:** inertial, infrared guidance
- **Kh-36 Grom-1:** AS-23 tactical cruise missile derivative/ AGM Air to Surface with 120km range
- **Kh-36P Grom-2:** AS-23B / KAB- guided bomb gliding 50-km range version 600 kg, various aim guidance, both created on the base of Kh-38M short-range tactical missile and also have a modular structure, warheads and seekers. First seen at MAKS 2015, intended to equip all types of fighters, including the MiG-35 and Su-57 fighters.
- **Kh-38M2:** improvement of Kh-38M, optoelectronic IR UV (CCD also ?) sensors

Kh-38/Kh-38M Missile

↳ ***Missile***

Name: Kh-38/Kh-38M Missile
Type: Air-to-Surface Missile
Manufacturer: Tactical Missiles Corporation JSC
Length: 4.2 m
Diameter: 0.31 m
Wingspan: 1.14 m
Weight: 520 kg
Warhead: HE fragmentation, cluster warhead, armor-piercing
Warhead Weight: up to 250 kg
Detonation Mechanism: Contact fuse
Engine: Solid rocket motor

Operational Range: up to 70 km

Flight Ceiling: 12000 m

Flight Altitude: 200-12000 m

Speed: Mach 2.2

Guidance System: Laser, active radar, IR, satellite, depending on variant

Notes:

The Kh-38/Kh-38M (Russian: X-38) is a family of air-to-surface missiles meant to succeed the Kh-25 family of missiles. The basic configuration of the Kh-38M was revealed at the 2007 Moscow Air Show (MAKS). The modular guided air-to-surface missile is meant to succeed the venerable Kh-25 missile family. The missile is designed to be carried by the fifth-generation Sukhoi Su-57 fighter aircraft. The first prototypes of the missile had initially folding wings and tail fins for internal carriage, and would have a variety of seeker heads for different variants. In a successive version, unveiled at MAKS 2017, both control surfaces were replaced by longer and narrower fixed ones, a solution similar to the one used in the Selenia Aspide missile.

YJ-8/C-802 (NATO: CSS-N-4 Sardine) Chinese Air-to-Surface Missile

Tiers:

Variants:

- **YJ-8:** YJ-8: Basic version with fixed wings
- **YJ-8A:** YJ-8A: Modified YJ-8 with folding wings
- **YJ-81:** YJ-81: Air-launched version without the booster.
- **YJ-82:** YJ-82: Submarine-launched version.
- **C-801:** C-801: Export version of YJ-8.
- **C-801K:** C-801K: Export version of the YJ-81.
- **C-801Q:** C-801Q: Export version of YJ-82.

YJ-8/C-802 (NATO: CSS-N-4 Sardine) Chinese Anti-Ship Missile

↳System

Name: YJ-8/C-802 (NATO: CSS-N-4 Sardine)
Type: Anti-Ship & Air-to-Surface Missiles
Manufactuer: China Aerospace Science and Industry Corporation
In Service: 1980s-Present
Length: m5.81
Width: INA
Weight: kg815
Warhead Type: High-explosive fragmentation
Warhead Weight: kg165
Engine: Rocket
Propellant: Solid Rocket
Operational Range: km42
Flight Altitude: m5-7
Speed: Mach 0.9
Guidance System: Inertial navigation/active radar homing terminal guidance
Basic Load: ea2

Notes:

The YJ-8 (Chinese: □□-8; pinyin: yingji-8; literally: 'eagle strike 8'; NATO reporting name: CSS-N-4 Sardine) is a Chinese surface-launched subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation (CASIC) Third Academy. The YJ-8 was developed into air-launched (YJ-81) and submarine-launched (YJ-82) variants. The YJ-8 is either based on, or is a heavily modified copy of, the MM38 Exocet; the two missiles share virtually identical operational profiles. The replication of the MM38's "revolutionary flight profile" in less than ten years and with an immature industrial base strongly suggests that China had access to proven technology.[4] The YJ-8 was a "radical departure" from China's first anti-ship missiles derived from the P-15 Termit. The YJ-8 carried a smaller warhead, but had the same range and speed while being significantly smaller and lighter. The development of the YJ-8 was approved in late-1976 following a few years of encouraging work on solid-fuel rockets. According to a 1991 Aerospace China article, development of the missile's engine began in 1978, and flight testing was completed in 1985. The YJ-8 reach initial operating capability in the People's Liberation Army Navy in 1987, the same year the export version—the C-801—was announced. CASIC received the first National Science and Technology Advancement Award for development of the YJ-8 in 1988.

9M17 Fleyta (AT-2 Swatter) Russian Air-to-Surface Missile

Tiers:

Variants:

- **AT-2A Swatter A MCLOS:** 3M11 / 9M11
- **AT-2B Swatter B Range increased to 3.5 km.:** 9M17 9M17DB Modified system to work with the Mi-8TB (Hip-E). 9M17M Skorpion-M MCLOS 9K8 (Falanga-M). Launch weight 29 kg (64 lb), Maximum range 3,500 m. First seen in the 1973 Moscow Parade.
- **AT-2C Swatter C SACLOS Falanga-PV (Fleyta) 9K8.:** 9M17P First SACLOS version. 9M17MP Improved engine and guidance lamp. Maximum range 4,000 m. 9M17N

9M17 Fleyta (AT-2 Swatter) Anti-Tank Guided Missile (ATGM)

↳***Missile***

Name: 9M17 Fleyta (AT-2 Swatter)
Type: Anti-Tank Guided Missile (ATGM)
Manufacturer: Nudelman OKB-16
Weight: kg27
Length: cm116
Diamter: mm148
Warhead Type: HEAT
Warhead Weight: kg5.4
Engine: Solid fuel rocket
Wingspan: cm68
Operational Range: km0.5-2.5
Speed: 160 m/s (360 mph)
Guidance System: Radio command

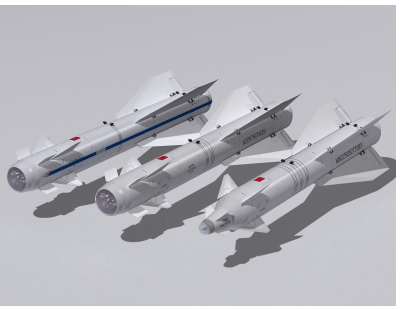
Steering System: MCLOS

Launch Platform: Mi-4, Mi-8, Mi-24, Mi-25, BRDM-1, BRDM-2

Notes:

The AT-2 Swatter is the NATO reporting name for the 3M11 Fleyta (flute) MCLOS radio command anti-tank missile of the Soviet Union. he missile was developed by the Nudelman OKB-16 design bureau. It was developed at about the same time as the AT-1 Snapper as a heavy ATGM for use on both ground launchers and helicopters. It addressed some of the problems of the AT-1; it was much faster, and had slightly longer range. These improvements were achieved by sending commands via a radio link instead of a trailing guidance wire, which allowed the missile to travel faster. However, it did make it vulnerable to jamming. The missile system was shown to Soviet premier Nikita Khrushchev in September 1964, and accepted for service shortly afterwards. The AT-2 was the first Soviet ATGM to be deployed from helicopters. Small numbers were fitted to the Mi-4AV. The missile was deployed on the Mi-8 Hip as well as the Mi-24 and Mi-25 'Hind' series of helicopters. It was also deployed on the BRDM-1 and BRDM-2 infantry fighting vehicles. The original AT-2A (3M11 Falanga) missile was problematic; one Russian source describes the missile as "notable for its complexity and low reliability". Also, the missile's range was felt to be inadequate. An improved version of the missile was developed: the AT-2B (9M17 Skorpion). Externally, the missiles are very similar, however the AT-2B range is increased to 3.5 km. The standard production version was the 9M17M Skorpion-M, which entered service in 1968. The next development was to integrate SACLOS guidance, resulting in the AT-2 Swatter-C or 9M17P Skorpion-P. It entered service in 1969. A product improved version the 9M17MP was developed that had an improved engine and signal lamp. The missile has been used extensively in the following wars on the Mi-24 platform. *Angolan War of Independence *Soviet invasion of Afghanistan *1980s Iran–Iraq War *1982 Lebanon War It was replaced in Soviet service by the 9K114 Shturm ATGM.

Kh-29 (AS-14 Kedge) Russian Air-to-Surface Missile



Tiers:

Variants:

- **Kh-29L (Izdeliye 63, 'Kedge-A'):** uses semi-active laser seeker and has a range of 8–10 km.
- **Kh-29ML:** is an upgraded version of the Kh-29L
- **Kh-29T (Izdeliye 64, 'Kedge-B')[:** is the TV-guided version which is fitted with automatic optical homing to a distinguishable object indicated by the pilot in the cockpit.
- **Kh-29TE[:** is a long-range (30 km) development of the Kh-29T. Minimum range is 3 km; launch altitude is 200-10,000 m.
- **Kh-29MP:** is a third generation guidance variant with active radar homing, making it a fire-and-forget weapon. It has a large 250 kg warhead with 12 km range.
- **Kh-29D:** is the fourth variant of the Kh-29TE which uses infrared imaging guidance.

System

:
:
:

↳*Kh-29 Air-to-Service Missile*

Name: Kh-29
Type: Air-to-Surface Missile
Manufacturer: Vympel / Tactical Missiles Corporation
Length: 390 cm
Diameter: 38.0 cm
Wingspan: 110 cm
Weight: 660 kg
Warhead Type: HE armour-piercing
Warhead Weight: 320 kg
Detonation Mechanism: Impact
Engine: Fixed thrust solid fuel rocket
Operational Range: 10 km
Maximum Speed: 1,470 km/h

Guidance System: semi-active laser guidance

Notes:

The Kh-29 (Russian: X-29; NATO: AS-14 'Kedge'; GRAU: 9M721) is a Soviet air-to-surface missile with a range of 10–30 km. It has a large warhead of 320 kg, has a choice of laser, infrared, active radar or TV guidance, and is typically carried by tactical aircraft such as the Su-24, Su-30, MiG-29K as well as the "T/TM" models of the Su-25, giving that craft an expanded standoff capability. The Kh-29 is intended for primary use against larger battlefield targets and infrastructure such as industrial buildings, depots and bridges, but can also be used against ships up to 10,000 tonnes, hardened aircraft shelters and concrete runways. The basic aerodynamic layout of the Kh-29 is similar to the Molniya R-60 (AA-8 'Aphid'), reflecting Molniya's heritage in air-to-air missiles. The laser guidance head came from the Kh-25 (AS-10 'Karen') and the TV guidance from the Kh-59 (AS-13 'Kingbolt'), mated to a large warhead. It has been compared to the United States' AGM-65 Maverick, but the AGM-65 is a much smaller missile than the Kh-29, and weighs less than half as much.

HOT-3 French Air-to-Ground Anti-Tank Guided Missile

Tiers:

Variants:

- **HOT-1:** fielded in 1978
- **HOT-2:** Fielded in 1985
- **HOT-3:** Fielded in 1998

Anti-Tank Guided Missile System

Name: HOT-3
Type: Air-to-Ground Anti-Tank Missile
Length: 1.30 m
Diameter, Launcher: 175 mm
Diameter, Missile: 150 mm
Launcher Weight: 23.5 kg
Launcher and Missile Weight: 32.0 kg
Warhead Weight: 5.0 kg
Warhead: Octol hollow-charge high-explosive anti-tank or multi-purpose penetration of rolled homogeneous armor (RHA). Penetrates up to 47 in (1,200 mm) of armor.
Engine: 1 x two-stage solid-propellant rocket; Bugeat booster with a burn of 0.9 sec; Epictete sustainer, 53 lb (24 kg) static thrust with a burn of 17.4 sec
Maximum Speed: Mach 0.74
Maximum Range: 4,300 m
Minimum Range: 400 m
Flight Time to 2,000 m: 9 sec
Flight Time to 3,000 m: 13 sec
Flight Time to 4,000 m: 17 sec
Guidance System: SACLOS wire-guided
Tracking System: optical or IR tracking of target; IR tracking of missile.
Basic Load: INA

Notes:

HOT-3 was brought into service in 1998 and has a tandem shaped-charge HEAT warhead capable of breaching explosive reactive armor as well as improved anti-jamming capabilities. HOT-3 was selected to be the missile armament of the Tiger attack helicopter for Germany at least until the PARS 3 LR becomes available. The HOT (French: Haut subsonique Optiquement Téléguidé Tiré d'un Tube, or High Subsonic, Optical, Remote-Guided, Tube-Launched) is a second-generation long-range anti-tank missile system developed originally as an effort to meet a joint German-French Army requirement, by the then German firm Bölkow and the French firm Nord, to replace the older SS.11 wire guided missile which was in service with both nations. A few years later, Bölkow and Nord merged into MBB and Aérospatiale respectively, both of which firms later formed Euromissile to design and produce the MILAN, Roland and HOT. This firm (now MBDA), is a joint corporation of French and German defense firms. The HOT has become one of the most successful missiles of its class, with tens of thousands of missiles produced, used by no fewer than a dozen countries worldwide, and validated in combat in several wars. The missile system is also commonly mounted on light and medium armored vehicles, and attack helicopters. HOT entered limited production in 1976, with mass production of 800 missiles a month reached in 1978. HOT initially became operational with the German and French armies fitted to specialized armored antitank vehicles. In addition, Euromissile was in the enviable position of having large export orders from Middle East nations at the start of mass production. This was likely due to the situation in the late 1970s where many nations did not want to rely solely on arms purchases from the Soviets combined with the U.S. Congress restrictions on the export sales of the TOW antitank missile. In Europe, the end of the service life of the HOT missile system is in sight with the French opting to purchase Hellfire II missiles for their Tiger-HAD attack helicopters and the Germans planning to transition to the PARS 3 LR. Austria has decommissioned its HOT-carrying tank destroyers, while Spain is transitioning to Spike missiles to replace their HOT missile inventory. The HOT missile continues to be in widespread use in other areas of the world.

9K121 Vikhr (AT-16 Scallion) Russian Laser Guided Anti-Tank Missile

Tiers:

1 **2** 3 4

Variants:

- **9A1472 Vikhr-1:** Upgraded version.[

System

Alternate Designation: 9K121 Vikhr; NATO: AT-16 Scallion
Manufacturer: KBP Instrument Design Bureau
Engine: solid-fuel rocket
Propellant: solid fuel
Operational Range: 10–12 km
Speed: 600m/s, Mach 1.8
Guidance System: Laser beam riding
Launch Platform: Helicopters Ka-50 Ka-52 Aircraft Su-25T/25TM Ships AK-630 Vikhr-K

Dimensions

Length: 2.80 m
Diameter: 130 mm
Weight: 45 kg
Wingspan: 380 mm
Warhead: 8–12 kg tandem HEAT charge, armor penetration behind ERA, 1,000 mm

Notes:

The 9K121 Vikhr (Russian: Вихрь, English: Whirlwind; NATO reporting name: AT-16 Scallion) is a Russian laser guided anti-tank missile. "9K121" is the GRAU designation for the missile system. The missile can be launched from warships, Ka-50 and Ka-52 helicopters, and Su-25T aircraft. It was first shown publicly at the 1992 Farnborough Airshow. The missile is designed to engage vital ground targets, including armoured targets fitted out with built-in and add-on explosive reactive armor, at a range of up to 8 km when fired from a helicopter and 10 km when fired from a fixed-wing aircraft in daytime and up to 5 km at night, as well as air targets in conditions of air defense assets activity. The Vikhr-1 missile is part of the Vikhr-M system, which also includes an automatic sight and a depressible launcher. Adopted in 1990. The automatic sight is provided with TV and IR channels for target sighting, a laser beam channel for missile control, a laser rangefinder, an automatic target tracking unit, a digital computer and a system for stabilization and aiming the sighting and beam channels. The automatic sight provides for target detection and identification both by day and night, automatic target tracking and missile guidance, and generates exact

information for gun and rocket firing. The guided missile consists of a HEAT fragmentation warhead fitted with a contact and a proximity fuze, an air-dynamic control actuator, control electronics, a motor and laser detector. It is kept in a sealed launching transporting container. The multi-purpose warhead (two-stage HEAT and an additional fragmentation sleeve) allows the missile to be used against armoured, airborne and area targets alike. This is an advantage compared to the three different missiles required in the 9M120 Ataka-V complex. The use of the proximity fuze allows a near miss of up to 5 m and makes it possible to engage an air target at speeds of 500 m/s. The Vikhr missile laser beam control system provides for its precise guidance owing to data transmission to the missile in the course of its launch, which is excluded in homing systems. The laser guidance principle is identical to that used by 9M117 Bastion or 9M119 Svir anti armor missiles. The Vikhr missile control system has high jamming immunity because its receiver faces the carrier, thereby protecting it from jamming signals. The high pinpoint target hit probability (reported 0.95 against stationary targets) is provided by the automatic target tracking system and highly accurate missile control system that makes allowance for changes in the parameters of the carrier and the target in the course of firing. The missiles can be fired singly or in pairs (at the same target to increase lethality). The high flight speed allows it to engage targets rapidly. The system is capable of launching Vikhr missiles against two to four targets during a 30-second period and starting at a range of 10 km, which increases its lethality to three to four times that of earlier systems.

9K114 Shturm (AT-6 Spiral) Russian SACLOS Radio Guided Anti-Tank Missile System

Tiers:

Variants:

- **9M114 Kokon / AT-6 Spiral:** 9M114 Kokon / AT-6 Spiral Entered service in 1976
- **9M114V Shturm-V:** 9M114V Shturm-V – Air to surface version for helicopters.
- **9M114 Shturm / AT-6A Spiral:** 9M114 Shturm / AT-6A Spiral SACLOS
- **9M114M:** 9M114M HEAT warhead.
- **9M114F:** 9M114F Thermobaric warhead.
- **9M114M1 Shturm / AT-6B Spiral:** 9M114M1 Shturm / AT-6B Spiral SACLOS, heavier 7.4 kg (16 lb) warhead penetrating 600–650 mm, longer 6 km (3.7 mi) range.
- **9M114M2 Shturm / AT-6C Spiral:** 9M114M2 Shturm / AT-6C Spiral SACLOS, further increased 7 km (4.3 mi) range.
- **9M120 Shturm-VM / AT-9 Spiral-2:** 9M120 Shturm-VM / AT-9 Spiral-2 – see 9M120 Ataka-V

9K114 Shturm SACLOS Radio Guided Anti-Tank Missile System

↳*System*

Name: 9K114 Shturm
Type: SACLOS Radio Guided Anti-Tank Missile System
Missile Length: mm1,630
Missile Diameter: mm130
Fin Span: mm360
Missile Weight: kg31.4

Warhead Type: HEAT

Warhead Weight: kg5.3

Guidance System: Radio Guided

Range of Fire: km5

Notes:

9K114 Shturm (Russian: 9К114 «Штурм» - "Sturm" is German for "storm" (also "assault") - is a SACLOS radio guided anti-tank missile system of the Soviet Union. Its GRAU designation is 9K114. Its NATO reporting name is AT-6 Spiral. The missile itself is known as the 9M114 Kokon (Cocoon). The missile called 9M114 Kokon (Cocoon) was developed by the Kolomna Machine Design Bureau, which was also responsible for the 3M6 Shmel and 9M14 Malyutka. Work on the missile began in 1967, with the hope of using the missile on Mi-24s. However, delays forced the design of an upgraded Falanga system (9M17 Skorpion) using SACLOS guidance as a stopgap. Testing of the missile was completed in 1974, and it was accepted into service in 1976. The missile has no direct western counterpart, though, in role, it is closest to the AGM-114 Hellfire, and in guidance method, to the MGM-18 Lacrosse. It was originally given the NATO designation AS-8, before being redesignated as AT-6. The missile can be deployed on a variety of platforms, including the Mi-24V and from 1979-onwards the MT-LB based 9P149 tank destroyer. There is also a shipborne version of the missile, with the launcher holding six missiles. The missile is transported and launched from a glass-reinforced plastic tube. The missile uses a Soyuz NPO solid-rocket sustainer, with a small booster stage to launch the missile from its tube. The missile is SACLOS with a radio command link. The use of a radio link allows the missile to travel much faster and further than if it were wire guided. The radio link is a VHF system with five frequency bands and two codes to minimize the risk of jamming. The system comprises a KPS-53AV 8× daylight-only direct vision sight with an integrated laser rangefinder. After the missile is launched, the gunner has to keep the sight's crosshairs on the target until impact. Appropriate steering commands are transmitted to the missile via the radio link. The missile flies above the gunner's line of sight to the target. With the range of the target determined by the laser rangefinder, the missile descends onto the target just before impact. This is done primarily to clear obstacles, instead of achieving a top-attack, and can be switched off. It is possible to engage low and slow moving helicopters with the system; however, since the missile only has a contact fuze, a direct hit would be needed. Soviet sources report kill ratios of 75–85% during the Soviet invasion of Afghanistan. Also a Mil demonstration in Sweden in late 1995 using a Mi-28A firing Shturm and Ataka missiles also showed good results: from a hovering helicopter, a Shturm was fired at a target 900 m away; and from level flight at 200 km/h an Ataka was fired at a target 4,700 m away. Both missiles passed within 1 m of their aiming point. t is possible there were problems with early models of the missile; Soviet stocks of the missile were rebuilt to AT-6B and C standard by 1994. 30 June 2014 adopted by the Russian army modernized self-propelled antitank missile system 9M114 Shturm-S into 9K132 Shturm-SM having a sight with television and thermal channels as well as a new missile with a high-explosive fragmentation warhead and a proximity fuse

YJ-6 Chinese Air-to-Surface Missile

Tiers:

Variants:

- **SY-2:** The liquid fuel engine was rather hazardous and unreliable, so a solid fuel rocket engine was developed. This engine also made it possible to reduce the size and weight of the missile while providing greater range. The warhead weight is also reduced, but its effectiveness was actually increased when a time-delayed semi-armour-piercing high-explosive design was adopted. The extended version developed is designated SY-2A.
- **HY-1:** The HY-1 received two separate NATO reporting name, the CSS-N-2 Safflower for the ship to ship version and the CSSC-2 Silkworm for the land based coastal defense variant. The HY-1J was intended for use on the Type 051 destroyers. However, the turmoil of the Cultural Revolution prolonged development into the 1980s. As a result, the Type 051s deployed into the Pacific Ocean to support ballistic missile tests without anti-ship missiles.
- **HY-2:** The HY-2 is identical to the HY-1 but with a further stretched body. The missile features a round nose accommodating the radar seeker, a pair of mid-mounted delta wings on the middle section of missile body, and three tail control surfaces. The missile is powered by a liquid-fuel rocket motor, with a solid rocket booster attached under the missile fuselage. The HY-2 is launched from land-based launcher and flies at an altitude of 1000 m during the initial stage of the flight. After the missile switched to the cruising mode, the flight altitude was reduced to 100 ~ 300 m. During the final stage of the flight, the missile switched on its radar seeker and dives to an altitude of 8 m until it hits the target. The single-shot hit probability is estimated to be 90%. Due to its oversized body, the HY-2 did not develop a ship-to-ship variant. The missile is obsolete and will be replaced by the YJ-8 series in the future.
- **HY-3:** The HaiYing-3 (HY-3, also known as C-301 in its export name; NATO codename: CSS-C-6 Sawhorse) is the active radar homing, ramjet-powered supersonic land-to-ship missile developed by China Haiying Electro-Mechanical Technology Academy (CHETA, also known as 3rd Space Academy). The missile was developed in the 1980s based on the design of the HY-2 (C-201) and the ramjet technology of the cancelled YJ-1 (C-101). The development was completed in the early 1990s but the missile did not enter service.
- **HY-4:** The HY-4 development of the C-201 is a mid-range ground-, air-, and ship-launched cruise missile. Development of the C-201 HY-4 is believed to have started in the mid-1970s, replacing the C-201 HY-2 liquid propellant sustainer motor with a small turbojet engine, and adding a monopulse active radar seeker. Apart from the substitution of the turbojet engine, the overall configuration of the HY-4 variant of the C-201 missile is similar to the HY-2 variants of the C-201, with two delta wings and tri-form rudder and tail. The missile has a radar altimeter which allows the cruise height to be varied between 70 and 200 m altitude, followed by a steep dive onto the target. The air-launched version is designated as C-401
- **FL-1:** The FL-1 (NATO designation CSS-NX-1) was a SY-1 with a high-frequency monopulse seeker. It used a radar altimeter to cruise at 30 metres.
- **FL-2:** The FL-2 anti-ship missiles was the land-based derivative of the SY-2. It was produced at the Nanchang Aircraft Factory
- **SFQ-1:** SFQ-1 was an unarmed test vehicle derivative of the Silkworm missile family. The test vehicle was used in the Chinese development of small turbojets that were designed to improve the range of the Chinese anti-ship cruise missiles, as well as powering the experimental versions of land attack YJ-4 cruise missiles. The entire project was reportedly named as Kunpeng (□□) Project, which first started in the early 1970s. SFQ-1 was specifically developed to test mini turbojet engines WP-11 and FW-41, the Chinese reverse engineered western turojet engines for UAVs and missiles.
- **YJ-4:** SFQ-1 was an unarmed test vehicle derivative of the Silkworm missile family. The test vehicle was used in the Chinese development of small turbojets that were designed to improve the range of the Chinese anti-ship cruise missiles, as well as powering the experimental versions of land attack YJ-4 cruise missiles. The entire project was reportedly named as Kunpeng (□□) Project, which first started in the early 1970s. SFQ-1 was specifically developed to test mini turbojet engines WP-11 and FW-41, the Chinese reverse engineered western turojet engines for UAVs and missiles.

- **YJ-4:** YJ-4 is a family of experimental land-attack cruise missiles developed by China in the 1970s and early 1980s. Due to the limitation of Chinese industrial and technological bottleneck at the time, the YJ-4 only entered the Chinese services in extremely limited numbers, mainly serving as a foundation for more successful Chinese cruise missiles developed later, such as Changfeng missile. Two versions of YJ-4 family were developed: YJ-4I, which is also frequently but erroneously referred as YJ-41, and YJ-4II, which is also frequently but erroneously referred as YJ-42. The two missiles only differed in their respective powerplant, YJ-4I was equipped with WP-11, the Chinese version of Turbomeca Marboré, while the longer ranged YJ-4II was equipped with an engine that was twice as powerful, FW-41, the Chinese version of Teledyne CAE J69, reversed engineered from downed American Ryan Firebee.
- **XW-41:** A developed version based on HY-4, known as the XW-41, has been developed. This latest version of the C-201 missile family is said to have a 300 km range with additional GPS/GLONASS guidance. However, due to the availability of more advanced anti-ship missile with similar range, such as the C-602, the future of XW-41, like others in the Silkworm missile family, is uncertain despite its successful trials. Although still a member of Silkworm missile, the developer considers the missile was different enough to be a listed as a separate category of its own due to the amount of new technologies adopted. After the Gulf War, United Arab Emirates ordered 30 of these shore-based version for coastal defense, and accordingly to Jane's Defence Weekly, these missiles are referred by the general name Silkworm missiles, but domestic Chinese sources have claimed that these were XW-41s, though there are reports claiming these missiles are other models of Silkworm series.
- **C-611:** Upgraded version of C-601 and other earlier models of the air-to-surface missiles of Silkworm family. Not all upgrades are necessarily the same due to difference between various versions, but electronics for all versions are upgraded to the latest standard. The seeker of the missile is modernized to include semi-active radar homing and passive homing capability, and the missile can be used against coastal ground targets. Cruise altitude is decreased while the range is increased.
- **YJ-63 (C-603):** XW-41 and its predecessor HY-4 lost their intended market when the wars in middle east ended, so XW-41 was converted to the first indigenously developed air-to-surface precision strike missile. The developmental work begun in the mid-1990s when Sea Eagle Mechanical-Electrical Research Academy (□□□□□□□□□) received support of Chinese military and the project was completed in 2002. The resulting new missile was named as YJ-63, also known as C-603. In comparison to XW-41, the original radar guidance was changed to TV guidance. The original inverted Y-configuration of tail control surfaces was changed to X-configuration. Like its predecessor, XW-41, turbojet engine was adopted instead of liquid fuel rocket engine used on HY-2. Range is 500km.[
- **KD-63:** Newest version of YJ-63 series that entered service in 2004 - 2005. This land attack version is almost identical to C-603 in appearance, except it has a solid nose instead of a window for TV guidance optronics. The solid nose indicates that the guidance of this air-to-surface missile adopts other means of guidance such as radar, but the exact type remain unknown.

YJ-6 Chinese Air-to-Surface Missile

↳*System*

Name: YJ-6
Type: Air-to-Surface Missile
Basic Load: INA
Manufactuer: Nanchang Aircraft Factory (Chinese)
Length: 7.48 m
Diameter: 0.76 m
Wingspan: 2.4 m
Warhead Type: Shaped charge high explosive
Warhead Weight: 513 kg
Weight, Total: 2,095 kg
Propulsion: One liquid rocket engine and one solid rocket booster
Speed: Mach 0.8
Range: 200 km
Cruising Altitude: < 20 metres

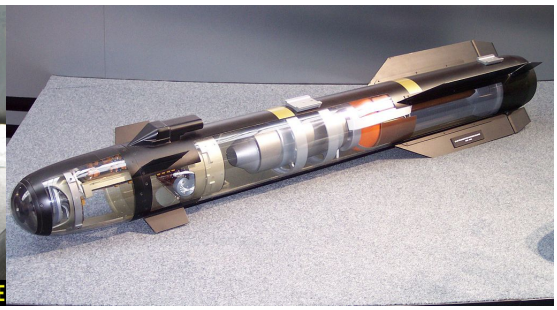
Guidanc System: Inertial guidance + active conical scanning terminal guidance radar (SY-1); or inertial + active monopulse radar (SY-1A)

Single-Shot Kill Probability: 90%

Notes:

YJ-6: Air launched variant of the HY-2. The HY-2 is identical to the HY-1 but with a further stretched body. The missile features a round nose accommodating the radar seeker, a pair of mid-mounted delta wings on the middle section of missile body, and three tail control surfaces. The missile is powered by a liquid-fuel rocket motor, with a solid rocket booster attached under the missile fuselage. The HY-2 is launched from land-based launcher and flies at an altitude of 1000 m during the initial stage of the flight. After the missile switched to the cruising mode, the flight altitude was reduced to 100 ~ 300 m. During the final stage of the flight, the missile switched on its radar seeker and dives to an altitude of 8 m until it hits the target. The single-shot hit probability is estimated to be 90%. Due to its oversized body, the HY-2 did not develop a ship-to-ship variant. The missile is obsolete and will be replaced by the YJ-8 series in the future. The HY-2 was widely exported to the Middle East, and was the missile most associated with the silkworm nickname.

AGM-114 Hellfire American Anti-Tank Guided Missile (ATGM)



Tiers:

Variants:

- **AGM-114A/B/C/D/E/F/G/H/J/K/L/M/N/P/Q/R/S/T/M36/R9X:** AGM-114A Basic Hellfire Target: Tanks, armored vehicles: Range: 8,700 yd (8,000 m), Guidance: Semi-active laser homing (SALH). Warhead: 18 lb (8 kg) shaped charge HEAT. Length: 64 in (163 cm) Weight: 99 lb (45 kg)// AGM-114B/C Basic Hellfire M120E1 low smoke motor.// AGM-114B has electronic SAD (Safe/Arming Device) for safe shipboard use. Unit cost: $25,000.// AGM-114D/E Basic Hellfire, Proposed upgrade of AGM-114B/C with digital autopilot—not built.// AGM-114F Interim Hellfire,Target: Tanks, armored vehicles, Range: 7,700 yd (7,000 m), Guidance: Semi-active laser homing. Warhead: 20 lb (9 kg) tandem shaped charge HEAT. Length: 71 in (180 cm) Weight: 107 lb (48.5 kg).// AGM-114G Interim Hellfire Proposed version of AGM-114F with SAD—not built// AGM-114H Interim Hellfire Proposed upgrade of AGM-114F with digital autopilot—not built.// AGM-114J Hellfire II Proposed version of AGM-114F with lighter components, shorter airframe, and increased range—not built. Hellfire II missile exposed through a transparent casing, showing laser homing guidance system in front, copper cone explosively formed penetrator (EFP) in shaped charge explosive in middle, propulsion in rear.// AGM-114K Hellfire II Target: All armored threats Range: 8,700 yd (8,000 m) Guidance: Semi-active laser homing with electro-optical countermeasures hardening, Digital autopilot improvements allow target reacquisition after lost laser lock New electronic SAD Warhead: 20 lb (9 kg) tandem shaped charge HEAT Length: 64 in (163 cm) Weight: 100 lb (45.4 kg) Unit cost: $65,000. Essentially the proposed AGM-114J w/ SAD.// AGM-114L Longbow Hellfire Target: All armored threats Range: 8,700 yd (8,000 m) Guidance: o Fire and forget millimeter wave radar seeker coupled with inertial guidance. Homing capability in adverse weather and the presence of battlefield obscurants Warhead: 20 lb (9 kg) tandem shaped charge high explosive anti-tank (HEAT) Length: 69 in (176 cm) Weight: 108 lb (49 kg).// AGM-114M Hellfire II Target: Bunkers, light vehicles, urban (soft) targets and caves Range: 8,700 yd (8,000 m) Guidance: Semi-active laser homing Warhead: Blast fragmentation/incendiary Weight: 106 lb (48.2 kg)) Length: 64 in (163 cm).// AGM-114N Hellfire II Target: Enclosures, ships, urban targets, air defense units Range: 8,700 yd (8,000 m) Guidance: o Semi-active laser homing Warhead: Metal augmented charge (MAC) (Thermobaric) Weight: 106 lb (48 kg) Length: 64 in (163 cm).// AGM-114P Hellfire II Version of AGM-114K optimized for use from UCAVs flying at high altitude.// ATM-114Q Hellfire II . Practice version of AGM-114N with inert warhead.// AGM-114R Hellfire II (Hellfire Romeo) Target: All Target Types , Range: 8,700 yd (8,000 m) Guidance: Semi-active laser homing. Warhead: Multi-function warhead, Weight: 110 lb (50 kg) Speed: Mach 1.3 Unit Cost: $99,600 (All-Up Round, 2015 USD).// AGM-114S Hellfire II Practice version of AGM-114K with a spotting charge instead of a warhead.// AGM-114T Hellfire II AGM-114R with insensitive munition rocket motor and electromagnetic control actuators.// M36 Captive Flight Training Missile The M36 is an inert device used for training the handling of the Hellfire. It includes an operational laser seeker.// AGM-114R9X The Hellfire R9X is a Hellfire variant that utilizes a kinetic warhead with pop-out blades, intended to reduce collateral damage when targeting specific individuals. Deployed in secret in 2017, its existence has been public since 2019. This variant was used in the killing of Jamal Ahmad Mohammad Al Badawi, accused mastermind of the 2000 USS Cole bombing, Abu Khayr al-Masri, a member of al Qaeda's leadership. The weapon has also been used in Syria and in Afghanistan, the latter gainst a commander in the Taliban.

AGM-114 Hellfire Anti-Tank Guided Missile

Name: AGM-114 Hellfire

Type: Air-to-Surface

Manufacturer: Northrop Grumman, Lockheed Martin, Boeing, United States of America

Length: 1.6m

Diameter: 180mm

Missile Weight: 45-49kg

Minimum Range: 499m

Maximum Range: 11,008m

Missile Velocity: 1601 km/h

Armor Penetration: INA

Warhead Type: High-explosive anti-tank (HEAT); 9.1 kg tandem anti-armor. Metal augmented charge (MAC); 8.2 kg shaped charge Blast fragmentation

Guidance: Semi-active laser homing millimeter wave radar seeker

Enginie: Solid-fuel rocket

Proliferation: Australia// Croatia// Egypt// France// Greece// India// Indonesia// Iraq// Israel// Italy// Jordan// Japan// Kuwait// Lebanon// Netherlands// Norway// Pakistan// Qatar// South Korea// Saudi Arabia// Singapore Spain// Sweden// Taiwan (Republic of China)// Tunisia// Turkey// United Arab Emirates// United Kingdom// United States

Notes:

"The AGM-114 Hellfire is an air-to-surface missile (ASM) first developed for anti-armor use, but later models were developed for precision drone strikes against other target types, and have been used in a number of targeted killings of high-profile individuals. It was originally developed under the name Heliborne, Laser, Fire and Forget Missile, which led to the colloquial name "Hellfire" ultimately becoming the missile's formal name. It has multi-mission, multi-target precision-strike ability, and can be launched from multiple air, sea, and ground platforms, including the Predator drone. The Hellfire missile is the primary 100-pound (45 kg) class air-to-ground precision weapon for the armed forces of the United States and many other nations. The Hellfire can be fired from rotary- and fixed-wing aircraft, waterborne vessels and land-based systems against a variety of targets. Most variants are laser guided, with one variant, the AGM-114L "Longbow Hellfire", being radar guided.Laser guidance can be provided either from the launcher, such as the nose-mounted opto-electronics of the AH-64 Apache attack helicopter, other airborne target designators or from ground-based observers, the latter two options allowing the launcher to break line of sight with the target and seek cover. Cockpit video showing a Hellfire missile being fired at two people in Afghanistan. The development of the Hellfire Missile System began in 1974 with the U.S. Army requirement for a "tank-buster", launched from helicopters to defeat armored fighting vehicles. Production of the AGM-114A started in 1982. The Hellfire II, developed in the early 1990s is a modular missile system with several variants. Hellfire II's semi-active laser variants—AGM-114K high-explosive anti-tank (HEAT), AGM-114KII with external blast fragmentation sleeve, AGM-114M (blast fragmentation), and AGM-114N metal augmented charge (MAC)—achieve pinpoint accuracy by homing in on a reflected laser beam aimed at the target. Predator and Reaper UCAVs carry the Hellfire II, but the most common platform is the AH-64 Apache helicopter gunship, which can carry up to 16 of the missiles at once. The AGM-114L, or Longbow Hellfire, is a fire-and-forget weapon: equipped with a millimeter wave (MMW) radar seeker, it requires no further guidance after launch—even being able to lock-on to its target after launch—and can hit its target without the launcher or other friendly unit being in line of sight of the target. It also works in adverse weather and battlefield obscurants, such as smoke and fog which can mask the position of a target or prevent a designating laser from forming a detectable reflection. Each Hellfire weighs 104 pounds (47 kg), including the 20 pounds (9 kg) warhead, and has a range of 4.4–6.8 miles (7.1–11 km) depending on trajectory.The AGM-114R "Romeo" Hellfire II entered service in late 2012. It uses a semi-active laser homing guidance system and a K-charge multipurpose warhead to engage targets that previously needed multiple Hellfire variants. It will replace AGM-114K, M, N, and P variants in U.S. service.In October 2012, the U.S. ordered 24,000 Hellfire II missiles, for both the U.S. armed forces and foreign customers. The Joint Common Missile (JCM) was to replace Hellfire II (along with the AGM-65 Maverick) by around 2011. The JCM was developed with a tri-mode seeker and a multi-purpose warhead that would combine the capabilities of the several Hellfire variants. In the budget for FY2006, the U.S. Department of Defense canceled a number of projects that they felt no longer warranted continuation based on their cost effectiveness, including the JCM. A possible new JCM successor called the Joint Air to Ground Missile (JAGM) is under consideration. Due to budget reductions, JAGM development was separated into increments, with Increment 1 focusing on adding a millimeter wave radar to the Hellfire-R to give it a dual-mode seeker, enabling it to track moving targets in bad

weather."

Kh-23 Grom (AS-7 Kerry) Russian Air-to-Surface Missile

Tiers:

Variants:

- **Kh-66:** the original beam-riding missile based on the K-8
- **Kh-23:** First command-guidance version with improved propellant
- **Kh-23M:** improved Kh-23 with technology from the Kh-25 family
- **Kh-23L:** Western name for a laser-guided version that in fact was the baseline Kh-25 (AS-10 'Karen')
- **A921:** Version made in Romania
- **Grom (Grom 02):** Yugoslav version that appeared in the 1980s. This should not be confused with the Polish SAM
- **Grom-B (Grom 2):** TV-guided version from Serbia's Vojno-Tehnički Institut in the mid-late 1990s; uses seeker based on that of AGM-65B Maverick

↳*Kh-23 Grom Air-to-Air Missile*

Name: Kh-23 Grom; NATO: A S-7 Kerry
Type: Air-to-Air Missile
Manufacturer: Zvezda-Strela
Length: 3.525 m
Diameter: 27.5 cm
Wingspan: 78.5 cm
Weight: 287 kg
Warhead Weight: 111 kg
Engine: Solid fuel rocket
Operational Range: 2–10 km
Maximum Speed: 2,160–2,700 km/h
Guidance System: Radio command guidance
Launch Platforms: MiG-21PFM, MiG-23, MiG-27, Su-17M3/20/22/22M3/M4,

Notes:

The Zvezda Kh-66 and Kh-23 Grom (Russian: Х-23 Гром 'Thunder'; NATO:AS-7 'Kerry') are a family of early Soviet tactical air-to-surface missiles with a range of 10 km. They were intended for use against small ground or naval targets. The Kh-66 was effectively a heavy-warhead, beam-riding version of the K-8 (AA-3 'Anab') air-to-air missile rushed into service in Vietnam in 1968. The Kh-23 was an improved Kh-66 with command-guidance, similar to the AGM-12 Bullpup. The Kh-66 used the airframe of the Kaliningrad K-8 (AA-3 'Anab') air-to-air missile, with the nozzle split to make room for the antenna of the beam-riding guidance system of the Kaliningrad K-5 (AA-1 'Alkali'). It has cruciform control fins on the nose, and four clipped-tip delta-wings at the rear with elevators for control. Work on air-to-air missiles had started at the Kaliningrad Engineering Plant (then known as Plant #455, and later merged into Zvezda-Strela) in 1955. This had resulted in the Kaliningrad K-5 (AA-1 'Alkali') family of beam-guided missiles, including the K-51 (RS-2-US) carried by the Su-9 'Fishpot'. OKB-4 Molniya (later Vympel NPO) under Matus Bisnovat would go on to produce missiles such as the AA-6 Acrid. Meanwhile, in 1963 the RS-2-US was tested as an air-to-surface missile. It was concluded that the small warhead and inaccurate guidance made such an application "pointless". However, in 1965 North Vietnam requested an air-to-surface missile from the Soviet government; the AGM-12 Bullpup had entered service with the US Air Force before the start of the Vietnam War. In April 1965 OKB-134 (later NPO Vympel) started work on this missile under the project name Kh-23, but they had problems developing a guidance system that would work with existing aircraft. As a result, Yurii N. Korolyov came up with his own proposals based on the earlier experiments with the RS-2-US. A design bureau to develop the RS-2-US for surface targets was set up under Korolyov by decree #100 of 12 March 1966 of the Ministry of the Aircraft Industry; this bureau would become the Zvezda OKB in 1976. The resulting weapon used the body of a K-8 (AA-3 'Anab') K-5 guidance and propulsion systems but increased the warhead from 13 kg (29 lb) to 100 kg (220 lb). This had the big advantage of allowing the new weapon to be fitted to any aircraft capable of firing the K-5. Design began in 1966, so the project was known as Kh-66 or Izdeliye 66 ('Article 66'). The Kh-66 was a beam-riding weapon that was tested on a MiG-21PFM and entered production in 1968 for that aircraft. The Kh-66 was only an interim solution as it required the launch aircraft to dive towards the target to maintain lock on the target. Flight testing of the Kh-66 began in 1967 and it entered service on 20 June 1968.

YJ-8/C-802 (NATO: CSS-N-4 Sardine) Chinese Anti-Ship Missile

↳***Missile***

Name: YJ-8/C-802 (NATO: CSS-N-4 Sardine)
Type: Anti-Ship & Air-to-Surface Missiles
Manufactuer: China Aerospace Science and Industry Corporation
In Service: 1980s-Present
Length: m5.81
Width: INA
Weight: kg815
Warhead Type: High-explosive fragmentation
Warhead Weight: kg165
Engine: Rocket
Propellant: Solid Rocket

Operational Range: km42

Flight Altitude: m5-7

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Basic Load: ea2

Notes:

The YJ-8 (Chinese: □□-8; pinyin: yingji-8; literally: 'eagle strike 8'; NATO reporting name: CSS-N-4 Sardine) is a Chinese surface-launched subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation (CASIC) Third Academy. The YJ-8 was developed into air-launched (YJ-81) and submarine-launched (YJ-82) variants. The YJ-8 is either based on, or is a heavily modified copy of, the MM38 Exocet; the two missiles share virtually identical operational profiles. The replication of the MM38's "revolutionary flight profile" in less than ten years and with an immature industrial base strongly suggests that China had access to proven technology.[4] The YJ-8 was a "radical departure" from China's first anti-ship missiles derived from the P-15 Termit. The YJ-8 carried a smaller warhead, but had the same range and speed while being significantly smaller and lighter. The development of the YJ-8 was approved in late-1976 following a few years of encouraging work on solid-fuel rockets. According to a 1991 Aerospace China article, development of the missile's engine began in 1978, and flight testing was completed in 1985. The YJ-8 reach initial operating capability in the People's Liberation Army Navy in 1987, the same year the export version—the C-801—was announced. CASIC received the first National Science and Technology Advancement Award for development of the YJ-8 in 1988.

AGM-84 (Harpoon) American Anti-Ship Missile

Tiers:

Variants:

- **Harpoon Block 1D:** This version featured a larger fuel tank and re-attack capability, but was not produced in large numbers because its intended mission (warfare with the Warsaw Pact countries of Eastern Europe) was considered to be unlikely following the Dissolution of the Soviet Union. Range is 278 kilometres (173 mi). Block 1D missiles were designated RGM/AGM-84F.
- **SLAM ATA (Block 1G):** This version, under development, gives the SLAM a re-attack capability, as well as an image comparison capability similar to the Tomahawk cruise missile; that is, the weapon can compare the target scene in front of it with an image stored in its on-board computer during terminal phase target acquisition and lock on (this is known as DSMAC). Block 1G missiles AGM/RGM/UGM-84G; the original SLAM-ER missiles were designated AGM-84H (2000-2002) and later ones the AGM-84K (2002 onwards)
- **Harpoon Block 1J:** Block 1J was a proposal for a further upgrade, AGM/RGM/UGM-84J Harpoon (or Harpoon 2000), for use against both ship and land targets.
- **Harpoon Block II:** In production at Boeing facilities in Saint Charles, Missouri, is the Harpoon Block II, intended to offer an expanded engagement envelope, enhanced resistance to electronic countermeasures and improved targeting. Specifically, the Harpoon was initially designed as an open-ocean weapon. The Block II missiles continue progress begun with Block IE, and the Block II missile provides the Harpoon with a littoral-water anti-ship capability.
- **Harpoon Block III:** Harpoon Block III was intended to be an upgrade package to the existing USN Block 1C missiles and Command Launch Systems (CLS) for guided missile cruisers, guided missile destroyers, and the F/A-18E/F Super Hornet fighter aircraft. After experiencing an increase in the scope of required government ship integration, test and evaluation, and a delay in development of a data-link, the Harpoon Block III program was canceled by the U.S. Navy in April 2009.
- **Harpoon Block II+ ER:** In April 2015, Boeing unveiled a modified version of the RGM-84 it called the Harpoon Next Generation. It increases the ship-launched Harpoon missile's range from the Block II's 70 nmi (81 mi; 130 km) to 167.5 nmi (192.8 mi; 310.2 km), along with a new lighter 300 lb (140 kg) warhead and a more fuel-efficient engine with electronic fuel controls. Boeing offered the missile as the U.S. Navy's Littoral Combat Ship frigate upgrade over-the-horizon anti-ship missile as a cost-effective missile upgrade option; complete Next Gen Harpoons would cost approximately as much as a Block II at $1.2 million each, with upgrades for an existing missile costing half that.

AGM-84 (Harpoon) American Anti-Ship Missile

↳***Missile***

Name: AGM-84 (Harpoon)
Manufacturer: McDonnell Douglas Boeing Defense, Space & Security
Length: Air-launched: 12.6 ft (3.8 m); Surface- and submarine-launched: 15 ft (4.6 m)
Diameter: 13.5 in (34 cm)
Wingspan: 3 ft (0.91 m)
Weight: 1,523 lb (691 kg) with booster
Warhead: 488 pounds (221 kg)
Detonation Mechanism: Impact Fuze
Engine: Teledyne CAE J402 Turbojet/solid propellant booster for surface and submarine launch; greater than 600 pounds (greater than 272.2 kg) of thrust
Operational Range: In excess of 150 nmi (280 km) depending on launch platform
Flight Altitude: Sea-skimming
Speed: 537 mph (864 km/h; 240 m/s; Mach 0.71)
Guidance System: Sea-skimming cruise monitored by radar altimeter / active radar terminal homing
Launch Platform: multi-platform: RGM-84A surface-launched AGM-84A air-launched UGM-84A submarine-launched

Notes:

The Harpoon is an all-weather, over-the-horizon, anti-ship missile, developed and manufactured by McDonnell Douglas (now Boeing Defense, Space & Security). The Standoff Land Attack Missile (SLAM) is a land-attack variant. The regular Harpoon uses active radar homing and flies just above the water to evade defenses. The missile can be launched from: * Fixed-wing aircraft (the AGM-84, without the solid-fuel rocket booster) * Surface ships (the RGM-84, fitted with a solid-fuel rocket booster that detaches when expended, to allow the missile's main turbojet to maintain flight) * Submarines (the UGM-84, fitted with a solid-fuel rocket booster and encapsulated in a container to enable submerged launch through a torpedo tube); * Coastal defense batteries, from which it would be fired with a solid-fuel rocket booster. In 1965 the United States Navy began studies for a missile in the 45 kilometres (24 nmi) range class for use against surfaced submarines. The name Harpoon was assigned to the project. The sinking of the Israeli destroyer Eilat in 1967 by a Soviet-built Styx anti-ship missile shocked senior United States Navy officers, who until then had not been conscious of the threat posed by anti-ship missiles. In 1970 Chief of Naval Operations Admiral Elmo Zumwalt accelerated the development of Harpoon as part of his "Project Sixty" initiative, hoping to add much-needed striking power to U.S. surface warships such as theTiconderoga-class cruiser.[citation needed] The first Harpoon was delivered in 1977; in 2004, Boeing delivered the 7,000th. The Harpoon has also been adapted for carriage on several aircraft, including the P-3 Orion, the P-8 Poseidon, the AV-8B Harrier II, the F/A-18 Hornet and the U.S. Air Force B-52H bombers. The Harpoon was purchased by many American allies, including India, Japan, Singapore, South Korea, Taiwan, the United Arab Emirates and most NATO countries. The Royal Australian Air Force can fire AGM-84-series missiles from its F/A-18F Super Hornets, F/A-18A/B Hornets, and AP-3C Orion aircraft, and previously from the now retired F-111C/Gs. The Royal Australian Navy deploys the Harpoon on major surface combatants and in the Collins-class submarines. The Spanish Air Force and the Chilean Navy are also AGM-84D customers, and they deploy the missiles on surface ships, and F/A-18s, F-16s, and P-3 Orion aircraft. The British Royal Navy deploys the Harpoon on several types of surface ships. The Royal Canadian Navy carries Harpoon missiles on its Halifax-class frigates. The Royal New Zealand Air Force is looking at adding the capability of carrying a stand-off missile, probably Harpoon or AGM-65 Maverick, on its six P-3 Orion patrol planes once they have all been upgraded to P3K2 standard.[citation needed] The Republic of Singapore Air Force also operates five modified Fokker 50 Maritime Patrol Aircraft (MPA) which are fitted with the sensors needed to fire the Harpoon missile. The Pakistani Navy carries the Harpoon missile on its frigates and P-3C Orions. The Turkish Navy carries Harpoons on surface warships and Type 209 submarines. The Turkish Air Force will be armed with the SLAM-ER. At least 339 Harpoon missiles were sold to the Republic of China Air Force (Taiwan) for its F-16 A/B Block 20 fleet and the Taiwanese Navy, which operates four guided-missile destroyers and eight guided-missile frigates with the capability of carrying the Harpoon, including the eight former U.S. Navy Knox-class frigates and

the four former USN Kidd-class destroyers which have been sold to Taiwan. The two Zwaardvis/Hai Lung submarines and 12 P-3C Orion aircraft can also use the missile. The eight Cheng Kung-class frigates, despite being based on the US Oliver Hazard Perry class, have Harpoon capabilities deleted from their combat systems, and funding to restore it has so far been denied. The Block 1 missiles were designated AGM/RGM/UGM-84A in US service and UGM-84B in the UK. Block 1B standard missiles were designated AGM/RGM/UGM-84C, Block 1C missiles were designated AGM/RGM/UGM-84D. Block 1 used a terminal attack mode that included a pop-up to approximately 1,800 metres (5,900 ft) before diving on the target; Block 1B omitted the terminal pop-up; and Block 1C provided a selectable terminal attack mode.

Kh-31A Russian Anti-Ship Missile

Tiers:

Variants:

- **Kh-31A:** active seeker head for use as an anti-ship missile against vessels up to destroyer size, range of 25 km–103 km (13.5–55.6 nmi). Missile is sea-skimming as it approaches the target.
- **Kh-31P:** Type 77P) - passive seeker head for use as an anti-radiation missile. Stays at high altitude throughout its flight, allowing higher speeds and increasing range to 110 km (60 nmi; 70 mi). The seeker has three interchangeable modules to cover different radar frequency bands, but they can only be changed at the factory.
- **Kh-31AD/Kh-31PD ("Kh-31 Mod 2"):** increase range through increasing the fuselage from 4.70 m (15 ft 5 in) to 5.3 m (17 ft 5 in) long.[18] As of 2012, the Kh-31PD is serially produced. Kh-31AD is in series production since 2013.
- **Kh-31PK:** installed non-contact fuse, maximum speed 900 m/s, range 120–160 km. Destined for Su-27SM, Su-30MK, Su-35. In serial production since 2009.
- **MA-31:** telemetry and other systems installed by McDonnell Douglas/Boeing for use by the US Navy as a target drone. Tested between 1996-2007; a version upgraded with GPS, the MA-31PG, was offered to the Navy as a replacement for the MQM-8 Vandal but they bought the GQM-163 Coyote. Even with the additional equipment, the MA-31 was capable of Mach 2.7 and 15G manoeuvres in its anti-ship (sea-skimming) flight profile and Mach 3.5 in ARM mode at 48,000 ft (15,000 m).
- **KR-1:** version of the Kh-31P exported to China in 1997. It seems that Zvezda wanted to sell an initial batch of KR-1's to China, before the KR-1 went into production in China. Rather than the original three seeker modules, the KR-1 has a single K-112E "export" seeker targeting D-F band (S band) emissions, and reportedly optimised for specific Taiwanese radars.
- **YJ-91:** Ying Ji 91 - Chinese missile based on the Kh-31P.[citation needed] They are also reported to have developed an anti-shipping version with an indigenous active seeker, and are looking to develop this for use in submarines. The name YJ-91 was already in use by 1997, and may have been a Chinese name for the original Russian missiles designated X-31 by the Russians. By 2005, the name YJ-93 was being applied to missiles made in China, but Western reports generally do not distinguish between YJ-91 and YJ-93.
- **Note:** An active/passive air-to-air version for use against slow-moving support aircraft, a so-called "AWACS killer", was announced at the 1992 Moscow air show with 200 km (110 nmi; 120 mi) range. That would be less than the 300–400 kilometres (160–220 nmi; 190–250 mi) promised by the Vympel R-37 (AA-13 'Arrow') and Novator R-172 missiles, but a Kh-31 derivative could be carried by a wider range of aircraft. However this may have been mere propaganda; in 2004 the Tactical Missiles Corporation "emphatically denied" that it had ever worked on an air-to-air version of the Kh-31. In 2005 rumours persisted of a Russian AWACS killer based on the Kh-31A anti-shipping model, and of the Chinese adapting the YJ-91, derived from the Kh-31P, for the same purpose.

KH-31 (AS-17 Krypton) Russian Air-to-Surface Missile

↳***Missile***

Name: KH-31A
Type: Medium-range Anti-Ship Missile
Basic Load: INA
Manufacturer: Tactical Missiles Corporation (Zvezda-Strela before 2002)
Length: Mod 1 : 4.700 m (15 ft 5.0 in)[3] Mod 2 (AD/PD) : 5.3 m (17 ft 5 in)
Diameter: 360 mm
Weight: Kh-31A :610 kg (1,340 lb) Kh-31P :600 kg (1,320 lb)
Warhead: HE shaped charge
Detonation Mechanism: Impact
Warhead Weight: Kh-31A :94 kg (207 lb) Kh-31P :87 kg (192 lb
Engine: Solid fuel rocket in initial stage, ramjet for rest of trajectory
Wingspan: mm914
Propellant: Kerosene
Operational Range: Kh-31A: 25 km–103 km (13.5–55.6 nmi; Kh-31P: up to 110 km (60 nmi; 70 mi)
Speed: Kh-31A/P: 2,160–2,520 km/h (1,340–1,570 mph) MA-31: Mach 2.7 (low), Mach 3.5 (high)
Guidance System: Kh-31A: inertial guidance with active radar homing Kh-31P: inertial with passive radar
Launch Platform: Both : Su-27SM, Su-30MKI, Su-25, Su-34, Su-35, MiG-29M, HAL Tejas Mk1 and Mk2, MiG-29K Kh-31A only : Su-33 Also : Su-24M
Note: Missile is sea-skimming as it approaches the target.

Notes:

Kh-31A - active seeker head for use as an anti-ship missile against vessels up to destroyer size, range of 25 km–103 km (13.5–55.6 nmi). Missile is sea-skimming as it approaches the target. The Kh-31A is a variant of the KH-31 (AS-17 Krypton) New air defense weapon systems of the American Patriot kind have raised the requirements which antiradar missiles must meet. These include first of all higher speed and longer range, then also high interference immunity and radar turn-off when attacked. For the special purpose of meeting these requirements, the "Zvezda" group under the direction of V. Bugayskiy began in 1977 working on the Kh-31 missile (Article) 77P). The first launchings of this missile took place in 1982. The most interesting component of the Kh-31P is its dual propulsion system designed by the "Soyuz" Design Bureau in Turayevo near Moscow (note: there are several "Soyuz" engineering groups in Russia). First the missile is accelerated by its solid-fuel rocket engine to a speed of Mach 1.8, then the engine is discarded and the interior of the missile is converted into the combustion chamber of the missile's jet engine. The latter accelerates the missile to a speed of almost Mach 4.5, while four air intake holes on the sides of the missile body open up. On the basis of the Kh-31P antiradar missile were developed the Kh-31A missile (Article 77A) with an active-radar guidance head and also an M-31 flying target for air defense training exercises. The Kh-31 was for the first time publicly displayed in November 1991, in Dubai (United Arab Emirates). The State Scientific Production Center Zvezda-Strela has upgraded the air-to-surface supersonic ASM Kh-31A NATO: AS-17 Krypton). Recently a variant of the air-to-air class based on the Kh-31 was made available, equipped with a hybrid active-passive guidance head for use against nonmaneuvering airborne

targets such as AWACS (passive guidance) from far distances. The range of this missile is 200 km. The unofficial designation of this missile is 'mini-Moskit'. The Kh-31A missile has been developed from the technologies of the 1970-80s. The improved version of the KH-31PM, a missile that is already very well known in the US Navy, was deployed in 2015. The KH-31 was a missile that the American fleet bought from Russia in the 1990s as a target missile for developing ships' anti-aircraft systems. The Americans used the KH-31PM to learn how to hit the Chinese 3M-54 Moskit anti-ship missiles, which had been produced by Russia. In the West the Moskit is codenamed “Sunburn”, due to its speed of over 1,700 mph and its destructive potential. The KH-31, which is very similar to the Moskit, is smaller and cheaper and is used for destroying above-water targets, radar stations and anti-aircraft missile complexes such as the Patriot. It can be installed in all types of Russian destroyers and bombers. The new KH-31PM has an increased range of 160 miles. It also has a new guidance system and engine, which make its flight more unpredictable and deadlier for the adversary. For example, the missile is equipped with the broadband guidance head, which can be used against practically all anti-aircraft systems. The earlier missiles were equipped with selective heads, which could only be used against one type of system.

AS15TT French Anti-Ship Guided Missile

Tiers:

1 2 3 4

System

:
:
:

↳ ***AS15TT Anti-Ship Missile***

Name: AS15TT Anti-Ship Missile
Type: Anti-Ship Missile
Length: 2.30 m
Diameter: 190 mm
Wingspan: 0.56 m
Warhead: 30 kg derived from OP3C APHE
Fuze: impact
Weight: 98 kg
Maximum Range: 15 km
Maximum Speed: 1,007 kph
Flight Altitude: Sea-Skimming
Guidance System: SACLOS by Thomson-CSF Agrion 15 chin-mounted I/J-band radar
Basic Load: INA

Notes:

The AS.15 and AS.15TT (in French: "Tous Temps", meaning "All weather") are French anti-shipping missiles. It was developed as a replacement for the AS-12 missile. The missile consists of a long cylindrical main body ending in a pointed nose, with four fins arranged in a cruciform cross-section. Each fin has a pod on the tip containing either a radar receiver or a battery. From front to back the missile consists of the warhead and impact fuse and safety and arming mechanism. Next is the autopilot (EOP), altimeter, gyro, and radar receiver and a battery. Following that is the SNPE Acis CDB solid rocket sustainer motor, which exhausts through a small central nozzle. Behind the sustainer are the two solid rocket SNPE Anubis CMDB booster motors, which exhaust through two large nozzles. On the rear underside of the missile is a radar altimeter. On the rear of the missile are four inline control fins. The guidance system of the missile is actually command guidance, as the missile doesn't have its

own radar. It only follows orders provided by the onboard radar of the carrier/launcher helicopter, the Thomson-CSF I/J-band "Agrion 15". When this radar detects and identifies a suitable target, it switches to automatic tracking mode. Once the target is inside the missiles range it launches, the booster motors accelerate the missile to its cruise speed of 280 meters per second, after which the sustainer motor cuts in. The missile immediately begins descending to an altitude of around 3 to 5 meters.The rocket motors have a combined burn time of around 45 seconds. Bearing corrections are transmitted to the missile via the Agrion 15 radar and are picked up by the rearward-facing receiver units in two of the wing pods. The directional nature of the receivers makes jamming the command link difficult. On final approach to the target (about 1000 ft remaining to target), the missile descends to an altitude of around two meters. Its powerful warhead is able to perforate a 40 millimetres (1.6 in) thick steel armoured hull. The Agrion 15 radar is capable of detecting a large ship at a range of 150 kilometres (93 mi) and a smaller attack boat at a range of 100 kilometres (62 mi).

YJ-91 Chinese Anti-Ship Missile

Tiers:

Variants:

- **YJ-91 Anti-Radiation Missile:** The anti-radiation version of the YJ-91 missile was developed from the Kh-31P, which uses a wide array of seekers to cover the entire radar frequency band. The Chinese were not satisfied with the requirement to include multiple seekers and preferred to have a single seeker capable of covering multiple frequency bands, like the AGM-88 HARM. However, such ambitions proved to be too great for the Chinese microelectronics industry. They could not achieve the goal in a single step within the required timeline originally specified by the Chinese military. Instead, a two-step approach was implemented: The completion of the development of a single seeker covering multiple frequency bands was pushed back, while a stopgap measure was adopted in the meantime. The Kh-31P was modified so that the seekers could be rapidly changed in the forward airstrips (providing the specialized tooling is available), so that missile would not need to be sent back to depots or factories to perform such operation. The resulting anti-radiation version of YJ-91 missile has a slightly increased the range to 120 km in comparison to 110 km of the original Kh-31P. In addition to a seeker that covers multiple frequency bands, additional measures to upgrade the missile are in development, such as, an open software architecture. Additional measures reportedly include prioritizing threats, which could be uploaded to the onboard computer from the ground or by the pilots while in flight. Threats could then be updated in real time. The multi-band seeker is of higher priority.
- **YJ-91 Anti-Ship Missile:** The Chinese have also developed an anti-ship version of the YJ-91 missile. However, this version is an indigenous development of the Chinese from the Kh-31P anti-radiation missile, and not from the Kh-31A anti-ship missile. China did not order any of the Kh-31A. The Chinese felt that the original Kh-31A could not fully satisfy their requirements, because the high-low trajectory of the missile meant early detection, thus it is prone to interception. In contrast, the low-low trajectory usually adopted by subsonic anti-ship missiles better uses the supersonic speed of Kh-31A. Such a trajectory shortens the detection range and the high-speed reduces the target's reaction time, once the missile is detected. As a result, China did not order any Kh-31A anti-ship missiles. The resulting anti-ship version of the YJ-91 is capable of sea-skimming. Its cruising altitude is no more than 20 metre above sea level. At the terminal attack stage (usually after the active radar seeker of the missile is turned on), the missile drops to 7 metre above sea level. This attack altitude can be further reduced to just 1.2 metre above sea level, when the sea state allows. Alternatively, the missile can be programmed to popup-and-dive like that the Boeing Harpoon. However, such sea-skimming capability comes at the expense of maximum range: in comparison to the original 70 km range of the Kh-31A, the maximum range of YJ-91 anti-ship missile was reduced by more than a quarter to 50 km. Like the anti-radiation version, it is reported that many planned upgrades are in development. An application for research grants to develop a submerged launched version of YJ-91 anti-ship missile once appeared on Chinese websites on the Internet, indicating China is attempting to develop a version for its submarine fleet.

↳*YJ-91 Anti-Radiation Missile*

Name: YJ-91

Type: Anti-Ship Missile

Manufacturer: Hongdu Aviation Industry Corporation

Length: 4.7 m

Diameter: 0.3602 m

Weight: 0.6 ton

Warhead: 165 kg

Detonation Mechanism: Semi-armor-piercing and other

Engine: Ramjet

Propellant: Liquid fuel

Operational Range: 50-120 km

Maximum Speed: Mach 4.5

Cruising Altitude: Its cruising altitude is no more than 20 metre above sea level. At the terminal attack stage (usually after the active radar seeker of the missile is turned on), the missile drops to 7 metre above sea level. This attack altitude can be further reduced to just 1.2 metre above sea level, when the sea state allows.

Guidance System: ARH / PRH

Notes:

YJ-91 is the Chinese version of the Kh-31. YJ is short for Ying Ji (Yingji, □□) meaning eagle strike. After purchasing 200 Kh-31Ps from Russia, China decided to develop its own version, because the original Kh-31 missile did not fully satisfy Chinese requirements. The resulting YJ-91 missile was developed by Hongdu Aviation Industry Corporation, the same manufacturer of the Silkworm missile. The experience gained from YJ-91 also helped the engine development of another supersonic missile indigenously developed in China, YJ-12, which is sometimes confused by non-Chinese sources with the YJ-91, as both share the same origin for their propulsion systems. YJ-91 Anti-Ship Missile The Chinese have also developed an anti-ship version of the YJ-91 missile. However, this version is an indigenous development of the Chinese from the Kh-31P anti-radiation missile, and not from the Kh-31A anti-ship missile. China did not order any of the Kh-31A. The Chinese felt that the original Kh-31A could not fully satisfy their requirements, because the high-low trajectory of the missile meant early detection, thus it is prone to interception. In contrast, the low-low trajectory usually adopted by subsonic anti-ship missiles better uses the supersonic speed of Kh-31A. Such a trajectory shortens the detection range and the high-speed reduces the target’s reaction time, once the missile is detected. As a result, China did not order any Kh-31A anti-ship missiles. The resulting anti-ship version of the YJ-91 is capable of sea-skimming. Its cruising altitude is no more than 20 metre above sea level. At the terminal attack stage (usually after the active radar seeker of the missile is turned on), the missile drops to 7 metre above sea level. This attack altitude can be further reduced to just 1.2 metre above sea level, when the sea state allows. Alternatively, the missile can be programmed to popup-and-dive like that the Boeing Harpoon. However, such sea-skimming capability comes at the expense of maximum range: in comparison to the original 70 km range of the Kh-31A, the maximum range of YJ-91 anti-ship missile was reduced by more than a quarter to 50 km. Like the anti-radiation version, it is reported that many planned upgrades are in development. An application for research grants to develop a submerged launched version of YJ-91 anti-ship missile once appeared on Chinese websites on the Internet, indicating China is attempting to develop a version for its submarine fleet.

Tiers:

Variants:

- **RBS-15 Mk. I:** Powered by a French Microturbo TRI-60 engine, with a thrust of 3.73 kN (380 khp/830 lbf). Range 70+ km
- **RBS-15F:** An Mk. I adapted for air launch. Entered service in 1989.
- **RBS-15 Mk. II:** Range 70+ km. Designed to be launched from a number of different platforms, such as land-based launchers, aircraft, and ships.
- **RBS-15SF:** Mk. II version for Finland. Local designation MTO 85 (Meritorjuntaohjus 1985)
- **RBS-15 Mk. III:** Range over 200 km, with land attack capability. New warhead (increased penetration and insensitive munitions qualification) from TDW. There is only a ship launched version. Production started in 2004. New oval launch tubes instead of the old box type.
- **RBS-15F ER:** Aircraft launched version of the Mk. III
- **RBS-15SF-3:** Both new Mk. IIIs and upgraded Mk. IIs, which have been upgraded to Mk. III standard. Finnish designation MTO 85M
- **RB-15 Mk. III+ & RB 15 F-ER:** Ordered in March 2017 by Sweden. Will have better range, a better seeker and lower weight. It will have the ability to knock out a wide range of sea and land targets, all-weather capability and a design that allows for future upgrades. To be carried by Visby-class corvettes and JAS Gripen E. Will be delivered between 2017-2026 and fully operational in the mid 2020s.

RBS-15 Missile

↳System

Name: RBS-15
Type: Long-Range Fire-and-Forget Surface-to-Surface and Ar-to-Surface, Anti-Ship Missile.
Manufacturer: Saab Bofors Dynamics, Diehl BGT Defence
Length: m4.33
Diameter: cm50
Wingspan: 1.4 m
Warhead: 200 kg HE blast and pre-fragmented warhead.
Detonation Mechanism: impact or proximity
Engine: Turbojet
Operational Range: 70 km for RBS-15 Mk. I and II, 250 km for RBS-15 Mk. III, 300+km for RBS-15 MkV
Flight Altitude: Sea skimming
Speed: Subsonic

Guidance System: inertial, GPS, terminal active radar homing (J band)

Launch Platform: naval ships, aircraft and land-based missile launchers

Notes:

The RBS-15 (Robotsystem 15) is a long-range fire-and-forget surface-to-surface and air-to-surface, anti-ship missile. The later version Mk. III has the ability to attack land targets as well. The missile was developed by the Swedish company Saab Bofors Dynamics. The missile was developed from the RB 04 missile that was used by the Swedish air force. The front of the missile was retained, including the warhead, but the rear received new wings and a turbofan engine replaced the rocket previously used. The RBS-15 underwent trials on the missile FAC HMS Piteå from 1983 and became operational with the Swedish Navy in 1985. The Västergötland class submarines were to have 4 vertical missile launch tubes for RBS-15 missiles in an extended hull, canceled due to budget constraints and to not fitting the way Swedish submarines operated. In March 2017 Saab received an order for a new generation anti-ship missile to replace the RBS-15. The order is valued at 3.2 billion SEK and deliveries will take place between 2017–26. The new missile will have better range, a better seeker and lower weight. It will have the ability to knock out a wide range of sea and land targets, all-weather capability and a design that allows for future upgrades.

AM 39 Exocet French Anti-Ship Missile

Tiers:

Variants:

- **MM38 (surface-launched):** deployed on warships. Range: 42 km. No longer produced (1970). A coast defence version known as "Excalibur" was developed in the United Kingdom and deployed in Gibraltar from 1985–1997
- **AM38 (helicopter-launched):** tested only
- **AM39 (air-launched):** B2 Mod 2: deployed on 14 types of aircraft (combat jets, maritime patrol aircraft, helicopters). Range between 50 and 70 km, depending on the altitude and the speed of the launch aircraft.
- **SM39 (submarine-launched):** B2 Mod 2: deployed on submarines. The missile is housed inside a watertight launched capsule (VSM or véhicule Sous marin), which is fired by the submarine's torpedo-launch tubes. On leaving the water, the capsule is ejected and the missile's motor is ignited. It then behaves like an MM40. The missile will be fired at depth, which makes it particularly suitable for discreet submarine operations.
- **MM40 (surface-launched):** Block 1, Block 2 and Block 3: deployed on warships and in coastal batteries. Range: 72 km for the Block 2, in excess of 180 km for the Block3.
- **MM40 Block 3:** In February 2004, the Délégation Générale pour l'Armement (DGA) notified MBDA of a contract for the design and production of a new missile, the MM40 Block 3. It has an improved range, in excess of 180 kilometres (97 nautical miles)—through the use of a turbojet engine, and includes four air intakes to provide continuous airflow to the power plant during high-G manoeuvres. The Block 3 missile accepts GPS guidance system waypoint commands, which allow it to attack naval targets from different angles and to strike land targets, giving it a marginal role as a land-attack missile. The Block 3 Exocet is lighter than the previous MM40 Block 2 Exocet.

AM 39 Exocet Anti-Ship Missile

↳*System*

Name: AM 39 Exocet
Type: Anti-Ship Missile
Basic Load: 2
Manufacturer: 1979–1999: Aérospatiale 1999–2001: Aérospatiale-Matra 2001–present: MBDA
Length: m4.69
Diameter: mm348

Wingspan: m1.10

Weight: kg655

Configuration: Slim, pointed cylinder cruciform cropped and swept delta mainplanes indexed in line with small cruciform tail planes

Propulsion: 2 SNPE double-base Nitramite smokeless solid-propellant rockets 1 Dondor booster with 2 sec burn 1 Helios sustainer with 130-150 sec burn

Speed: 1,100 km/h or Mach 0.93

Maximum Range: 50-70 km

Warhead Type: Hexolite blast-fragmentation

Warhead Weight: kg165

Senors /Fire Control: "Fire-and-forget" TRT AHV-7 radio altimeter inertial navigation during first part of flight Electronique Marcel Dassault ADAC or Super ADAC I/J-band active radar homing in terminal phase that begins search approximately 5.4 nm (6.2 mi.; 10 km) from target's estimated position

Notes:

The Exocet (French pronunciation: [ɛgzɔsɛ]; French for "flying fish" is a French-built anti-ship missile whose various versions can be launched from surface vessels, submarines, helicopters and fixed-wing aircraft. The Exocet is built by MBDA, a European missile company. Development began in 1967 by Nord as a ship-launched weapon named the MM 38. A few years later Aerospatiale and Nord merged. The basic body design was based on the Nord AS30 air-to-ground tactical missile. The air-launched Exocet was developed in 1974 and entered service with the French Navy five years later. The relatively compact missile is designed for attacking small- to medium-size warships (e.g., frigates, corvettes and destroyers), although multiple hits are effective against larger vessels, such as aircraft carriers. It is guided inertially in mid-flight and turns on active radar late in its flight to find and hit its target. As a countermeasure against air defence around the target, it maintains a very low altitude during ingress, staying one to two meters above the sea surface. Due to the effect of the radar horizon, this means that the target may not detect an incoming attack until the missile is only 6,000 m from impact. This leaves little time for reaction and stimulated the design of close-in weapon systems (CIWS). Its rocket motor, which is fuelled by solid propellant, gives the Exocet a maximum range of 70 kilometres (43 mi; 38 nmi). It was replaced on the Block 3 MM40 ship-launched version of the missile with a solid-propellant booster and a turbojet sustainer motor which extends the range of the missile to more than 180 kilometres (110 mi; 97 nmi). The submarine-launched version places the missile inside a launch capsule.

SY-1 (Silkworm) Chinese Anti-Ship Missile

Tiers:

Variants:

- **SY-2:** The liquid fuel engine was rather hazardous and unreliable, so a solid fuel rocket engine was developed. This engine also made it possible to reduce the size and weight of the missile while providing greater range. The warhead weight is also reduced, but its effectiveness was actually increased when a time-delayed semi-armour-piercing high-explosive design was adopted. The extended version developed is designated SY-2A.
- **HY-1:** The HY-1 received two separate NATO reporting name, the CSS-N-2 Safflower for the ship to ship version and the CSSC-2 Silkworm for the land based coastal defense variant. The HY-1J was intended for use on the Type 051 destroyers. However, the turmoil of the Cultural Revolution prolonged development into the 1980s. As a result, the Type 051s deployed into the Pacific Ocean to support ballistic missile tests without anti-ship missiles.
- **HY-2:** The HY-2 is identical to the HY-1 but with a further stretched body. The missile features a round nose accommodating the radar seeker, a pair of mid-mounted delta wings on the middle section of missile body, and three tail control surfaces. The missile is powered by a liquid-fuel rocket motor, with a solid rocket booster attached under the missile fuselage. The HY-2 is launched from land-based launcher and flies at an altitude of 1000 m during the initial stage of the flight. After the missile switched to the cruising mode, the flight altitude was reduced to 100 ~ 300 m. During the final stage of the flight, the missile switched on its radar seeker and dives to an altitude of 8 m until it hits the target. The single-shot hit probability is estimated to be 90%. Due to its oversized body, the HY-2 did not develop a ship-to-ship variant. The missile is obsolete and will be replaced by the YJ-8 series in the future.
- **HY-3:** The HaiYing-3 (HY-3, also known as C-301 in its export name; NATO codename: CSS-C-6 Sawhorse) is the active radar homing, ramjet-powered supersonic land-to-ship missile developed by China Haiying Electro-Mechanical Technology Academy (CHETA, also known as 3rd Space Academy). The missile was developed in the 1980s based on the design of the HY-2 (C-201) and the ramjet technology of the cancelled YJ-1 (C-101). The development was completed in the early 1990s but the missile did not enter service.
- **HY-4:** The HY-4 development of the C-201 is a mid-range ground-, air-, and ship-launched cruise missile. Development of the C-201 HY-4 is believed to have started in the mid-1970s, replacing the C-201 HY-2 liquid propellant sustainer motor with a small turbojet engine, and adding a monopulse active radar seeker. Apart from the substitution of the turbojet engine, the overall configuration of the HY-4 variant of the C-201 missile is similar to the HY-2 variants of the C-201, with two delta wings and tri-form rudder and tail. The missile has a radar altimeter which allows the cruise height to be varied between 70 and 200 m altitude, followed by a steep dive onto the target. The air-launched version is designated as C-401
- **FL-1:** The FL-1 (NATO designation CSS-NX-1) was a SY-1 with a high-frequency monopulse seeker. It used a radar altimeter to cruise at 30 metres.
- **FL-2:** The FL-2 anti-ship missiles was the land-based derivative of the SY-2. It was produced at the Nanchang Aircraft Factory
- **SFQ-1:** SFQ-1 was an unarmed test vehicle derivative of the Silkworm missile family. The test vehicle was used in the Chinese development of small turbojets that were designed to improve the range of the Chinese anti-ship cruise missiles, as well as powering the experimental versions of land attack YJ-4 cruise missiles. The entire project was reportedly named as Kunpeng (□□) Project, which first started in the early 1970s. SFQ-1 was specifically developed to test mini turbojet engines WP-11 and FW-41, the Chinese reverse engineered western turojet engines for UAVs and missiles.
- **YJ-4:** SFQ-1 was an unarmed test vehicle derivative of the Silkworm missile family. The test vehicle was used in the Chinese development of small turbojets that were designed to improve the range of the Chinese anti-ship cruise missiles, as well as powering the experimental versions of land attack YJ-4 cruise missiles. The entire project was reportedly named as Kunpeng (□□) Project, which first started in the early 1970s. SFQ-1 was specifically developed to test mini turbojet engines WP-11 and FW-41, the Chinese reverse engineered western turojet engines for UAVs and missiles.

- **YJ-4:** YJ-4 is a family of experimental land-attack cruise missiles developed by China in the 1970s and early 1980s. Due to the limitation of Chinese industrial and technological bottleneck at the time, the YJ-4 only entered the Chinese services in extremely limited numbers, mainly serving as a foundation for more successful Chinese cruise missiles developed later, such as Changfeng missile. Two versions of YJ-4 family were developed: YJ-4I, which is also frequently but erroneously referred as YJ-41, and YJ-4II, which is also frequently but erroneously referred as YJ-42. The two missiles only differed in their respective powerplant, YJ-4I was equipped with WP-11, the Chinese version of Turbomeca Marboré, while the longer ranged YJ-4II was equipped with an engine that was twice as powerful, FW-41, the Chinese version of Teledyne CAE J69, reversed engineered from downed American Ryan Firebee.
- **XW-41:** A developed version based on HY-4, known as the XW-41, has been developed. This latest version of the C-201 missile family is said to have a 300 km range with additional GPS/GLONASS guidance. However, due to the availability of more advanced anti-ship missile with similar range, such as the C-602, the future of XW-41, like others in the Silkworm missile family, is uncertain despite its successful trials. Although still a member of Silkworm missile, the developer considers the missile was different enough to be a listed as a separate category of its own due to the amount of new technologies adopted. After the Gulf War, United Arab Emirates ordered 30 of these shore-based version for coastal defense, and accordingly to Jane's Defence Weekly, these missiles are referred by the general name Silkworm missiles, but domestic Chinese sources have claimed that these were XW-41s, though there are reports claiming these missiles are other models of Silkworm series.
- **C-611:** Upgraded version of C-601 and other earlier models of the air-to-surface missiles of Silkworm family. Not all upgrades are necessarily the same due to difference between various versions, but electronics for all versions are upgraded to the latest standard. The seeker of the missile is modernized to include semi-active radar homing and passive homing capability, and the missile can be used against coastal ground targets. Cruise altitude is decreased while the range is increased.
- **YJ-63 (C-603):** XW-41 and its predecessor HY-4 lost their intended market when the wars in middle east ended, so XW-41 was converted to the first indigenously developed air-to-surface precision strike missile. The developmental work begun in the mid-1990s when Sea Eagle Mechanical-Electrical Research Academy (□□□□□□□□□) received support of Chinese military and the project was completed in 2002. The resulting new missile was named as YJ-63, also known as C-603. In comparison to XW-41, the original radar guidance was changed to TV guidance. The original inverted Y-configuration of tail control surfaces was changed to X-configuration. Like its predecessor, XW-41, turbojet engine was adopted instead of liquid fuel rocket engine used on HY-2. Range is 500km.[
- **KD-63:** Newest version of YJ-63 series that entered service in 2004 - 2005. This land attack version is almost identical to C-603 in appearance, except it has a solid nose instead of a window for TV guidance optronics. The solid nose indicates that the guidance of this air-to-surface missile adopts other means of guidance such as radar, but the exact type remain unknown.

SY-1 (Silkworm) Anti-Ship Missile

↳***Missile***

Name: SY-1 (Silkworm)
Type: Anti-Ship Missile
Basic Load: INA
Manufactuer: Nanchang Aircraft Factory (Chinese)
Length: 6.55 m
Diameter: 0.76 m
Wingspan: 2.4 m
Warhead Type: Shaped charge high explosive
Warhead Weight: 513 kg

Weight, Total: 2,095 kg

Propulsion: One liquid rocket engine and one solid rocket booster

Speed: Mach 0.8

Range: 150 km

Cruising Altitude: < 20 metres

Guidanc System: Inertial guidance + active conical scanning terminal guidance radar (SY-1); or inertial + active monopulse radar (SY-1A)

Single-Shot Kill Probability: 70%

Notes:

This is the original Chinese version of Soviet P-15 Termit missile, and the first was SY-1, produced at Factory 320 (the Nanchang Aircraft Factory, □□□□□□□); Chinese sources identify the designers as Li Tongli and Lu Lin. The main difference between P-15 Termit and SY-1 missiles is that the unreliable aneroid altimeter of P-15 Termit was replaced by a much more reliable radar altimeter in SY-1. The successor of SY-1, designed by Peng Lisheng (□□□) and designated as SY-1A, had a mono-pulse terminal guidance radar seeker replacing the original conical scanning radar seeker. The missile received a NATO reporting name CSS-N-1 Scrubbrush. The missile has been upgraded to be air-launched, and the air-launched version is known as C-601 (YJ-6), which is the first air-launched anti-ship missile in China. The missile received a NATO reporting name CAS-1 Kraken. It was used by Iraqi H-6Ds during Iran–Iraq War. An upgraded version that is fully solid state (electronics) with integrated circuitry and new active radar homing seeker and new radar altimeter entered service as SY-1A in early 1980s.

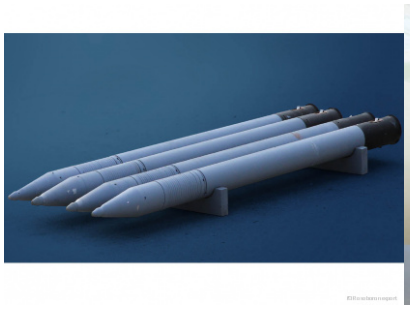
S-8KOM Russian Air-to-Air Rocket



Tiers:

1 2 3 4

System

:
:
:

↳***S-8KOM Air-to-Air Rocket***

Name: S-8KOM
Type: HEAT Rocket, Air-to-Air Rocket
Length: 1.57 m
Diameter: INA
Weight: 11.3 kg
Warhead Weight: 3.6 kg (1.1 kg of Hecphol-5/A-IX-10 explosive)
Engine: low smoke motor with powder BN-K.
Range: 1.3 to 4 km
Velocity: 400 mm versus RHA.
Armor Penetration: Velocity 610 m/s.

Notes:

The S-8 is a rocket weapon developed by the Soviet Air Force for use by military aircraft. It remains in service with the Russian Air Force and various export customers. Developed in the 1970s, the S-8 is an 80 mm (3.1 in) rocket used by fighter bombers and helicopters. The system entered service in 1984 and is produced in a variety of subtypes with different warheads, including HEAT anti-armor, high-explosive fragmentation, smoke, and incendiary, as well as the specialized S-8BM runway-destroying munition and the S-8DM fuel-air explosive variants. Each rocket is between 1.5 meters (4 ft 11 in) and 1.7 meters (5 ft 7 in)

long and weighs between 11.3 kg (25 lb) and 15.2 kg (33.5 lb), depending on warhead and fuse. Range is 2 to 4 kilometers (1.3 to 2.6 mi). The S-8 is generally carried in the B series of rocket pods, carrying either seven or 20 rockets. In 2018, the Russian Aerospace Forces took delivery and completed state tests of several batches of the S-8OFP Broneboishchik, successor to the S-8. While both rockets are unguided, the S-8OFP has greater range, a heavier warhead, and a digital fuse. The rocket is intended for armament of Su-25 type aircraft and Mi-8 helicopters, depending on the settings of the fuse, is able to penetrate obstacles facing the set targets, it can also explode in front of the obstacle and behind the obstacle. An armored self-propelled 80-tube MLRS vehicle using S-8 rockets has been developed by Belorussian industry. Relatively short range of the rocket (3 - 5km cross-ground) compared to Grad rockets is compensated for by lower cost and greater beaten area from a high number of rockets.

:

↳ ***S-13T Air-to-Air Rocket***

Name: S-13T
Type: Tandem HEAT, Air-to-Air Rocket
Length: 2.99 m
Diameter: INA
Weight: 75 kg
Warhead Weight: 21 kg and 16.3 kg (1.8 kg and 2.7 kg of explosives)
Range: 1.1 – 4 km
Velocity: Velocity 500 m/s
Armor Penetration: Combined penetration of 6 m of earth and 1 m of reinforced concrete.

Notes:

The S-13 is a 122 mm calibre unguided rocket weapon developed by the Soviet Air Force for use by military aircraft. It remains in service with the Russian Air Force and some other countries. The S-13 rocket was developed in the 1970s to meet requirements for a penetrating weapon capable of cratering runways and penetrating hardened aircraft shelters, bunkers and pillboxes, to fill a gap between 80 mm and 240 mm rockets and fulfill a role similar to the 127 mm Zuni rocket. The S-13 is conventional in layout, with a solid rocket motor and folding tail fins that provide stability after launch. The first trials were in 1973, but it was introduced only in 1983. S-13 rockets are shot from 5-tube launchers B-13L, that can be carried by most of Soviet and Russian attack and new fighter aircraft, like Sukhoi Su-17/20/22, Sukhoi Su-24, Sukhoi Su-25, Sukhoi Su-27, MiG-23BN, MiG-27, MiG-29. B-13L1 launcher is used by helicopters such as Mil Mi-24, Mil Mi-28, Kamov Ka-29TB, Kamov Ka-50 and Kamov Ka-52.

↳Rocket Launching System

Name: UB-32
Type: 57mm, reusable, 32-salvo rocket pod
Basic Load (UB-32 Rocket Pod): ea2-4
Launcher Length: mm2,080
Launcher Diameter: mm464
Weight, Empty: kg103
Weight, Loaded: kg264

↳Rocket System Projectile

Name: S-5M (ARS-57) Rocket
Type: Unguided HE-FRAG
Caliber: mm55
Length: m1.4
Diameter: mmINA
Weight: kg5
Basic Load (S-5 Rockets): ea32
Operational Range: km3-4

Engine: Solid Rocket Motor
Speed: 300 meters in 1.1 seconds
Note #1: Produces 75 Splinters
Note #2: The S-5 is carried in rocket pods, with 4–32 rockets.

Notes:

The UB-32 is a 57mm, reusable, 32-salvo rocket pod developed by the Soviet Union in the 1970s for aerial use in close air support and ground attack situations. Typically, it is mounted on external aircraft hardpoints and fires S-5 rockets. The launcher has a length of 2,080 mm (6.8 ft) and a diameter of 464 mm (1.5 ft). The UB-32 has also been used in improvised manners on the back of armored vehicles and trucks.

Zuni American 5-inch Folding-Fin Aircraft Rocket (FFAR)

Engine: Solid-fuel rocket
Operational Range: km8
Speed: km/h2,599
Guidance System: None

System

:
:
:

Notes:

The Zuni 5-inch Folding-Fin Aircraft Rocket (FFAR), or simply Zuni, is a 5.0 in (127.0 mm) unguided rocket developed by the Hunter-Douglas Division of Bridgeport Brass Company and deployed by the United States armed forces. The rocket was developed for both air-to-air and air-to-ground operations. It can be used to carry various types of warheads, including chaff for

countermeasures. It is usually fired from the LAU-10 rocket pod holding four rockets. In the early 1950s, U.S. Navy engineers Naval Ordnance Test Station China Lake began to develop a new 12.7 cm unguided rocket to replace the High Velocity Aircraft Rocket. The Zuni was designed as a modular system, to allow the use of different types of warheads and fuzes. One type of warhead was a proximity fuze, as the rocket was originally intended to be used as an air-to-air rocket. This led to its selection as the basis for the AIM-9 Sidewinder airframe in the early 1950s. The Zuni was approved for production in 1957. A number of different launchers were tested for the Zuni, e.g. single launchers fitted to the Sidewinder launching rails of the Vought F-8 Crusader. However, four-tube LAU-10/A series pods became the most commonly used launcher.

S-24 Russian Air-to-Surface Rocket

S-24 Rocket

↳*System*

Name: S-24 Rocket
Type: Unguided high-velocity airborne rocket
Proliferation: INA
Diameter: mm240
Length: m2.33
Launch Weight: kg235
Warhead Type: blast-fragmentation warhead
Warhead Weight: kg123
Operational Range: km2-3
Basic Load: ea2-4
Proximity Fuze: R-24
Fragmentation Casualty Zone Radius: m300-400
Number of Fragments: 4,000
Penetration: 30mm of armor
Note: The S-24 Warhead detones 3 meters above the ground

Notes:

The S-24 is a rocket weapon designed and used by the Soviet Air Force. It remains in use by the Russian Aerospace Forces The name is based on the diameter of the rocket, 24 cm (9.4 in). The Soviet Union was an early, enthusiastic user of rocket weapons, employing them as early as the 1930s. The S-24/S-24B is a very large, powerful unguided weapon and one of a handful of successors to the earlier World War II-era BETAB-750DS rockets. The S-24B differs from the S-24 in that it uses BN-K low smoke motor powder for a low-smoke flight. The S-24 is 2.33 metres (7 ft 8 in) long, with a launch weight of 235 kg (520 lb). It has a 123 kg (271 lb) blast-fragmentation warhead. Its range is about 2–3 kilometres (1.2–1.9 mi). The S-24 is carried individually on weapon pylons, rather than in pods. Proximity fuze RV-24 is also available, in which the warhead detonate 3 meters above ground, creating 300—400m radius of fragmentation casualty zone. The body is mesh-texture shape-harden by electric treatment and creating 4000 fragments that can penetrate up to 30 millimeters of armor, though some sources dispute this and give a figure of 25 millimeters. The rocket is also license produced in Iran under the name of Shafaq.

S-13 Russian 122mm Unguided Rocket

Tiers:

Variants:

- **S-13:** Penetrates 3 m of earth and 1 m of reinforced concrete. On runways it produces a demolition area of 20 m². Velocity 650 m/s
- **S-13B:** Penetrates 3 m of earth and 1 m of concrete.
- **S-13T:** Combined penetration of 6 m of earth and 1 m of reinforced concrete. Velocity 500 m/s
- **S-13OF:** Produces 450 splinters between 23 and 35 g, capable of penetrating lightly armoured vehicles such as APCs and IFVs. Velocity 530 m/s. Introduced in 1993.
- **S-13D:** 35 – 40 kg TNT equivalent. Velocity 530 m/s. Introduced in 1995.
- **S-13DF[:** Up to 40 kg TNT equivalent. Velocity 530 m/s. Ordered upgraded in 2018.

S-13 Russian 122mm Unguided Rocket

↳*Rocket Launcher*

Name: B-13L Rocket Pod
Type: Rocket Pod
Basic Load: 2 x Rocket Pods
Length: mm3560
Diameter: mm410
Unloaded Weight: kg160
Number of Rockets per Rocket Pod: ea5
Firing Interval: sec0.15

↳*Rocket System Ammunition*

Name: S-13
Type: 122 mm calibre unguided rocket weapon

Proliferation: The S-13 is a 122 mm calibre unguided rocket weapon developed by the Soviet Air Force for use by military aircraft. It remains in service with the Russian Air Force and some other countries.
Length: m2.54
Diameter: mmINA
Muzzle Velocity: m/sINA
Basic Load: ea5 Rockets per B-13L
Launch Weight: kg57
Warhead Weight: kg21
Effective Range: km1.1-3
Penetration: Penetrates 3 m of earth and 1 m of reinforced concrete. On runways it produces a demolition area of 20 m^2. Velocity 650 m/s.

Notes:

The S-13 is a 122 mm calibre unguided rocket weapon developed by the Soviet Air Force for use by military aircraft. It remains in service with the Russian Air Force and some other countries. The S-13 rocket was developed in the 1970s to meet requirements for a penetrating weapon capable of cratering runways and penetrating hardened aircraft shelters, bunkers and pillboxes, to fill a gap between 80 mm and 240 mm rockets and fulfill a role similar to the 127 mm Zuni rocket. The S-13 is conventional in layout, with a solid rocket motor and folding tail fins that provide stability after launch. The first trials were in 1973, but it was introduced only in 1983. S-13 rockets are shot from 5-tube launchers B-13L, that can be carried by most of Soviet and Russian attack and new fighter aircraft, like Sukhoi Su-17/20/22, Sukhoi Su-24, Sukhoi Su-25, Sukhoi Su-27, MiG-23BN, MiG-27, MiG-29. B-13L1 launcher is used by helicopters such as Mil Mi-24, Mil Mi-28, Kamov Ka-29TB, Kamov Ka-50 and Kamov Ka-52.

Shafaq Iranian Air-to-Surface Rocket

Tiers:

Variants:

- **S-24:** The S-24 is a rocket weapon designed and used by the Soviet Air Force. It remains in use by the Russian Aerospace Forces The name is based on the diameter of the rocket, 24 cm (9.4 in).

Shafaq Rocket

↳ ***System***

Name: Shafaq Rocket
Type: Unguided high-velocity airborne rocket
Diameter: mm240
Length: m2.33
Launch Weight: kg235
Warhead Type: blast-fragmentation warhead
Warhead Weight: kg123
Operational Range: km2-3
Basic Load: ea2-4
Proximity Fuze: R-24
Fragmentation Casualty Zone Radius: m300-400
Number of Fragments: 4,000
Penetration: 30mm of armor
Note: The S-24 Warhead detones 3 meters above the ground

Notes:

The Shafaq is a Iranian licensed Russian S-24 Rocket. The S-24 is a rocket weapon designed and used by the Soviet Air Force. It remains in use by the Russian Aerospace Forces The name is based on the diameter of the rocket, 24 cm (9.4 in). The Soviet Union was an early, enthusiastic user of rocket weapons, employing them as early as the 1930s. The S-24/S-24B is a very large,

powerful unguided weapon and one of a handful of successors to the earlier World War II-era BETAB-750DS rockets. The S-24B differs from the S-24 in that it uses BN-K low smoke motor powder for a low-smoke flight. The S-24 is 2.33 metres (7 ft 8 in) long, with a launch weight of 235 kg (520 lb). It has a 123 kg (271 lb) blast-fragmentation warhead. Its range is about 2–3 kilometres (1.2–1.9 mi). The S-24 is carried individually on weapon pylons, rather than in pods. Proximity fuze RV-24 is also available, in which the warhead detonate 3 meters above ground, creating 300—400m radius of fragmentation casualty zone. The body is mesh-texture shape-harden by electric treatment and creating 4000 fragments that can penetrate up to 30 millimeters of armor, though some sources dispute this and give a figure of 25 millimeters.

LS-6 Chinese Precision-Guided Bomb

Tiers:

1 2 3 4

System

:
:
:

↳***LS-6 Precision-Guided Bomb***

Name: LS-6
Type: Precision-Guided Bomb
Manufacturer: Luoyang Electro-Optics Technology Development Centre (EOTDC)
Length: INA
Diameter: INA
Weight: 50 kg version and a 100 kg version
Warhead: Various gravity bombs
Detonation Mechanism: Impact or Proximity
Maximum Speed: Free-fall
Guidance System: INS with GPS or laser guidance

Notes:

LS is an abbreviation for a family of Chinese built precision-guided munitions (PGM) named Thunder Stone Precision Guided Bomb developed by Luoyang Electro-Optics Technology Development Centre (EOTDC), a subsidiary of China Aerospace Science and Technology Corporation (CASC). Alternatively, the LS PGB is also referred to by its gliding capability, as Thunder Stone Gliding Guided Bomb, or LS GGB. The guidance design of LS PGB is also adopted for another family of Chinese PGM, the YZ series, such as YZ-102 series. These PGMs are referred to in China as precision guided bombs (PGB). LS PGB is actually an

upgrade kit to modernize gravity bombs with precision / laser guidance, with the kit consisted of two modules, the guidance module and the gliding module. The guidance of the weapon is based on two other Chinese PGM, the FT PGB and LT PGB, with the former providing the inertial/satellite guidance, while the latter providing different types of laser guidance. The gliding module including the folding wings and control surfaces is made of the composite material and aluminum alloys, and comes in different versions for different sizes of gravity bombs. The LS PGB upgrade kit can be fit to iron bombs up to five tons. Advanced versions are reportedly under development, such as imaging infrared targeting system, which is based on the seekers of air-to-air missiles developed by EOTDC. When released at an altitude of eleven thousand meters, the maximum range of LS PGB is greater than sixty kilometers. Chinese media have shown photographs of FT PGB being dropped from helicopters such as Chinese Naval Ka-28, in addition to the fixed-wing platforms. However, for the laser guided subfamily of FT PGB based on LT PGB/LGB, neither nose-mounted nor mast-mounted targeting turrets have been specially developed for rotary platforms, but instead, the targeting pods for fixed-wing platforms are carried directly by Chinese helicopters for targeting. All targeting pods developed for LT LGB/PGB can be used for the laser guided subfamily of FT PGB that is based on LT LGB/PGB, and additionally, general purpose targeting pod such as FILAT can also be used. LS series GGB/PGB was first revealed to public at the 6th Zhuhai Airshow held in November 2006 with LT-6 model of the family. All models in the family of this weapon are built to Chinese GJV289A standard, the Chinese equivalent of MIL-STD-1553B. The adaptation of such military standard means that the weapon can be readily deployed on any western platforms. Small 50 kg and 100 kg variants of the LS-6 are also featured, similar to the GBU-39 Small Diameter Bomb, that can be carried in the internal weapons bays of fighters like the J-20.

Mark 83 American Low-Drag General Purpose Bomb

Tiers:

Variants:

- **Mark 81:** The Mark 81 (Mk 81) 250-pound (110 kg) general-purpose bomb (nicknamed "Firecracker") is the smallest of the Mark 80 series of low-drag general-purpose bombs.
- **Mark 82:** The Mark 82 (Mk 82) is an unguided, low-drag general-purpose bomb, part of the United States Mark 80 series. The explosive filling is usually tritonal, though other compositions have sometimes been used.
- **Mark 84:** The Mark 84 or BLU-117 is an American general-purpose bomb. It is the largest of the Mark 80 series of weapons. Entering service during the Vietnam War, it became a commonly used US heavy unguided bomb (due to the amount of high-explosive content packed inside) to be dropped. At the time, it was the third largest bomb by weight in the US inventory behind the 15,000-pound (6,800 kg) BLU-82 "Daisy Cutter" and the 3,000-pound (1,400 kg) M118 "demolition" bomb. It is currently sixth in size due to the addition of the 5,000 lb (2,300 kg) GBU-28 in 1991, the 22,600 lb (10,300 kg) GBU-43/B Massive Ordnance Air Blast bomb (MOAB) in 2003, and the 30,000 lb (14,000 kg) Massive Ordnance Penetrator.

System

:
:
:

↳*Mark 83 Unguided General-Purpose Bomb*

Name: Mark 83
Type: Unguided General-Purpose Bomb
Manufacturer: General Dynamics
Length: 3000 mm
Diameter: 357 mm
Weight: 459 kg
Filling: Tritonal, Minol or Composition H6
Filling Weight: 202 kg
Note: The Mk 83 is a streamlined steel casing containing 445 lb (202 kg) of tritonal high explosive. When filled with PBXN-109 thermally insensitive explosive, the bomb is designated BLU-110.

Notes:

The Mark 83 is part of the Mark 80 series of low-drag general-purpose bombs in United States service. The nominal weight of the bomb is 1,000 lb (454 kg), although its actual weight varies between 985 lb (447 kg) and 1,030 lb (468 kg), depending on fuze options, and fin configuration. The Mk 83 is a streamlined steel casing containing 445 lb (202 kg) of tritonal high explosive. When filled with PBXN-109 thermally insensitive explosive, the bomb is designated BLU-110. The Mk 83/BLU-110 is used as the warhead for a variety of precision-guided weapons, including the GBU-16 Paveway laser-guided bombs, the GBU-32 JDAM and Quickstrike sea mines. This bomb is most typically used by the United States Navy but is used by the USAF in the F-22A in a JDAM configuration. According to a test report conducted by the United States Navy's Weapon System Explosives Safety Review Board (WSESRB) established in the wake of the 1967 USS Forrestal fire, the cooking-off time for a Mk 83 is approximately 8 minutes 40 seconds. The bomb has been controversially used during the Saudi Arabian-led intervention in Yemen.

BETAB-500 Russian Concrete-Piercing Bomb

Tiers:

1 2 3 4

System

:
:
:

↳ ***BETAB-500 Concrete-Piercing Bomb***

Name: BETAB-500
Type: Concrete-Piercing Bomb
Length: 2,200 mm
Diameter: 350 mm
Weight: 477 kg
Explosive Weight: 98 kg
Release Altitude: 30–5,000 m
Release Speed: 600–1,200 km/h

Notes:

The BETAB-500 (Russian: БетАБ-500) or the BETAB-500 Concrete-Piercing Bomb is a Soviet and Russian 500-kilogram (1,100 lb) bomb designed to penetrate and destroy reinforced concrete structures and to damage runways. During the Syrian civil war, the Russian military has used it repeatedly. In 2016, apparently the first use of this bomb in an urban environment occurred in the Eastern part of the city of Aleppo.

Mark 84 American General-Purpose Bomb

Tiers:

1 2 3 4

Variants:

- **Mark 82:** The Mark 82 (Mk 82) is an unguided, low-drag general-purpose bomb, part of the United States Mark 80 series. The explosive filling is usually tritonal, though other compositions have sometimes been used.

- **Mark 81:** The Mark 81 (Mk 81) 250-pound (110 kg) general-purpose bomb (nicknamed "Firecracker") is the smallest of the Mark 80 series of low-drag general-purpose bombs.

System

:
:
:

↳***Mark 84 General-Purpose Bomb***

Name: Mark 84
Type: General-Purpose Bomb
Length: 3280 mm
Diameter: 458 mm
Weight: 925 kg
Filling: Tritonal, Minol or Composition H6
Filling Weight: 429 kg
Note: It is a streamlined steel casing filled with 945 lb (429 kg) of Tritonal high explosive.

Notes:

The Mark 84 or BLU-117 is an American general-purpose bomb. It is the largest of the Mark 80 series of weapons. Entering service during the Vietnam War, it became a commonly used US heavy unguided bomb (due to the amount of high-explosive content packed inside) to be dropped. At the time, it was the third largest bomb by weight in the US inventory behind the 15,000-pound (6,800 kg) BLU-82 "Daisy Cutter" and the 3,000-pound (1,400 kg) M118 "demolition" bomb. It is currently sixth in size due to the addition of the 5,000 lb (2,300 kg) GBU-28 in 1991, the 22,600 lb (10,300 kg) GBU-43/B Massive Ordnance Air Blast bomb (MOAB) in 2003, and the 30,000 lb (14,000 kg) Massive Ordnance Penetrator. The Mark 84 has a nominal weight of 2,000 lb (907 kg), but its actual weight varies depending on its fin, fuze options, and retardation configuration, from 1,972 to 2,083 lb (894 to 945 kg). It is a streamlined steel casing filled with 945 lb (429 kg) of Tritonal high explosive. The Mark 84 is capable of forming a crater 50 feet (15 m) wide and 36 ft (11 m) deep. It can penetrate up to 15 inches (38 cm) of metal or 11

ft (3.4 m) of concrete, depending on the height from which it is dropped, and causes lethal fragmentation to a radius of 400 yards (370 m). Many Mark 84s have been retrofitted with stabilizing and retarding devices to provide precision guidance capabilities. They serve as the warhead of a variety of precision-guided munitions, including the GBU-10/GBU-24/GBU-27 Paveway laser-guided bombs, GBU-15 electro-optical bomb, GBU-31 JDAM and Quickstrike sea mines. The HGK is a Turkish guidance kit used to convert 2000-lb Mark 84 bombs into GPS/INS guided smart bombs. According to a test report conducted by the United States Navy's Weapon System Explosives Safety Review Board (WSESRB) established in the wake of the 1967 USS Forrestal fire, the cooking off time for a Mk 84 is approximately 8 minutes 40 seconds.

BL755 British Cluster Bomb

Tiers:

1 2 **3** 4

System

:
:
:

BL755 Cluster Bomb

↳***Bomb***

Name: BL755
Type: Cluster Bomb
Manufacturer: Hunting Engineering, Ltd.
Proliferation: Widely Proliferated
Length: mm2,451
Diameter: mm419
Weight: kg264
Warhead: Shaped charge HEAT warhead
Fragments: 1,400 anti-personnel fragments

Notes:

BL755 is a cluster bomb. Its primary targets are armoured vehicles and tanks with secondary soft target (anti personnel) capabilities. The BL755 looks like a standard 450-kilogram (1,000 lb) general-purpose bomb but with a hard "saddle" on the spine for ejector release and crutching pad loads and a distinctive large turbine-like air arming vane on the nose. The four rear fins are squared off in appearance, but on closer inspection can be seen to be hollow and telescopic. A central extruded aluminum skeleton is divided into seven bays, each containing 21 submunitions (147 total). The submunitions are ejected by means of a central cartridge and individual inflatable bladders for each bay, operating in a similar manner to a car airbag. Ejection on the original BL755 bomb is triggered by the rotation of the arming vane, driven by the airflow. Each submunition is contained within its own SAFU (safety and arming unit) and is telescoped shut. Upon release, the submunition is expanded by a spring. A focal distance stand off and detonating device deploys at the front and a fan of stabilising fins at the rear. Each has a shaped charge HEAT warhead for armour penetration, the casing of which is constructed from wound tessellated square wire, which produces around 1,400 anti-personnel fragments. A single cluster bomb produces a total of more than two hundred thousand fragments. The weapon was developed in the early 1970s by Hunting Engineering, Ltd. of Ampthill, Bedfordshire but manufactured elsewhere at their production facility. The original BL755 has been updated twice. IBL755 is a bomblet update,

increasing its reliability and armour penetration. RBL755 is the BL755 weapon fitted with a radar altimeter that acts as a proximity fuze, triggering bomblet ejection at the optimum altitude whilst allowing the bomb to be released from a safe height and distance. This was in response to the dangers illustrated by low-level Panavia Tornado missions in the 1991 Gulf War; the original vane-armed BL755 had to be released at a predetermined low altitude, with the attacking aircraft exposed to ground fire and shoulder-launched surface-to-air missiles such as the 9K34 Strela-3 and its variants.

KAB-1500L Russian Precision Guided Bomb

Tiers:

Variants:

- **KAB-1500S-E:** The KAB-1500S-E (Russian: КАБ-1500С-Э) is a precision guided bomb, part of KAB-1500 family, designed for the Russian Federation Air Force (RFAF) to carry out precision attacks, using 24-channel GLONASS and is equivalent to the United States Air Force (USAF) Joint Direct Attack Munition (JDAM) family of Global Positioning System (GPS) guided weapons. It is believed to be similar to the KAB-500S-E, and to use the same Kompas PSN-2001 (Pribor Sputnikovoy Navigatsii) satellite receiver.[1][2] KTRV has fully completed testing of products of the K08B and K029B (UPAB-1500B) types, both products are in serial production and are delivered to combat units. Russia intends to fit it to the Su-24M, Su-34, Su-35 and Mig-35 aircraft. They hope to export to India and China.

System

:
:
:

↳*Bomb*

Name: KAB-1500L
Type: Precision Guided Bomb
Manufacturer: Tactical Missiles Corporation
Length: 4,280 mm
Diameter: 820 mm
Wingspan: 0.58 m
Weight: about 1500 kg
Warhead Type: high explosive (LG-F-E), penetrating (LG-Pr-E), fuel-air (LG-OD-E)

Warhead Weight: INA
Flight Ceiling: 8-10 km
Guidance System: Laser-guided
Accuracy: 4 to 7 m

Notes:

KAB-1500L is a Russian precision guided weapon, part of KAB-1500 family, a laser guided bomb and also the current production standard for use on 4+ and 4++ generation fighter jets, like the Sukhoi Su-30MKI/Sukhoi Su-30MKK, Sukhoi Su-34 and Sukhoi Su-35. It is claimed to be the Russian equivalent to USA's Paveway II/Paveway III and is designed to hit railway, ammunition depots, railway terminals, highway bridges, military and industrial facilities, ships and transport vessels. The KAB-1500LG-F-E has an impact fuze which includes 3 different delay modes for target attack and it can also be mounted on older aircraft, like the Sukhoi Su-24 and the Mikoyan MiG-27. The bomb has been used in the Russian military campaigns in Chechnya and Syria.

KAB-500L Russian Laser-Guided Bomb

Tiers:

Variants:

- **KAB-500S-E:** KAB-500S-E is a Precision-Guided Munition (PGM) whose guidance system is based on GLONASS. The weapon can be dropped from aircraft flying at an altitude from 500 meters to 5000 meters and with an airspeed of 500–1150 km/h. The CEP is 7–12 meters. These bombs were used for the first time in the Russian military intervention in the Syrian Civil War in September 2015.

Systems

:
:
:

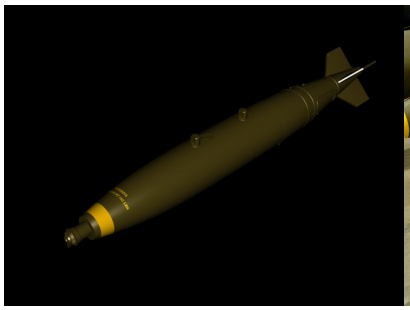
↳***KAB-500L Laser-Guided Bomb***

Name: KAB-500L
Type: Laser-Guided Bomb
Length: 3.05 m
Diameter: INA
Weight: Its warhead makes up 450 kg (990 lb) of the total weight, of which roughly 50% is blast-effect high explosive.
Warhead Type: INA
Warhead Weight: 450 kg
Guidance Sytem: semi-active laser seeker and guidance fins, turning it into an unpowered guided bomb.
CEP: 7 meters

Notes:

The KAB-500L is a laser-guided bomb developed by the Soviet Air Force. It remains in service with the CIS and post-Soviet Russian Air Force. The KAB-500L is a standard FAB-500 general-purpose bomb, which has a nominal weight of 500 kg (1,100 lb), fitted with a semi-active laser seeker and guidance fins, turning it into an unpowered guided bomb. The KAB-500L is 3.05 m (10.0 ft) long and weighs 525 kg (1,157 lb). Its warhead makes up 450 kg (990 lb) of the total weight, of which roughly 50% is blast-effect high explosive. Russian sources credit it with a CEP of 7 meters (23 feet). The technology of KAB-500L is also used for larger bombs, such as the KAB-1500L family. It is also deployed by the Indian Air Force. The primary launch platform is Su-30MKI.

Mark 82 American General-Purpose Bomb



Tiers:

Variants:

- **Mark 82:** The Mark 82 (Mk 82) is an unguided, low-drag general-purpose bomb, part of the United States Mark 80 series. The explosive filling is usually tritonal, though other compositions have sometimes been used.
- **Mark 83:** The Mark 83 is part of the Mark 80 series of low-drag general-purpose bombs in United States service.
- **Mark 81:** The Mark 81 (Mk 81) 250-pound (110 kg) general-purpose bomb (nicknamed "Firecracker") is the smallest of the Mark 80 series of low-drag general-purpose bombs.

System

:
:
:

↳*Mark 82 Unguided General-Purpose Bomb*

Name: Mark 82
Type: Unguided General-Purpose Bomb
Length: 2.22 m
Diameter: 273 mm
Weight: 227 kg
Filling: Tritonal, Minol (explosive) or Composition H6
Filling Weight: 87 kg
Cook Off Time: approximately 2 minutes 30 seconds.

Notes:

The Mark 82 (Mk 82) is an unguided, low-drag general-purpose bomb, part of the United States Mark 80 series. The explosive filling is usually tritonal, though other compositions have sometimes been used. With a nominal weight of 500 lb (227 kg), it is the one of the smallest in current service, and one of the most common air-dropped weapons in the world. Although the Mk 82's nominal weight is 500 lb (227 kg), its actual weight varies depending on its configuration, from 510 lb (232 kg) to 570 lb (259 kg). It is a streamlined steel casing containing 192 lb (89 kg) of Tritonal high explosive. The Mk 82 is offered with a variety of fin kits, fuzes, and retarders for different purposes. The Mk 82 is the warhead for the GBU-12 laser-guided bombs and for the GBU-38 JDAM. Currently only the General Dynamics plant in Garland, Texas and Nitro-Chem in Bydgoszcz, Poland is Department of Defense-certified to manufacture bombs for the US Armed Forces. The Mk 82 is currently undergoing a minor redesign to allow it to meet the insensitive munitions requirements set by Congress. According to a test report conducted by

the United States Navy's Weapon System Explosives Safety Review Board (WSESRB) established in the wake of the 1967 USS Forrestal fire, the cooking off time for a Mk 82 is approximately 2 minutes 30 seconds. More than 4,500 GBU-12/Mk 82 laser-guided bombs were dropped on Iraq during the Persian Gulf War. France requested 1,200 Mk 82s in 2010 to Société des Ateliers Mécaniques de Pont-sur-Sambre (SAMP) which builds Mk 82s under licence. Saudi Arabia requested 8,000 Mk 82s in 2015, along with guidance kits and other weapons.

RBK-250 Russian Cluster Bomb

Tiers:

Variants:

- **AO-2.5 Bomblet:** The AO-2.5 (aviatsionnaya oskolochnaya bomba, "aviation fragmentation bomb") bomblet is the original submunition used in the RBK-250-275. It has a cylindrical body with four fins on the tail. A variant, the AO-2.5-2, has elongated, flatter fins.
- **AO-1 SCh bomblet:** The AO-1 SCh looks like a miniature bomb, with a serrated cylindrical body and four tail fins, and is probably a more modern successor of the original AO-2.5. When armed with this bomblet, the RBK-250-275 has a destructive footprint of 5,740 sq yd (4,800 sq m).
- **PTAB-2.5 bomblet:** The PTAB-2.5 (protivotankovaya aviatsionnaya bomba, "anti-tank aviation bomb") is an anti-tank bomblet armed by an air-rotating vane in the drum assembly. The shaped charge can reportedly penetrate up to 4.72 in (120 mm) of armor plate.
- **PTAB-2.5M long-tail and short-tail bomblet:** A slight variation on the PTAB-2.5, the PTAB-2.5M comes in long-tail and short-tail versions, which differ from the original only in a protective covering over the nose fuze, the tail assembly and a slightly altered explosive mixture.

System

:
:
:

↳***RBK-250 Cluster Bomb***

Name: RBK-250
Type: Cluster Bomb
Manufacturer: VO GED (General Export for Defense), Moscow, Russia Bazalt State Research and Production Enterprise, Moscow, Russia
Length: 2.12 m
Diameter: 325 mm
Lug Spacing: 250 mm
Weight: 275 kg
Warhead: HE Bomblets
Fuzes: INA

Notes:

The RBK-250-275 (razovaya bombovaya kasseta, "one-use bombing cartridge") is designed to carry a wide variety of bomblets, including the AO-2.5, AO-1 SCh and PTAB-2.5. This permits the weapon to be used in many different roles, including anti-personnel, anti-materiel, anti-armor and runway-c ratering missions.

KAB-500KR Russian Fire and Forget Bomb

Tiers:

1 2 3 4

System

:
:
:

↳*KAB-500Kr Bomb*

Name: KAB-500Kr
Type: Electro-optical TV-guided fire and forget bomb
Basic Load: INA
Manufacturer: Russia
Proliferation: INA
Length: m3.05
Diameter: INA
Warhead Type: Hardened, armor-piercing warhead
Weight: kg520
Warhead Weight: kg380
Penetration: up to 1.5 metres (4 feet 11 inches) of reinforced concrete.
Effective Range: The weapon's seeker can lock onto a target at ranges of up to 15 to 17 km (9.3 to 10.6 mi), depending on visibility.
Note: It uses a standard Soviet/Russian FAB-500 general-purpose bomb, with a nominal weight of 500 kg (1,100 lb), as a warhead, adding a low-light television seeker and guidance fins to turn it into a guided, unpowered glide bomb.

Notes:

The KAB-500Kr (Correctable air bomb - 500 kg) is an electro-optical TV-guided fire and forget bomb developed by the Soviet Air Force in the 1980s. It remains in service with the CIS and various export customers. The KAB-500Kr is analogous to the American GBU-15 weapon. It uses a standard Soviet/Russian FAB-500 general-purpose bomb, with a nominal weight of 500 kg (1,100 lb), as a warhead, adding a low-light television seeker and guidance fins to turn it into a guided, unpowered glide bomb. The bomb is 3.05 m (10.0 ft) long and weighs 520 kg (1,150 lb), of which 380 kg (840 lb) is a hardened, armor-piercing warhead capable of penetrating up to 1.5 metres (4 feet 11 inches) of reinforced concrete. The weapon's seeker can lock onto a

target at ranges of up to 15 to 17 km (9.3 to 10.6 mi), depending on visibility. The KAB-500-OD[3] variant is equipped with a fuel-air explosive warhead. The technology of KAB-500Kr is also used for larger bombs, such as KAB-1500Kr based on the 1500 kg class FAB-1500 iron bomb. There is also training bomb KAB-500Kr-U

KAB-500 Series of Russian Fire and Forget Bombs

Tiers:

1 2 **3** 4

Variants:

- **KAB-500-OD:** Is equipped with a fuel-air explosive warhead.
- **KAB-1500Kr:** Based upon the 1500kg class FAB-1500 iron bomb.

System

↳***Bomb***

Name: KAB-500Kr
Type: Electro-optical TV-guided fire and forget bomb
Basic Load: INA
Length: m3.05
Diameter: 0.35
Warhead Type: Hardened, armor-piercing warhead
Weight: kg520
Warhead Weight: kg380
Penetration: Up to 1.5 metres (4 feet 11 inches) of reinforced concrete.
Effective Range: The weapon's seeker can lock onto a target at ranges of up to 15 to 17 km (9.3 to 10.6 mi), depending on visibility.

Bomb Drop Altitude: km0.5-5

Note: It uses a standard Soviet/Russian FAB-500 general-purpose bomb, with a nominal weight of 500 kg (1,100 lb), as a warhead, adding a low-light television seeker and guidance fins to turn it into a guided, unpowered glide bomb.

Notes:

The KAB-500Kr, KAB-500-OD, KAB-1500Kr corrected air bombs are fitted with TV/terrain-matching homing heads and various types of warheads. TV homers with target data processing correlation algorithm can "remember" target location and correct bomb's flight trajectory until the impact on the target, thus realizing the "fire and forget" principle. Such homing heads can help defeat low-contrast and masked targets provided that terrain reference points and target coordinates related to them are available. The Pr-E/F-E/OD-E/K-E are the most perfected example of the caliber of 500 kg, which has no direct relation to their foreign counterparts in the TV seeker, with a correlation algorithm of information processing of the purpose. Theyhave a Betonoboynymi-explosive warhead. Corrected air bombs KAB-500Kr caliber 500 kg is designed to engage a wide range of ground and surface stationary targets, including durable and low-contrast (disguised, whose position is known relative to the surrounding landmark), with the implementation of the "Reset - forget" principle). The guidance system bombs on target - TV-correlation. KAB-500Kr can be used singly and a volley from horizontal flight, dive, or pitching in the daytime (for illuminated targets - and at night), including a plurality of spaced targets in a single attack. The bomb consists of a housing, a television homing, electric charging fuse, unit control system device, warhead, turbogenerator power source, fuse, steering gear, block-board automation. Television gyrostabilized seeker head with the correlation algorithm of the information processing target includes opto-electronic part mounted on a three-stage gyrostabilized platform and an electronic data processing unit located in a single housing. The front part of the head is closed spherical transparent fairing. The head provides guidance bombs on target with illumination on the ground 50-100000 lux and contrast targets 0.2. Range capture target type "aircraft parked" at a meteorological visibility range of 10 km - 15-17 km. Suspension bomb on the plane by means of a universal beam holder DB3-U series. The KAB-500Kr, KAB-500-OD, KAB-1500Kr corrected air bombs make part of weapon systems of such front-line aircraft types as Su-27, Su-30, Su-34, Su24M, MIG-29 and others. The KAB-500Kr corrected air bomb is designed to engage stationary ground/surface small-sized hardened targets, such as reinforced concrete shelters, runways, railway and highway bridges, military industrial installations, warships, and transport vessels. < The KAB-1500Kr corrected air bomb is designed to engage various stationary ground/surface small-sized hardened targets, such as reinforced concrete shelters, military industrial installations, depots, and seaport terminals. The delivery set can be completed with the KAB-500Kr-U training bomb used for pilots' mastering combat employment skills for KAB-500Kr, KAB-500-OD and KAB-1500Kr corrected air bombs. The KAB-500Kr-U training bomb parameters are as follows: weight - 85kg, length 1,83m, diameter - 0,35m. The television channel management KAB-500Kr was developed in parallel with the KAB-500L air bombs. It had a caliber of 500 mm. The bomb was intended to destroy stationary ground targets such as railway bridges, fortifications, communications nodes, and so on. The television guidance system correlation type provide the possibility of defeat and concealed targets. Unlike foreign analogues, such as American bombs AGM-62 Walleye, exciting contrast optical target seeker KAB-500Kr fixed the relative positions of different optical contrast objects. This goal can not stand out from the area, and the bomb will be induced on a design point defined marker. If one believed the advertising magazine article "Military Parade" during the military operation received circular error probability less than three meters.

FT-2 Chinese Precision Guided Bomb

Tiers:

Variants:

- **FT-1:** This kit equips 1,100-lb (500-kg) bombs and is effective only against fixed targets. It consists of an unguided bomb section and a tail-guidance module with four control fins. Four stabilizing strakes are fitted to the body.
- **FT-2:** This kit is also for 1,100-lb (500-kg) bombs and features a planar wing kit for extended range.
- **FT-3:** The FT-3 is for 550-lb (250-kg) bombs and has a unique cruciform strake arrangement on the tail kit.
- **FT-3A:** The FT-3A is an improvement upon the FT-3 that includes a TV/imaging infrared seeker. The manufacturer, CASC, claims the accuracy has improved from a circular error probable of 65 ft (20 m) to 10 ft (3 m).
- **FT-4:** This version is for 550-lb (250-kg) bombs and has a planar wing kit.
- **FT-5:** This kit is for 220-lb (100-kg) bombs, with a strake and tail kit similar to the FT-1. The bomb-casing geometry is reportedly conventional and not intended for deep penetration of concrete. According to some reports, the FT-5 is designed primarily for unmanned aerial vehicles. It is said to be similar to the U.S. Small Diameter Bomb . A laser-guided variant has also reportedly been developed for integration with the Chinese CH-3 UAV.
- **FT-6:** This version is for 550-lb (250-kg) bombs and has a slim low drag bomb casing and a planar glide wing kit similar to the FT-3.
- **FT-6A:** An improvement upon the FT-6, the FT-6A is able to directly target air-defense and mobile systems through its anti-radiation seeking capability.
- **FT-12:** This is a rocket-boosted, precision-guided glide bomb. It has an 11-22 lb (5-10 kg) rocket motor, according to CASC. A release velocity of 370-620 mph (600-1,000 kmh) gives the 1,540 lb (700 kg) FT-12 a maximum range of 90 mi (150 km). The FT-12 can attack static targets with an accuracy of about 66 ft (20 m) circular error probable using a GPS /INS guidance system.

Propulsion System

Engine Name: INA

Steam Boilers: 8

Steam Turbines: 4

Engine Power: 200,000 shp

Shafts: 4

Main Armament

↳*System*

Name: Type 730 CIWS

Type: Close-In Weapon System

Caliber: 30mm

Quantity: 3 x Type 730 CIWS

Main Armament: The 30 mm Gatling gun mount designated as H/PJ-12 is extremely similar to the General Electric GAU-8/A Avenger. Although there are sources claiming that it is the Chinese version of the Russian Gryazev-Shipunov GSh-6-30 Gatling gun, this appears to be unlikely, since the Russian Gatling gun only has six barrels. H/PJ-12 is versatile in that its FCS can be either separately installed at different locations like the Soviet AK-630, or directly integrated on the gun mount. Like the American GAU-8/A Avenger, it is recommended not to fire longer than a single minute at a rate of 4,200 rounds per minute, after which the generated heat would begin melting the rifling of the barrels, shortening its useful life. Rates of fire beyond 4,200 rounds per minute increase wear. There are one Type 730 or two Type 730B/C, LD-2000 ammunition drums each contains 640 Type 730 or 500 Type 730B/C, LD-2000 rounds, and other versions of the ammunition drums have been reportedly developed.

Barrels: 7-barrel

Rate of Fire: 1,200-4,200 rounds/minute (Type 730) 11,000 rounds/minute (Type 1130)

Effective Firing Range: 1–1.5 km

Maximum Firing Range: 3 km

Feed System: Type 730: One ammunition boxes, holding 640 rounds.

Guidance Systemm: TR47C J-band radar OFC-3 electro-optical fire control system

↳*Ammunition*

Missile Weapon Systems

↳ ***System***

Name: FL-3000N

Type: Ship-Defense Missile System

Quantity: 3 x FL-3000N Ship-Defense Missile Systems

Length: 2.00 m

Diamter: 0.12 m

Missile: HQ-10

Missile Basic Load: INA

Maximum Range Against High-Speed Targets: 6,000 m

Maximum Range Against Low-Speed Targets: 9,000 m

Minimum Range: 500 m

Elevation: INA

Traverse: INA

Onboard Aviation Facilities

Aircraft: 28-36 J-15 naval fighters

Helicopters: 12-16 helicopters

Fire Control

Type 730 CIWS: The OFC-3 system is modular design that comprises a laser range finder, a color TV camera, and an IR camera, and the laser range finder can be replaced by a laser designator (for a laser beam-riding SAM), the TV camera can be replaced by a night vision camera, and the IR camera can be replaced by an ImIR, at higher cost. Development to incorporate the dual band IR, night vision camera, and the color TV camera is reportedly in progress. Type 730 CIWS is an autonomous closed-loop system and thus offers faster reaction time than the Russian AK-630. Type 730 CIWS is fully compatible with Chinese and European combat data systems such as ZKJ-1, ZKJ-4, ZKJ-4A-3, ZKJ-5, ZKJ-6, ZKJ-7, H/ZBJ-1, and Thomson-CSF TAVITAC, and can be directly integrated with these combat data systems without any modification.

Sensors: The carrier is fitted with the advanced Type 346 S-band active electronically scanned array (AESA) radar. The phased-array radar panels face diagonally outward on both sides of the bridge, fore and aft. The Type 001A's electronic equipment is entirely new.

Fire Control Radar

Type 730 CIWS: The TR47C radar operates in the same way of AN/APY-1/2 radar on board E-3 Sentry in that the azimuth is scanned mechanically, while the elevation is scanned electronically, incorporating a total of 169 transceivers of phased array technology that enables the radar to pick up the splashes of 30 mm rounds. Like the western CIWS, the information is processed on site, via local computers of the radar and the gun mount, thus providing faster reaction time than the Russian design in which the radar and fire control system are separately located. The system can track a sea-skimming target with 0.1 square metre radar cross section at 8 km, extended to 15 km if the radar cross section is increased to 2 square metres, and further extended to 20 km if the radar cross section is increased to 10 square metres, though the targets could not be engaged until much closer (3 km) due to the limited range of the gun.

Protection

Active Protection System: INA

NBC Protection: Yes

Notes:

The SHANDONG (Type 001A) is China's first domestically built aircraft carrier. It is a development of the LIAONING class, China's first aircraft carrier, which is based on a former Soviet vessel (see separate record). The carrier is named after the province in eastern China. Shandong (17; Chinese: □□□; pinyin: Shāndōng Jiàn) is a first-generation Chinese aircraft carrier that was launched on 26 April 2017 for the People's Liberation Army Navy (PLAN) of the People's Republic of China (PRC). It is the country's second aircraft carrier after the completion of Liaoning, and the first built domestically. Shandong was initially designated as a Type 001A air carrier during development but was finalized as Type 002 at commissioning. Shandong was constructed by the Dalian Shipbuilding Industry, part of the China Shipbuilding Industry Corporation, in Dalian, Liaoning province, China. According to the state media service Xinhua, they started fabrication of vessel in November 2013, and laid down the keel for its hull in a drydock beginning in March 2015. The Chinese government did not publicly confirm the ship's existence until construction was well underway. Satellite imagery for the defense analysis industry showed the aircraft carrier in the early stages of hull assembly by March 2015. Public photos of a hull with military characteristics at the Dalian shipyard surfaced on the internet the next month. In October 2015, the first definitive signs of the vessel's role appeared when construction of a hangar deck began on the hull. In December 2015, a Chinese defense ministry spokesman confirmed that the ship was an aircraft carrier, stating that the design and construction work was under way. In May 2016, the ski jump takeoff ramp was noted to be close to installation. The ship's island superstructure was fabricated in two parts: the nine-deck forward half, containing the bridge and main mast, was installed by September of that year; the aft half, with the funnel and air intakes, was installed in the weeks that followed. By the end of 2016, the ship was substantially structurally complete. Following the launch, the carrier was fitted-out and underwent early tests of the propulsion system. The dockside system trials began after the out-fitting was completed in November 2017. At the time of its launch, the ship was not expected to be delivered to PLAN until 2020; however, successful early tests put the project ahead of schedule and media reports indicated that it could enter the navy fleet in 2019. While its predecessor Liaoning has been used largely as a training ship since it entered active service in 2012, the Type 002 is expected to be used in regular military operational service. The aircraft carrier's design is largely based on China's first carrier Liaoning, which was itself built from the partially-complete hull of the Soviet Kuznetsov-class aircraft carrier Varyag. It retains the ski jump takeoff, which limits its air wing to helicopters and Shenyang J-15 fighter jets, and the ship is powered by conventional oil-fired boilers driving eight steam turbines derived from the Soviet-designed examples installed on Liaoning. It measures about 315 metres (1,033 ft) long, with a displacement of about 55,000 tonnes (70,000 loaded). However, it carries modifications and upgrades compared to Liaoning. It has increased storage for ammunition and fuel, with a larger aircraft capacity of 44 aircraft, eight more than Liaoning. Shandong has a broader flight deck but a shorter island superstructure than Liaoning to give more space for aircraft movements. The island also has redesigned radars and a new bridge, while the fleet command and flight control tower are on separate floors for more efficiency. It includes an active electronically scanned array (AESA) radar system. Shandong, like its predecessor, uses the simpler "short take-off but arrested recovery" (STOBAR) launch and recovery system. Future carriers, such as the Type 003 aircraft carrier, are planned to use an Electromagnetic Aircraft Launch System (EMALS) that allows the launch of heavier and more advanced aircraft such as the Shenyang J-31 or the Chengdu J-20.

Main Gun System

Radar/Optronic Director: LIROD MK2

LIROD MK2 Description: LIROD MK2 is a flexible and compact sensor system, most suitable as an accurate, low cost, all-weather tracker for fire control systems.

LIROD MK2 Details: The system has been designed for as the primary gun control system onboard of smaller ships, against both surface and air targets, and as a secondary system in larger configurations. With an appropriate gun, it is suitable for CIWS functions. LIROD Mk2 is also capable of controlling short-range missiles. The radar system operates in the K-band, and applies a new, powerful TWT transmitter to improve the performance under adverse conditions. The antenna is of an ellipsoid design to achieve the best low elevation performance against sea-skimming targets, while maintaining fast target acquisition against manoeuvring targets.

Onboard Aviation Facilities

Aircraft: 26 × Mikoyan MiG-29K multi-role fighters

Helicopters: 10 × Kamov Ka-31 AEW&C and Kamov Ka-28 ASW helicopters

Note: Vikramaditya has been designed as a STOBAR carrier capable of operating both conventional fixed-wing aircraft and helicopters, with up to 34 aircraft capable of being accommodated. Its primary embarked aircraft type is the Mikoyan MiG-29K, a navalised version of the Mikoyan MiG-29M. The MiG-29K is an advanced, all weather multi-role fighter capable of undertaking both the fleet air defence, low level strike and anti-shipping roles. The primary ASW platform is the venerable Westland Sea King, while AEW is undertaken by the Kamov Ka-31. Carriage ranges given for the ship seem to converge around 16–24 MiG-29K and 10 Kamov Ka-31 or Dhruv helicopters; however Vikramaditya is not capable of operating fixed-wing AEW aircraft owing to her configuration as a STOBAR carrier. Utility and plane guard duties are undertaken by the HAL Chetak (or HAL Dhruv).

Torpedos: 2 x towed torpedo decoys

Notes:

INS Vikramaditya (Sanskrit, Vikramāditya meaning "Brave as the Sun") is a modified Kiev-class aircraft carrier and the flagship of the Indian Navy, which entered into service in 2013. She has been renamed in honour of Vikramaditya, a legendary emperor of India. Originally built as Baku and commissioned in 1987, the carrier served with the Soviet Navy and later with the Russian Navy (as Admiral Gorshkov) before being decommissioned in 1996. The carrier was purchased by India on 20 January 2004

after years of negotiations at a final price of $2.35 billion. The ship successfully completed her sea trials in July 2013 and aviation trials in September 2013. She was commissioned on 16 November 2013 at a ceremony held at Severodvinsk, Russia. On 14 June 2014, the Prime Minister of India formally inducted INS Vikramaditya into the Indian Navy and dedicated her to the nation. Refurbishment The hull work was completed by 2008[45] and Vikramaditya was launched on 4 December 2008. Around 99% of the structural work and almost 50% of the cabling work had been completed by June 2010. Almost all of the large equipment, including engines and diesel generators, was installed. A naval MiG-29K prototype aircraft was used to test the deck systems of Vikramaditya in 2010. All reconfiguration work was completed at Severodvinsk, Russia; however it was delayed by three years due to underestimation of the amount of cabling needed. An expert level discussion on technical and financial matters was held between India and Russia to sort out the issues. The MiG-29K entered operational service with India in February 2010. A compromise was finalised and India was to pay an extra undisclosed amount. Russia was to install new systems instead of repairing the old ones. On 1 June 2010, The Times of India reported a naval officer saying: "With India earlier this year agreeing to the revised refit cost of $2.33 billion for Gorshkov after three years of bitter wrangling since the earlier agreement inked in January 2004 had earmarked only $974 million for it, Russia has appointed a high-level apex committee to oversee the work on the carrier". The ship was to go for harbour trials by early 2011 to ensure it could be handed over to India by December 2012 or so. Dock trials began on 1 March 2011. The focus of these trials was on the main power generation units and the radio-electronic armament systems, manufactured in India. Indian Navy personnel began training on Vikramaditya in April 2011. On 19 April 2012, it was announced that all internal systems were functioning, and the ship was entirely self-contained. Measurement of the ship's magnetic field and centre of gravity were performed before sea trials began. As completed, Vikramaditya has a larger full load displacement than when the ship was originally launched in 1982 as Baku. 1,750 out of 2,500 compartments of the ship were re-fabricated, and extensive re-cabling was done to support new radars and sensors. The elevators were upgraded, and two restraining stands were fitted, allowing combat aircraft to reach full power before making a ski jump-assisted short take-off. Three arresting gears were fitted on the aft part of the angled deck, and navigation and carrier-landing aids were added to support fixed-wing "short take-off but arrested recovery" (STOBAR) operations. The major modifications were to allow Admiral Gorshkov to operate as a STOBAR aircraft carrier in Indian service, as opposed to the STOVL configuration the ship was built as. This involved removal of all the armament, including the P-500 Bazalt cruise missile launchers and the four Antey Kinzhal surface-to-air missile bins fitted on ship's bow, to make way for a 14.3°, full-width ski-jump. The 20-ton capacity aircraft lift beside the ship's island superstructure was unchanged, but the aft lift was enlarged and its lift capacity increased to 30 tons. For STOBAR operations, three 30 m arrestor wires and three restraining gears on the stern of the angled deck were fitted. Sponsons were installed to increase the area of the flight deck, to allow the ski-jump to be fitted, for strengthening of arresting gear and runway area, and to lengthen the after end, which allowed an increase to the length of the landing strip aft of the arresting gear. 234 new hull sections were installed to achieve the desired shape, and the total steel added to carry out these modifications amounted to 2500 tons. The superstructure profile was designed to accommodate the fixed phased array scanners of the Soviet Navy's Mars-Passat 3D air search radar system, along with extensive command and control facilities to conduct an aerial campaign. Extensive revamp of sensors was carried out, with long range air-surveillance radars and advanced electronic warfare suites fitted, which enable the maintenance of a surveillance bubble of over 500 km around the ship. An aft mast was installed to accommodate various communication antennae. These changes needed 2,300 km of new cables, and 3,000 km of new pipes. The eight original boilers were replaced by new generation, high-pressure boilers, converted to take diesel fuel utilising LSHSD instead of furnace fuel oil, each providing a steam capacity of 100 tonnes per hour. The new boilers are highly efficient and have high levels of automation. They power four propellers in four shaft configuration, producing a total thrust of 180,000 horsepower (134,226 kW) at the shaft, providing a top speed of over 30 knots. Six turbo alternators and six diesel alternators generate 18 MW of electricity to power various equipment. Modern oil-water separators as well as a sewage treatment plant were incorporated to meet international standards. Six new Finnish Wärtsilä 1.5 MW diesel generators, a Global Marine communications system, Sperry Bridgemaster navigation radar, a new telephone exchange, new data link and an IFF Mk XI system were added. Hotel services were improved with the addition of two reverse osmosis plants producing 400 tons of fresh water per day, as well as updated refrigeration and air conditioning. A new galley was installed together with improved domestic services and accommodation for 10 female officers. Combat systems he combat systems on board the carrier are controlled by LESORUB-E, the computer-aided action information system. It gathers data from the ship's sensors and data links and creates comprehensive situation awareness. The CCS Mk II communication complex is installed for external communications and the Link II tactical data system enables integration into the Indian Navy's network-centric operations. Modern launch and recovery systems are installed for handling different aircraft – the LUNA landing system for MiG-29Ks and the DAPS Landing system for Sea Harriers. The Resistor-E automated air-traffic control system has been installed, which provides assistance during approach, landing and short range navigation down to a distance of 30 metres short of flight deck to the pilots. Along with various other sub-systems, it provides navigation and flight data to ship-borne aircraft operating at long distances from the carrier. When delivered, Vikramaditya had yet to be fitted with any on-board armament, leaving her dependent on her battle group for self-defence. This was rectified during the ship's short refit of April–June 2015, when she was fitted with four license-built AK-630 CIWS, and a Barak 1 SAM system stripped from the decommissioned INS Godavari. During the ship's first scheduled major refit in 2017, the Barak 1 system will be replaced with the newly developed Barak 8 long-range air-defence system (LR-SAM), which is currently being tested. It is launched from vertical launch cells, and has an operational range of 0.5–100 km. The carrier will carry up to 48 missiles. The official expected life span of the ship is 40 years, and is unlikely to require any major repair work for at least a decade. Over 70% of the ship and her equipment is new and the remainder has been refurbished.[Sevmash Shipyard, which upgraded the carrier, will provide warranty servicing including maintenance for the next 20 years.

INS Vikrant Class Indian Aircraft Carrier

Tiers:

System

Alternative Designation: INS Vikrant, also known as Indigenous Aircraft Carrier 1 (IAC-1),
Total Built: 1 Aircraft Carrier Scheduled to be built
Laid Down: 28 February 2009
Completed: 2021 (expected)
Commissioned: 2022 (expected)
Builder: Cochin Shipyard Limited
Type: Air Craft Carrier
Crew: 1,400 (160 off. + 1,240 enl.)

Dimensions

Length: 262.50 m
Beam: 60.84 m
Draft: 8.40 m
Draght: 8.4 m
Decks: 2.5 acres (110,000 sq ft; 10,000 m2)
Displacment, Standard: 40,642 tons

Propulsion System

Engine Name: 4 x H.A.L.-General Electric LM-2500 gas turbines

Engine Power: 120,000 hp total

Shaft: 2 shafts w/controllable-pitch propellers

Maximum Range: 7,500 nm at 18 knots

Maximum Speed: 28 knots

Endurance: INA

Main Armament

↳*System*

Name: OTO Melara

Caliber: 76mm

Type: Naval Gun

Quantity: 4 x OTO Melara 76mm Naval Gun

Barrel Length: 4,724.4mm

Weight: Empty: 7.5 tonnes

Crew: Remote Controlled

Elevation: −15°/+85° speed: 35°/s (acceleration: 72°/s²)

Traverse: 360° speed: 60°/s (acceleration: 72°/s²)

Rate of Fire: Compact: 85 rounds/min Super Rapid: 120 rounds/min

Muzzle Velocity: 915 m/s

Maximum Firing Range: HE-PFF 16,000 m

Feed System: Magazine capacity: 80 ready rounds on Compact gun mount

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm76

Shell: 76×636mmR cartridge weight 12.5 kilograms (28 lb) shell weight 6.3 kilograms (14 lb) propellant weight 2.35 kilograms (5.2 lb)

Basic Load: INA

Auxiliary Weapon Systems

↳*System*

Name: AK-630

Caliber: 30mm

Type: Close-In Weapon System (CIWS)

Quantity: 1 x AK-630 30mm Close-In Weapon System (CIWS)

Main Armament: 1 or 2 AO-18 autocannons

Secondary Armament: 2 x 32 cells VLS

Missile Type: Barak 1 & Barak 8 Missile

Missile Basic Load: 64

Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)

Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630) 1,800 kg (4,000 lb) (AK-630M) 2,500 kg (5,500 lb) (AK-630M-2) External nodes: 800 kg (1,800 lb) (AK-630) 2000 rounds in belt: 1,918 kg (4,228 lb)

Action: Gas-operated rotary cannon

Elevation: +88° ... -12° (50°/sec)

Traverse: ±180° (70°/sec)

Rate of Fire: 4,000–5,000 rounds/min

Muzzle Velocity: 880–900 m/s

Maximum Firing Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime)

Effective Firing Range: the projectiles self-destruct past 5,000 m

Feed System: 2,000 rounds (additional 1,000 rounds in reserve feed bin

Sights: Radar / TV-optical

Fire Control Systems: Vympel MR-123 Vympel-A MR-123/176 Vympel-AM MR-123-02/MR-123-03 Vympel-AME MR-123-02/176 Laska 5P-10E

↳***Ammunition***

Type: Rifle

Caliber: mm30

Shell: HEI-Frag, Frag-T

Shell Weight: 0.39 kg

Basic Load: 4,000

Onboard Aviation Facilities

Aircraft: 20 x MiG-29K Fulcrum-D and/or Tejas light combat aircraft

Helicopters: 10 x Ka-31 and HAL Dhruv helicopters

Radar

Navigation Radar: 1 x navigation (Name: INA)

Air/Surface Radar: 1 x ELM-2248 STAR air/surface search

Surface Radar: 1 x Selex RAN-40L long-range early warning and surveillance AESA radar

Protection

Active Protection System: Yes

Sonar: 1 x HUMSA hull-mounted sonar

NBC Protection: Yes

Notes:

INS Vikrant, also known as Indigenous Aircraft Carrier 1 (IAC-1), is an aircraft carrier under construction by Cochin Shipyard in Kochi, Kerala for the Indian Navy. It is the first aircraft carrier to be built in India. The name Vikrant (Sanskrit vikrānta, literally "stepping beyond") means "courageous". The motto of the ship is Jayema Sam Yudhi Sprdhah, which is taken from Rigveda 1.8.3 and can be translated as "I defeat those who fight against me". Work on the ship's design began in 1999, and the keel was laid in February 2009. The carrier was floated out of its dry dock on 29 December 2011 and was launched on 12 August 2013. As of 2019, the ship is expected to start sea trials in February 2021 and enter into service in early 2022. The project cost has escalated, by 2014, to ₹19,341 crore (equivalent to ₹230 billion or US$3.2 billion in 2018). With an additional ₹3,000 crore (US$420 million) authorised for phase III, in 2019. It is 262 metres (860 ft) long and 60 metres (200 ft) wide, and displaces about 40,000 metric tons (39,000 long tons). It features a STOBAR configuration with a ski-jump. The deck is designed to enable aircraft such as the MiG-29K to operate from the carrier. It is expected to carry an air group of up to thirty aircraft, which will include up to 24–26 fixed-wing combat aircraft,[23] primarily the Mikoyan MiG-29K, besides carrying 10 Kamov Ka-31 or Westland Sea King helicopters. The Ka-31 will fulfill the airborne early warning (AEW) role and the Sea King will provide anti-submarine warfare (ASW) capability. Vikrant is powered by four General Electric LM2500+ gas turbines on two shafts, generating over 80 megawatts (110,000 hp) of power. The gearboxes for the carriers were designed and supplied by Elecon Engineering. The ship's combat management system (CMS) was developed by Tata Power Strategic Engineering Division in collaboration with Weapon and Electronics System Engineering Establishment and MARS, Russia. It is the first CMS developed by a private company for the Indian Navy, was handed over to the Navy on 28 March 2019 India considered a number of aircraft for operation from its INS Vikramaditya and the planned indigenous aircraft carrier. India evaluated the Russian Sukhoi Su-33, but chose the lighter Mikoyan MiG-29K as Vikramaditya was smaller and lacked an aircraft catapult. On 18 January 2010, it was reported that India and Russia were close to signing a deal for 29 MiG-29K fighters to operate from IAC-1. In addition, the navy signed a deal for six naval-variants of the HAL Tejas. In June 2012, Flight Global reported that the Indian Navy was considering the use of Rafale M (Naval variant) on these carriers. In December 2016, the navy announced that the HAL Tejas was overweight for carrier operations, and other alternatives would be looked at. The ship's completion and commissioning has been delayed several times. Vikrant was originally intended to be delivered in December 2010 and commissioned in 2016. This was later postponed, with sea trials to begin in 2017 and commissioning planned for 2018. In July 2016, the Comptroller & Auditor General (CAG) published a 2014 project plan, supplied by the Cochin Shipyard, that shows an expected completion date in 2023, though the Navy hoped to partially commission the ship before this date. In December 2017, the Chief of Naval Staff Admiral Sunil Lanba announced that the ship was expected to be commence sea trials and be commissioned in 2020.[62][64] In January 2018, Commodore Chowdhary, the principal director of naval design, announced the remaining procurement delays stalling Vikrant's construction had been resolved, and that the carrier would be completed and delivered by December 2018; it would then undergo two years of sea trials before its expected commissioning in October 2020. In July 2019, Vice Admiral Saxena, Controller of Warship Production and Acquisition in the Navy, said that the ship was expected to be delivered by 2021.

Liaoning (16) Chinese Type 001 Aircraft Carrier

Tiers:

System

Alternative designations: Originally laid down in 1985 for the Soviet Navy as the Kuznetsov-class aircraft cruiser Riga, she was launched on 4 December 1988 and renamed Varyag in 1990. Riga (1988) then Varyag (1990)
Namesake: City of Riga, Latvia (1988) then Varyag, named for the Varangians (1990), the name Varyag was then adopted by another cruiser.
Builder: Mykolaiv South Nevskoye Planning and Design Bureau
Laid Down: 6 December 1985
Launched: 4 December 1988
Completed: 2011
Fate: Sold to a Chinese shell company, 1998 Transferred to Chinese navy, 2002
Commissioned: 25 September 2012
Status: In Active Status
Crew: 1,960 (200 off. + 626 air crew + 40 flag staff)
Endurance: 45 days

Dimensions

Length, Overall: 304.5 m
Length, Waterline: 280.0 m
Beam, Overall: 70.0 m
Beam, Waterline: 37.0 m
Draft: 10.5 m

Flight Deck Length: 304.5 m

Flight Deck Beam: 70.0 m

Hanger Length: 183.0 m

Hanger Width: 29.4 m

Hanger Height: 7.5 m

Displacement, Standard: 46,637 tons

Displacement , Load: 59,439 tons

Automotive

Propulsion: 8 x boilers; 4 x turbines

Power: 200,000 hp (147 MW); 4 shafts

Maximum Speed: 30 knots (56 km/h)

Maximum Range: 3,850 nm at 29 knots 8,500 nm at 18 knots

Armament

↳*Weapon Station #1*

Name: FL-3000N 24-cell launchers

Type: Missile Launcher

Quantity: 4 x FL-3000N 24-cell launchers

Missile: Instead of using QW-1 Vanguard MANPADs, the FL-3000N system uses the HHQ-10 (Red Flag 10) naval surface to air missile developed from TY-90 missile.

Length: m2

Diameter: m0.12

Maximum Range: > 9 km for subsonic targets, > 6 km for supersonic targets

Minimum Range: < 500 meters

Guidance System: passive RF + ImIR or ImIR only. The FL-3000N missile utilizes a combined guidance system that incorporates both passive radio frequency (RF) guidance and imaging infrared (ImIR) guidance. There are a pair of horn like protrusions mounted on the ImIR seeker at the tip of the missile, and these two protrusions are the passive RF seeker. An optional ImIR only guidance is also available and the missile is a fire and forget weapon.

Fire Control: The fire control system (FCS) of FL-3000N can simultaneously control two launchers, and can be integrated into other FCS on board ships. Alternatively, FL-3000N is also capable being directly controlled by other FCS on board ships. The system is usually fully automatic without human intervention, but manual operation can be inserted when needed.

↳*Weapon Station #2*

Name: Type 730 CIWS

Type: seven-barrelled 30 mm Gatling gun CIWS.

Caliber: 30mm

Quantity: 2 x 30-mm Type 730 CIWS

Barrels: 7-barrel (Type 730)

Crew: Automated, with human oversight

Rate of Fire: 1,200-4,200 rounds/minute (Type 730) 11,000 rounds/minute (Type 1130)

Effective Firing Range: 1–1.5 km

Maximum Firing Range: 3 km

Feed System: Type 730: One ammunition boxes, holding 640 rounds Type 730B/C, LD-2000: Two ammunition boxes, each holding 500 rounds (total 1000 rounds) Type 1130: Two ammunition boxes, each holding 640 rounds (total 1280 rounds)

Main Armament: 1×30 mm H/PJ-12 or H/PJ-11 Gatling gun

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

↳*Ammunition Weapon Station #2*

Cartridge: INA

Caliber: 30mm

Basic Load: INA

↳*Weapon Station #3*

Name: RBU-6000

Type: 213 mm caliber Soviet anti-submarine rocket launcher.

Quantity: 2 x RBU-6000 mortar

Launcher, Length: 2 m

Launcher, Width: 1.75 m

Launcher, Height: 2.25 m

Launcher, Weight: 3,100 kg (empty)

Launcher, Elevation: -15° to +65°

Launcher, Traverse: 180°

Maximum Effective Range: Ballistic 1 - 350 m to 1700 m, Ballistic 2 - 1500 m to 5500 m

Rocket Name: RGB-60 projectile

Rocket, Length: m1.83

Rocket, Diameter: m0.212

Rocket, Weight: 113.5 kg

Rocket, Warhead Weight: 23 kg

Rocket, Depth: 10 to 500 m

Rocket, Sink Rate: 11.6m/s

Aircraft

Note: On 4 November 2012, the People's Liberation Army's website (Chinese: □□□□) reported that Shenyang J-15s had performed carrier touch-and-go training. On 25 November 2012, China announced that J-15s had made five successful arrested landings on Liaoning. In June 2013, a second round of flight tests began on board Liaoning, with personnel from the fleet air arm of the Brazilian Navy providing carrier training support to the PLAN. In August 2014, based on an article from Chinese state media, Western news outlets reported that two pilots had been killed testing jets slated to operate from

Liaoning. Chinese military officials stated such reports were misleading, and clarified that deaths were in fact unrelated with tests on the carrier. The original Chinese article from Xinhua also did not link the deaths with the J-15 nor mention any loss of such aircraft. In August 2014, the Chinese-language Shanghai Morning Post listed that Liaoning would carry 36 aircraft: 24 Shenyang J-15 fighters, six Changhe Z-18F anti-submarine warfare (ASW) helicopters, four Changhe Z-18J airborne early warning helicopters and two Harbin Z-9C rescue helicopters. The Chinese carrier aircraft inventory is similar to a balanced combat and support aircraft approach intended for Soviet aircraft carriers, which supported nuclear submarines, large surface combatants, and land-based strike bombers performing anti-access roles. The air wing lacks long-range radar and anti-submarine fixed-wing aircraft, needing support from shore-based aircraft such as Tupolev Tu-154 ASW and Shaanxi Y-8 AWACS aircraft. The U.S. Department of Defense noted that J-15s will have below normal range and armament when operating from the carrier, due to limits imposed by the ski-jump takeoff system. The lack of a carrier onboard delivery aircraft like the United States Navy (USN) Grumman C-2 Greyhound also limits logistics capabilities. Liaoning would need extensive land-based support to oppose a USN carrier strike group; however, it would be potent against the Vietnam People's Navy and the Philippine Navy. Deficiencies will likely be corrected with future aircraft carriers, which are expected to be larger with conventional takeoff decks and catapult launching for heavier fighters, plus fixed-wing radar and anti-submarine patrol aircraft.

↳***J-15 or Su-33 Flanker***

Quantity: Up to 24

↳***Ka-31 Helix / Ka-27 / Z-8 / Z-9 / Z-18***

Quantity: Up to 12

Radars

1 x Top Plate (Fregate MAE-3) air search: The Fregat, Top Plate and Top Steer NATO codename, is a family of 3D, 360-degree/full-coverage ship-based radar systems developed for the Soviet Union Navy and designed to provide surveillance and detection of surface and airborne targets and to deliver target designation data to weapon systems. The Fregat radar system can operate effectively in intense jamming and countermeasures environments. Moreover, the radar system also provides identification friend or foe (IFF). The Fregat family of radar systems features automatic target tracking and built-in self-diagnosis system. The radar system is made of line replaceable units that can be removed with ease in the event of a malfunction. The radars developed under Fregat family are tailored for a variety of ships depending on their displacement and purpose. The main differences among them are: air surveillance range, number of channels and frequency bands, and weight. Typically, Fregat radars operate in the E-band excepting the lightest Fregat MAE-4k which operates in the H-band. All variants can detect a surface ship at the line-of-sight while the maximum detection range for an airborne target with the radar cross section of a non-stealth fighter aircraft varies from 58 to 230 kilometers. The Fregat MAE-3 radar system is intended for medium and large displacement ships. It is an E-band two-channel radar with a maximum instrumented range of 300 kilometers and a maximum vertical detection range of 30 km. Fregat MAE-3 can detect a fighter aircraft at a maximum range of 180 km or a missile at a maximum range of 38 km. The radar's equipment and the antenna station weigh approximately 9.1-t (6.6-t and 2.5-t respectively).

1 x Type 346 Dragon Eye air search/fire: Type 346 radar is a highly digitized, multi-function, dual-band (S and C bands) naval active electronically scanned array (AESA) installed on Type 052C destroyers, Type 052D destroyers, Type 055 destroyers and Type 001A aircraft carriers[1] of the PLAN. The radar is named as the Star of the Sea (Hai-Zhi-Xing, □□□) by its developer and it is one of the two competitors for PLAN’s SAPARS (Shipborne Active Phased Array Radar System) project/program. Due to its secrecy and lack of information, Type 346 radar has been frequently but erroneously confused with a Chinese fire control radar Type 348, and mistakenly identified as Type 348 by many sources. Furthermore, it is also frequently confused with and misidentified as Sea Lion series C-band phased array radars developed by another design house. Several models in the Type 346 series have been developed. When Star of the Sea was selected as the winner of SAPARS and accepted into Chinese service, it received the Chinese naval designation for the entire radar system as H/LJG-346 or Type 346 for short. The NATO reporting name for Type 346 radar is Dragon Eye.

1 x Sea Eagle surface search: Type 382 radar is a Chinese naval 3-D air search radar designed to replace earlier Chinese Type 381. Contrary to many frequent but erroneous claim, Type 382 radar is not a simple Chinese copy of Russian MR-710 Fregat (meaning frigatebird) radar (NATO reporting name: Top Plate), though Type 382 does borrow heavily from MR-710 radar. Type 382 radar program had already begun in the early 1990s, before the start of the negotiation of importing Russian Sovremennyy-class destroyer in 1994. Type 382 is designed to be a successor of earlier Type 381, but development had run into technological bottleneck for the next generation passive phased array radar due to the technical and industrial limitations in the early and mid-1990s China had at the time. The import of Russian MR-710 radar had provided a significant boost in the development of Type 382 radar in that designers of Type 382 can borrow ideas of MR-710, and as a result, Type 382 has become a cross between Type 381 and MR-710. L Chinese designers abandoned the development of passive phased

array radar and decided to adopt the planar array of MR-710 with the same back-to-back configuration of MR-710, because Chinese industry at the time could not provide a new generation passive phased array with the reliability and performance level required by Chinese navy. The more matured planar array of MR-710 not only provided better reliability, but also proved to be more capable than the domestic Chinese passive phased array designed in the mid-1990s. However, Chinese passive phased array Type 381 does have its advantage over its Russian counterpart in that the equipment below deck is far more compact and reliable. Type 382 design was hence altered to combine the best of two systems by integrating the planar array of MR-710 above the deck and the electronic cabinets and operator consoles of Type 381 below deck together. As a result, the original more than 20 cabinets of MR-710 is drastically reduced on the Type 382. However, the most significant difference between MR-710 and Type 382 is that the former is only a single band radar operates at E-band, while the latter is a dual band radar operates at two frequency bands: S (E/F) and C (G/H) bands. Hence Type 382 also has a name: Sea Eagle (Hai-Ying, □□) S/C, named after the frequency bands it operates at.Maximum power of Type 382 is increased to 100 kW from the 90 kW of the original MR-710. while the maximum range against a fighter sized target is increased to 250 km from the original 230 km of MR-710. In addition to stronger power and higher precision, the rotation rate of Type 382 is increased from the original 12/min to nearly 30/min and scan rate is also nearly doubled.

Notes:

Liaoning (16; Chinese: □□□; pinyin: Liáoníng Jiàn) is a Chinese Type 001 aircraft carrier. The first aircraft carrier commissioned into the People's Liberation Army Navy Surface Force, she is classified as a training ship, intended to allow the Navy to experiment, train and gain familiarity with aircraft carrier operations. Originally laid down in 1985 for the Soviet Navy as the Kuznetsov-class aircraft cruiser Riga, she was launched on 4 December 1988 and renamed Varyag in 1990. After the dissolution of the Soviet Union in 1991, construction was halted and the ship was put up for sale by Ukraine. The stripped hulk was purchased in 1998 and towed to the Dalian naval shipyard in northeast China. The ship was rebuilt and commissioned into the People's Liberation Army Navy (PLAN) as Liaoning on 25 September 2012. Its Chinese ship class designation is Type 001. In November 2016, the political commissar of Liaoning, Commodore Li Dongyou, stated that Liaoning was combat ready. The Kuznetsov-class ships were originally designated by the Soviet Navy as "тяжёлый авианесущий крейсер" (tyazholiy avianesushchiy kreyser, TAKR or TAVKR), meaning "heavy aircraft-carrying cruiser". In addition to aircraft, the ships were designed to carry P-700 Granit anti-ship cruise missiles that also form the main armament of the Kirov-class battlecruisers. This multirole capability allowed the ships to avoid classification as aircraft carriers, thus allowing them to pass through the Turkish Straits between the Black Sea and the Mediterranean Sea. Under the Montreux Convention, aircraft carriers larger than 15,000 tons are not permitted to pass through the Straits, but there is no displacement limit on other types of capital ship from Black Sea powers. In contrast, the People's Liberation Army Navy considers Liaoning to be an aircraft carrier. Since China is not located on the Black Sea and thus not considered a Black Sea power under the Montreux Convention, it does not need and cannot use the tonnage exemption for non-aircraft carrier capital ships. The ship was completed as an aircraft carrier, and cruise missiles were never installed. Liaoning is equipped only with air defence weapons and must use its aircraft for surface attack. Modernization and refit 701st Institute was tasked to redesign Varyag with Zhu Yingfu (□□□) and Wu Xiaoguang (□□□) were assigned respectively as the general designer and deputy general designer. Wang Zhiguo (□□□) was assigned as the general system engineer, and Yang Lei (□□) was assigned the general supervisor. The workload of converting Varyag for operational use was equivalent to building ten new destroyers. Varyag was moved in June 2005 to a dry dock at Dalian (38.935°N 121.6141°E). Her hull was sandblasted, scaffolding erected, and the ship's island was painted in a red marine primer to treat metal corrosion. Observers have noted the installation of Type 348 active electronically scanned array (AESA) Radar (four arrays) and Sea Eagle radar.[citation needed] The air defence system consists of the Type 1130 CIWS and the FL-3000N missile system. The anti-ship missile tubes would not be used, freeing up internal space for hangar or storage use. Russia has explored similar modifications to her sister ship Admiral Kuznetsov. On 8 June 2011, General Chen Bingde made the first public acknowledgement of the ship's refit. On 27 July 2011, the Chinese Defence Ministry announced it was refitting the vessel for "scientific research, experiment and training"

FPB-57 Nav I Class Indonesian Fast Patrol Boat (FPB)

Tiers:

1 2 **3** 4

Variants:

- **KRI Kakap (811):** Commissioned: 1988 Status: Active
- **KRI Grouper (812):** Commissioned: 1989 Status: Active
- **KRI Tongkol (813):** Commissioned: 1993 Status: Active
- **KRI Barracuda (814):** Commissioned: 1998 Status: Active

System

Alternative Designation: FPB-57 Nav I Class

Type: Fast Patrol Boat

Builder: Manufactured in Lurssen, Germany

Crew: 42

Dimensions

Length: 58.10 m

Beam: 7.62 m

Draft: 4.75 m

Displacement, Standard: 454 tons

Displacement, Full Load: INA

Propulsion System

Engine Name: 2 X Diesel Engines

Engine Type: Diesel

Engine Power: 8,260 hp

Maximum Range: INA

Maximum Speed: 28.1 kn (52.0 km / h; 32.3 mph) (maximum)

Fuel Capacity: INA

Main Weapon System

Note: The main cannon of the FPB-57 Nav I is a single 40 mm cannon (name: INA) and two 7.62 mm machine guns.

Fire Control Systems

FCS Name: INA

Computerized FCS: No

Battle Management System: No

Radar Systems

Navigation Radar: INA

Aircraft Facilities

Note: The FPB-57 Nav I Class is equipped with a flight deck and hangar at the rear for the NBO-105 Class Helicopters.

Protection

Active Protection System: Yes, DR200S system for defense against guided missiles

Countermeasures: INA

NBC Water Washdown System: Yes

Notes:

FPB-57 or Fast Patrol Boat 57 m or Fast Patrol Boats 57 m or PB-57 (because not all high speed) is a draft patrol boat made by Liirssen , Germany . In the agreement, PT. PAL, which originally only assembled this ship in Surabaya , also obtained the right to produce the design of this ship. Furthermore, this ship has been made in Surabaya. In Germany it started with the Albatros class fast patrol boat , where in Germany itself in 2005 , some ships in this class had been retired or sold to Tunisia. It is the first generation FPB-57, fully manufactured in Lurssen, Germany. This ship functions as a torpedo attack ship, which is: *KRI Kakap (811) , operated in 1988 *KRI Grouper (812) , operated in 1989 *KRI Tongkol (813) , operated in 1993 *KRI Barracuda (814) , put into operation in 1995

Charles De Gaulle Class French Nuclear-Powered Aircraft Carrier

Tiers:

System

Alternative Designation: Charles de Gaulle; CDG	
Total Built: 1 ship	
Type: Aircraft Carrier	
Builder: Naval Group	
In Service: 1994-Present	
Vessel Crew: 1,150	
Air Crew: 550	
Air Support: 50

Length, Overall: 261.50 m	
Length, Waterline: 238.00 m	
Beam, Overall: 64.36 m	
Beam, Waterline: 31.50 m	
Draft: 9.40 m	
Flight Deck Length: 261.50 m	
Flight Deck Width: 64.40 m	
Displacement, Standard: 37,085 tons	
Displacement, Full Load: 42,500 tons	

Propulsion System

Main engine: 2 x Gec-Alsthom 150-mW each PWR type K15 pressurized-water reactor plants; double reduction Alsthom geared steam turbines, 83,000 total shp; two shafts
Engine Power: hp83,000 total shp
Maximum Range: Unlimited distance; 20–25 years
Maximum Speed: 27 knots
Endurance: 45 days of food
Capacity: 800 commandos, 500 tonnes of ammunitions

Main Armament

↳*System*

Name: Modèle F2 gun
Type: Naval Defense Weapon System
Caliber: 20mm
Quantity: 8 x Modèle F2 gun Naval Defense Weapon System
Length: INA
Weight: 332 kg (732 lb) (without ammunition)
Action: Gas unlocked, delayed blowback
Maximum Elevation: deg+65
Minimum Elevation: deg-15
Traverse Range: INA
Rate of Fire: 720 round/min
Muzzle Velocity: 1,050 m/s (3,400 ft/s)
Effective Firing Range: 1,500 m (4,900 ft) against aerial targets

↳*Ammunition*

Type: Rifle
Caliber: mm20
Cartridge: 20×139mm
Basic Load: INA

Auxiliary Missile Systems

↳*System*

Name: Sylver A-43 octuple vertical-launch SAM
Type: Vertical Launch SAM System
Quantity: 2 x Sylver A-43 octuple vertical-launch SAM groups
Missile Types: * Aster 15 - Ship point and local area defence. * Aster 30 Block 0 - Ship local and wide area defence. *

Aster 30 Block 1NT (New Technology) - wide area defence capable against 1500 km-range ballistic missiles * Aster 30 Block 2 BMD currently being developed for anti-ballistic defense against 3000 km-range maneuvering missiles.

Missile Length: Aster 15: 4.2 m Aster 30: 4.9 m

Missile Diameter: Aster 15: 180 mm

Missile Warhead: Directed fragmentation.

Missile Detonation Mechansim: Direct contact or proximity

Missile Engine: Solid propellant two-stage rocket.

Missile Operaitonal Range: Aster 15: 1.7–30+ km Aster 30: 3–120 km

Missile Flight Altitude: Aster 15: 0–13 km Aster 30: 0–20 km

Missile Speed: Aster 15: Mach 3.5 (1,191 m/s) Aster 30: Mach 4.5 (1,531 m/s)[

Missile Guidance System: Inertial guidance with up-link. Active RF seeker.[

Missile Basic Load: INA

Auxiliary Missile Systems

Name: Matra-Sadral 6-round point-defense SAM System

Type: Vertical Launch SAM System

Quantity: 2 x Matra-Sadral 6-round point-defense SAM systems [Mistral missiles)

Missile Type: Mistral Missile

Missile Length: 1.86 m

Missile Diameter: 90 mm

Missile Effective Fire: up to 6 km

Missile Warhead: High Explosive with high density tungsten balls

Missile Warhead Weight: 2.95 kg

Missile Detonation Mechansim: Laser proximity or impact triggered

Missile Engine: Solid Rocket Motor

Missile Speed: 800 m/s, approx. Mach 2.6 (high supersonic)

Missile Guidance System: Infrared homing

Missile Basic Load: INA

Onboard Aviation Facilities

Capacity: 40 Max

↳*Aircraft*

Note: 30 x Dassault Rafale-M F2 or F3 strike-fighters 3 x Northrop Grumman E-2 Hawkeye

Note: 1 x Thales ARBR-21 radar intercept 2 x ARBB-33B jammers 4 x AMBL-2A Sagaie six-round decoy rocket launchers 1 x ARBG-2 Enigme comms. intercept 1 x SLAT torpedo alert and decoy launcher

Protection

Active Protection System: Yes

NBC Protection: Yes

Notes:

The 38,000 ton, nuclear-powered aircraft carrier Charles De Gaulle was constructed at the DCN Brest naval shipyard in Brittany. The ship was launched in May 1994 and commissioned in September 2000, following sea trials that began in January 1999. As a result of trials, the landing deck has been lengthened by 4.4m to enable the E-2C to land and clear the deck quickly. The carrier was due to enter service in December 2000, but, following the breakage of a propeller blade during long-distance trials, this was delayed to April 2001. In June 2001, the carrier took part in exercises in the Mediterranean and in December 2001 left to take part in Operation Enduring Freedom where it was stationed in the Arabian Gulf. It returned to its home port of Toulon in July 2002. Super Etendard and Hawkeye E-2C aircraft carried out a number of sorties but the ship's F1 standard Rafale M fighters did not take part in operations, although they were included in exercises with the US Navy. In April 2007, DCN became DCNS. This followed an agreement in which Thales became a 25% shareholder in the new company and DCN acquired the naval business of Thales France (excluding naval equipment). In September 2007, Charles de Gaulle began a refit, which included overhaul and refuelling of the nuclear propulsion system and installing a new SYTEX command and control system with Syracuse III satellite communications system. The combat system has also been adapted for operations with the Rafale F3 equipped with AASM, ASMPA and Scalp-EG missiles. The refit was completed and the carrier returned to the French Navy in December 2008. DCNS completed an intermediate refit of Charles de Gaulle in July 2013 and works included painting of the ship, systems inspection, refurbishing of galley, and 35km of cabling and replacement of stabilisation computer. DCNS performed second major technical shutdown and mid-life refit of Charles de Gaulle from February 2017 to November 2018 to extend the life of the vessel for an additional 25 years. The maintenance works included overall replacement of the control room, modernisation of tactical system, refurbishment of telecommunication systems, replacement of radars, as well as the renovation and recalibration of the steering control system. The aviation installations and spaces were also modernised as part of the refit. The French Navy's plans of a second carrier have been put on hold. The new carrier will not be the same class as the Charles de Gaulle, but will be a conventionally powered carrier. It will be built by DCNS. The design phase for the carrier programme (PA2) was launched in January 2005. In December 2005, following discussions between the French and UK governments on the possibility of a joint development with the UK's CVF carrier project, which Thales UK is designing, it was agreed that France would pay one-third of the costs of the demonstration phase of the baseline CVF design. The ship can operate a fleet of up to 40 aircraft: Rafale M (range 3,340km), Super Etendard (range 1,682km) and three E-2C Hawkeye airborne early warning aircraft. The ship also supports Dolphin PEDRO, AS 565 Panther or NH 90 helicopters. The main deck consists of a main runway angled at 8.5° to the ship's axis and an aircraft launch area forward of the island. These are each equipped with a USN-type C13 catapult, capable of launching one aircraft a minute. The runway is 195m long and the whole deck measures 260m x 64m. The carrier is fitted with the Sagem Defense Sécurité (formerly EADS Defence and Electronics) DALAS laser landing aid. The carrier is fitted with the SATRAP computerised, integrated stabilisation system designed to maintain stabilisation to within 0.5° of horizontal, allowing aircraft to be operated up to sea state 5/6. As well as the carrier's two pairs of active stabilising fins and twin rudders, the system has two computer-controlled compensation units consisting of two rail tracks for trains carrying 22t of deadweight. These tracks run transversely below the flight deck. This system is

designed to compensate for wind and heel and control roll, yaw and surge. The ship's weapons are managed by a Senit combat management system, which has the capacity to track up to 2,000 targets. The weapon control system consists of two Vigy 105 optronic directors supplied by Sagem. The ship also has two Sagem Vampir search and track systems. In February 2004, Thales was awarded a contract for a new command and control system for the French Navy. The new SYTEX system is being fitted on the Charles de Gaulle as well as other vessels and shore locations and allows the vessel to access national or coalition command networks. The ship is armed with two surface anti-air missile (SAAM) () system, developed by Eurosam (set up by MBDA and Thales) for defence against hostile aircraft and anti-ship missiles. The system uses the Aster 15 surface-to-air missile and entered operational service in November 2002, with the first firing of the missile from the Charles de Gaulle. The Aster missile has a 13kg warhead and a range of 30km. The missile's guidance is inertial with data uplink and active radar terminal homing. For increased manoeuvrability in the terminal phase, the missile uses a 'PIF-PAF' direct thrust control system with gas jets. Two eight-cell Sylver vertical launch systems are installed on the starboard side forward of the bridge and two on the port side aft of the bridge. The system uses the Thales (formerly Thomson-CSF) Arabel radar, which is a multi-function three-dimensional radar with a range of 70km for a target area of 2m². The ship has two six-cell Sadral launching systems for the MBDA (formerly Matra BAe Dynamics) Mistral anti-aircraft and anti-missile missile. Mistral has an infra-red seeker and a range of 4km.

EW: 1 x Thales DR 2000U

Notes:

These submarines are the 1300 design of the widely used German Type 209 attack submarines; they were designed by the IKL firm in Lubeck and constructed in Germany. The subs were ordered on April 2, 1977. CAKRA and NANGGALA finished refits in 1987 and 1989, respectively. CAKRA was again refitted between June 1993 and June 1997; NANGGALA also received another refit between October 1997 and mid-1997. During these refits, both boats received new batteries and an improved combat data system. Both were refitted again by Daewoo Shipbuilding, South Korea -- CAKRA in 2004/2005. NANGGALA's was completed in April 2006. During the latter refits, both received new batteries, had their engines overhauled and their combat data systems modernized.

System

Alternative designations: IS 120
Total Built: 23 Ghadir Class Submarines in total.
Builders: Marine Industries Organization
Operators: Islamic Republic of Iran Navy
In Service: 2007-Present

Type: Coastal submarine

Crew: 7

Dimensions

Length: 29.00 m

Beam: 2.75 m

Draft: 2.50 m

Displacement, Surface: 117 tons

Displacement, Submerged: 125 tons

Draught: 2.5 m

Automotive

Main Propulsion: 1 x diesel-electric drive

Maximum Speed, Surface: 7 knots

Maximum Speed, Submerged: 9 knots

Armament

Torpedoes Carried: INA

Mines Carried: INA

Missile Carried: INA

Note: It is reported that the torpedoes are 533mm Torpedoes, which have a average maximum effective range of 18,000 meters, a Wake Homing Guidance System, and a speed of 83 km/h

Notes:

Ghadir (Persian: غدیر) is a class of midget submarines built by Iran specifically for cruising within the shallow waters of the Persian Gulf. It has a surface displacement estimated at about 115 long tons (117 tons). The Ghadir class is probably better described as a coastal or littoral submarine, similar in concept to the Italian Sauro class, though significantly smaller. The Ghadir class is based on the North Korean Yono-class submarine. Photographs indicate a pair of bow torpedo tubes around 21 inches (530 mm) diameter, allowing them to fire typical heavyweight torpedoes. It could thus serve as a launch platform for the VA-111 Shkval rocket torpedo. On 24 November 2007 Iranian rear-admiral Habibollah Sayyari announced: "A home-made destroyer called Jamaran and a home-made submarine of Ghadir class will launch operation on November 28." He also said that the submarine was equipped with the latest military and technological equipment and that its capabilities are equal to that of foreign types. Iranian supreme leader Ali Khamenei was quoted saying to Iran's navy commanders on the day the submarine was launched: "Today, you have been able to design and build many of the military requirements. We have become self-sufficient from other countries." New Ghadir submarines were delivered to the Iranian navy on June 2009, August 2010, August 2011, November 2011, February 2012, November 2012 and November 2018. While Ghadir resembles the North Korean Yono-class submarine, it is probably better described as a littoral submarine. Head of the Marine Industries Organization of Iran General Amir Rastegari announced Dec 02, 2018 that subsurface-to-surface missiles have been mounted on the new home-made Qadir-class submarine, adding that many foreign states are willing to purchase the vessel. He also added that a home-made torpedo, Valfajr, mounted on the submarine enjoys a destruction power 6 times more than a cruise missile and can drown a 1,000-ton vessel into the sea in less than 10 seconds. He said that a unique periscope has also been mounted on Qadir submarine, noting that a number of industrial countries have demanded to purchase this periscope and optical system from Iran.

Yono Class North Korean Midget Submarine

Tiers:

1 2 3 4

Variants:

- **Export and foreign production:** Iran The US Congressional Research Service suggests that Iran has purchased several midget submarines from North Korea. The purchase may have involved Yono and Yugo-class mini-subs. Beginning in 2006, Iran launched the first of several domestically-produced mini-submarines. In 2007 the Iranian navy unveiled its Ghadir-class submarine, the first of a number of planned midget submarines of the Yono class. Observers have disagreed on the exact classification of the Iranian derivative: Iran claims the vessel is a fully independent design, but it has been compared to the North Korean Yugo boats, Yono subs, and/or Sang-O-class coastal submarines.

Notes:

The Yono-class submarine (also as Yugo class) is a class of North Korean miniature submarines, produced for domestic use as well as for export. Also referred to as the Yeono class, these submarines displace 130 tons, significantly less than North Korea's larger 1,800-ton Romeo-class submarines. As of May 2010, North Korea is reported to operate ten of these submarines. A Yono-class submarine is thought to have fired the torpedo attack which sank a South Korean Pohang-class corvette, ROKS Cheonan on 26 March 2010 in South Korean waters. According to some investigators, the weapon used in the attack was a North Korean-manufactured CHT-02D torpedo, from which substantial propulsion parts were recovered. The device allegedly exploded not by contact, but by proximity 6 to 9 metres (20 to 30 ft) below Cheonan, creating a powerful pillar of water, called the bubble jet effect. High ranking North Korean military officials denounced the international investigation and said the North does not have the type of submarines that supposedly carried out the attack. They also dismissed claims regarding writings on the torpedo and clarified that "when we put serial numbers on weapons, we engrave them with machines." South Korea's Yonhap News quoted South Korean officials as saying the North has about ten of the Yeono-class submarines. A member of the North Korean cabinet who defected to South Korea in 2011, said on 7 December 2012 that the crew of the North Korean submarine which

sank Cheonan had been honored by the North Korean military and government. The defector, known by the alias "Ahn Cheol-nam", stated that the captain, co-captain, engineer, and boatswain of the mini-sub which sank Cheonan had been awarded "Hero of the DPRK" in October 2010.

Santa Cruz Class (TR-1700 Class) Argentinian Diesel-Electric Patrol Submarine

Tiers:

Variants:

- **ARA Santa Cruz:** Completed: 1984 Status: In service with Argentine Navy
- **ARA San Juan:** Completed: 1985 Status: Formerly in service with Argentine Navy. Confirmed lost on 23 November 2017; wreck found in Atlantic Ocean on 16 November 2018. Recovery by American team pending naval decision.
- **ARA Santa Fe:** Completed: INA Status: Construction suspended - 70% (or 52%) complete Boat could be completed after feasibility studies. Unknown if sub was cannibalized for parts along with the rest of incomplete members of the class.
- **ARA Santiago Del Estero:** Completed: INA Status: Construction suspended - 30% complete and eventually cannibalized for spare parts for active subs.

System

Alternative Designation: Santa Cruz Class; TR-1700-class
Total Built: 4 Submarines Built
Type: Diesel-Electric Patrol Submarine
Builders: Thyssen Nordseewerke, Emden, Germany
In Service: 1984-Present
Crew: 30 (5 off. + 25 enl.)

Dimensions

Length: 65.93 m
Beam: 7.30 m
Draft: 6.50 m
Displacement, Standard: 1,770 tons
Displacement, Surface: 2,116 tons
Displacement, Submerged: 2,264 tons

Propulsion System

Engine Name: 4 x MTU 16V652 MB80 diesel driving 4 alternators driving 2 Siemens HR4525 motors
Engine Type: Diesel-Electric
Engine Power: 8,980 total bhp

Shaft: 1

Speed, Surface: 11 knots

Speed, Snorkeling: 12 knots

Speed, Submerged: 21 knots

Range, Submerged: 400 nm at 4 knots

Range, Surface: 12,000 nm at 8 knots

Range Snorkeling: 6,000 nm at 8 knots

Operational Depth: 270 m

Maximum Depth: 300 m

Endurance: 30 days

Main Armament

↳*System*

Name: INA

Type: 533mm Torpedo Tubes

Quantity: 6 x 533mm Torpedo Tubes

↳*Torpedos*

Name: Mk 48

Type: Heavy Torpedo

Caliber: mm533

Variants: Ex-10 RETORC (Research Torpedo Configuration); Mk 48 Mod 0/2; Mk 48 Mod 1; Mk 48 Mod 3; Mk 48 Mod 4; Mk 48 Mod 5; Mk 48 Mod 6; Mk 48 Mod6AT; "Full-up" ADCAP; Closed-Cycle Advanced Capability Propulsion System (CCACPS); Mk 48 Mod 7 ADCAP CBASS Half-Length Mk 48

Basic Load: 22

Length: 5.84 m

Diameter: 533 mm

Weight: 1,565 kg

Warhead Weight: 295 kg

Warhead Type: conventional high-explosive (PBXN-3)

Propulsion: 500-hp axial-flow, gas-piston (swashplate) pump-jet using Otto II mono-propellant (nitrogen ester and Hydroxylamine Perchlorate/HAP oxidant) liquid fuel

Speed: 55 kts (102 kmh)

Maximum Range at 55 knots: 20 nm (23 mi, 37 km)

Maximum Range at 40 knots: 27 nm (31 mi, 50 km)

Maximum Depth: 760 m

Guidance System: may be launched as free-running or wire-guided free-running; homing is by either active or passive acoustic means. Wire-guidance permits two-way communication between torpedo and submarine and can be either active or passive acoustic search.

↳***Mines***

Note: 34 x total mines in lieu of torpedoes

Radar

Navigation Radar: 1 x Thales Calypso-IV navigation

Search and Attack Radar: 1 x STN Atlas-Electronic CSU-3/4 active/passive search and attack suite

Passive Radar: 1 x Thales DUUX-5 passive ranging

Fire Control

Type: Signaal SIMBADS weapons control system

Quantity: 1 x Signaal SIMBADS weapons control system

Protection

Active Protection System: INA

NBC Protection: Yes

Electronic Warfare: 1 x Kollmorgen Sea Sentry III radar warning

Notes:

The TR-1700 (Santa Cruz) is a class of diesel-electric patrol submarines built by Thyssen Nordseewerke for the Argentine Navy in the 1980s, with two submarines completed. These ships are amongst the largest submarines built in Germany since World War II and are among the fastest diesel-electric submarines in the world. ARA San Juan was lost on 17 November 2017, leaving ARA Santa Cruz as the only remaining submarine of this class. The original 1977 plan called for six boats, two TR-1700s built in Germany by Thyssen Nordseewerke, two in Argentina by Astillero Domecq Garcia, and two smaller TR-1400s also built in Argentina. The final agreement in 1982 was modified to six TR-1700s, with the last four to be built in Argentina. The TR-1700s to be built in Argentina were considered for an upgrade to a nuclear submarine using INVAP's CAREM reactor, which began development at that time. The nuclear submarine project never came to fruition, despite later attempts to revive it. The submarine was designed by Thyssen and its features include high underwater speed, endurance (for a diesel submarine), and survivability. The boat's four MTU diesel engines, four generators, and Siemens electric motor can propel it at speeds up to 25 knots (46 km/h; 29 mph). Eight 120-cell batteries are installed on each boat. They have a diving depth of 300 m (980 ft). Normal endurance of these boats is 30 days with an extended range up to 70 days. These boats are equipped to accept a Deep Submergence Rescue Vehicle (DSRV). Armaments include six bow 533 mm (21 in) torpedo tubes and 22 SST (Special Surface Target) or Mark 37 torpedo. The automatic torpedo reload system can reload the tubes in 50 seconds. Thyssen proposed the TR1700A for the Australian Collins-class submarine program. The proposed design had a reworked pressure hull, was six meters longer, and half a meter wider than the TR-1700s built for Argentina. It lost to the Type 471 from Kockums, an enlarged Västergötland-class submarine. The first two submarines were delivered on schedule in 1984–85. The remaining four built in Argentina were suspended due to the Argentinean economic crisis of the 1980s. In 1996 work completely ceased on ARA Santa Fe at 70% (or 52%) completion while ARA Santiago del Estero was only 30% complete. After attempts to complete and sell the boats to Taiwan failed, they were cannibalized, along with the parts for the fifth and sixth units, to support the continued operations of the first two submarines. Santa Cruz received its mid-life modernization at Arsenal de Marinha, Rio de Janeiro Brazil between September 1999 and 2001. The work involved the replacement of the engines, batteries, and sonar. Her sister boat San Juan entered the Astillero Domecq Garcia shipyard to receive her refit in 2007; she completed refit in 2013. In September 2010, it was revealed that the Ministry of Defense was conducting feasibility studies to decide if ARA Santa Fe (S-43) should be completed. The decision should be made sometime after completing the mid-life modernization of ARA San Juan (S-42). The estimated cost of completing Santa Fe was $60 million. On 17 November 2017, the ARA San Juan was reported missing; reports of a fire at the time were denied by the Argentine Navy. A year after that, on 17 November 2018, private company Ocean Infinity (appointed by the Argentine Government) announced that they successfully located the wreck, at 900 metres depth and 500 km from Comodoro Rivadavia.

Type 849 Class (Romeo Class) Egyptian Diesel-Electric Submarine

Tiers:

Variants:

- **Chinese Type 033 Romeo-class and its variants:** Under the 1950 Sino-Soviet Friendship and Mutual Assistance Treaty, the Soviets passed to China (and later to North Korea) the documentation necessary to produce Romeo submarines in 1963. The Chinese variant is known as the Type 033 Romeo. A total of 84 Type 033 submarines were built in China from 1962 to 1984, plus several exported to other countries. The Chinese Type 033 incorporated some improvements over the original Romeo, including noise reduction of 20 dB. Sonar on board was also continuously upgraded: the original Soviet sonar was first replaced by domestic Chinese Type 105 sonar, which consequently was replaced by H/SQ2-262A sonar built by No. 613 Factory. Today most of the Type 033 subs have been retired or preserved, with a few remaining in service for training purposes. A total of six Chinese Romeo class submarine variants were developed: Type 6633: Original Chinese built Romeo, China was to have assembled these Romeos from knock-down kits provided by the Soviet Union, 6 were planned, but only 2 were completed. The construction program came to a complete stop when the USSR stopped delivery of parts following the Sino-Soviet split. Construction of the 3rd unit at Wuhan was stopped, and available parts were diverted to complete the first pair, but many parts had to be developed indigenously. The primary improvement of Type 6633 over the original Soviet boats is the use of domestic Chinese batteries, which had slightly superior performance to that of the original Soviet batteries. Type 033: Complete domestic production in China was achieved in 1967, and subsequently the project was renamed the Type 033. However, experience from deployment of completed boats in warmer climates proved that the original Soviet refrigeration and air conditioning system designed for subarctic and arctic area was woefully inadequate for subtropical and tropical regions, so redesigns were needed to improve refrigeration and air conditioning systems, and all boats to be stationed in tropical and subtropical regions went through such a refit. In September 1969 construction of new Type 033s, with improved air conditioning and refrigeration capability, began at Huangpu Shipyard in Guangzhou, eventually, 13 units were completed. ES5A: Upgraded Type 033, with improvements mainly involving the replacement of equipment of Soviet origin with domestic Chinese systems, which includes: QZHA—10 (Type 779) attack periscope and QDYA—10 (Type 778) general purpose periscope. Addition of H/SQG-2 ranging sonar, Type 063 communication systems, and countermeasure systems. Domestic Chinese Type 801 sonar replaced the original Soviet MARS-24 sonar. The only difference between the Type 801 sonar and the MARS-24 sonar is that there are 24 transducer elements for the Type 801 as opposed to 12 in the original MARS 24, so the Chinese sonar had better accuracy. Domestic Chinese H/SQZ-D reconnaissance sonar (with Type 105 transducers) replaced the original Soviet system, the performance of the SQZ-D is almost identical to the original Soviet sonar it was developed from, except for the sector of scan, which is increased by 15 degrees. Additional noise reduction measures were also adopted. This is the type China originally sold to Egypt in the 1980s. Type 033G: Development of the ES5A, with the incorporation of the capability to launch acoustic homing torpedoes; analog computers installed to achieve automation of, and speeding up of, torpedo fire control calculations that were previously manually calculated. All Chinese Romeos were converted to this standard. The NATO reporting name for this type is rumored to be the Wuhan-class. Type 033G1: A single Type 033G was modified to carry 6 YJ-1 (CSS-N-4) anti-

ship missiles, this variant is called Type 033G1, with the rumored NATO reporting name of Wuhan A. The missile had to be fired while the boat was surfaced, with a total exposure time on the surface of less than 7 minutes. The most significant improvement, however, is the reduction of noise level by 12 dB. ES5B: Development of the Type 033G, primarily intended for export. This is an upgrade package for Romeo submarine users. The primary improvement of this class is the ability to launch wire guided torpedoes and anti-ship missiles (AShM) while submerged. The program originally begun in the mid-1980s, and Egypt is reported to be the only customer when China won a contract to upgrade its Romeo-class submarine fleet, including both Soviet built and Chinese built units. This is the last type of Chinese Romeo class submarine; with noise reduction of 20 dB to 140 dB in comparison to the 160 dB of the original Soviet Project 633 submarines acquired by China.

System

Alternative Designation: Type 849 Class; NATO: Romeo Class

Notes:

he ROMEO class is a Russian-designed, medium-range, torpedo attack submarine. The four surviving from the Egyptian ROMEO class were all Chinese-built. The first pair was delivered on March 28, 1983, and the second pair on Jan. 3, 1984. When cruising on the surface, these submarines are easily identified by the periscope housing that tops the sail and resembles a surface ship's funnel. The sonar is housed in a small "bump" on the bow. All were officially commissioned on May 21, 1984.

The only difference between the Type 801 sonar and the MARS-24 sonar is that there are 24 transducer elements for the

Type 801 as opposed to 12 in the original MARS 24, so the Chinese sonar had better accuracy. Domestic Chinese H/SQZ-D reconnaissance sonar (with Type 105 transducers) replaced the original Soviet system, the performance of the SQZ-D is almost identical to the original Soviet sonar it was developed from, except for the sector of scan, which is increased by 15 degrees. Additional noise reduction measures were also adopted. This is the type China originally sold to Egypt in the 1980s. Type 033G: Development of the ES5A, with the incorporation of the capability to launch acoustic homing torpedoes; analog computers installed to achieve automation of, and speeding up of, torpedo fire control calculations that were previously manually calculated. All Chinese Romeos were converted to this standard. The NATO reporting name for this type is rumored to be the Wuhan-class. Type 033G1: A single Type 033G was modified to carry 6 YJ-1 (CSS-N-4) anti-ship missiles, this variant is called Type 033G1, with the rumored NATO reporting name of Wuhan A. The missile had to be fired while the boat was surfaced, with a total exposure time on the surface of less than 7 minutes. The most significant improvement, however, is the reduction of noise level by 12 dB. ES5B: Development of the Type 033G, primarily intended for export. This is an upgrade package for Romeo submarine users. The primary improvement of this class is the ability to launch wire guided torpedoes and anti-ship missiles (AShM) while submerged. The program originally begun in the mid-1980s, and Egypt is reported to be the only customer when China won a contract to upgrade its Romeo-class submarine fleet, including both Soviet built and Chinese built units. This is the last type of Chinese Romeo class submarine; with noise reduction of 20 dB to 140 dB in comparison to the 160 dB of the original Soviet Project 633 submarines acquired by China.

Notes:

Kilo class, Soviet designation Project 877 Paltus (Russian: Па́лтус, meaning "halibut", NATO reporting name Kilo), is a class of diesel-electric attack submarines designed and built in the Soviet Union for the Soviet Navy. The class was built until the mid-1990s, when production was switched to the more advanced Project 636 Varshavyanka variant, also known as Improved Kilo-class by the West. These attack submarines are mainly intended for anti-shipping and anti-submarine operations in relatively shallow waters. Original Project 877 boats are equipped with Rubikon MGK-400 sonar system (with NATO reporting name Shark Gill), which includes a mine detection and avoidance sonar MG-519 Arfa (with NATO reporting name Mouse Roar). Newer Project 636 boats are equipped with improved MGK-400EM, with MG-519 Arfa also upgraded to MG-519 EM.MGK 400E can detect submarines with 0.05 Pa/Hz noisiness in 16 km and surface vessels with 10 Pa/Hz noisiness in 100km. The improved sonar systems have reduced the number of operators needed by sharing the same console via automation. Anechoic tiles are fitted on casings and fins to absorb the sound waves of active sonar, which results in a reduction and distortion of the return signal. These tiles also help attenuate sounds that are emitted from the submarine, thus reducing the range at which the sub may be detected by passive sonar.

Type 039A Class (Yuan Class) Chinese Diesel-Electric Submarine

Tiers:

System

Alternative Designation: Type 039A Class; Yuan Class
Type: Diesel-Electric Submarine
Builder: Wuchang Shipbuilding, Wuhan
Crew: 52
Note: There is little publicly known about the new Chinese YUAN-class diesel-electric powered submarine. The class is comparable to the Russian KILO-class (Project 636) submarine, however with numerous improvements.

Dimensions

Countermeasures: Yes
NBC Water Washdown System: Yes
EW: 1 X Radar Warning

Notes:

The Type 039A submarine (NATO reporting name: Yuan class) is a class of diesel-electric submarine in China's People's Liberation Army Navy. It is China's first AIP powered submarine and presumed to be one of the quietest diesel-electric submarine classes in service. This class is the successor of the Type 039 submarine. The official Chinese designation is 039A as the ship is based on the 039 class, but as the 039A has very little resemblance to the 039 it is commonly referred to as the Type 041. The class is designed to replace the aging Type 033 Romeo and the older Type 035 submarines that previously formed the backbone of the conventional submarine force. According to an early assessment by the US Naval Institute, the Yuan class was primarily designed as "an anti-ship cruise missile (ASCM) platform capable of hiding submerged for long periods of time in difficult to access shallow littorals. However, another assessment by USNI includes an open-ocean capability which can be used beyond coastal waters. Also updated was its role within China's naval fleet, and as of August 2015 it is considered to be a more traditional attack submarine, with a secondary ASCM role. The Type 039A inherits the tail design of the Type 039 (NATO codename: Song class) with four diving planes and a single large shaft. A pair of foreplanes are positioned in the middle of the sail. The submarine is equipped with indigenously developed cabin-raft (shock absorbers) system that helped to reduce noise level by over 35 dB. Additionally, the submarine is covered with rubber anti-sonar protection tiles to reduce the risk of detection. A new improved "C" variant was also launched.

Notes:

The Type 039 submarine (NATO reporting name: Song-class) is a class of diesel-electric submarines of the People's Liberation Army Navy. The class is the first diesel-electric submarine to be fully developed within China and also the first Chinese diesel-

electric submarine to use the modern teardrop hull shape. Designed for attacking both other submarines and surface ships with torpedoes, the submarine uses a modern teardrop-shape hull for underwater performance. The hull incorporates four rudders and is propelled by a single propeller. The engine is imported from Germany. For quieter operation, the engine was mounted with shock absorbers and the hull is plated in rubber tiles for sound deadening. Development was not without problems, as a lengthy testing period for the first vessel (320) attests. Problems with noise levels and underwater performance led to revisions in the design and only a single boat was ever built to the original specification. Improvements led to the specification for the Type 039G, which became the bulk of production, with seven of the type entering service. Elimination of the stepped design for the conning tower is the primary visual cue for identification of the G variant. This class has two versions: the original Type 039, Type 039G. The most obvious visual difference between the two types is the conning tower. The Type 039's conning tower is stepped, rising aft. In an effort to shrink the submarine's acoustic signature, the Type 039G's conning tower was given a more conventional shape without any step. Weapons: Primary weapon for the Type 039 is the 533 mm Yu-4 torpedo, a locally produced passive homing 40-knot (74 km/h) torpedo based on the SAET-50 and roughly comparable to the SAET-60. Surface targets may be attacked at up to 15 km. Yu-6 wire-guided torpedoes may also be used for targeting submarines. It is also likely that the Type 039 is capable of carrying the YJ-8 anti-ship missile, a cruise missile which can be launched from the same tube as the boat's torpedoes, and can target surface vessels at up to 80 km. The missile is subsonic and carries a 165 kg warhead. For mining operations, in place of torpedoes, the submarine can carry 24 to 36 naval mines, deliverable through the torpedo tubes. The general designer of the torpedo and missile launching system is Mr. Sun Zhuguo (□□□, 1937-), and the launching system is compatible with AShM, ASW, torpedoes of both China and Russian/Soviet origin. Although Type 039 has successfully test fired the CY-1 ASW Missile under water like the Yuan-class submarine, the status of the missile is in question because nothing is heard about it entering mass production. The CY-1 ASW missile has a maximum range of 18 km (10 nm), and when using A244 or Mark 46 torpedo as a payload. Sensors: The main sensor is the medium-frequency sonar mounted in the bow of the submarine, with passive and active modes, which is used for both search and attack. In addition, the system offers a method of underwater communications, and also functions as a torpedo approach warning system. This sonar is the Chinese development of French Thomson-CSF TSM-2233 sonar, and is capable of simultaneously tracking 4 to 12 targets depending on the function it is used for. To enhance passive search capabilities, a low frequency sonar of French Thomson-CSF TSM-2255 design is mounted on the flanks of the hull, with a maximum range in excess of 30 km and capable of simultaneously tracking four targets. The system is further enhanced with the integration of a domestic Chinese passive ranging sonar on board, designated as H/SQG-04 sonar. For surface search, a small I-band radar is fitted. This class is the first Chinese submarine to be fitted with an integrated electronic support measures / radio direction finder / radar warning receiver system designated as SRW209 Submarine Radar Reconnaissance Equipment, which works at S - Ku bands with 100% detection rate. The SRW209 is fully automatic and can be either operated by a single operator with a console with a color CRT (which can be replaced by LCD) display console, or linked to the combat data system, which is capable of tracking multiple targets.

Notes:

The German Type 212 class, also Italian Todaro class, is a non-nuclear submarine developed by Howaldtswerke-Deutsche Werft AG (HDW) for the German and Italian navies. It features diesel propulsion and an additional air-independent propulsion (AIP) system using Siemens proton exchange membrane (PEM) compressed hydrogen fuel cells. The submarines can operate at high speed on diesel power or switch to the AIP system for silent slow cruising, staying submerged for up to three weeks with little exhaust heat. The system is also said to be vibration-free, extremely quiet and virtually undetectable. Type 212 is the first fuel cell propulsion system equipped submarine series.

Snorkeling Speed: km/h13.3
Submerged Speed: km/h16.5
Maximum Range: 5,000 km

Armament

Torpedo Version: 4 x bow 533-mm torpedo tubes, no reloads

Minelaying Version: 16 x mines in external racks

↳*Weapon Station #1*

Name: 53-65KE Torpedoes

Type: Type 53 torpedo

Basic Load: INA

Length: 7.2 m

Diameter: 533 mm

Weight: 2,070–2,300 kg

Operational Range: 18,000 meters

Speed: 83 km/h

Warhead: 307.6 kilograms (678 lb) high explosive

Guidance System: Wake homing

Sensors

Radar: 1 x Furuno navigation

Sonar: 1 x passive array only

Notes:

The Sang-o-class coastal submarine is smaller than Romeo- and Whiskey-class subs, but larger than a midget submarine. It is apparently intended for use in coastal defense missions, minelaying and special forces insertion. The name Sang-o is a Korean word meaning shark. It was given to the submarine by Western intelligence agencies. The actual North Korea class name is unknown. Examinations of a special forces transport version reveal a crude design with poor manufacturing quality. The captured variant did not have any torpedo tubes, but instead had 16 mine or external cargo-carrying fixtures, eight per side. Another variant reportedly does carry torpedo tubes. Reportedly built at Singpo beginning in 1991 at a rate of four to six per year. Only three were built in 1997 when construction halted. Two submarines, both reportedly in extremely poor condition, were sold to Vietnam in 1996. The Vietnamese ships were last reported to be undergoing reconditioning at Cam Ranh Bay naval base.

Decoys: 1 x Argo/Systems Phoenix AR-740-US intercept

Notes:

The Collins class of six Australian-built diesel-electric submarines is operated by the Royal Australian Navy (RAN). The Collins class takes its name from Australian Vice Admiral John Augustine Collins; all six submarines are named after significant RAN

personnel who distinguished themselves in action during World War II. The boats were the first submarines to be constructed in Australia, prompting widespread improvements in Australian industry and delivering a sovereign (Australian controlled) sustainment/maintenance capability. Planning for a new design to replace the RAN's Oberon-class submarines began in the late 1970s and early 1980s. Proposals were received from seven companies; two were selected for a funded study to determine the winning design, which was announced in mid-1987. The submarines, enlarged versions of Swedish shipbuilder Kockums' Västergötland class and originally referred to as the Type 471, were constructed between 1990 and 2003 in South Australia by the Australian Submarine Corporation (ASC). The submarines have been the subject of many incidents and technical problems since the design phase, including accusations of foul play and bias during the design selection, improper handling of design changes during construction, major capability deficiencies in the first submarines, and ongoing technical problems throughout the early life of the class. These problems have been compounded by the inability of the RAN to retain sufficient personnel to operate the submarines—by 2008, only three could be manned, and between 2009 and 2012, on average two or fewer were fully operational. The resulting negative press has led to a poor public perception of the Collins class. After 20 years of service issues, the boats have finally provided high availability to the RAN since 2016. The Collins class was expected to be retired about 2026, however, the 2016 Defence White Paper extended this into the 2030s. The Collins class life will now be extended and will receive an unplanned capability upgrade, including but not limited to: sonar and communications. The Collins class will be replaced by the Future Submarine Program (SEA 1000) that is scheduled, according to the 2016 Defence White Paper, to begin entering service in the early 2030s with construction extending to 2050. The Future Submarine Program will be based on the Shortfin Barracuda, a nuclear attack submarine designed by French company DCNS; twelve submarines will be acquired, all built in Australia. The Australian Submarine Corporation construction facility was established on previously undeveloped land on the bank of the Port River, at Osborne, South Australia. Work on the site began on 29 June 1987, and it was opened in November 1989. South Australia was selected as the site of the construction facility based on the proposed location of the facility and promises by the State Government to help minimise any problems caused by workers unions. The state's bid was aided by careful promotion to both Kockums and IKL/HDW during early in the project, and problems with the other states' proposals: Tasmania and Western Australia lacked the necessary industrial base, New South Wales could not decide on the location of the construction facility, Victoria's proposed site was poorly sited, and building in Liberal-led Queensland would have been politically unwise for the project when Labor was in power both federally and in all other states. Each submarine was constructed in six sections, each consisting of several sub-sections. One of the main criteria of the project was that Australian industries contribute to at least 60% of the work; by the conclusion of the project 70% of the construction and 45% of the software preparation had been completed by Australian-owned companies. Work was sub-contracted out to 426 companies across twelve countries, plus numerous sub-sub-contractors. In many cases, components for the first submarine were constructed by companies outside Australia, while those for the following five boats were replicated by an Australian-owned partner or subsidiary. The project prompted major increases in quality control standards across Australian industries: in 1980, only 35 Australian companies possessed the appropriate quality control certifications for Defence projects, but by 1998 this had increased to over 1,500. Although the acquisition project organisers originally planned for the first submarine to be constructed overseas, the Cabinet decided as part of the project's approval that all six submarines would be built in Australia; the increases in construction time and cost from not building the lead ship in the winning designer's home shipyard was considered to be offset by the additional experience provided to Australian industries. Even so, two sections of the first submarine were constructed by Kockums' shipyard in Malmo, Sweden. By the end of 1990, Chicago Bridge & Iron and Wormald International had both sold their shares in ASC. The shares were bought up by Kockums and the Australian Industry Development Corporation, with some of Kockums' shares then sold to James Hardie Industries to maintain an Australian majority ownership of the company. On 5 April 2000, the shares in ASC held by Kockums were bought out and the company was nationalised, despite a trend at the time to privatise government-owned companies. At the end of 2003, a contract to maintain the Collins class worth $3.5 billion over 25 years was awarded to ASC. As of April 1996, the option to order the seventh and eighth submarines was still under consideration, but was looked on unfavourably by the Department of Defence at the time, as the additional cost would require the diversion of funding from the Australian Army and Royal Australian Air Force, resulting in an imbalance in the capabilities of the Australian Defence Force. The option was cancelled outright by late 2001.

Notes:

The North Korean Yugo class (NATO code name) is said by some sources to be so named because it was built to plans supplied by Yugoslavia in 1965. The Yugoslav Navy was designed to control the coast of the Adriatic with fast patrol boats, frigates and small submarines. These submarines included three Heroj class submarines commissioned in the 1960s, no less than nine Una and Mala class midgets submarines (the same model was later sold to North Korea) and two more modern Sava class boats laid down in 1975. The Savas were 964 tons full load displacement, and carried six 533mm forward torpedo tubes in a 65 meter (213 foot) long hull. Pyongyang exported some midget submarines to Vietnam in 1997. Vietnam purchased two Yugo-class midget submarines from North Korea that are torpedo-capable, but are used mostly for swimmer/diver delivery. A Yugo-class midget submarine from North Korea was seized in late June 1998 on the territorial waters of South Korea. The North Korean Yugo-class midget submarine was found to have nine dead men, who were speculated to have preferred death instead of capture. The North Korean Yugo-class midget submarine, which sank after getting entangled in nets utilized for fishing, was believed to be performing an infiltration mission in South Korea.

Lada-Class Russian Diesel-Electric Attack Submarine

Tiers:

1 **2** 3 4

Variants:

- **Kronshtadt:** Commissioned: 2010 Fleet: Northern
- **Velikiye Luki:** Commissioned: 2021 Fleet: Baltic

System

Alternative designations: Project 677; SANKT PETERSBURG

Date of introduction: 2010

Type: Attack Submarine

Total Built: Planned: 12 Active: 1

Builder: Admiralty Shipyard, Saint Petersburg

Crew (total): 35 officers and men

Dimensions

Length: 72 m (236 ft 3 in); 67 m (219 ft 10 in) on waterline

Beam: 7.1 m

Draught: 6.5 m

Displacement: 2,700 long tons (2,700 t) submerged 1,765 long tons (1,793 t) surfaced

Automotive

Propulsion: Electric propulsion motor on permanent magnets Storage battery with increased service life 2 diesel Air Independent Propulsion (AIP) systems based on oxygen-hydrogen fuel cells (perspectively) 1 shaft 2,700 hp (2,013 kW)

Speed: 21 kn (24 mph; 39 km/h) submerged 10 kn (12 mph; 19 km/h) surfaced

Endurance: 45 days

Test Depth: 300 m

Electric Motors: 1 x 5 576 hp

Diesel Generators: 2 x 3 499 hp

Armament

Launcher: 6 × 533-millimetre (21 in) torpedo tubes

Armament Options: Missiles: Alfa (SS-N-27 Sizzler) cruise missile, Oniks (SS-N-26) anti-ship cruise missile Torpedoes: 6 x 533 mm torpedo tubes, for 18 torpedoes, anti-submarine or anti-ship missiles.

↳*Weapon Station #1*

Name: SS-N-27 “Sizzler”

Type: Short-Range Anti-Ship Missile

Basic Load: 18

Length: 8.22 m

Diameter: 0.534-0.645 m

Launch Weight: 1,920 kg for 3M54 (1,570 kg for 3M54M1)

Payload: single conventional warhead

Basing: ubmarine- ship-launched

Warhead: 1X200 kg HE for 3M54 (1X450 kg HE for 3M54M1)

Propulsion: solid propellant, turbojet (3M54 is three stage, 3M54M1 is two stage)

Range: 220 km (3M54), 300 km (3M54M1)

Sensors

CICS: Litiy CICS

Sonar: sophisticated sonar equipment with bow and flank arrays, as well as towed array.

Notes:

Lada class, Russian designation Project 677 Lada (Russian: Лада, meaning "Lada", NATO reporting name Lada) is the new advanced class of diesel-electric attack submarine designed by the Russian Rubin Design Bureau. A program to develop a "fourth generation" diesel-electric submarine, it aimed to produce a highly improved version of the Project 636 with better acoustic signature, new combat systems and possibly air-independent propulsion. The project 677 St. Petersburg is a Russian diesel-electric submarine developed in the late 1990s. The submarine is designed for anti-submarine and anti-surface warfare, defense of naval bases, seashore and sea lanes, as well as for conducting reconnaissance. The class marks the first usage of a mono-hull design by the Russian navy for an attack submarine since the 1940s. Displacement is 25% lower than that of its predecessor, the Kilo-class submarine, but its capabilities are greatly enhanced. Top submerged speed is 21 knots (39 km/h), up from 19 knots for the Kilo class. The class is designed for an endurance of 45 days with a complement of 34. The submarine is equipped with automated combat control system Litiy, (eng. Lithium). A variant designated as the project 1650 Amur-class submarine is offered as an export model.

Project 633 Class (Romeo Class) Russian Diesel-Electric Submarine

Tiers:

Variants:

- **Chinese Type 033 Romeo-class and its variants:** Under the 1950 Sino-Soviet Friendship and Mutual Assistance Treaty, the Soviets passed to China (and later to North Korea) the documentation necessary to produce Romeo submarines in 1963. The Chinese variant is known as the Type 033 Romeo. A total of 84 Type 033 submarines were built in China from 1962 to 1984, plus several exported to other countries. The Chinese Type 033 incorporated some improvements over the original Romeo, including noise reduction of 20 dB. Sonar on board was also continuously upgraded: the original Soviet sonar was first replaced by domestic Chinese Type 105 sonar, which consequently was replaced by H/SQ2-262A sonar built by No. 613 Factory. Today most of the Type 033 subs have been retired or preserved, with a few remaining in service for training purposes. A total of six Chinese Romeo class submarine variants were developed: Type 6633: Original Chinese built Romeo, China was to have assembled these Romeos from knock-down kits provided by the Soviet Union, 6 were planned, but only 2 were completed. The construction program came to a complete stop when the USSR stopped delivery of parts following the Sino-Soviet split. Construction of the 3rd unit at Wuhan was stopped, and available parts were diverted to complete the first pair, but many parts had to be developed indigenously. The primary improvement of Type 6633 over the original Soviet boats is the use of domestic Chinese batteries, which had slightly superior performance to that of the original Soviet batteries. Type 033: Complete domestic production in China was achieved in 1967, and subsequently the project was renamed the Type 033. However, experience from deployment of completed boats in warmer climates proved that the original Soviet refrigeration and air conditioning system designed for subarctic and arctic area was woefully inadequate for subtropical and tropical regions, so redesigns were needed to improve refrigeration and air conditioning systems, and all boats to be stationed in tropical and subtropical regions went through such a refit. In September 1969 construction of new Type 033s, with improved air conditioning and refrigeration capability, began at Huangpu Shipyard in Guangzhou, eventually, 13 units were completed. ES5A: Upgraded Type 033, with improvements mainly involving the replacement of equipment of Soviet origin with domestic Chinese systems, which includes: QZHA—10 (Type 779) attack periscope and QDYA—10 (Type 778) general purpose periscope. Addition of H/SQG-2 ranging sonar, Type 063 communication systems, and countermeasure systems. Domestic Chinese Type 801 sonar replaced the original Soviet MARS-24 sonar. The only difference between the Type 801 sonar and the MARS-24 sonar is that there are 24 transducer elements for the Type 801 as opposed to 12 in the original MARS 24, so the Chinese sonar had better accuracy. Domestic Chinese H/SQZ-D reconnaissance sonar (with Type 105 transducers) replaced the original Soviet system, the performance of the SQZ-D is almost identical to the original Soviet sonar it was developed from, except for the sector of scan, which is increased by 15 degrees. Additional noise reduction measures were also adopted. This is the type China originally sold to Egypt in the 1980s. Type 033G: Development of the ES5A, with the incorporation of the capability to launch acoustic homing torpedoes; analog computers installed to achieve automation of, and speeding up of, torpedo fire control calculations that were previously manually calculated. All Chinese Romeos were converted to this standard. The NATO reporting name for this type is rumored to be the Wuhan-class. Type 033G1: A single Type 033G was modified to carry 6 YJ-1 (CSS-N-4) anti-ship missiles, this variant is called Type 033G1, with the rumored NATO reporting name of Wuhan A. The missile had to be fired while the boat was surfaced, with a total exposure time on the surface of less than 7 minutes. The most significant improvement, however, is the reduction of noise level by 12 dB. ES5B: Development of the Type 033G, primarily intended for export. This is an upgrade package for Romeo submarine users. The primary improvement of this class is the ability to launch wire guided torpedoes and anti-ship missiles (AShM) while submerged. The program originally begun in the mid-1980s, and Egypt is reported to be the only customer when China won a contract to upgrade its Romeo-class submarine fleet, including both Soviet built and Chinese built units. This is the last type of Chinese Romeo class submarine; with noise reduction of 20 dB to 140 dB in comparison to the 160 dB of the original Soviet Project 633 submarines acquired by China.

System

Alternative Designation: Project 633 Class; NATO: Romeo Class

Type: Diesel-Electric Submarine

Builder: Krasnoye Sormovo Shipyard, Gorky Wuchang Shipyard (Wuhan) Guangzhou Shipyard (Canton) Jiangnan Shipyard (Shanghai) Bohai Shipyard (Huludao) Mayang-do Naval Shipyard (North Korea) - Assembly site of North Korean kits from China.

Crew: 51 total (8 Off. + 43 Enl.)

Dimensions

Length: 76.6 m

Beam: 6.7 m

Draft: 5.0 m

Displacement, Surface: 1,319 tons surface

Displacement, Submerged: 1,712 tons submerged

Propulsion System

Engine Name: Type 37D

Engine Type: Diesel-Electric drive: 2 Type 37D diesels

Engine Power: hp2,700 total bhp; 2 shafts

Auxiliary Power: 2 Electric 100 shp creep motors

Speed, Surface: 15.2 knots surface

Speed, Submerged: 13 knots submerged

Range, Surface: 14,000 nm at 9 kts(surface)

Range, Submerged: 350 nm at 9 kts(submerged

Normal Operation Depth: 270.0 m

Maximum Operation Depth: 300.0 m

Torpedo Weapon Systems

↳*Torpedo Launcher*

Number of Tubes: 6 forward 533-mm and 2 aft 533-mm torpedo tubes

↳*Torpedo (Option #1)*

Name: SAET-60

Type: Heavy Weight Torpedo

Length: 7.80 m

Diameter: 533 mm

Weight, Total: 1.855 kg

Explosive Warhead: The SAET-60 uses an electric motor and has a 300 kg high explosive warhead with impact and proximity fuse.

Guidance System: Homing Passive acoustic homing

Wire Guidance: No

Power Source: Silver zinc battery, 46 cells

Propulsion: Twin propeller wakeless propulsion

Speed: 42 kt

Maximum Range: 13 km at 42 kt

Depth: Up to 400 m launch depth

Basic Load: 14

↳ ***Torpedo (Option #2)***

Name: Type 53-65

Type: Torpedo

Length: 7.2 m

Diameter: 533 mm

Weight: 2,070–2,300 kg

Range: 18,000 metres

Speed: 83 km/h

Guidance System: Wake homing

Warhead: 307.6 kilograms (678 lb) high explosive

Mines

Note: Can carry 28 mines in lieu of torpedoes

Active Protection System: INA

Countermeasures: INA

NBC Water Washdown System: Yes

Electronic Warfare: 1 x MRP-11-14 series Stop Light intercept

Notes:

The Project 633 class (known in the West by its NATO reporting name as the Romeo class) is a class of Soviet diesel-electric submarine, built between 1957 and 1961. A Chinese variant - Type 033 - was built in China from 1962 to 1984. Project 633 was a further development of the Soviet navy's post-war 611 (Zulu-) and 613 (Whiskey-class) designs. The project was undertaken by Lazurit Central Design Bureau of Gorky. Only 20 of the Soviet Union's originally intended 56 were completed between October 1957 and the end of December 1961 because of the introduction of the nuclear submarine into the Soviet Navy. By today's standards Romeo class submarines are considered obsolete, but they still have some value as training and surveillance vessels.

Type 035 Class (Ming Class) Chinese Diesel-Electric Submarine

Tiers:

Variants:

- **Type 035:** First unit of the Ming-class submarine, with construction of two units begun simultaneously in October 1969 in Wuchang Shipyard and Jiangnan Shipyard. The general designer was Wei Xumin (□□□). The most significant difference between Type 035 Ming class and Type 033 Wuhan class is that the former is driven by a single shaft instead of twin shafts of the latter. Trials completed in October 1974 and this first unit (original pennant number 162, but later changed to 232) built at Jiangnan Shipyard entered Chinese service in the following month.
- **Type 035A:** The second unit of the Ming-class submarine with pennant number 342 was built at Wuchang Shipyard, and many problems were discovered during its trials. As a result, the Chinese navy ordered 701st Institute to perform a major redesign, which not only solved the problem, but also increased the top speed by 40% to 18.3 knots (33.9 km/h; 21.1 mph). The redesigned boat was completed in June 1980, and finally entered Chinese service on December 24, 1982, with a new designation of Type 035A. In December 1983, the decision was made to stop the production of a new Type 033-class boat and replace it with a Type 035A. After the completion of the first Type 035A in 1982, the production of Type 035 briefly halted, until 1987, when the production restarted again and 3 more units were completed before the production ended in 1990.
- **ES5C:** Export version of Type 035/035A, with updated fire control system to launch acoustic homing torpedoes. There is no known export, but the design was used to upgrade Type 035/035A fleet.
- **ES5D:** further development of ES5C for export, with capability to launch anti-ship missiles while submerged added. As with its predecessor ES5C, there is no known export but the design was used to upgrade Type 035/035A fleet.
- **Type 035G:** Program begun in 1985, and the first unit with pennant number 356 was launched in 1989, entering service in December 1990, and state certification received in 1993. This is the first Type 035 series to have anti-submarine (ASW) capability. The primary weaponry for Type 035G is Yu-3 torpedo, and French sonar DUUX-5 and its Chinese-built version were used on later units, 12 of which were completed between 1990 and 1999. The last unit with pennant number 308 was lengthened by 2 meters (6 ft 7 in) to add a section for AIP tests.
- **ES5E:** Export version developed from Type 035G, with ability to launch wire-guided torpedoes added, but there is no known export.
- **Type 035ET:** French sonar system and its equivalent Chinese version on ES5E export version of Ming was expensive, so a cheaper alternative was developed, using Italian sonar systems, the JP-64 active sonar and Velox passive sonar of the Toti-class submarine. However, this failed to attract any buyers and the unit went into Chinese service instead.
- **ES5F:** Export version with integrated sonar system that integrates previously separated active, passive ranging, flank (and towed upon customer's request) sonar into one
- **Type 035B:** First batch of four completed between 2000 through 2003, and additional order followed sometimes later. Conning tower and certain portion of hull was redesigned, with new structure similar to that of Type 039 submarine. This type was capable of launching land attack cruise missiles from torpedo tubes.

System

Alternative Designation: Type 035 Class; Ming Class

Pendant Numbers: Pendant Numbers 305 through 310 342 352 through 354 356 through 360 362 and 363 plus four more units All are reported to be active. The "Ming Mod." type are all assigned to the Northern Fleet, while the "Ming Mod-II" type are being assigned to the Southern Fleet.

Type: Diesel-Electric Submarine

Builder: Wuchang Shipyard Jiangnan Shipyard

In Service: 1974-Present

Crew: 57

Dimensions

Length: 76.0 m

Beam: 7.6 m

Draft: 5.1 m

Displacement, Full Load: 1,584 tons surface 2,113 tons submerged

Propulsion System

Engine Name: Diesel-electric drive: 2 Shaanxi type 6E390 ZC1 diesels

Engine Type: Diestel-Electric

Engine Power: 3,500 total bhp

Maximum Range: 330 nm at 4 kts. (submerged); 8,000 nm at 8 kts.(snorkle)

Maximum Speed: 5 knots (surfaced); 10 knots (snorkle); 18 knots (submerged)

Endurance: 60 days

Countermeasures: INA

NBC Water Washdown System: Yes

Notes:

The Type 035 submarine (NATO reporting name: Ming class) is a class of diesel-electric submarines of the People's Liberation Army Navy. The Type 035 is a heavily improved redesign of the older Type 033 Romeo-class submarines, which were built in China from 1962 to 1984. In 1963, under the 1950 Sino-Soviet Treaty of Friendship, Alliance and Mutual Assistance, the Soviet

Union passed to China the necessary design details in order to produce Romeo-class submarines. The Chinese variant became known as the Type 033 Romeo class, of which China built a total of 84 between 1962 and 1984. During the 1970s, China's ambition to create an indigenous submarine industry lead to the commissioning of Wuhan Ship Development and Design Institute (701 Institute) to design and build an improved submarine based on the Type 033 hull, named the Type 035 Ming class. Two Type 035 boats were completed by 1974. Further improvements were deemed necessary and by the early 1980s a new and improved design, named the Type 035A Ming class were produced. The first of these improved "A" models entered service in 1982, with three more under construction. The latter three boats were completed and commissioned by 1990. The Type 035G Ming class is the most numerous variant. A total of 12 were built and commissioned between 1990 and 1999. They were built with further improvements, especially in terms of noise reduction, weapons, sensors and crew living standards. The PLAN refer to this sub-class as, "new wine in an old bottle". Two boats of the Type 035A were upgraded to same standard as the Type 035G. The most modern design variant is the Type 035B Ming class, which features a redesigned conning tower and portions of the hull, giving it a very similar appearance to the newer Type 039 submarines. Type 035B are capable of launching land attack cruise missiles from their torpedo tubes. A total of four boats were commissioned between 2000 and 2003.

→→Nuclear-Powered Attack Submarines

Type 093 Class (Shang Class) Chinese Nuclear-Powered Attack Submarine

Tiers:

Variants:

- **Type 093 Shang-I class:** Construction of the Type 093 reportedly began in the late 1990s at the Huludao-based CSIC Bohai Shipbuilding Heavy Industry Co., Ltd. The first-of-class Boat 407 was launched sometime in 2001 to 2002. After a sea trial that lasted for four years, the submarine was finally commissioned by the PLA Navy in 2006. The second hull Boat 408 was launched in late 2003 and commissioned around 2007. The production then stopped and replaced by the follow-up variants. The basic variant Type 093 (Shang I class) was said to have been partially based on the Russian Victor III class in design, though the two submarines bear no resemblance in appearance. The submarine is estimated to have 6.000 to 7,000 t displacement when dived. It features a water-drop shape hull, with a pair of fin-mounted hydroplanes and four diving planes. Six (three on each side) flank-mounted sonar arrays are clearly visible on the hull of the submarine. There are six 533 mm bow torpedo tubes (4 above, 2 below), capable of carrying the various anti-submarine/surface torpedoes of wire-, acoustic- and wake-homing, as well as the YJ-82 anti-ship cruise missile (ASCM).
- **Type 093A Shang-II class:** This is an improved variant with a redesigned sail with a tapered front (similar to that of the Seawolf class and Virginia class) and all windows removed.
- **Type 093B Shang-III class:** The improved Type 093B nuclear-power guided missile submarine (SSGN) was launched n 2012 and commissioned in 2015. This variant features some redesign to the sail, with the tapered front retained but all windows removed. There is a mysterious hump located immediately behind the sail, which is believed to accommodate a missile vertical launch system (VLS). The VLS is said to be used for carrying and launching the YJ-18 ASCM, the Yu-8 rocket-propelled torpedo, and the CJ-10 land-attack cruise missile (LACM). The YJ-18, a Chinese copy of the Russian 3M-54 Klub (SS-N-27 'Sizzler'), is capable of attacking surface and land targets to a maximum range of 650 km. The CJ-10, rumoured to have been developed from the Russian Kh-55 (AS-15 'Kent'), employs a combined inertial navigation system (INS), satellite, and terrain contour matching (TERCOM) navigation to a maximum range of 1,500 km. These missiles allow the Type 093B to project power ashore over long distance – a capability not previously possessed by Chinese SSNs.

System

Alternative Designation: Type 093 Class; Shang Class
Total Built: 6 Type 093 Class Attack Submarines Built.
Type: Nuclear-Powered Attack Submarine

Builder: China Shipbuilding Industry Corporation Bohai Shipyard, Huludao

In Service: 2006-Present

Crew: 100

Dimensions

Length: m107

Beam: m11

Draught: m7.5

Displacement, Submerged: 7,000 tons

Displacement, Surface: INA

Draft: INA

Propulsion System

Engine Name: INA (Nuclear with turbo-electric arrangement)

Engine Type: Pressurized water Nuclear Reactor

Engine Power: INA

Shafts: 1

Maximum Range: Unlimited

Maximum Speed: 30 knots; 56 km/h

Endurance: INA

Propeller: 7-blade propeller

Auxiliary Armament

Torpedo Tube: 6x 533mm torpedo tubes

↳*Torpedos*

Note: The Shang class nuclear-powered attack submarine is armed with six 533 mm torpedo tubes. These can be used to launch a range of indigenous and Russian anti-submarine and anti-ship torpedoes with wire-, acoustic- and wave-homing. Torpedo tubes can also be used to launch Chinese YJ-82 anti-ship missiles.

Basic Load: 20 Torpedos

↳*Mines*

Note: The Type 093 can carry either 20 Torpedoes or 36 Mines

Fire Control System

FCS Name: INA

Computerized FCS: Yes, Multi-purpose combat data and command system for submarine control and weapon firing.

Radars

Surface Search Radar: Yes, (Name: INA)

Sonar Systems

Bow-Mounted Sonar: H/SQ2-262 bow-mounted, medium-frequency sonar for active/passive search and attack

Flank-Mounted Sonar: H/SQG-207 flank-mounted sonar (3 sonar arrays on each side)

Additional Sonar Systems: Low frequency sonar, passive ranging and intercept and a Towed array sonar for active search and attack

Protection

Active Protection System: INA

Electronic Warfare: INA

Decoys: INA

Radar Warning: Radar warning receiver and direction-finder

Notes:

The Type 093 (or Type 09-III, NATO codename: Shang class) is China's 2nd-generation nuclear-powered attack submarine (SSN) introduced in the early 2000s. It represents a significant improvement over the 1st-generation submarines in performance and capability. At least six hulls have already been commissioned into the PLA Navy as of 2015, and the construction programme continues. The improved Type 093B (Shang-III class) SSGN is capable of carrying log-range cruise missiles for anti-ship and land-attack. The PLA Navy initiated the development of its next-generation Type 093 nuclear attack submarine in the mid-1980s as a successor to its 1st-generation Type 091 (Han class). However, little progress was made until the mid-1990s, when Russia agreed to transfer its nuclear submarine technology to China in exchange for urgently-needed cash. The St. Petersburg-based Rubin Central Design Bureau for Marine Engineering, one of Russia's primary centres for submarine design, offered consultation to the Type 093's development, including overall hull design, engine and machinery quieting, combat system, weapon system, and countermeasures outfit. The existence of the submarine programme was first reported by the Pentagon in 2003. The U.S. Navy intelligence and Pentagon suggested that 2 hulls in the basic variant Type 093 and 4 hulls in the improved Type 093A variant had been constructed by 2017 ((Annual Report to Congress: Military and Security Developments Involving the People's Republic of China, 2017, page 24.)). While the basic variant Type 093 is only comparable to the 1970s U.S. and Russian designs such as the early variant Los Angeles (688) class and the Victor-III class, the improved Type 093A/B is believed to be approaching the later variant Los Angeles class and the Akula class in quietness and overall capability, though they still cannot match the more advanced Seawolf and Virginia class. Type 093 Shang-I class Construction of the Type 093 reportedly began in the late 1990s at the Huludao-based CSIC Bohai Shipbuilding Heavy Industry Co., Ltd. The first-of-class Boat 407 was launched sometime in 2001 to 2002. After a sea trial that lasted for four years, the submarine was finally commissioned by the PLA Navy in 2006. The second hull Boat 408 was launched in late 2003 and commissioned around 2007. The production then stopped and replaced by the follow-up variants. The basic variant Type 093 (Shang I class) was said to have been partially based on the Russian Victor III class in design, though the two submarines bear no resemblance in appearance. The submarine is estimated to have 6.000 to 7,000 t displacement when dived. It features a water-drop shape hull, with a pair of fin-mounted hydroplanes and four diving planes. Six (three on each side) flank-mounted sonar arrays are clearly visible on the hull of the submarine. There are six 533 mm bow torpedo tubes (4 above, 2 below), capable of carrying the various anti-submarine/surface torpedoes of wire-, acoustic- and wake-homing, as well as the YJ-82 anti-ship cruise missile (ASCM). Type 093A Shang-II class This is an improved variant with a redesigned sail with a tapered front (similar to that of the Seawolf class and Virginia class) and all windows removed. Type 093B Shang-III class The improved Type 093B nuclear-power guided missile submarine (SSGN) was launched n 2012 and commissioned in 2015. This variant features some redesign to the sail, with the tapered front retained but all windows removed. There is a mysterious hump located immediately behind the sail, which is believed to accommodate a missile vertical launch system (VLS). The VLS is said to be used for carrying and launching the YJ-18 ASCM, the Yu-8 rocket-propelled torpedo, and the CJ-10 land-attack cruise missile (LACM). The YJ-18, a Chinese copy of the Russian 3M-54 Klub (SS-N-27 'Sizzler'), is capable of attacking surface and land targets to a maximum range of 650 km. The CJ-10, rumoured to have been developed from the Russian Kh-55 (AS-15 'Kent'), employs a combined inertial navigation system (INS), satellite, and terrain contour matching (TERCOM) navigation to a maximum range of 1,500 km. These missiles allow the Type 093B to project power ashore over long distance – a capability not previously possessed by Chinese SSNs.

Borei Class Russian Nuclear-Powered Ballistic Missile Submarine

Tiers:

Variants:

- **Project 955A (Borei-A):** Units of the Project 955A include improved communication and detection systems, improved acoustic signature and have major structural changes such as addition of all moving rudders and vertical endplates to the hydroplanes for higher maneuverability, and a different sail geometry. Besides, they are equipped with hydraulic jets and improved screws what allows them to sail at nearly 30 knots while submerged with minimal noise. Although first reported to carry 20 Bulava SLBMs, the 955A will be armed with 16 SLBMs with 6-10 nuclear warheads atop each, just like the project 955 submarines. The contract for five modified 955A submarines was delayed several times due to price dispute between the Russian Defence Ministry and the United Shipbuilding Corporation. The contract was formally signed on 28 May 2012. The first 955A submarine, Knyaz Vladimir, was laid down on 30 July 2012, during a ceremony attended by the Russian President Vladimir Putin. Two additional project 955A submarines were laid down in 2014, one in late 2015, and one in late 2016. According to Sevmash official, Vitaliy Bukovskiy, all Borei-A submarines are to be equipped with aspen banyas able to accommodate 3-4 people.
- **Project 955B (Borei-B):** The Project 955B was expected to feature a new water jet propulsion system, an upgraded hull, and new noise reduction technology. The concept design was to be initiated by the Rubin Design Bureau in 2018 and four project 955B boats were been proposed with first unit to be delivered to the Russian Navy in 2026. However, the project wasn't reportedly included in the Russia's State Armament Programme for 2018–2027 due to cost-efficiency. Instead, six more Borei-A submarines were to be built after 2023. According to a 2018 report, Russia's State Armament Programme for 2018–2027 includes construction of two more Borei-A submarines by 2028. The construction should take place at Sevmash starting in 2024 with deliveries to the Russian Navy in 2026 and 2027 respectively.
- **Yury Dolgorukiy:** Project: 955 Commisioned: 2013 Fleet: Northern
- **Alexander Nevsky:** Project: 955 Commisioned: 2013 Fleet: Pacific
- **Vladimir Monomakh:** Project: 955 Commisioned: 2014 Fleet: Pacific
- **Knyaz Vladimir:** Project: 955A Commisioned: 2020 Fleet: Northern
- **Knyaz Oleg:** Project: 955A Commisioned: 2020 Fleet: Pacific
- **Generalissimus Suvorov[7:** Project: 955A Commisioned: 2021 Fleet: Pacific
- **Imperator Aleksandr III[:** Project: 955A Commisioned: 2022 Fleet: Pacific
- **Knyaz Pozharskiy:** Project: 955A Commisioned: 2023 Fleet: Northern

System

Alternative designations: BOREI; Project 955; YURI DOLGORUKY

Builders: Sevmash, designed by Rubin

Type: Ballistic Missile Submarine

Crew: 107 (55 off. + 52 enl.)

Diminsions

Length: 170.0 m

Beam: 13.5 m

Draft: 9.0 m

Displacement, Surface: 14,720 tons

Displacement, Submerged: 24,000 tons

Draught: 10 m

Automotive

Reactor: 2 x OK-650B pressurized-water nuclear reactors

Power: 190 MW each

Turbine: 2 x OK-9 steam

Emergency Prop Power: 2 DC electric

Generator: 1,000 shp total

Total Electrical: 7,400 kW

Surface Speed: 15 knots (17 mph, 28 kph) max

Submerged Speed: 29 knots (33 mph, 54 kph) max

Endurance: 90 days

Normal Diving Depth: 1,247 ft (380 m)

Maximum Diving Depth: 1,575 ft (480 m)

Armament

↳*Weapon Station #1*

Name: RSM-56 Bulava (NATO: SS-NX-30)

Type: Submarine-Launched Ballistic Missile (SLBM)

Basic Load: 12 x RSM-56 Bulava (NATO: SS-NX-30)

Proliferation: The Russian Navy is the only operator of the RSM-56 Bulava. As of 2019, 48 missiles were deployed on 3 Borei-class ballistic missile submarines: K-535 Yury Dolgorukiy K-550 Alexander Nevsky K-549 Vladimir Monomakh

Length: 11.5 m (38 ft) (without warhead) 12.1 m (40 ft) (launch container)

Diameter: 2 m (6 ft 7 in) (missile) 2.1 m (6 ft 11 in) (launch container)

Weight: 36.8 t (36.2 long tons; 40.6 short tons)

Warhead: 6-10 × 100-150 kt MIRVs

Engine: Three stage solid and liquid head stage

Propellant: Solid propellant and liquid fuel

Operational Range: 8,000-8,300 km ≥ 9,300 [7] (> 9 - 10+k km)

Guidance System: Inertial guidance, possibly with Astro-inertial guidance and/or GLONASS update

Accuracy: 120-350 meters

Launch Platform: Borei-class submarines Typhoon-class submarine Dmitri Donskoi (as a testbed)

↳*Weapon Station #2*

Name: Type 53 Torpedo

Type: ASUW Torpedo

Length: 7.2 m

Basic Load: 12 x Type 53 Torpedos

Diameter: 533 mm

Weight: 2,070–2,300 kg

Range: 18,000 metres

Speed: 83 km/h

Guidance System: Wake homing

Note: Type 53 Torpedos include a mixture of SAET-60M and UGST torpedoes, SS-N-16 Stallion anti-ship missiles

↳ *Weapon Station #3*

Name: 1 x Igla-M shoulder-launched system

Type: man-portable infrared homing surface-to-air missile (SAM)

Basic Load: 1 x Igla-M shoulder-launched system with 8 x 9K38 Igla Missiles

Length: 1.574 m

Diameter: 72 mm

Warhead: 1.17 kg (2.6 lb) with 390 g (14 oz) explosive

Weight: Missile weight: 10.8 kg (24 lb), Full system: 17.9 kg (39 lb)

Detonation Mechanism: contact and grazing fuzes

Engine: solid fuel rocket motor

Operational Range: 5.2 km

Flight Ceiling: 3.5 km

Speed: 570m/s

Guidance System: dual waveband infra-red (S-version

Sensors

Navigation: Medveditsa-M system

Sonar: MGK-540 Skat-3M with towed array

Communications: Molnaya-M system

Combat Control: Omnibus system

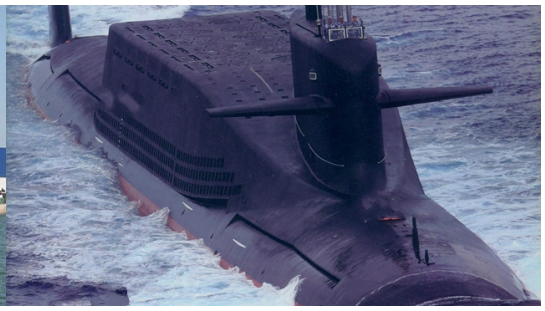
Protection

Note: Borei class includes a compact and integrated hydrodynamically efficient hull for reduced broadband noise and the first ever use of pump-jet propulsion on a Russian nuclear submarine.The noise level is to be five times lower when compared to the third-generation nuclear-powered Akula-class submarines and two times lower than that of the U.S. Virginia-class submarines. The acoustic signature of Borey is significantly stealthier than that of the previous generations of Russian SSBNs, nevertheless the USN has been able to identify the main noise emitter, i.e. the hydraulic pump. As the pump ages, it tends to become noisier, allowing for easier detection of the submarine.

Notes:

The Borei class, alternate transliteration Borey, Russian designation Project 955 Borei and Project 955A Borei-A, (Russian: Борей, meaning "Boreas, NATO reporting name Borei), also referred to as Dolgorukiy class, are series of nuclear-powered ballistic missile submarines being constructed by Sevmash for the Russian Navy. The class is projected to replace the Soviet-era Delta III, Delta IV and Typhoon classes in Russian Navy service. Despite being a replacement for many types of submarines, the Borei-class submarines are much smaller than those of the Typhoon class in both volume and crew (24,000 tons opposed to 48,000 tons and 107 people as opposed to 160 for the Typhoons), and are in terms of class more accurately a follow-on to for the Delta IV-class SSBNs. The first design work on the project started in the mid-1980s and the construction of the first vessel started in 1996. Previously, a short-lived, smaller parallel design appeared in 1980s with designation Project 935 Borei II. A new submarine-launched ballistic missile (SLBM) called the R-39UTTH Bark was developed in parallel. However, the work on this missile was abandoned and a new missile, the RSM-56 Bulava, was designed. The submarine needed to be redesigned to accommodate the new missile, and the design name was changed to Project 955. The vessels were developed by Rubin Design Bureau are being built by Russia's Northern shipyard Sevmash in Severodvinsk. Because of the repeated failures during Bulava test launches, some experts suggested that the Borei submarines could instead be armed with R-29RMU Sineva SLBMs, already in active duty with the Delta IV-class submarines. It has been reported that the arrival of the Borei class will enable the Russian Navy to resume strategic patrols in southern latitudes that have not seen a Russian missile submarine for 20 years. Borei class includes a compact and integrated hydrodynamically efficient hull for reduced broadband noise and the first ever use of pump-jet propulsion on a Russian nuclear submarine. The noise level is to be five times lower when compared to the third-generation nuclear-powered Akula-class submarines and two times lower than that of the U.S. Virginia-class submarines. The acoustic signature of Borey is significantly stealthier than that of the previous generations of Russian SSBNs, nevertheless the USN has been able to identify the main noise emitter, i.e. the hydraulic pump. As the pump ages, it tends to become noisier, allowing for easier detection of the submarine. The Borei submarines are approximately 170 metres (560 ft) long, 13 metres (43 ft) in diameter, and have a maximum submerged speed of at least 46 kilometres per hour (25 kn; 29 mph). They are equipped with a floating rescue chamber designed to fit in the whole crew. Smaller than the Typhoon class, the Boreis were initially reported to carry 12 missiles but are able to carry four more due to the decrease in mass of the 36-ton Bulava SLBM (a modified version of the Topol-M ICBM) over the originally proposed R-39UTTH Bark. Cost is some ₽23 billion (USD$890 million), in comparison the cost of an Ohio-class SSBN was around US$2 billion per boat (1997 prices). Each Borey includes of 1.3 million units and mechanisms. Its construction requires 17 thousand tons of metal which is 50 % more than the Eiffel Tower. The total length of pipelines is 109 km and the length of cable routes is 600 km. 10 thousand rubber plates cover the hull of the boat.

Type 094 Class (Jin Class) Chinese Nuclear-Powered Ballistic Missile Submarine (SSBN)



Tiers:

Variants:

- **Type 094A:** The Type 094A is a variant with a modified and improved sail. The sail appears to incorporate features from one installed on a modified Type 093.

System

Alternative Designation: Type 094 Class; Jin Class
Total Built: 8 Planned; 6 Completed
Type: Nuclear-Powered Ballistic Missile Submarine (SSBN)
Builder: Bohai Shipyard, Huludao, China
In Service: 2010-Present
Crew: 140+
Note: Once on high alert these submarines can leave their bases and operate in China's coastal water, protected by the China's fleet. So the Jin class boats have high probability of surviving the first strike, once the country has been attacked. However these submarines are not as advanced or stealthy as the Western ballistic missile submarines. Furthermore these are even inferior to the Russian submarines. China was always dragging behind in terms of submarine technology. It was reported that the Type 094 class boats are as noisy as the Russian Delta III class submarines, that were adopted back in the mid 1970s.

Notes:

The Type 094 (simplified Chinese: 09-IV□□□□; traditional Chinese: 09-IV□□□□; Chinese designation: 09-IV; NATO reporting name: Jin class) is a class of ballistic missile submarine developed by China for the People's Liberation Army Navy Submarine Force. The Type 094 succeeds the Type 092 submarine. The Type 094 was first spotted in 2006 on commercial satellite imagery of the Xiaopingdao Submarine Base. It was noted as being longer than the Type 092. Two Type 094s were spotted at the Bohai Shipyard in May 2007, although it was not clear if these included the one spotted in 2006. One was operational in 2010, three in 2013, and four in 2015. As many as eight may enter service by 2020. The PRC is interested in augmenting its ICBM forces with SSBNs to enhance its comprehensive nuclear deterrent force. Nuclear deterrent patrols commenced in December 2015. The Type 094 is armed with 12 JL-2 SLBMs, each with an estimated range of 7,400 km (4,600 mi). Each missile carries one warhead. The Type 094 and JL-2 is China's first credible sea-based nuclear deterrent. Globalsecurity.org notes that a Type 094 patrolling just northeast of the Kuril Islands would be able to strike three-quarters of the contiguous United States; whereas launching from Chinese coastal waters would barely reach the Aleutian Islands. Thomas-Noone and Medcalf note that the Type 094's noisiness would make it difficult for it to reach and maintain patrol areas where it could strike at the contiguous United States; no such limitations would exist against Indian targets. The Type 094 (Western reporting name Jin class) is a Nuclear-Powered Ballistic Missile Submarine (SSBN). It is the second-generation SSBN of the Chinese navy. Development possibly began in the early 1980s. It is a successor to the unreliable sole Type 092 or Xia class boat, which was a catalogue of disasters and had little strategic value. The whole development project of the Type 094 class is kept in secrecy. Speculations have been made, that development of the Type 094 class was assisted by Russian Rubin Design Bureau, however this information was not confirmed. Construction of the lead vessel began in 1999 and it was launched in 2004. It seems that the first boat was commissioned in 2010. The second boat of the class was launched in 2007. Some sources claim that these Chinese ballistic missile submarines were plagued with various problems and design flaws. As of 2018 China operates 4 of these ballistic missile submarines. This fact was also confirmed by a US Department of Defense report. It is believed that at least one of these boats was completed to an improved project, which is sometimes referred as Type 094A. These boats are deployed on the Longpo naval base on Hainan island. These ballistic missile boats form China's sea-based nuclear deterrent capability. By 2018 Jin class boats were never sent on long-range deterrent patrol missions, possibly due to various problems and design flaws. Instead these boats are patrolling in South China Sea, relatively close to China's coastal waters. The South China Sea is becoming a

bastion for Chinese SSBN operations.

Notes:

The Type 091 (Chinese designation: 09-I; NATO reporting name: Han class) is a first generation nuclear attack submarine produced by the People's Republic of China. They were the first nuclear-powered submarine employed by the People's Liberation Army Navy Submarine Force, and the first indigenously produced nuclear attack submarines in Asia. The Chinese naval nuclear power program started in July 1958 when the Central Military Commission gave approval to start the 091 submarine project.[5] Mao Zedong declared that China would build nuclear attack submarines even if it took ten thousand years.[6] Peng Shilu was the first chief designer of this project. The first submarine in the class, the Long March I, was commissioned in 1974[3]; the last was launched in 1990. In 1983, Peng shifted from military to civilian sector in application of nuclear power plants and his duty at the nuclear submarine project was succeeded by Huang Xuhua. The Type 091 has operated mainly in local waters, and has appeared in incidents. One submarine shadowed a U.S. carrier battle group in the mid-1990s. Another entered Japanese territorial waters through the Ishigaki, Okinawa island group near Taiwan in November 2004, causing Japan's maritime forces to go on alert for the second time since the Second World War; China apologized for the trespass and blamed "technical reasons" on the submarine. The boats have received major upgrades and numerous refits since commissioning. They have six 533 mm (21 in) torpedo tubes and carry 20 torpedoes. Alternatively, they can carry 36 mines in their tubes. It is capable of firing sub-launched variants of the C-801 anti-ship missile as well as a range of indigenous and Russian torpedoes or mines. All remaining hulls have been refitted with new sonars, with Type H/SQ2-262B sonar manufactured by No. 613 Factory replacing the original Type 603 sonar on board. Anechoic tiles were added later to reduce noise levels.

Crew: 64

Dimensions

Length: Surfaced: 8,600 tons Submerged: 13,800 tons
Beam: 13–15 m
Displacement: Surfaced: 8,600 tons Submerged: 13,800 tons

Automotive

Propulsion: OK-650KPMpressurized water reactor 200 MWt turbines of 43,000 shp
Range: Unlimited
Endurance: Only limited by food and maintenance requirements
Surface Speed: 20 kn (37 km/h; 23 mph)
Submerged Speed (Silent): 28 kn (52 km/h; 32 mph)
Submerged Speed (Maximum): 35 kn (65 km/h; 40 mph)
Test Depth: Safe depth: 1,475 feet (450m) Never exceed depth: 1,804 feet (580m) Crush depth: 2,160 feet (658m)

Armament

Launcher: 8 x VLS equipped silos for either

↳*Weapon Station #1*

Name: P-800 Oniks

Type: Supersonic Anti-Ship Cruise Missile

Basic Load: 32

Length: 8.9 m

Diameter: 0.7 m

Weight: 3,000 kg

Warhead: national ver. 300 kg semi-armour piercing HE, thermonuclear; for export 200 kg semi-armour piercing HE

Detonation Mechanism: delay fuze

Engine: Ramjet 4 tons of thrust

Wingspan: 1.7 m

Propellant: kerosene liquid fuel

Operational Range: 600 km (370 mi; 320 nmi) (Oniks version for Russia) 120 to 300 km (75 to 186 mi; 65 to 162 nmi) depending on altitude (Yakhont export version)

Flight Ceiling: 14,000 m

Flight Altitude: 10 meters or higher

Speed: Mach 2

Guidance System: midcourse inertial guidance, active radar homing-passive radar seeker head

Accuracy: 1.5 m

Launch Platform: coastal installations, naval ships, Fixed-wing aircraft

↳*Weapon Station #2*

Name: 9K38 Igla

Type: Surface-to-Air Missiles

Basic Load: INA

Launcher: 10 x torpedo tubes (533 mm

Length: 1.574 m

Diameter: 72 mm

Weight: Missile weight: 10.8 kg (24 lb), Full system: 17.9 kg (39 lb)

Warhead: 1.17 kg (2.6 lb) with 390 g (14 oz) explosive

Detonation Mechanism: contact and grazing fuzes

Engine: solid fuel rocket motor

Operational Range: 5.2 km

Flight Ceiling: 3.5 km

Speed: 570m/s

Guidance System: dual waveband infra-red (S-version)

Sensors

Radar: Rim Hat ESM/ECM Snoop Pair Surface Search Radar

Notes:

K-560 Severodvinsk is a Yasen class nuclear-powered cruise missile submarine of the Russian Navy, and the lead vessel of the class. The submarine is named after the city of Severodvinsk. The Yasen class, Russian designations Project 885 Yasen and Project 885M Yasen-M (Russian: Ясень, lit. 'ash tree', NATO reporting name: Yasen), also referred to as Graney class, are series of newest nuclear-powered cruise missile submarines designed by Malakhit and being constructed by Sevmash for the Russian Navy. Based on the Akula class and Alfa class designs, the Yasen class is projected to replace Russian Navy's current Soviet-era nuclear attack submarines. The vessel's design is claimed to be state-of-the-art. The Yasen-class nuclear submarines are presumed to be armed with land-attack cruise missiles, anti-ship missiles, anti-submarine missiles including the P-800 Oniks SLCM, Kalibr family SLCM or 3M51 SLCM.[9] Kalibr-PL has several variants including the 3M54K (terminal-supersonic) and 3M54K1 (subsonic) anti-ship, 91R1 anti-submarine, and the 3M14K land-attack variant. In the future, there will be also an option to install the hypersonic 3M22 Zircon cruise missiles on upgraded 855M boats. Each submarine can carry 32 Kalibr or 24 Oniks (other sources claim 40 Kalibr and 32 Oniks) cruise missiles which are stored in eight (ten for 855M) vertical launchers (additional missiles may be carried in the torpedo room at the expense of torpedoes). It will also have ten 533 mm tubes, as well as mines and anti-submarine missiles such as the RPK-7. It is the first Russian submarine class to be equipped with a spherical sonar, designated as MGK-600 Irtysh-Amfora. The device (allegedly the Irtysh/Amfora sonar system) was tested on a modified Yankee-class submarine. The sonar system consists of a spherical bow array, flank arrays and a towed array. Due to the large size of this spherical array, the torpedo tubes are slanted. In other words, the torpedo tube outer doors are not located in the immediate bow as in the previous Akula class but moved aft. The hull is constructed from low-magnetic steel. Unlike previous Russian submarines which have a double hull, Yasen-class submarines mostly have a single hull. The Yasen class has a crew of 85 on project 885 and 64 on project 885M, suggesting a high degree of automation in the submarine's different systems. The newest U.S. Virginia-class submarines, has a crew of 134 in comparison. Yasen-class submarines are the first to be equipped with a fourth generation nuclear reactor. The reactor, built by Afrikantov OKBM, will allegedly have a 25-30 year core life and will not have to be refueled. Steam turbines are supplied by Kaluga Turbine Works. The inclusion of new generation KTP-6 reactor on the Yasen-M boats is thought to significantly reduce their noise level: the reactor's primary cooling loop facilitates natural circulation of water and thus doesn't require continuous operation of the main circulation pumps, which are the key noise factor on a nuclear submarine. The only other submarine classes in service with such reactor design are USN' Ohio and Virginia, employing the S8G and S9G reactors respectively. A VSK rescue pod is carried in the sail. According to admiral Foggo, the commander of the US Naval Forces Europe, the Yasen class submarines are "very quiet, which is the most important thing in submarine warfare". It's claimed that Severodvinsk is far quieter than previous Russian SSNs, capable of 20 knots while running quiet, which is equal to the Seawolf class and inferior only to Virginia (25 knots). Other sources claim that Severodvinsk is capable of even 28 knots in silent mode

Suffren Class (Barracuda Class) French Nuclear Attack Submarine

Tiers:

Variants:

- **Note:** Ships Planned: 6 Ships Completed: 1
- **Suffren:** Commissioned: Expected in 2020
- **Duguay-Trouin:** Commissioned: Expected in 2025
- **Tourville:** Commissioned: Expected in 2025
- **De Grasse:** Commissioned: Expected in 2025
- **Rubis:** Commissioned: Expected in 2030
- **Casabianca or Dupetit-Thouars:** Commissioned: Expected in 2030

System

Alternative Designation: Suffren Class; Barracuda Class
Total Built: Ships Planned: 6 Ships Completed: 1
Type: Nuclear Attack Submarine
Builder: Naval Group (formerly known as DCNS and DCN)
Crew: 60 (8 off. + 52 enl.) + 10 special forces

Dimensions

Length: 99.5 m
Beam: 8.8 m
Draft: 7.3 m
Displacement, Surface: 4,680 tons
Displacement, Submerged: 5,300 tons
Draught: 7.3 m

Propulsion System

Engine Name: 1 x modified K-15 pressurized water reactor.

Engine Power: 41,500 total shp

Auxiliary Propulsion: 2 x SEMT-Pielstick 8 PA4 V200 diesel generator sets; 1,225 total bhp

Maximum Range: Unlimited range, 10 years (nuclear fuel)

Maximum Speed, Surface: 14 knots

Maximum Speed, Submerged: 25 knots

Endurance: 70 days

Main Armament

Torpedo Tubes: 4 x 533-mm Torpedo Tubes

Total Armament: 20 total Weapons of either SCALP Naval cruise missiles; SM 39 Exocet anti-ship missiles; F21 heavyweight torpedoes; or FG-29 type mines in lieu of torpedoes.

↳*Anti-Ship Missile (Option 1)*

Name: SM 39 Exocet

Type: Anti-Ship Cruise Missile

In Service: 1974-Present

Proliferation: India France Pakistan

Manufacturer: 1979–1999: Aérospatiale 1999–2001: Aérospatiale-Matra 2001–present: MBDA

Length: 5.80 m

Diameter: 348 mm

Wingspan: 1.14 m

Weight: 666 kg

Configuration: slim, pointed cylinder cruciform cropped and swept delta mainplanes indexed in-line with small cruciform tail planes

Propulsion: 2 x SNPE double-base Nitramite smokeless solid-propellant rockets. 1 x Epervier booster with 2.4 sec burn. 1 x Eole V sustainer with 200-220 sec burn

Speed: 594 kt (684 mph; 1,100 km/h) or Mach 0.93

Maximum Range: 50 km

Minimum Range: 4 km

Peak Altitude: 50 m

Warhead: 363 lb. (165 kg) Hexolite blast fragmentation

Sensor and Fire Control: TRT AHV-7 radio altimeter inertial navigation during first part of flight Electronique Marcel Dassault ADAC or Super ADAC I/J-band active radar homing in terminal phase that begins search approx 5.4 nm (6.2 mi.; 10 km) from target's estimated position.

Basic Load: See total Armament

↳*Cruise Missile (Option 2)*

Name: Missile de Croisière Naval (Storm Shadow CASOM)

Type: Long-Range Cruise Missile

Manufacturer: MBDA

Proliferation: Egypt 50 ordered for the Egyptian Air Force in 2015 as part of the Dassault Rafale deal France 500 ordered for the French Air Force in 1998. 50 MdCNs ordered in 2006 and a further 100 ordered in 2009 for the French Navy. As of 2016, France will reduce its stocks down 100 missiles. Greece 90 ordered for the Hellenic Air Force in 2000 and 2003. Italy 200 ordered for the Aeronautica Militare in 1999. India Unknown number ordered for the Indian Air Force in 2016 as part of the Dassault Rafale deal. Qatar 140 ordered for the Qatar Air Force in 2015. Saudi Arabia 300+ ordered for the Royal Saudi Air Force in 2006. United Arab Emirates 600 ordered for the United Arab Emirates Air Force in 1997. Known as Black Shaheen. United Kingdom 900+ ordered for the Royal Air Force in 1997

Length: 6.5 m

Diameter: 500 mm

Wingspan: 2.85 m

Engine: Microturbo

Effective Firing Range: >1,000 km (620 mi; 540 nmi

Speed: 800 km/h (500 mph; 430 kn; Mach 0.65)

Guidance System: inertial guidance, topographic (TERCOM/TERPROM), active radar homing and infrared guidance, GPS

Accuracy: Metric

Launch Platform: FREMM frigates Barracuda submarines Scorpène submarines

Basic Load: See total Armament

↳*Torpedo (Option 3)*

Name: F21

Type: Heavy Torpedo

Length: 6.0 m

Diameter: 533 mm

Weight: 1,550 kg

Effective Firing Range: >50 km (31 mi; 27 nmi)

Detonation Mechanism: proximity fuze

Maximum Depth: up to 600 m (2,000 ft)

Speed: 50 kn (58 mph; 93 km/h)

↳*Mines*

Note: FG-29 type mines can be carried in lieu of torpedoes.

Fire Control System

FCS Name: INA

Computerized FCS: Yes

Radar Systems

Navigation Radar: 1 x Sagem/Kelvin Hughes Series 10 CSR navigation

Sonar Systems

Hull and Flank Sonar: 1 x Thales UMS-3000 integrated sonar suite

Protection

Active Protection System: Yes

Electronic Warfare: INA

Decoys: 1 x Canto-S decoy dispenser

Notes:

The Barracuda class (or Suffren class) is a nuclear attack submarine, designed by the French shipbuilder Naval Group (formerly known as DCNS and DCN) for the French Navy. It is intended to replace the Rubis-class submarines. Construction began in 2007 and the first unit will be commissioned in 2020. In October 1998, the Delegation Générale pour l'Armement, the French government's defense procurement agency, established an integrated project team consisting of the Naval Staff, DCN (now known as Naval Group), Technicatome and the Commissariat a l'Énergie Atomique, a regulatory body that oversees nuclear power plants, to oversee the design of a new attack submarine class. DCN was to be the boat's designer and builder while Technicatome (since acquired by Areva) was to be responsible for the nuclear power plant. The two companies were to act jointly as a single prime contractor to share the industrial risks, manage the schedules, and be responsible for the design's performance and costs, which at the time was estimated to be US$4.9 billion. On 22 December 2006, the French government placed a €7.9 billion order for six Barracuda submarines with Naval Group and their nuclear power plants with Areva-Technicatome. According to the DGA “Competition at the subcontractor level will be open to foreign companies for the first time.”According to the contract, the first boat was to commence sea trials in early 2016, with delivery occurring in late 2016/early 2017. This was to be followed by entry into service in late 2017. Naval Group also designed a conventionally powered derivative, dubbed the SMX-Ocean, featuring fuel cells and vertical launchers. Another conventionally powered design, the Shortfin Barracuda, was selected as a future replacement for the Collins-class vessels with the Royal Australian Navy. In 2016, Naval Group also began to position itself and its Shortfin Barracuda design to the Royal Canadian Navy's Future Canadian Submarines project. The project is planned to replace the Victoria-class submarines by 2030. Naval Group is also offering a version of the "Shortfin" diesel-electric variant as replacement for the current Walrus-class submarines of the Royal Netherlands Navy competing against the A26 design by Saab and Damen. Barracudas will use technology from the Triomphant class, including pump-jet propulsion. This class reportedly produces approximately 1/1000 of the detectable noise of the Redoutable-class boats (submarines), and they are ten times more sensitive in detecting other submarines. They will be fitted with torpedo-tube-launched cruise missiles MDCN SCALP Naval for long-range (well above 1,000 km, 620 mi) strikes against strategic land targets. Their missions will include anti-surface and anti-submarine warfare, land attack, intelligence gathering, crisis management and special operations. The Barracuda class nuclear reactor incorporates several improvements over that of the preceding Rubis. Notably, it extends the time between refueling and complex overhauls (RCOHs) from 7 to 10 years, enabling higher at-sea availability. In support of special operations missions, Barracudas may also accommodate up to 12 commandos, while carrying their equipment in a mobile pod attached aft of the sail.

→Guided Missile Cruisers

Type 055 Class Chinese Guided Missile Cruiser

Tiers:

System

Alternative Designation: Type 055 destroyer (NATO/OSD Renhai-class cruiser[
Total Built: 1 ship built as of 2020, 6 in total scheduled to be built.
Type: Guided Missile Cruiser
Builders: Changxingdao-Jiangnan Shipyard Dalian Shipbuilding Industry Company
In Service: 2019-Present
Crew: 280 ~ 300 men

Dimensions

Length: m180
Beam: m20
Draught: m6.6
Displacement, Standard: INA
Displacement, Full Load: 12 000 - 13 000 tons

Propulsion System

Engine Name: COGAG propulsion system with 4 QC-280 gas turbines (28 MW each) and 6 QD-50 gas turbines (5 MW each)
Engine Power: Total: 112 MW (150,000 shp
Maximum Range: 5,000 nmi (9,300 km)

Maximum Speed: 30 knots (56 km/h; 35 mph)

Endurance: INA

Weapons Station #1

↳*System*

Name: H/PJ-38 130mm Naval Gun

Type: Naval Gun

Quantity: 1 X H/PJ-38 130mm Naval Gun

Caliber: 30mm

Note: Designed by the Zhengzhou Mechanical-Electrical Engineering Research Institute (□□□□□□□□□, also known as the 713th Research Institute of the 7th Academy) and manufactured by Inner Mongolia 2nd Machinery Manufacturing Factory (□□□□□□□□□), the H/PJ-38 130 mm naval gun was developed from reverse engineering of Soviet AK-130 twin 130 mm naval gun, which was carried out by the same two establishments. The general designer of the H/PJ-38, Chen Dingfeng (□□□), was also the general designer of all models of Type 79 100 mm naval gun, all models of Type 210 100 mm naval gun, and the H/PJ26 76 mm naval gun. Chen was recalled from retirement to complete the H/PJ-38 single barrel 130 mm naval gun. When the Soviet AK-130 was first successfully copied by Chinese developers, the Chinese navy was unsatisfied and decided not to let the AK-130 into production, despite all performance parameters being met. Because the AK-130 was judged out-of-date by the Chinese Navy, the H/PJ-38 program was created in 2005. The H/PJ-38 130 mm single barrel naval gun is considered more powerful and more reliable than other smaller caliber naval guns currently in Chinese service, and as with naval guns on most warships, it is installed in front of the VLS.

↳*Ammunition*

Type: Rifle

Caliber: mm130

Note: The general designer of munitions for the H/PJ-38, Zhou Bingwu (□□□), entered the business in 1997 and almost lost the index finger of his right hand in November 2007 during an important trial. As early as 1987, Zhou had proposed multiple kinds of precision-guided munitions (PGMs) to be fired by a single caliber gun mount, but due to the limitations of the Chinese technological base and industrial capability, it was not until two decades later when it finally became a reality. Research led to the development of a single barreled 70 caliber, 130 mm system which took more than four years to complete, and the H/PJ-38 went to series production soon after completion. The primary improvement of the H/PJ-38 over the AK-130 is its adaptability: H/PJ-38 can fire both separate loading rounds and semi-fixed rounds, which is crucial in firing gun-launched missiles and PGMs. The H/PJ-38 can also fire a variety of sub-caliber rounds, but more importantly, a variety of PGMs were developed for H/PJ-38 to increase its effectiveness.

Weapon Station #2

↳*System*

Name: H/PJ-11 CIWS (forward)

Type: Gatling Gun

Caliber: 30mm

Quanitity: 1 × H/PJ-11 CIWS

Crew: Automated, with human oversight

Rate of Fire: 1,200-4,200 rounds/minute (Type 730)

Effective Firing Range: 1–1.5 km

Maximum Firing Range: 3 km

Feed System: Type 730: One ammunition boxes, holding 640 rounds

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

↳***Ammunition***

Type: Rifle

Caliber: mm30

Basic Load: INA

Weapon Station #3

Name: HHQ-10 Short-Range SAM

Type: Short-Range SAM

Quantity: 1 × HHQ-10 short-range SAM in 24-cell launcher (aft)

Missile: HHQ-10 (Red Flag 10) Surface-to-Air Missile

Length: 2 m

Diameter: 0.12 m

Maximum Range: 9 km for subsonic targets, > 6 km for supersonic targets.

Minimum Range: Less than 500 m

Guidance System: RF + ImIR or ImIR only

Weapon Station #4

Name: 112 VLS

Type: Vertical Launch System

Missile Types: * HHQ-9 surface-to-air missiles * YJ-18 anti-ship cruise missiles * CJ-10 land-attack cruise missiles * Missile-launched anti-submarine torpedoes

Maximum Range: INA

Minimum Range: INA

Onboard Aviation Facilities

Helicopters: 2 × Changhe Z-18F ASW helicopters

Facilities: Stern hangar for up to two medium-lift helicopters Helicopter landing platform

Sensors and Processing Systems

Radar: H/LJG-346B Active Phased Radar System (C/S-band) coordinated by X-band Horizon-Search&Track Active Phased Radar System (Dual-band radar)

Protection

Active Protection System: Yes

Electronic Warfare: Electronic Warfare Support System Decoy Launching System

NBC Protection: Yes

Notes:

The Type 055 destroyer (NATO/OSD Renhai-class cruiser) is a class of stealth guided missile destroyers being constructed for the Chinese People's Liberation Army Navy Surface Force. It is a multi-mission design; the combination of sensors and weapons suggests a main role of area air defence, with anti-submarine warfare capabilities surpassing previous Chinese surface combatants. The Type 055 is expected to undertake expeditionary missions and form the primary escort for Chinese aircraft carriers. The United States classifies these ships as cruisers. The United States Navy defines a cruiser as a large multi-mission surface combatant with flag facilities; this suggests the U.S. expects the Type 055 to fulfil a similar role as the Ticonderoga-class cruiser. The People's Liberation Army Navy was interested in a large destroyer from at least the late-1960s. A development program, code-named "055", initiated in 1976 was cancelled in 1983 after encountering insurmountable technical obstacles from industrial underdevelopment; for example, the required gas turbine power plants could neither be produced domestically, nor imported at acceptable prices. In April 2014, an image emerged of a full-scale mock-up of the Type 055 superstructure - with enclosed integrated mast for radar and other electronics - at the Chinese naval electronic testing range in Wuhan. Nanchang, the first ship of the class, began construction in 2014 at the Jiangnan Shipyard in Shanghai, and was commissioned on 12 January 2020. Its first public appearance - preceding commissioning - was during the PLAN's 70th anniversary parade on 23 April 2019. When launched, Nanchang was among the largest post-Second World War warships launched in East Asia. The Type 055 adopts a conventional flared hull with distinctive stealthy features including an enclosed bulbous bow that hides mooring points, anchor chains and other equipment. The bow and main deckhouse are configured similarly to previous Type 052C/D destroyers. A continuous structure amidship increases internal volume and reduces radar cross-section. The smoke stack design reduces both infrared signature and radar cross-section. Chinese sources credit the design as being generally stealthy, with reduced radar, noise, infrared, and electromagnetic radiation signatures. Power plants Propulsive power is generated by four 28 MW QC-280 gas turbines in combined gas and gas arrangement. Additional power may be provided by six 5 MW QD-50 gas turbines. The maximum speed is estimated to be 30 knots. Electronics The Type 055's battle management system may allow integration with carrier strike groups. The integrated mast may mount X band radar in four fixed active electronically scanned arrays (AESA). The deckhouse may mount four Type 346B AESA panels; the previous Type 346 was a dual S and C band radar, but the Type 346B may only be S band as a X band radar is included. The X band radar may be mounted higher as it is better suited for horizon search and low altitude object detection. The Type 346B arrays can be larger and have higher power when mounted on the deckhouse below the X band radar. Various electronic warfare support measures (ESM), electronic countermeasures (ECM), and electro-optic (EO) sensors and datalinks are mounted. They are likely more advanced than those deployed on previous ships. A deployment port exists for variable depth and towed array sonar. The large bulbous bow likely contains a bow sonar; the Type 055 may mount a larger bow sonar than previous Chinese surface combatants. Armament The primary armament are missiles carried in 112 universal vertical launch cells (VLS); 64 cells forward and 48 cells aft. The same VLS model is used on the Type 052D destroyer,[8] which is believed to be an implementation of the GJB 5860-2006 standard. The longest variant, with 9-metre cells, is likely used. The Type 055 is expected to carry HHQ-9 surface-to-air missiles, YJ-18 anti-ship cruise missiles, CJ-10 land-attack cruise missiles, and missile-launched anti-submarine torpedoes upon entering service. Future developments It has been suggested that future variants may be armed with lasers or electromagnetic railguns. Since the current design does not have integrated electric propulsion, installation of integrated electric propulsion will be required for the ship to meet power requirements in the future. The universal VLS makes it possible to carry future anti-ballistic missiles (ABM).

Slava Class Russian Guided Missile Cruiser

Tiers:

1 2 **3** 4

Variants:

- **Moskva (ex-Slava):** Commisioned: 1982
- **Marshal Ustinov (ex-Admiral Lobov):** Commisioned: 1986
- **Varyag (ex-Chervona Ukraina):** Commisioned: 1989
- **Ukraina (ex-Admiral Lobov):** Incomplete, never commissioned. Belongs to Ukraine

System

Alternative Designation: Slava Class; Project 1164 Atlant Class
Total Built: 3 Slava Class Cruisers built.
Type: Guided Missile Cruiser
Builder: 61 Communards Shipyard
In Service: 1982-Present
Crew: 485 (66 Off, 419 WO/Enl), alternate information 476-529 (84 Off, 75 WO, 370 Enl)

Dimensions

Length: 186 m
Beam: 21.5 m
Draught: 7.6 m
Displacement, Standard: 10 000 tons
Displacement, Full Load: 12 500 tons

Propulsion System

Engine Name: GTU M21 2x M70 cruise gas turbines and 4x M90 boost gas turbines , 2 cruise steam turbines, 2 exhaust gas

boilers, 4 x M8KF Gas turbines

Engine Power: 130,000 shp (97,000 kW)

Shafts: 2

Speed: 32 kn (59 km/h; 37 mph) (36.8mph)

Range: 3,000 nmi (3,450 mi) (5,560 km) at 18kn (20.7mph)

Endurance: INA

Missile System

↳*Anti-Ship Missile System*

Name: P-1000 Vulkan

Type: Anti-Ship Missile Cruise Missile

Basic Load: 16 x Missiles (8 x 2) P-1000 Vulcan (SS-N-12 Sandbox) anti-ship missiles

Manufactuer: P.A. Strela

In Service: 1982-Present

Proliferation: The P-1000 has been installed on the Slava class cruiser Varyag,[7] and some sources report P-1000 missiles on her sister ship Moskva.

Length: 11.7 m

Diameter: 0.88 m

Wingspan: 2.6 meters

Weight: 2 tons

Warhead: High explosive or nuclear

Warhead Weight: 1,000 kg

Blast Yield: 350 kt

Engine: Turbojet

Operational Range: 800 km

Flight Altitude: 50–5,000 m

Speed: Mach 2.5

Guidance System: Semi-active radar homing, terminal active radar homing

Launch Platform: Echo II & Juliett-class submarines Kiev-class aircraft carrier & Slava-class cruiser.

↳*Surface-to-Air Missile #1*

Name: S-300F

Type: Naval Surface-to-Air Missile

In Service: 1984-Present

Basic Load: 64 x Missile total (8 x 8) S-300F Fort (SA-N-6 Grumble) Cruise Missile

Missile Name: 5V55RM missile

Launcher: Vertical Launching System

Length: 7 m

Diameter: 450mm

Weight: 1,450 kg

Warhead: 100 kg

Target Acquisition Radar #1: MR-750 Top Steer target acquisition radar, D/E band, range 300 km

Target Acquisition Radar #2: Top Pair target acquisition radar, C/D band, range 200 km.

Target Tracking Radar: 3R41 Volna Top Dome target tracking radar, I/J band, range 100 km.

Speed: 6,120 kph (3,800 mph)

Maximum Range: 90 km

Minimum Range: 7.00 km

Floor: 25 m

↳*Surface-to-Air Missile #2*

Name: 4K33 "OSA-M" (NATO reporting name SA-N-4 "Gecko")

Type: Navel Surface-to-Air Missile

Basic Load: 40 x Missiles (2 × 20) OSA-M (SA-N-4 Gecko) SR SAM

In Service: 1974-Present

Missile Name: 9M33M3 Missile

Length: 3158 mm

Diameter: 209.6 mm

Weight: 170 kg

Warhead: Frag-HE

Warhead Weight: 16 Kg

Detonation Mechanism: Contact and proximity

Propellant: Solid propellant rocket motor

Operational Range: 15 km

Flight Altitude: 12,000 m

Boost TIme: 2 s boost, then 15 s sustain

Speed: 1020 m/s

Guidance System: RF CLOS

Accuracy: 5 m

Launch Platforms: . It has been installed on Gepard class frigate, Kara class guided missile cruisers, Kiev class VTOL cruisers and also the Kirov, Slava and Krivak classes.

Gun Weapon Systems

↳*Gun System #1*

Name: AK-130

Type: Automatic Naval Cannon

Caliber: 130mm

Quantity: 1 x AK-130 Automatic Naval Cannon Stations

Length: 9100 mm (70 calibers)

Barrel Length: INA

Weight: 8 tons

Maximum Elevation: deg+85

Minimum Elevation: INA

Traverse Range: INA

Rate of Fire: 90 rds/min

Maximum Firing Range: 23,000 m (surface targets) 15,000 m (aircraft) 8,000 m (missiles)

Autoloader: The autoloader removed the need of a loader and allows for continuous firing until the ammo storage is emptied.

Fire Control System: The fire control system has sight correction devices for bursts of falling shells and a target post for firing at coastal targets. Its high rate of fire, when provided with adequate types of shells, allows the cannon to serve as anti-aircraft artillery. The cartridges include charges with remote and radar detonators.

Radar: It uses the MR-184 radar, a dual-band radar. It can track and target two targets. Its range is 75 km with a tracking range of 40 km.

Guidance System: The Lev-218 (MR-184) guidance system was developed by KB Ametist on the basis of Lev-114: (MR-114 from the AK-100). According to some reports, Lev-214 (MR-104) was used instead on Project 956 destroyers. The system includes a target tracking radar, a TV-sight, the DVU-2 laser rangefinder, a ballistic computer, equipment selection system and counter-jamming. The system is able to receive target designation from detection equipment on the ship, movement parameters, elevate the cannons and can adjust shooting bursts as well as track projectiles automatically. The DVU-2 , along with the software, was developed by TsNIIAG and PO LOMO, using an autonomous indirectly stabilized laser beam in 1977.

↳*Gun System Ammunition #1*

Type: Rifle

Caliber: mm130

Basic Load: INA

↳*Gun System #2*

Name: AK-630

Type: Close-In Weapons Systems stations

Quantity: 6 × AK-630 Close-In Weapons Systems stations

Main Armament: 1 or 2 AO-18 autocannons

Secondary Armament: 4 x 9A4172 Missiles (Vikhr-K upgrade)

Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)

Decoys: 2 PK-2 decoy RL, 12 PK-10 decoy RL (in last two units only) Bell Crown intercept

Jammers: MR-404/Rum Tub jammers

Notes:

The Slava class, Soviet designation Project 1164 Atlant, is a class of guided missile cruisers designed and constructed in the Soviet Union for the Soviet Navy, and currently operated by the Russian Navy. The design started in the late 1960s, based around use of the P-500 Bazalt missile, and was intended as a less expensive conventionally powered alternative to the nuclear-powered Kirov-class battlecruisers. Moskva is armed with P-1000 Vulkan AShM missiles, developed in the late 1970s to late 1980s. It is not known which Slava-class cruisers carry P-1000s other than Moskva. There was a long delay in this programme, while the problems with the Bazalt were resolved. These ships acted as flagships for numerous task forces. All ships were built at the 61 Kommunar yard, in Mykolaiv (Nikolaev), Ukrainian SSR. The class was a follow up to the Kara-class cruiser which the Soviet Navy typed as a Large Anti-submarine Ship (Russ. BPK), constructed at the same shipyard and appears to be built on a stretched version of the Kara-class hull. The Slava class was initially designated BLACKCOM 1 (Black Sea Combatant 1) and then designated the Krasina class for a short period until Slava was observed at sea. The SS-N-12 launchers are fixed facing forward at around 8° elevation with no reloads available. As there was nothing revolutionary about the design of the class western observers felt they were created as a hedge against the failure of the more radical Kirov class. The helicopter hangar deck is located 1/2 deck below the landing pad with a ramp connecting the two. Originally 10 ships were planned, but with the collapse of the Soviet Union only three were completed. A fourth vessel was launched, but final construction remains incomplete and the ship has not been commissioned into service. Following the collapse and the re-emergence of the nation of Russia, the three finished ships serve in the Russian Navy and the uncompleted fourth vessel, renamed Ukrayina, is owned by Ukraine. Efforts have been made to complete and update the unfinished ship; in 2010, Ukrainian president Viktor Yanukovych stated that Russia and Ukraine would work together on the project. Russia has also expressed interest in purchasing the vessel, which Ukraine had previously offered for sale. However, as of early 2011 no final agreement has been concluded between the two countries, on this matter. The Russian navy has plans for extensive upgrades of all their Slava-class vessels during the 2010s; completing work on Ukrayina may serve as a test-bed for this. As of mid-2016 the fourth hull remains afloat in the shipyard uncompleted.

Diameter: INA

Weight: INA

Warhead Weight: 210 kg

Detonation Mechanism: Semi-armor-piercing

Operational Range: 400 km

Flight Altitude: 7 – 10 meter terminal

Speed: Mach 0.6-0.8

Guidance System: Inertial/active terminal guidance

Launch Platform: TEL Type 052C destroyer

Gun Systems

↳*Gun System #1*

Name: Type 210

Type: Naval Gun

Caliber: 100mm

Quantity: 2 x Type 210 100mm Naval Gun Systems

Rate of Fire: The weapon's maximum rate of fire for a single type of unguided round was 90 rounds per minute.

Range: INA

Note: The Type 210 automatic single 100 mm naval gun is the Chinese modification of the Compact model of the French 100 mm naval gun. There are at least two variants, with both sharing similar characteristics with the French weapon.The Type 210 was developed to make the French gun suitable for Chinese deployment. The French gun was incompatible with Soviet and Chinese electronics; it was easier to make the gun compatible with these electronics, and Western electronics, than to alter the electronic suites already aboard warships. Furthermore, the Chinese added the capability to fire laser- and infrared-guided shells; this required significant changes to the magazine.

↳*Ammunition Gun System #1*

Type: Rifle

Caliber: 100mm

Shell: INA

Basic Load: INA

↳*Gun System #2*

Name: Type 730 CIWS

Type: Close-In Weapon System

Quantity: 2 x 30-mm Type 730 Gatling CIWS

Caliber: 30mm

Main Armament: 1×30 mm H/PJ-12 or H/PJ-11 Gatling gun

Barrels: 7-barrel

Rate of Fire: 1,200-4,200 rounds/minute

Maximum Effective Range: 3 km

Effective Firing Range: 1–1.5 km

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

Feed System: Type 730: One ammunition boxes, holding 640 rounds

Fire Control Radar: 1 x Type 366 radar (YJ-62 fire control) Bow mounted sonar

Protection

Active Protection System: INA

Electronic Warfare: NRJ-6A

Decoys: INA

Notes:

Luyang II / Type 052C / Lanzhou Multirole Destroyer There are significant difference between the “Lanzhou” guided missile destroyer, also known as the “Chinese Aegis”, and the “Yulin” and “Hengshui” guided missile frigates. These two types of warships are differently graded in tonnage. About 2,000 tons bigger than “Yulin” and “Hengshui” guided missile frigates in tonnage, the “Lanzhou” guided missile destroyer is mounted with more powerful air-defense guided missiles and radar-detection equipment than those in the frigates. Nevertheless, coordination must be formed between these two types of warships. Although frigates are relatively small, they are very agile and can accomplish different tasks respectively under the unified command of the taskforce. During an air defense operation in an open air, the frigates can perform pre-phase security detection and early warning, and serve as an effective sentinel against the detection of the enemy's air defense areas. Its anti-aircraft guided missiles can also form an effective protection shield. In terms of costs, frigates cost less than destroyers. Therefore, the taskforce composed by guided missile frigates and guided missile destroyers is an effective coordination and bears key importance. The Type 052C Luyang II is generally similar to 052B, with the notable addition of four fixed phased array antennas in the foreward superstructure. Two antennae cover the forward hemisphere while the other pair covers the rear hemisphere, the arragement adopted on the US Navy's Arleigh Burkes and the Japanese Kongos. Reports indicate this radar may be a co-development program with the Kvant-Radiolokatsiya company of the Ukraine. The band and performance of this radar have not yet been publicly reported. The radar may be a developed version of that first seen on the No. 970 weapons development ship, and could either be S-Band or Russian-style X-Band. Based on the hull design of the Type 052B (Luyang class) multirole destroyer, the Type 052C features an indigenously developed e four-array multifunction phased array radar (PAR) similar to the Aegis AN/SPY-1 equipped by the U.S. Arleigh Burke class and Japanese Kongo class DDG. The ship is also armed with the indigenous HQ-9 air defence missile system, which is believed to be comparable to the Russian S-300F/Rif in performance, and a newly developed anti-ship cruise missile (ASCM) designated YJ-62 (C-602). The Type 052C is fitted with four multifunction phased array radar antenna. The radar is reportedly developed by Nanjing Research Institute of Electronic Technology (also known as 14 Institute). There is also a Type 517H-1 (NATO codename: Knife Rest) long-range 2D air search radar; a Russian Band Stand fire-control radar (for anti-ship missile and main gun); and two Type 327G (EFR-1, NATO codename: Rice Lamp) fire control radar for the CIWS. By adopting a modular approach where two classes of destroyers shared the same hull design and propulsions, Jiangnan was able to save construction time and costs in the programs. However, unlike the Type 052B Luyang class, which was fitted with a mixture of both Russian and Chinese indigenous systems, the Type 052C Luyang-II class was largely based on the indigenous technologies. The bridge is also much taller on the Type 052C, so that four fixed phased array radar antennas can be embedded on its four sides. Using the same stealthy hull and engine configuration of the No. 168 class, this destroyer is armed with forty-eight new type vertical-launched anti-aircraft missiles of either Russian or Chinese origin. As such they will be the first dedicated long range air defense ships for the PLAN. The forward VLS station (possibly 6 revolver launchers, each with 6 missiles) are between the forward CIWS platform and the main gun, while the aft VLS station (possibly a pair of six-pack revolver launchers) are forward of the helicopter hanger. A total of 48 indigenous HQ-9 air defence missiles are housed in eight 6-cell vertical launch systems (VLS). Unlike the Russian-style revolver VLS, the Type 052C’s VLS is fixed with each launch cell having its own lid. The missile system utilises the ‘cold launch’ method, in which the missile was first ejected from the launch tube, and then ignites its rocket engine at low altitude. This launch method avoids the complex flame and gas exhausting pipes on the Western-style ‘hot launch’ VLS, and also decreases damage to the ship

structure caused by the rocket motor blast. The naval variant HQ-9 was developed from the land-based HQ-9 surface-to-air missile system developed in the 1990s. The missile may have adopted some Russian S-300 rocket motor and control technologies, with a “Track via Missile” (TVM) guidance system developed from the U.S. Patriot missile technology. The missile is housed inside a cylinder shape container, which is placed inside the VLS. The missile is guided by an unknown type of guidance radar with multi-target engagement capability. The surface-to-surface weapon of the Type 052C destroyer is the indigenously developed YJ-62 (C-602) ASCM. A pair of quadruple semi-cylindical racks for the new YJ-62 long-range SSM are between the rear mast and the helicopter hanger. The missiles are guided by the Band Stand radar on top of the bridge and a Light Bulb datalink forward of the hanger. The same guidance package was also found onboard 052B. A metric-wave radar with Yagi antenna is midship, for long range detection or ECM. A new EW suite featuring phased array antennas similar to AN/SLQ-32 EW system is on the side of the forward mast. The ship was also expected to have a new generation of Aegis-like C3I system. The ships feature an aft flight deck for the Z-9C ASW helicopter, and a hangar that can support a pair of these helicopters. Unlike the previous YJ-8 series anti-ship missiles, which were all carried inside a box-shape launcher, the YJ-62 is carried inside a cylinder-shape launcher. A total of eight missiles (two 4-cell launchers) are located at the mid-ship position. The missiles are guided by the Band Stand radar installed on top of the bridge and a Light Bulb datalink forward of the hanger. The YJ-62 missile uses strap-down inertial guidance coupled with GPS, and active radar for the terminal phase. The missile has a stated range of 280km, with the missile flying at an altitude of 30m during the cruise phase of an engagement. In the terminal phase, the missile descends 7~10m. The active radar seeker has an acquisition range of up to 40km. The ship has a single-barrel 100mm gun developed by 713 Institute on the basis of the French Creusot-Loire T100C design. The gun can be used against surface targets and air targets such as aircraft and low speed missile, with a maximum rate of fire of 90 rounds/min. The gun can be operated in fully automatic mode from the radar control system, from the shipborne optical sighting system, or laid manually. The turret design incorporates strong radar cross-section reduction features. For short-range air defence, the Type 052C is equipped with two (one front, one rear) Type 730 close-in weapon system (CIWS) for short-range air defence. The two Type 730 CIWS have been relocated to the raised platform in front of bridge and atop the rear helicopter hanger. The two seven-barrel 30mm Type 730 CIWS are located both sides behind the bridge. The weapon system has a maximum rate of fire of 4,600~5,800 rounds/min and a maximum range of 3km. A destroyer’s overall air defence, surface strike, and antisubmarine warfare (ASW) capabilities largely depend on how well different weapon systems and sensors are integrated together by the combat system. Most Chinese warships use the command and control system derived from the French Thomson-CSF TAVITAC, but the Type 052C might have a newly developed system with improved processing power to engage anti-ship missile threats. Although the detailed information on the combat system of the Type 052C is unknown, it is likely that the system comprises the multifunction phased array radar system, command and decision system, battlefield display system, and weapon control system. The command and decision system receives data from ship sensors and provides command, control and threat assessment. The weapon control system receives engagement instruction from the command and decision system, selects weapons and interfaces with the weapon fire control systems. In together with its long-range air defence missile and close-in weapon system (CIWS), the Type 052C is the first Chinese-made surface combatant with a true fleet air defence capability. The combat system will ensure that the ship can engage multiple air targets such as sea-skimming missile and aircraft simultaneously. The ship might also be able to transmit combat information to other ships and aircraft via datalink and satellite communications to form a maritime combat network. The destroyer’s stern hanger accommodates one Kamov Ka-28 (NATO codename: Helix) antisubmarine warfare (ASW) helicopter. Carrying various weapons including torpedoes and deep charges, the helicopter can operate in all weather conditions up to 200km from the host ship. Alternatively, the destroyer can carry an indigenous Z-9C helicopter. The Type 052C’s propulsion is in the form of CODOG, consisting of two Ukraine-made DA80/DN80 gas turbines rated at 48,600hp and two Shaanxi diesels (Chinese copy of the MTU 20V956TB92) rated at 8,840hp (6.5 MW). Two Type 052C (NATO codename: Luyang-II class) air defence guided missile destroyers have been built by Jiangnan Shipyard of Shanghai for the PLA Navy. Following the launch of two Type 052B multirole missile destroyers in 2002, Shanghai-based Jiangnan Shipyard began to build two subsequent hulls based on the same hull design but with different weapon and sensor configuration. The first-of-class 170 Lanzhou was laid down in late 2002 and launched on 29 April 2003. Sea trial began in late 2003 and the destroyer was commissioned in July 2004. The second hull, 171 Haikou was launched on 30 October 2003 and was commissioned in 2005. Both hulls are deployed by the South Sea Fleet based at Zhanjiang in Guangdong Province. The fourth unit of the Luhai class (probably Type 052C or possibly Type 052BK?) was also constructed at Jiangnan Shipyard, as the two Type 052B DDGs were being fitted out. The Type 052 series has evidently embraced a modular design featuring spiral development, with new variants being introduced after only one or two units of the previous version. As of early 2004 a pair of 052Cs were under construction (170 & 171) with the first ship launched on 29 April 2003 and the second on 30 October 2003. The building of two 052Bs and two 052Cs in such a short time frame reflects the PLAN's need to replace the obsolete air-defense systems of its surface ships. In June 2005 it was reported that two Luyang II missile destroyers were undergoing sea trials. The fourth Type 052C class destroyer, pennant number 173 went into service with the People's Liberation Army Navy (PLA Navy) in June 2012. After commissioning no new destroyers in 2008-2010, construction of new destroyers appeared to have resumed with serial production of Luyang II-class ships. Construction of the LUYANG II-class DDG (Type 052C) continued, with one ship entering service in 2012, and an additional three ships under various stages of construction and sea trials, bringing the total number of ships of this class to six by the end of 2013.

Hangzhou Class Chinese Guided Missile Destroyer

Name: AK-130

Type: Automatic Naval Cannon

Caliber: 130mm

Quantity: 2 x twin 130-mm/70 cal. (AK-130) DP guns

Length: 9100 mm

Barrel Length: INA

Weight: INA

Elevation: 85 degrees

Traverse: 360 degrees

Rate of Fire: 35 RPM

Maximum Firing Range: 23,000 m (surface targets) 15,000 m (aircraft) 8,000 m (missiles)

↳*Gun Weapon System #2 Ammunition*

Type: Rifle

Caliber: 130mm

Cartridge: INA

Basic Load: 2,000 Rounds

Missile Weapon System

↳*Missile #1*

Name: SS-N-22 Sunburn

Type: Anti-Ship Missile

Launcher: 2 x quad P-100 Moskit-M 3M83 SSM

Note: SS-N-22 Sunburn is the NATO reporting name for two unrelated Soviet anti-ship missiles. Although the missiles were very different, distinguishing between them is difficult because their ship-mounted launching containers were identical. Confusion was exacerbated by the Soviet practice of mixing missile types within a class of ships. It was therefore not confirmed that the "SS-N-22" actually referenced two different missiles until after the fall of the Soviet Union.

↳*Missile #2*

Name: SA-N-7 Gadfly

Type: Surface-to-Air Missile (SAM)

Launcher: 2 x ZR-90 Uragan (SA-N-7) type MS-196 SAM missile launchers

Length: 5.55 m

Diameter: 0.40 m

Wingspan: 1.20 m

Weight: 690 kg

Engine: 1 x solid-fuel rocket

Maximum Range: 30 km

Maximum Speed: 3,680 kph, Mach 3

Maximum Altitude: 15,000 m

Minimum Altitude: 25-30 m

Maximum Load: 23 g

Sensors/Electronics: Front Dome (Orekh) H/I-band radar, said to be capable of illuminating an individual target once it is designated by D/E/F-band air search radars and associated digital computers

Torpedoes

Torpedo Tubes: 2 x twin 533-mm type DTA-53 tubes

Torpedos: INA

Basic Load: INA

Fire Control Systems

SA-N-7 Missile FCS: 6 x OP-3 (Front Dome**) fire control for SA-N-7 missiles

AK-130 Gun FCS: 1 x MR-184M Lev (Kite Screech**) fire control for 130-mm guns

AK-630 Gun FCS: 2 x MR-123 Vympel (Bass Tilt**) fire control for 30-mm CIWS

Protection

Active Protection System: INA

Countermeasures: 8 x 10-tubed PK-10 fixed decoy launchers (all except BOYEVOY: none)

NBC Water Washdown System: Yes

Electronic Warfare: 2 x MP-405M Start-2 or MR-401 intercept system; 2 x MRP-11M/12M (Bell Shroud**); 2 x Bell Squat**; 4 x Foot Ball-B**

Jamming System: 1 x MR-407 jamming system

Notes:

The Chinese People's Liberation Army Navy Surface Force (PLAN) had two modified Sovremenny-class destroyers delivered in December 1999 and November 2000. In 2002, the PLAN ordered two improved versions designated 956-EM. The first vessel was launched in late 2005, while the second was launched in 2006. All four vessels were commissioned to the East Sea Fleet. On the improved Project 956EM the aft AK-130 main gun was removed. The four AK-630 CIWS were replaced by two sets of Kashtan CIWS short-range air defence gun/missile systems. Each Kashtan system comprises a 3R86E1 command module and two 3R87E combat modules. Each 3R87E combat module has two 30 mm GSh-30k six-barrel automatic guns (range 0.5–4 km (0.31–2.49 mi)) and two SA-N-11 air defence missiles. The missile is armed with a 9 kg (20 lb) warhead and has a range of 1.5–8 km (0.93–4.97 mi). This improved 956EM version is also the first to be armed with the newer version of SS-N-22, which is reported to have a designation of 3-M80MBE and possibly funded by China (according to Russian sources), and the new missile differs from the older ones mainly in that the range is increased from 120 km (75 mi) to 200 km (120 mi). The air defense software is upgraded to accommodate the newer SA-N-12/SA-17 SAM system, but since China had already joined Russia in developing an even newer successor, it is not clear if SA-N-12/SA-17 has entered Chinese service in large numbers. In 2006, the extra spheres (painted white as the mid-2006) added atop of the superstructures of the Chinese ships appearing in latest photographs of the Chinese units have shown that these Chinese ships had been upgraded with the domestic HN-900 Data link (Chinese equivalent of Link 11A/B, to be upgraded) and SATCOM (probably the SNTI-240). From mid-2014, all four Chinese Sovremenny-class destroyers are planned to undergo a midlife upgrade program. As of 2016, Hangzhou was reported to be undergoing refit with its original components replaced with domestic systems. In addition to replacement of electronics and sensors, armament upgrades include replacing 2x4 3M80E Moskit anti-ship missiles with 2x4 YJ-12A supersonic missiles, swapping two launchers for 48 SA-N-12 SAMs with 4 sets of 8-cell vertical launch systems totaling 32 cells for HQ-16C or Yu-8 anti-submarine missiles and adding a 24-cell FL-3000N short-range anti-air missiles. Project cost: 600 million US$ (mid-1990s price) was the price paid for Project 956A (two ships), and 1.4 billion US$ (early-2000s price) for Project 956EM (two ships).

Type 051C Class (Luzhou Class) Chinese Guided Missile Destroyer

Tiers:

1 **2** 3 4

Variants:

Name: INA

Type: 100-mm/56 cal DP Naval Gun

Caliber: 100mm

Quantity: 1 x 100-mm/56 cal DP Naval Gun

Note: There is no information available that outlines the name of this Gun Weapon System #1.

↳*Gun Weapon Systems #1 Ammunition*

Type: Rifle

Caliber: mm100

Cartridge: INA

Basic Load: INA

↳*Gun Weapon System #2*

Name: Type 730 CIWS

Type: Close-in Weapon System

Caliber: 30mm

Quantity: 2 x Type 730 30mm CIWS

Length: INA

Weight: INA

Barrels: 7-barrel

Rate of FIre: 1,200-4,200 rounds/minute

Maximum Firing Range: 3 km

Effective Firing Range: 1–1.5 km

Feed System: One ammunition boxes, holding 640 rounds

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

↳*Gun Weapon System #2 Ammunition*

Type: Rifle

Caliber: 30mm

Cartridge: INA

Basic Load: INA

Missile Weapon System

↳*Missile #1*

Name: SA-N-6 Grumble
Type: Naval Long-Range Surface-to-Air Missile
Launcher: 6 x circular VLS (2 fwd, 4 aft) (8 rounds/launcher)
Length: 7.20 m
Diameter: 0.51 m
Tailspin: 1.13 m
Missile Weight: 1,665 kg
Warhead Weight: 130 kg
Warhead Type: high-explosive fragmentation w/RF fuze
Engine: 1 x single-stage, solid-fuel rocket
Maximum Speed: Mach 6
Maximum Range: 100 km
Maximum Altitude: 30,480 m
Minimum Altitude: 305 m
Maximum Load: 100 g
Sensors/Electronics: Top Dome I- or J-band radar system missile guidance is thought to be track-via-missile (i.e., the missile provides radar updates to the launching ship)
Basic Load: 48

↳*Missile #2*

Name: YJ-83
Type: Anti-Ship Cruise Missile
Launcher: 2 x quad YJ-83 (C-803) SSM launchers
Length: INA
Width: INA
Engine: CTJ-2 turbojet
Warhead: 190 kg high-explosive fragmentation
Operational Range: 180 km
Maximum Speed: Mach 0.9
Guidance System: Inertial navigation/active radar homing terminal guidance
Basic Load: 8

Torpedoes

Name: Yu-7

Type: Lightweight Torpedo

Launcher: 2 x triple 324-mm torpedo tubes

Length: 2.7 m

Diameter: 324 mm

Weight: 235 kg

Warhead: high explosive

Warhead Weight: 45 kg

Effective Firing Range: 14.1 km

Propellant: Otto fuel II

Maximum Depth: 400 m

Maximum Speed: >45 kn

Guidance System: active / passive acoustic homing

Steering System: CIACIO-S seeker

Basic Load: INA

Fire Control Systems

YJ-83 FCS: 1 x Mineral-ME (Band Stand**) fire control (for YJ-83)

10mm Gun FCS: 1 x Type 344 (MR-34 (for 100-mm gun)

Rif-M FCS: 1 x Volna (Tomb Stone**) (for Rif-M)

Type 730 FCS: 2 x Type 347G(2) (LR-66) (for Type 730)

Battle Management System: INA

Computerized FCS: Yes

Radar Systems

Air Search Radar: 1 x Fregat-MAE-5 Top Plate** E-band 3-D air-search

Air/Surface Search Radar: 1 x Type 364 (Seagull-C**) air/surface search

Long Range Air Search: 1 x Type 363 E/F-band long range air search

Navigation Radar: INA

Protection

Active Protection System: INA

Decoys: 2 x Type 946 15-round chaff/decoy launchers and 2 x 10-round Launchers

NBC Water Washdown System: Yes

Electronic Warfare: INA

Notes:

The Type 051C or Luzhou class destroyer is a long-range air-defence guided missile destroyer built by China in its ongoing effort to create a true blue water navy. The ship uses the hull design of the older Type 051B (Luhai class), but is equipped with the advanced Russian S-300FM air defence missiles systems. Currently, two ships of this class have been launched and deployed by People's Liberation Army Navy North Sea Fleet. The construction of the Luzhou class destroyer at China’s northern

Dalian Shipyard was revealed in 2004 with the help of Internet photographs. A disadvantage of the Type 051C is that it lacks the stealthier radar cross-section found on the newer Chinese warships. The ship also possesses less advanced steam turbine propulsion compared to gas turbine propulsion present in all newer Chinese destroyers. The Type 051C is a stop gap measure to provide long range area air defense to the fleet by mating the mature hull design with proven SAM system that is more capable than that of Type 052B destroyer. Production of this class stopped once more advanced Type 052C destroyers became available.

Type 052 Class (Luhu Class) Chinese Guided Missile Destroyer

Tiers:

Variants:

- **Harbin:** Commissioned: 1993 Status: Active
- **Qingdao:** Commissioned: 1996 Status: Active

System

Alternative Designation: Type 052 Class; Luhu Class

Type: Guided Missile Destroyer

Builder: HARBIN: Qiuxin Shipyard, Shanghai, China QINGDAO: Jiangnan Shipyard, Shanghai, China

Crew: 260 (40 Off. + 220 Enl.)

2011 Upgrade: Both of the Type 052 destroyers were upgraded in 2011. The four Type 76A guns were replaced by two Type 730 CIWS on top of the helicopter hangar. The Crotale/HHQ-7 short-range SAM may have been replaced by the newer model (FM-90?) which provides better interception against sea-skimming AShMs. Two Type 726-4 decoy launchers were installed on the sides of the forward bridge for better self-protection. Various onboard systems were integrated together (to a certain degree) by a Thomson-CSF TAVITAC combat data system which is thought to have been replaced by a new indigenous C3I system (ZJK-4B or a newer model). The Thomson-CSF Sea Tiger air/surface search radar was first replaced by an indigenous Type 518 Hai Ying radar and is now replaced by a Type 517M long-range air search radar. The Type 362 air/surface radar installed on top of the aft mast has been replaced by a Type 364. A pair of SATCOM antennas has been installed on top of the helicopter hangar as well.

Dimensions

Length, Overall: 148.0 m

Length, Waterline: 142.6 m

Beam: 16.0 m

Draft: 7.5 m

Displacement, Standard: 4,800 tons

Displacement, Full Load: 5,700 tons

Propulsion System

Engine Name: HARBIN: 2 x General Electric LM-2500; QUINGDAO: 2 x Mashproekt-Zorya GT25000

Engine Type: Gas Turbines

Engine Power: 26,800 shp each

Maximum Range: 4,000 nm at 29.6 km/h(16 kts)

Maximum Speed: 69.2 km/h (32 kts)

Endurance: 15 Days

Gun Weapon Systems

NBC Water Washdown System: Yes

Intercept/Jammer EW: 1 x Type 826C (BM-8610) intercept/jammer; radar warning intercept system

Notes:

The Type 052 Luhu-class is one of the first modern multi-role guided missile destroyers built by China. There are currently two units in active service with the People's Liberation Army Navy Surface Force. It was succeeded by the Type 051B. Designed by the China Warship Design Institute (formerly the Seventh Academy of the Ministry of National Defense), both ships were built at Jiangnan Shipyard - No. 112 Harbin was the first Luhu destroyer followed by No. 113 Qingdao. The chief designer was academician Mr. Pan Jingfu (□□□). The class is said to be the first indigenous Chinese warship design approaching modern standards, a significant improvement over the earlier Luda class. The Luhu class made extensive use of foreign technologies that were accessible to the PRC prior to the Tiananmen Square incident of 1989. These included French-made radars and fire-control systems and the General Electric LM2500 gas turbine engines from the US, two of which power each ship. The Type 052 became the first Chinese destroyer design to use gas turbine engines, and also the first equipped with an integrated combat system. Even with incorporation of Western technology, the chronic lack of adequate shipborne air defense systems has had great impact on PLAN operations. Equipped with a small number of surface-to-air missiles with visual-range only and guns with limited range and performance, Chinese warships have historically limited their operations to the area covered by their land-based aircraft due to a lack of fleet defense capability. To rectify this trend, the Luhu destroyers (and the smaller Jiangwei class frigate) were fitted with the HQ-7 SAM that gives them much better air defense capability than other previous Chinese designs, although they are still limited to within visual range (WVR). The HQ-7 SAM system is reported to be equipped with 8 ready to fire missiles, plus 16 stored in a semi-automatic reloader system. The same system is also used on the upgraded 051G Luda Destroyer. In spite of the advances, the 052 Luhu-class destroyers still suffer in some areas such as electronic warfare and electronic counter-measures. The operational capability of the Luhu-class destroyers has been called into question by naval analysts. Ship visits in 1997 allowed US Naval officers to board and inspect Luhu Destroyer No. 112 Harbin and to take numerous photographs. Analysis of these photographs and reports by officers present strongly suggested that the Luhu destroyers were mainly intended as technology demonstration vessels rather than serious naval combatants. For example, the large amount of foreign-supplied equipment onboard was still labeled in the language of the country of origin; this was also the case with most of the onboard manuals and other documentation, calling into question the ability of the crew to operate efficiently under stressful circumstances when called upon to deal with equipment labeled in English, French, or Italian, as well as Chinese. Furthermore, the various European systems installed were not originally designed to operate together and as a result were not well integrated - a problem the Chinese could not overcome owing to their lack of familiarity with the underlying technology. The Chinese attempted to address these problems with the introduction of an improved Luhu design, the Luhai-class. This follow-on, essentially an enlarged Luhu, features some improved electronics from foreign suppliers as well as more advanced weapons. However, in some cases, the designers appear to have opted for less capable indigenous designs to ease the system integration issues suffered by the Luhu-class destroyers. The PLAN was reportedly unhappy with the design of the Luhai-class destroyers and production ceased after a single unit was completed. According to Chinese media and internet sources, the Luhu-class is mainly used as a technological demonstrator to compare and evaluate different foreign systems, and the two ships initially did not have identical equipment. The first unit had a licensed production of Raytheon AN/SQS-56 sonar, the Italian DE-1164 integrated sonar system, which consists of DE-1160 hull mounted sonar (HMS) and DE-1163 variable depth sonar (VDS), and these were later replaced by domestic copy, SJD-7 sonar system. The second unit had French Thomson-CSF DUBV 23/43 HMS/VDS, which were subsequently replaced by domestic copy SJD-9 sonar system. the combat data systems for the first unit was ZKJ-3 (ZKJ-III), a Chinese equivalent of the Italian IPN-10 combat data system. ZKJ-3 is developed from the export version of IPN-10, SADOC 2, (SADOC = systema dirizione della Operazioni di combattimento). SADOC 2 was sold to China in 1985 and it differs from IPN-10 in that it lacks the data link the latter has. Incorporation of a domestic data link is the main improvement of Chinese ZKJ-3, making it the Chinese equivalent of IPN-10. The combat data system of the second unit is ZKJ-4, which is the Chinese version of French Thomson-CSF TAVITAC combat data system, two of which were sold to China in 1985 and delivered 2–3 years later. These combat data systems were later replaced by more advanced follow-on equipment such as ZKJ-4A/B series during upgrades. Experience gained in handling these foreign systems has helped subsequent development of similar Chinese systems. 2011 Upgrade: Both of the Type 052 destroyers were upgraded in 2011. The four Type 76A guns were replaced by two Type 730 CIWS on top of the helicopter hangar. The Crotale/HHQ-7 short-range SAM may have been replaced by the newer model (FM-90?) which provides better interception against sea-skimming AShMs. Two Type 726-4 decoy launchers were installed on the sides of the forward bridge for better self-protection. Various onboard systems were integrated together (to a certain degree) by a Thomson-CSF TAVITAC combat data system which is thought to have been

replaced by a new indigenous C3I system (ZJK-4B or a newer model). The Thomson-CSF Sea Tiger air/surface search radar was first replaced by an indigenous Type 518 Hai Ying radar and is now replaced by a Type 517M long-range air search radar. The Type 362 air/surface radar installed on top of the aft mast has been replaced by a Type 364. A pair of SATCOM antennas has been installed on top of the helicopter hangar as well.

Gun Weapon Systems

↳*Gun Weapon Systems #1: System*

Name: Type 210 100mm Dual Purpose Gun

Type: Dual Purpose Naval Gun

Caliber: 100mm

Quantity: 1× Type 210 100 mm dual purpose gun

Note: The Type 210 automatic single 100 mm naval gun is the Chinese modification of the Compact model of the French 100 mm naval gun. There are at least two variants, with both sharing similar characteristics with the French weapon.The Type 210 was developed to make the French gun suitable for Chinese deployment. The French gun was incompatible with Soviet and Chinese electronics; it was easier to make the gun compatible with these electronics, and Western electronics, than to alter the electronic suites already aboard warships. Furthermore, the Chinese added the capability to fire laser- and infrared-guided shells; this required significant changes to the magazine. The weapon's maximum rate of fire for a single type of unguided round was 90 rounds per minute. The rate of fire was reduced when switching between different types of ammunition.

Notes:

Type 052B Luyang-class Multirole Destroyer Guangzhou Although the PLAN had claimed that Shenzhen was the first indigenously-produced warship to be designed with stealth as a primary design feature, measures to further reduce radar signature from the hull and superstructure are far more pronounced in this second unit of the class. The large smooth and angled surfaces, a common feature among the new generaton of European FFGs such as French La Fayette class, represent a considerable innovation for China. The PLA Navy received two Type 052B (NATO codename: Luyang class) multirole missile destroyer in 2004. These ships, built by Shanghai-based Jiangnan Shipyard, featured enhanced air defence and antisubmarine warfare capabilities using a mixture of Russian-made and Chinese indigenous systems. Building of the first-of-class ship, 168 Guangzhou, began in 2000. The ship was launched on 23 May 2002, and had been stationed at Jiangnan Shipyard sine then for weapon and radar system installations. The sea trial began in May 2003, and the ship officially entered service with the PLA Navy on 15 July 2004. The second hull 169 Wuhan was launched in January 2003 and commissioned in late 2004. Unlike the previous Chinese-built surface combatants, which were mainly equipped with European and indigenous weapon and radar systems, the Type 052B was the first to have adopted Russian technologies including the 9M317 Shtil (NATO codename: SA-N-12 Grizzly) air defence missile and its associated Front Dome fire-control radar, and the Top Plate 3D air search radar. The ship also used two Ukraine-made DA80/DN80 gas turbines as its primary propulsion. Newly developed indigenous technologies onboard the Type 052B included the 100mm single-barrel compact main gun and the Type 730 seven-barrelled close-in defence system (CIWS). The Type 052B is thought to be comparable to the Russian Project 956E Sovremenny class destroyer in terms of general performance and capability. This project has set a perfect example of integrating the indigenous platform with foreign-made systems to fill the gap before similar indigenous systems become available, thus reducing the amount of time required in the whole project. The acquiring of the two Type 052B destroyers further increased the PLA Navy’s capability to combat in deep ocean. It also demonstrates China’s rapid progress in building a ‘blue water’ navy that is capable of operating far away from its homeports, a capability that the Chinese navy has been seeking for nearly two decades. The displacement of the ship is estimated to be 6,500 tonnes. The ship’s hull design incorporates strong radar signature reduction features such as the sloped sides and reduced external features. The hull surface is coated in radar-absorbent paint. The funnel also has cooling devices to reduce the ship’s infrared feature. The ships has a stern flight deck and a helicopter hanger to accommodate one Ka-28 ASW helicopter. The Type 052B destroyer is armed with two Russian-made surface-to-air missile launchers, one on the front deck behind the 100mm main gun, and one on top of the helicopter hanger. The launchers can fire the latest 9M317 Shtil (NATO codename: SA-N-12 Grizzly) semi-active, radar-homing, medium-range air defence missile. The missile uses the ship’s Russian-made Fregat M2EM Top Plate 3D circular scan radar for target acquisition, and the Front Dome (two radar for each launcher, each radar with two guidance channels) indication radar for missile guidance. Up to three missiles can be aimed simultaneously. The range is up to 38km against aircraft and 20km against anti-ship cruise missile. The ship carries 48 missiles. Four 4-cell launcher for the YJ-83 (C-803) sea-skimming, radar-homing anti-ship cruise missile system are installed behind the funnel. The YJ-83 is said to have a final approach speed of Mach 1.5 and a maximum range of 150km. It was noted that the YJ-83 onboard the Type 052B relies on a Russian-made Band Stand fire-control radar to provide target information, which would enable the YJ-83 to reach its maximum range of fire without relaying target information by the shipborne helicopter. The Type 052B destroyer was the first PLA Navy warship to be fitted with the CIWS. There is a seven-barrel 30mm Type 730 CIWS

installed on each side of the bridge. The weapon system has a maximum rate of fire of 4,600~5,800 rounds/min. The ship also has a single-barrel 100mm gun developed by 713 Institute on the basis of the French Creusot-Loire T100C design. The gun can be used against surface targets and air targets such as aircraft and low speed missile, with a maximum rate of fire of 90 rounds/min. The gun can be operated in fully automatic mode from the radar control system, from the shipborne optical sighting system, or laid manually. The turret design incorporates strong radar cross-section reduction features. The Type 052B destroyer is fitted with two triple 324mm Yu-7 (Mk-46 Mod 1) antisubmarine torpedo tubes and two Type 75 twelve-barrel 240mm antisubmarine rocket launchers. Range is up to 1,200m. The rocket is armed with a 34kg warhead. Additionally, the destroyer has four 18-barrel multiple rocket launchers (MRLs) installed on the front deck. The purpose of these MRLs remains unknown but is thought to be used to launch antisubmarine rockets, ground- attack rockets and/or decoys/chaffs. The air search radar is a Russian Fregat M2EM (NATO codename: Top Plate) 3D air search radar operating at D/E band. The radar has a maximum detect range of 230km to aircraft and 50km to sea-skimming missile. There are four (in contrast to six on Sovremenny class) Russian Front Dome fire control radar (F band) for the 9M38 air defence missile. The main gun and anti-ship missile are controlled by the Russian Band Stand radar. The ZJK-5 combat system onboard the Type 052B is thought to be an improved variant of the Type 051B (Luhai class)'s ZJK-4-3A. The ZJK-5 is based on the 1553B military data bus and the 100Mbps Ethernet technology. The multi-channel defence suite is capable of engaging several targets simultaneously. The destroyer's stern hanger accommodates one Kamov Ka-28 (NATO codename: Helix) antisubmarine warfare (ASW) helicopter. Carrying various weapons including torpedoes and deep charges, the helicopter can operate in all weather conditions up to 200km from the host ship. Alternatively, the destroyer can carry an indigenous Z-9C helicopter. The Type 052B's propulsion is in the form of CODOG, consisting of two Ukraine-made DA80/DN80 gas turbines rated at 48,600hp and two Shaanxi diesels (Chinese copy of the MTU 20V956TB92) rated at 8,840hp (6.5 MW). The unit [hull number 168, initially thought to possibly be named Yantai, but actually named Guangzhou], started building in 1999, with initially completion expected in 2001. By mid-2002 it appeared that this unit was fitting out, and was evidently constructed along modified lines to reduce radar signature. Initially it was expected that the second unit of this class would enter service in 2000, with two more following with commissioning dates in 2002 and 2003. Since 1999, only two hulls had been constructed at Jiangnan Shipyard in Shanghai, with the first ship [168] launched on 25 May 2002. The second ship [169] was launched in October 2002. By April 2003 it became apparent that the ships would carry new Russian weapons -- the effective SA-N-12 anti-aircraft missile plus a long-range Russian search radar, and another radar similar to the Russian BAND STAND over-the-horizon targeting radar. The latter indicated that a new, long range anti-ship missile will be carried. These ships are basically comparable to Taiwan's new U.S. KIDD class destroyers in size and capability, but much more stealthy. In June 2005 it was reported that two Luyang I destroyers were operational or undergoing sea trials. The destroyer "Guangzhou" (Hull Number 168) of the PLA Navy set sail for the sea waters off Pakistan on 21 February 2009 from Sanya City of Hainan Province to participate in the "Peace 09" multinational maritime military exercise. The multinational maritime military exercise was initiated by the Pakistani Navy. Navies from 11 countries, including China, the US, the UK, France, Japan and Turkey, sent their ships, aircraft and Marine Corps elements to participate in the exercise. And military observers from 20-odd countries, including Russia, Germany, Australia, Egypt and Indonesia viewed the exercise. The Chinese Navy sent a task force composed of the destroyer "Guangzhou" from the South China Sea Fleet (SCSF), a helicopter and 10 members of the Marine Corps to participate in this "Peace 09" exercise. Military officials and soldiers of Chinese navy's missile destroyer DDG-168 Guangzhou attended a sail setting ceremony in Sanya, south China's Hainan Province, on March 4, 2010. A new Chinese naval task force set sail on Thursday morning from a military port in the south Hainan Island to replace the fourth batch of flotilla in the Gulf of Aden escorting merchant vessels. Chinese navy's missile destroyer DDG-168 Guangzhou arrived in Guangzhou in south China's Guangdong province, December 26, 2012 and took part in an activity marking the 4th anniversary of the start of China's escorting missions in the Gulf of Aden. The ship was open to the public during its stay in the city. China's Defense Ministry defended a regular training and sailing mission by Chinese ships in the East China Sea. The statement on 26 October 2012 was in response to Japanese reports that three Chinese maritime surveillance ships entered the waters around the Diaoyu Islands. The Ministry added that the mission of China's ships was justified and legal. China hopes related parties will treat the issue objectively and rationally. The three surveillance ships belong to the South China Sea Fleet. They were the 168 Guangzhou guided missile destroyer, the 171 Haikou guided missile destroyer and the missile frigate 571 Yuncheng. Japan's Coast Guard spotted three Chinese maritime ships in waters 471 kilometers off the island of Okinawa. Japan said it would conduct a thorough investigation. A total of seven Chinese vessels registered under China's three People's Liberation Army Navy fleets (South Sea, East Sea and North Sea) sail near Japanese islands before returning to their bases on Oct. 28 and 29. The Type 052B (Guangzhou, 168) Destroyer and the Type 054A (Hunagshan, 570) Frigate, both from the South Sea Fleet, are followed by a Japanese destroyer when they sail through the waters at some 600 kilometers from Okinawa.

Type 052D Class (Luyank III-Class) Chinese Destroyer

System

Alternative designations: Kunming (LUYANG III Class) Chinese Type 052D Destroyer
Total Built: 10 total ships in the Luyang III Class
Builder: INA
In Service: 2014-Present
Crew (total): 280

Dimensions

Length: 160 m
Beam: 18 m
Displacement, Full Load: 8,000 tons
Draught: 6 m

Automotive

Propulsion: 2 x gas turbines
Maximum Speed: 30 knots
Maximum Range: 4,500 nm

Armament

↳*Weapon Station #1*

Name: PJ-38

Type: 30 mm naval gun

Caliber: 130mm

Quantity: 1 x PJ-38

Design: Designed by the Zhengzhou Mechanical-Electrical Engineering Research Institute (□□□□□□□□□, also known as the 713th Research Institute of the 7th Academy) and manufactured by Inner Mongolia 2nd Machinery Manufacturing Factory (□□□□□□□□□), the H/PJ-38 130 mm naval gun was developed from reverse engineering of Soviet AK-130 twin 130 mm naval gun, which was carried out by the same two establishments. The general designer of the H/PJ-38, Chen Dingfeng (□□□), was also the general designer of all models of Type 79 100 mm naval gun, all models of Type 210 100 mm naval gun, and the H/PJ26 76 mm naval gun. Chen was recalled from retirement to complete the H/PJ-38 single barrel 130 mm naval gun. When the Soviet AK-130 was first successfully copied by Chinese developers, the Chinese navy was unsatisfied and decided not to let the AK-130 into production, despite all performance parameters being met. Because the AK-130 was judged out-of-date by the Chinese Navy, the H/PJ-38 program was created in 2005. The H/PJ-38 130 mm single barrel naval gun is considered more powerful and more reliable than other smaller caliber naval guns currently in Chinese service, and as with naval guns on most warships, it is installed in front of the VLS.

Ammunition: The general designer of munitions for the H/PJ-38, Zhou Bingwu (□□□), entered the business in 1997 and almost lost the index finger of his right hand in November 2007 during an important trial. As early as 1987, Zhou had proposed multiple kinds of precision-guided munitions (PGMs) to be fired by a single caliber gun mount, but due to the limitations of the Chinese technological base and industrial capability, it was not until two decades later when it finally became a reality. Research led to the development of a single barreled 70 caliber, 130 mm system which took more than four years to complete, and the H/PJ-38 went to series production soon after completion. The primary improvement of the H/PJ-38 over the AK-130 is its adaptability: H/PJ-38 can fire both separate loading rounds and semi-fixed rounds, which is crucial in firing gun-launched missiles and PGMs. The H/PJ-38 can also fire a variety of sub-caliber rounds, but more importantly, a variety of PGMs were developed for H/PJ-38 to increase its effectiveness.

↳*Weapon Station #2*

Name: Type 730 CIWS

Type: seven-barrelled 30 mm Gatling gun CIWS.

Caliber: 30mm

Quantity: 2 x Type 730 CIWS Systems

Crew: Automated, with human oversight

Barrels: 7-barrel (Type 730)

Rate of Fire: 1,200-4,200 rounds/minute (Type 730) 11,000 rounds/minute (Type 1130)

Effective Firing Range: 1–1.5 km

Maximum Firing Range: 3 km

Feed System: Type 730: One ammunition boxes, holding 640 rounds Type 730B/C, LD-2000: Two ammunition boxes, each holding 500 rounds (total 1000 rounds) Type 1130: Two ammunition boxes, each holding 640 rounds (total 1280 rounds)

Main Armament: 1×30 mm H/PJ-12 or H/PJ-11 Gatling gun

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

Radar: The TR47C radar operates in the same way of AN/APY-1/2 radar on board E-3 Sentry in that the azimuth is scanned mechanically, while the elevation is scanned electronically, incorporating a total of 169 transceivers of phased array technology that enables the radar to pick up the splashes of 30 mm rounds. Like the western CIWS, the information is processed on site, via local computers of the radar and the gun mount, thus providing faster reaction time than the Russian design in which the radar and fire control system are separately located. The system can track a sea-skimming target with 0.1 square metre radar cross section at 8 km, extended to 15 km if the radar cross section is increased to 2 square metres, and further extended to 20 km if the radar cross section is increased to 10 square metres,

though the targets could not be engaged until much closer (3 km) due to the limited range of the gun.

Fire Control System: The OFC-3 system is modular design that comprises a laser range finder, a color TV camera, and an IR camera, and the laser range finder can be replaced by a laser designator (for a laser beam-riding SAM), the TV camera can be replaced by a night vision camera, and the IR camera can be replaced by an ImIR, at higher cost. Development to incorporate the dual band IR, night vision camera, and the color TV camera is reportedly in progress. Type 730 CIWS is an autonomous closed-loop system and thus offers faster reaction time than the Russian AK-630. Type 730 CIWS is fully compatible with Chinese and European combat data systems such as ZKJ-1, ZKJ-4, ZKJ-4A-3, ZKJ-5, ZKJ-6, ZKJ-7, H/ZBJ-1, and Thomson-CSF TAVITAC, and can be directly integrated with these combat data systems without any modification.

↳*Weapon Station #3*

Name: 64 cell VLS (GJB 5860-2006)

Type: Missile Launcher (32 Cells)

Missiles: HHQ-9 SAM YJ-18 SSM CY-5 ASW

Basic Load: INA

Note: GJB 5860-2006 (Chinese: □□□□□□ 5860-2006; pinyin: Guo-jia Jun-yong 5860-2006; literally: 'National Military Standard 5860-2006') is a Chinese military technical standard describing a vertical launching system (VLS) for all types of missiles aboard surface combatants. Cells have a square cross section with 850 millimetres (33 in) sides, and may be 9 m (30 ft), 7 m (23 ft), or 3.3 m (11 ft) deep. Each cell carries one missile; the shortest cell may carry four missiles. Hot and cold launches are supported; hot launching uses the concentric canister launch (CCL) approach with exhaust vents within each launch cell. The first operational implementation is believed to be the VLS aboard the People's Liberation Army Navy's Type 052D destroyer

Torpedoes

Name: Yu-7 torpedo

Type: Torpedos

Quantity: 6 x Yu-7 Torpedos

Length: 2.7 m

Weight: 235 kg

Effective Firing Range: 14.1 km

Warhead Weight: 45 kg (99 lb) shaped charge

Propellant: Otto fuel II

Maximum Depth: 400 m

Speed: 83 km/h

Steering System: CIACIO-S seeker

Launch Platform: Surface ships Helicopters

Aircraft

↳*Z-9 / Ka-27 / Ka-28 Helix*

Quantity: 1-2

Radars

1 x Type 346 multi-function phased-array radar: Type 346 radar is a highly digitized, multi-function, dual-band (S and C

bands) naval active electronically scanned array (AESA) installed on Type 052C destroyers, Type 052D destroyers, Type 055 destroyers and Type 001A aircraft carriers[1] of the PLAN. The radar is named as the Star of the Sea (Hai-Zhi-Xing, □□□) by its developer and it is one of the two competitors for PLAN's SAPARS (Shipborne Active Phased Array Radar System) project/program. Due to its secrecy and lack of information, Type 346 radar has been frequently but erroneously confused with a Chinese fire control radar Type 348, and mistakenly identified as Type 348 by many sources. Furthermore, it is also frequently confused with and misidentified as Sea Lion series C-band phased array radars developed by another design house. Several models in the Type 346 series have been developed. When Star of the Sea was selected as the winner of SAPARS and accepted into Chinese service, it received the Chinese naval designation for the entire radar system as H/LJG-346 or Type 346 for short. The NATO reporting name for Type 346 radar is Dragon Eye.

1 x Type 518 L-band air-surveillance radar: The Type 518 radar is a Chinese high performance L band long range shipboard air surveillance radar. The Type 518 radar may be installed in destroyers or heavy tonnage naval vessels to detect long range high altitude aircraft in adverse natural noise and active electronic jamming environments. The Type 518 have only been installed and deployed on the 2 units of the Luhu class destroyers. It is manufactured and exported by the Nanjing Changjiang Machinery Group Co Ltd. Specifications: *L - band *Wide frequency band, pulse-to-pulse frequency jump *4 phase code pulse compression technology *Low sidelobe super cosecant squared antenna *Counter electronic countermeasure and noise suppression capability *Adaptive MTI filters for noise map and speed map are provided. *Interference analysis and selected transmission technology

Notes:

The LUYANG III incorporates the PLA Navy's first multipurpose vertical launch system, likely capable of launching ASCM, land attack cruise missiles (LACM), surface-to-air missiles (SAM), and anti-submarine rockets. One source reported that "Type 052D DDG ... will be a 10,000 ton destroyer, upgraded version of the Type 052C, with up to 96 VLS launchers and 128 YJ-12 anti ship missiles. Construction is expected in 2012. This will be the main surface combatant of the future PLA Navy." At least one Chinese source of uncertain reliability predicted the Type 052D would have a vertical launch system with a a total of 96 new missile interceptors [16 VLS system with six VLS with 96 VLS cells] , and eight new Eagle 12e anti-ship cruise missiles with a range of about 180-240 km. The ship was projected to have a top speed of 32 knots, and an endurance of 14,000 nautical miles. The ship was projected to have a light displacement of 9500 tons, and a full load displacement of 12,000 tons. The length was reported as 180 meters, a beam of 20 meters, and a draft of 6.5 meters. Even if these specifications were little more than wishful thinking, they are indicative of an expectation that China would eventually deploy a locally designed surface combatant with a displacement of about 10,000 tons, significantly larger than the 7,000 tons of the Type 052. Whether the Type 052D is this vessel, or whether something larger remains in the wings, remained unclear. Type 052D "Red Aegis" improvements over Type 052C destroyer Larger main gun: 130 mm vs. 100 mm More secure communication: Chinese Link 16 vs. Link 11/TADIL-A equivalent Larger and more advanced phased array radar: Flat AESA vs. Convex AESA radar More numerous and versatile VLS (vertical launch system): 64 versatile VLS cells vs. 48 AAW VLS cells The new destroyers are equipped with two 32-unit vertical launch systems capable of launching HQ-9B air-defense missiles, anti-ship and anti-submarine missiles. The original YJ-62 missile launchers used on the Type 052C do not appear to be present on the new destroyer. It has been speculated that the Type 052D could be equipped with a naval-style version of the DH-10 land-attack cruise missile. The new-type guided missile destroyer "Kunming" was delivered and commissioned to the Navy of the Chinese People's Liberation Army (PLAN) on 21 March 2014. The "Kunming" with hull number 172, is the new generation of China-made guided missile destroyers. It has strong capacity in air defense and naval warfare. The layout of the 052D destroyer is similar to that of the earlier 052C, but the superstructure of the 052D slopes inward at a greater angle, providing reduced radar cross-section. Some analysts have said that the overall performance of 052D destroyers is superior to that of Japan's Atago-class destroyers, South Korea's Sejong the Great-class destroyers and the U.S. Navy's Arleigh Burke-class destroyers. But compared with Arleigh Burke-class destroyers, China's type 052D destroyers are inferior in terms of quantity, displacement and ship-based guided missiles. China needs to build larger models, including a 10,000-ton guided-missile destroyer. Furthermore, the country needs an increase in the quantity of guided-missile destroyers, as China will build more aircraft carriers in the future. Since China does not currently have cruisers, larger guided-missile destroyers are needed to play the role of cruisers. Type 052D, the first of which commissioned in 2014, is a newer design than the DDG-57 Arleigh Burke, but both vessels are very good looking and capable. However, there are characteristics of the Burke IIA that are noteworthy and important, despite aesthetics. The Burke IIA has 96 VLS cells the Type 052D has 64. The Burke IIA carries two helicopters, the Type 052D carries one. The slope on the side panels of the Burke IIA provide better radar dispersion, because they are sloped more, particularly above the main deck, and also with the "raked" mast. The bow Sonar on the Burke IIA is much more powerful than that on the Type 052D. The wider beam on the Burke IIA allows for better handling, particularly in rough sea states. The AEGIS system and cooperative engagement capabilities on the Burke IIA are very well known, understood, and proven. The effectiveness of the new APARs and the combat system on the Type 052D remain unknown. About 160 meters long and with a beam of 18 meters [versus 157 and 18 meters for the DDG-51], the Type 052D is slightly larger than its predecessor, the Type 052C, and is believed to displace slightly over 6,000-7,000 tons [rather less than the 9,200 ton Arleigh Burke]. The vessel uses the Type 346 Active Phased Array Radar System and a Type 518 L-band long-range radar. The main 100mm gun on the Type 052C, which was reportedly unreliable, has been replaced by a new PJ-38 130mm gun. The vessel also has a helicopter-landing platform [and probably a hangar for two helicopters, as the Type 52C] and the Chinese Type 730 counterpart to the US Close-In Weapon System. The 130 mm gun was developed by the Institute of Mechanical and Electrical Engineering of Zhengzhou (Zhengzhou 713 Institute), and produced by by the 2nd Machinery Factory (Baotou,Inner Mongolia). The original design used a single tube

dual link ammunition handling and water-cooled systems; the barrel length (with breech) is 70 calibers. Using fully automatic loading gear teh gun has a rate of fire 40 rounds / minute. The range of non-guided shells is about 30 kilometers. The entire gun has a weight (excluding peripherals) greater than 50 tonnes, including the stealth housing. The design of this gun is thought to be based on the proven technologies of the Russian AK-130 130 mm twin-barrel gun, mainly the mechanical design, which is a weak element in Chinese ship-borne guns. The gun electrical control and aiming servo system are dependent on a new localization design. One of the most moving episodes in the Chinese blockbuster Wolf Warrior 2 is the one in which the captain of a Type 052D guided-missile destroyer shouts "Fire!" to order the launch of supersonic cruise missiles to hit rebel troops in an imaginary African nation holding Chinese hostages. However, this scenario could not have happened in real life because in the Gulf of Aden there have been no Type 052D destroyers-now considered the most capable combat ship in the People's Liberation Army Navy. Instead, the Navy has sent other vessels to the once pirate-plagued waters to protect civilian vessels for nearly 11 years. That changed as the Navy decided to dispatch a Type 052D to take part in its latest escort mission. The CNS Xining, the fifth in the Type 052D class, sailed toward the Gulf of Aden in August 2019.

Almirante Brown Class Argentinian Guided Missile Destroyer

Tiers:

Variants:

- **Almirante Brown:** Commissioned: 1983 Status: Active
- **La Argentina:** Commissioned: 1983 Status: Active
- **Heroína:** Commissioned: 1983 Status: Active
- **Sarandí:** Commissioned: 1984 Status: Active

System

Alternative Designation: Almirante Brown Class
Total Built: 4 ships total
Type: Destroyer
Builder: Blohm+Voss
In Service: 1983-Present
Crew: 200 (26 off. + 174 enl.)

Dimensions

Length, Overall: 125.9 m
Length, Perpendiculars: 119.0 m
Beam: 14.0 m
Draft, Hull: 4.3 m
Draft Sonar: 5.8 m
Displacement, Standard: 2,947 tons
Displacement, Full Load: 3,667 tons

Propulsion System

Engine Name: 2 x Olympus type TM3B gas turbines
Engine Power: 25,800 shp each
Propellers: 2 x Escher-Wyss controllable-pitch propellers
Maximum Range: 4,500 nm at 18 kts

Maximum Speed: 31 knots

Endurance: INA

Missile System

↳*Missile System #1*

Name: Quad MM-40 Exocet

Type: Anti-Ship Missile

Quantity: 2 x Quad MM-40 Exocet SSM launchers

Launcher: SSM Launcher

Missile: Exocet

Basic Load: 2

Length: 6 m

Diameter: 34.8 cm

Wingspan: 1.35 m

Weight: 780 kh

Warhead: 165 kg

Engine: solid propellant engine turbojet (MM40 Block 3 version)

Operational Range: 180 km

Flight Altitude: Sea-skimming

Speed: Mach 0.93

Guidance System: Inertial guidance and terminal active radar homing

Launch Platforms: MM38 surface-launched; AM39 air-launched; SM39 submarine-launched; MM40 surface-launched

↳*Missile System #2*

Name: Albatros (Mark 29)

Type: Surface-to-Air Missile

Quantity: 1 x Albatros (Mark 29) 8-cell launcher for Aspide SAM

Launcher: 8-cell launcher

Missile: Albatros (Mark 29) Missile

In Service: 1973-Present

Proliferation: Over 30 countries

Length: 3.72 m

Diameter: 234 mm

Wingspan: 80 cm

Weight: 220 kg

Speed: 4520 km/h (mach 3.7)

Effective Firing Range: 25 km

Warhead: 35 kg warhead

Gun Weapon System

↳*Gun Weapon System #1*

Name: Otobreda 127/54 Compact

Type: The Otobreda 127mm/54 Compact (127/54C) gun is a dual purpose naval artillery piece built by the Italian company Oto Melara. It uses the 127mm round which is also used in the 5 inch/ 54 gun, albeit that this gun calibre is measured in United States customary units rather than metric.

Caliber: 127mm

Quantity: 1 x 127-mm/54-cal Oto Melara DP

In Service: 1992-Present

Proliferation: Currently the gun is still in use by navies around the world but it is slowly being replaced by the Otobreda 127/64 for new vessels, such as the German Navy's F125-class frigate and Italian Navy's FREMM.

Length: INA

Weight: INA

Crew: Remote Control

Loading System: The gun uses an automatic loading system where 66 127mm rounds of various kinds can be stored ready-to-fire in three loader drums (each holding 22 rounds).

Elevation: −15°/+83°

Traverse: deg360

Rate of Fire: 40 rounds/min

Effective Firing Range: ±30 km (100 km with guided VULCANO ammunition)

Feed System: Magazine capacity: 66 ready rounds

↳*Ammunition Gun Weapon System #1*

Type: Rifle

Caliber: mm127

Basic Load: INA

↳*Gun Weapon System #2*

Name: Bofors 40mm Gun

Type: Anti-Aircraft Gun

Caliber: 40mm

Quantity: 4 x twin 40-mm/70-cal Breda/Bofors AA Systems

Length: 6.5 m

Barrel Length: 2.2 m

Width: 1.8 m

Height: 1.9 m

Weight: 1,981 kg

Crew: 4

Elevation: −5°/+90°

Traverse: deg360

Rate of Fire: 120 round/min

Muzzle Velocity: 881 m/s

Maximum Firing Range: 7,160 m

↳*Ammunition Gun Weapon System #2*

Type: Rifle

Caliber: 40mm

Shell: Complete round: L/43 40×311mmR L/60 40×311mmR L/70 40×365mmR

Shell Weight: 0.9 kg (2 lb 0 oz)

Basic Load: INA

↳*Gun Weapon System #3*

Name: Oerlikon 20

Type: Autocannon

Caliber: 20mm

Quantity: 2 x Oerlikon 20mm Stations

Barrel Length: 2,210 mm

Weight: 68.04 kg

Barrels: Single barrel (progressive RH parabolic twist, 9 grooves)

Action: API blowback

Elevation: Manual training, typically able to depress to -15° and elevate to +90°

Traverse: Manual training, full 360°

Rate of Fire: Cyclic: 450 rounds per minute Practical: 250-320 rounds per minute

Muzzle Velocity: 820 m/s

Maximum Firing Range: HE round at 45° L70: 4,389 m (4,800 yd)

Effective Firing Range: Against low-flying aircraft (HE round) L70: 914 m (1,000 yd)

Feed System: Cylindrical magazine holding 60 rounds, Later adjusted to be a belt fed gun

↳*Ammunition Gun Weapon System #3*

Type: Rifle HE

Caliber: 20mm

Shell: 20×110mmRB

Shell Weight: 123 g

Basic Load: INA

Onboard Aviation Facilities

Facilities: Helicopter deck and hangar

Helicopters: 1 x AS-355M Fennec or SH-3D Sea King

Fire Control

FCS #1: 1 x Thales WM-25 track-while-scan for missiles

FCS #2: 1 x Thales STIR fire control

FCS #3: 2 x Thales LIROD radar/optronic GFCS control the 40-mm guns

Sonar Systems

Sonar System: 1 x STN Atlas-Elektronik KAE-80 (DSQS-21BZ) hull-mounted, medium-frequency

Radar Systems

Air and Surface Radar: 1 x Thales DA-08A air/surface search

Surface Radar: 1 x Thales ZW-06 surface search

Navigation Radar: 1 x Racal-Decca 1226 navigation

Protection

Active Protection System: Yes

Electronic Warfare Intercept: 1 x Racal Rapids intercept

Electronic Warfare Jammer: 1 x Racal Scimitar jammer

Decoy System #1: 1 x Graseby G1738 towed torpedo decoy

Decoy System #2: 2 x 20-round Oto Melara 105-mm SCLAR decoy rocket launchers

Decoy System #3: 1 x CSEE Dagaie double mounting decoy launcher

ASW Weapon System: 2 x depth charge racks [10 Mk 9 depth charges carried]

Notes:

The Almirante Brown class is a class (MEKO 360H2 type) of warships built in Germany for the Argentine Navy. They were commissioned between 1983 and 1984, after the Falklands War. The class comprises four ships; Almirante Brown, La Argentina, Heroína and Sarandí. They are classified as either frigates or destroyers by different publications. The MEKO 360 type warships are based on modular designs which allow quick changes to the vessel's armaments depending on mission requirements. The modular nature of the construction also allows the ships to be modernized or refitted with greater ease. Six vessels were initially ordered, however two ships were cancelled and replaced with orders for MEKO 140 type hulls. Ordered in 1979, construction of the ships was delayed as the British turbines were embargoed after the Falklands War. Furthermore, the acquisition of helicopters for the vessels has seen many incarnations. They were initially intended to be equipped with Westland Lynx helicopters, but the order was cancelled in 1982. The planned replacement Agusta-Bell AB 212 helicopters were not funded and instead, all of the Almirante Brown class deploy with AS 555 Fennec, while only La Argentina and Sarandí can employ SH-3D Sea King helicopters. Almirante Brown took part in Gulf War operations in 1990. All of the ships can be used as flagships. Six vessels were ordered and four vessels of a second variant, MEKO 360H2, were constructed for Argentina. They were locally named the Almirante Brown class. They are considered frigates and destroyers by different publications. The design is based on the concept of modular systems and is capable of changing the armament of the ship swiftly and can be modernized/refitted with more ease. Each ship is capable of being used as a flagship. The ships have a standard displacement of 2,900 long tons (2,900 t) and 3,360 long tons (3,410 t) at full load. The vessels are 125.9 metres (413 ft 1 in) long overall and 119.0 metres (390 ft 5 in) between perpendiculars with a beam of 15 metres (49 ft 3 in) and a draught of 5.8 metres (19 ft

0 in). The vessels are powered by a COGOG system driving two shafts composed of two Olympus TM 3B gas turbines rated at 51,800 shaft horsepower (38,600 kW) and two Tyne RM-IC gas turbines rated at 10,200 shaft horsepower (7,600 kW). The ships have a maximum speed of 30.5 knots (56.5 km/h; 35.1 mph) while using their Olympus gas turbines at 18 knots (33 km/h; 21 mph) using their Tyne turbines. The MEKOs have a maximum range of 4,500 nautical miles (8,300 km; 5,200 mi) at 18 knots. The Argentinian vessels are armed with eight Exocet surface-to-surface missiles in two quad launchers mounted centrally and one octuple launcher for Aspide surface-to-air missiles mounted aft of the superstructure. The MEKO 360H2 are also equipped with one OTO Melara 5-inch (127 mm)/54 calibre naval gun forward of the superstructure, eight Bofors 40 mm/70 calibre guns, and two triple-mounted 324 mm (13 in) ILAS torpedo tubes. The ships are equipped with a Graseby G1738 towed decoy countermeasure system, two Breda 105 mm (4 in) SCLAR chaff rocket launchers with each launcher sporting 20 tubes. For electronic support measures, the vessels are armed with the Sphinx system and the Scimitar system for electronic countermeasures. The class is equipped with two Signaal DA08A air/surface search radar operating on the F band and Signaal ZW06 surface search radar operating on I band. They have Decca 1226 navigational radar operating on the I band and their fire control systems are controlled by the Signaal SEWACO Link 10/11 system supported by Signaal STIR radar operating on the I/J and K bands, Signaal WM25 operating on I and J band, along with LIRODA radar systems that control the 40 mm gun mounts. For sub-surface search, the vessels have Atlas Elektronik 80 hull-mounted active search sonar. All of the Almirante Brown class are equipped with a helicopter deck and hangar. They all deploy with AS 555 Fennec helicopters, while only La Argentina and Sarandí can employ SH-3D Sea King helicopters. The ships have a complement of 200, including 26 officers.

Type 051G (Luda III Class) Chinese Destroyer

Tiers:

1 2 **3** 4

Variants:

- **Zhanjiang:** Commissioned: 1991 Fleet: South Sea Fleet
- **Zhuhai:** Commissioned: 1991 Fleet: South Sea Fleet

System

Alternative Designation: Type 051G; Luda III Class
Total Built: Only two vessels the Zhanjiang and the Zhuhai
Type: Destroyer
Builder: Luda Shipyard Zhonghua Shipyard Dalian Shipyard
In Service: 1991-Present
Crew: 280

Dimensions

Length: 132 m
Beam: 12.8 m
Draft: 4.6 m
Displacement, Full Load: 3,670 tons

Propulsion System

Engine Name: INA
Engine Type: 2 steam turbines
Engine Power: 72,000 shp (53,700 kW)
Maximum Range: 2,970 miles
Maximum Speed: 32 knots (59 km/h)
Endurance: INA

Gun Weapon Systems

↳*Gun Weapon System #1: System*

Name: Canon de 100mm

Type: Naval Gun

Caliber: mm100

Manufacturer: GIAT

Length: INA

Barrel Length: 55 calibres

Weight: 22 metric tons

Crew: 2 (modèle 68) ; later version entirely automatic

Elevation: 29°/s

Traverse: 40°/s

Rate of Fire: 78 round/min

Muzzle Velocity: 870 m/s

Effective Firing Range: 17,000 m (elevation 40°) Maximum practical range: 6,000 m against aerial targets 12,000 m against surface targets

↳*Gun Weapon System #1: Ammunition*

Type: Rifle

Caliber: mm100

Shell: 100 x 700mm .R

Basic Load: INA

↳*Gun Weapon System #2: System*

Name: DARDO

Type: Close-In Weapon System (CIWS)

Quantity: 1 x DARDO Close-In Weapon System (CIWS)

Length: INA

Diameter: Mount ring: 1.7 m (5 ft 7 in) Working circle: 2.902 m (9 ft 6.3 in)

Height: Enclosed turret: 2.4 m (7 ft 10 in) Type A mount: 1.3 m (4 ft 3 in) Type B mount: 0.92 m (3 ft 0 in)

Weight: Complete gun mount (less ammo): 5,500 kg (12,100 lb) Complete round (HE): 4.05 kg (8.9 lb)

Barrels: 2 × Breda-built Bofors-40 mm L/70

Elevation: Minimum −13° Maximum +85° speed: 60°/s (70°/s Fast Forty)

Traverse: Full 360° traverse, speed: 90°/s (100°/s Fast Forty)

Rate of Fire: 2 × 300 round/min 2 × 450 round/min (Fast Forty)

Maximum Firing Range: AA with HE: 8,700 m (9,500 yd)

Effective Firing Range: HE round: 4,000 m (4,400 yd)

Feed System: Magazine: 736 HE rounds (444 Type B mount) Dual feed mechanism with 736 HE and 200 APFSDS rounds (Fast Forty)

↳*Gun Weapon System #2: Ammunition*

Type: Rifle
Caliber: mm40
Shell: INA
Basic Load: INA

Missile Weapon Systems

↳*Missile Weapon Systems #1: Missile Launcher*

Name: YJ-8 Launchers
Type: Missile Launcher
Quantity: 4 x twin YJ-8 Launchers

↳*Missile Weapon Systems #1: Missile*

Type: YJ-8 Missile
Type: Surface-launched subsonic anti-ship cruise missile.
Length: 5.81 m
Weight: 815 kg
Warhead Weight: 165 kg
Engine: Rocket
Propellant: Solid Rocket
Operational Range: 42 km
Flight Altitude: 5-7 m
Speed: Mach 0.9
Guidance System: Inertial navigation/active radar homing terminal guidance

↳*Missile Weapon Systems #2: Missile Launcher*

Name: HQ-7 SAM Launcher
Type: Missile Launcher
Elevation: INA
Traverse: INA
Radar: Type 360S E/F-band Doppler radar
Radar Detection Range: 18.4 km
Combat Management System: ZJK-4 (Thomson-CSF TAVITAC) combat management system.
Note: The system is capable of processing up to 30 targets, and tracking 12 targets simultaneously.

↳*Missile Weapon Systems #2: Missile*

Name: HQ-7

Type: Short-range air defense missile.

Length: 3 m

Diameter: 0.156 m

Wingspan: 0.55 m

Weight: 84.5 kg

Operating Altitude: 30–5,000 m

Maximum Operating Range: 12 km

Minimum Operating Range: 500 m

Speed: Mach 2.3 (750 m/s)

Guidance System: Command + electro-optical tracking

Warhead: HE-FRAG with proximity fuse

Torpedo Weapon Systems

↳*Torpedo Launcher*

Name: Yu-7 Torpedo Tubes

Quantity: INA

↳*Torpedo*

Name: Yu-7 torpedo

Type: Torpedo

Length: 2.7 m

Diameter: 324 mm

Weight: 235 kg

Warhead: high explosive

Warhead Weight: 45 kg

Effective Firing Range: 14.1 km

Propellant: Otto fuel II

Maximum Depth: 400 m

Speed: >45 kn (83 km/h)

Guidance System: active / passive acoustic homing

Steering System: CIACIO-S seeker

Onboard Aviation Facilities

Aviation Facilities: No

Aircraft Carried: No

Fire Control System

FCS Name: INA

Computerized FCS: See Weapon Systems

Combat Data System #1: ZKG-4A

Combat Data System #2: ZKG-4B

Radar Systems

Name: Type 354 radar

Type: 3-D air and surface search radar

Alternate Designation: MX902 H/LJQ-354

Proliferation: Type 354 Radars are one of the most widely deployed air and surface search naval radars in Chinese service. The Type 354 was predominantly found on major People's Liberation Army Navy (PLAN) surface combatants such as the Luda class destroyer and Jianghu class frigate in the 1980s and 1990s. By 2006 it was slowly being replaced in favour of the Type 360 radar, which in turn, itself being replaced by Type 364 radar for new vessels.

Frequency: G/H band

Beam: 1.2 × 5 deg

Pulse Width: 4 µs

Polarisation: linear

Beam width: 1.20 (horizontal); 1.30 (vertical)

PRF: 400 or 800 Hz

Scan Rate: 4–10 rpm

Resolution: 800 m (range); 1.30 (azimuth)

Range: more than 93 km on aircraft with RCS of 10 m2

Sonar Systems

Search Sonar: DUBV-23 search sonar

Depth Sonar: DUBV-43 variable depth sonar (VDS)

Protection

Active Protection System: See Weapon Systems

Countermeasures: INA

NBC Water Washdown System: Yes

Notes:

Type 051G The Type 051G was an improved variant that the last two ships, Zhanjiang and Zhuhai, were completed to. They were equipped with Type 354 3-D air and surface search radar. Four twin YJ-8 launchers replaced the HY-1/HY-2 launchers. The Soviet sonar was replaced by French DUBV-23 search sonar and DUBV-43 variable depth sonar (VDS). Zhuhai was modified in 1999. The Soviet 130 mm guns were replaced by 100 mm (4 in) guns, derived from French Creusot-Loire Compact, with automated reloaders. An HQ-7 SAM launcher replaced the "X" turret, as on the Type 051DT. Zhuhai was similarly modified. Zhanjiang and Zhuhai were equipped with the ZKG-4A and ZKG-4B combat data systems respectively. The Type 051G was also the first Chinese ship to deploy the YU-7 lightweight torpedo, and the Italian 40 mm (1.6 in) anti-aircraft gun. The Type 051G was part of the Luda III class[10], and later the Luda IV class. Note: There are no longer any Type 051 Class, Luda II Class, Type 051D Class, Type 051Z Class, or Type 051DT Class Chinese Destroyers left in active service.

Sovremenny Class (Project 956 Sarych) Russian Guided Missile Destroyer

Tiers:

Variants:

- **BOYEVOY:** Commissioned: 1986 Status: Active
- **BURNYY:** Commissioned: 1988 Status:Active
- **GREMYASHCHY:** Commissioned: 1989 Status: Refit
- **BYSTRYY:** Commissioned: 1989 Status: Active
- **RASTOROPNY:** Commissioned: 1989 Status: Non-operational
- **BEZBOYAZNENNYY:** Commissioned: 1990 Status: Refit
- **BEZURDERZHANNY:** Commissioned: 1989 Status: Active

System

Alternative Designation: Sovremenny Class; Project 956 Sarych
Type: Guided Missile Destroyer
Builder: Zhdanov Shipyard
Crew: 296 (25 off. + 271 enl.)
Accomodation: 368 (38 off. + 330 enl.)

Dimensions

Length: 156.4 m
Beam: 17.2 m
Draft: 7.9 m
Displacement, Light: 6,500 tons
Displacement, Standard: 7,940 tons
Displacement, Full Load: 8,480 tons

Propulsion System

Engine Name: 2 x TV-12
Engine Type: Geared Steam Turbines
Engine Power: 110,000 total shp
Boiler: 4 x turbo pressurised Type KVN-98/64, 640 kg/sq cm, 500 deg Celsius
Fuel Capacity: 1,740 tons + 5 tons aviation
Maximum Range: 1,345 nm at 32.7 kts, 3,920 nm at 18 kts
Maximum Speed: 63 km/h (34 knots)
Endurance: 30 days

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: AK-630
Type: Naval Close-In Weapon System
Caliber: 30mm
Quantity: 4 x 30-mm/65 cal. (AK-630M) Gatling CIWS
Length: INA
Barrel Length: 1,629 mm
Width: 1,240 mm
Height: 1,070 mm
Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630); External nodes: 800 kg (1,800 lb) (AK-630); 2000 rounds in belt: 1,918 kg (4,228 lb)
Crew: 1
Action: Gas-operated rotary cannon
Elevation: +88° ... -12° (50°/sec)
Traverse: ±180° (70°/sec)
Rate of Fire: 4,000–5,000 rounds/min
Muzzle Velocity: 880–900 m/s
Maximum Firing Range: the projectiles self-destruct past 5,000 m
Effective Firing Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime)
Feed System: Belt: 2,000 rounds
Sights: Radar / TV-optical

↳*Gun Weapon Systems #1 Ammunition*

Type: Rifle
Caliber: mm30
Shell: HEI-Frag, Frag-T

Shell Weight: 0.39 kg

Basic Load: 16,000

↳*Gun Weapon System #2*

Name: AK-130

Type: Automatic Naval Cannon

Caliber: 130mm

Quantity: 2 x twin 130-mm/70 cal. (AK-130) DP guns

Length: 9100 mm

Barrel Length: INA

Weight: INA

Elevation: 85 degrees

Traverse: 360 degrees

Rate of Fire: 35 RPM

Maximum Firing Range: 23,000 m (surface targets) 15,000 m (aircraft) 8,000 m (missiles)

↳*Gun Weapon System #2 Ammunition*

Type: Rifle

Caliber: 130mm

Cartridge: INA

Basic Load: 2,000 Rounds

Missile Weapon System

↳*Missile #1*

Name: SS-N-22 Sunburn

Type: Anti-Ship Missile

Launcher: 2 x quad P-270 Moskit SSM missile launchers

Note: SS-N-22 Sunburn is the NATO reporting name for two unrelated Soviet anti-ship missiles. Although the missiles were very different, distinguishing between them is difficult because their ship-mounted launching containers were identical. Confusion was exacerbated by the Soviet practice of mixing missile types within a class of ships. It was therefore not confirmed that the "SS-N-22" actually referenced two different missiles until after the fall of the Soviet Union.

↳*Missile #2*

Name: SA-N-7 Gadfly

Type: Surface-to-Air Missile (SAM)

Launcher: 2 x ZR-90 Uragan (SA-N-7) type MS-196 SAM missile launchers

Length: 5.55 m

Diameter: 0.40 m

Wingspan: 1.20 m

Weight: 690 kg

Engine: 1 x solid-fuel rocket

Maximum Range: 30 km

Maximum Speed: 3,680 kph, Mach 3

Maximum Altitude: 15,000 m

Minimum Altitude: 25-30 m

Maximum Load: 23 g

Sensors/Electronics: Front Dome (Orekh) H/I-band radar, said to be capable of illuminating an individual target once it is designated by D/E/F-band air search radars and associated digital computers

Torpedoes

Torpedo Tubes: 2 x twin 533-mm type DTA-53 tubes

Torpedos: INA

Basic Load: INA

Fire Control Systems

SA-N-7 Missile FCS: 6 x OP-3 (Front Dome**) fire control for SA-N-7 missiles

AK-130 Gun FCS: 1 x MR-184M Lev (Kite Screech**) fire control for 130-mm guns

AK-630 Gun FCS: 2 x MR-123 Vympel (Bass Tilt**) fire control for 30-mm CIWS

SS-N-22 Missile FCS: 1 x Mineral (Band Stand**) surface target and designation for the SS-N-22

Laser Rangfinder: 1 x Squeeze Box optronic director with laser range finder

Aircraft

Helicopters: 1 x Kamov Helix-A(Ka-27PL)** ASW; or 1 x Helix-A (Ka-27RT) targeting type

ASW Weapons

Launcher: 2 x 6-round RBU-1000 rocket launchers

Rocket Name: RGB-10

Basic Load: 48

Mines

Launcher: 2 x mine rails fitted

Mine Name: INA

Basic Load: 40

Radar Systems

3-D Air Search Radar: 1 x MR-760MA Fregat-MA (Top Plate**) 3-D air search

Navigation Radar: 3 x MR-212/201 Vaygach-U (Palm Frond**) navigation

Sonar Systems

Name: 1 x MGK-335MS Platina-S (Bull Horn**)

Type: Medium-Frequency, Hull Mounted Sonar

Protection

Active Protection System: INA

Countermeasures: 8 x 10-tubed PK-10 fixed decoy launchers (all except BOYEVOY: none)

NBC Water Washdown System: Yes

Electronic Warfare: 2 x MP-405M Start-2 or MR-401 intercept system; 2 x MRP-11M/12M (Bell Shroud**); 2 x Bell Squat**; 4 x Foot Ball-B**

Jamming System: 1 x MR-407 jamming system

Notes:

The Sovremenny class, Soviet designation Project 956 Sarych (buzzard), is a class of anti-ship and anti-aircraft guided missile destroyers of the Soviet and later Russian Navy. The ships are named after qualities, with "Sovremenny" translating as "modern" or "contemporary". Most of the ships have been retired from active service and one converted into a museum ship in 2018, but several remain in commission with the Russian Navy. Four modified ships were delivered to the People's Liberation Army Navy, and remain in service. The Sovremenny class were guided missile destroyers, primarily tasked with anti-ship warfare, while also providing sea and air defense for warships and transports under escort. The class was designed to complement the Udaloy-class destroyers, which were fitted primarily for anti-submarine operations. The ship's combat systems can use target designation data from the ship's active and passive sensors, from other ships in the fleet, from surveillance aircraft or via a communications link from the ship's helicopter. The multi-channel defence suite is capable of striking several targets simultaneously.

Hobart Class Australian Destroyer

Tiers:

Variants:

- **Hobart:** Commissioned: 2015 Status: Active
- **Brisbane:** Commissioned: 2016 Status:Active
- **Sydney:** Commissioned: 2020 Status: Sea Trials

System

Alternative Designation: Hobart Class
Date of Introduction: 2015
Total Built: 3 ships built
Type: Destroyer
Builder: Navantia (designer) AWD Alliance (project coordinator) ASC (primary shipbuilder) Forgacs Group and BAE Systems Australia (module builders)
In Service: 2015-Present
Crew: 186 + 16 aircrew Accommodation for 234

Dimensions

Length, Overall: 146.7 m
Length, Perpendiculars: 133.2 m
Beam: 18.6 m
Draft: 7.2 m
Displacement, Full Load: 7,000 tons

Propulsion System

Diesel Engine Name: 2 x Bazan/Caterpillar diesels
Diesel Engine Power: 12,240 hp sustained
Gas Turbine Engine Names: 2 x GE LM 2500 gas turbines
Gas Turbine Engine Power: 47,328 hp sustained
Shafts: 2

Propellers: controllable-pitch propellers

Range: 5,000 nm (5,750 mi, 9,260 km) at 18 knots

Speed: 28 knots (32 mph, 52 km/h)

Communcations

Sataliete Communications: 1 x MBS-567A COMINT system

Missile Systems

↳*Missile System #1*

Name: Mk 41 Vertical Launch Systems

Type: Surface-to-Air Missile

Quantity: 48 x Mk 41 vertical launch systems

Missile Name (Primary Missile): SM-2MR

Missile Type: Surface-to-Air Missile

SM-2MR Missile Basic Load: 32

SM-2MR Missile Range: 167 km

SM-2MR Missile Speed: Mach 3

Missile Name (Secondary Missile): RIM-7 Sea Sparrow

Missile Type: Surface-to-Air Missile

RIM-7 Sea Sparrow Basic Load: 64

RIM-7 Sea Sparrow Range: 14.8 km

RIM-7 Sea Sparrow Speed: Mach 2.5

↳*Missile System #2*

Name: Quad RGM-84L Harpoon

Type: Anti-Ship Missile

Launcher: 2 x quad RGM-84L Harpoon launchers

Basic Load: 8 Harpoon Block II missiles carried

Length: 3.90 m

Diameter: 340 mm

Wingspan: 0.91 m

Weight: 531.6 kg

Range: 139-148 km

Speed: Mach 0.85

Warhead: Conventional high-explosive with some penetration capability

Warhead Weight: 227 kg

Sensors: short-pulse radar Kollsman frequency-modulated continuous wave altimeter Texas Instruments PR-53/DSQ-28 monopulse frequency-agile, jittered pulse repetition frequency active radar homing seeker switched on at pre-planned

point
Guidance System: on-board Midcourse Guidance Unit (MGU)-IBM digital computer Smiths Industries three-axis ARA Honeywell AN/APN-194
Targeting: HCLS provides targeting data; no updates once missile is launched.

Gun Weapon System

↳*Gun Weapon System #1*

Name: Mk 45 Naval Gun
Type: Naval Gun
Caliber: 127mm
Quantity: 1 x FMC 127-mm/62-cal Mk 45 Mod 2
Length: 6.86 m
Barrel Length: 6.858 m
Weight: 22,226.00 kg
Crew: 6 (gun captain, panel operator, 4 ammunition loaders, all below decks)
Elevation: −15° to +65°
Traverse: ±170° from centerline Max. traversing rate: 30°/s[
Rate of Fire: 16–20 rounds per minute automatic
Muzzle Velocity: 762.0 m/s
Effective Firing Range: 24.1 km
Feed System: 600 rounds

↳*Ammunition Gun Weapon System #1*

Type: Rfile
Caliber: mm127
Shell: 31.75 kg
Basic Load: INA

↳*Gun Weapon System #2*

Name: Typhoon Weapon Station
Type: Remote Weapon Station
Caliber: 25mm
Quantity: 2 x Rafael 25mm/75-cal Mk 25 Typhoon-G RWS
Barrel Length: INA
Weight: 1,000 kg
Elevation: -20 deg to 45 deg
Traverse: +/-160 deg

Muzzle Velocity: INA

Effective Firing Range: INA

Sensors: CCD/ICCD/FLIR

↳*Ammunition Gun Weapon System #2*

Type: Rifle

Caliber: 25mm

Basic Load: INA

↳*Gun Weapon System #3*

Name: Mk 15 Phalanx CIWS

Type: Close-In Weapon System

Caliber: 20mm

Quantity: 2 x Raytheon 20-mm Mk 15 Phalanx Block 2B CIWS

Barrel Length: 1,500 mm

Height: 4.7 m

Weight: 5,700 kg

Crew: Automated, with human oversight

Barrels: 6-barrel (progressive RH parabolic twist, 9 grooves)

Elevation: −10°/+80°

Traverse: 150° from either side of centerline (Rate of traverse: 100°/sec

Rate of Fire: 3,000 rounds/minute

Maximum Firing Range: 3.5 km

Effective Firing Range: Classified

Muzzle Velocity: 1,100 m/s

Guidance System: Ku-band radar and FLIR

↳*Ammuntion Gun Weapon System #3*

Type: Rifle

Caliber: 20mm

Shell: • Naval: Armor-piercing tungsten penetrator rounds with discarding sabots. • Land: High-Explosive Incendiary Tracer, Self-Destruct.

Basic Load: INA

Torpedo Weapon System

Torpedo Tubes: Triple 323mm Mk 32 Mod 9

Quantity: 2 x Triple 323mm Mk 32 Mod 9 fixed launchers Systems

Torpedo Name: MU90 Impact

Torpedo Type: Anti-Submarine Torpedo

Length: 2.85 m

Diameter: 323.7 mm

Weight: 304 kg

Warhead: PBX shaped charge warhead

Warhead Weight: 32.7 kg

Engine: Pump-jet Electric

Operational Range: >10 km (5.4 nmi) (max speed) >23 km (12 nmi) (min speed)

Maximum Depth: >1000 m

Speed: 29 kn (54 km/h) to well over 50 kn (93 km/h)

Guidance System: Active or passive acoustic homing

Onboard Aviation Facilities

Helicopters: 1 x MH-60R helicopter

Fire Control

Combat Management System: 1 x Lockheed Martin Aegis Baseline 7.1; Link 11/16; AN/USG-7B Cooperative Engagement Capability

Sonar Systems

Sonar System: 1 x Ultra integrated sonar suite w/Type 2150 hull-mounted and VDS w/torpedo detection

Radar Systems

Air and Surface Radar: 1 x AN/SPY-1D(V) Aegis air/surface search

Surface Radar: 1 x Northrop Grumman AN/SPQ-9B surface search

Target Radar: 3 x Raytheon SPG-62 target illuminators

Navigation Radar: 2 x L3 Radarpilot 1100 navigation

Protection

Active Protection System: Yes

EO System #1: 1 x Mk 20 EOSS

EO System #2: 2 x Sagem VAMPIR IRST

EO System #3: 2 x Ultra 2500 EO tracking systems

Electronic Warfare: 1 x ITT ES-3701 ESM and surveillance system

Decoy System #1: 4 x Mk 169 Nulka decoy launchers

Decoy System #2: 4 x Terma Mk 137 C-Guard decoy launchers for SRBOC/NATO Sea Gnat

Decoy System #3: LESCUT torpedo decoys (Basic Load: INA)

Decoy System #4: SLQ-25 Nixie torpedo countermeasures (Basic Load: INA)

Notes:

The Hobart class is a ship class of three air warfare destroyers (AWDs) being built for the Royal Australian Navy (RAN). Planning for ships to replace the Adelaide-class frigates and restore the capability last exhibited by the Perth-class destroyers began by 2000, initially under acquisition project SEA 1400, which was re-designated SEA 4000. Although the designation "Air Warfare Destroyer" is used to describe ships dedicated to the defence of a naval force (plus assets ashore) from aircraft and missile attack, the planned Australian destroyers are expected to also operate in anti-surface, anti-submarine, and naval gunfire support roles. Planning for the Australian Air Warfare Destroyer (as the class was known until 2006) continued through the mid-2000s, with the selection of the Aegis combat system as the intended combat system and ASC as the primary shipbuilder in 2005. In late 2005, the AWD Alliance was formed as a consortium of the Defence Materiel Organisation (DMO), ASC, and Raytheon. Between 2005 and 2007, Gibbs & Cox's Evolved Arleigh Burke-class destroyer concept and Navantia's Álvaro de Bazán-class frigate competed for selection as the AWD design. Although the Arleigh Burke design was larger and more capable, the Álvaro de Bazán design was selected in June 2007 as it was an existing design, and would be cheaper, quicker, and less risky to build. Three ships were ordered in October 2007, and will be assembled at ASC's facility in Osborne, South Australia, from 31 pre-fabricated modules (or 'blocks'). An option to build a fourth destroyer was included in the original contract, but has not been exercised. ASC, NQEA Australia, and the Forgacs Group were selected in May 2009 to build the blocks, but within two months, NQEA was replaced by BAE Systems Australia. Construction errors and growing delays led the AWD Alliance to redistribute the construction workload in 2011, with some modules to be built by Navantia. Increasing slippage has pushed the original planned 2014-2016 commissioning dates out by at least three years, with lead ship Hobart to be completed by June 2017, Brisbane in September 2018, and Sydney by March 2020. The AWD Alliance, Navantia, and the involved shipyards have been criticised for underestimating risks, costs, and timeframes; faulty drawings and bad building practices leading to repeated manufacturing errors; and blame-passing. The alliance concept has been panned for having no clear management structure or entity in charge, and having the DMO simultaneously acting as supplier, build partner, and customer for the ships. Each destroyer will have a length overall of 147.2 metres (483 ft), a maximum beam of 18.6 metres (61 ft), and a draught of 5.17 metres (17.0 ft). At launch, the ships will have a full-load displacement of 6,250 tonnes (6,150 long tons; 6,890 short tons). The Hobarts have been designed to allow for upgrades and installation of new equipment, with a theoretical maximum displacement of 7,000 tonnes (6,900 long tons; 7,700 short tons). The Hobarts use a more powerful propulsion system than their Spanish predecessors. The combined diesel or gas turbine (CODOG) propulsion arrangement consists of two General Electric Marine model 7LM2500-SA-MLG38 gas turbines, each generating 17,500 kilowatts (23,500 hp), and two Caterpillar Bravo 16 V Bravo diesel engines, each providing 5,650 kilowatts (7,580 hp).[4] These drive two propeller shafts, fitted with Wärtsilä controllable pitch propellers. The ships' maximum speed is over 28 knots (52 km/h; 32 mph), with a range of over 5,000 nautical miles (9,300 km; 5,800 mi) at 18 knots (33 km/h; 21 mph); although not fast enough to keep pace with an American carrier battle group, the RAN is happy with the speed/range tradeoff, as endurance is more important for Australian operating conditions. For in-harbour manoeuvring, each destroyer is fitted with a bow thruster. The standard ship's company is 186-strong, plus 16 additional personnel to operate and maintain the ship's helicopter. Additional accommodation increases the maximum potential complement to 31 officers and 203 sailors. Onboard electricity requirements (the hotel load) are supplied by four MTU prime mover diesel motors connected to Alconza alternators

Type 051B Class (Luhai Class) Chinese Destroyer

Tiers:

Variants:

- **Shenzhen:** Commissioned: Fleet: South Sea Fleet Status: Active

System

Alternative Designation: Type 051B; Luhai Class
Date of Introduction: 1999
Total Built: 1 vessel of this class
Type: Destroyer
Builder: INA
In Service: 1999-Present
Crew: 250 (40 officers)

Dimensions

Length: 155 m
Beam: 17.2 m
Draught: 6 m
Displacement: 6,100 tonnes (6,000 long tons; 6,700 short tons) tons

Propulsion System

Engine Name: INA
Engine Type: 2 Steam turbines
Engine Power: 94,000 shp (70,100 kW)
Maximum Range: 14,000 miles (23,000 km)
Maximum Speed: 31 knots (57 km/h; 36 mph)
Endurance: INA

Communications

Information Processing System: Information processing system designed by the 709th Institute (Reported speed: 10 Mbit/s)

Data Link: Data link: HN-900 (Chinese equivalent of Link 11 A/B, to be upgraded)

Communications: SNTI-240 SATCOM

Missile Weapon System

↳*Missile Weapon System #1*

Name: YJ-83

Type: Anti-Ship Missile

Launcher: INA

Length: INA

Diameter: INA

Engine: CTJ-2 turbojet

Warhead: 190 kg high-explosive fragmentation

Operational Range: 180 km

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Basic Load: 16

↳*Missile Weapon System #2*

Name: HQ-16

Type: Surface-to-Air Missile

Launcher: Vertical Launch System (VLS)

Length: INA

Diamter: INA

Operational Range: 40 km

Speed: INA

Note: HQ-16 (Hongqi-16) - Co-developed by China and Russia,believed to be based on either the SA-11 or SA-17.Credited with a range of 40 km. Also known as the HQ-16A.

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: Type 79A

Type: Naval Gun

Caliber: 100mm

Barrel Length: INA

Weight: INA

Elevation: INA

Traverse: deg360

Rate of Fire: INA

Maximum Firing Range: INA

Note: Based on the successful performance of the automated system, the manual backup system was eliminated in this upgrade. As a result, the total weight and size of the gun mount was reduced. Beside the obvious different in size, the most obvious visual external difference between Type 79 and Type 79A is that the Type 79 version has sharp edges, thus a very boxy look like the cars of the 1970s, while Type 79A has round and curved edges, thus a rather smooth look like the cars of the 1990s.

↳*Ammunition Gun Weapon System #1*

Type: Rifle

Caliber: 100mm

Basic Load: INA

↳*Gun Weapon System #2*

Name: Type 730 CIWS

Type: Close-In Weapon System

Caliber: 30mm

Quantity: 2 x Type 1130 CIWS

Main Armament: 1×30 mm H/PJ-12 or H/PJ-11 Gatling gun

Barrel Length: INA

Diameter: INA

Weight: INA

Barrels: 7-barrel

Crew: Automated, with human oversight

Rate of Fire: 1,200-4,200 rounds/minute

Maximum Firing Range: 3 km

Effective Firing Range: 1–1.5 km

Feed System: Type 730: One ammunition boxes, holding 640 rounds

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

Radar: The TR47C radar operates in the same way of AN/APY-1/2 radar on board E-3 Sentry in that the azimuth is scanned mechanically, while the elevation is scanned electronically, incorporating a total of 169 transceivers of phased array technology that enables the radar to pick up the splashes of 30 mm rounds. Like the western CIWS, the information is processed on site, via local computers of the radar and the gun mount, thus providing faster reaction time than the Russian design in which the radar and fire control system are separately located. The system can track a sea-skimming target with 0.1 square metre radar cross section at 8 km, extended to 15 km if the radar cross section is increased to 2 square metres, and further extended to 20 km if the radar cross section is increased to 10 square metres, though the targets could not be engaged until much closer (3 km) due to the limited range of the gun.

Fire Control System: The OFC-3 system is modular design that comprises a laser range finder, a color TV camera, and an IR camera, and the laser range finder can be replaced by a laser designator (for a laser beam-riding SAM), the TV camera can be replaced by a night vision camera, and the IR camera can be replaced by an ImIR, at higher cost.

Development to incorporate the dual band IR, night vision camera, and the color TV camera is reportedly in progress. Type 730 CIWS is an autonomous closed-loop system and thus offers faster reaction time than the Russian AK-630. Type 730 CIWS is fully compatible with Chinese and European combat data systems such as ZKJ-1, ZKJ-4, ZKJ-4A-3, ZKJ-5, ZKJ-6, ZKJ-7, H/ZBJ-1, and Thomson-CSF TAVITAC, and can be directly integrated with these combat data systems without any modification.

↳ ***Ammuntiion Gun Weapon System #2***

Type: Rifle

Caliber: 30mm

Shell: INA

Basic Load: INA

Torpedo Weapon Systems

Torpedo Tubes: 6 x Torpedo Tubes

Torpedo Name: INA

Torpedo Basic Load: INA

Onboard Aviation Facilities

Facilities: Hangar accommodating 2 helicopters Landing platform for one helicopter Helicopter landing system

Helicopters: 2 x helicopters: (Kamov Ka-28 or Harbin Z-9C)

Fire Control

FCS Name: INA

Computerized FCS: Yes

FCS Radar: Type 344 fire-control radar (for 100 mm gun & SSMs)

Radar Systems

Air and Surface Radar: Type 360S air/surface search radar

Air Search Radar: Sea Eagle 3-D air search radar

Fire Control Radar: Type 344 fire-control radar (for 100 mm gun & SSMs)

Sonar Systems

Hull Mounted Sonar: Yes (Name: INA)

Towed ArrayS Sonar: Yes (Name: INA)

Protection

Active Protection System: Yes

Electronic Warfare: INA

Decoys: INA

Notes:

The Type 051B Luhai-class is a class of destroyer built by the People's Republic of China. It consists of only one ship, DD-167 Shenzhen. When Shenzhen was commissioned into the People's Liberation Army Navy Surface Force in 1998, it was then, the largest surface combatant that China had ever built. It resembles in many ways an enlarged version of the Luhu-class destroyer, and is one of the first PLAN ships with a slope-sided hull to reduce radar signature. The 051B was succeeded by the domestic Type 052B, discounting the 4 Soviet built Sovremennyy-class destroyer China purchased in the interim. Shenzhen was laid down by the Dalian Shipyard in May 1996. The Shenzhen was intended to be an experimental vessel with improvements over the Luhu-class' in terms of modular construction and stealth. The ship is powered by two indigenous steam turbine engines, due to Dalian Shipyard's experience in steam turbine construction and that Chinese domestic research and development on marine gas turbines had not yet matured. The displacement of the Luhai-class is 2,000 tons heavier than the Type 052 destroyer, Luhu-class. Shenzhen was launched in 1997, although official revelation of the ship's existence did not come until the year following its commissioning. The chief designer of this class is academic, Mr. Pan Jingfu (□□□), who is also the designer of both the Type 051B's predecessor and successor. The main purpose of the Type 051B was to gain experience in modern naval ship design and construction, and refining the knowledge and skills accumulated from the earlier Type 052, such as integrating many different foreign subsystems on the Type 052 more effectively. The ship is powered by steam turbines due to the 1989 western arms embargo and that domestic gas turbines were not ready in time. The Type 051B also employed stealth construction techniques which resulted in a smaller radar cross section in comparison to its predecessor. Analysts speculated that the ship would have been equipped with an VLS system in the forward section for air-defense SAMs. However, when the ship was finally revealed, it was still armed with the 8-cell HQ-7 SAM launcher. These SAMs lack effectiveness against sea skimming missiles with multiple approaching angles. The PLAN was unsatisfied with the design and no further ships of the class were built. At the time, area air defence for the fleet was the PLAN's priority which older systems couldn't sufficiently provide, and since the capability couldn't be served by the final vessel the gap remained open. As a result, the decision to import two pairs of Sovremennyy-class destroyer from Russia was determined to fulfil the role. However, Type 051B does have an advantage over earlier Chinese principle surface combatants and Russian ships in that it is the first Chinese naval ship to be equipped with fleet formation command and control system so it can act as a flagship of the fleet. The sole Type 051B destroyer 167 Shenzhen participated in the PLA Navy's first goodwill visit to Africa in 2000, the first visit to Europe in 2001 and the first visit to Japan in 2007. In 2004, the ship received its mid-life modernization refit, with its original 100mm main gun and the HQ-7 air defense missile system being replaced by improved models. Type 051B destroyer 167 Shenzhen visited Kochi, India for four days in August 2009, after deployment in the Gulf of Aden on anti-piracy operations. 2015 Refit and upgrades: In early 2015, the sole Type 051B destroyer was spotted at the Zhanjiang naval base undergoing work. Initially it was unclear whether this was due to a midlife refit program or decommissioning, but pictures revealed in January 2016 that the ship was being refitted with new systems. For self-defense, the four old Type 76A 37 mm AA guns were replaced with two H/PJ-11 eleven-barreled 30 mm CIWS (export designation Type 1130), one covering each side. Anti-aircraft defense is upgraded from the 8-unit HQ-7 with a 10–15 km (6.2–9.3 mi) range to a 32-cell vertical launch system (VLS) in front of the superstructure for 50–60 km (31–37 mi)-ranged HQ-16s, directed by four Type 345 (Front-Dome type) illuminators, increasing SAM coverage by 16 times. The helicopter hangar was modified to carry a single Ka-28 ASW helicopter in place of the original dual Z-9 hangar, and two new mast structures were fitted; a Type 382 Radar on the forward mast and a Type 364 targeting radar (under dome) on the aft mast. The upgrades give the Type 051B weapon and sensor capabilities similar to the Type 054A frigate. The Type 382 replaced the Type 381 singe-faced phased-array radar, and moved from the aft to the forward mast to remove the blind arc it previously exhibited, the quarterdeck was fully enclosed, and new apertures were added in the transom indicating that torpedo decoy and towed array sonar systems have been added; a variable depth sonar has not been installed. The ship completed the weapon systems upgrade in August 2016. In May 2020, it was revealed that the Type 051B had its YJ-83 subsonic ASMs replaced with 16 supersonic YJ-12 missiles.

System

Alternative Designation: Iver Huitfeldt Class
Total Built: 3 ships built
Type: Frigate
Builder: Odense Staalskibsværft Baltija Shipbuilding Yard Loksa Shipyard
In Service: 2011-Present
Crew: 101 total + air group

Dimensions

Length: 138.70 m
Beam: 19.50 m
Draft: 6.30 m
Displacement, Standard: 4,000 tons
Displacement, Full Load: 5,850 tons

Propulsion System

Engine Name: 4 x MTU 8000 M-70 diesels
Engine Type: Diesel
Engine Power: 44,600 total bhp
Propeller: 2 variable-pitch propellers
Bow-thruster: Yes

Maximum Range: 15,000 nm at 9 knots

Maximum Speed: 28 knots

Endurance: INA

Missile Weapon System

↳*Missile Weapon System #1*

Name: BGM-109A Tomahawk Land-Attack Missile (TLAM)

Type: Long-Range Cruise Missile

Quantity: 1 x 8-tubed Lockheed-Martin Mark 41 VLS system

Manufacturer: General Dynamics (initially) McDonnell Douglas Hughes Aircraft Corporation Raytheon

Proliferation: Widely Proliferated

In Service: 1983-Present

Launcher: 8-tubed Lockheed-Martin Mark 41 VLS system

Missile Basic Load: INA

Length: Without booster: 18 ft 3 in (5.56 m) With booster: 20 ft 6 in (6.25 m)

Diameter: 0.52 m

Wingspan: 2.67 m

Weight: 2,900 lb (1,300 kg), 3,500 lb (1,600 kg) with booster

Warhead: Nuclear: W80 warhead (retired) Conventional: 1,000 pounds (450 kg) high explosive or submunition dispenser with BLU-97/B Combined Effects Bomb or PBXN

Detonation Mechanism: FMU-148 since TLAM Block III, others for special applications

Engine: Williams International F107-WR-402 turbofan using TH-dimer fuel and a solid-fuel rocket booster

Operational Range: Block II TLAM-A – 1,350 nmi (1,550 mi; 2,500 km) Block III TLAM-C, Block IV TLAM-E – 900 nmi (1,000 mi; 1,700 km) Block III TLAM-D – 700 nmi (810 mi; 1,300 km)

Flight Altitude: 98–164 ft (30–50 m) AGL

Speed: Subsonic; ~Mach 0.74. about 550 mph (480 kn; 890 km/h)

Guidance System: GPS, INS, TERCOM, DSMAC, active radar homing (RGM/UGM-109B)

Launch Platforms: Vertical Launch System (VLS) and horizontal submarine torpedo tubes (known as TTL (torpedo tube launch))

↳*Missile Weapon System #2*

Name: RIM-7 Sea Sparrow

Type: Anti-Aircraft and Anti-Ship Missile

Quantity: 2 x 12-tubed Raytheon Mk 56 VLS system

Launcher: 12-tubed Raytheon Mk 56 VLS system

Missile Basic Load: 24

Length: 3.7 m

Diameter: 20 cm

Wingspan: 1.02 m

Weight: 230 kg

Warhead: Annular blast fragmentation warhead, 90 lb (41 kg)

Detonation Mechanism: Proximity fuzed, expanding rod, with a 27 ft (8.2 m) kill radius

Engine: Hercules MK-58 solid-propellant rocket motor

Operational Range: 19 km

Speed: 4,256 km/h (2,645 mph)

Guidance System: Semi-active radar homing

Launch Platform: Ship

↳*Missile Weapon System #3*

Name: RGM-84C Block II Harpoon

Type: Anti-Ship Missile

Quantity: 2 x 8-tubed Harpoon SSM Launchers Systems

Launcher: 8-tubed Harpoon SSM Launchers Systems

Missile Basic Load: 16

Length: Air-launched: 12.6 ft (3.8 m); Surface- and submarine-launched: 15 ft (4.6 m)

Diameter: (34 cm

Wingspan: 0.91 m

Weight: 1,523 lb (691 kg) with booster

Warhead: 221 kg

Detonation Mechanism: Impact fuze

Engine: Teledyne CAE J402 Turbojet/solid propellant booster for surface and submarine launch; greater than 600 pounds (greater than 272.2 kg) of thrust

Operational Range: in excess of 150 nmi (280 km) depending on launch platform

Flight Altitude: Sea-skimming

Speed: 537 mph (864 km/h; 240 m/s; Mach 0.71)

Guidance System: Sea-skimming cruise monitored by radar altimeter / active radar terminal homing

Launch Platform: multi-platform: RGM-84A surface-launched AGM-84A air-launched UGM-84A submarine-launched

↳*Missile Weapon System #4*

Name: FIM-92 Stinger

Type: Surface-to-Air Missile

Quantity: 6 x Twin Sea Stinger SAM launchers

Launcher: Twin Sea Stinger SAM launchers

Missile Basic Load: 6

Length: 1.52 m

Diameter: 70.1mm

Weight: 15.19 kg

Crew: 1

Warhead: High explosive annular blast fragmentation

Warhead Weight: 3 kg

Engine: Solid-fuel rocket motor

Guidance System: Infrared homing

Launch Platform: MANPADS, M6 Linebacker, Multi-Mission Launcher, Eurocopter Tiger, AN/TWQ-1 Avenger, MQ-1 Predator, AH-64 Apache, T-129 ATAK

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: OTO Melara

Type: Naval Gun

Caliber: 76,,

Quantity: 2 x 76-mm/62-cal Mark 75 Oto Melara Compact DP Weapon Stations

Barrel Length: 62 caliber: 4,724.4 mm (186.00 in)

Weight: Empty: 7.5 tonnes (17,000 lb)

Crew: Remote Controlled

Elevation: −15°/+85° speed: 35°/s (acceleration: 72°/s²)

Traverse: 360° speed: 60°/s (acceleration: 72°/s²)

Rate of Fire: Compact: 85 rounds/min Super Rapid: 120 rounds/min

Muzzle Velocity: 915 m/s (3,000 ft/s)

Maximum Firing Range: HE-PFF 16,000 m SAPOMER 20,000 m VULCANO 40,000 m

Feed System: Magazine capacity: 80 ready rounds on Compact gun mount

↳*Ammunition Gun Weapon System #1*

Type: Rifle

Caliber: mm76

Shell: 76×636mmR cartridge weight 12.5 kilograms (28 lb) shell weight 6.3 kilograms (14 lb) propellant weight 2.35 kilograms (5.2 lb)

Shell Weight: INA

Basic Load: INA

↳*Gun Weapon System #2*

Name: Rheinmetall Oerlikon Millennium Gun

Type: Close-In Weapon System (CIWS)

Caliber: 35mm

Quantity: 2 x 35-mm Oerlikon-Contraves Millennium AA

Length: 5.5 m

Width: 2.39 m

Height: 1.94 m

Weight: Gun: 450 kg Installation: 3300 kg

Crew: unmanned

Action: Gas-operated revolver cannon

Elevation: -15 / +85 degrees rate: 70 degree/s

Traverse: 360 degrees rate: 120 degrees per second

Rate of Fire: Single shot Rapid Single Shot: 200 rounds per minute Burst (automatic fire): 1000 rounds per minute

Muzzle Velocity: AHEAD: 1,050 m/s (3,445 ft/s) HEI: 1,175 m/s (3,854 ft/s) APDS/T: 1,440 m/s (4,724 ft/s)

Effective Firing Range: 3,500–5,000 m (3,800–5,500 yd)

Feed System: 252 linkless rounds in installation

↳*Ammuntiion Gun Weapon System #2*

Type: Rifle

Caliber: 35mm

Shell: 35×228mm

Shell Weight: INA

Basic Load: INA

↳*Gun Weapon System #3*

Name: AX50

Type: Anti-Material Rifle

Quantity: 7 x 12.7mm machine guns

Manufacturer: Accuracy International

Proliferation: Bangladesh: Recently started to be used by Bangladesh Army. Denmark: Awarded contract with Danish Defence. Due to be introduced into Service. Turkey: In service with Turkish Police Special Operation Department. United Kingdom: It has replaced the AW50 as the British Army's standard .50 BMG rifle. Malaysia: Used By Malaysian Army. Singapore: Employed by the Special Operations Force. Peru: used by the special forces of the navy and air force of Peru

In Service: 2010-Present

Length: 1,370 mm (53.9 in) 1,115 mm (43.9 in) folded

Barrel Length: 685.8 mm (27.0 in)

Width: 125 mm (4.92 in)

Height: 190 mm (7.48 in)

Weight: 12.5 kg (27.6 lb) (no scope/no rails, empty mag)

Action: Bolt-action

Muzzle Velocity: 900 m/s (2,953 ft/s)

Effective Firing Range: 2,500 m (2,734 yd)

Feed System: 5-round detachable box magazine

Sights: Standard: S&B 5-25×56 PM II telescopic sight

↳ ***Ammunition Gun Weapon System #3***

Decoy #1: 2 x Sea Gnat DL-12T decoy/chaff launchers

Decoy #2: 2 x Sea Gnat DL-6T decoy/chaff launchers

NBC Protection: Yes

Notes:

The Iver Huitfeldt class is a three-ship class of frigates that entered service with the Royal Danish Navy in 2012 and 2013. The class is built on the experience gained from the Absalon-class support ships, and by reusing the basic hull design of the Absalon class the Royal Danish Navy have been able to construct the Iver Huitfeldt class considerably cheaper than comparable ships. Side view of frigate Niels Juel in front of green hills of Harstad port F363 Niels Juel in Harstad (Norway), June 2018 The frigates are compatible with the Danish Navy's StanFlex modular mission payload system used in the Absalons, and are designed with slots for six modules. Each of the four stanflex positions on the missile deck is able to accommodate either the Mark 141 8-cell Harpoon launcher module, or the 12-cell Mark 56 ESSM VLS. The Peter Willemoes passed the British Flag Officer Sea Training test in 2015. While the Absalon-class ships are primarily designed for command and support roles, with a large ro-ro deck, the three new Iver Huitfeldt-class frigates will be equipped for an air defence role with Standard Missiles, and the potential to use Tomahawk cruise missiles, a first for the Danish Navy. The ships were constructed in blocks in Estonia and Lithuania. These blocks were then towed to Odense where they were assembled.

Recoil: 20 in (51 cm)

Rate of Fire: 50 to 60 rounds per minute

↳*Ammunition Weapon Station #1*

Shell: INA

Caliber: mm100

Shell Weight: 26.8 kg

Type: HE anti-air or HE fragmentation varieties.

Basic Load: Typical ammo stowage: 350 rounds for a 4,000 ton class frigate

↳*Weapon Station #2*

Name: SS-N-27 Sizzler

Type: Anti-Ship Cruise Missile

Quantity: 8

Proliferation: Widely Proliferated Russia: Russian Navy uses the 3M14, 3M54, 3M54-1, 91R1, 91RT2. Submarine launched variants (entered service in 2016) are used by Kilo-class submarine, Lada-class submarine, Akula-class submarine, Oscar II-class submarine and the Yasen-class submarine. Surface ship launched variants are used by the

Gremyashchy class, Karakurt class, Buyan-M class corvettes, Gepard class, Admiral Gorshkov class and the Admiral Grigorovich class frigates. Algeria: The Algerian National Navy uses the 'Club-S' variant for their Kilo class submarines. India: The Indian Navy uses both 'Club-S' and 'Club-N' variants for the Kilo class submarines (known as the Sindhughosh Class in Indian service), the Talwar class frigates respectively. Vietnam: The Vietnam People's navy uses the 'Club-S' variant for its six Kilo class submarines. China: The People's Liberation Army Navy uses the 'Club-S' variant for its Kilo class submarines. Iran: Contradictory sources indicate that the Iranian Navy is thought to have purchased or is about to purchase 'Club-S' missiles for its three Kilo class submarines.

Manufacturer: Novator Design Bureau, KTRV, MKB Fakel, NPO Mash, Raduga, NPO Zvezda Strela (Orenburg)

In Service: 1990-Present

Length: Varies on variant, from 6.2 m to 8.9 m

Diameter: 0.533 m

Warhead: 400-500 kg HE or thermonuclear

Weight: Varies on variant, from 1,300 kg-1780 kg-2300 kg

Engine: Multi-stage solid-fuel rocket, turbojet engine for 3M-54/E/TE/E1/TE1, -14/E/TE, solid fuel rocket for 91RE1/RTE2

Operational Range: 91RE1: 50 km 3M-54E (export version): 220 km 3M-54E1/3M-14E (export version): 300 km 3M-54/3M-54T: 660 km 3M-14/3M-14T: 1,500-2,500 km Kalibr-M: 4,500 km

Flight Ceiling: 1,000 m

Flight Altitude: 50-150 m AGL 20 m over water

Speed: 0.8-2.5-2.9 Mach

Guidance System: Inertial guidance plus terminal Active radar homing, By satellites, DSMAC

Accuracy: 3 m (Club-S/Kalibr-PL)

Launch Platforms: naval ships, submarines, containers, airplanes, TEL

↳*Weapon Station #3*

Name: Kashtan CIWS

Type: close-in weapon system (CIWS) is a modern naval air defence gun-missile system deployed by the Russian Navy

Caliber: 30mm

Barrel Length: INA

Quantity: 2

Main Armament: 8 × 9M311K + 32 missiles[N 4]N Kashtan-M: 8 × 9M311-1E + 24 missiles

Secondary Armament: 2 × AO-18K autocannon Kashtan-M: 2 × AO-18KD autocannon

Barrels: 2 × 6 (guns); 2 × 4 launch tubes

Height: 2,250 mm (89 in) (above deck)

Weight: 15,500 kg (34,200 lb) (Kashtan) 12,500 kg (27,600 lb) (Kashtan-M)

Action: Gas-operated rotary cannon

Rate of Fire: Kashtan:[N 2] 9,000 rounds/min (guns) Kashtan-M:[N 2] 1–2 (salvo) missiles per 3–4 sec 10,000 rounds/min (guns)

Muzzle Velocity: 860 m/s (2,800 ft/s) (HEIF, FT) Kashtan-M: 960 m/s (3,100 ft/s) (HEIF, FT) 1,100 m/s (3,600 ft/s) (APDS-T

Effective Firing Range: By missiles: Kashtan: 1,500–8,000 m (4,900–26,200 ft) Kashtan-M: 1,500–10,000 m (4,900–32,800 ft) By guns: Kashtan: (range, altitude) 500–4,000 m (1,600–13,100 ft), 3,000 m (9,800 ft) Kashtan-M: 300–5,000 m (980–16,400 ft)

Feed System: Link-less, helical; 1000 rounds

Sights: Radar / TV-optical:[N 3] 2–3/1 m (6.6–9.8/3.3 ft) accuracy, tracks 6 targets simultaneously

Warhead: Continuous-rod w/ frag layer

Note: The weapon is a modular system consisting of a command module and typically two combat modules, as in the case of the two Sovremennyy-class destroyers Taizhou (ex-Vnushitelnyy) and Ningbo (ex-Vechnyy) in Chinese service, although the number can be as many as 8 in the case of Admiral Kuznetsov. The command module detects and tracks threats, distributes targeting data to the combat modules, and interrogates IFF of approaching threats. The command module has a 3-D target detection radar, and an all weather multi-band integrated control system. Depending on the number of installed combat modules, the system can engage multiple targets simultaneously. The combat modules automatically track using either radar, electro-optronic control system (such as FLIRs) or both, and then engages targets with missiles and guns. The combat modules are typically equipped with two GSh-30K (AO-18K) six-barrel 30 mm rotary cannons, fed by a link-less feeding mechanism, and two 9M311-1 missile launchers equipped with 4 ready-to-fire missiles each and fed by a reloading system storing 32 missiles in ready-to-launch containers. The guns used in the Kortik are the GSh-30K six-barrel 30 mm rotary cannon. Individually, each GSh-30K has a higher rate of fire compared to other guns used by other CIWS such as the GAU-8 on the Goalkeeper and the M61 Vulcan on the Phalanx. Along with a high rate of fire, the fairly heavy round (390 g or 14 oz) used by the Kortik is comparable to the DPU rounds of the GAU-8 Avenger (425 g or 15.0 oz), although the muzzle velocity (and therefore both the kinetic energy and effective range) is slightly lower, partially offsetting the high caliber and rate of fire. The missiles used in the Kortik are the 9M311 missiles, which is also used on the 9K22 Tunguska. The 9M311 is a SACLOS guided missile, however, it is steered automatically by the command module. The warhead weighs 9 kilograms (20 lb) and is either laser or radio fused. The warhead is a continuous-rod warhead with a steel cube fragmentation layer. The detonation of the warhead will form a complete circle of fragmentation that is 5 meters in radius, and damage or destroy anything in that circle. The combination of the missiles and guns, provides more comprehensive protection when compared to other CIWS utilising either missiles or guns only. The system's combined kill probability is 0.96 to 0.99

Flight Altitude: 3,500 m (11,500 ft) (Kashtan) 6,000 m (20,000 ft) (Kashtan-M)

↳*Ammunition Weapon Station #3*

Shell: HEI-Frag, Frag-T, APDS-T

Caliber: 30mm

Shell Weight: 0.39 kg (0.86 lb) (HEIF, FT)[6] 0.30 kg (0.66 lb) (APDS-T)[

Basic Load: INA

↳*Weapon Station #4*

Name: RBU-6000 Smerch-2

Type: 213 mm caliber Soviet anti-submarine rocket launcher.

Quantity: 1

Launcher Length: 2 m

Launcher Width: 1.75 m

Launcher Height: 2.25 m

Launcher Weight: 3,100 kg (empty)

Maximum Elevation: deg+65

Minimum Elevation: deg-15

Traverse Range: deg180

Traverse Left: deg90

Traverse Right: deg90

↳*Rocket Weapon Station #5*

Name: RGB-60

Type: Ballistic Anti-Submarine Rocket

Length: 1.83 m

Diameter: 0.212 m

Warhead Weight: 23 kg

Weight: 113.5 kg

Range: Ballistic 1 - 350 m to 1700 m, Ballistic 2 - 1500 m to 5500 m

Depth: 10 to 500 m

Sink Rate: 11.6m/s

↳*Weapon Station #6*

Name: DTA-52

Type: Twin 533mm fixed Torpedo Launchers

Quantity: 2

Torpedo Basic Load: INA

Maximum Effective Range: On Average, The torpedo has an effective launch range of 7km and cruising range of 10km.

Note: There is no information on the type of torpedoes used onboard this vessel.

Sonar #2: 1 x SNN-137 towed-active array

Notes:

The Admiral Grigorovich class, also referred to as Krivak IV class, Russian designation Project 11356P/M, is a class of frigates built by the Yantar Shipyard in Kaliningrad for the Russian Navy. Based on the Talwar class, six ships were ordered for the Russian Black Sea Fleet under two contracts in 2010 and 2011 as a complement to the Admiral Gorshkov class frigates. By 2010-2011, it was decided the Russian Navy will procure six vessels based on the proven Talwar class design, mainly due to repeated delays with production of Admiral Gorshkov frigates and because of the urgent need for new frigates necessary for modernization of the Black Sea Fleet. The Yantar Shipyard won the contract for construction of the frigates and three vessels was to be completed in four years. Previously, six ships of the same design, known as Talwar class, were built for the Indian Navy between 1999 and 2011 by the Baltic Shipyard, Saint Petersburg and Yantar Shipyard, Kaliningrad. The lead ship, Admiral Grigorovich, was laid down on 18 December 2010 and was commissioned on 11 March 2016. Initially, Ukrainian state-owned

enterprise Zorya-Mashproekt was providing gas turbines for the Russian frigates, but after the Ukrainian crisis, Ukraine said it would no longer supply the engines. Instead, Russian manufacturer Saturn was asked to supply alternative M90FR gas turbines. Since October 2016, it was claimed the three incomplete frigates, Admiral Butakov, Admiral Istomin and Admiral Kornilov, that construction was suspended in 2015 due to Ukraine's refusal to supply gas turbine power plants, are considered to be sold to India. The Russian Navy has opposed this export. On 1 June 2017, the United Shipbuilding Corporation (USC) announced that it would resume construction of the last three frigates in 2018 and that the ships will later join the Russian Navy. The decision to resume the work was made following the preliminary testing of latest Russian gas turbine engines, the M70FRU (14 MW), M70FRU2 (6-8 MW) and M90FR (20 MW , maximal 25-28 MW), from the United Engine Corporation, built at NPO Saturn and TurboRus plants. With an access to alternative power plants, the ships were believed to remain in Russian service. However, on 27 October 2018, India's Ministry of Defence and Russia signed a US$950 million deal for delivery of two incomplete Admiral Grigorovich-class frigates to the Indian Navy. Reportedly, these are to be Admiral Butakov and Admiral Istomin frigates, previously being built for the Russian Navy. As of February 2019, the last three vessels remain without engines. On 3 November 2016, as part of Russian military intervention in the Syrian Civil War, Admiral Grigorivich was deployed to the Mediterranean Sea for the first time. On 15 November 2016, it has launched Kalibr cruise missile on IS and Al-Nusra targets in Syria's Idlib and Homs provinces, destroying ammunition warehouses, gathering and training centers and weapon production plants. Admiral Grigorivich was redeployed to the Mediterranean Sea in April 2017, following the US missile strikes against Syria. On 20 November 2018, Rosoboronexport and Goa Shipyard signed a US$500 million deal for construction of additional two Admiral Grigorovich-class frigates for the Indian Navy. The frigates are to be license-built at the Goa Shipyard in India under a technology transfer from Russia. The construction is expected to start in 2020, with first vessel to be delivered in 2026 and second in 2027.

Shivalik Class (Project 17 Class) Indian Frigate

Tiers:

Variants:

- **INS Shivalik:** Commissioned: 2010 Home Port: Visakhapatnam Status: Active
- **INS Satpura:** Commissioned: 2011 Home Port: Visakhapatnam Status: Active
- **INS Sahyadri:** Commissioned: 2012 Home Port: Visakhapatnam Status: Active

System

Alternative Designation: Shivalik class or Project 17 class
Total Built: 3 vessels built
Type: Frigate
Builder: Mazagon Dock Limited
In Service: 2010-Present
Crew: 257 men

Dimensions

Length: 142.5 m
Beam: 16.9 m
Draft: 4.5 m
Displacement, Full Load: 6,200 tonnes (6,100 long tons; 6,800 short tons) full load

Propulsion System

Diesel Engine Name: 2 × Pielstick 16 PA6 STC Diesel engines
Diesel Engine Power: 15,200 shp

Turbine Name: 2 × GE LM2500+

Turbine Power: 33,600 shp

Maximum Range: In excess of 5,000 nautical miles (9,000 km) at 18 kn (33 km/h)

Maximum Speed: 32 knots (59 km/h; 37 mph) 22 knots (41 km/h; 25 mph) (diesel engines)

Endurance: INA

Missile Weapon System

↳*Missile Weapon System #1*

Name: Barak 1

Type: Surface-to-Air Missile

Quantity: 1 x 32-cell VLS launcher

Launcher: Vertical Launch System (VLS)

Missile Basic Load: INA

Length: 2.1 m

Diameter: 177mm

Wingspan: 685 mm

Weight: 98 kg

Warhead: 22 kg blast fragmentation warhead

Detonation Mechanism: Proximity fuze

Operational Range: 0.5-12 km

Flight Altitude: 5.5 km

Speed: Mach 2.1 (720 m/s)

Guidance System: Radar CLOS guidance

Launch Platform: Surface Ship

↳*Missile Weapon System #2*

Name: 3M-54 Kalibr

Type: Cruise Missile

Quantity: 8 × VLS launchers

Launcher: Vertical Launch System

Length: Varies on variant, from 6.2 m to 8.9 m

Diameter: 0.533 m

Weight: Varies on variant, from 1,300 kg-1780 kg-2300 kg

Warhead: 400-500 kg HE or thermonuclear

Engine: Multi-stage solid-fuel rocket, turbojet engine for 3M-54/E/TE/E1/TE1, -14/E/TE, solid fuel rocket for 91RE1/RTE2

Operational Range: 50 km

Flight Ceiling: 1,000 m

Flight Altitude: 50-150 m AGL 20 m over water

Speed: 0.8-2.5-2.9 Mach

Guidance System: Inertial guidance plus terminal Active radar homing, By satellites, DSMAC

Accuracy: 3 m

Launch Platform: naval ships, submarines, containers, airplanes, TEL

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: OTO Melara

Type: Naval Gun

Caliber: 76mm

Quantity: 1 × OTO Melara 76 mm naval gun

Barrel Length: 62 caliber: 4,724.4 mm (186.00 in)

Weight: Empty: 7.5 tons

Crew: Remote Controled

Elevation: −15°/+85° speed: 35°/s (acceleration: 72°/s²)

Traverse: 360° speed: 60°/s (acceleration: 72°/s²)

Rate of Fire: Compact: 85 rounds/min Super Rapid: 120 rounds/min

Muzzle Velocity: 915 m/s

Maximum Firing Range: HE-PFF 16,000 m

Feed System: Magazine capacity: 80 ready rounds on Compact gun mount

↳*Ammunition Gun Weapon System #1*

Type: Rifle

Caliber: mm76

Shell: 76×636mmR cartridge weight 12.5 kilograms (28 lb) shell weight 6.3 kilograms (14 lb) propellant weight 2.35 kilograms (5.2 lb)

Basic Load: INA

↳*Gun Weapon System #2*

Name: AK-630

Type: Close-In Weapon System

Caliber: 30mm

Quantity: 2 × AK-630 CIWS Stations

Main Armament: 1 or 2 AO-18 autocannons

Secondary Armament: 4 9A4172 missiles

Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)

Width: 1,240 mm

Height: 1,070 mm (42 in) (above deck) 2,050 mm (81 in) (below deck)

Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630) 1,800 kg (4,000 lb) (AK-630M) 2,500 kg (5,500 lb) (AK-630M-2) External nodes: 800 kg (1,800 lb) (AK-630) 2000 rounds in belt: 1,918 kg (4,228 lb)

Crew: 1

Fire Control: Vympel MR-123; Vympel-A MR-123/176 5.2 tonnes (5.7 short tons); Vympel-AM MR-123-02/MR-123-03; and Vympel-AME MR-123-02/176) 1 tonne (2,200 lb) (Laska 5P-10E)

Barrels: 6

Action: Gas-operated rotary cannon

Elevation: +88° ... -12° (50°/sec)

Traverse: ±180° (70°/sec)

Muzzle Velocity: 880–900 m/s

Rate of Fire: 4,000–5,000 rounds/min

Maximum Firing Range: the projectiles self-destruct past 5,000 m (16,000 ft) range

Effective Fring Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime)

Feed System: Belt: 2,000 rounds (additional 1,000 rounds in reserve feed bin

Sights: Radar / TV-optical

NBC Protection: Yes

Notes:

The Shivalik class or Project 17 class is a class of multi-role frigates in service with the Indian Navy. They are the first stealth warships built in India. They were designed to have better stealth features and land-attack capabilities than the preceding Talwar-class frigates. A total of three ships were built between 2000 and 2010, and all three were in commission by 2012. The Shivalik class, along with the seven Project 17A frigates currently being developed from them, are projected be the principal frigates of the Indian Navy in the first half of the 21st century. All ships of the class were built by Mazagon Dock Limited. The class and the lead vessel have been named for the Shivalik hills. Subsequent vessels in the class are also named for hill-ranges in India. Project 17 was conceived in the 1990s to meet the Indian Navy's need for a class of stealthy frigates that were to be designed and built in India. The Directorate of Naval Design (DND)'s specifications for the project called for a class of "5000 ton stealth frigates (Project 17) incorporating advanced signature suppression and signature management features". The first three units were formally ordered by the Indian Navy in early 1999. Shivalik's design embodies many firsts in Indian ships. Shivalik is the first Indian naval vessel to use a combined diesel or gas (CODOG) propulsion system. The CODOG gearboxes were designed and built by Elecon Engineering. An officer's cabin on the INS Shivalik The main features of the class are its stealth characteristics and land-attack capability. The ships incorporate structural, thermal and acoustic stealth features. The vessels use 10 gigabit LAN for their network. There has also been an increased emphasis on crew comfort in this class of ships with more spacious accommodation being provided. Also, INS Shivalik is the first ship in the Indian Navy with chapati- and dosa-makers on board. The Shivalik-class frigates have a length of 142.5 m (468 ft) overall, a beam of 16.9 m (55 ft) and a draft of 4.5 m (15 ft). The ships displace about 4,900 tonnes (4,800 long tons; 5,400 short tons) at normal load and 6,200 tonnes (6,100 long tons; 6,800 short tons) at full load. The complement is about 257, including 35 officers. They use two Pielstick 16 PA6 STC Diesel engines and two GE LM2500+ boost turbines in CODOG configuration providing a total of 47,370 shp (35,320 kW) of power. This allows the ships to reach a maximum speed of 32 knots (59 km/h; 37 mph).

- **Saif:** F-22P Zulfiquar-class frigate, Commissioned: 2010, Fleet: INA , Status: Active.
- **Aslat:** F-22P Zulfiquar-class frigate, Commissioned: 2013, Fleet: INA , Status: Active.

System

Alternative Designation: Type 053H3, Jiangwei II Class
Type: Frigate
Builder: Hudong Shipyard,Guangzhou Shipyard KSEW Shipyard
In Service: 14 Frigates in service 1998 - Present
Crew: 168
2015 Upgrade: A limited, mid-life upgrade was observed for the 053H3 starting in 2015. Visible difference include the replacement of the ESM/EW suite/radars to similar systems from the Type 054, replacement of the HQ-7 with the HHQ-10 short range air defense missile and replacement of the 4 x Type 76A 37mm guns with a new 2 x 30mm CIWS similar to the Gryazev-Shipunov AO-18K.

Dimensions

Length: 122 m
Beam: 12.4 m
Draft: 4.3 m
Displacement, Full Load: 2,393 tons

Propulsion System

Engine Name: CODAD, 2 shaft
Engine Type: 2 x 18E390VA diesel 2 x MTU diesel
Engine Power: 2 x 18E390VA diesel at 17,600 kW 2 x MTU diesel at 6,499 kW
Maximum Range: 5,800 miles
Maximum Speed: 16 knots (30 km/h)
Endurance: INA

Gun Weapon Systems

↳*Gun Weapon System #1: PJ33A Twin 100 mm gun, Type 79*

Name: PJ33A Twin 100 mm gun, Type 76
Type: Naval anti-aircraft and anti-surface
Caliber: mmMunition specific (see ammunition section)
Manufacturer: INA
Length: 5.8 m
Barrel Length: 4.6 m
Weight: 34 tons
Crew: INA
Elevation: -5 /85 degrees
Traverse: INA
Rate of Fire: 25 rounds per minute
Muzzle Velocity: Munition specific (see ammunition section)
Effective Firing Range: Maximum Range 22,241m, AA Ceiling: 10,000m
Notes: Basic Load: 26 ready service rounds per gun. Approximate Barrel Life 800

↳*Gun Weapon System #1, PJ33A, Ammunition: AA Grenade, AA (ZS-56), AA (ZS-56P*

Type: Rifle
Caliber: 5.3 Calibers
Shell: Anti Aircraft
Basic Load: Varies
Muzzle Velocity: 900 mps

Weight: 15.6 kg to 15.9 kg

Bursting Charge: 0.79 kg to 1.23 kg

Propellant Charge Weight: 13.2 kg

↳*Gun Weapon System #1, PJ33A, Ammunition: HE Mod 1928*

Type: Rifle

Caliber: 5.2 calibers

Shell: High Explosive

Basic Load: Varies

Muzzle Velocity: 895 mps

Weight: 15.8 kg

Bursting Charge: 1.25 kg

Propellant Charge Weight: 6.0 kg

↳*Gun Weapon System #1, PJ33A, Ammunition: Diving*

Type: Rifle

Caliber: 5.04 calibers

Shell: Diving (sub surface impact)

Basic Load: Varies

Muzzle Velocity: 250 mps

Projectile Weight: 15.0 kg

Bursting Charge Weight: 2.85 kg

Propellant Charge Weight: 6.0 kg

↳*Gun Weapon System #1, PJ33A, Ammunition: Star Shell (SB-56)*

Type: Rifle

Caliber: 5.2 calibers

Shell: Star Shell (illumination)

Basic Load: Varies

Muzzle Velocity: 646 mps

Projectile Weight: 16.0 kg

Bursting Charge Weight: 0.015 kg

Propellant Charge Weight: 6.0 kg

↳*Gun Weapon System #1, PJ33A, Ammunition: ECM (anti radar) (PB-56)*

Type: Rifle

Caliber: INA

Shell: ECM (anti-radar)(Electronic Counter Measures) (PB-56) (reflective material)

Basic Load: Varies

Muzzle Velocity: INA

Projectile Weight: INA

Bursting Charge Weight: INA

Propellant Charge Weight: 6.0 kg

↳*Gun Weapon System #2: Type 76A Twin, 37mm, AA Gun*

Name: Type 76A Twin 37mm AA gun

Type: Naval Anti Aircraft

Caliber: Munition specific (see ammunition section)

Manufacturer: INA

Length: 2.729 m including flash suppressor and breech

Barrel Length: 2.315 m (62.5 calibers) without flash suppresser

Weight: 126 kg

Crew: INA

Elevation: -10 / +85 degrees

Traverse: INA

Rate of Fire: INA

Muzzle Velocity: Varies with projectile

Effective Firing Range: Ballistic range: 8,400 m, Maximum AA ceiling: 5,000 m, Effective AA Ceiling 4,000 m

Notes:

↳*Gun Weapon System #2, Type 76A, Ammunition: HE-FRAG/ HE-FRAG Tracer*

Type: Rifle

Caliber: HE FRAG: 4.7 Calibers/ HE FRAG Tracer 4.4 Calibers

Shell: HE-FRAG/ HE- FRAG Tracer

Basic Load: INA

Muzzle Velocity: 880 mps

Complete Round Weights: 1.496 kg

Projectile Weights: 0.732 kg

Propellant Charge Weight: 0.21 kg

↳*Gun Weapon System #2, Type 76A, Ammunition: AP/ AP Tracer*

Type: Rifle

Caliber: mmAP tracer: 4.5 calibers/ AP: 4.2 calibers

Shell: AP tracer/ AP

Basic Load: INA

Muzzle Velocity: 880 mps

Complete Round Weights: 1.522 kg

Projectile Weights: 0.758 kg

Propellant Charge Weight: 0.21 kg

Missile Weapon Systems

↳*Missile Weapon Systems #1: YJ-83 Missile Launcher*

Name: YJ-83 Launchers

Type: Missile Launcher

Quantity: 8 x twin YJ-83 Launchers (2 x4 cell box)

↳*Missile Weapon Systems #1: YJ-83 Missile*

Name: YJ-83 (CSS-N-8 Saccade)

Type: Subsonic anti-ship cruise missile

Manufacturer: China Aerospace Science and Industry Corporation

In Service: 1998-Present

Length: INA

Diameter: INA

Warhead Type: High-explosive fragmentation

Warhead Weight: 190

Operational Range: 180 km

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Basic Load: INA

↳*Missile Weapon Systems #2: HQ-7 SAM Launcher*

Name: HQ-7 SAM Launcher

Type: Missile Launcher

Elevation: INA

Traverse: INA

Radar: Type 360 E/F-band Doppler radar

Radar Range: 18.4 km

Combat Management System: ZJK-4 (Thomson-CSF TAVITAC) combat management system.

Note: The system is capable of processing up to 30 targets, and tracking 12 targets simultaneously.

↳*Missile Weapon Systems #2: HQ-7 SAM*

Name: HQ-7

Type: Short-Range Air Defense Missile System.

Manufacturer: China, Company: INA

In Service: 1988-Present

Length: 3 m

Diameter: .55

Warhead Type: HE-FRAG

Warhead Weight: 15 km

Operational Range: 500-700 m

Speed: Mach 2.3 or 750 m/s

Guidance System: Command + electro-optical tracking

Basic Load: HE-FRAG with proximity fuse

Torpedo Weapon Systems

↳*Torpedo, YU-7 Torpedo*

Name: YU-7 Torpedo

Type: Torpedo

Length: 2.7 m

Diameter: 324 mm

Weight: 235 kg

Warhead: High Explosive

Warhead Weight: 45 kg

Effective Firing Range: 14.1 km

Propellant: Otto fuel II

Maximum Depth: 400 m

Speed: >45 kn (83 km/h)

Guidance System: active / passive acoustic homing

Steering System: CIACIO-S seeker

Onboard Aviation Facilities

Aviation Facilities: Helicopter Hanger

Aircraft Carried: Harbin Z-9C duties include SAR and ASW. The Z-9C can be fitted with an X-band KLC-1 surface search radar to detect surface targets beyond the range of shipborne radar systems..

Fire Control System

FCS Name: INA

Computerized FCS: See Weapon Systems

Combat Data System #1: ZKG-4A

Combat Data System #2: ZKG-4B

Sonar Systems

Search Sonar: DUBV-23 search sonar

Depth Sonar: DUBV-43 variable depth sonar (VDS)

Protection

Active Protection System: See Weapon Systems

Countermeasures: See Weapon Systems

NBC Water Washdown System: INA

Electronic Detection System: SR-210 Radar warning receiver

Electronic Identification System: Type 651A IFF

Radar Systems

↳*Radar System # 1: Type 354 radar*

Name: Type 354 radar

Type: 3-D air and surface search radar

Alternate Designation: MX902 H/LJQ-354

Proliferation: Type 354 Radars are one of the most widely deployed air and surface search naval radars in Chinese service. The Type 354 was predominantly found on major People's Liberation Army Navy (PLAN) surface combatants such as the Luda class destroyer and Jianghu class frigate in the 1980s and 1990s. By 2006 it was slowly being replaced in favour of the Type 360 radar, which in turn, itself being replaced by Type 364 radar for new vessels.

Frequency: G/H band

Beam: 1.2 × 5 deg

Pulse Width: 4 µs

Polarization: linear

Beam Width: 1.20 (horizontal); 1.30 (vertical)

PRF: 400 or 800 Hz

Scan Rate: 4–10 rpm

Resolution: 800 m (range); 1.30 (azimuth)

Range: more than 93 km on aircraft with RCS of 10 m2

Mast: INA

Antenna: INA

Notes: None

↳*Radar System #2: Type 360 Radar*

Name: Type 360 radar

Type: Air/surface search radar

Alternate Designation: SR60, H/LJQ360, Seagull-S, S-3

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: E/F-band

Beam: 1.5° × 17° (coverage to 60° elevation)

Pulse Width: 20.8 (compressed to 0.4) microseconds

Polarization: INA

Beam Width: INA

PRF: 900 pps

Scan Rate: 15 or 30 rpm

Resolution: INA

Range: 250 km, Max altitude: 10,000 m

Mast: 900 kg

Antenna: 4.3 m x 0.7 m

Notes: Phased coded burst pulse, each burst consist of 4 pulses and frequency agile transmitter. Separate IFF antenna (4 × yagi) installed on top of antenna.

↳*Radar System #3: Type 517H-1 Radar*

Name: Type 517H-1 Radar

Type: VHF Air search radar

Alternate Designation: Spider (export), SUR17B

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: A Band

Beam: INA

Pulse Width: INA

Polarization: INA

Beam Width: 5° (H), 30° (V)

PRF: INA

Scan Rate: INA

Resolution: INA

Range: 350km against 4m2 RCS target; 100km against 0.1m2 RCS Stealth aircraft, Accuracy: range error ≤200m, angle error ≤1°

Mast: INA

Antenna: INA

Notes: Non-coherent pulse compression (NCPC) system, Moving target automatically detection, Long range air surveillance Antenna : Yagi-Uda array, Rotation speed: 6RPM, Transmitter / Receiver Frequency: meter-band NF: <6dB Power Supply AC: 220VAC (150~250 VAC) Power consumption: 25kW Maximum Tracking: >20pcs <- 1m Accuracy: range error<-200m, angle

↳*Radar System #4: Type 352 Radar*

Name: Type 352 Radar

Type: Surface search radar

Alternate Designation: Square Tie, H/LJQ35

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: I - band

Beam: INA

Pulse Width: INA

Polarization: INA

Beam Width: INA

PRF: INA

Scan Rate: INA

Resolution: INA

Range: 55m - 77 km

Notes: It is analogous to the Russian MR-331 Rangout radar

↳*Radar System #5: Type 347/EFR-1 Radar*

Name: Type 347/EFR-1 Radar

Type: Fire Control Radar (Type 76A Dual 37mm AAA gun)

Alternate Designation: Rice Bowl, TRC47C

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: X Band

Beam: INA

Pulse Width: INA

Polarization: Vertical

Beam Width: 1.8°±0.2°

PRF: INA

Resolution: INA

Scan Rate: INA

Range: 30 km against 2 m² RCS aircraft ; 15 km against: 0.1 m² ASM

Mast: INA

Antenna: Circular parabolic antenna

Notes: Uses a coherent pulse doppler design Non coherent Moving Target Indicator/Detection (MTI, MTD), CFAR (Constant False Alarm Rate) Antinodding, anti clutter capability (A well advertised feature of the RTN family)

↳*Radar System #6: Racal RM-1290 Radar*

Name: Racal RM-1290

Type: Navigation

Alternate Designation: RACAL

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: J Band

Beam: 1.3 dgrees

Pulse Width: 0.05 micro seconds

Polarization: Horizontal

Beam Width: INA

PRF: 1300 hz

Scan Rate: INA

Resolution: INA

Range: INA

Notes: INA

Communications and Electronic Warfare

↳*Communications*

SATCOM: SNTI-240

Data Link: HN-900

Combat Data System: ZKJ-3C

↳*Electronic Warfare*

Electronic Intercept: RWD-8 (Jug Pair) intercept

Electronic Jamming: Type 981-3 EW Jammer

Notes:

The Type 053H3 (NATO codename Jiangwei II) were Chinese frigates that entered service with the People's Liberation Army Navy Surface Force in the 1990s and 2000s. The class comprised 10 vessels, all of which remain in active service. Four of them are sold to the Bangladesh Navy. They were a follow-on of the Type 053H2G Jiangwei I class. The Zulfiquar-class frigate used by the Pakistan Navy was based on the Type 053H3. History In the 1980s, the PLAN ordered Shanghai-based Hudong Shipyard (now Hudong-Zhonghua Shipyard) to build a replacement for the Type 053K air defence frigate. The new class was based on the Type 053H2 frigate and designated Type 053H2G. Development was carried out under Project 055. The Type 053H2G was slightly larger than the Type 053H2, and equipped with HQ-61B surface-to-air missiles (SAM). However, the HQ-61 proved unsatisfactory and the class was quickly superseded by the Type 053H3 which was an improved Type 053H2G equipped with HQ-7 SAMs. The HQ-7 was a Chinese-produced version of the French R330 Sea Crotale. Ten Type 053H3s were produced between 1996 and 2005. The most obvious visual distinction between Jiangwei I & II are: The Jiangwei II's have HQ-7 instead of HQ-61B SAMs, 8 C-802 anti-ship missiles instead of 6, and aft AAA mounts elevated compared to the Jiangwei I. The Jiangwei II class was briefly equipped with HQ-61B SAM system before being replaced by HQ-7 during upgrade, and some sources claim that the upgraded version is also called Type 057. Mid-Life Upgrade A limited, mid-life upgrade was observed for the 053H3 starting in 2015. Visible difference include the replacement of the ESM/EW suite/radars to similar systems from the Type 054, replacement of the HQ-7 with the HHQ-10 short range air defense missile and replacement of the 4 x Type 76A 37mm guns with a new 2 x 30mm CIWS similar to the Gryazev-Shipunov AO-18K.

Type 632 Class (Fulin Class) Chinese Oil Tanker

Tiers:

Variants:

- **Note:** 14 ships Built. (Names: INA)

System

Alternative Designation: Type 632 Class; Fulin Class
Total Built: 14 Built
Type: Oil Tanker
Builder: Hudong-Zhonghua Shipbuilding
In Service: 1972-Present
Crew: 30

Dimensions

Length: 66 m
Beam: 10 m
Draft: 4 m
Displacement, Full Load: 2,200 long tons

Propulsion System

Engine Name: 1 × Marine Diesel Engine
Engine Type: Diesel Engine
Engine Power: hp600
Maximum Range: 1,500 nmi (2,800 km; 1,700 mi) at 8 kn (15 km/h; 9.2 mph)
Maximum Speed: 10 knots (19 km/h; 12 mph)
Endurance: INA

Gun Weapon System

↳*System*

Name: Type 61
Type: Anti-Aircraft Gun
Caliber: 25mm
Quantity: 2 x Type 61 25mm Anti-Aircraft Gun
Barrel Length: 1.5 m
Weight: INA
Crew: 1
Barrels: Single or Dual
Elevation: -10° ~ +85°
Traverse: 360°
Rate of Fire: Compact: 800~900 round/min
Muzzle Velocity: 900 m/s
Maximum Firing Range: 3,000 m
Effective Firing Range: 2,700 m
Feed System: Magazine
Sights: Optical

↳*Ammunition*

Type: Rifle
Caliber: mm25
Shell: 25 x 218 mm SR
Shell Weight: INA
Basic Load: INA

Fire Control

Note: INA

Radar Systems

Navigation Radar: 1 x Type 756 or Fine Curve radar

Protection

Active Protection System: INA
Electronic Warfare: INA
Decoys: INA
NBC Protection: Yes

Notes:

The Type 632 tanker is a type of naval auxiliary ship currently in service with the People's Republic of China Navy (PLAN). Designed as a type that is capable of transport both water and oil, these ships entered service from 1972 onward. Type 632 tanker has received NATO reporting name as Fulin class.[2] After transferred to reserves, these ships begun to retire in the early 2010s. Type 632 tankers in PLAN service are designated by a combination of two Chinese characters followed by three-digit number. The second Chinese character is You (□), meaning oil in Chinese, or Shui (□), meaning water, because these ships are classified either as oil and water tankers. The first Chinese character denotes which fleet the ship is service with, with East (Dong, □) for East Sea Fleet, North (Bei, □) for North Sea Fleet, and South (Nan, □) for South Sea Fleet. However, the pennant numbers may have changed due to the change of Chinese naval ships naming convention.

Najin Class North Korean Frigate

Tiers:

1 2 **3** 4

System

Alternative Designation: Najin Class
Type: Frigate
Builder: Unknown, but built in North Korea (Najin Shipyards)
Crew: 180

Dimensions

Length: 100 m
Beam: 10.0 m
Draft: 2.7 m
Displacement, Full Load: 1,600 long tons

Propulsion System

Engine Name: INA
Engine Type: 2x Diesels
Engine Power: 15,000 bhp; 2 shafts
Maximum Speed: 26 knots (30 mph; 48 km/h)
Range: 4,000 nmi (4,600 mi; 7,400 km) at 14 knots

Notes:

The North Korean Najin-class frigates are some of the largest vessels in the Korean People's Navy. Although they bear a striking resemblance to ex-Soviet Kola class frigates, they are unrelated to any Russian or Chinese design. The class was originally fitted with a trainable triple 21 inch torpedo launcher, which was replaced in the mid-1980s with fixed Styx missile launchers taken from Osa class missile boats. The design is inherently dangerous, and even a minor missile failure would result in significant damage to the ship. At least one Najin-class ship appears to have been upgraded with much more modern weaponry in 2014. Refitted at Namp'o, the outdated anti-ship missiles, aft 57mm dual cannon, Drum Tilt fire-control radar and surface search radar were removed, and several new systems were installed. Most clearly identifiable are two 30mm automated turrets at the aft, likely based on the Soviet AK-630 CIWS, and two Kh-35 missile racks with the capacity for about 8 missiles in place of the older Styx/HY-2 launchers. The modernization program appears to be continuing as of December 2014.

Type 054A Class (Jiangkai II Class) Chinese Frigate

Tiers:

Variants:

- **Binzhou:** Builder:INA, Launched: INA, Commissioned: 29 December 2016, Fleet: East Sea Fleet, Status: Active

In Service: 2008-Present

Crew: 165

Dimensions

Length: 134.1 m

Beam: 16.0 m

Draft: 5 m

Displacement, Full Load: 4,053 tons

Propulsion System

Engine Name: MAN 16 PA6V-280 STC diesel engines

Engine Type: Combined diesel and diesel (CODAD) system

Engine Power: hp18,880 kw Total Power

Maximum Range: km8000 mi

Maximum Speed: km/h27 kts

Endurance: km/hINA

Notes: Type 054 Frigate CODAD propulsion system consists of : 4 MAN Diesel 16 PA6V-280 STC engines

Gun Weapon Systems

↳*Gun Weapon System #1: Type 76A Twin, 37mm, AA Gun*

Name: Type 76A Twin 37mm AA gun

Type: Naval Anti Aircraft

Caliber: Munition specific (see ammunition section)

Quantity: 1

Manufacturer: INA

Length: 2.729 m including flash suppressor and breech

Barrel Length: 2.315 m (62.5 calibers) without flash suppressor

Weight: 126 kg

Crew: INA

Elevation: -10 / +85 degrees

Traverse: INA

Rate of Fire: INA

Muzzle Velocity: Varies with projectile

Effective Firing Range: Ballistic range: 8,400 m, Maximum AA ceiling: 5,000 m, Effective AA Ceiling 4,000 m

↳*Gun Weapon System #1, Type 76A, Ammunition: HE-FRAG/ HE-FRAG Tracer*

Type: Rifle

Caliber: HE FRAG: 4.7 Calibers/ HE FRAG Tracer 4.4 Calibers

Shell: HE-FRAG/ HE- FRAG Tracer

Basic Load: INA

Muzzle Velocity: 880 mps

Shell Weight: 1.496 kg

Bursting Charge Weight: 0.732 kg

Propellant Charge Weight: 0.21 kg

↳*Gun Weapon System #1, Type 76A, Ammunition: AP/ AP Tracer*

Type: Rifle

Caliber: AP tracer: 4.5 calibers/ AP: 4.2 calibers

Shell: AP tracer/ AP

Basic Load: INA

Muzzle Velocity: 880 mps

Shell Weight: 1.522 kg

Bursting Charge Weight: 0.758 kg

Propellant Charge Weight: 0.21 kg

↳*Gun Weapon System #2 : 2 × Type 730 7-barrel 30 mm CIWS guns*

Name: Type 730 CIWS

Type: Close-In Weapon Station

Caliber: 30mm

Quantity: 2 x Type 730 CIWS Stations

Barrel Length: INA

Weight: INA

Barrels: 7-barrel

Rate of Fire: 1,200-4,200 rounds/minute

Maximum Firing Range: 3 km

Effective Firing Range: 150 m minimum, 1400 m interception, 2500 m effective against missiles (using APDS), 150-3500 meters against aircraft (using HE), 5000 meters against surface targets (using HE).

Feed System: Type 730: One ammunition boxes, holding 640 rounds

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

↳*Ammunition Gun Weapon System #2: Type 730 7-barrel 30 mm CIWS guns*

Type: Rifle

Caliber: 30mm

Shell: High Explosive (HE), Armor Piercing Discarding Sabot (APDS)

Shell Weight: INA

Basic Load: INA

Shell Weight: INA

Bursting Charge Weight: INA

Propellant Charge Weight: INA

Radar Systems

↳*Radar System #1: Type 382 Radar (NATO: Top Plate)*

Name: Type 382 Radar

Type: Air search radar

Alternate Designation: Top Plate (NATO)

Proliferation: China, Russia

Frequency: Bands: S (E/F) and C (G/H) bands

Beam: 2.7 degrees

Pulse Width: INA

Beam Width: INA

PRF: INA

Scan Rate: 30/minute

Resolution: INA

Range: 250 km

Mast: INA

Antenna: Planar array of MR-710

Notes: Radiation Power: 100 kw

↳*Radar System #2: Type 344*

Name: Type 344 Radar

Type: Fire control Radar

Alternate Designation: MR34

Proliferation: China

Frequency: I and J Band

Beam: INA

Pulse Width: INA

Beam Width: INA

PRF: INA

Scan Rate: INA

Resolution: INA

Range: INA

Mast: INA

Antenna: INA

Notes: The Type344 Radar: Uses phase scanning techniques •Uses pulse compression, MTI (Moving Target Indicator) and CFAR (Constant False Alarm Rate) •Traveling Wave Tube (TWT) amplifier •Independent search capability in 10" X 10" •Able to track both surface and airborne targets

↳*Radar System #3: Type 345 Fire Control Radar*

Name: Type 345

Type: Fire Control Radar

Alternate Designation: INA

Proliferation: INA

Frequency: Ku/J Band

Beam: INA

Pulse Width: INA

Polarization: Horizontal

Beam Width: 1.2 degrees

PRF: 3600 pps or 7200 pps

Scan Rate: INA

Resolution: ININAA

Range: 30 km against 2m2 RCS aircraft; 15 km against sea skimming targets.

Mast: INA

Antenna: 21 db gain

Notes: None

↳*Radar System #4: MR-36A*

Name: MR-36A Radar

Type: Surface search

Alternate Designation: Type 363

Proliferation:

Frequency: E/F - band

Beam: 1.65 x 8 deg

Pulse Width: 5.5 – 12 microsec

Polarization: Circular / Linear

Beam Width: INA

PRF: 2200/1100pps

Scan Rate: 15 or 24 rpm

Resolution: INA

Range: 130 km

Mast: INA

Antenna: 29.5 db

Notes: China Type 363 - (MR-36) Radar Track While Scan (TWS), Pulse-only Radar Role: Radar, Target Indicator, 2D Surface-to-Air Max Range: 129.6 km

↳*Radar System #5: Racal RM-1290 Radar*

Name: Racal RM-1290

Type: Navigation

Alternate Designation: Peoples Liberation Army

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: J Band

Beam: 1.3 degrees

Pulse Width: 0.505 microseconds

Polarization: Horizontal

Beam Width: INA

PFR: 1300 hz

Scan Rate: INA

Resolution: INA

Range: INA

Notes: INA

Missile Weapon Systems

↳*Vertical Launch System (VLS), Missile/Rocket: 1 x 32 cell VLS*

↳*VLS Missile System #1: HQ-16 Missiles*

Name: HQ-16 Missiles

Type: Surface-to-Air Missile

Quantity: 1 x 32-cell VLS System

Launcher: 1 x 32-cell Vertical Launch System

Length: INA

Diameter: INA

Speed: Mach 3

Range: 40 km

Guidance System: Semi-active radar homing

Note: HQ-16 (Hongqi-16) - Co-developed by China and Russia, believed to be based on either the SA-11 or SA-17. Credited with a range of 40 km. Also known as the HQ-16A.

↳*VLS Rocket System #2: YJ-83 Missile*

Name: YJ-83 Missile

Type: Anti-Ship Cruise Missile

Quantity: 2 x quad YJ-83 Launcher Systems

Launcher: 2 x quad YJ-83 Launchers

Length: INA

Diameter: INA

Engine: CTJ-2 turbojet

Warhead: 190 kg high-explosive fragmentation

Operational Range: 180 km

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Note: The US military considers the C-802 and C-802A as parts of the YJ-83 family.[4] The C-802 precedes the closely related YJ-83; strictly speaking, only the C-802A is the export development of the YJ-83.[5] The C-802 is sometimes and erroneously considered the export version of the YJ-82; the two are separate developments.[6] A prospective "C-803" was erroneously promulgated as the export version of the YJ-83 by enthusiasts in the late-1990s. As yet, no such missile exists.

↳*Type 87 240mm anti-submarine rocket launcher (36 rockets carried)*

Name: Type 87

Type: Type 81G ASW Projectile

Quantity: Three 2 x 12 Rockets

Launcher: Manually reloaded

Length: INA

Diameter: INA

Engine: Rocket

Warhead: 34 kg High Explosive (HE)

Operational Range: 5 km

Speed: INA

Guidance System: FCS controlled by sonar

Note:

Torpedo Weapon Systems

↳*Torpedo, YU-7 Anti Submarine Warfare Torpedo*

Name: YU-7 Torpedo

Type: Anti Submarine Warfare (ASW) Torpedo (2 x 3 laucher)

Length: 2.7 m

Diameter: 324 mm

Weight: 235 kg

Warhead: High Explosive (HE)

Warhead Weight: 45 kg

Effective Firing Range: 14.1 km

Propellant: Otto fuel II

Maximum Depth: 400 m

Speed: >45 kts (83 km/h)

Guidance System: active / passive acoustic homing

Guidance System: CIACIO-S seeker

↳*Torpedo, Yu-8 Anti Submarine Warfare (ASW), Rocket Propelled Torpedo*

Name: YU-8 ASW Rocket Propelled Torpedo

Type: Light Torpedo

Length: Approx 1.2 m

Diameter: Approx 0.4 m

Engine: Rocket motor

Weight: Approx 0.6 ton

Warhead: Semi-armor-piercing

Warhead Weight: INA

Effective Firing Range: Approx 20 km

Propellant: Solid Fuel

Maximum Depth: INA

Speed: Supersonic

Guidance System: Inertial in flight, passive / active sonar in water

Onboard Aviation Facilities

Facilities: Helicopter Hanger

Helicopters: 1 Kamov Ka-28 'Helix' or Harbin Z-9C

Fire Control

FCS Name: See Weapon Systems

Computerized FCS: Yes

Radar FCS: 3 x Type 347G gun fire-control

Sonar Systems

Search and Attack Sonar 1: 1 x MGK-335 suite w/ Bull Horn active and Whale Tongue passive hull-mounted, medium-frequency search and attack

Search and Attack Sonar 1: H/SJG-206 is low frequency towed array sonar, the first towed sonar in China. Developed by ChinaShipbuilding Industry Corporation, it won second place in National Science & Technology Advancement Award in 2003, and it equips many Chinese primary surface combatant

Protection

Active Protection System: Yes, 1 x HZ100 shipborne ECM/ELINT system

Electronic Warfare: 1 x Type 922-1 radar warning intercept

Decoys: 2 x Type 726-4 18-tube decoy/chaff launcher

NBC Protection: Yes

ASW: 2 x six-tube Type 87 anti-submarine rocket launchers; 36 rockets carried

Communications and Electronic Warfare

↳*Communications*

Satellite Communications: SNTI-240 SATCOM

Satellite Communications: AKD5000S Ku band SATCOM

↳*Electronic Warfare*

ECM/ELINT: HZ-100 ECM & ELINT system

Missile Jamming System: Kashtan-3 missile jamming system

Notes:

The Type 054A (NATO codename Jiangkai II) frigate is a class of Chinese multi-role frigates, the first of which entered service with the People's Liberation Army Navy Surface Force in 2007. It is a development of the Type 054 frigate, using the same hull but with improved sensors and weapons. The Type 054A was first revealed while under construction at the Guangzhou-based Huangpu Shipyard in 2005. The Type 054A carries HQ-16 medium-range air defence missiles and anti-submarine missiles in a vertical launching system (VLS) system. The HQ-16 has a range of up to 50 km, with superior range and engagement angles to the Type 054's HQ-7. The Type 054A's VLS uses a hot launch method; a shared common exhaust system is sited between the two rows of rectangular launching tubes. The four AK-630 close-in weapon systems (CIWS) of the Type 054 were replaced with two Type 730 CIWS on the Type 054A. The autonomous Type 730 provides improved reaction time against close-in threats. The Type 054A retains its predecessor's stealth features, including sloped hull design, radar absorbent materials, and a clean profile. An improved variant beginning with the 17th unit launched from Huangpu Shipyard in 2009 has the seven-barrelled Type 730 CIWS replaced by the more capable 11-barrelled Type 1130, and is unofficially referred as Type 54A+. Another reported improvement over the original Type 054A includes the incorporation of variable depth sonar and towed array sonar. Type 054A frigate made its first operational deployment to the Gulf of Aden, when 570 Huangshan set sail as part of 2nd Escort Flotilla/Task Group 167 on 2 April 2009, the Escort Flotilla arrived there on 13 April 2009, and took over form 1st Escort Flotilla/Task Group 169 on 15 April 2009. Since then, 11 Type 054A have deployed to the Gulf of Aden for anti-piracy operations. In the lead-up to the Libyan civil war, 530 Xuzhou was deployed from anti-piracy operations in the Gulf of Aden to help evacuate Chinese nationals from Libya. In January 2014, 546 Yancheng was redeployed from anti-piracy operations in the Gulf of Aden to the eastern Mediterranean Sea to escort Syrian chemical weapons destined for destruction.

Type 053H1G Class (Jianghu-V Class) Chinese Frigate

Tiers:

Variants:

- **Beihai:** Commissioned: 1993 Fleet: East Sea Fleet
- **Dongguan:** Commissioned: 1993 Fleet: South Sea Fleet
- **Shantou:** Commissioned: 1993 Fleet: South Sea Fleet
- **Foshan:** Commissioned: 1994 Fleet: East Sea Fleet
- **Jiangmen:** Commissioned: 1995 Fleet: South Sea Fleet
- **Zhaoqing:** Commissioned: 1995 Fleet: South Sea Fleet

System

Alternative Designation: Type 053H1G; Jianghu-V Class
Total Built: 6 Ships
Type: Frigate
Builder: Hudong Shipyard,Guangzhou Shipyard KSEW Shipyard
In Service: 1993-Present
Crew: 160 to 200

Dimensions

Length: 103 to 112 m
Beam: 10 to 12 m
Draft: 3 to 4 m
Displacement, Full Load: 1,700 to 2,000 tons

Propulsion System

Engine Name: INA
Engine Type: Diesel
Engine Power: 16,000 to 22,000 shp
Maximum Range: 7,408 km
Maximum Speed: 34 knos
Endurance: INA

Gun Weapon Systems

↳*Gun Weapon System #1: PJ33A Twin 100 mm gun, Type 79*

Name: PJ33A Twin 100 mm gun, Type 76
Type: Naval anti-aircraft and anti-surface
Caliber: mmMunition specific (see ammunition section)
Manufacturer: INA
Length: 5.8 m
Barrel Length: 4.6 m
Weight: 34 tons
Crew: INA
Elevation: -5 /85 degrees
Traverse: INA
Rate of Fire: 25 rounds per minute
Muzzle Velocity: Munition specific (see ammunition section)
Effective Firing Range: Maximum Range 22,241m, AA Ceiling: 10,000m
Notes: Basic Load: 26 ready service rounds per gun. Approximate Barrel Life 800

↳*Gun Weapon System #1, PJ33A, Ammunition: AA Grenade, AA (ZS-56), AA (ZS-56P*

Type: Rifle
Caliber: 5.3 Calibers
Shell: Anti Aircraft
Basic Load: Varies
Muzzle Velocity: 900 mps
Weight: 15.6 kg to 15.9 kg
Bursting Charge: 0.79 kg to 1.23 kg
Propellant Charge Weight: 13.2 kg

↳*Gun Weapon System #1, PJ33A, Ammunition: HE Mod 1928*

Type: Rifle
Caliber: 5.2 calibers
Shell: High Explosive
Basic Load: Varies
Muzzle Velocity: 895 mps
Weight: 15.8 kg
Bursting Charge: 1.25 kg
Propellant Charge Weight: 6.0 kg

↳*Gun Weapon System #1, PJ33A, Ammunition: Diving*

Type: Rifle

Caliber: 5.04 calibers

Shell: Diving (sub surface impact)

Basic Load: Varies

Muzzle Velocity: 250 mps

Projectile Weight: 15.0 kg

Bursting Charge Weight: 2.85 kg

Propellant Charge Weight: 6.0 kg

↳*Gun Weapon System #1, PJ33A, Ammunition: Star Shell (SB-56)*

Type: Rifle

Caliber: 5.2 calibers

Shell: Star Shell (illumination)

Basic Load: Varies

Muzzle Velocity: 646 mps

Projectile Weight: 16.0 kg

Bursting Charge Weight: 0.015 kg

Propellant Charge Weight: 6.0 kg

↳*Gun Weapon System #1, PJ33A, Ammunition: ECM (anti radar) (PB-56)*

Type: Rifle

Caliber: INA

Shell: ECM (anti-radar)(Electronic Counter Measures) (PB-56) (reflective material)

Basic Load: Varies

Muzzle Velocity: INA

Projectile Weight: INA

Bursting Charge Weight: INA

Propellant Charge Weight: 6.0 kg

↳*Gun Weapon System #2: Type 76A Twin, 37mm, AA Gun*

Name: Type 76A Twin 37mm AA gun

Type: Naval Anti Aircraft

Caliber: Munition specific (see ammunition section)

Manufacturer: INA

Length: 2.729 m including flash suppressor and breech

Barrel Length: 2.315 m (62.5 calibers) without flash suppresser

Weight: 126 kg

Crew: INA

Elevation: -10 / +85 degrees

Traverse: INA

Rate of Fire: INA

Muzzle Velocity: Varies with projectile

Effective Firing Range: Ballistic range: 8,400 m, Maximum AA ceiling: 5,000 m, Effective AA Ceiling 4,000 m

↳*Gun Weapon System #2, Type 76A, Ammunition: HE-FRAG/ HE-FRAG Tracer*

Type: Rifle

Caliber: HE FRAG: 4.7 Calibers/ HE FRAG Tracer 4.4 Calibers

Shell: HE-FRAG/ HE- FRAG Tracer

Basic Load: INA

Muzzle Velocity: 880 mps

Complete Round Weights: 1.496 kg

Projectile Weights: 0.732 kg

Propellant Charge Weight: 0.21 kg

↳*Gun Weapon System #2, Type 76A, Ammunition: AP/ AP Tracer*

Type: Rifle

Caliber: mmAP tracer: 4.5 calibers/ AP: 4.2 calibers

Shell: AP tracer/ AP

Basic Load: INA

Muzzle Velocity: 880 mps

Complete Round Weights: 1.522 kg

Projectile Weights: 0.758 kg

Propellant Charge Weight: 0.21 kg

Missile Weapon Systems

↳*Missile Weapon Systems #1: YJ-83 Missile Launcher*

Name: YJ-83 Launchers

Type: Missile Launcher

Quantity: 8 x twin YJ-83 Launchers (2 x4 cell box)

↳*Missile Weapon Systems #1: YJ-83 Missile*

Name: YJ-83 (CSS-N-8 Saccade)

Type: Subsonic anti-ship cruise missile

Manufacturer: China Aerospace Science and Industry Corporation

In Service: 1998-Present

Length: INA

Diameter: INA

Warhead Type: High-explosive fragmentation

Warhead Weight: 190

Operational Range: 180 km

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Basic Load: INA

↳*Missile Weapon Systems #2: HQ-7 SAM Launcher*

Name: HQ-7 SAM Launcher

Type: Missile Launcher

Elevation: INA

Traverse: INA

Radar: Type 360 E/F-band Doppler radar

Radar Range: 18.4 km

Combat Management System: ZJK-4 (Thomson-CSF TAVITAC) combat management system.

Note: The system is capable of processing up to 30 targets, and tracking 12 targets simultaneously.

↳*Missile Weapon Systems #2: HQ-7 SAM*

Name: HQ-7

Type: Short-Range Air Defense Missile System.

Manufacturer: China, Company: INA

In Service: 1988-Present

Length: 3 m

Diameter: .55

Warhead Type: HE-FRAG

Warhead Weight: 15 km

Operational Range: 500-700 m

Speed: Mach 2.3 or 750 m/s

Guidance System: Command + electro-optical tracking

Basic Load: HE-FRAG with proximity fuse

Torpedo Weapon Systems

↳*Torpedo, YU-7 Torpedo*

Name: YU-7 Torpedo
Type: Torpedo
Length: 2.7 m
Diameter: 324 mm
Weight: 235 kg
Warhead: High Explosive
Warhead Weight: 45 kg
Effective Firing Range: 14.1 km
Propellant: Otto fuel II
Maximum Depth: 400 m
Speed: >45 kn (83 km/h)
Guidance System: active / passive acoustic homing
Steering System: CIACIO-S seeker

Onboard Aviation Facilities

Aviation Facilities: Helicopter Hanger
Aircraft Carried: Harbin Z-9C duties include SAR and ASW. The Z-9C can be fitted with an X-band KLC-1 surface search radar to detect surface targets beyond the range of shipborne radar systems..

Fire Control System

FCS Name: INA
Computerized FCS: See Weapon Systems
Combat Data System #1: ZKG-4A
Combat Data System #2: ZKG-4B

Sonar Systems

Search Sonar: DUBV-23 search sonar
Depth Sonar: DUBV-43 variable depth sonar (VDS)

Protection

Active Protection System: See Weapon Systems
Countermeasures: See Weapon Systems
NBC Water Washdown System: INA
Electronic Detection System: SR-210 Radar warning receiver
Electronic Identification System: Type 651A IFF

Radar Systems

↳*Radar System # 1: Type 354 radar*

Name: Type 354 radar

Type: 3-D air and surface search radar

Alternate Designation: MX902 H/LJQ-354

Proliferation: Type 354 Radars are one of the most widely deployed air and surface search naval radars in Chinese service. The Type 354 was predominantly found on major People's Liberation Army Navy (PLAN) surface combatants such as the Luda class destroyer and Jianghu class frigate in the 1980s and 1990s. By 2006 it was slowly being replaced in favour of the Type 360 radar, which in turn, itself being replaced by Type 364 radar for new vessels.

Frequency: G/H band

Beam: 1.2 × 5 deg

Pulse Width: 4 µs

Polarization: linear

Beam Width: 1.20 (horizontal); 1.30 (vertical)

PRF: 400 or 800 Hz

Scan Rate: 4–10 rpm

Resolution: 800 m (range); 1.30 (azimuth)

Range: more than 93 km on aircraft with RCS of 10 m2

Mast: INA

Antenna: INA

Notes: None

↳*Radar System #2: Type 360 Radar*

Name: Type 360 radar

Type: Air/surface search radar

Alternate Designation: SR60, H/LJQ360, Seagull-S, S-3

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: E/F-band

Beam: 1.5° × 17° (coverage to 60° elevation)

Pulse Width: 20.8 (compressed to 0.4) microseconds

Polarization: INA

Beam Width: INA

PRF: 900 pps

Scan Rate: 15 or 30 rpm

Resolution: INA

Range: 250 km, Max altitude: 10,000 m

Mast: 900 kg

Antenna: 4.3 m x 0.7 m

Notes: Phased coded burst pulse, each burst consist of 4 pulses and frequency agile transmitter. Separate IFF antenna

(4 × yagi) installed on top of antenna.

↳*Radar System #3: Type 517H-1 Radar*

Name: Type 517H-1 Radar

Type: VHF Air search radar

Alternate Designation: Spider (export), SUR17B

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: A Band

Beam: INA

Pulse Width: INA

Polarization: INA

Beam Width: 5° (H), 30° (V)

PRF: INA

Scan Rate: INA

Resolution: INA

Range: 350km against 4m2 RCS target; 100km against 0.1m2 RCS Stealth aircraft, Accuracy: range error ≤200m, angle error ≤1°

Mast: INA

Antenna: INA

Notes: Non-coherent pulse compression (NCPC) system, Moving target automatically detection, Long range air surveillance Antenna : Yagi-Uda array, Rotation speed: 6RPM, Transmitter / Receiver Frequency: meter-band NF: <6dB Power Supply AC: 220VAC (150~250 VAC) Power consumption: 25kW Maximum Tracking: >20pcs <- 1m Accuracy: range error<-200m, angle

↳*Radar System #4: Type 352 Radar*

Name: Type 352 Radar

Type: Surface search radar

Alternate Designation: Square Tie, H/LJQ35

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: I - band

Beam: INA

Pulse Width: INA

Polarization: INA

Beam Width: INA

PRF: INA

Scan Rate: INA

Resolution: INA

Range: 55m - 77 km

Notes: It is analogous to the Russian MR-331 Rangout radar

↳*Radar System #5: Type 347/EFR-1 Radar*

Name: Type 347/EFR-1 Radar

Type: Fire Control Radar (Type 76A Dual 37mm AAA gun)

Alternate Designation: Rice Bowl, TRC47C

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: X Band

Beam: INA

Pulse Width: INA

Polarization: Vertical

Beam Width: 1.8°±0.2°

PRF: INA

Resolution: INA

Scan Rate: INA

Range: 30 km against 2 m² RCS aircraft ; 15 km against: 0.1 m² ASM

Mast: INA

Antenna: Circular parabolic antenna

Notes: Uses a coherent pulse doppler design Non coherent Moving Target Indicator/Detection (MTI, MTD), CFAR (Constant False Alarm Rate) Antinodding, anti clutter capability (A well advertised feature of the RTN family)

↳*Radar System #6: Racal RM-1290 Radar*

Name: Racal RM-1290

Type: Navigation

Alternate Designation: RACAL

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: J Band

Beam: 1.3 dgrees

Pulse Width: 0.05 micro seconds

Polarization: Horizontal

Beam Width: INA

PRF: 1300 hz

Scan Rate: INA

Resolution: INA

Range: INA

Notes: INA

Communications and Electronic Warfare

↳*Communications*

SATCOM: SNTI-240

Data Link: HN-900

Combat Data System: ZKJ-3C

↳*Electronic Warfare*

Electronic Intercept: RWD-8 (Jug Pair) intercept

Electronic Jamming: Type 981-3 EW Jammer

Notes:

Type 053H1G (Jianghu-V) Ships. Type 53HT Jianghu V Zigong - the least expensive and least powerful variant feature a reduction in missiles and no helicopter facilities.

Anzac Class Australian Frigate

Tiers:

Variants:

- **Anzac (FFH 150):** Commissioned: 1996 Status: Active
- **Arunta (FFH 151):** Commissioned: 1998 Status: Active
- **Warramunga (FFH 152):** Commissioned: 2001 Status: Active

- **Te Mana (F111):** Commissioned: 1999 Status: Active

System

Alternative Designation: The Anzac class (also identified as the ANZAC class and the MEKO 200 ANZ type).

Total Built: 10 Total Ships

Type: Frigate

Builder: AMECON

In Service: 1996-Present

Crew: 163 men

Dimensions

Length: 118 m

Beam: 14.8 m

Draught: 4.35 m

Displacement, Standard: 3,000 tons

Displacement, Full Load: 3,600 tons

Propulsion System

Gas Turbine: 1 × General Electric LM2500-30 gas turbine

Gas Turbine Power: 30,172 hp

Diesel Engine: 2 × MTU 12V1163 TB83 diesel engines

Diesel Engine Power: 8,840 hp each

Propeller: 2 × controllable-pitch propellers

Range: 6,000 nautical miles (11,000 km; 6,900 mi) at 18 knots (33 km/h; 21 mph)

Speed: 27 knots (50 km/h; 31 mph)

Endurance: at least 30 days

Missile Weapon System

↳*System*

Name: RIM-7 Sea Sparrow

Type: Anti-Aircraft, Anti-Missile Weapon System

Quantity: 1 × 8-cell Mark 41 Mod 5 vertical launch system, firing RIM-7 Sea Sparrow

Launcher: Mark 41 Vertical Launching System

Missile Name: RIM-7 Sea Sparrow

Basic Load: 16

Length: 3.7 m

Diameter: 20 cm

Wingspan: 1.02 m

Weight: 230 kg

Warhead: Annular blast fragmentation warhead, 90 lb (41 kg)

Detonation Mechanism: Proximity fuzed, expanding rod, with a 27 ft (8.2 m) kill radius

Engine: Hercules MK-58 solid-propellant rocket motor

Operational Range: 19 km

Speed: 4,256 km/h

Guidance System: Semi-active radar homing

Gun Weapon Systems

↳*Gun System #1*

Name: 5"/54 caliber Mark 45 gun

Type: Naval Gun

Caliber: 127mm

Quantity: 1 × 5-inch 54 calibre Mark 45 dual purpose gun Stations

Length: 8.992 m

Barrel Length: 6.858 m (270.0 in) Rifling: 5.82 m (229 in)

Weight: 21,691 kg

Barrels: Single barrel (progressive RH parabolic twist)

Elevation: −15° to +65°

Travese: ±170° from centerline Max. traversing rate: 30°/s

Rate of Fire: 16–20 rounds per minute automatic

Muzzle Velocity: 762.0 m/s

Effective Firing Range: 24.1 km

Feed System: 600 rounds (Ticonderoga class) 680 rounds (Arleigh Burke class) 475–500 rounds (other classes)

↳*Ammunition Gun System #1*

Type: Rifle

Caliber: mm127mm

Shell: 127 x 835mm .R Conventional: 31.75 kg (70.0 lb)

Basic Load: 2,000

↳*Gun System #2*

Name: M2 Browning

Type: Heavy Machine Gun

Caliber: 12.7mm

Quantity: 2 × 12.7-millimetre (0.50 in) machine guns

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

↳*Ammunition Gun System #2*

Name: Rifle

Type: 12.7mm

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 2,000 each

Torpedo Weapon System

Launcher: 2 × Mark 32 3-tube torpedo launchers,

Torpedo Name: Mark 46 torpedo

Length: 2.59 m

Diameter: 323.8 mm

Weight: 230 kg

Warhead: PBXN-103 high explosive (bulk charge); 43.9 kg

Engine: Two-speed, reciprocating external combustion

Propellant: Otto fuel II

Operational Range: 10,973 m

Maximum Depth: 366 m

Speed: >40 kn (74 km/h; 46 mph)

Guidance System: Active or passive/active acoustic homing

Launch Platform: Mark 32 Surface Vessel Torpedo Tubes, ASW Aircraft, RUM-139 VL-ASROC

Onboard Aviation Facilities

Helicopters: 1 x SH-60 Seahawk or SH-2G Super Seasprite

Fire Control

FCS Name: Saab Systems Ceros 200 Fire Control Director

Illuminator: CEAMOUNT Illuminators

Combat Data System: Saab Systems 9LV453 Mk3E

Sonar Systems

Bow Sonar: ThomsonSintra Spherion B hull-mounted bow sonar

Obstacle Sonar System: Petrel Mine and Obstacle Avoidance Sonar system

Towed Arrary Sonar: Fitted for but not with towed-array sonar

Radar Systems

Search Radar: Raytheon SPS-49(V)8 ANZ

Phased Array Radar: CEAFAR Active Phased Array Radar

Navigation Radar: Kelvin Hughes Sharp Eye Navigation Radar

Radar Intercept: Telefunken PST-1720 Telegon 10 radar intercept unit

Protection

Active Protection System: Yes

IFF: Cossor AIMS Mk XII IFF

NBC Protection: Yes

Electronic Support Measures #1: JEDS 3701 electronic support measures

Electronic Support Measures #2: Rascal Thorn modified Sceptre-A electronic support measures

Intercept: Telefunken PST-1720 comms intercept

Decoy #1: Mark 36 SRBOC launchers

Decoy #2: SLQ-25A towed torpedo decoy

Decoy #3: Nulka decoy launchers

Notes:

The Anzac class (also identified as the ANZAC class and the MEKO 200 ANZ type) is a ship class of ten frigates; eight operated by the Royal Australian Navy (RAN) and two operated by the Royal New Zealand Navy (RNZN). During the 1980s, the RAN began plans to replace the River-class destroyer escorts (based on the British Leander Class) with a mid-capability patrol frigate, and settled on the idea of modifying a proven foreign design for Australian conditions. Around the same time, the RNZN was seeking to replace their Leander-class frigates while maintaining blue-water capabilities. A souring of relations between New Zealand and the United States of America in relation to New Zealand's nuclear-free zone and the ANZUS security treaty prompted New Zealand to seek improved ties with other nations, particularly Australia. As both nations were seeking warships of similar capabilities, the decision was made in 1987 to collaborate on their acquisition. The project name (and later, the class name) is taken from the Australian and New Zealand Army Corps of the First World War. Twelve ship designs were tendered in 1986.[1] By 1989, the project had selected a proposal by Germany's Blohm + Voss, based on their MEKO 200 design, to be built in Australia by AMECON at Williamstown, Victoria. The modular design of the frigates allowed sections to be constructed at Whangarei, New Zealand and Newcastle, New South Wales in addition to Williamstown. The RAN ordered eight ships, while the RNZN ordered two and had the option to add two more. The frigate acquisition was controversial and widely opposed in New Zealand, and as a result, the additional ships were not ordered. In 1992, work started on the frigates; 3,600-tonne (3,500-long-ton) ships capable of a 27-knot (50 km/h; 31 mph) top speed, and a range of 6,000 nautical miles (11,000 km; 6,900 mi) at 18 knots (33 km/h; 21 mph). The armament initially consisted of a single 5-inch gun and a point-defence missile system, supported by a missile-armed helicopter. In addition, the ships were fitted for but not with a torpedo system, anti-ship missiles, and a close-in weapons system. The last ship of the class entered service in 2006; by this point, the RAN and RNZN had embarked on separate projects to improve the frigates' capabilities by fitting the additional weapons, along with updates to other systems and equipment. Since entering service, Anzac-class frigates have made multiple deployments outside local waters, including involvement in the INTERFET multi-national deployment to East Timor, and multiple operational periods in the Persian Gulf. As of 2014, all ten ships are in service. The RAN intends to start replacing theirs in 2024, while the RNZN ships will remain active until around 2030. The Anzac design is derived from Blohm + Voss' MEKO 200 PN (or Vasco da Gama-class) frigate, and is identified by the company as the MEKO 200 ANZ.[43] In addition to capability modifications to meet RAN and RNZN requirements, the ships were redesigned during the development phase to maximise the involvement of Australian and New Zealand industries through the use of locally sourced components: 80% of the materials (by value) was locally sourced, and within this, 20% must come from New Zealand. The Anzacs were designed to German Navy standards, except where Australian or United States standards were specifically requested. Each frigate has a 3,600-tonne (3,500-long-ton; 4,000-short-ton) full load displacement. The ships are 109 metres (358 ft) long at the waterline, and 118 metres (387 ft) long overall, with a beam of 14.8 metres (49 ft), and a draught at full load of 4.35 metres (14.3 ft). The hull and superstructure are of all-steel construction, and the ships are fitted with fin stabilisers. The frigates use a Combined Diesel or Gas (CODOG) propulsion machinery layout, with a single, 30,172-horsepower (22,499 kW) General Electric LM2500-30 gas turbine and two 8,840-horsepower (6,590 kW) MTU 12V1163 TB83 diesel engines driving the ship's two controllable-pitch propellers. Maximum speed is 27 knots (50 km/h; 31 mph), and maximum range is over 6,000 nautical miles (11,000 km; 6,900 mi) at 18 knots (33 km/h; 21 mph). The frigates' range is about 50% greater than other MEKO-type frigates, due to an enhanced fuel supply. Originally, two gas turbines were to be fitted; this layout would have provided a top speed of 31.75 knots (58.80 km/h; 36.54 mph). The starboard turbine was cancelled to save costs. The standard ship's company of an Anzac consists of 22 officers and 141 sailors. Onboard electricity requirements are met by four MTU diesel generators. Each ship can carry up to 29 cubic metres (1,000 cu ft) of dry provisions, 29 cubic metres (1,000 cu ft) of refrigerated provisions, and 54 tonnes (53 long tons; 60 short tons) of fresh water.

Admiral Gorshkov Class Russian Frigate

Tiers:

Variants:

- **Admiral Gorshkov:** Commisioned: 2018 Fleet: Northern
- **Admiral Kasatonov:** Commisioned: 2020 Fleet: Northern

- **Admiral Isakov:** Commisioned: 2022 Fleet: Northern
- **Admiral Amelko:** Commisioned: 2024 Fleet: INA
- **Admiral Chichagov:** Commisioned: 2025 Fleet: INA

System

Alternative designations: Admiral Gorshkov-class frigate; Project 22350

Builders: Severnaya Verf, Saint Petersburg

Vessel Planned: 15

Type: Guided Missile Frigate

Crew: 210

Dimensions

Length: 130.0 m

Beam: 16.0 m

Draught: 4.5 m

Displacement: Standard: 4,500 tons Full: 5,400 tons

Automotive

Main Propulsion: 2 shaft CODAG; 2 10D49 cruise diesel engines 5,200 shp (3,900 kW); 2 M90FR boost gas turbines 27,500 shp (20,500 kW); Total: 65,400 shp (48,800 kW)

Maximum Speed: 29.5 knots (54.6 km/h; 33.9 mph)

Maximum Range: 4,850 nmi (8,980 km; 5,580 mi) at 14 kn (26 km/h; 16 mph)

Endurance: 30 days

Armament

↳*Weapon Station #1*

Name: A-192 Naval Gun

Caliber: 130mm

Quantity: 1 x A-192 Naval Gun

Length: m1.37

Diameter: m0.13

Weight: kg52

Targets: Targets: Aircraft, Helicopter, Missile, Surface Vessel, Land Structure - Soft, Mobile Target - Soft

Maximum Effective Range, Air Targets: km3.3

Maximum Effective Range, Surface Targets: km22.2

↳*Ammunition Weapon Station #2*

Type: FRAG

Caliber: 130mm

Cartridge: INA

Basic Load: 2,000

↳*Weapon Station #2*

Name: Kashtan Close-in Weapon System (CIWS)

Type: modern naval air defence gun-missile system deployed by the Russian Navy.

Caliber: 30mm

Quantity: 1 x Kashtan Close-in Weapon System (CIWS)

Main Armament: 8 × 9M311K + 32 missiles

Number of Missiles: 32 missiles

Secondary Armament: 2 × AO-18K Autocannon (30mm)

Length: INA

Height: 2,250 mm (89 in) (above deck)[

Weight: 15,500 kg

Barrels: 2 × 6 (guns); 2 × 4 launch tubes

Action: Gas-operated rotary cannon

Rate of Fire: 9,000 rounds/min

Muzzle Velocity: 860 m/s

Effective Firing Range, Missiles: 1,500–8,000 m

Feed System: Link-less, helical; 1000 round

Sights: Radar / TV-optical:[N 3] 2–3/1 m (6.6–9.8/3.3 ft) accuracy, tracks 6 targets simultaneously

Warhead: Continuous-rod w/ frag laye

Flight Altitude: 3,500 m (11,500 ft) (Kashtan) 6,000 m (20,000 ft) (Kashtan-M

Speed: 910 m/s

↳*Ammunition Weapon Station #2*

Shell: HEI-Frag, Frag-T, APDS-T

Caliber: mm30

Shell Weight: 0.39 kg (0.86 lb) (HEIF, FT)[6] 0.30 kg (0.66 lb) (APDS-T)

Basic Load: INA

↳*Weapon Station #3*

Name: 3S90/M-22 Uragan (SA-N-7 "Gadfly")

Type: Surface-to-air missile

Quantity: 24 x Uragan SAMs

Length: 5.55

Diameter: 0.4 m

Warhead: Frag-HE

Warhead Weight: 70 kg

Detonation Mechanism: Radar proximity fuse

Propellant: Solid propellant rocket

Operational Range: km30

Flight Altitude: m14,000

Speed: Mach 3

Guidance System: Semi-active radar homing

Note: 3S90/M-22 Uragan (SA-N-7 "Gadfly") – Naval version of the 9K37 Buk missile system with 9M38/9M38M1 missile.

↳*Weapon Station #4*

Name: Type 53

Type: 53 cm (21 inch) torpedoes

Primary Function: ASUW torpedo

Length: 7.2 m

Diameter: 2,070–2,300 kg

Weight: 2,070–2,300 kg

Range: 18,000 meters (20,000 yd)

Speed: 45 kn (52 mi/h, 83 km/h)

Guidance System: Wake homing

Warhead: 307.6 kilograms (678 lb) high explosive

Aircraft

↳*Ka-26 / 27 / 28 / 31 / 32*

Quantity: 1

↳*Ka-31 Helix / Ka-27 / Z-8 / Z-9 / Z-18*

Quantity: Up to 12

Protection

Electronic Warfare: EW Suite: Prosvet-M

Countermeasures: 2 × PU KT-308 8 × PU KT-216 2 × 5P-42 Filin

Notes:

The Admiral Gorshkov class, Russian designation Project 22350, is the newest class of frigates being built by the Severnaya Verf in Saint Petersburg for the Russian Navy. The class was designed by the Severnoye Design Bureau and incorporates use of stealth technology. So far, six vessels of the class have been ordered and scheduled for delivery by 2025. The lead ship of the class, Admiral Gorshkov, was commissioned on 28 July 2018. The Admiral Gorshkov is a new Russian class of multi-role frigates. It is a successor to the Burevestnik class (Western reporting name Krivak class). The project was approved by the Russian Naval Command in 2003. Construction of the lead ship, Admiral Gorshkov, started in 2006. It was commissioned with the Russian Navy in 2018. By of 2018 another 3 frigates of the class were under construction, plus 2 more were ordered and 2 more were planned. The Russian Navy has a requirement for 20-30 of such new frigates to fully replace the surviving Krivak class frigates and Sovremenny class destroyers. It is planned that Admiral Gorshkov class frigates will become the mainstay of the future Russian fleet. An export version of this frigate class is also being proposed for possible customers. The Admiral Gorshkov class is a perfect example of multi-role frigate. Many other frigates are focused on specific tasks, such as anti-air warfare, or anti-submarine warfare. This Russian frigate was designed to perform multiple roles, such as perform long-range attacks against surface targets and ships, conduct anti-submarine warfare, carry out escort missions and be deployed in a variety of situations that a general frigate class would not be able to fulfill. In some cases such multi-role frigates can even substitute deployment of larger destroyers. This new class of Russian frigates incorporate best weapons and sensors that the Russian industry can produce. The Admiral Gorshkov class is equipped with a 16-cell Vertical Launch System (VLS) for a mix of Kalibr-NK land attack cruise missiles (range 2 500 km), P-800 Oniks anti-ship missiles (range 300-500 km) and 91RTE2 anti-submarine missiles (missile drops torpedo 50 km away). There is another 32-cell VLS for medium-range air defense missiles. It uses the same 9M96E and 9M96E2 interceptor missiles as the S-400 land-based air defense system. These missiles are intended to defend against precision attacks and various defense suppression weapons. These missiles are designed for direct impact have a range of 40 and 120 km respectively. Their claimed kill probability is 90% against aircraft and 70% against Harpoon anti-ship missile. It has been reported that this vertical launch system can also launch a short-range missile which is likely a variant of the 9M100. Further anti-submarine/anti-shipping capabilities are provided via two quadrupple 330 mm torpedo launchers for unique Paket-NK torpedoes. These can engage both enemy submarines, as well as incoming torpedoes, thus serving a dual role. There is a 130 mm A-192M gun. It has a rate of fire of 45 rounds per minute. It can be used to engage surface targets, as well as to bombard land. Last ditch defense is provided by two Palash Close-In Weapon Systems (CIWS), mounted at the rear. These defense systems are fitted with 30 mm rapid-firing Gatling guns and 8 short-range surface-to-air missiles each. Also there are two pedestal-mounted 14.5 mm heavy machine guns. The Admiral Gorshkov class frigates have a hangar and can accommodate a single Kamov Ka-27, or similar naval helicopter. The Admiral Gorshkov class has a Combined Diesel and Gas (CODAG) propulsion. Machinery includes two cruise diesel engines, developing a combined output of 10 400 shp and two boost gas turbines, developing a combined output of 55 000 shp. The power is delivered to 2 shafts. Maximum speed is 29.5 knots (55 km/h). However construction of the third and forth ship was postponed due to problems with the engine supply. The first two ships of the Admiral Gorshkov class have Ukrainian gas turbines engines. A center of Soviet maritime gas turbine design and production was in Ukraine. After the collapse of the Soviet Union, Russia used to purchase these engines from Ukraine. However following the 2014 Russian military aggression in Ukraine, the Ukrainians refused to supply Russia with military technology. In 2014 one gas turbine engine of the second ship, Admiral Kasatonov, was transferred to the lead ship,

Admiral Gorshkov, in order to complete it. The Russian NPO Saturn has been commissioned to design new engines for the Admiral Gorshkov class frigates, allowing third and forth ship to be commissioned from 2020.

Type 054 Class (Jiangkai I Class) Chinese Frigate

Tiers:

1 **2** 3 4

Variants:

- **MAANSHAN:** Commissioned: 2005 Status: Active
- **WENZHOU:** Commissioned: 2005 Status: Active

System

Alternative Designation: Type 054 Class; JIANGKAI I class

Date of Introduction: 2005

Type: Frigate

Builder: Hudong-Zhonghua Shipyard Huangpu Shipyard

In Service: 2005-Present

Crew: 190

Dimensions

Length: 125 m

Beam: 14 m

Draft: 5 m

Displacement, Standard: 3,400 tons

Displacement, Full Load: 3,800 tons

Propulsion System

Engine Name: 2 x SEMT Pielstick 16-cylinder PA6 STC diesel; 2 x Shaanxi diesel (license-built MTU 20V 956TB82)

Engine Type: Combined diesel and diesel (CODAD) system

Engine Power: hp25,320 hp (18,880 kW) total at 1,084 rpm; 2 shafts

Maximum Range: 6,500 nm at 33.3 km/h (18 knots)

Maximum Speed: km/h33.6 km/h(30 knots)

Endurance: km/hINA

Gun Weapon Systems

↳*Gun Weapon System #1: Type 76A Twin, 37mm, AA Gun*

Name: Type 76A Twin 37mm AA gun

Type: Naval Anti Aircraft

Caliber: Munition specific (see ammunition section)

Quantity: 1

Manufacturer: INA

Length: 2.729 m including flash suppressor and breech

Barrel Length: 2.315 m (62.5 calibers) without flash suppressor

Weight: 126 kg

Crew: INA

Elevation: -10 / +85 degrees

Traverse: INA

Rate of Fire: INA

Muzzle Velocity: Varies with projectile

Effective Firing Range: Ballistic range: 8,400 m, Maximum AA ceiling: 5,000 m, Effective AA Ceiling 4,000 m

↳*Gun Weapon System #1, Type 76A, Ammunition: HE-FRAG/ HE-FRAG Tracer*

Type: Rifle

Caliber: HE FRAG: 4.7 Calibers/ HE FRAG Tracer 4.4 Calibers

Shell: HE-FRAG/ HE- FRAG Tracer

Basic Load: INA

Muzzle Velocity: 880 mps

Shell Weight: 1.496 kg

Bursting Charge Weight: 0.732 kg

Propellant Charge Weight: 0.21 kg

↳*Gun Weapon System #1, Type 76A, Ammunition: AP/ AP Tracer*

Type: Rifle

Caliber: AP tracer: 4.5 calibers/ AP: 4.2 calibers

Shell: AP tracer/ AP

Basic Load: INA

Muzzle Velocity: 880 mps

Shell Weight: 1.522 kg

Bursting Charge Weight: 0.758 kg

Propellant Charge Weight: 0.21 kg

↳*Gun Weapon System #2 : 2 × Type 730 7-barrel 30 mm CIWS guns*

Name: Type 730 CIWS

Type: Close-In Weapon Station

Caliber: 30mm

Quantity: 2 x Type 730 CIWS Stations

Barrel Length: INA

Weight: INA

Barrels: 7-barrel

Rate of Fire: 1,200-4,200 rounds/minute

Maximum Firing Range: 3 km

Effective Firing Range: 150 m minimum, 1400 m interception, 2500 m effective against missiles (using APDS), 150-3500 meters against aircraft (using HE), 5000 meters against surface targets (using HE).

Feed System: Type 730: One ammunition boxes, holding 640 rounds

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

↳*Ammunition Gun Weapon System #2: Type 730 7-barrel 30 mm CIWS guns*

Type: Rifle

Caliber: 30mm

Shell: High Explosive (HE), Armor Piercing Discarding Sabot (APDS)

Shell Weight: INA

Basic Load: INA

Shell Weight: INA

Bursting Charge Weight: INA

Propellant Charge Weight: INA

Radar Systems

↳*Radar System #1: Type 382 Radar (NATO: Top Plate)*

Name: Type 382 Radar

Type: Air search radar

Alternate Designation: Top Plate (NATO)

Proliferation: China, Russia

Frequency: Bands: S (E/F) and C (G/H) bands

Beam: 2.7 degrees

Pulse Width: INA

Beam Width: INA

PRF: INA

Scan Rate: 30/minute

Resolution: INA

Range: 250 km

Mast: INA

Antenna: Planar array of MR-710

Notes: Radiation Power: 100 kw

↳*Radar System #2: Type 344*

Name: Type 344 Radar

Type: Fire control Radar

Alternate Designation: MR34

Proliferation: China

Frequency: I and J Band

Beam: INA

Pulse Width: INA

Beam Width: INA

PRF: INA

Scan Rate: INA

Resolution: INA

Range: INA

Mast: INA

Antenna: INA

Notes: The Type344 Radar: Uses phase scanning techniques •Uses pulse compression, MTI (Moving Target Indicator) and CFAR (Constant False Alarm Rate) •Traveling Wave Tube (TWT) amplifier •Independent search capability in 10" X 10" •Able to track both surface and airborne targets

↳*Radar System #3: Type 345 Fire Control Radar*

Name: Type 345

Type: Fire Control Radar

Alternate Designation: INA

Proliferation: INA

Frequency: Ku/J Band

Beam: INA

Pulse Width: INA

Polarization: Horizontal

Beam Width: 1.2 degrees

PRF: 3600 pps or 7200 pps

Scan Rate: INA

Resolution: ININAA

Range: 30 km against 2m2 RCS aircraft; 15 km against sea skimming targets.

Mast: INA

Antenna: 21 db gain

Notes: None

↳*Radar System #4: MR-36A*

Name: MR-36A Radar

Type: Surface search

Alternate Designation: Type 363

Proliferation:

Frequency: E/F - band

Beam: 1.65 x 8 deg

Pulse Width: 5.5 – 12 microsec

Polarization: Circular / Linear

Beam Width: INA

PRF: 2200/1100pps

Scan Rate: 15 or 24 rpm

Resolution: INA

Range: 130 km

Mast: INA

Antenna: 29.5 db

Notes: China Type 363 - (MR-36) Radar Track While Scan (TWS), Pulse-only Radar Role: Radar, Target Indicator, 2D Surface-to-Air Max Range: 129.6 km

↳*Radar System #5: Racal RM-1290 Radar*

Name: Racal RM-1290

Type: Navigation

Alternate Designation: Peoples Liberation Army

Proliferation: People's Liberation Army Navy, Pakistan Navy, Bangladesh Navy

Frequency: J Band

Beam: 1.3 degrees

Pulse Width: 0.505 microseconds

Polarization: Horizontal

Beam Width: INA

PFR: 1300 hz

Scan Rate: INA

Resolution: INA

Range: INA

Notes: INA

Missile Weapon Systems

↳*Vertical Launch System (VLS), Missile/Rocket: 1 x 32 cell VLS*

↳*VLS Missile System #1: HQ-16 Missiles*

Name: HQ-16 Missiles

Type: Surface-to-Air Missile

Quantity: 1 x 32-cell VLS System

Launcher: 1 x 32-cell Vertical Launch System

Length: INA

Diameter: INA

Speed: Mach 3

Range: 40 km

Guidance System: Semi-active radar homing

Note: HQ-16 (Hongqi-16) - Co-developed by China and Russia, believed to be based on either the SA-11 or SA-17. Credited with a range of 40 km. Also known as the HQ-16A.

↳*VLS Rocket System #2: YJ-83 Missile*

Name: YJ-83 Missile

Type: Anti-Ship Cruise Missile

Quantity: 2 x quad YJ-83 Launcher Systems

Launcher: 2 x quad YJ-83 Launchers

Length: INA

Diameter: INA

Engine: CTJ-2 turbojet

Warhead: 190 kg high-explosive fragmentation

Operational Range: 180 km

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Note: The US military considers the C-802 and C-802A as parts of the YJ-83 family.[4] The C-802 precedes the closely related YJ-83; strictly speaking, only the C-802A is the export development of the YJ-83.[5] The C-802 is sometimes and erroneously considered the export version of the YJ-82; the two are separate developments.[6] A prospective "C-803" was erroneously promulgated as the export version of the YJ-83 by enthusiasts in the late-1990s. As yet, no such missile exists.

↳*Type 87 240mm anti-submarine rocket launcher (36 rockets carried)*

Name: Type 87
Type: Type 81G ASW Projectile
Quantity: Three 2 x 12 Rockets
Launcher: Manually reloaded
Length: INA
Diameter: INA
Engine: Rocket
Warhead: 34 kg High Explosive (HE)
Operational Range: 5 km
Speed: INA
Guidance System: FCS controlled by sonar
Note:

Torpedo Weapon Systems

↳*Torpedo, YU-7 Anti Submarine Warfare Torpedo*

Name: YU-7 Torpedo
Type: Anti Submarine Warfare (ASW) Torpedo (2 x 3 laucher)
Length: 2.7 m
Diameter: 324 mm
Weight: 235 kg
Warhead: High Explosive (HE)
Warhead Weight: 45 kg
Effective Firing Range: 14.1 km
Propellant: Otto fuel II
Maximum Depth: 400 m
Speed: >45 kts (83 km/h)
Guidance System: active / passive acoustic homing
Guidance System: CIACIO-S seeker

↳*Torpedo, Yu-8 Anti Submarine Warfare (ASW), Rocket Propelled Torpedo*

Name: YU-8 ASW Rocket Propelled Torpedo

Type: Light Torpedo

Length: Approx 1.2 m

Diameter: Approx 0.4 m

Engine: Rocket motor

Weight: Approx 0.6 ton

Warhead: Semi-armor-piercing

Warhead Weight: INA

Effective Firing Range: Approx 20 km

Propellant: Solid Fuel

Maximum Depth: INA

Speed: Supersonic

Guidance System: Inertial in flight, passive / active sonar in water

Onboard Aviation Facilities

Facilities: Helicopter Hanger

Helicopters: 1 x Ka-28 or Harbin Z-9C helicopter

Fire Control

FCS Name: See Weapon Systems

Computerized FCS: Yes

Radar FCS: 3 x Type 347G gun fire-control

Sonar Systems

Search and Attack Sonar 1: 1 x MGK-335 suite w/ Bull Horn active and Whale Tongue passive hull-mounted, medium-frequency search and attack

Search and Attack Sonar 1: H/SJG-206 is low frequency towed array sonar, the first towed sonar in China. Developed by ChinaShipbuilding Industry Corporation, it won second place in National Science & Technology Advancement Award in 2003, and it equips many Chinese primary surface combatant

Protection

Active Protection System: Yes, 1 x HZ100 shipborne ECM/ELINT system

Electronic Warfare: 1 x Type 922-1 radar warning intercept

Decoys: 2 x Type 726-4 18-tube decoy/chaff launcher

NBC Protection: Yes

ASW: 2 x six-tube Type 87 anti-submarine rocket launchers; 36 rockets carried

Communications and Electronic Warfare

↳*Communications*

Satellite Communications: SNTI-240 SATCOM

Satellite Communications: AKD5000S Ku band SATCOM

↳*Electronic Warfare*

ECM/ELINT: HZ-100 ECM & ELINT system

Missile Jamming System: Kashtan-3 missile jamming system

Notes:

The Type 054 (NATO Codename Jiangkai I) frigate is a Chinese multi-role warship that were commissioned in the People's Liberation Army Navy Surface Force in 2005. They superseded the Type 053H3 frigates. Two ships, 525 Ma'anshan, and 526 Wenzhou, were completed before production switched to the improved Type 054A frigate. The Type 054 has a stealthy hull design with sloped surfaces, radar absorbent materials, and a reduced superstructure clutter. The main anti-ship armament were YJ-83 sea-skimming anti-ship cruise missiles in two four-cell launchers. It retained the HQ-7 SAM, an improved version of the French Crotale, from the preceding Type 053H3; the HQ-7 had a ready-to-fire 8-cell launcher, with 16 stored in the automatic reloader. Short range defence was improved with four AK-630 CIWS turrets. A 100 mm main gun, also based on a French design, was mounted. Both ships were powered by four CODAD Type 16 PA6 STC marine diesel engines designed by SEMT Pielstick, each generating 6,330 hp. Licenses for the engines were sold to China in April 2002, where they were built by the Shaanxi Diesel Engine Factory. Other reports claimed each ship was powered by two (or four) Type 16 PA STC and two MTU 20V 956TB92 diesels.

Azmat Class Pakistani Fast Attack Craft

Tiers:

System

Alternative Designations: PNS Azmat (Azmat Class)
Class and Type: Fast attack craft
Builder: China State Shipbuilding Corporation, Xingang
Launched: 20 September 2011
Commissioned: 24 April 2012
Status: Active
Crew: 12-14
Mission: The fast attack craft can be deployed in maritime patrol, anti-surface warfare, anti-air warfare, search-and-rescue (SAR) and anti-piracy missions.
Pennant Number: 1013

Dimensions

Length: 62.97 m
Beam: 8.76 m
Displacement: 560 tons
Draught: 2.46m

Automotive

Engine Name: INA

Engine Type: Diesel

Engine Power: INA

Number of Engines: ea4

Maximum Speed: 30 knots

Maximum Range: 1,000 nm

Propellers: Fixed Pitch Propellers (FPPs) through a pair of two propulsion shafts.

Armament

↳*Gun Station #1*

Name: AK-630

Type: Close-In Weapon System

Caliber: 30mm

Quantity: 1

Configuration: In "630", "6" means 6 barrels and "30" means 30 mm.

Mission: The system's primary purpose is defense against anti-ship missiles and other precision guided weapons. However it can also be employed against fixed or rotary wing aircraft, ships and other small craft, coastal targets, and floating mines.

Turret: It is mounted in an enclosed automatic turret

Radar: MR-123 radar and television detection and tracking.

Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)

Width: 1,240 mm (49 in) (mount ring)

Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630) 1,800 kg (4,000 lb) (AK-630M) 2,500 kg (5,500 lb) (AK-630M-2) External nodes: 800 kg (1,800 lb) (AK-630) 2000 rounds in belt: 1,918 kg (4,228 lb)

Height: 1,070 mm (42 in) (above deck)

Crew: 1

Barrels: 6

Action: Gas-operated rotary cannon

Elevation: +88° ... -12° (50°/sec) +90° ... -25° (60°/sec) AK-630M-2

Traverse: ±180° (70°/sec) ±180° (80°/sec) AK-630M-2

Rate of Fire: 4,000–5,000 rounds/min (AK-630M) 10,000 rounds/min (AK-630M1-2)

Effective Firing Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime) 5,000 m (16,000 ft) (all, AK-630M-2)

Muzzle Velocity: 880–900 m/s

Maximum Firing Range: the projectiles self-destruct past 5,000 m (16,000 ft) range

Feed System: Belt: 2,000 rounds (additional 1,000 rounds in reserve feed bin, AK-630M) 4,000 rounds (AK-630M1-2)

Sights: Radar / TV-optical

↳*Ammunition Gun Station #1*

Shell: HEI-Frag, Frag-T

Caliber: 30×165mm AO-18

Shell Weight: 0.39 kg

Basic Load: INA

↳*Gun Station #2*

Name: INA

Type: Automatic gun

Caliber: 23mm

Quantity: 1

↳*Ammunition Gun Station #2*

Name: INA

Type: Rifle

Caliber: 23mm

Basic Load: INA

↳*Missile System*

Name: C-802

Type: Anti-Ship Cruise Missile

Manufacturer: China Aerospace Science and Industry Corporation

Proliferation: Widely Proliferated

In Service: 1998-Present

Engine: TRI 60-2 turbojet

Maximum Range: 65 nautical miles (120 km)

Guidance System: Inertial navigation/active radar homing terminal guidance

Note: The C-802 which is a export variant of the YJ-83 (NATO: CSS-N-8 Saccade)

Protection

Armor: INA

Close-In Weapon System (CIWS): Yes, the AK-630

Note: The boat's speed itself is also considered as a defense system, as it can outmaneuver older, less maneuverable anti-ship missiles.

Notes:

PNS Azmat is the lead ship of the Azmat class fast attack crafts of the Pakistan Navy and is based on the Chinese Type 037II Houjian-class missile boat. Azmat was commissioned on 24 April 2012 at Tianjin, China after being launched on 20 September 2011. It has the pennant number 1013. PNS Azmat is considered by many[citation needed] as a stealth boat, due to its hull and design, even though it was not so designed. The small fast attack craft is a green water vessel and does not have blue water capabilities, and so it is mostly used to patrol the coast, and to assist the Coast Guard in any special operations that require extensive firepower. PNS Azmat is equipped with eight C-802 anti-ship cruise missiles, carried in two quadruple missile

containers. The vessel uses a fully automatic 23 mm gun. The decision to install the 23 mm gun was due to lack of hull space, which meant less storage area for 75-100 mm rounds required for larger guns and weight requirements. Also a 23 mm gun is much easier to maintain than larger 75 mm to 100 mm guns. For its defensive capabilities, Azmat uses a CIWS. Also, the boat's speed itself is also considered as a defense system, as it can outmaneuver older, less maneuverable anti-ship missiles.

CB90 Class Swedish Fast Assault Craft

Tiers:

Variants:

- **The Strb 90 L:** The Strb 90 L is outfitted for battalion-level command and control, with computer and communications equipment and an auxiliary generator to provide electrical power when the engines are not running. The L stands for ledning (command or leadership).
- **The Strb 90 KompL:** The Strb 90 KompL is a plain Strb 90 H in which portable computer and communications equipment has been installed, allowing it to temporarily provide company-level command and control. Electrical power is provided by a rather loud portable generator installed on deck.
- **The Strb 90 HS:** is designed for overseas peace-keeping and rescue operations. It is modified to keep its crew comfortable in Mediterranean conditions, with air conditioning, an auxiliary generator, a head, and more comfortable crew stations. More importantly, it is armored, and its engines have been upgraded to compensate for the added weight.
- **Strb 90 H:** At least one Strb 90 H, pennant number 802, is equipped with a decompression chamber.
- **SB90N:** The Royal Norwegian Navy operates 20 CB90s under the designation SB90N; the N simply stands for Norsk utgave (Norwegian version). The S90N differs from the Strb 90 H in a few areas: *It is armed with only one 12.7 mm machine gun, instead of three. *The anchor winch is motorized, and the anchor is mounted at the stern, allowing a grounded S90N to tow itself afloat rather than risk damage to its impellers. It carries an auxiliary generator which provides electrical power to navigation and communications systems even when the engines are not running. The "Troops transportation room" has a higher deck height, making it possible for most people to stand without crouching. It has two water tight compartments in the bow, having an extra room for toilet and stores. It has a much more sophisticated navigation equipment based on GPS-technology delivered by Kongsberg Seatex AS.

System

Alternative Designation: CB90; Stridsbåt 90 H(alv) (Strb 90 H, literally: Combat Boat 90 Half

Name: Mk 19 Grenade Launcher

Type: Grenade Launcher

Quantity: 1 x Mk 19 Grenade Launcher

In Service: 1968-Present

Manufacturer: Saco Defense Industries (now a division of General Dynamics Ordnance and Tactical Systems), Combined Service Forces, MKEK

Length: 1,090 mm

Barrel Length: 413 mm

Width: 240.4 mm

Height: 199 mm

Weight: 35.2 kg (empty without accessories)

Action: Blowback (Advanced primer ignition)

Rate of Fire: 360–390 rpm (cyclic) 40 rpm (sustained) 60 rpm (rapid)

Muzzle Velocity: 750–790 feet per second (230–240 m/s) (average)

Effective Firing Range: 1,500 m

Maximum Firing Range: 2,212 m

Feed System: 32- or 48-grenade belt

↳***Ammunition, Weapon Station #2***

Cartridge: 40×53 mm

Caliber: 40mm

Basic Load: INA

Protection

Hull Armor: INA

Notes:

Stridsbåt 90 H(alv) (Strb 90 H, literally: Combat Boat 90 Half; the 90 refers to the year of acceptance and Half refers to the fact that it can carry and deploy a half platoon of amphibious infantry (18 men) fully equipped) is a class of fast military assault craft originally developed for the Swedish Navy by Dockstavarvet. In addition to the many variants in service with the Swedish Navy under the "Stridsbåt 90H" designation, the CB 90 has been adopted by the navies of several countries, including Norway (as the S90N), Greece, Mexico (as the CB 90 HMN), the United States (as the Riverine Command Boat) and Malaysia. Additionally, the German Navy plans to equip the Berlin-class replenishment ships with the CB90. The CB90 is an exceptionally fast and agile boat that can execute extremely sharp turns at high speed, decelerate from top speed to a full stop in 2.5 boat lengths, and adjust both its pitch and roll angle while under way. Its light weight, shallow draught, and twin water jets allow it to operate at speeds of up to 40 knots (74 km/h) in shallow coastal waters. The water jets are partially ducted, which, along with underwater control surfaces similar to a submarine's diving planes, gives the CB90 its maneuverability.

Engine: Teledyne CAE J402 Turbojet/solid propellant booster for surface and submarine launch; greater than 600 pounds (greater than 272.2 kg) of thrust

Operational Range: in excess of 150 nmi (280 km) depending on launch platform

Flight Altitude: Sea-skimming

Speed: 537 mph (864 km/h; 240 m/s; Mach 0.71)

Guidance System: Sea-skimming cruise monitored by radar altimeter / active radar terminal homing

Launch Platform: multi-platform: RGM-84A surface-launched AGM-84A air-launched UGM-84A submarine-launched

Notes:

The La Combattante IIa fast attack craft is a class of fast attack craft originally built for the German Navy as Type 148 Tiger-class fast attack craft. They were later transferred to the Hellenic Navy and the class was renamed Combattante IIa, as with similar French made ships. All the ships were under mid-life updates in 1980s. Two vessels in the class, P-74 and P-75, were fitted with RGM-84 Harpoon anti-ship missiles and a new ESM was fitted after transfer. A version called the Beir Grassa class, of which 10 were built and 8 were operational as of 1995, were used by the Libyan Navy. One had been sunk and another disabled during a 1986 confrontation with US forces. Iran ordered 12 ships of the same class (known in Iran as Kaman class), nine of which were delivered in 1977 and 1978, and three of which were delayed until 1981 as a result of the 1979 Islamic Revolution. The Iranian fast attack craft Paykan was sunk during Operation Morvarid in 1980, while Joshan was sunk by USS Simpson during Operation Praying Mantis in 1988. These ships are not to be confused with the new Joshan and Paykan, which were named in their memories. Iran built a heavily upgraded version of this class called the Sina class. As of 2012 Iran has built 4 Sina-class vessels and is building 5 more of this class. French-built. US-supplied Harpoon missiles have been expended, and replaced by Iranian made, medium range "Noor", anti-ship cruise missiles. Paykan was sunk during Operation Morvarid by the Iraqi Navy, in 1980, while Joshan was sunk by the American Navy, during Operation Praying Mantis, in 1988. These ships must not be confused with the new Joshan and Paykan, which are part of the Iranian Navy fleet of warships serving in the Caspian Sea.

Notes:

The Mandau-class is a class of four missile-armed fast attack craft operated by the Indonesian Navy. They were built by the Korea Tacoma shipyard from 1977 to 1980. In 1975, Indonesia placed an order with the South Korean shipbuilder, Korea Tacoma International, for 4 PSK Mark 5 missile armed fast attack craft. The design was based on Korea Tacoma's PSSM patrol boat built for the Republic of Korea Navy, which in turn was based on the Asheville-class gunboat built for the US Navy. The ships are 53.58 m (175 ft 9 in) long, with a beam of 8.00 m (26 ft 3 in) and a draught of 1.63 m (5 ft 4 in). Displacement is 250 long tons (250 t) standard and 290 long tons (290 t) full load. The ships's machinery is arranged in a 2-shaft, Combined Diesel or Gas (CODOG) layout, with a single General Electric-Fiat LM2500 gas turbine rated at 25,000 shp (19,000 kW) powering the ship at high speeds, with two MTU 12V331 TC81 diesel engines rated at 1,120 bhp (840 kW) each, power the ship at lower speeds. Maximum speed is 41 kn (47 mph; 76 km/h) using the gas turbine, and 17 kn (20 mph; 31 km/h) using the diesels. Range is 2,500 nmi (2,900 mi; 4,600 km) at 17 kn (20 mph; 31 km/h). The ships are fitted with a single Bofors 57 mm SAK-57 Mk I gun forward, with a Bofors 40 mm L/70 gun aft, with two Rheinmetall 20 mm cannon providing close-in defence. Four mm 38 Exocet anti-ship missiles can be carried. The ships have a crew of 7 officers and 36 other ranks. A Racal Decca 1226 I-band surface search radar is fitted, while fire control is by a Signaal WM 28 fire control radar and a Selenia NA-18 optronic director.

Flight Altitude: Sea-skimming
Speed: 537 mph (864 km/h; 240 m/s; Mach 0.71)
Guidance System: Sea-skimming cruise monitored by radar altimeter / active radar terminal homing
Launch Platform: multi-platform: RGM-84A surface-launched AGM-84A air-launched UGM-84A submarine-launched

Notes:

The La Combattante IIa fast attack craft is a class of fast attack craft originally built for the German Navy as Type 148 Tiger-class fast attack craft. They were later transferred to the Hellenic Navy and the class was renamed Combattante IIa, as with similar French made ships. All the ships were under mid-life updates in 1980s. Two vessels in the class, P-74 and P-75, were fitted with RGM-84 Harpoon anti-ship missiles and a new ESM was fitted after transfer. A version called the Beir Grassa class, of which 10 were built and 8 were operational as of 1995, were used by the Libyan Navy. One had been sunk and another disabled during a 1986 confrontation with US forces. Iran ordered 12 ships of the same class (known in Iran as Kaman class), nine of which were delivered in 1977 and 1978, and three of which were delayed until 1981 as a result of the 1979 Islamic Revolution. The Iranian fast attack craft Paykan was sunk during Operation Morvarid in 1980, while Joshan was sunk by USS Simpson during Operation Praying Mantis in 1988. These ships are not to be confused with the new Joshan and Paykan, which were named in their memories. Iran built a heavily upgraded version of this class called the Sina class. As of 2012 Iran has built 4 Sina-class vessels and is building 5 more of this class. French-built. US-supplied Harpoon missiles have been expended, and replaced by Iranian made, medium range "Noor", anti-ship cruise missiles. Paykan was sunk during Operation Morvarid by the Iraqi Navy, in 1980, while Joshan was sunk by the American Navy, during Operation Praying Mantis, in 1988. These ships must not be confused with the new Joshan and Paykan, which are part of the Iranian Navy fleet of warships serving in the Caspian Sea.

These ships must not be confused with the new Joshan and Paykan, which are part of the Iranian Navy fleet of warships serving in the Caspian Sea.

Type 062 Class (Shanghai II Class) Chinese Gunboat

Tiers:

Variants:

- **Type 062I-class gunboat:** The Type 062I-class gunboat (NATO: Shanghai III class), is the successor of the original Type 062 Shanghai I & II-class gunboats of the People's Liberation Army Navy. The Shanghai III-class gunboat is more heavily armed than its predecessor, with the 23 mm guns replacing the 14.5 mm heavy machine guns and is also substantially larger at 170 tons. Significantly more Shanghai III-class gunboats have entered service in foreign navies than in the People's Liberation Army Navy, and the ones in the Chinese inventory are mainly used for training foreign crews, and not all export boats have the same configuration due to different customers' requirements. They are primarily used for coastal and inland patrol.
- **Haizhui-class submarine chaser:** The Haizhui-class submarine chaser is based on the Type 062I-class gunboat and entered service in the early 1960s. It was a stopgap measure as a follow on class to Kronshtadt-class submarine chaser before the arrival of the Type 037 submarine chaser in the mid 1960s. Although Type 062I originated as a gunboat, the submarine chaser version was more successful in serving the People's Liberation Army Navy, actually serving operationally rather than a training vessel for foreign crews.

Notes:

The Type 062 gunboat is a class of gunboat of the People's Liberation Army Navy first developed and constructed in the 1950s. This unsophisticated class is relatively well-armed for its size and is the most widely built and exported Chinese naval vessel in terms of numbers. A total of 30 were built, initial boats being known as the Shanghai I class and later slightly improved boats being known as the Shanghai II class. The Shanghai I class was slightly smaller than its successor, the Shanghai II class, displacing 125 tons instead of 135 tons, and had a twin Chinese Type 66 57 mm gun mount forward. All other specifications are identical to the Shanghai II class, which replaced the 57 mm with twin 37 mm gun mounts. Some boats remained in active service well into the early 1990s in the PLA navy and longer in the case of the Korean People's Navy. The Type 062 gunboat (NATO reporting name: Shanghai I & II class), is a family of gunboats built to replace the preceding Shantou and Huangpu-class gunboats. During the late 1950s, the PLAN found they needed a more powerful gunboat, as the 50-80-ton class Shantou and Huangpu-class gunboats were too small and lacked both firepower and endurance. Several prototypes are built by different shipyards. They were the Type 0105 from Luda, the Type 0108 from Qingdao, the Type 0109 from Shanghai, and the Type 0110 from Guangzhou. Displacement of the prototypes varied from 100-150 t, speed varied from 28–30 knots (52–56 km/h; 32–35 mph), with different weapon arrangements including 57IIx1, 37IIx1, 14.5IIx2 or 37IIx2,14.5IIx2. In 1960, a hybrid of all the prototypes, Type 0111 was laid down at Dalian shipyard, Luda. Full production variants became known as the Type 062-class. A total of 30 were built, initial boats being known as the Shanghai I class and later slightly improved boats being known as the Shanghai II class. Some boats even remained in active service well into the early 1990s. The Shanghai I class was slightly smaller than its successor, the Shanghai II class, displacing 125 tons instead of 135 tons, and had a twin Chinese Type 66 57 mm gun mount forward. All other specifications are identical to the Shanghai II class, which replaced the 57 mm with twin 37 mm gun mounts. The L-12V-180 diesel engines used on the Type 062 were prone to overheat, thirsty for fuel and had a poor working life. So the smaller L-12D-6 diesel engine was introduced. The new engine was more fuel efficient and had longer life, but rated only 910 horsepower (680 kW), resulting in a maximum speed of only 28.5 knots (52.8 km/h; 32.8 mph). The low speed disappointed PLAN and thus one of the reason construction ended at 30 boats.

Type 22 Class (Houbei Class) Chinese Fast Attack Missile Boat

Notes:

In April 2004, China's Quixin Shipyard in Shanghai produced the lead Houbei Type 022 wave-piercing catamaran, hull number 2208. The Type 022 was 43 meters (140 feet) long and displaces 225 tons. It was equipped with two missile launchers and has a top speed of 38 knots. The Type 022 was the PLA Navy's new-generation stealth missile fast attack craft (FAC). The boat features a unique high-speed, wave-piercing catamaran hull design with evident radar cross-section reduction design features. A number of Chinese shipyards across the country were involved in the construction of the boat. The Salvo equations are the successors to Lanchester Equations whose square law was applied to a formation of battleships. Specifically the salvo equations apply when missiles or torpedoes are fired in batches instead of “continuously.” The salvo-like phenomenon was also seen in the five big Pacific carrier battles in World War II in which each side endeavored to detect and attack first with all its air wings simultaneously in a single pulse, or “salvo,” of aircraft attacking as a coordinated unit. The salvo equations show that if a fleet has three times as many combatants, then for parity in loss ratios (in other words, which side will have ships remaining when all of the opponents are out of action), to overcome a numerical advantage each of my ships must have thrice the offensive power, thrice the defensive power, and thrice the survivability (the “staying power”). The weight of ordnance to put a warship out of action increases only as the one-third power of its displacement, making smaller missile ships a cost-effective

offensive capability. Another general property of missile warfare shown by the equations is that if ship numbers and staying power are both small, then an unstable combat situation arises, in which the shift in results of an exchange moves from total victory to total loss within a small change in the number of ships on either side. This is to an extent an artifact of the equation structure, but it is a warning that a fleet of big surface warships can be put out of action with a small number of missile hits in 21st Century combat. This first ship appears to be focused on the FAC mission, and appears to be designed for the installation of anti-ship missile launchers amidship (in the middle of the ship). But some speculated that the Chinese will soon design and build larger models that can carry UAVs and small boats for landing commandoes, as the U.S. may soon be doing. The Chinese probably already have its version of the digital connectivity which lies at the heart of the LCS program. So here is an area of military technical competition in which the Chinese are demonstrating creativity and a potential ability to match the U.S. just as it was embarking on a new direction in naval warship and combat tactics modernization. The new Chinese FAC design also demonstrates that the real naval threat from China was not aircraft carriers and large destroyers bought from Russia. The real threat was quiet diesel submarines and small ships like this new FAC. The real potential of this new design would be its use in co-ordination with their diesel subs and, possibly, theater ballistic missiles with precision guidance. A combination like that could enable the Chinese to deny the U.S. Navy the ability to safely move in some vital areas, such as the waters surrounding Taiwan First spotted under construction at Qiuxin Shipyard in Summer 2004, the vessel completed sea trials in late 2004 and was possibly commissioned in 2005. It was followed by three additional boats (2209, 2210 and 2211) in or around the 2005-06 time period. More hulls were subsequently spotted under construction at other locations starting in early 2006. The Type 022 appeared to be replacing the ageing Type 021 (Huangfeng class) missile FAC in the PLA Navy service. After several years of extensive prototype testing, Quixin then produced hulls 2209, 2210 and 2211. Many observers thought this could be only a four-ship design, such as the People's Liberation Army Navy's (PLAN's) previous five new guided-missile destroyer (DDG) designs of only one or two hulls since 1991. The startup of production for additional Type 022 hulls in Dalian, Quixin and Jiangnan shipyards in Shanghai, as well as in the Huangpu shipyard in Guangzhou, changed this precept. The large number of wave-piercing catamaran Type 022 hulls being launched several at a time at five different shipyards was a major event in PLAN shipbuilding. By early 2008 China was believed to have built as many as 40 Type 022 missile boats to replace the ageing Huangfeng class missile boats. The Type 022 Houbei PCFG appeared to be building at a rate of about 10 units per year. The August 2009 US Office of Naval Intelligence report "The People's Liberation Army Navy: A Modern Navy With Chinese Characteristics" stated " ... the PLA(N) has built up its long-range capability, it has also reinforced its coastal defense and near-littoral strengths with the introduction of the highly-capable Houbei class guided-missile patrol craft (PTG) in 2004. The Houbei utilizes a wave-piercing catamaran hullform, probably based on a commercial fastferry design, and water jet propulsion to attain considerably better seakeeping, speed, and mission flexibility than the older Gsa and Houku missile boats that they replaced. The relatively low construction, operating, and crew costs of the Houbeis have allowed China to build well over 50 by 2007, with more under construction." About the new stealth boat, the U.S. Congress submitted to Congress Armed Services Committee report entitled "China's impact on the U.S. Navy's modernization," the report said, "2004 China launched anti-ship cruise missile equipped attack boats, the boat prominent stealth performance, can quickly walk through the waves, and has a double hull shape of double hull is a more advanced hull shape design, the world's navies are trying this design approach in this area was currently a leading Australian company . " In recent years, China and Australia have engaged in production of different types of wave-piercing vessels. So far, China produced a total of several models of civilian-type Rogue boats. The general law of development of the shipbuilding industry, the continuous improvement of 022 boats will refer civilian type catamaran trends. China's missile boats have used French diesel engines, and with high-power engines the type 022 may reach 40 or more full speed. The most noteworthy was that all 022 missile boats are equipped with one-way hn900 tactical data link, which can work together to achieve the intent. It can collaborate with other frigates, missile destroyers, shore-based reconnaissance, early warning aircraft, boats and even between the implementation of the "proper reach," the distant sea offensive operations. As a result of jet propulsion, with no propeller, the 022 more than any one Chinese navy missile boats to was quiet, especially when at high speed. Chinese military's "Liberation Army Daily" reported that "China Water National Key Laboratory of acoustic vibration casing vibration and noise reduction technology research made fruitful achievements in scientific research." Military experts believe that this technology was important for high-speed vessels. Type 022 stealth missile boats with double hull shape, highlighting the invisibility. The Chinese trimaran fast attack craft (FAC) design may grow into a larger more versatile platform, similar to the U.S. Littoral Combat Ship (LCS) program. China Shipbuilding Trading Corporation (CSSC) revealed a concept for a 700 tonne derivative of the PLAN's Type 022 catamaran fast attack craft (FAC). The design was modeled in February 2017 at Abu Dhabi’s IDEX expedition, and showcased many possible features for the vessel. It was armed with a 76 mm gun and four anti-ship missile launchers. CSSC officials said the PLAN has so far shown no interest in this version and there are no plans to build it. The CSSC consortium, comprised of over a dozen Chinese industry shipbuilders, showcased designs for export vessels, mostly based on existing designs from the Chinese Coast Guard or the Navy. There was no indication that China was building an additional level of conventional missile boats, showing the 022-boat and on the basis of improvement, improved missile boats could become China's future development direction. A workshop sponsored by the Secretary of Defense’s Office of Net Assessment on retaining American influence in East Asia led to a report published in October 2011. The workshop participants advocated four force elements to reduce the chance of Chinese aggression and a shooting war. One component is a flotilla of small, highly lethal combatants that can be sent on the surface into the China Seas. Analysis at the Naval Postgraduate School and war gaming at the Naval War College independently saw the potential of such low-cost missile combatants and the need for a more detailed examination, since no such capability exists in the U.S.Navy.

BK-16 Raptor Class Russian Fast Attack Craft

Tiers:

System

Alternative Designation: Raptor; CB90 Class

Crew: 2

Passenger Capacity: 19

Dimensions

Displacement: t19.5

Length: m16.45

Width: m4

Drought: m.87

Height Over Waterline: m4.33

Automotive

Number of Engines: 2

Engine Name: INA

Engine Type: INA

Engine Power: hp780

Cruising Range: nm400

Speed, Maximum: knots42

Speed, Sustainable: knots30

Endurance: day1

Primary Weapon

↳*Remote Controlled Weapon Station (RCWS)*

Options: 7.62mm machine gun, a 12.7mm machine gun, AG-17 30mm automatic grenade launchers and 40mm grenade launchers

Auxiliary Weapon Options

All machine guns in the Russian military arsenal:

Kornet anti-tank guided missile system:

Mine countermeasures:

Fire Control of the RCWS

Type: Two-axis, gyro-stabilised sighting device equipped with surveillance cameras that have a wide and narrow field of view (FOV) and automatic target tracking system

Computerized FCS: Yes

Laser Rangefinder: Yes

Thermal Sights: Yes

RCWS Stabilization: Yes

Mobility of the RCWS: Horizontal travel angle of 360°, a vertical travel angle between -20° and 70°, and angular velocity of rotation of 60° a second

Aquisition Range: km2.5

Number of Targets System Can Track: 10

Protection

Hull Armor: AMg alloys

Superstructure Armor: AMg alloys

NBC Protection: Yes

Ballistic Protection: The weapon station offers armored protection against 7.62x54mm armor-piercing bullets

Notes:

Russia`s Kalashnikov Group has developed new fast attack craft (FAC). They were demonstrated at the Army-2017 international military-technical forum held outside Moscow from August 22-27. The company showcased the BK-16 FAC intended for offshore operations, troops transporting, fire support, counter-piracy and counter-terror missions, and search-and-rescue (SAR) operations. The hull and superstructures of the landing craft are made from AMg alloys. It has a crew of two members and can transport up to 19 servicemen. The craft features a cruising range of 400 nautical miles and an endurance of one day. The BK-16 is powered by two engines with a power output of 780 hp each. The FAC demonstrated at the Army-2017 international military-technical forum received a remote control weapon station (RCWS) with a heavy machine gun (HMG) and several medium machine guns. The type and number of weapons are mission dependent. Furthermore, the landing craft’s ability to launch and retrieve an unmanned aerial vehicle (UAV) was demonstrated during the International Maritime Defense Show (IMDS 2015) held in St Petersburg, Russia, in July 2015. The front section of the upper deck facilitates launch and recovery of light reconnaissance UAVs such as ZALA 421-16EM developed by ZALA Aero Group. The UAV provides increased situational awareness and the ability to engage targets effectively over land and sea.

In Service: 1977-Present

Length: Air-launched: 12.6 ft (3.8 m); Surface- and submarine-launched: 15 ft (4.6 m)

Diameter: 13.5 in (34 cm)

Wingspan: 3 ft (0.91 m)

Weight: 1,523 lb (691 kg) with booster

Warhead: 488 pounds (221 kg)

Detonation Mechanism: Impact Fuze

Engine: Teledyne CAE J402 Turbojet/solid propellant booster for surface and submarine launch; greater than 600

pounds (greater than 272.2 kg) of thrust
Operational Range: in excess of 150 nmi (280 km) depending on launch platform
Flight Altitude: Sea-skimming
Speed: 537 mph (864 km/h; 240 m/s; Mach 0.71)
Guidance System: Sea-skimming cruise monitored by radar altimeter / active radar terminal homing
Launch Platform: multi-platform: RGM-84A surface-launched AGM-84A air-launched UGM-84A submarine-launched

Notes:

The La Combattante IIa fast attack craft is a class of fast attack craft originally built for the German Navy as Type 148 Tiger-class fast attack craft. They were later transferred to the Hellenic Navy and the class was renamed Combattante IIa, as with similar French made ships. All the ships were under mid-life updates in 1980s. Two vessels in the class, P-74 and P-75, were fitted with RGM-84 Harpoon anti-ship missiles and a new ESM was fitted after transfer. A version called the Beir Grassa class, of which 10 were built and 8 were operational as of 1995, were used by the Libyan Navy. One had been sunk and another disabled during a 1986 confrontation with US forces. Iran ordered 12 ships of the same class (known in Iran as Kaman class), nine of which were delivered in 1977 and 1978, and three of which were delayed until 1981 as a result of the 1979 Islamic Revolution. The Iranian fast attack craft Paykan was sunk during Operation Morvarid in 1980, while Joshan was sunk by USS Simpson during Operation Praying Mantis in 1988. These ships are not to be confused with the new Joshan and Paykan, which were named in their memories. Iran built a heavily upgraded version of this class called the Sina class. As of 2012 Iran has built 4 Sina-class vessels and is building 5 more of this class. French-built. US-supplied Harpoon missiles have been expended, and replaced by Iranian made, medium range "Noor", anti-ship cruise missiles. Paykan was sunk during Operation Morvarid by the Iraqi Navy, in 1980, while Joshan was sunk by the American Navy, during Operation Praying Mantis, in 1988. These ships must not be confused with the new Joshan and Paykan, which are part of the Iranian Navy fleet of warships serving in the Caspian Sea.

System

Alternative Designation: Type 071 (NATO reporting name: Yuzhao)

Total Built: China: 7 total to be built. Thailand: 1 total to be built.

Type: Amphibious Transport Dock

Builder: Hudong-Zhonghua Shipbuilding

In Service: 2007-Present

Crew: INA

Passenger Capacity: 600–800 troops

Endurance: 60 days

Dimensions

Length: m210 m

Beam: m28 m

Draft: m7 m

Displacement: 25,000 tons full load

Propulsion System

Engine Name: INA

Engine Type: The Type 071 LPDs are powered by integrated combined diesel and diesel (CODAD) propulsion, controlled by an automated propulsion control system. The propulsion system integrates four Shaanxi 16 PC2.6 V400 diesel engines driving two controllable pitch propellers through twin shafts.

Engine Power: Each engine produces a maximum power of 35,197kW.

Maximum Range: 10,000 nm at 18 knots

Maximum Speed: 25 knots

Endurance: km/h60

Weapon System #1

↳*System*

Name: AK-176

Type: Naval Gun

Caliber: 76mm

Quantity: 1 × AK-176 76 mm (3.0 in) Gun

Length: INA

Barrel Length: INA

Height: 2.6 Meters

Weight: 16,800 kg

Crew: 2 (4 in manual control mode)

Barrels: 1

Recoil: 380 to 500 mm

Maximum Elevation: deg+85

Minimum Elevation: deg-15

Traverse Right: deg175

Traverse Left: deg175

Rate of Fire: 120 rds/min

Muzzle Velocity: 980 m/s

Maximum Firing Range: 15.5 km

Effective Firing Range: 10 km

Feed System: 152 ready to fire rounds

↳*Ammunition*

Type: Rifle

Caliber: mm76.2

Cartridge: INA

Shell Weight: 12.4 kg

Basic Load: INA

Weapon System #2

↳*System*

Name: AK-630

Type: Naval Close-in Weapon System

Quanitity: 4 × AK-630 30mm (1.2 in) CIWS

Caliber: 30mm

Main Armament: 1 or 2 AO-18 autocannons

Secondary Armament: 4 9A4172 missiles (Vikhr-K upgrade)

Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)

Width: 1,240 mm (49 in) (mount ring)

Height: 1,070 mm (42 in) (above deck)

Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630) 1,800 kg (4,000 lb) (AK-630M) 2,500 kg (5,500 lb) (AK-630M-2) External nodes: 800 kg (1,800 lb) (AK-630) 2000 rounds in belt: 1,918 kg (4,228 lb)

Crew: 1

Action: Gas-operated rotary cannon

Elevation: +88° ... -12° (50°/sec)

Traverse: ±180° (70°/sec)

Rate of Fire: 4,000–5,000 rounds/min

Muzzle Velocity: 880–900 m/s

Maximum Firing Range: the projectiles self-destruct past 5,000 m

Effective Firing Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime)

Feed System: Belt: 2,000 rounds (additional 1,000 rounds in reserve feed bin,

Fire Control System: * Zavod Topaz (V. P. Yegorov): * Vympel MR-123, * Vympel-A MR-123/176 * Vympel-AM MR-123-02/MR-123-03, * Vympel-AME MR-123-02/176

Sights: Radar / TV-optical

↳*Ammunition*

Type: Rifle

Caliber: mm30

Shell: HEI-Frag, Frag-T[

Shell Weight: 0.39 kg

Basic Load: INA

Onboard Aviation Facilities

Helicopters: 4 x Z-8 Super Frelon

Boats and Landing Craft Carried

LCAC's: 4 × Type 726 Yuyi class LCAC. Landing craft on port/starboard davits.

Radars

Note: The LPD is equipped with a Type 360 (Seagull-S) air / surface search radar operating on E / F-band frequencies, a Type 364 G-band air search radar, a Type 344 I-band fire control radar and a navigation radar.

Protection

Active Protection System: Yes

Countermeasures: Countermeasures are provided by four 18-tube Type 726-4 decoy or chaff launchers.

NBC Protection: Yes

Notes:

The Type 071 (NATO reporting name: Yuzhao) is a class of Chinese amphibious transport dock ships in service with the People's Liberation Army Navy (PLAN). The Type 071 provides the PLAN with capabilities and flexibility not found in its previous landing ships. Type 071 landing platform dock (LPD) is a new class of amphibious warfare vessels built by Hudong-Zhonghua Shipbuilding, a subsidiary of China State Shipbuilding Corporation (CSSC), for the People’s Liberation Army Navy (PLAN). The Type 071 LPD is primarily deployed in amphibious landing missions and can also conduct humanitarian aid and civilian evacuation missions. The first LPD in the series, Kunlun Shan (998), was launched in December 2006 and commissioned in November 2007. Jinggang Shan (999), the second vessel in the series, was floated out in November 2010 and was inducted into service in October 2011. The third ship in class, Changbai Shan (989), was launched in September 2011 and entered service with the PLAN in September 2012. Yimeng Shan (988) was launched in January 2015 and commissioned in February 2016. A modified variant of the Type 071 LPD was offered by the China State Shipbuilding & Trading Corp (CSTC) consortium for the Royal Malaysian Navy. Type 071 LPD ships feature a unique hull platform offering a large dock space. The ship also offers a dedicated space for medical care and is equipped with a fresh water supply system. The stabilisers fitted to the vessel reduce roll and improve the stability in high sea states. The high volumes of internal space support the installation of additional communications systems, which make the ship a fleet command and control centre during amphibious operations. The Type 071 LPD has a length of 210m, beam of 28m and a draft of 7m. The full load displacement of the vessel is 25,000t. The amphibious warfare ship features a vehicle deck, well-deck, landing deck and a hanger. It can carry a combination of marines, vehicles, landing craft and helicopters. The vehicle deck can house amphibious assault vehicles including ZBD05 amphibious IFV, and ZTD-05 amphibious assault tracked armoured vehicle. The stern ramp, two side doors and ramps allow rapid loading of the vehicles and equipment. The well deck houses up to four landing craft air-cushioned (LCAC), which can transfer vehicles or marines to the shore at high speed. The LCAC are launched by flooding of the docking area. The vessel can also carry landing craft on port / starboard davits. The stern helicopter deck offers two landing spots for supporting the operations of two Z-8 (SA 321 Super Frelon) transport helicopters. The twin-door cantilever hangar can house up to four Z-8 helicopters. The LPD also has the capacity to carry a marine battalion, including up to 800 marines and associated equipment and supplies. The bow deck is installed with an AK-176 76mm naval gun system. The vessel is also armed with four 30mm AK-630 close-in weapon systems (CIWS). Countermeasures are provided by four 18-tube Type 726-4 decoy or chaff launchers.

Class: Mistral class
Active: Mistral, Tonnerre, Dixmude Gamal Abdel Nasser, Anwar El Sadat
Type: Amphibious assault ship
Complement: 20 officers, 80 petty officers, 60 quarter-masters

Troops: 900 (short duration) 450 (long durations) 150 (serving as operational headquarters)

Capacity: 59 vehicles (including 13 AMX Leclerc tanks) or a 40-strong Leclerc tank battalion

Boats & landing craft carried: 4 CTM (chaland de transport de matériel) alternatively, 2 LCAC (Landing Craft, Air Cushion)

Sensors and processing systems: DRBN-38A Decca Bridgemaster E250 navigation radar MRR3D-NG air/surface sentry radar 2 optronic fire control systems

Aircraft Carried: 16 heavy or 35 light helicopters

Aviation Facilities: 6 helicopter landing spots

Dimensions

Length: m199

Beam: m32

Draught: m6.3

Dispacement, Empty: 16,500 tonnes

Dispacement, Fully Loaded: 21,300 tonnes

Automotive

Engine Name: Wärtsilä diesel-alternators 16 V32 (6.2 MW) + 1 Wärtsilä Vaasa auxiliary diesel-alternator 18V200 (3 MW)

Number of Engines: 3

Propulsion: 2 Rolls-Royce Mermaid azimuth thrusters (2 × 7 MW), 2 five-bladed propellers

Speed: 18.8 knots (35 km/h)

Range: 10,800 km (5,800 nmi) at 18 knots (33 km/h) 19,800 kilometres (10,700 nmi) at 15 knots (28 km/h)

Armament

↳*Weapon Station #1*

Name: SIMBAD-RC (Mistral Missile)

Type: Man Portable surface-to-air missile

Quantity: 2

Manufacturer: MBDA (France)

In Service: 1988-Present

Length: 1.86 m

DIameter: 90 mm

Crew: 1

Effective Firing Range: 6 km

Warhead: High Explosive with high density tungsten balls

Warhead Weight: 2.95 kg

Detonation Mechanism: Laser proximity or impact triggered

Engine: Solid Rocket Motor

Speed: m/s800

Guidance System: Infrared homing

Note: SIMBAD-RC is a naval remote controlled turret using Mistral missiles developed by MBDA

↳*Weapon Station #2*

Name: M621 (NARWHAL 20mm RWS)

Type: Automatic Cannon

Caliber: mm20

Quantity: 2

Manufacturer: Nexter Systems

Length: 2,207 mm

Width: 202 mm

Height: 245 mm

Weight: 45.5 kg

Action: Blowback operated

Rate of Fire: 800 rounds/min

Muzzle Velocity: 1,005 m/s (3,297 ft/s) (AP-T) 985 m/s (3,231.6 ft/s) (HEI and TP)

Feed System: Open-link M12 belt

↳*Ammunition Weapon Station #2*

Name: INA

Type: Rifle

Caliber: mm20

Cartridge: 20×102mm

Basic Load: INA

↳*Weapon Station #3*

: M134 Minigun

Type: six-barrel rotary machine gun with a high, sustained rate of fire (2,000 to 6,000 rounds per minute).

Caliber: 7.63mm

Quantity: 2

Barrels: 6

Length: 801.6 mm

Barrel Length: 558.8 mm

Weight: 85 lb (39 kg) (41 lb (19 kg) lightweight mod.)

Action: Electrically driven rotary breech

Rate of Fire: Variable, 2,000–6,000 rpm

Muzzle Velocity: 2,800 ft/s (853 m/s)

Maximum Firing Range: 3,280 ft (1,000 m, 1,093 yd)

Feed System: Disintegrating M13 linked belt or linkless feed; dependent on installation [500-5,000-round belt]

Sights: Dependent on installation; no fixed sights

↳*Ammunition Weapon Station #3*

Name: INA

Type: Rifle

Caliber: 7.62mm

Cartridge: 7.62×51mm NATO

Basic Load: INA

↳*Weapon Station #4*

Name: M2 machine gun or Browning .50 caliber machine gun

Type: Heavy Machine Gun

Caliber: 12.7mm

Quantity: 4

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min (M2HB) 750–850 rounds/min (AN/M2) 1,200–1,300 rounds/min (AN/M3

Muzzle Velocity: 890 m/s

Effective Firing Range: 1,800 m

Maximum Firing Range: 7,400 m

Feed System: Belt-fed (M2 or M9 links)

↳*Ammunition Weapon Station #4*

Name: INA

Type: Rifle

Caliber: 12.7mm

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: INA

Accommodations

Note: The space gained by the use of the azimuth thrusters allowed for the construction of accommodation areas where no pipes or machinery are visible. Located in the forward section of the ship, crew cabins aboard Mistral-class ships are comparable in comfort levels to passenger cabins aboard Chantiers de l'Atlantique-constructed cruise ships. The fifteen officers each have an individual cabin. Senior non-commissioned officers share two-man cabins, while junior crew and

embarked troops use four- or six-person cabins. Conditions in these accommodation areas are said to be better than in most barracks of the French Foreign Legion, and when United States Navy vice-admiral Mark Fitzgerald inspected one of the Mistral-class ships in May 2007, it was claimed that he would have used the same accommodation area to host a crew three times the size of Mistral's complement.

Notes:

The Mistral class is a class of five amphibious assault ships, also known as a helicopter carrier, of the French Navy. Referred to as "projection and command ships" (French: bâtiments de projection et de commandement or BPC), a Mistral-class ship is capable of transporting and deploying 16 NH90 or Tiger helicopters, four landing barges, up to 70 vehicles including 13 AMX Leclerc tanks, or a 40-strong Leclerc tank battalion, and 450 soldiers. The ships are equipped with a 69-bed hospital, and are capable of serving as part of a NATO Response Force, or with United Nations or European Union peace-keeping forces. Three ships of the class are in service in the French Navy: Mistral, Tonnerre, and Dixmude. A deal for two ships for the Russian Navy was announced by then French President Nicolas Sarkozy on 24 December 2010, and signed by Russian Deputy Prime Minister Igor Sechin and French Defence Minister Alain Juppé in the presence of Sarkozy on 25 January 2011. On 3 September 2014, French President François Hollande announced the postponement of delivery of the first warship, Vladivostok, due to the Russia–Ukraine crisis. On 5 August 2015, President François Hollande and Russian president Vladimir Putin announced that France would pay back payments and keep the two ships initially produced for the Russian Navy; the two ships were later sold to Egypt. Based on displacement tonnage, Mistral and Tonnerre are the largest ships in the French Navy after the nuclear-powered aircraft carrier Charles de Gaulle, for roughly the same height above water. Aviation The flight deck of each ship is approximately 6,400 square metres (69,000 sq ft). The deck has six helicopter landing spots, one of which is capable of supporting a 33-tonne helicopter. The 1,800-square-metre (19,000 sq ft) hangar deck can hold 16 helicopters, and includes a maintenance area with an overhead crane. To aid launch and recovery, a DRBN-38A Decca Bridgemaster E250 landing radar and an Optical Landing System are used. The flight and hangar decks are connected by two aircraft lifts, each capable of lifting 13 tonnes. The 225-square-metre (2,420 sq ft) main lift is located near the stern of the ship, on the centreline, and is large enough for helicopters to be moved with their rotors in flight configuration. The 120 square metres (1,300 sq ft) auxiliary lift is located aft of the island superstructure. Every helicopter operated by the French military is capable of flying from these ships. On 8 February 2005, a Westland Lynx of the Navy and a Cougar landed on Mistral. The first landing of a NH90 took place on 9 March 2006. Half of the air group of the BPCs is to be constituted of NH-90s, the other half being composed of Tigre attack helicopters. On 19 April 2007, Puma, Écureuil and Panther helicopters landed on Tonnerre. On 10 May 2007, a MH-53E Sea Dragon of the US Navy landed on her reinforced helicopter spot off the U.S. Naval Station Norfolk. According to Mistral's first commanding officer, Capitaine de vaisseau Gilles Humeau, the size of the flight and hangar decks would allow the operation of up to thirty helicopters. Mistral aviation capabilities approach those of the Wasp-class amphibious assault ships, for roughly 40% the cost and crew requirements of the American ship. Amphibious transport Mistral-class ships can accommodate up to 450 soldiers, although this can be doubled for short-term deployments. The 2,650-square-metre (28,500 sq ft) vehicle hangar can carry a 40-strong Leclerc tank battalion, or a 13-strong Leclerc tank company and 46 other vehicles. By comparison, Foudre-class ships can carry up to 100 vehicles, including 22 AMX-30 tanks, in the significantly smaller 1,000-square-metre (11,000 sq ft) deck. The 885-square-metre (9,530 sq ft) well deck can accommodate four landing craft. The ships are capable of operating two LCAC hovercraft, and although the French Navy appears to have no intention of purchasing any LCACs, this capability improves the class' ability to interoperate with the United States Marine Corps and the British Royal Navy. Instead the DGA ordered eight French-designed 59-tonne EDA-R catamarans. Command and communications Mistral-class ships can be used as command and control ships, with a 850-square-metre (9,100 sq ft) command centre which can host up to 150 personnel. Information from the ship's sensors is centralised in the SENIT system (Système d'Exploitation Navale des Informations Tactiques, "System for Naval Usage of Tactical Information"), a derivative of the US Navy's Naval Tactical Data System (NTDS). Problems in the development of the SENIT 9 revision contributed to the one-year delay in the delivery of the two ships. SENIT 9 is based around Thales' tri-dimensional MRR3D-NG Multi Role Radar, which operates on the C band and incorporates IFF capabilities. SENIT 9 can also be connected to NATO data exchange formats through Link 11, Link 16 and Link 22. For communications, the Mistral-class ships use the SYRACUSE satellite system, based on French satellites SYRACUSE 3-A and SYRACUSE 3-B which provide 45% of the Super High Frequency secured communications of NATO. From 18 to 24 June 2007, a secure video conference was held twice a day between Tonnerre, then sailing from Brazil to South Africa, and VIP visitors at the Paris Air Show. Armament As of 2008, the two Mistral-class ships were armed with two Simbad launchers for Mistral missiles and four 12.7 mm M2-HB Browning machine guns. Two Breda-Mauser 30 mm/70 guns are also included in the design, though not installed as of 2009. Incidents such as the near-loss of the Israeli corvette INS Hanit to a Hezbollah-fired anti-ship missile during the 2006 Lebanon War have shown the vulnerability of modern warships to asymmetric threats, with the Mistral-class ships considered under-equipped for self-defence in such a situation. Consequently, Mistral and Tonnerre cannot be deployed into hostile waters without sufficient escorting ships. This problem is compounded by the small number of escort ships in the French Navy; there is a five-year gap between the decommissioning of the Suffren-class frigates and the commissioning of their replacements, the Horizon-class and FREMM frigates. Following the experiences of French naval commanders during Opération Baliste, the French deployment to aid European citizens in Lebanon during the 2006 war, proposals to improve the self-defence capabilities of the two Mistral-class ships were supported by one of the French chiefs of staff, and are under active consideration as of 2008. One suggestion is to upgrade the dual-launching, manual Simbad launchers to quadruple-launching, automatic Tetral launchers. In December 2014, the French Navy awarded a contract to Airbus to study the integration of the Multiple Launch Rocket System (MLRS) with Mistrals. This is an attempt to increase the ships' naval fire support capabilities, as current 76 mm and 100 mm guns have been determined to have insufficient range and

lethality for the role. The MLRS is in service with the French Army, using a GPS-guided rocket with a range of 70 km (43 mi) and a unitary 90 kg (200 lb) high-explosive warhead. In late 2013 The French Navy equipped all three Mistral "BPC" ships with two M134 Miniguns each; intended for close-in self-defense against asymmetric threats faced during anti-piracy operations, such as speedboats and kamikaze boats. In late 2011, the French Navy selected the NARWHAL20 remote weapon station (RWS) to equip Mistral ships for close-in self-defense. Nexter Systems will deliver two NARWHAL20B guns for each ship, chambered in 20×139mm ammunition, with one gun covering the port bow and the other covering the starboard stern. The Dixmude was the first of the vessels outfitted with the cannons in March 2016. Hospital Each ship carries a NATO Role 3 medical facility, i.e., equivalent to the field hospital of an Army division or army corps, or to the hospital of a 25,000-inhabitant city, complete with dentistry, diagnostics, specialist surgical and medical capabilities, food hygiene and psychological capabilities. A Syracuse-based telemedicine system allows complex specialised surgery to be performed. The 900 m2 hospital[38] provides 20 rooms and 69 hospitalisation beds, of which 7 are fit for intensive care. The two surgery blocks come complete with a radiology room providing digital radiography and ultrasonography, and that can be fitted with a mobile CT scanner. 50 medicalised beds are kept in reserve and can be installed in a helicopter hangar to extend the capacity of the hospital in case of emergency

Notes:

ENS Gamal Abdel Nasser (L1010) is an Egyptian Navy amphibious assault ship, a type of helicopter carrier, of the French-designed Mistral class. It was originally built for the Russian Navy and underwent sea trials.Subsequently, the contract was cancelled by France and agreement on compensation reached with the Russian government. Egypt and France concluded the deal to acquire the two former Russian Mistral for roughly 950 million euros. Egypt is the first and to date only country in Africa and the Middle East to possess a helicopter carrier. The Russian government placed an order for the ship in 2011. The construction of the ship would be shared between the countries with France building about 60 percent and Russia 40. Work started in France, in Saint-Nazaire, on 1 February 2012 and in the Russian Baltiysky Zavod shipyard in St. Petersburg in October 2012. Russia would send its parts to France for final assembly. The ship was expected to join the Russian Navy in 2015. The ship was launched on 15 October 2013. The ship began its first sea trials on 5 March 2014. Savings in construction costs were anticipated, due to the use of commercial off the shelf (COTS) parts, rather than requiring every system to be designed to military standards. The Russian acquisition of French Mistral-class amphibious assault ships was considered to be the largest defense deal between Russia and the West since World War II. The 2014 Russian military intervention in Ukraine triggered rising international criticism. France was under political pressure from other nations to sanction Russia by cancelling or suspending delivery of the two Mistral-class vessels. On 3 September 2014, French President François Hollande released an announcement that France was suspending the delivery of Vladivostok to Russia due to the ongoing War in Donbass, Ukraine. By 13 September 2014, a partial ceasefire was in place in Ukraine. This improvement in conditions in Ukraine was sufficient for French authorities to allow Vladivostok to go to sea for her acceptance trials. French Defence Ministry sources said a decision on the delivery of Vladivostok would be taken by mid-November. On 25 November, it was announced that delivery of the two ships was to be postponed indefinitely. Russia threatened legal action over the postponement. In August 2015 the two governments reached agreement on terms for cancelling the contract; France would keep the ships and fully reimburse Russia. On 7 August 2015, a French diplomatic source confirmed that President Hollande discussed the matter with Egyptian President Abdel Fattah el-Sisi during his visit to Egypt during the inauguration of the New Suez Canal in Ismailia. Subsequently, Egypt and France concluded the deal to acquire the two former Russian Mistral for roughly 950 million euros, including the costs of training Egyptian crews. Speaking on RMC Radio, Jean-Yves Le Drian, French Defence Minister, said that Egypt had already paid

the whole price for the helicopter carriers. On 2 June 2016, DCNS delivered the first of two helicopter carriers acquired by the Arab Republic of Egypt in October 2015, the Landing Helicopter Dock Gamal Abdel Nasser. The flag transfer ceremony took place in the presence of Egyptian and French Navies' Chiefs of Staff, Admiral Rabie and Admiral Rogel, Hervé Guillou, chairman and chief executive officer of DCNS, Laurent Castaing, chairman and chief executive officer of STX France, and senior Egyptian and French officials. Before sailing to Alexandria, the helicopter carrier Gamal Abdel Nasser participated in a joint exercise between the Egyptian and French Navies. On 16 September 2016, DCNS delivered the second of two helicopter carriers, the Landing Helicopter Dock Anwar El Sadat which also participated in a joint exercise with the French Navy before arriving at its home port of Alexandria. Aircraft Since receiving its two Mistral-class carriers, Egypt had issued an international tender for the procurement of new maritime helicopters. The Egyptian Navy and Air Force studied several offers for helicopters to use on both carriers. European and Russian manufacturers entered the bidding procedure; NHIndustries and Airbus Helicopters were reported to have offered their NH90 and Tiger helicopters, while Russian Helicopters offered its Ka-52K helicopter. By May 2017, the tender had reached its final stage, Russian Helicopters stated that it would intermediary enter into pricing negotiations if the company won the tender. In June 2017, Russia announced it had won the tender for providing deck helicopters Ka-52K for the Egyptian Mistral carriers. The head of the FSVTS, Dmitry Shugayev, said that pre-contract work was underway, including final agreement on the helicopter's technical concept and other financial conditions. Egypt is likely to buy the same package intended for the Russian Navy, which includes Ka-52K attack helicopters and Ka-29/31 utility helicopters, before the contract was cancelled by France.

Conditions in these accommodation areas are said to be better than in most barracks of the French Foreign Legion, and when United States Navy vice-admiral Mark Fitzgerald inspected one of the Mistral-class ships in May 2007, it was claimed that he would have used the same accommodation area to host a crew three times the size of Mistral's complement.

Notes:

ENS Anwar El Sadat (L1020) is an Egyptian Navy amphibious assault ship, a type of helicopter carrier, of the French Mistral class. It was originally built in France for the Russian Navy as part of a contract for two of these warships and underwent sea trials. The contract with Russia was subsequently cancelled by France and an agreement on compensation was reached with the Russian government. Egypt and France eventually concluded a deal to acquire the two warships for roughly 950 million euros. Egypt is considered the first and only country in Africa and the Middle East to possess a helicopter carrier of such type. The Russian government placed an order for this and another warship in 2011. The construction of these ships would be shared between both countries, with France building about 60 percent and Russia 40 percent. Work started in Saint-Nazaire, France, on 18 June 2013, and in the Russian Baltiysky Zavod shipyard in St. Petersburg on 4 July 2013. Russia would send its parts to France for final assembly. The ship was originally expected to join the Russian Navy in 2015. After final assembly of the main structures in France the ship was then scheduled to go to St. Petersburg, Russia, for the outfitting of additional Russian-specific weapons and subsystems. The Russian acquisition of these two French Mistral-class amphibious assault ships was considered to be the largest defense deal between Russia and the West since World War II. In 2014, as criticism of Russian intervention in Ukraine grew, France came under increasing pressure to cancel or suspend the delivery of the two Mistral-class hulls, tentatively named Vladivostok and Sevastopol. Some commentators suggested France try to find alternative customers for the two vessels. In August, 2015, the two governments reached agreement on terms for cancelling the contract; France would keep the ships and fully reimburse Russia. On 7 August 2015, a French diplomatic source confirmed that President Hollande had discussed the matter with Egyptian President Abdel Fattah el-Sisi during his visit to Egypt for the inauguration of the New Suez Canal in Ismailia. Subsequently, in October 2015, Egypt and France concluded a deal to acquire the two formerly Russian-bound warships for roughly 950 million euros, which included the costs of training Egyptian crews. Speaking on RMC Radio, Jean-Yves Le Drian, French Defence Minister, said that Egypt had already paid the whole price for the helicopter carriers. Beginning in February 2016, 180 Egyptian sailors began training in Saint-Nazaire, France, on the newly renamed landing helicopter dock Gamal Abdel Nasser, with the support of the DCNS (Direction des Constructions Navales Services) and STX France instructors and Défense Conseil International. On 2 June 2016, DCNS delivered the first of these two helicopter carriers acquired by the Arab Republic of Egypt, Gamal Abdel Nasser. The flag transfer ceremony took place in the presence of Egyptian and French Navies' Chiefs of Staff, Admiral Rabie and Admiral Rogel, Hervé Guillou, chairman and chief executive officer of DCNS, Laurent Castaing, chairman and chief executive officer of STX France, and senior Egyptian and French officials. Gamal Abdel Nasser left Saint-Nazaire after a few days with associated support vessels. Before sailing to the vessel's home port of Alexandria, Egypt, the warship participated in a joint exercise between the Egyptian and French Navies. On 16 September 2016, DCNS delivered the second of the two helicopter carriers, Anwar El Sadat, which also participated in a joint exercise with the French Navy before arriving at its home port of Alexandria on 6 October 2016, coinciding with the country's celebrations of the 43rd anniversary of the 1973 October War against Israel. Aircraft Since receiving its two Mistral-class carriers, Egypt had issued an international tender for the procurement of new maritime helicopters. The Egyptian Navy and Air Force studied several offers for helicopters to use on both carriers. European and Russian manufacturers entered the bidding procedure;

NHIndustries and Airbus Helicopters were reported to have offered their NH90 and Tiger helicopters, while Russian Helicopters offered its Ka-52K helicopter. By May 2017, the tender had reached its final stage, Russian Helicopters stated that it would intermediary enter into pricing negotiations if the company won the tender. In June 2017, Russia announced it had won the tender for providing deck helicopters Ka-52K for the Egyptian Mistral carriers. The head of the FSVTS, Dmitry Shugayev, said that pre-contract work was underway, including final agreement on the helicopter's technical concept and other financial conditions. Egypt is likely to buy the same package intended for the Russian Navy, which includes Ka-52K attack helicopters and Ka-29/31 utility helicopters, before the contract was cancelled by France.

Nampo Class North Korean Landing Craft Utility (LCU)

Tiers:

1 2 **3** 4

System

Alternative Designation: Nampo Class
Type: Landing Craft Utility
Builder: North Korea; Shipyard: INA
Crew: 19

Dimensions

Length: 27.70 m
Beam: 6.10 m
Draft: 1.80 m
Displacement, Full Load: 82 tons full load

Propulsion System

Engine Name: 4 x type M50-F4 Engines
Engine Type: Diesel
Engine Power: 4,800 total bhp;
Maximum Range: 450 nm at 30 knots
Maximum Speed: 40 max. knots

- **Wufeng Shan:** Commissioned: 1980 Fleet: East Sea Fleet
- **Zijin Shan:** Commissioned: 1982 Fleet: East Sea Fleet

System

Alternative Designation: Type 072 Class; Yukan Class
Total Built: 3 ships total
Type: Landing Ship
Builder: Zhonghua Shipyard
In Service: 1978-Present
Crew: 130
Cargo Capacity: 10–11 tanks and 100–120 troops, or 200 troops and 82~mm anti-tank gun company, or 500 tonnes of cargo

Dimensions

Length: 120 m
Beam: 15.3 m
Draft: 2.9 m
Displacement: 3,100 tonnes (standard) 4,170 tonnes (full load)

Propulsion System

Engine Name: 2 x 12E390
Engine Type: Diesel
Engine Power: 9,600 hp each
Maximum Range: 3,000 nautical miles (5,600 km; 3,500 mi) at 14 knots
Maximum Speed: 18 knots (33 km/h; 21 mph) (maximum) 14 knots (26 km/h; 16 mph) (economical)
Endurance: INA

Gun Weapon Systems

↳*Gun Weapon Systems #1: System*

Name: Type 66 dual-57mm Naval Gun

Type: Naval Gun

Caliber: 57 mm

Quantity: 4 x Type 66 dual-57mm Naval Guns

Note: The AK-257 is a Soviet 57mm naval gun, originally a land ZIF-31 L/70 57mm (Type 66/76) cannon. During the early 1950s, development began of naval versions of the 57x348mmSR 70 calibre weapon which had entered service with the Soviet army in 1950 as the S-60. This was to be a supplementary weapon for larger warships and as the main gun armament for minesweepers and auxiliaries. The twin gun version, ZIF-31, appears to have entered service with the Project 264 Minesweepers (T58 class) and the Project 310 (Don class) submarine support ships in 1958. In 1960, two other versions of the mounting appeared; a single gun ZIF-71 for the modernised Skoryy class destroyers and the quad ZIF-75 for the Krupny/Kanin class destroyers. The ZIF designation is an industrial one and it is possible that the naval designations were AK-157 (ZIF-71), AK-257 (ZIF-31) and AK-457 (ZIF-75). In smaller warships these mountings were sometimes associated with MR-103 and in larger ones with the Yakhond (Hawk Screech) radar. The ZIF-31/71/75 mountings may not have been very successful and an improved twin mounting appeared shortly afterwards as the AK-725. The twin 57mm ZIF-31 has also been manufactured in China as the Type 66 and there is a water-cooled derivative known as the Type 76. The AK-257 is currently employed on the Grisha class Corvette.

Notes:

The Type 072 landing ship (NATO designation Yukan class) are large landing ships built by Shanghai-based Zhonghua Shipyard (now Hudong-Zhonghua Shipbuilding) in the 1980s to replace the aging World War II-era ex-US Navy L-1511 tank landing ships in service with the PLA Navy. The Type 072 is the PLA Navy’s first indigenous large landing ship. A total of 3 Type 072 are in service all of them are in service with the East Sea Fleet of the People's Liberation Army Navy (PLAN ESF).

Type 073 Yudao-Class Chinese Landing Ship

Tiers:

Variants:

- **Type 073 Yudao-class landing ship:** Requirement of the Type 073-class landing ship was finalized in May 1965, and design work by Shanghai-based 708th Research Institute completed just 4 months later in September 1965. Preparation to build this class was completed in October 1966, and construction begun a month later in November 1966. Due to political turmoil in China at the time, namely, Cultural Revolution, it was not until almost three years later in August 1969 when the ship was launched. From November 1969 thru December 1969, extensive trials were conducted and the ship was handed over to PLAN in December 1969 for further tests. In 1970 more tests were conducted with more than 7,000 km (3,800 nmi; 4,300 mi) logged, and the longest trip was from Chongqing to Dalian. However, trials revealed that the vibration was too great at high speed, and the Type 073 did not enter production. Redesign work designated as Type 073II immediately started after the trials of the first unit ended, and the first unit entered PLAN service with pennant number 904 and was subsequently designated as Type 073I, and was later ordered to be fully converted to Type 073II standard. Due to the political turmoil at the time, conversion was not completed until 1975.
- **Type 073II Yudao-class landing ship:** Shortcomings of Type 073I exposed in trials caused a crush program to rework and redesign at Dalian Shipyard, but due to political turmoil in China at the time, it was not sufficient to correct the problem completely. Shipyard # 9308 in Anhui petitioned the 6th Machinery Industrial Ministry and Anhui provincial Defense Industrial Office to construct Type 73II LSM in 1975, which was approved in April 1976, with orders for 3 ships. Construction of the first Type 073II LSM at Shipyard # 9308 begun five months later in September 1976, and it was launched in June 1978. From 1978 to 1979, extensive trials were conducted and the ship was handed over to PLAN in early 1980, with pennant number East Transport 757 (East Transport = Dong Yun □□ in Chinese), meaning Transport 757 of East Sea Fleet of PLAN. This unit was later reassigned as # 937. The primary difference between Type 073I and Type 073II is in the engine. Additional balance weight was added to the diesel engine which solved the vibration problem, but the reliability issue of the engine remain unsolved, and as a result, Type 073II did not enter mass production, just like its predecessor Type 073I.
- **Type 073IIY Yudao-class landing ship:** As the mass production plan for Type 073II was cancelled due to reliability problem of its engine, Shipyard # 9308 begun to modify the remaining two units that were already being built, which was successfully completed in September 1985. The resulting type is Type 073IIY landing ship, with Y for Yun (□), meaning transport in Chinese. Type 073I, Type 073II, and Type 073IIY all received the NATO reporting name Yudao-class. A total of two units of Type 073IIY were completed, with pennant #s 937 and 938. The primary difference between Type 073II and Type 073 IIY includes more than 100 upgrades in addition to engine improvement.
- **Type 073III Yudeng-class landing ship:** The reliability problem of the engine of Type 073 series was not completely solved until the appearance of Type 073III landing ship, with NATO reporting name Yudeng-class. The D-39 engine that is reliable only at slower speed was replaced by a new engine that is reliable at all speeds, and displacement is also increased. Only one unit entered service, with pennant # 990 in 1991.
- **Type 073A Yunshu-class landing ship:** After the completion of the first unit (pennant # 990), it takes a decade for more units to follow, and 10 more entered service between 2001 through 2002. These later units are slightly larger in displacement at 2,000 tons, and more advanced equipment, mainly in electronics and on board machinery. This latest batch is referred to as the Type 073A landing ship (NATO reporting name: Yunshu-class). Pennant numbers; 941 (Shengzhou Hill), 942 (Lushan), 943 (Monsanto), 944 (Yushan), 945 (Huashan), 946 (Songshan), 947, 948, 949 (Hengshan), 950 (Taishan).

Notes:

KRI Teluk Semangka class ships are Landing Ship Tank [LST] type vessels used to carry personnel, aid supplies and other heavy equipment to help post-disaster recovery efforts. These ships were made by South-Korea and commissioned in 1981 and 1982. The last two units have large helicopter hangars and command facilities. The KRI Teluk Ende (517) is the last ship of the Teluk Semangka class large landing ships, the final unit, is also outfitted as a hospital ship. KRI Teluk Ende-517 is named after Teluk Ende (Bay of Ende), which is also known as Baai van Endeh, Ende Baai, Hende, and Hèndé. Ende, with it's 60,000 residents is the biggest city on Flores. Located along the southern coast, it's hidden in the curve of a small peninsula. At both sides of it is a harbor. Most shipping activity is concentrated in Pelabuhan Ende, which is located at the western side and has a good view over Teluk Ende (Bay of Ende). In February 2001 Dayak mobs hunted down and killed Madurese, including women, children and the elderly. The bloody attacks by indigenous Dayaks on Madurese migrants in the river town of Sampit, Central Kalimantan, have claimed hundreds of lives, mostly Madurese. It was a mad scramble as thousands of refugees trying to escape the riot which swept Sampit rushed to board a navy ship taking them away from ethnic violence which has claimed over 210 lives. But to the dismay of some 20,000 refugees who had gathered, only one ship, KRI Teluk Sampit, was docked and ready to be boarded at Samuda, some 40-kilometers south of Sampit. The ship had a capacity of less than 2,000. The refugees, mostly Madurese migrants, must await the arrival of the KRI Teluk Ende which had also been dispatched from Surabaya, East Java. Indonesian warship KRI Teluk Ende which arrived in Surabayae on 26 February 2001 with more than 3,200 refugees who became victims of the ethnic clashes in Sampit, Central Kalimantan, returned to the troubled area the next morning. "As there had been requests for transport of more refugees, KRI Teluk Ende will return to Sampit, while KRI Teluk Sampit still remains in Surabaya for further orders," spokesman for the local naval authorities Lt Col Ditya Soedarsono said here Monday night. He said the 1,800 refugees, mostly Madurese, will also be brought to Surabaya, which is close to their hometowns in Madura. Indonesian Navy TELUK ENDE (517) was photographed at Surabaya on 27 November 2006, without red cross markings. Two Indonesian's Navy Ships, KRI KI HAJAR DEWANTARA 364 and KRI TELUK ENDE 517, made a three days goodwill visit to Brunei Darussalam from 14 to 16 April 2009. Their arrivals at Muara Port were received by senior officers of Royal Brunei Navy and officials from The Embassy of the Republic of Indonesian. In October 2010 Navy warship KRI Kalakay carryied at least six tons of basic necessaries from President Susilo Bambang Yudhoyono to Wasior in the district of Teluk Wondama in West Papua recently hit by flash floods. The Command has also sent three other warships to help overcome the impact of the disaster namely KRI Teluk Ende-517, KRI Fatahilah-361 and KRI dr Soeharto-990. KRI dr Soeharto served as a floating hospital and had much experience in carrying out humanitarian missions in a number of places in the country.

Hantae Class North Korean Landing Craft Utility (LCU)

Tiers:

1 2 **3** 4

System

Alternative Designation: Hantae Class
Type: Landing Craft Utility
Builder: North Korea; Shipyard: INA
Crew: 36
Troop Capacity: 350
Cargo Capacity: up to three tanks

Dimensions

Length: 48.00 m
Beam: 6.50 m
Draft: 2.00 m
Displacement, Standard: 200 tons standard
Displacement, Full Load: 350 tons full load

Propulsion System

Engine Name: INA
Engine Type: 2 x Diesel Engines
Engine Power: 4,350 total bhp
Maximum Range: 2,000 nm at 12 kts.
Maximum Speed: 18 knots

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: 2M-3M
Type: Naval Gun

Caliber: mm25

Quantity: 2 x 2M-3M Naval Guns

Notes:

The Type 072III landing ship (NATO designation Yuting-I class) is the follow-on of the Type 072II landing ships initially introduced in the 1990s by the People's Republic of China. Type 072-III features a redesigned concealed bridge, and possibly enhanced sealift capability. The main difference between Type 072III and its predecessor Type 072II is that Type 072III incorporates a helicopter platform at stern (no hangar). A total of ten ships have entered service with People's Liberation Army Navy (PLAN), and all of them were built by China Shipbuilding Shipyard (□□□□) in Shanghai, Most of Type 072III deployed in PLAN East Sea Fleet (ESF), and the remaining in PLAN North Sea Fleet (NSF) and South Sea Fleet (SSF).

Notes:

The Type 072A landing ship is the latest member of the Type 072 series of landing ships. A total of 15 ships have been identified, with most of them assigned to the 6th Detachment of the People's Liberation Army Navy (PLAN) South Sea Fleet at Zhanjiang. They received the NATO reporting name of Yuting II. Derived from the Type 072III, the most obvious visual difference between the Type 072A and all earlier models of the Type 072 series is that the step of the stepped superstructure on all earlier models has been eliminated. In addition, the Type 072A is designed to accommodate air-cushioned landing craft by incorporating a deck well. Like its predecessor the Type 072III, the Type 072A has a helipad but no hangar. The Type 072A is designed to carry 10 tanks, 4 landing craft, a medium helicopter and air cushioned vehicles; a total of 250 fully armed troops can be carried. The People's Liberation Army Navy (PLAN) Type 072A Yuting-II is a class of large landing ships developed as an

enlarged version of the Type 072-III landing craft adding an aft helicopter deck for a medium-sized helicopter and more room for troops. The 5,000-ton class vessels propulsion system is based on two diesel engines developing a top speed of 21 knots. These ships can transport a payload of 500 tons and are provided with one dual 37mm gun to provide fire support during landing operations. The ship accommodates up to 250 fully equipped marines. The Type 072A ships carry four landing crafts, up to 10 tanks or 16 trucks. The PLAN commissioned 15 vessels built by Dalian Shipyard between 2003 and 2016.

LCM-8 (Mike Boat) American Landing Craft Mechanized

Tiers:

System

Alternative Designation: LCM-8 (Mike Boat)
Type: Landing Craft Mechanized
Builder: INA
In Service: 1967-Present
Crew: 4-6
Cargo Capacity: 53.5 long tons (54.4 t) of cargo

Dimensions

Length: 22.265 m
Beam: 6.4 m
Draft: 1.234 m light; 1.60 m loaded
Displacement, Light: 57.8 long tons
Displacement, Full Load: 111.4 long tons

NBC Protection: INA

Notes:

The LCM-8 ("Mike Boat") is a river boat and mechanized landing craft used by the United States Navy and Army during the Vietnam War and subsequent operations. They are currently used by governments and private organizations throughout the world. The acronym stands for "Landing Craft Mechanized, Mark 8". (The "Mike Boat" term refers to the military phonetic alphabet, LCM being "Lima Charlie Mike".) The vessel weighs 135,000 pounds (61,200 kg) and has a crew of four: a Boatswain's Mate petty officer, an Engineman petty officer, a non-rated fireman, and a seaman. US Army specifications call for a crew of six during 24-hour operations: two coxswains, two seamen and two enginemen. The LCM-8s are constructed from welded steel and powered by four 6V71 or two 12V71 diesel engines, twin propellers, and rudders. The ship can carry 60 short tons of cargo. It was designed by Marinett Marine Corp Dimensions. It has a range of 190 miles at 9kts with a full load. They were used by the United States Navy and Army during the Vietnam War. During the Vietnam War, there were two new aluminum LCM-8s on Johnston Island, which carried trucks and cargo between islands, and one being used as a rescue boat. They had the newer fluid shift transmissions, and 2-671's paired up to two props. In I Corps (the northernmost military district in Vietnam) boats

based at Da Nang, Tan My and Cửa Việt had three man crews of various rates and ranks. On U.S. Navy boats, the senior rate was usually a third class petty officer or above, and the two crewmen could be E-2, E-3 or E-4 ranks (i.e. seaman apprentice, seaman, or petty officer third class). One of the two crewmen was almost always an Engineman, and could be an ENFA, ENFN, or an EN3 in rank. The LCM-8s there all had two sets of the twin 6-71 Detroits paired up to a hydro transmission. Two air compressors, port and starboard of the engine sets, provided air pressure to operate the air cylinders that raised and lowered the bow ramp. The air cylinders were below deck in the eighth void from the bow and stretched cables attached to the ramp to raise it. Lowering the ramp was accomplished by releasing the air and allowing gravity to bring the ramp down. They also saw use during Operation Just Cause in Panama as well as Operation Desert Shield and Operation Desert Storm. Three Army LCM-8s served in the 1992–1993 US mission to Somalia (fictionalized in Christian Bauman's 2002 novel The Ice Beneath You, which is set in part on a US Army LCM-8 near Kismaayo, Somalia), and a platoon of LCM-8s from the 1098th Trans Co. deployed to Port-au-Prince for the Haitian invasion (1994). The United States Army Reserve's 464th Transportation Company assisted the United States Coast Guard in patrolling the Potomac River after the terrorist attacks on September 11, 2001. Some are currently deployed aboard Maritime Prepositioning ships to facilitate their mission of being able to unload all their cargo while still offshore with no outside assistance. The LCM-8 was constructed in Australia for the Australian Army from 1965 to 1967 and again in 1972 using a heavily modified design, crewed (four) and administered by the Royal Australian Corps of Transport and one engineer from the Royal Australian Electrical and Mechanical Engineers (RAEME). The modification of the vessels included an extended enclosed wheelhouse with full galley facilities, chart table and storage space to aid in extended operations beyond the original design parameters. A water purification system allows the vessels to be somewhat independent for longer periods of time. A fully functioning toilet (head) and shower are also installed as part of the wheelhouse extensions; external provision for bedding is also included for the full crew complement. The extension of the wheelhouse increased rigidity of the craft leading to excessive vibration and cavitation with the original three-blade propeller. Further development included a more balanced and expensive five-blade propeller, negating the vibration and cavitation of the original. The prop change found a few negative effects in the beaching performance of the vessel but over time tactics have been changed to suit the new system. The vessels are also installed with a full suite of electronics allowing the craft to navigate in all weather, day or night in military operations anywhere in the world with little to no special training requirements for an indefinite period. During the mid-1990s, the Army LCM-8 received a life of type extension with a re-engine program. The original twin-pac 6-71 two-stroke Detroit Diesel engines and Allison mechanical transmissions were replaced with 8v-92 Silver Series Detroit Diesel engines and Allison Hydraulic Transmissions thus extending the life of the craft for another 20 years. Two craft were utilized during the invasion of Iraq in 2003, patrolling the shallow waters of the Khawr Abd Allah estuary using HMAS Kanimbla as their base of operations. They were extensively used in East Timor for logistic operations in direct support of multinational peace keepers. Other deployments include peacekeeping and peace monitoring operations in Bougainville and the Solomon Islands. The LCM-8 fleet of fifteen was to be replaced by six Australian designed type LCM2000 waterjet propelled craft, however these craft were scrapped, after not meeting the required in-service specifications and being deemed not fit for use for the intended Kanimbla-class.The Army will now continue to operate the LCM-8 until 2027.

Ivan Green Class Russian Landing Ship

Tiers:

System

Alternative Designations: Project 11711 / 1171.1 / 1171.1E

Type: Landing Ship

Total Built: 4 scheduled to be built

Builders: Yantar Shipyard, Kaliningrad

Cargo Capacity: 13 main battle tanks 40 BTR or IFV and 300 troops

Endurance: 30 days

Aviation Facilities: Hangar for 2 Ka-27 ASW or Ka-29 transport-attack helicopters

Dimensions

Length: m120

Beam: m16

Displacement: 6,600 tons full load

Automotive

Engine Name: Kolomna 10D49 diesel engine

Number of Engines: 1

Maximum Range: 3,500 nmi (6,500 km) at 16 knots (30 km/h)

Maximum Speed: 18 knots (33 km/h)

Armament

↳*Weapon Station #1*

Name: AK-630M-2 Gun

Type: fully automatic naval close-in weapon system based on a six-barreled 30 mm rotary cannon.

Caliber: 30mm

Quantity: 1

Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)

Width: 1,240 mm (49 in) (mount ring)

Height: 1,070 mm (42 in) (above deck) 2,050 mm (81 in) (below deck

Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630) 1,800 kg (4,000 lb) (AK-630M) 2,500 kg (5,500 lb) (AK-630M-2) External nodes: 800 kg (1,800 lb) (AK-630) 2000 rounds in belt: 1,918 kg (4,228 lb) Fire control system: (Vympel MR-123) (Vympel-A MR-123/176) 5.2 tonnes (5.7 short tons) (Vympel-AM MR-123-02/MR-123-03 and Vympel-AME MR-123-02/176) 1 tonne (2,200 lb) (Laska 5P-10E)

Crew: 1

Action: Gas-operated rotary cannon

Elevation: +88° ... -12° (50°/sec) +90° ... -25° (60°/sec) AK-630M-2

Traverse: ±180° (70°/sec) ±180° (80°/sec) AK-630M-2

Rate of Fire: 4,000–5,000 rounds/min

Muzzle Velocity: 880–900 m/s

Effective Firing Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime) 5,000 m (16,000 ft) (all, AK-630M-2)

Feed System: Belt: 2,000 rounds (additional 1,000 rounds in reserve feed bin, AK-630M) 4,000 rounds (AK-630M1-2)

Sights: Radar / TV-optical

Note: AK-630M-2 Gun n 1983, a decision was made to update the design and modify the AK-630 system to include a second gun mounted above the first, which provides 10,000 rpm in total. The AK-630M1-2 "Roy" was roughly the same size and weight allowing installation in existing AK-630 mounts. Though the system proved to be successful, the AK-630M1-2 Roy was not accepted for production due to the maturity of a combined missile and gun system, then designated the 3M87 Kortik, but later called Kashtan. The single example of AK-630M1-2 Roy remains installed on the Project 206.6 class missile boat # P-44. In July 2007 at IMDS-2007, a modernized version of the AK-630M1-2 was showcased by OAO AK Tulamashzavod under the new name "Duet". Visually "Duet" differs from "Roy" in having a new mount with a stealthy low RCS design compared with the more traditional rounded AK-630 mounts. In 2012 it was announced that the new Ivan Gren-class landing ship would be armed with the modified AK-630M-2 system. It is also used by the Buyan-M-class missile corvette.

↳*Ammunition Weapon Station #1*

Shell: HEI-Frag, Frag-T

Caliber: 30mm

Shell Weight: kg0.39

Notes:

The Ivan Gren class, Russian designation Project 11711, is a class of landing ship that is being built for the Russian Navy. The class was to be composed of two vessels, Ivan Gren and Pyotr Morgunov, but later it was announced that the Russian Navy intends to acquire several more vessels of a modified design. The vessels of the class have a displacement of 5,000–6,000 tons

and are able to carry up to 13 main battle tanks or 36 armoured personnel carriers and 300 marines. The first ship of the class, Ivan Gren, was laid down on 23 December 2004. The hull of Ivan Gren was completed by the end of November 2010. On 9 October 2010 a contract to increase work on the vessel was signed. The ship was launched on 18 May 2012 and was scheduled to be delivered to the Russian Navy by 2014. Delivery of Ivan Gren was delayed until 2015 while the second ship of the class, Pyotr Morgunov, was laid down in October 2014. Ivan Gren started its sea trials in June 2016 in the Baltic Sea. According to Russian sources, the delaying of commissioning of the lead ship was due to several design faults that includes hull stability and engine problems. On 3 May 2018, the lead ship of the class, Ivan Gren, successfully completed its sea trials held in the Baltic Sea. The warship's systems and complexes were checked by the state acceptance commission of Russia's Defense Ministry. Ivan Gren was accepted into service on 20 June 2018. Initially, there were no plans to build more ships following Pyotr Morgunov. However, in December 2018, it was reported by the head of Russia's United Shipbuilding Corporation that Russia plans to order additional two or three modified Ivan Gren-class landing ships. On 9 April 2019, Russian Defence Minister Sergey Shoygu announced two more Project 11711 landing ships will be laid down on 23 April 2019. On 23 April 2019, two modified Project 11711 landing ships, Vladimir Andreev and Vasily Trushin, were laid down during a ceremony at the Yantar Shipyard in Kaliningrad. The two new ships differ with modified superstructure, increased displacement to 7000-8000 tons and capability to carry the Kamov Ka-52K carrier-based attack helicopters. Their delivery to the Russian Navy is scheduled for 2023 and 2024, respectively.

Type 073A Yunshu-Class Chinese Landing Ship

Tiers:

Variants:

- **Type 073 Yudao-class landing ship:** Requirement of the Type 073-class landing ship was finalized in May 1965, and design work by Shanghai-based 708th Research Institute completed just 4 months later in September 1965. Preparation to build this class was completed in October 1966, and construction begun a month later in November 1966. Due to political turmoil in China at the time, namely, Cultural Revolution, it was not until almost three years later in August 1969 when the ship was launched. From November 1969 thru December 1969, extensive trials were conducted and the ship was handed over to PLAN in December 1969 for further tests. In 1970 more tests were conducted with more than 7,000 km (3,800 nmi; 4,300 mi) logged, and the longest trip was from Chongqing to Dalian. However, trials revealed that the vibration was too great at high speed, and the Type 073 did not enter production. Redesign work designated as Type 073II immediately started after the trials of the first unit ended, and the first unit entered PLAN service with pennant number 904 and was subsequently designated as Type 073I, and was later ordered to be fully converted to Type 073II standard. Due to the political turmoil at the time, conversion was not completed until 1975.
- **Type 073II Yudao-class landing ship:** Shortcomings of Type 073I exposed in trials caused a crush program to rework and redesign at Dalian Shipyard, but due to political turmoil in China at the time, it was not sufficient to correct the problem completely. Shipyard # 9308 in Anhui petitioned the 6th Machinery Industrial Ministry and Anhui provincial Defense Industrial Office to construct Type 73II LSM in 1975, which was approved in April 1976, with orders for 3 ships. Construction of the first Type 073II LSM at Shipyard # 9308 begun five months later in September 1976, and it was launched in June 1978. From 1978 to 1979, extensive trials were conducted and the ship was handed over to PLAN in early 1980, with pennant number East Transport 757 (East Transport = Dong Yun □□ in Chinese), meaning Transport 757 of East Sea Fleet of PLAN. This unit was later reassigned as # 937. The primary difference between Type 073I and Type 073II is in the engine. Additional balance weight was added to the diesel engine which solved the vibration problem, but the reliability issue of the engine remain unsolved, and as a result, Type 073II did not enter mass production, just like its predecessor Type 073I.
- **Type 073IIY Yudao-class landing ship:** As the mass production plan for Type 073II was cancelled due to reliability problem of its engine, Shipyard # 9308 begun to modify the remaining two units that were already being built, which was successfully completed in September 1985. The resulting type is Type 073IIY landing ship, with Y for Yun (□), meaning transport in Chinese. Type 073I, Type 073II, and Type 073IIY all received the NATO reporting name Yudao-class. A total of two units of Type 073IIY were completed, with pennant #s 937 and 938. The primary difference between Type 073II and Type 073 IIY includes more than 100 upgrades in addition to engine improvement.
- **Type 073III Yudeng-class landing ship:** The reliability problem of the engine of Type 073 series was not completely solved until the appearance of Type 073III landing ship, with NATO reporting name Yudeng-class. The D-39 engine that is reliable only at slower speed was replaced by a new engine that is reliable at all speeds, and displacement is also increased. Only one unit entered service, with pennant # 990 in 1991.
- **Type 073A Yunshu-class landing ship:** After the completion of the first unit (pennant # 990), it takes a decade for

more units to follow, and 10 more entered service between 2001 through 2002. These later units are slightly larger in displacement at 2,000 tons, and more advanced equipment, mainly in electronics and on board machinery. This latest batch is referred to as the Type 073A landing ship (NATO reporting name: Yunshu-class). Pennant numbers; 941 (Shengzhou Hill), 942 (Lushan), 943 (Monsanto), 944 (Yushan), 945 (Huashan), 946 (Songshan), 947, 948, 949 (Hengshan), 950 (Taishan).

System

Alternative Designation: Type 073A Yunshu-class

Type: Landing Ship

Builder: Shanghai-based 708th Research Institute

In Service: INA

Crew: 70

Cargo Capacity: 250 tons or 5 × medium tanks or 10 × amphibious light tanks or 500 fully equipped troops

Dimensions

Length: 87 m

Beam: 12.6 m

Draft: 2.25 m

Displacement, Full Load: 2,000 tons full

Propulsion System

Engine Name: 2 × 6PA6L-380

Engine Type: Diesel

Engine Power: 3,540 kW (4,750 hp) each

Maximum Range: 1,500 nmi (2,800 km; 1,700 mi) at 14 knots (26 km/h; 16 mph)

Maximum Speed: 17 knots (31 km/h; 20 mph)

Endurance: INA

Main Weapon System

↳*System*

Name: Type 76

Type: Naval Gun

Caliber: 37 mm

Quantity: 2 × Type 76 twin 37 mm AAA

Note: The Type 76 is a further development of the Type 65. The Chinese military wanted to further improve the Type 65 by incorporating a fully automatic operational mode, but political turmoil from the Cultural Revolution delayed development of the Type 65's successor until its eventual release in 1976. The Type 76 incorporated a fully automatic operational mode, though the semi-automatic operational mode was retained as a backup measure. The model's rate of fire could reach a maximum rate of 400 rounds per minute per barrel (cyclic). The gun saw military action in the 1988 Spratly Islands naval battle and received positive feedback from the Chinese navy.

Ammunition

Type: Medium Range Surface-to-Air Missile System

Quantity: 12 × Redut VLS Cells

Launcher: Vertical Launch Systems (VLS)

Missile Name: 9M96E2

Missile Basic Load: 12

Length: 5.65 m

Diameter: 240 mm

Weight: 420 kg

Warhead Weight: 24 kg

Maximum Range: 120 km

Minimum Range: 1 km

Maximum Altitiude: 30 km

Minimum Altitude: 5 m

Speed: 1,800 m/s

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: AK-100

Type: Naval Gun

Caliber: 100mm

Quantity: 1 × 100mm A-190 Arsenal

Length: INA

Weight: 35.5 tons

Elevation: -10 / +85 degrees

Rate of Elevation: 30 degrees per second

Traverse: 360 degrees

Traverse Rate: 35 degrees per second

Rate of Fire: 50 to 60 rounds per minute

Effective Firing Range: INA

↳*Ammunition Gun Weapon System #1*

Type: Rifle

Caliber: mm100

Shell: INA

Shell Weight: INA

Basic Load: Typical ammo stowage: 350 rounds for a 4,000 ton class frigate

↳*Gun Weapon System #2*

Name: Kashtan CIWS

Type: Close-In Weapons System (CIWS)

Caliber: 30mm

Quantity: 1 × Kashtan CIWS-M (Project 20380)

Main Armament: 8 × 9M311K + 32 missiles

Secondary Amrament: 2 × AO-18K Autocannon

Length: INA

Height: 2,250 mm

Weight: 15,500 kg

Barrels: 2 × 6 (guns); 2 × 4 launch tubes

Action: Gas-operated rotary cannon

Rate of Fire: 9,000 rounds/min (guns) 1–2 (salvo) missiles per 3–4 sec

Muzzle Velocity: 860 m/s

Warhead: Continuous-rod w/ frag layer

Effective Firing Range: Missile: 1,500–8,000 m Gun: 500–4,000 m

Feed System: Link-less, helical; 1000 rounds

Sights: Radar / TV-optical:[N 3] 2–3/1 m (6.6–9.8/3.3 ft) accuracy, tracks 6 targets simultaneously

↳*Ammunition Gun Weapon System #2*

Type: Rifle

Caliber: 30mm

Shell: HEI-Frag, Frag-T, APDS-T

Shell Weight: 0.39 kg (0.86 lb) (HEIF, FT) 0.30 kg (0.66 lb) (APDS-T)

Basic Load: INA

↳*Gun Weapon System #3*

Name: AK-630

Type: Close-In Weapon System (CIWS)

Caliber: 30mm

Quantity: 2 × AK-630M CIWS

Main Armament: 1 or 2 x AO-18 autocannons

Secondary Armament: 4 x 9A4172 missiles (Vikhr-K upgrade)

Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)

Width: 1,240 mm

Height: 1,070 mm (42 in) (above deck) 2,050 mm (81 in) (below deck)

Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630) 1,800 kg (4,000 lb) (AK-630M) 2,500 kg (5,500 lb) (AK-630M-2) External nodes: 800 kg (1,800 lb) (AK-630) 2000 rounds in belt: 1,918 kg (4,228 lb)

Crew: 1

Barrels: 6

Action: Gas-operated rotary cannon

Elevation: +88° ... -12° (50°/sec)

Traverse: ±180° (70°/sec)

Rate of Fire: 4,000–5,000 rounds/min

Muzzle Velocity: 880–900 m/s

Maximum Firing Range: the projectiles self-destruct past 5,000 m (16,000 ft) range.

Effective Firing Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime)

Feed System: Belt: 2,000 rounds (additional 1,000 rounds in reserve feed bin,

Sights: Radar / TV-optical

Fire Control System (FCS): Fire control system: Vympel MR-123; Vympel-A MR-123/176 5.2 tonnes (5.7 short tons); Vympel-AM MR-123-02/MR-123-03 and Vympel-AME MR-123-02/176) 1 tonne (2,200 lb) (Laska 5P-10E).

Towed: Vinyetka low frequency active/passive towed array

Protection

Electronic Warfare: TK-25E-5 ECM

Countermeasures: 4 x PK-10 decoy launchers

NBC Protection: Yes

Notes:

The Steregushchiy class (Russian: Стерегущий, lit. 'Vigilant'), Russian designation Project 20380, is the newest class of corvettes being built for the Russian Navy. Designed by the Almaz Central Marine Design Bureau, subsequent vessels were built to an improved design (Project 20381), incorporating the Poliment-Redut SAM system. The ship full displacement and dimensions are large for a corvette, thus it is designated as a frigate by NATO. The Steregushchiy class has been further developed into the Gremyashchiy class (Project 20385) and Project 20386 subclasses. The export variant is known as Project 20382 Tigr. The ships of the Steregushchiy class are multipurpose corvettes, designed to replace the Grisha class. Such ships are used for littoral zone operations, engagement of enemy submarines and surface ships, and gun support of landing operations. The first batch built at the Severnaya Verf shipyard in St. Petersburg consists of four ships. A second building line has been started at Komsomolsk. The lead ship of this second batch was named Sovershennyy. The Russian Navy has publicly announced that they expect to buy at least 30 of these ships, for all four major fleets. According to Jane's Naval Forces News, the first vessel was commissioned on 14 November 2007. An additional order of 10 corvettes was under consideration in the late 2019, according to the Deputy Commander of Pacific Fleet Igor Korolev. The ships were to be laid down at Amur Shipyard and to be commissioned into the Pacific fleet. The Steregushchiy-class corvettes have a steel hull and composite material superstructure, with a bulbous bow and nine watertight subdivisions. They have a combined bridge and command centre, and space and weight provision for eight SS-N-25 missiles. Stealth technology was widely used during construction of the ships, as well as 21 patents and 14 new computer programs. Newest physical field reduction solutions were applied too. As a result, designers considerably reduced the ship's radar signature thanks to hull architecture and fire-resistant radar-absorbent fiberglass applied in tophamper's design. The Kashtan CIWS on the first ship was replaced in subsequent vessels by 12 Redut VLS cells containing[9] 9M96E medium-range SAMs of the S-400 system. SS-N-27 (Kalibr type missiles) will be fitted to a larger domestic version, Project 20385. The export version known as Project 20382 Tigr carries either eight supersonic SS-N-26 (P-800 Oniks) anti-ship missiles or sixteen subsonic SS-N-25 'Switchblade' (Kh-35E Uran). It also carries two twin-tube launchers for 533mm heavy torpedoes. The A-190E 100mm gun first used in the Talwar-class frigates is controlled by a 5P-10E system that can track four targets simultaneously. Protection from air attacks is provided by the Kashtan CIWS and eight mounts for the SA-N-10 'Grouse' (9K38 Igla) SAM. In 2007 the Indonesian Navy made an agreement in principle (pending a full contract) for four vessels of this type to replace their ageing Dutch-built Fatahillah-class corvettes. The first was to be built in Spain and fitted out in St. Petersburg, leaving open the option of Indonesian involvement in building the subsequent ships. This agreement appears to have lapsed; in 2011 Indonesia signed a deal for two Milgem-class corvettes from Turkey. Rosoboronexport have briefed Singapore and the United Arab Emirates on the vessel. The first actual contract for the export version, Project 20382 Tigr, was signed at the 5th International Maritime Defense Show in St. Petersburg in July 2011 when Algeria ordered two ships. The cost was estimated at US$120–150 million per ship. One was to be delivered in 2014 and one in 2015.

Type 056A Class (Jiangdao II Class) Chinese Corvette

Length: INA

Weight: INA

Warhead: 190 kg high-explosive fragmentation

Engine: CTJ-2 turbojet

Operational Range: 180 km

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

↳*Missile System #2*

Name: Flying Leopard 3000 Naval (FL-3000N)

Type: Surface-to-Air Missile System

Quantity: 1 × 8-cell FL-3000N SAM launcher

Location: INA

Missile Name: HHQ-10 (Red Flag 10)

Missile Basic Load: INA

Length: 2 m

Diameter: 0.12 m

Maximum Range: > 9 km for subsonic targets, > 6 km for supersonic targets

Minimum Range: < 500 meters

Guidance System: Passive RF + ImIR or ImIR only

Note: The Flying Leopard 3000 Naval (FL-3000N) was first revealed to the public at the 7th Zhuhai Airshow at the end of 2008. Although using the Flying Leopard designation, the FL-3000N is actually a different missile system than the FL-2000(V) shown earlier. In fact, the only commonality shared by both SAM system is the launcher design, and even the launchers differ in size due to the different diameters of the missiles used in the systems. Instead of using QW-1 Vanguard MANPADs, the FL-3000N system uses the HHQ-10 (Red Flag 10) naval surface to air missile developed from TY-90 missile. The diameter of the missile is enlarged by a third, but the most important design difference is its guidance system. The FL-3000N missile utilizes a combined guidance system that incorporates both passive radio frequency (RF) guidance and imaging infrared (ImIR) guidance. There are a pair of horn like protrusions mounted on the ImIR seeker at the tip of the missile, and these two protrusions are the passive RF seeker. An optional ImIR only guidance is also available and the missile is a fire and forget weapon. The fire control system (FCS) of FL-3000N can simultaneously control two launchers, and can be integrated into other FCS on board ships. Alternatively, FL-3000N is also capable being directly controlled by other FCS on board ships. The system is usually fully automatic without human intervention, but manual operation can be inserted when needed. The primary launching system of FL-3000N is a 24-cell launcher, developed from FLS-1. An optional extra magazine with automated loading system is available for larger warships when there is enough space provided. On smaller surface combatants where space is limited, the extra magazine with the automated loading system is eliminated and the reload is done manually. To further utilize confined space, an 8-cell launcher and a quadruple launcher are also available. Additionally, a single-cell launcher is available for mounting on existing naval gun mounts.

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: AK-176

Type: Naval Gun

Caliber: 76.2mm

Quantity: 1 × AK-176 76mm. gun stations

Length: 4484 mm

Weight: 16,800 kg

Crew: 2 (4 in manual control mode)

Barrels: 1

Elevation: -15° to +85°

Traverse: ±175°

Rate of Fire: 120 rds/min

Muzzle Velocity: 980 m/s

Maximum Firing Range: 15 km

Effective Firing Range: 10 km

Feed System: 152 ready to fire rounds

↳*Ammunition Gun Weapon System #1*

Type: Rifle

Caliber: mm76.2

Active Protection System: INA

Electronic Warfare: INA

Decoys: INA

NBC Protection: Yes

Notes:

The Type 056A is a anti-submarine warfare configuration of the Type 056 Corvette. The Type 056A includes a SJG-206 Variable-Depth, Low-Frequency, Towed Array Sonar System. Jiangdao Type-056 Frigate/Corvette (FFL) Reputed as the new-generation “maritime cavalry”, the 056 frigate is rapidly augmenting the PLA Navy’s littoral warfare capabilities, especially in the South China Sea and East China Sea. This new class of small combatant augment the 60 HOUBEI-class wave-piercing catamaran missile patrol boats (PTG) (Type 022). The frigate was deployed primarily for patrol and escort missions as well as anti-submarine operations and sea combat tasks, independent or in coordination with other forces. Its primary duty is to patrol sea areas. The South China Sea has relatively high requirements for single patrol boats because it is far from the coast and is often choppy. Patrolling is a daily labor-intensive task, and requires a large number of soldiers. Therefore, patrol boats should be deployed in a large scale and cost less than warships. Unlike fighting, patrolling does not need too many weapons. Overall, ships designed for patrolling should have good seakeeping ability and be relatively cheap. The Type-056 frigate aimed at changing the situation of China's active-service base-defense system featuring aging military strength, single function and low combat power. The new-generation base-defense military strength commissioned in large quantities was another important platform for optimizing the equipment structure of the PLA Navy, improving the base-defense combat power as well as enhancing the PLA Navy's capability of safeguarding China's national security and territorial integrity, and defending China's maritime sovereignty and maritime rights and interests. The construction of the 056 frigate has come to an end in late 2019 and the upgrading of the domestic offshore combat system has been completed. Type 056 frigate is a type 1 light frigate developed by the Chinese Navy in the new century. According to overseas sources, it has a length of 89 meters, a width of 12 meters, a full-load displacement of 1,300 tons, diesel power, dual-axis propulsion, a maximum speed of 28 knots, and a cruising range of 3,500 nautical miles. The type 056 frigate weapon and the onboard electronic system are relatively simple. The weapon includes two double-mounted YJ-83 anti-ship missile launchers, one 8-unit red flag 10 ship-to-air missile launcher, and the main gun is a 76 mm gun. , 2 30mm single-tube remote-control naval guns, and anti-submarine weapons are two 2-unit antisubmarine torpedo launchers. Shipborne electronic systems include air / sea search radars, optoelectronic fire control systems, electronic warfare systems, and shipborne combat systems. The bow has a helicopter take-off and landing deck, which can take off and land straight -9 anti-submarine helicopters, but there is no hangar, which limits its helicopter operation capabilities. The Type 056 frigate weapon is relatively simple and mainly performs offshore patrol tasks. The PLA Navy had to build large warships if it is to go to the high sea, but large warship will be a waste of resources if it’s only used for “yard-protecing”. The PLA Navy needed vessels that are suitable for carrying out fishing protection, patrol and guarding tasks at the “house gate”, so that it can free the large combat ships from the trivial everyday maritime services and consequently ensure the combat capacity of main high-sea-going taskforces. With complete functions, the 056 guided missile frigate is capable of air defense, anti-submarine warfare, assault, and garrisoning. Such high cost effectiveness better caters to the rapidly increasing equipment manufacturing of the PLA Navy. The PLA Navy’s inshore combat tasks mainly consist of daily patrol, guarding, fishing protection, and other low-intensity and low-risk tasks. It provides the basic maritime force support for the civilian and law enforcement forces of oceanic administration and fishing affair bureau in coping with the provocations by military vessels of enemy states. Light surface vessels have to be used in the early stage of islands disputes. The flexible body and comprehensive combat capability of the 056 guided missile frigate decide that it is of best use on islands and the surrounding waters, where it can deal with all kinds of maritime crisis flexibly and make the mobilization and deployment of large vessels more effective. Designed not solely for islands disputes but for more extensive purposes such as maritime target assaulting, air defense and anti-submarine, the 056 guide missile frigate is a light maritime striking weapon platform with the highest performance-price ratio and the widest applications. It can be manufactured by a number of coastal and inland shipyards on a large scale and in large quantities and supplied to the PLA Navy incessantly. Light guide missile frigate can serve as steady support for PLA Navy’s high-sea-going maneuver combat and help free the inshore fast attack forces from everyday coast defense tasks, so as to establish a new-type inshore defensive combat system. China has an 18,000km-long coastline to guard. The new-type frigate is able to engage in low-intensity conflicts and carry out patrol, escort and fishing protection tasks in key waters. It makes the military force structure more reasonable, shows greater flexibility in carrying out combat tasks, and will soon become the main combat equipment for base defense. Moreover, the large-scale commissioning of the new-type frigate was expected to exert considerable effects on the PLAN’s combat thinking, methods of operation, training, management and application, talent cultivation and battlefield construction. The long coastline needs to be patrolled, the disputes over several islands need to be solved, and the maritime transportation routes need to be protected. Guided missile frigate is the most economic choice if those issues need to be solved by force. According to a ranking by the British website Naval Technology, the Type-056 is one of the world's 10 best modern corvettes along with Sweden's Visby class and Germany's K130 Braunschweig class. Cao Weidong, a researcher at the PLA Naval Military Studies Research Institute, said despite the Type-056 class being smaller compared with frigates, it will be as powerful as frigates in battles in coastal waters thanks to its stealth design and strong firepower. Because the ship's weapons and electronic systems are relatively simple, many international sources classify it as "corvettes" (light frigates) rather than "frigates". In fact, the Chinese Navy's original intention to develop the Type 056 frigate was also to replace the Type 037 hunting submarine, performing offshore patrol, escort, search and rescue tasks. For quite a long time, the Type 037 submarine hunting submarine has been the main battleship of the Chinese Navy's offshore

defense, and has built more than 100 ships. However, the type 037 submarine hunting ship has a small tonnage and poor long-range combat capabilities, making it difficult to perform combat missions in far-off sea areas. After the 1990s, the Chinese Navy built several 053H frigates to perform such tasks, but the 053H frigate tactical and technical indicators had fallen behind. It is difficult to meet the needs of the battlefield in the new century. In this case, the 056 frigate appeared. The first 056 frigate was started in 2011, launched in 2012, and delivered to the Navy in 2013. From a practical point of view, compared with the 037 frigate, the 056 frigate had a larger tonnage, more internal space, and can carry more supplies and materials, which is conducive to long-duty maritime operations. The crew's long-distance sea mission execution environment has been improved and efficiency has been improved. The ship was loved by the troops and became an ideal replacement for the 037 hunting submarine. Since then, the Type 056 frigate has entered a period of high-speed construction. It is reported that within about 9 years from 2011 to 2019, about 70 Type 056 frigates were built. On average, about 8 ships per year, and this speed can be said to be very amazing. Along with rapid construction, the Type 056 frigate also developed a series of improved and modified ships. For example, in use, the army found that the 30mm single-barrel remote-control naval gun was not very useful and the price was relatively expensive. Large-caliber machine guns can be used for patrol tasks. Therefore, the latest batch of 14.5-mm naval machine guns was used instead. Considering that there are many advanced AIP submarines in the first island chain, the anti-submarine type was developed for this type 056. It is the first domestic surface ship equipped with active / passive towed line sonars, improving the ship's ability to resist modern quiet submarines. In order to cooperate with the advanced underwater acoustic system, the 056 anti-submarine type has been replaced with a new type of anti-submarine missile. The new missile uses a turbojet engine with a longer range and stronger attack capabilities. Sonar, better detection performance. The 056 anti-submarine service effectively improved the Chinese Navy's offshore anti-submarine combat capabilities. Exports The Type 056 1,440-ton class corvette is available for the export market with Bangladesh having ordered at least two ships and the Nigerian Navy ordering the P18N offshore patrol vessel with a full load displacement of 1,800 tons. In October 2012, the first ship P18N in Wuhan shipyard started. In 2013, Bangladesh and China signed a purchase for a group of vessels contract, believed to consist of two frigates, two patrol boats and six large patrol boats. Type C13B [B for Bangladesh] is one of two light frigates ordered by the Bangladesh Navy in 2013. The ship was improved on the basis of Type 056. It replaced the weapon and radar system different from the domestic version and cancelled the anti-submarine capability. The most advanced frigate in the media, once known as China's export, its shape has been fully integrated with the overall trend of international light frigates. Although there is no such new trend as the chasing wind, the high cost performance has won the praise of the Bangladesh Navy. Two more ships have been added. The Thai Navy's Pattani-class OPV bears a resemblance to the subsequent Chinese Type 056 corvette / light frigate, though the later is up-gunned relative to the the Thai OPV, with four YJ-3/C803 ASM and a FL-3000N RAM launcher aft, while the former has a much taller superstructure. Built for the Royal Thai Navy by the China State Shipbuilding Corporation, each OPV cost about US$50 million. The vessels were commissioned in 2006-2007. In November 2014 China completed sea trials of a offshore patrol ship on order for the Nigerian Navy that will assist in suppressing the growing threat of piracy off West African shores. The vessel was the first of two acquired by the Nigerian Navy to bolster its maritime surveillance, patrolling, search-and-rescue and to counter piracy. The patrol ship was launched by state-owned shipbuilder China Shipbuilding & Offshore International Co (CSOC) in January 2014, and was taken for sea trials by affiliated shipyard Wuchang Shipbuilding Industry. The second patrol ship was built by CSOC in China but would be outfitted at the naval shipyard in Port Harcourt, Nigeria, in a technology transfer arrangement. According to specifications provided by CSOC, the ship has a full load displacement of 1,800 tonnes and can go 21 knots. The vessel can accommodate 75 crew, has 20 days endurance, and a standard range of 3,000 nautical miles. A computer-generated image issued by the Nigerian Navy suggested that the ship will have a helicopter hangar and landing deck. The weapons fit comprises a single 76mm NG-16-1 gun with a TR47 fire-control radar, as well as pairs of 30mm and 20mm guns. Nigerian Chief of Naval Staff Vice Admiral Dele Ezeobam told reporters in January 2014 that the F 91 would be handed over mid-2014. The Nigerian Navy is standing up to a host of challenges it faces in the Gulf of Guinea. Prior to 2009 before it commissioned the Sea Eagle-class patrol boats, the navy struggled to counter the often heavily armed pirates of West Africa. The two patrol ships is the latest in a string of measures to wrest back control of its seas from criminal groups.

Type 037I Class (Haiqing Class) Chinese Corvette

Tiers:

Variants:

- **Type 037I:** Pennant Numbers: 688, 693 , 694 and 697 Pendant No. 275/285, 290, 302, 305, 609/610, 618/622, 626/629, 636/637, 689/692, 695/699, 701, 707, 723/733 and 740/742
- **Type 037IS:** Pennant Numbers: Approx. 611–614, 619, 631, 632–635, 710–713, 743, 744, 761–763 and 786–789

System

Alternative Designation: Type 037I Class; NATO: Haiqing Class
Type: Corvette
Builder: China; Shipyard: INA
Crew: 71

Dimensions

Length: 62.8 m
Beam: 7.2 m
Draft: 2.4 m
Displacement, Standard: 395 tons
Displacement, Full Load: 478 tons

Propulsion System

Engine Name: 4 × Chinese PR 230ZC
Engine Type: Diesel
Engine Power: 4 × Chinese PR 230ZC diesel engines at 4,000 hp (2,983 kW) with 4 shafts
Maximum Range: \1,300 nmi (2,400 km) at 15 kn (28 km/h)
Maximum Speed: 28 knots (52 km/h; 32 mph)

Gun Weapon Systems

Note: The earlier boats are fitted with two manually operated twin-barrel 37 mm guns, but they have been replaced by two automatic 37 mm guns on the later variants. They also have various other mounted heavy machine guns for patrol duty. These weapons focus on a general-purpose patrol boat, with only a limited anti-submarine capability.

↳*Gun Weapon System #1*

Name: Type 76A

Type: Naval Gun

Caliber: 37mm

Quantity: 4 × Type 76A 37 mm gun (2 × 2)

Note: The Type 76A is a fully enclosed and fully automatic model in the Type 76 series. Unlike the Type 76F, the gun is fully automatic, with the semi-automatic operational mode and the one-man operator console removed. In addition to the optronic FCS found in the Type 76F, the Type 76A is linked to radar FCS. The maximum rate of fire, however, is reduced in comparison to Type 76, dropping from the original 400 rd/min/barrel to 375 rd/min/barrel. In addition to anti-aircraft and anti-surface roles, the Type 76A can also be used as a close-in-weapon system.

↳*Gun Weapon System #1 Ammunition*

Type: Rifle

Caliber: 37mm

Shell: INA

Basic Load: INA

↳*Gun Weapon System #2*

Name: Type 69

Type: Heavy Machine Gun

Caliber: 12.7mm

Quantity: 4 × Type 69 14.5 mm heavy machine guns (2 × 2)

Length: 1,980 mm

Barrel Length: 1,346 mm

Width: 162mm

Height: 225mm

Weight: 49 kg

Action: Short recoil operation

Rate of FIre: 600 rpm

Muzzle Velocity: 1,005 m/s

Maximum Firing Range: 4000m

Effective Firing Range: 3000m

Feed System: 40-round belt

Sights: iron or optical

↳*Gun Weapon System #2 Ammunition*

Type: Rifle

Caliber: 14.5mm

Cartridge: 14.5×114 mm

Basic Load: INA

Mines

Note: 12 max. mines (two mine rails fitted)

Mortar System

Mortar Launcher: The ships are armed with two 6-tubed anti-submarine mortar launchers.

Mortar Type: Type 87 Mortar

Fire Control Systems

FCS Name: INA

Computerized FCS: INA

Battle Management System: No

Radar Systems

Name: 1 x Pot Head Radar

Type: Surface Search Radar

Frequency: INA

Range: INA

Sonar Systems

Name: 1 x Tamir-11 HF

Type: Hull-Mounted Sonar

Protection

Active Protection System: INA

Countermeasures: INA

NBC Water Washdown System: INA

Depth Charge Racks: 2 depth charge racks

Depth Chargers: 2 BMB-2 depth charge mortars

Notes:

The Type 037I submarine chaser (NATO reporting name: Haiqing class), is a follow-on class of submarine chasers to the preceding Type 037-class of the People's Liberation Army Navy. There are two designation sof this class, the base Type 037I and the improved Type 037IS. The earlier boats were built by the Qiuxin Shipyard of Shanghai, and later by Huangpu Shipyard. The ships are armed with two 6-tubed anti-submarine mortar launchers. The earlier boats are fitted with two manually operated twin-barrel 37 mm guns, but they have been replaced by two automatic 37 mm guns on the later variants. They also have various other mounted heavy machine guns for patrol duty. These weapons focus on a general-purpose patrol boat, with only a limited anti-submarine capability. One Haiqing class submarine chaser was purchased by the Sri Lanka Navy and was commissioned in 1996 as SLNS Parakramabahu (P351), serving in the Sri Lankan Civil War.

Buyan Class (Project 21630 Buyan) Russian Corvette

Tiers:

1 **2** 3 4

Variants:

System

Alternative designations: Astrakhan; Project 21630

Builder: Almaz Shipbuilding Company Zelenodolsk Plant Gorky

Total Built: 3 Buyan Class Corvettes are in service

Type: Guided Missile Corvette

Crew (total): 29-36

Dimensions

Length: m62

Beam: m9.6

Height: m6.57

Draft: m2

Displacement: 500 tons (standard) 520 (full)

Automotive

Propulsion: 2 shaft CODAD, 4 x Zvezda M520, 14,584 shp (10,880 kW) and Kolomna Diesel, Pumpjet.

Maximum Speed: 28 knots (52 km/h; 32 mph)

Maximum Range: 1,500 nmi (2,800 km; 1,700 mi)

Endurance: 10 days

Armament

↳*Weapon Station #1*

Name: AK-100

Type: Naval Cannon

Quantity: 1 x AK-100 Unit

Caliber: mm100

Length: INA

Weight: 35.5 tons

Elevation: -10 / +85 degrees

Rate of Elevation: 30 degrees per second

Traverse: 360 degrees

Traverse Rate: 35 degrees per second

Recoil: 20 in (51 cm)

Rate of Fire: 50 to 60 rounds per minute

↳*Ammunition Weapon Station #1*

Shell: INA

Caliber: mm100

Shell Weight: 26.8 kg

Basic Load: INA

↳*Weapon Station #2*

Name: AK-630-M2 CIWS

Type: Fully automatic naval close-in weapon system based on a six-barreled 30 mm rotary cannon.

Caliber: 30mm

Quantity: 2 x AK-630-M2 CIWS Stations

Main Armament: 1 or 2 AO-18 autocannons

Secondary Armament: 4 x 9A4172 missiles (Vikhr-K upgrade

Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)

Width: 1,240 mm (49 in) (mount ring)

Height: 1,070 mm (42 in) (above deck) 2,050 mm (81 in) (below deck)

Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630) 1,800 kg (4,000 lb) (AK-630M) 2,500 kg (5,500 lb) (AK-630M-2) External nodes: 800 kg (1,800 lb) (AK-630) 2000 rounds in belt: 1,918 kg (4,228 lb) Fire control system: (Vympel MR-123) (Vympel-A MR-123/176) 5.2 tonnes (5.7 short tons) (Vympel-AM MR-123-02/MR-123-03 and Vympel-AME MR-123-02/176) 1 tonne (2,200 lb) (Laska 5P-10E)

Crew: 1

Barrels: 6 (AK-630M) 6 (× 2) (AK-630M1-2)

Action: Gas-operated rotary cannon

Elevation: +88° ... -12° (50°/sec) +90° ... -25° (60°/sec) AK-630M-2

Traverse: ±180° (70°/sec) ±180° (80°/sec) AK-630M-2

Muzzle Velocity: 880–900 m/s

Rate of Fire: 4,000–5,000 rounds/min (AK-630M) 10,000 rounds/min (AK-630M1-2)

Effective Firing Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime) 5,000 m (16,000 ft) (all, AK-630M-2)

Maximum Firing Range: the projectiles self-destruct past 5,000 m (16,000 ft) range

Feed System: Belt: 2,000 rounds (additional 1,000 rounds in reserve feed bin, AK-630M)[10] 4,000 rounds (AK-630M1-2)

Sights: Radar / TV-optical

↳*Ammunition Weapon Station #2*

Shell: HEI-Frag, Frag-T

Caliber: mm100

Shell Weight: kg0.39

Basic Load: 3,000

↳*Weapon Station #3*

Name: BM-21 Grad

Quantity: 1 BM-21 Grad unit consists of 40 Retractable A-215 Rockets

Type: Rocket Launcher

Crew: 3

Barrel Length: m3.0

Barrels: 40

Rate of Fire: 2 rounds/s

Muzzle Velocity: m/s690

Maximum Firing Range: 20 km (12 mi) (new rockets 30–45 km)

Sights: PG-1M panoramic telescope

↳*Weapon Station #4*

Name: 3M-47 Gibka

Type: A turret for ships that is equipped with Igla missiles.

Quantity: 1 3M-47 Gibka Unit

Number of Missiles: 4

Missile Type: Surface-to-Air Missile

Missile Warhead Weight: 1.17 kg (2.6 lb) with 390 g (14 oz) explosive

Detontation Mechansim: contact and grazing fuzes

Engine: solid fuel rocket motor

Operational Range: 5.2 km

Flight Ceiling: 3.5 km

Speed: 570m/s

Guidance System: dual waveband infra-red (S-version)

↳*Weapon Station #5*

Name: DP-65

Type: 55 mm ten-barreled remotely-controlled naval grenade launcher system

Description: The DP-65 (98U) is a Russian special compact 55 mm ten-barreled remotely-controlled naval grenade launcher system based on MRG-1 seven-barrel grenade launcher. It also has a manual control mode. DP-65 uses sonar Anapa-ME for underwater target detection. DP-65 high explosive grenades RG-55M are akin to miniature depth charges equipped with jet engine with an annular stabilizer. In 1991, the DP-65 automated, small size, remotely-controlled Rocket Grenade Launcher system was developed and adopted by the Russian Navy. DP-65 can be installed directly on watercraft and on the coast. Designed to protect ships, waterworks, offshore platforms and other important marine and coastal facilities from combat divers, frogmen, and saboteurs. The grenades are believed to produce casualties to divers within 16 meters of the explosion. They are employed by Grachonok-class anti-saboteur ships.

Maximum Effective Fire: INA

↳*Weapon Station #6*

Name: KPV-14.5 Heavy Machine Gun

Type: Heavy Machine Gun

Caliber: 14.5mm

Quantity: 2 x KPV-14.5 heavy machine gun

Length: 1,980 mm

Barrel Length: 1,346 mm

Width: 162mm

Height: 225mm

Weight: 49 kg

Action: Short recoil operation

Rate of Fire: 600 rpm

Muzzle Velocity: 1,005 m/s

Effective Firing Range: 3000m

Maximum Firing Range: 4000m

Feed System: 40-round belt

Sights: iron or optical

↳*Ammunition Weapon Station #6*

Cartridge: 14.5×114 mm

Caliber: mm14.5

Basic Load: 2,000

Protection

Electronic Warfare: 2 × 10 PK-10 decoy launchers

Sensors and Processing Systems

Navigation Radar: MR-231 Navigation Radar

Phased Array Radar: 5P-26M Pozitiv-M phased array radar system (Pozitiv-ME1.2 for export)

Fire Control System: 5P-10-03 Laska fire control system (5P-10-03E for export) and the MP-123 fire control system

Sonar System: Anapa-M anti-saboteur sonar system (Anapa-ME for export)

Notes:

The Buyan class, (Russian: Буян, lit. 'Buyan'), Russian designations Project 21630 Buyan and Project 21631 Buyan-M, are series of corvettes (small artillery and missile ships in Russian classification) developed by Zelenodolsk Design Bureau for the Russian Navy. Since 2010, all subsequent vessels are being constructed as improved Project 21631 subclass, incorporating greater tonnage, stealth technology and the 3S-14 vertical launching system for either Kalibr or Oniks anti-ship cruise missiles, significantly enhancing combat capabilities. The ships are primarily designed for operations within littoral zones to protect Russia's vast coastal areas. Due to the small tonnage, they can operate even within shallow parts of oceans and seas and Russia's river system. The export variant is known as Project 21632 Tornado. In August 2010, some informations about the newly modified Project 21631, dubbed as Buyan-M, were published. The Project 21631 ships are said to be an up-to-date variant of Project 21630 Buyan small artillery ship, armed with the nuclear-capable Kalibr cruise missiles (SS-N-27 Sizzler) with a claimed range of at least 1,500 km and electronic countermeasure equipment. Ships of Project 21631 are designed to defend the national economic zones of Russia. The ships' small size and displacement enable them to operate within inland river systems, including traversing the Moscow Canal which allows them to deploy to various seas around European Russia. This is a particular advantage for the Buyan-M series, because while the Intermediate-Range Nuclear Forces Treaty (INF) prohibits long-range cruise missiles from operating on land they can operate from ships, so a river-based corvette can deploy missiles without being subject to restrictions. The lead ship of this project, Grad Sviyazhsk, was laid down on 27 August 2010 and commissioned on 27 July 2014. On 7 October 2015, corvettes Grad Sviyazhsk, Uglich, Velikiy Ustyug and Gepard-class frigate Dagestan, deployed in the Caspian Sea, launched 26 Kalibr cruise missiles at 11 terrorist targets in Syria. The missiles flew nearly 1,500 kilometres (930 mi) over Iran and Iraq and struck targets in Raqqa and Aleppo provinces (controlled by the Islamic State) as well as in Idlib province (controlled by the al-Qaeda-linked Nusra Front)According to US DoD officials, several of these cruise missiles fired from Russian ships crashed in Iran and did not make it to their intended targets in Syria. An Iranian dissident organizations's TV reported that an "unidentified flying object" crashed and exploded in a village near the Iranian city of Takab. On 20 November 2015, the same warships launched 18 Kalibr cruise missiles from the Caspian Sea at seven terrorist targets in Rakka, Idlib and Aleppo provinces. On 13 February 2016, corvette Zelenyy Dol was deployed to the Mediterranean Sea. On 19 August 2016, corvettes Zelenyy Dol and Serpukhov, deployed in the Mediterranean Sea, launched Kalibr cruise missiles at positions of Al-Nusra terrorist group in Syria. As a result of the strikes, number of terrorist facilities were destroyed, including command post and base near the village of Dar Ta Izzah and weapon production plants and warehouses in Aleppo province. On 25 October 2016, Zelenyy Dol and Serpukhov were deployed to the Baltic Sea to join a newly formed division in Kaliningrad. On 4 November 2014, during the Euronaval-2014 exhibition, it was announced Kazakhstan has sent a request for the construction of three Project 21632 Tornado small artillery/missile ships. The ships were believed to be laid down in 2015.

- **Ships in Pakistan Navy Service::** 1013 Azmat; 1014 Dehshat; 1027 Himmat

System

Alternative Designation: Type 037II Class; NATO: Houjian Class
Type: Corvette; Missile Boat
Builder: Qiuxing and Huangpu Shipyard
Crew: 75

Dimensions

Length: 62.8 m
Beam: 7.2 m
Draft: 2.4 m
Displacement, Standard: INA
Displacement, Full Load: 520 tons

Propulsion System

Engine Name: 2 x SEMT-Pielstick 12 PA6 280
Engine Type: Diesel
Engine Power: 2 x SEMT-Pielstick 12 PA6 280 diesel engines at 1,584 hp (1,181 kW) with 3 shafts
Maximum Range: 1,800 nmi (3,300 km; 2,100 mi) at 18 knots (33 km/h; 21 mph)
Maximum Speed: 30 knots (56 km/h)

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: AK-176

Type: Naval Gun

Caliber: 76.2mm

Quantity: 1 × AK-176 Naval Gun

Length: 4484 mm

Weight: 16,800 kg

Crew: 2 (4 in manual control mode)

Barrels: 1

Recoil: 380 to 500 mm

Elevation: -15° to +85°

Traverse: ±175°

Rate of FIre: 120 rds/min

Muzzle Velocity: 980 m/s

Maximum Firing Range: 15.5 km

Effective Firing Range: 10 km

Feed System: 152 ready to fire rounds

Sights: INA

↳*Gun Weapon System #1 Ammunition*

Type: Rifle

Caliber: 76.2mm

Shell: INA

Basic Load: INA

↳*Gun Weapon System #2*

Name: Type 69

Type: Heavy Machine Gun

Caliber: 12.7mm

Quantity: 4 × Type 69 14.5 mm heavy machine guns (2 × 2)

Length: 1,980 mm

Barrel Length: 1,346 mm

Width: 162mm

Height: 225mm

Weight: 49 kg

Action: Short recoil operation

Rate of FIre: 600 rpm

Muzzle Velocity: 1,005 m/s

Maximum Firing Range: 4000m

Effective Firing Range: 3000m

Feed System: 40-round belt

Sights: iron or optical

↳*Gun Weapon System #2 Ammunition*

Type: Rifle

Caliber: 14.5mm

Cartridge: 14.5×114 mm

Basic Load: INA

Missile Weapon System

↳*Missile Weapon System #1*

Name: C-802

Type: Anti-Ship Missile System

Note: The C-802 is the export version of the YJ-83

Length: INA

Weight: INA

Warhead: 190 kg high-explosive fragmentation

Engine: CTJ-2 turbojet

Operational Range: 120 km

Maximum Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Mines

Note: 12 max. mines (two mine rails fitted)

Mortar System

Mortar Launcher: The ships are armed with two 6-tubed anti-submarine mortar launchers.

Mortar Type: Type 87 Mortar

Fire Control Systems

FCS Name: INA

Computerized FCS: Yes, 1 × I-band Type 347 (Rice Lamp)

Battle Management System: No

Radar Systems

Name: 1 × I-band Type 352 (Square Tie)

Type: Surface Search Radar

Frequency: INA

Range: INA

Sonar Systems

Name: 1 x Tamir-11 HF

Type: Hull-Mounted Sonar

Protection

Active Protection System: INA

Countermeasures: INA

NBC Water Washdown System: INA

Depth Charge Racks: 2 depth charge racks

Depth Chargers: 2 BMB-2 depth charge mortars

Notes:

The Type 037II missile boat (NATO: Houjian class) is a missile equipped corvette built by Huangpu Shipyard of Guangzhou for the People's Liberation Army Navy. A total of six vessels were delivered to the PLA Navy and form the main naval defence force currently protecting Hong Kong. The original one-off design was by an American company, the H-3 group, the design was for a 245-ton boat, equipped with Harpoon SSMs, OTO Melara 76 mm guns, gas turbine engines and waterjet propulsion. However, this specifications was too complicated for China, and a major redesign was begun, resulting in a boat with C-801 SSMs, diesel engines and propellers instead. The OTO Melara 76mm gun was retained in the revised design, called in 1988 the EH-3D (and in 1996 the 520T), but failed to survive the cooling of relations with the West following the Tiananmen Square protests of 1989 and the resulting end of Western participation in Chinese military projects. The first vessel was built in 1990, as a technology demonstrator and proof-of-concept trials vessel, it fired its first C-801 missile in a 1995 exercise. Three more vessels were built in 1995/96. However, due to technological difficulties (particularly with regards the license produced SEMT diesel engines), high price, and over sophisticated design compared to the PLAN standard, further production was terminated. A fifth vessel, hull number 774, was built in 2001, as another proof of concept vessel for modified SEMT engines with new turbochargers and license produced Russian AK-176 76 mm gun. Four vessels were built for rotation, with 2 vessels being deployed to Hong Kong at a time. The fifth vessel has been involved in two navigation incidents. The first time in 2001 whilst on a pre-delivery test it was nearly sunk after a crash with a fast ferry servicing the Hong Kong-Guangzhou route. In June 2006, it crashed again, this time with a Chinese freighter, and sank immediately, 13 servicemen going missing in the accident. The vessel was later refloated and sent to the shipyard for repair. The Azmat-class vessels in service with the Pakistani Navy are based on this class. In 2012 Bangladesh contracted for two slightly modified ships.

Type 037IG Class (Houxin Class) Chinese Corvette

Tiers:

1 2 3 4

Variants:

- **Ships in PLAN Service:** Pennant Numbers: 651□656□ 751□760 and 764□767. Completed: 26 (20 PLAN + 6 Myanmar) Active: 26 (20 PLAN + 6 Myanmar) Pendant No. 275/285, 290, 302, 305, 609/610, 618/622, 626/629, 636/637, 689/692, 695/699, 701, 707, 723/733 and 740/742

System

Type: Corvette; Missile Boat
Builder: Qiuxing and Huangpu Shipyard
Crew: 71

Dimensions

Length: 62.8 m
Beam: 7.2 m
Draft: 2.4 m
Displacement, Standard: 395 tons
Displacement, Full Load: 478 tons

Propulsion System

Engine Name: 4 × Chinese PR 230ZC
Engine Type: Diesel
Engine Power: 4 × Chinese PR 230ZC diesel engines at 4,000 hp (2,983 kW) with 4 shafts

Maximum Range: 1,300 nmi (2,400 km) at 15 kn (28 km/h)

Maximum Speed: 28 knots (52 km/h; 32 mph)

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: Type 76A

Type: Naval Gun

Caliber: 37mm

Quantity: 4 × Type 76A 37 mm gun (2 × 2)

Note: The Type 76A is a fully enclosed and fully automatic model in the Type 76 series. Unlike the Type 76F, the gun is fully automatic, with the semi-automatic operational mode and the one-man operator console removed. In addition to the optronic FCS found in the Type 76F, the Type 76A is linked to radar FCS. The maximum rate of fire, however, is reduced in comparison to Type 76, dropping from the original 400 rd/min/barrel to 375 rd/min/barrel. In addition to anti-aircraft and anti-surface roles, the Type 76A can also be used as a close-in-weapon system.

Notes:

The Type 037IG missile boat (NATO: Houxin class) were first built by Qiuxing and Huangpu Shipyard from 1991 through 1999 for the People's Liberation Army Navy (PLAN). In addition to the PLAN, 6 were exported to Myanmar: 2 in 1995, 2 in July 1996, and 2 in late 1997. This boat is the anti-ship version of the Type 037 submarine chasers, armed with missiles rather than torpedoes. It is most effectively used in conjunction with multiple missile boats to send a swarm of missiles towards its intended target and then egress from the area immediately. The swarm of anti-ship missiles will hopefully slip past the target's air defenses for at least one or possibly more hits.

Buyan-M Class (Project 21631 Buyan-M) Russian Corvette

Builder: Almaz Shipbuilding Company Zelenodolsk Plant Gorky
Total Built: 12 Buyan-M Class Corvettes are scheduled to be built.
Type: Guided Missile Corvette
Crew (total): 52

Dimensions

Length: m75
Beam: m11
Height: m6.57
Draft: m2.5

Displacement: 949 tons (full)

Automotive

Propulsion: 2 shaft CODAD, 4 x Zvezda M520, 14,584 shp (10,880 kW) and Kolomna Diesel, Pumpjet.

Maximum Speed: 26 knots (48 km/h; 30 mph)

Maximum Range: 2,300 nmi (4,300 km; 2,600 mi) at 12 knots

Endurance: 10 days

Armament

↳*Weapon Station #1*

Name: AK-100

Type: Naval Cannon

Quantity: 1 x AK-100 Unit

Caliber: mm100

Length: INA

Weight: 35.5 tons

Elevation: -10 / +85 degrees

Rate of Elevation: 30 degrees per second

Traverse: 360 degrees

Traverse Rate: 35 degrees per second

Recoil: 20 in (51 cm)

Rate of Fire: 50 to 60 rounds per minute

↳*Ammunition Weapon Station #1*

Shell: INA

Caliber: mm100

Shell Weight: 26.8 kg

Basic Load: INA

↳*Weapon Station #2*

Name: AK-630-M2 CIWS

Type: Fully automatic naval close-in weapon system based on a six-barreled 30 mm rotary cannon.

Caliber: 30mm

Quantity: 2 x AK-630-M2 CIWS Stations

Main Armament: 1 or 2 AO-18 autocannons

Secondary Armament: 4 x 9A4172 missiles (Vikhr-K upgrade

Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)

Width: 1,240 mm (49 in) (mount ring)

Height: 1,070 mm (42 in) (above deck) 2,050 mm (81 in) (below deck)

Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630) 1,800 kg (4,000 lb) (AK-630M) 2,500 kg (5,500 lb) (AK-630M-2) External nodes: 800 kg (1,800 lb) (AK-630) 2000 rounds in belt: 1,918 kg (4,228 lb) Fire control system: (Vympel MR-123) (Vympel-A MR-123/176) 5.2 tonnes (5.7 short tons) (Vympel-AM MR-123-02/MR-123-03 and Vympel-AME MR-123-02/176) 1 tonne (2,200 lb) (Laska 5P-10E)

Crew: 1

Barrels: 6 (AK-630M) 6 (× 2) (AK-630M1-2)

Action: Gas-operated rotary cannon

Elevation: +88° ... -12° (50°/sec) +90° ... -25° (60°/sec) AK-630M-2

Traverse: ±180° (70°/sec) ±180° (80°/sec) AK-630M-2

Muzzle Velocity: 880–900 m/s

Rate of Fire: 4,000–5,000 rounds/min (AK-630M) 10,000 rounds/min (AK-630M1-2)

Effective Firing Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime) 5,000 m (16,000 ft) (all, AK-630M-2)

Maximum Firing Range: the projectiles self-destruct past 5,000 m (16,000 ft) range

Feed System: Belt: 2,000 rounds (additional 1,000 rounds in reserve feed bin, AK-630M)[10] 4,000 rounds (AK-630M1-2)

Sights: Radar / TV-optical

↳*Ammunition Weapon Station #2*

Shell: HEI-Frag, Frag-T

Caliber: mm100

Shell Weight: kg0.39

Basic Load: 3,000

↳*Weapon Station #3*

Name: Pantsir-M

Quantity: 1 x Pantsir-M System

Type: Ship-based CIWS/Missile launcher

Main Armament: Hermes-K missiles and 57E6 missiles

Secondary Armament: Two 30×165mm AO-18KD

Rate of Fire: 10000 rounds/minute

Maximum Firing Range: 20km

↳*Weapon Station #4*

Name: P-800 Oniks

Type: Supersonic anti-ship cruise missile

Quantity: 2 x P-800 Oniks Unit

Manufacturer: NPO Mashinostroyeniya

In Service: 2002-Present

Proliferation: Widely Proliferated Hezbollah – with diverse launching platforms. Indonesia – 4 VLS (vertical launching system) mounted on Ahmad Yani class frigate KRI Oswald Siahaan (354). Russia – 3 "Bastion-P" complexes delivered in 2010, all the complexes taken into service with the Russian Black Sea Fleet's 11th Independent Coastal Missile-Artillery Brigade stationed near Anapa and the Project 1234.7 Nakat, a one-off Nanuchka IV-class corvette commissioned in 1987 with 2x6 Oniks. The "Bastion-P" is deployed by Russian forces in Crimea. One more Bastion-P was delivered in 2015. 2 Bastion systems are in service with the Northern Fleet and at least one with Western Military District (Baltic Fleet). Two more systems entered service in 2016 with Pacific Fleet. Newest class of Russian nuclear-powered attack submarines, Yasen-class submarine, can also launch the missile. Submarine-launched variant entered service in 2016. Two Bastion missile systems delivered in 2017 and one more in 2018. Totally 4 Bal and Bastion systems in 2018. One more system delivered for the Pacific Fleet in early 2019. Totally 3 Bastion systems in 2019. Syria – 2 "Bastion-P" complexes delivered in 2011, 72 missiles. Vietnam – 2 "Bastion-P" land-based coastal defense systems delivered, 40 missiles

Length: 8.9 m

Diameter: 0.7 m

Weight: 3,000 kg

Wingspan: 1.7 m

Warhead: national ver. 300 kg semi-armour piercing HE, thermonuclear; for export 200 kg semi-armour piercing HE

Detonation Mechanism: delay fuze

Engine: Ramjet 4 tons of thrust

Propellant: kerosene liquid fuel

Operational Range: 600 km (370 mi; 320 nmi) (Oniks version for Russia) 120 to 300 km (75 to 186 mi; 65 to 162 nmi) depending on altitude (Yakhont export version)

Flight Ceiling: 14,000 m

Flight Altitude: 10 meters or higher

Speed: Mach 2

Guidance System: midcourse inertial guidance, active radar homing-passive radar seeker head

Accuracy: m1.5

Launch Platform: coastal installations, naval ships, Fixed-wing aircraft

↳*Weapon Station #5*

Name: DP-65

Type: 55 mm ten-barreled remotely-controlled naval grenade launcher system

Description: The DP-65 (98U) is a Russian special compact 55 mm ten-barreled remotely-controlled naval grenade launcher system based on MRG-1 seven-barrel grenade launcher. It also has a manual control mode. DP-65 uses sonar Anapa-ME for underwater target detection. DP-65 high explosive grenades RG-55M are akin to miniature depth charges equipped with jet engine with an annular stabilizer. In 1991, the DP-65 automated, small size, remotely-controlled Rocket Grenade Launcher system was developed and adopted by the Russian Navy. DP-65 can be installed directly on watercraft and on the coast. Designed to protect ships, waterworks, offshore platforms and other important marine and coastal facilities from combat divers, frogmen, and saboteurs. The grenades are believed to produce casualties to divers within 16 meters of the explosion. They are employed by Grachonok-class anti-saboteur ships.

Maximum Effective Fire: INA

↳*Weapon Station #6*

Name: KPV-14.5 Heavy Machine Gun

Type: Heavy Machine Gun

Caliber: 14.5mm

Quantity: 2 x KPV-14.5 heavy machine gun

Length: 1,980 mm

Barrel Length: 1,346 mm

Width: 162mm

Height: 225mm

Weight: 49 kg

Action: Short recoil operation

Rate of Fire: 600 rpm

Muzzle Velocity: 1,005 m/s

Effective Firing Range: 3000m

Maximum Firing Range: 4000m

Feed System: 40-round belt

Sights: iron or optical

↳***Ammunition Weapon Station #6***

Cartridge: 14.5×114 mm

Caliber: mm14.5

Basic Load: 2,000

Protection

Electronic Warfare: TK-25E radar jammers

Sensors and Processing Systems

Navigation Radar: MP-231-2 navigation radar

Phased Array Radar: 5P-26M1 Pozitiv-M1 phased array radar system

Fire Control System: 5P-10-03 Laska fire control system and the MP-123-02 fire control system

Sonar System: Anapa-M anti-saboteur sonar system

Notes:

The Buyan class, (Russian: Буян, lit. 'Buyan'), Russian designations Project 21630 Buyan and Project 21631 Buyan-M, are series of corvettes (small artillery and missile ships in Russian classification) developed by Zelenodolsk Design Bureau for the Russian Navy. Since 2010, all subsequent vessels are being constructed as improved Project 21631 subclass, incorporating greater tonnage, stealth technology and the 3S-14 vertical launching system for either Kalibr or Oniks anti-ship cruise missiles, significantly enhancing combat capabilities. The ships are primarily designed for operations within littoral zones to protect Russia's vast coastal areas. Due to the small tonnage, they can operate even within shallow parts of oceans and seas and Russia's river system. The export variant is known as Project 21632 Tornado. In August 2010, some informations about the newly modified Project 21631, dubbed as Buyan-M, were published. The Project 21631 ships are said to be an up-to-date variant of Project 21630 Buyan small artillery ship, armed with the nuclear-capable Kalibr cruise missiles (SS-N-27 Sizzler) with a claimed range of at least 1,500 km and electronic countermeasure equipment. Ships of Project 21631 are designed to defend the national economic zones of Russia. The ships' small size and displacement enable them to operate within inland river systems, including traversing the Moscow Canal which allows them to deploy to various seas around European Russia. This is a particular advantage for the Buyan-M series, because while the Intermediate-Range Nuclear Forces Treaty (INF) prohibits long-

range cruise missiles from operating on land they can operate from ships, so a river-based corvette can deploy missiles without being subject to restrictions. The lead ship of this project, Grad Sviyazhsk, was laid down on 27 August 2010 and commissioned on 27 July 2014. On 7 October 2015, corvettes Grad Sviyazhsk, Uglich, Velikiy Ustyug and Gepard-class frigate Dagestan, deployed in the Caspian Sea, launched 26 Kalibr cruise missiles at 11 terrorist targets in Syria. The missiles flew nearly 1,500 kilometres (930 mi) over Iran and Iraq and struck targets in Raqqa and Aleppo provinces (controlled by the Islamic State) as well as in Idlib province (controlled by the al-Qaeda-linked Nusra Front)According to US DoD officials, several of these cruise missiles fired from Russian ships crashed in Iran and did not make it to their intended targets in Syria. An Iranian dissident organizations's TV reported that an "unidentified flying object" crashed and exploded in a village near the Iranian city of Takab. On 20 November 2015, the same warships launched 18 Kalibr cruise missiles from the Caspian Sea at seven terrorist targets in Rakka, Idlib and Aleppo provinces. On 13 February 2016, corvette Zelenyy Dol was deployed to the Mediterranean Sea. On 19 August 2016, corvettes Zelenyy Dol and Serpukhov, deployed in the Mediterranean Sea, launched Kalibr cruise missiles at positions of Al-Nusra terrorist group in Syria. As a result of the strikes, number of terrorist facilities were destroyed, including command post and base near the village of Dar Ta Izzah and weapon production plants and warehouses in Aleppo province. On 25 October 2016, Zelenyy Dol and Serpukhov were deployed to the Baltic Sea to join a newly formed division in Kaliningrad. On 4 November 2014, during the Euronaval-2014 exhibition, it was announced Kazakhstan has sent a request for the construction of three Project 21632 Tornado small artillery/missile ships. The ships were believed to be laid down in 2015.

Bung Tomo Class Indonesian Corvette

Tiers:

Variants:

- **KRI Bung Tomo (ex KDB Jerambak):** Commissioned: 2014 Status: Active
- **KRI John Lie (ex KDB Bendahara Sakam):** Commissioned: 2014 Status: Active
- **KRI Usman-Harun (ex KDB Nakhoda Ragam):** Commissioned: 2014 Status: Active

System

Alternative Designation: Bung Tomo Class'; They were originally built for the Royal Brunei Navy and named Nakhoda Ragam-class corvettes but were ultimately bought by Indonesia and renamed.
Total Built: 3 ships built
Type: Corvette
Builder: BAE Systems Marine
In Service: 2014-Present
Crew: 79 men (up to 24 passengers)

Dimensions

Length: 95 m
Beam: 12.8 m
Draft: 3.6 m
Displacement, Standard: 1,500 tons
Displacement, Full Load: 2,000 tons
Note: The ship has 12,572 cubic ft (356 cubic m) of ballast. A total of 4,767 cubic ft (135 cubic m) of fresh water and 24,791 cubic ft (702 cubic m) of fuel can be carried. Two bow thrusters permit precise maneuvering. Fin stabilizers are fitted.

Propulsion System

Engine Name: 4 x MAN B&W diesel engines

Engine Type: Diesel

Engine Power: 40,500 shp

Propellers: 2 controllable-pitch propellers

Maximum Range: 5 000 nm at 12 knots

Maximum Speed: 30 knots

Endurance: 14 days

Communications

Radio: Classified

Missile Weapon System

↳*Missile System #1*

Name: Exocet Missile

Type: Anti-Ship Missile

Quantity: 2 × 4 Exocet MM40 Block II missile launchers.

Launcher: MM40 Block II missile launchers.

Missile Basic Load: 8

Length: 6 m

Diameter: 34.8 cm

Wingspan: 1.35 m

Weight: 780 km

Warhead: 165 km

Engine: Solid propellant engine turbojet (MM40 Block 3 version)

Operational Range: 180 km

Flight Altitude: Sea-skimming

Speed: Mach 0.93 1,148 kilometres per hour (713 mph; 319 m/s)

Guidance System: Inertial guidance and terminal active radar homing

Launch Platform: multi-platform: *MM38 surface-launched *AM39 air-launched *SM39 submarine-launched *MM40 surface-launched

↳*Missile Weapon System #2*

Name: Sea Wolf Missile

Type: Surface-to-Air Missile

Quantity: 1 x VLS for Seawolf SAM Launcher

Launcher: Vertical Launching System

Missile Basic Load: 16 x Sea Wolf Missile

Length: 1.9 m

Diameter: 180 mm

Wingspan: 450 mm

Weight: 82 kg

Warhead: 14 kg (30.9 lb) HE Blast-Fragmentation

Detonation Mechanism: Direct contact/Proximity fuse activated

Engine: Blackcap solid fuel sustainer

Operational Range: 1–10 km

Flight Ceiling: 3,000 m

Speed: Mach 3 (3,675 km/h; 2,284 mph)

Guidance System: Automatic Command to Line-Of-Sight (ACLOS)

Steering System: Control surfaces

Gun Weapon Systems

↳*System*

Name: OTO Melara 76mm

Type: Naval Gun

Caliber: 76mm

Quantity: 1 x 76-mm/62-cal Oto Melara Super Rapid DP

Barrel Length: 4,724.4 mm

Weight: Empty: 7.5 tonnes (17,000 lb)

Crew: Remote Controlled

Elevation: −15°/+85°

Traverse: 360°

Rate of Fire: 85 rounds/min

Muzzle Velocity: 915 m/s

Maximum Firing Range: 16,000 m

Feed System: Magazine capacity: 80 ready rounds on Compact gun mount

↳*Ammunition*

Type: Rifle

Caliber: mm76

Shell: 76×636mmR cartridge weight 12.5 kilograms (28 lb) shell weight 6.3 kilograms (14 lb) propellant weight 2.35 kilograms (5.2 lb)

Basic Load: INA

↳*Gun Weapon System #2*

Name: DS30M Mark 2 Automated Small Calibre Gun

Type: Naval Gun

Caliber: 30mm

Quantity: 2 x 30-mm/75-cal DS 30B AA

Note: The DS30M Mark 2 system consists of a 30mm Mark 44 Bushmaster II on a fully automated mount or manual controlled with an off-mount electro-optical director (EOD). The gun and the EOD are controlled from a remote operator console elsewhere on the ship. The "mount is a single cannon naval mount that is gyro stabilized, electrically operated and self contained gun mounting featuring a choice of cannon, control mode and sights. It has low magnetic, radar and IR signatures and excellent ergonomic availability, reliability and maintainability (ARM)." In theory "the unique dual feed system of the Bushmaster series allows the operator to select different types of ammunition for use against a variety of targets. The safety, reliability and low life-cycle costs of the Bushmaster system added to its overall value." However, photographs show only a single ammunition feed.

Onboard Aviation Facilities

Facilities: Flightdeck, no hangar

Helicopter: 1 x Eurocopter AS565 Panther[

Fire Control

Gun and Missile FCS: 2 x AMS-1802SW gun/missile fire control

Weapons Tracking System: 1 x Rademac 2500 surveillance and tracking system

Radar Systems

Navigation Radar: 1 x Thales Scout navigation

Air Search Radar: 1 x Alenia Marconi Systems (AMS) AWS-9 3-D air-search radar

Sonar Systems

Hull-Mounted Sonar: 1 x Thales TMS-4130C1 hull-mounted sonar

Protection

Active Protection System: Yes

Electronic Warfare: 1 x Racal Cutlass 242 intercept and Scorpion Jammer

Decoy: 1 x Super Barricade decoy rocket launcher

NBC Protection: Yes

Notes:

The Bung Tomo class is a class of three Indonesian multi role patrol corvettes. They were originally built for the Royal Brunei Navy and named Nakhoda Ragam-class corvettes but were ultimately bought by Indonesia and renamed. The class is named after Bung Tomo, a noted leader of Indonesia's independence movement. The three vessels were built by BAE Systems Marine (now BAE Systems Maritime - Naval Ships). The contract was awarded to GEC-Marconi in 1995 and the ships, a variant of the F2000 design, were launched in January 2001, June 2001 and June 2002 at the then BAE Systems Marine yard at Scotstoun, Glasgow. The customer refused to accept the vessels and the contract dispute became the subject of arbitration. When the dispute was settled in favour of BAE Systems, the vessels were handed over to Royal Brunei Technical Services in June 2007. In 2007, Brunei contracted the German Lürssen shipyard to find a new customer for the three ships; in November 2012, it was announced that Indonesia had signed a memorandum of understanding with Britain to acquire the vessels for one-fifth of the original unit cost. The ships are now in service with the Indonesian Navy. The ships were originally armed with MBDA Exocet Block II anti-ship missiles and MBDA Seawolf air defence missiles. The main gun is an Oto Melara 76 mm; the ship also carries two torpedo tubes, two 30 mm remote weapon stations and has a landing spot for a helicopter. As 2018 the MBDA Seawolf missile was out of service due to expired and there was plan to replace it with VL Mica. In late December 2014, KRI Bung Tomo was involved in search and recovery operations of the Indonesia AirAsia Flight 8501 which crashed off the Java Sea between the islands of Belitung and Borneo. Later in early January 2015, KRI Usman Harun was deployed to search for the black boxes as the ship is equipped with the Thales Underwater Systems TMS 4130C1 hull-mounted sonar. KRI Bung Tomo is named after Sutomo, the leader of Indonesian guerrillas during the Battle of Surabaya. The naming of KRI John Lie memorializes the first Chinese Indonesian to be honored as National Hero of Indonesia, who was also one of the first high ranking navy commanders during the Indonesian National Revolution. The naming of KRI Usman-Harun memorializes Harun Said and Osman Hj Mohd Ali, who were executed by Singapore after the MacDonald House bombing, creating a controversy between the two nations.

Sariwon Class North Korean Corvette

Tiers:

System

Alternative Designation: Sariwon Class
Type: Corvette
Builder: Stationed on the east coast, these ships were likely built at either Mayang-do Naval Shipyards or Bong Dao Bo Shipyards in nearby Sinpo on the mainland.
Crew: 70

Dimensions

Length: 62.10 m
Beam: 7.30 m
Draft: 2.40 m
Displacement, Standard: 450 tons standard
Displacement, Full Load: 490 tons full load

Propulsion System

Engine Name: INA
Engine Type: 2 x Diesel Engines
Engine Power: 3,000 total bhp
Maximum Range: 2,700 nm at 18 kts.
Maximum Speed: 21 knots

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: Type 66
Type: Naval 57mm Gun
Caliber: 57mm

Quantity: 2 x Type 66 Naval 57mm Gun

Length: 3,990 mm

Weight: 14,000 kg

Barrels: Single barrel (progressive RH parabolic twist, 24 grooves)

Action: Electronic firing

Elevation: −10°/+78°

Traverse: Full 360°

Rate of Fire: 200 rounds/min

Maximum Firing Range: 17,000 m

Effective Firing Range: 8,500 m

Feed System: 40 ready rounds, 128 rounds in ready racks in mount

Sights: Gyro-stabilized in local control.

Notes:

The Sariwon class corvette is a Soviet-designed corvette used by North Korea. The class is based on the Soviet Fugas-class Tral type fleet minesweepers, but were built in North Korea in the 1960s. It is believed five ships of this type are currently active in the Korean People's Navy. Stationed on the east coast, these ships were likely built at either Mayang-do Naval Shipyards or Bong Dao Bo Shipyards in nearby Sinpo on the mainland.

Type: Hull Mounted

Protection

Active Protection System: INA

Countermeasures: Yes

NBC Water Washdown System: Yes

EW: 1 x Thales DR3000 system; 1 x Racal Scorpion 2L system jammer; 2 x 12-barreled PK-16 chaff decoy rocket launchers

Notes:

Indonesia's SIGMA-class (or DIPONEGORO-class) corvettes are based on a Dutch modular design to produce three different sizes of naval patrol vessels. SIGMA is an acronym for "ship integrated geometrical modularity approach." The ships are based on a common design defined by a set of geometric parameters, which are applied throughout the entire range of the class and which provide a repetition of identical units, both in the dimensions of the ship's spaces and in the layout. The corvettes for Indonesia cost an estimated $212 million for the first two and $339 million for the second two

Maximum Speed: 25 knots

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: AK-257 DP

Type: Naval Gun

Caliber: 57mm

Quantity: 1 x AK-257 Naval Gun

Note: The AK-257 is a Soviet 57mm naval gun, originally a land ZIF-31 L/70 57mm (Type 66/76) cannon. During the early 1950s, development began of naval versions of the 57x348mmSR 70 calibre weapon which had entered service with the Soviet army in 1950 as the S-60. This was to be a supplementary weapon for larger warships and as the main gun armament for minesweepers and auxiliaries. The twin gun version, ZIF-31, appears to have entered service with the Project 264 Minesweepers (T58 class) and the Project 310 (Don class) submarine support ships in 1958. In 1960, two other versions of the mounting appeared; a single gun ZIF-71 for the modernised Skoryy class destroyers and the quad ZIF-75 for the Krupny/Kanin class destroyers. The ZIF designation is an industrial one and it is possible that the naval designations were AK-157 (ZIF-71), AK-257 (ZIF-31) and AK-457 (ZIF-75). In smaller warships these mountings were sometimes associated with MR-103 and in larger ones with the Yakhond (Hawk Screech) radar. The ZIF-31/71/75 mountings may not have been very successful and an improved twin mounting appeared shortly afterwards as the AK-725. The twin 57mm ZIF-31 has also been manufactured in China as the Type 66 and there is a water-cooled derivative known as the Type 76. The AK-257 is currently employed on the Grisha class Corvette.

Mines: mines can be deployed from depth charge racks

Notes:

The Parchim-class corvette (Soviet designation Project 1331M) was developed for the East German Navy in the late 1970s, and built by the Wolgast Peene-Werft. The ships were designed for coastal anti-submarine warfare. In case of an all-out NATO-Warsaw Pact war in Europe their prime targets would have been the small U-206 coastal submarines of the West German navy. The first ship, Wismar (now the Indonesian KRI Sutanto), was launched on 9 April 1981 in Rostock, and subsequently another 15 ships were built until 1986. To make production more economical, the Soviet Union agreed to purchase another 12 ships from Wolgaster Peenewerft built between 1986 and 1990, thereby effectively subsidising the East German shipbuilding industry. The ships of the Soviet Navy were named Parchim II by NATO. Though useful as a coastal ASW platform, the Soviet production of the similar but far more powerful Grisha class made this purchase even more illogical for the Soviet Navy. After German re-unification the former East German ships were sold to the TNI-AL (Indonesian Navy) in 1993. The Indonesian Navy extensively refurbished their Parchims, to the point where the refurbishing exceeded the cost of purchase. They are still in service, both in the Indonesian Navy and in the Russian Baltic Fleet. For air defence, the ships were equipped with one double-barrel AK-230 30 mm gun and one double-barrel AK-725 57 mm gun. The Ak-725 double 57 mm AA gun, designed in 1959, was directed by the ESP-72 fire control system, which received ranging and target bearing information from an MR 103 (NATO codename 'MUFF COB') radar. The MR 103 had a 1.30 m (4.3 ft) parabolic radar dish, with an optical camera system slaved to it, as a backup system in case of failure or heavy EW environment. The barrels of the gun were water-cooled and belt-fed, with each belt containing 550 rounds, but the first round had to be manually chambered. In an emergency, the turret could be manually operated with an optical fire control system. The MR 103 radar system, already outdated when the Parchims were developed, used 1950s-style electromechanical systems, built around vacuum tubes. As a result, it wasn't considered to be an effective anti-missile system, or CIWS (Close-in weapon system), as was evidenced by a Soviet training accident in 1987 when a test missile drone accidentally locked in on a small Soviet Navy training vessel. Although the ship's AK-725 system kept firing until the moment of impact, no hits were scored and the ship was destroyed by the resulting fire, allegedly killing 39 crew members. The AK-230 gun was a fully automatic, stabilized, NN-30 double-barrel, water-cooled, four-chamber revolver cannon. The guns had a 1,000 round per minute (rpm) rate of fire and were fed by independent 500 round ammunition belts. The regular associated radar system was the (NATO codename) DRUM TILT radar, which was not used in the Parchim class. According to some sources the AK-230 could not only be linked with the DRUM TILT but also with the MUFF COB radar system, but this is disputed by old East German naval sources. According to these East German sources, the AK-230 gun on the Parchim-class corvette was optically guided, thereby leaving the Parchim class without an effective CIWS, and therefore unable to counter anti-shipping missiles. There were also two SA-N-5 (Naval SA-7 or Strela II) MANPAD positions aboard the Parchims. But without an effective, radar guided SAM missile system, the Parchims were left completely vulnerable to enemy precision guided anti-shipping weapons. This was a major restriction and confined the Parchims to brown water coastal operations, close to the protective air force and air defence umbrella. The air search radar was the ubiquitous (NATO codename) STRUT CURVE radar. This radar had a 4 m (13 ft) parabolic radar dish, worked in the F-band frequency, and had a respectable 60 nautical miles (110 km) radar range against aircraft flying at 5,000 m (16,000 ft) height, and a less respectable 20 nautical miles (40 km) radar range against surface shipping or low flying aircraft. The electronic defense suite was very basic, and consisted of an IFF (Identification Friend or Foe) receiver and transmitter, and an 'ELOKA' multiband passive RWR antenna slaved to a double 16-cell chaff dispenser. All in all, air defence - or the lack of one - was a very restrictive factor in the tactical usefulness of the Parchim design.

Guidance System: Inertial navigation/active radar homing terminal guidance

↳*Missile System #2*

Name: Flying Leopard 3000 Naval (FL-3000N)

Type: Surface-to-Air Missile System

Quantity: 1 × 8-cell FL-3000N SAM launcher

Location: INA

Missile Name: HHQ-10 (Red Flag 10)

Missile Basic Load: INA

Length: 2 m

Diameter: 0.12 m

Maximum Range: > 9 km for subsonic targets, > 6 km for supersonic targets

Minimum Range: < 500 meters

Guidance System: Passive RF + ImIR or ImIR only

Note: The Flying Leopard 3000 Naval (FL-3000N) was first revealed to the public at the 7th Zhuhai Airshow at the end of 2008. Although using the Flying Leopard designation, the FL-3000N is actually a different missile system than the FL-2000(V) shown earlier. In fact, the only commonality shared by both SAM system is the launcher design, and even the launchers differ in size due to the different diameters of the missiles used in the systems. Instead of using QW-1 Vanguard MANPADs, the FL-3000N system uses the HHQ-10 (Red Flag 10) naval surface to air missile developed from TY-90 missile. The diameter of the missile is enlarged by a third, but the most important design difference is its guidance system. The FL-3000N missile utilizes a combined guidance system that incorporates both passive radio frequency (RF) guidance and imaging infrared (ImIR) guidance. There are a pair of horn like protrusions mounted on the ImIR seeker at the tip of the missile, and these two protrusions are the passive RF seeker. An optional ImIR only guidance is also available and the missile is a fire and forget weapon. The fire control system (FCS) of FL-3000N can simultaneously control two launchers, and can be integrated into other FCS on board ships. Alternatively, FL-3000N is also capable being directly controlled by other FCS on board ships. The system is usually fully automatic without human intervention, but manual operation can be inserted when needed. The primary launching system of FL-3000N is a 24-cell launcher, developed from FLS-1. An optional extra magazine with automated loading system is available for larger warships when there is enough space provided. On smaller surface combatants where space is limited, the extra magazine with the automated loading system is eliminated and the reload is done manually. To further utilize confined space, an 8-cell launcher and a quadruple launcher are also available. Additionally, a single-cell launcher is available for mounting on existing naval gun mounts.

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: AK-176

Type: Naval Gun

Caliber: 76.2mm

Quantity: 1 × AK-176 76mm. gun stations

Length: 4484 mm

Weight: 16,800 kg

Crew: 2 (4 in manual control mode)

Barrels: 1

Elevation: -15° to +85°

Traverse: ±175°

Rate of Fire: 120 rds/min

Muzzle Velocity: 980 m/s

Maximum Firing Range: 15 km

Effective Firing Range: 10 km

Feed System: 152 ready to fire rounds

↳*Ammunition Gun Weapon System #1*

Type: Rifle

Caliber: mm76.2

Shell: INA

Shell Weight: 12.4 kg

Basic Load: INA

↳*Gun Weapon System #2*

Name: Type 730

Type: Close-In Weapon System (CIWS)

Caliber: 30mm

Quantity: 2 x Type 730 CIWS

Main Armament: 1×30 mm H/PJ-12 or H/PJ-11 Gatling gun

Length: INA

Weight: INA

Barrels: 7-barrel

Crew: Automated, with human oversight

Rate of Fire: 1,200-4,200 rounds/minute

Maximum Firing Range: 3 km

Effective Firing Range: 1–1.5 km

Feed System: Type 730: One ammunition boxes, holding 640 rounds

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

↳*Ammunition Gun Weapon System #2*

Type: Rifle

Caliber: 30mm

Notes:

Jiangdao Type-056 Frigate/Corvette (FFL) Reputed as the new-generation “maritime cavalry”, the 056 frigate is rapidly augmenting the PLA Navy’s littoral warfare capabilities, especially in the South China Sea and East China Sea. This new class of small combatant augment the 60 HOUBEI-class wave-piercing catamaran missile patrol boats (PTG) (Type 022). The frigate was deployed primarily for patrol and escort missions as well as anti-submarine operations and sea combat tasks, independent or in coordination with other forces. Its primary duty is to patrol sea areas. The South China Sea has relatively high requirements for single patrol boats because it is far from the coast and is often choppy. Patrolling is a daily labor-intensive task, and requires a large number of soldiers. Therefore, patrol boats should be deployed in a large scale and cost less than warships. Unlike fighting, patrolling does not need too many weapons. Overall, ships designed for patrolling should have good seakeeping ability and be relatively cheap. The Type-056 frigate aimed at changing the situation of China's active-service base-defense system featuring aging military strength, single function and low combat power. The new-generation base-defense military strength commissioned in large quantities was another important platform for optimizing the equipment structure of the PLA Navy, improving the base-defense combat power as well as enhancing the PLA Navy's capability of safeguarding China's national security and territorial integrity, and defending China's maritime sovereignty and maritime rights and interests. The construction of the 056 frigate has come to an end in late 2019 and the upgrading of the domestic offshore combat system has been completed. Type 056 frigate is a type 1 light frigate developed by the Chinese Navy in the new century. According to overseas sources, it has a length of 89 meters, a width of 12 meters, a full-load displacement of 1,300 tons, diesel power, dual-axis propulsion, a maximum speed of 28 knots, and a cruising range of 3,500 nautical miles. The type 056 frigate weapon and the onboard electronic system are relatively simple. The weapon includes two double-mounted YJ-83 anti-ship missile launchers, one 8-unit red flag 10 ship-to-air missile launcher, and the main gun is a 76 mm gun. , 2 30mm single-tube remote-control naval guns, and anti-submarine weapons are two 2-unit antisubmarine torpedo launchers. Shipborne electronic systems include air / sea search radars, optoelectronic fire control systems, electronic warfare systems, and shipborne combat systems. The bow has a helicopter take-off and landing deck, which can take off and land straight -9 anti-submarine helicopters, but there is no hangar, which limits its helicopter operation capabilities. The Type 056 frigate weapon is relatively simple and mainly performs offshore patrol tasks. The PLA Navy had to build large warships if it is to go to the high sea, but large warship will be a waste of resources if it’s only used for “yard-protecing”. The PLA Navy needed vessels that are suitable for carrying out fishing protection, patrol and guarding tasks at the “house gate”, so that it can free the large combat ships from the trivial everyday maritime services and consequently ensure the combat capacity of main high-sea-going taskforces. With complete functions, the 056 guided missile frigate is capable of air defense, anti-submarine warfare, assault, and garrisoning. Such high cost effectiveness better caters to the rapidly increasing equipment manufacturing of the PLA Navy. The PLA Navy’s inshore combat tasks mainly consist of daily patrol, guarding, fishing protection, and other low-intensity and low-risk tasks. It provides the basic maritime force support for the civilian and law enforcement forces of oceanic administration and fishing affair bureau in coping with the provocations by military vessels of enemy states. Light surface vessels have to be used in the early stage of islands disputes. The flexible body and comprehensive combat capability of the 056 guided missile frigate decide that it is of best use on islands and the surrounding waters, where it can deal with all kinds of maritime crisis flexibly and make the mobilization and deployment of large vessels more effective. Designed not solely for islands disputes but for more extensive purposes such as maritime target assaulting, air defense and anti-submarine, the 056 guide missile frigate is a light maritime striking weapon platform with the highest performance-price ratio and the widest applications. It can be manufactured by a number of coastal and inland shipyards on a large scale and in large quantities and supplied to the PLA Navy incessantly. Light guide missile frigate can serve as steady support for PLA Navy’s high-sea-going maneuver combat and help free the inshore fast attack forces from everyday coast defense tasks, so as to establish a new-type inshore defensive combat system. China has an 18,000km-long coastline to guard. The new-type frigate is able to engage in low-intensity conflicts and carry out patrol, escort and fishing protection tasks in key waters. It makes the military force structure more reasonable, shows greater flexibility in carrying out combat tasks, and will soon become the main combat equipment for base defense. Moreover, the large-scale commissioning of the new-type frigate was expected to exert considerable effects on the PLAN’s combat thinking, methods of operation, training, management and application, talent cultivation and battlefield construction. The long coastline needs to be patrolled, the disputes over several islands need to be solved, and the maritime transportation routes need to be protected. Guided missile frigate is the most economic choice if those issues need to be solved by force. According to a ranking by the British website Naval Technology, the Type-056 is one of the world's 10 best modern corvettes along with Sweden's Visby class and Germany's K130 Braunschweig class. Cao Weidong, a researcher at the PLA Naval Military Studies Research Institute, said despite the Type-056 class being smaller compared with frigates, it will be as powerful as frigates in battles in coastal waters thanks to its stealth design and strong firepower. Because the ship's weapons and electronic systems are relatively simple, many international sources classify it as "corvettes" (light frigates) rather than "frigates". In fact, the Chinese Navy's original intention to develop the Type 056 frigate was also to replace the Type 037 hunting submarine, performing offshore patrol, escort, search and rescue tasks. For quite a long time, the Type 037 submarine hunting submarine has been the main battleship of the Chinese Navy's offshore defense, and has built more than 100 ships. However, the type 037 submarine hunting ship has a small tonnage and poor long-range combat capabilities, making it difficult to perform combat missions in far-off sea areas. After the 1990s, the Chinese Navy built several 053H frigates to perform such tasks, but the 053H frigate tactical and technical indicators had fallen behind. It is difficult to meet the needs of the battlefield in the new century. In this case, the 056 frigate appeared. The first 056 frigate was started in 2011, launched in 2012, and delivered to the Navy in 2013. From a practical point of view, compared with the 037 frigate, the 056 frigate had a larger tonnage, more internal space, and can carry more supplies and materials, which is conducive to long-duty maritime operations. The crew's long-distance sea mission execution environment has been improved and efficiency has been improved. The ship was loved by the troops and

became an ideal replacement for the 037 hunting submarine. Since then, the Type 056 frigate has entered a period of high-speed construction. It is reported that within about 9 years from 2011 to 2019, about 70 Type 056 frigates were built. On average, about 8 ships per year, and this speed can be said to be very amazing. Along with rapid construction, the Type 056 frigate also developed a series of improved and modified ships. For example, in use, the army found that the 30mm single-barrel remote-control naval gun was not very useful and the price was relatively expensive. Large-caliber machine guns can be used for patrol tasks. Therefore, the latest batch of 14.5-mm naval machine guns was used instead. Considering that there are many advanced AIP submarines in the first island chain, the anti-submarine type was developed for this type 056. It is the first domestic surface ship equipped with active / passive towed line sonars, improving the ship's ability to resist modern quiet submarines. In order to cooperate with the advanced underwater acoustic system, the 056 anti-submarine type has been replaced with a new type of anti-submarine missile. The new missile uses a turbojet engine with a longer range and stronger attack capabilities. Sonar, better detection performance. The 056 anti-submarine service effectively improved the Chinese Navy's offshore anti-submarine combat capabilities. Exports The Type 056 1,440-ton class corvette is available for the export market with Bangladesh having ordered at least two ships and the Nigerian Navy ordering the P18N offshore patrol vessel with a full load displacement of 1,800 tons. In October 2012, the first ship P18N in Wuhan shipyard started. In 2013, Bangladesh and China signed a purchase for a group of vessels contract, believed to consist of two frigates, two patrol boats and six large patrol boats. Type C13B [B for Bangladesh] is one of two light frigates ordered by the Bangladesh Navy in 2013. The ship was improved on the basis of Type 056. It replaced the weapon and radar system different from the domestic version and cancelled the anti-submarine capability. The most advanced frigate in the media, once known as China's export, its shape has been fully integrated with the overall trend of international light frigates. Although there is no such new trend as the chasing wind, the high cost performance has won the praise of the Bangladesh Navy. Two more ships have been added. The Thai Navy's Pattani-class OPV bears a resemblance to the subsequent Chinese Type 056 corvette / light frigate, though the later is up-gunned relative to the the Thai OPV, with four YJ-3/C803 ASM and a FL-3000N RAM launcher aft, while the former has a much taller superstructure. Built for the Royal Thai Navy by the China State Shipbuilding Corporation, each OPV cost about US$50 million. The vessels were commissioned in 2006-2007. In November 2014 China completed sea trials of a offshore patrol ship on order for the Nigerian Navy that will assist in suppressing the growing threat of piracy off West African shores. The vessel was the first of two acquired by the Nigerian Navy to bolster its maritime surveillance, patrolling, search-and-rescue and to counter piracy. The patrol ship was launched by state-owned shipbuilder China Shipbuilding & Offshore International Co (CSOC) in January 2014, and was taken for sea trials by affiliated shipyard Wuchang Shipbuilding Industry. The second patrol ship was built by CSOC in China but would be outfitted at the naval shipyard in Port Harcourt, Nigeria, in a technology transfer arrangement. According to specifications provided by CSOC, the ship has a full load displacement of 1,800 tonnes and can go 21 knots. The vessel can accommodate 75 crew, has 20 days endurance, and a standard range of 3,000 nautical miles. A computer-generated image issued by the Nigerian Navy suggested that the ship will have a helicopter hangar and landing deck. The weapons fit comprises a single 76mm NG-16-1 gun with a TR47 fire-control radar, as well as pairs of 30mm and 20mm guns. Nigerian Chief of Naval Staff Vice Admiral Dele Ezeobam told reporters in January 2014 that the F 91 would be handed over mid-2014. The Nigerian Navy is standing up to a host of challenges it faces in the Gulf of Guinea. Prior to 2009 before it commissioned the Sea Eagle-class patrol boats, the navy struggled to counter the often heavily armed pirates of West Africa. The two patrol ships is the latest in a string of measures to wrest back control of its seas from criminal groups.

Type 037 Class (Hainan Class) Chinese Corvette

Tiers:

1 2 3 4

Variants:

Notes:

The Type 037 corvette is a series 400–500 ton corvette type classes in service with the People's Liberation Army Navy. Unlike western navies, the People's Liberation Army Navy does not have dedicated patrol boats in its inventory. Instead, a large variety of corvette type classes, in the form of missile boats and submarine chasers fulfill the tasks of patrolling China's territorial waters. The Egyptian Navy operates eight vessels. The Type 037 submarine chaser (NATO reporting name: Hainan class), is a class of submarine chaser of the People's Liberation Army Navy. It was designed by China to replace the Soviet S.O.-1 class submarine chaser. In addition to anti-submarine warfare missions, these simple yet effective units are also capable of a wide variety of missions such as mine laying and patrol. These boats were first equipped with Soviet Tamir-11 (MG-11, NATO reporting name: Stag Hoof) hull-mounted sonars which had a typical range of 3 km (1.9 mi), but in the 1970s, they were superseded by domestic Chinese SJD-3 sonar, which is modification of original MG-11: instead of being fixed to the hull, SJD-3 has a telescoping arm, so when not in use, the sonar is stored in the hull, and when deployed, the sonar is lowered into water several meter below the hull, thus increased detection range by avoiding baffles generated by the hull. During the Sino-South Vietnamese naval clashes on 19 January 1974, two boats of this class, # 281 & # 282 (two out of the eight total in Chinese inventory) participated in the latter half of the battle, the fastest Chinese units in the conflict. Originally the units were waiting at Yongxing Island, but due to the problem of communications, they were not notified until the battle was already in progress. Over 100 were built, but as newer submarine chasers enter service, this class is steadily being decommissioned. A number of these ships have subsequently been exported to Bangladesh, Egypt, North Korea, Pakistan and Myanmar. On October 13, 2013, A North Korean Type 037 was lost off Wonsan with the loss of at least nineteen of her crew. She may have been in collision with another Korean People's Navy ship. It is understood that four Type 037 submarine chasers were modified and became known as the Type 037 Mod (NATO: Haijiu class).

Missile Weapon System

↳ ***System***

Name: 9K38 Igla (SA-16 Gimlet) Missile

Type: Surface-to-Air Missile

Quantity: 2 x quad SA-N-8 Gremlin** SAM launchers

Missile Basic Load: 16

Length: 1.67 m

Diameter: 72 mm

Weight: 10.80 kg

Warhead Weight: 1.27 kg

Engine: Two-stage, solid-propellant rocket

Maximum Range: 5,000 m

Minimum Range: 500 m

Speed: 1,870 fps (570 mps, Mach 1.7) at sea level

Maximum Altitude: (3,500 m

Minimum Altitude: 10m

Seeker: Infrared w/40-deg field of view; single channel, 3.5-5 micron

Fuze: contact and graze

Gun Weapon Systems

↳*System*

Name: AK-230

Type: Close-In Weapons System (CIWS)

Caliber: 30mm

Quantity: 2 x 30-mm/54-cal AK-230 Gatling CIWS

Length: 2.140 m

Weight: 156 kg

Elevation: -12 to +87 degrees at 50 degree/s

Traverse: +180 to -180 degrees at 35 degree/s

Rate of Firing: over 1,000 rounds per minute cyclic

Muzzle Velocity: 1,050 m/s

Note: The weapon consists of two stabilized NN-30 30 mm water-cooled four chamber revolver cannons, which are mounted inside a riveted steel turret. The gun mechanism is gas operated. The guns each weigh 155 kg and have barrels 1930 mm long, and a total length of 2670 mm. The barrels are rifled with 12 grooves. The guns each have a rate of fire of 1,000 round per minute;they are fed by independent 500-round belts of ammunition. The rounds are electrically fired; propellent gases are used to eject the spent shells and belt links into a space between the magazine and the hull. Ballistic maximum range for the weapon is about 6.7 km, but realistic ranges for engaging air targets are quoted as between 2.5 and 4 km. The weapon is remote-directed, typically by a fire-control system linked to either a Drum Tilt or Muff Cobb radar systems.

↳*Ammunition*

Type: Rifle

Caliber: mm30

Basic Load: INA

Note: The AK-230 fires specially developed 30x210B 30 mm ammunition that is electrically primed. Two rounds were developed: a high-explosive round with an impact fuze, and an armour-piercing round. The Chinese Type 69 fires only a locally produced version of the high-explosive round. Ammunition is also produced in Romania and Serbia.

Electronic Warfare: various intercept arrays

Decoys: INA

NBC Protection: Yes

Notes:

The Viktor Leonov returned to international waters off the east coast of the United States after a short stop in Cuba to refuel and resupply. The 15 March 2017 report explained the ship was spotted 23 miles southeast of a US Navy submarine base in Kings Bay in the US state of Georgia. The base is home to US Navy's Atlantic fleet of ballistic missile submarines, according to the report. As first reported by Fox News, the Russian ship SSV-175 Viktor Leonov was spotted 15 February 2017 in international waters 30 miles south of Groton, Connecticut — home to a US naval submarine base. According to the TV channel, the ship was found 70 miles off the coast of Delaware in international waters. "This is the first patrol since Donald Trump entered the office" - said the TV channel. Lt. Col. Valerie Henderson, a Defense Department spokeswoman, stated "It has not entered U.S. territorial waters. We respect freedom of navigation exercised by all nations beyond the territorial sea of a coastal State consistent with international law." US Senator Richard Blumenthal, D. Conn., a member of the Senate Armed Services Committee, told the Albany TImes Union "the presence of this spy ship has to be regarded very seriously because Russia is an increasingly aggressive adversary. It reflects a clear need to harden our defenses against electronic surveillance and cyber espionage." "The return of a Russian vessel is particularly concerning in the context of escalating Russian aggression - within days of the Russians buzzing a U.S. Navy ship in the Black Sea, as well as deploying a cruise missile in violation of our arms control treaty - which only underscores the need for an independent investigation into possible collusion between the Trump administration and Russian agents." Vishnya class SSV [Sudno Svyazyy = Communications Vessel] electronic surveillance ships are Project 864 Meridian reconnaissance ship, with a displacement of 3,470 tonnes and 94.4 meters long. Its cruising endurance is 7,000 nautical miles. Its crew consists of 146-220 people. The first two vessels belong to the Northern Fleet, the third - to the Black Sea, the fourth and fifth - to the Pacific, sixth and seventh - to the Baltic. The Russian Navy operates seven Meridian-class vessels to be replaced by the Project 18280 intelligence ship by 2020. The Vishnya class are a group of intelligence collection ships built for the Soviet Navy in the 1980s. The ships continue in service with the Russian Navy. These ships are large, purpose built ships designed for SIGINT and COMINT electronic intelligence via an extensive array of sensors. The data could be transmitted to shore via satellite link antennaes. The Project 864 are equipped with two satellite communications antennae inside radomes. The ships are armed with two AK-630 close-in weapon systems and SA-N-8 SAM launchers. The propulsion system consists of two diesel engines developing 4,400-bhp and a top speed of 16 knots. In the early 80s there were technologies that enable using special sonar to detect submarines at ultra-large distances. This led to the creation of new exploration ships, which were the name of the ship underwater situation (GRO). "Vasily Tatishchev" - one of them. Total armed Navy of the Russian Federation is the seven ships of the project 864 - "Tavria", "Victor Leonov," "Sea of Azov", "Kuril Islands", "Karelia", "Vasily Tatishchev," "Admiral Fyodor Golovin." All of them were built in Polish shipyards in Gdansk in the period from 1985 to 1990. During operation some ships of this class have visited on several fleets of the Russian Federation to undergo repairs and upgrades. The main highlight of the ships of the "Meridian" is a decoding apparatus that can intercept and listen to military communications between ships and aircraft. In addition, the board SRZK "Vasily Tatishchev" set of radio stations and radio intelligence, sonar systems, and apparatus for removing the telemetry data and trajectory of the observations. The Ministry of Defence at the end of 2014 came to revive from the reserve the medium intelligence ship "Karelia". Project documentation on modernization work was to be prepared by the summer of 2015. Currently, CER-535 "Karelia" was at the "Dalzavod" yard. According to the protocol, "51 TSKTIS" after the installation of new equipment, such as radar equipment, it will be calculated the ship's stability. Medium reconnaissance ship of the 2nd rank "Karelia" was built in Gdansk (Poland) under the project 864 "Meridian". Launched in 1987, it went into operation in 1988, and had served in the Pacific Fleet. A Russian intelligence-gathering ship accompanied by a tugboat roamed the waters off the East Coast and the Gulf of Mexico in April 2014. The Russian vessels Viktor Leonov and Nikolay Chiker have been operating beyond American territorial seas near the coast of Cuba. 'We respect the freedom of all nations, as reflected in international law, to operate military vessels beyond the territorial seas of other nations,' Pentagon spokesman Lt. Col. Tom Crosson stated. The Viktor Leonov CCB-175 was first sighted in Cuba back in February 2014, when it docked in Havana. At the time, neither Cuba nor Russia acknowledged or explained the presence of the spy ship in Havana. Pentagon officials believed the ships were part of an operation since March collecting against the US nuclear missile submarine base at Kings Bay, GA and other US military facilities. The Baltic fleet's reconnaissance ship Vasily Tatishchev left Baltiysk for the eastern part of the Mediterranean, a military source told Interfax-AVN on 05 October 2015. "The Vasily Tatishchev has left for the coast of Syria, where it will join and reinforce the Russian naval group in the eastern part of the Mediterranean. The ship will be fulfilling its mission. Its crew will monitor the situation on the airwaves both in Syria and all neighboring countries, and also over their territorial waters," the source said. The source said this approach is considered routine for Baltic fleet reconnaissance ships. "They once successfully monitored the war in Yugoslavia," the source said. The Baltic fleet press service declined to comment on the issue. In February 2016 the Ministry of Defence announced that the Russian military strengthened all kinds of intelligence in the Middle East to better defeat the terrorists. One of the elements of national technical intelligence of the Armed Forces are special reconnaissance ships of the Russian Navy. One such ship STS-201 "Sea of Azov" started getting ready for combat duty in the Mediterranean Sea. At the end of January 2016 made a reconnaissance control access to the sea. The Medium Intelligence Ship "Sea of Azov" was built in Poland, Gdansk at CVD im.Bohaterev Vesterplyati" (factory #864 / 4). The ship was laid down 08.04.1986 city, launched on 30.09.1986, entered into operation 12.06.1987 was entered into the Black Sea Fleet. Board

number - "STS-201". In 2001, the ship was named the best Russian Navy ships in the class. In 2005 the ship was "excellent" fulfill the task of three long voyage to the Mediterranean Sea, as well as was again declared the best vehicle in its class in the Navy, with the award of the prize rolling Navy. In 2006-2007. the ship's radio equipment was modernized. It is part of the 519th separate division of scout ships of the Black Sea Fleet, based at South Bay (Sevastopol).

Yantar Class Russian Intelligence Collection Ship

Tiers:

Variants:

- **Almaz:** Under Construction as of February 2020.

System

Alternative Designation: Yantar Class; Project 22010 Class
Total Built: 1 built, 1 under construction
Type: Intelligence Collection Ship
Builder: Yantar Shipyard
In Service: 2015-Present
Crew: 60

Dimensions

Length: 107.8 m
Beam: 17.2 m
Draft: INA
Displacement, Full Load: 5,736 tons

Propulsion System

Engine Name: INA
Engine Type: 2 × Electric Motors
Engine Power: 3400 hp each

Main Generators: 4 × 1600 kW diesel generators

Auxiliary Generators: 2 × 1080 kW diesel generators

Propellers: 2 azipods with fixed pitch propellers

Bow Thrusters: 2

Maximum Range: 8,000 nmi (15,000 km; 9,200 mi)

Maximum Speed: 15 kn (28 km/h; 17 mph)

Endurance: 60 days

Communications

Note: There is no unclassified information available about the Communication Systems onboard the Yantar Class Vessels.

Main Weapon System

Note: There is no unclassified information available about the Weapon Systems onboard the Yantar Class Vessels.

Onboard Aviation Facilities

Facilities: 1 x Helipad

Helicopters: 1 x Heliopter (Name: INA)

Boats and Landing Craft Carried

Autonomous Underwater Vehicles (AUV): 2 x deep-diving autonomous underwater vehicles

AUV #1: 1 Rus-class (Project 16810)

AUV#2: 1 Konsul-class (Project 16811)

Fire Control

Note: INA

Protection

Active Protection System: INA

Electronic Warfare: INA

Decoys: INA

NBC Protection: INA

Notes:

Yantar (Янтарь) is a special purpose intelligence collection ship built for the Russian Navy. The ship has been operated by the Russian Navy's Main Directorate of Underwater Research (GUGI) since 2015 and is reportedly a spy ship. The vessel's home port is Severomorsk, where it is attached to the Northern Fleet. A sister Project 22010-class ship "Almaz" is also under construction. Yantar was designed by the CMDB Almaz Design Bureau in St. Petersburg, and the hull was laid down on 8 July 2010. It was launched in December 2012, and concluded its sea trials in May 2015. The ship has a length of 108 metres (354 ft) and a full displacement of 5,736 tons. It uses diesel-electric propulsion for a top speed of approximately 15 knots (28 km/h; 17 mph). It officially has a complement of 60. The ship was built at the Yantar Shipyard in Kaliningrad. Yantar can act as a mothership to mini-subs. The United States Navy has stated that the submersibles are able to sever cables miles beneath the ocean's surface. The submersibles are reportedly capable of operating at depths of up to 6,000 metres (20,000 ft). The submersibles are reportedly the project 16810 Rus-class submersible and the project 16811 Konsul-class submersible. According to Alexei Burilichev, head of the Russian Defense Ministry's deepwater research department, Yantar is an oceanic

research complex. Yantar has been reported in position near undersea telecommunications cables. In 2015, Yantar was spotted off the coast of Guantánamo Bay, Cuba. Summer 2016, Yantar was anchored outside the Nuuk, Greenland. In 2017, Yantar was active in the eastern Mediterranean, near an undersea cable linking Israel to Cyprus. It was also reportedly used to recover "secret equipment" from crashed Su-33 and MiG-29 aircraft. On 23 November 2017, upon an order of Russian President Vladimir Putin, Yantar and the specialists of the Russian Navy's 328th expedition search and rescue unit were sent to Argentina's coast to search for the Argentine submarine ARA San Juan that went missing on 15 November 2017. In Summer 2018, she was deployed to Mediterranean off the Syrian coast. In November 2019, Yantar visited Trinidad and Tobago.

Oste Class (Type 423 Class) German Intelligence Collection Ship

Tiers:

1 2 **3** 4

Variants:

- **Oste (A52):** Commissioned: 1988 Status: Active
- **Oker (A53):** Commissioned: 1988 Status: Active
- **Alster (A50):** Commissioned: 1989 Status: Active

System

Alternative Designation: Oste Class; Type 423 Class

Total Built: 3 ships in total built

Type: Intelligence Collection Ship

Builder: Flensburger Schiffbau-Gesellschaft, Flensburg

In Service: 1988-Present

Crew: 42 + 38 technicians

Note: All ships are currently based in Eckernförde and belong to the 1st Ubootgeschwader (1st Submarine Squadron) stationed in Eckernförde.

Dimensions

Length: 83.5 m

Beam: 14.6 m

Draft: 4.2 m

Displacement, Standard: 2,375 tons

Displacement, Full Load: 3,251 tons

Propulsion System

Main Engine Name: 2 x Deutz-MWM BV 16M 628 diesels;

Main Engine Power: 8,800 total bhp

Auxiliary Engine Name: 2 x 380-shp electric motors for low speed, quiet operations

Generators: 2 x MWM-KHD 604 V12 diesel generator sets

Maximum Range: 5,000 nm at 18 kts

Maximum Speed: 20 knots

Endurance: INA

Propellers: 2 fixed-pitch 6-bladed propellers

Communications

Note: Classified Information.

Missile Weapon System

Launcher: 2 x Stinger AAM launchers

↳*System*

Name: FIM-92 Stinger

Type: lightweight, short-range, heat-seeking, surface-to-air missile (SAM)

Quantity: 2 x Stinger AAM launchers

Missile Basic Load: INA

Length: 1.52 m

Diameter: 70 mm

Weight: 10.0 kg

Warhead Weight: 3.0 kg

Warhead Type: Penetrating high-explosive; impact fuze

Engine: 1 x Atlantic Research Mk 27 dual-thrust solid-fuel rocket

Speed: 2,445 ft/sec (745 m/sec; Mach 2.2)

Maximum range: 4.8 km

Maximum Altitude: 3,800 m

Guidance System: all-aspect passive infrared homing

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: Mauser BK-27

Type: Revolver Cannon

Caliber: 27mm

Manufacturer: Mauser (now Rheinmetall)

In Service: 1977-Present

Proliferation: +3,100 built

Length: 2.31 m

Barrel Length: 27×145 mm

Weight: 100 kg

Barrels: Single barrel

Action: Revolver

Rate of Fire: 1,000–1,700 rpm

Muzzle Velocity: 1,100 m/s

↳*Ammunition Gun Weapon System #1*

Type: Rifle

Caliber: mm27

Shell: 27×145 mm

Basic Load: 4,000 Rounds

↳*Gun Weapon System #2*

Name: M2 Browning

Type: Heavy Machine Gun

Caliber: 12.7mm

Quantity: 2 x 12.7mm M2 Browning Heavy Machine Guns

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min

Muzzle Velocity: (890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

↳*Ammunition Gun Weapon System #2*

Type: Rifle

Caliber: 12.7mm

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 2,000 Rounds each

Fire Control

Note: Sea Weapon Systems.

Radar Systems

Surface Search Radar: 1 x Surface Search (Name: INA)

Ranging and Tracking Radar: 1 x Ranging and Tracking (Name: INA)

Navigation Radar: 1 x Navigation Radar (Name: INA)

Sonar Systems

Passive Array Sonar: 1 x STN Atlas Elektronik AISYS passive array

Protection

Active Protection System: INA

Electronic Warfare: 1 x 300 MHz-40 Ghz intercept suite

Decoys: INA

Countermeasures: 1 x EADS COLDS laser countermeasures system

NBC Protection: Yes

Notes:

The Oste class intelligence collection ships are officially designated as fleet service ships. This class is also referred as the Type 423. Three ships of the class were built and are currently in service with the German Navy. These are Oste, Oker and Alster. The lead ship was commissioned in 1988. They replaced the precious Type 422 class. Vessels received the same name and pennant numbers as the three Type 422 class ships they replaced. Currently all Oste class ships are assigned to the 1st submarine squadron. The Oste class are purpose-built reconnaissance and intelligence collection ships. Primary function of these vessels is strategic intelligence gathering. These were originally intended to gather data on the Soviet warships. Vessels are fitted with a wide array of electromagnetic, hydroacoustic and electro-optic sensors. Ships of this class can be also used as advanced warning units. These electronic surveillance ships carry no armament. Crew of the ship includes 36 sailors and up to 40 intelligence technicians. Accommodation for the crew was designed to civil standard, so the Oste class ships offer more comfort for the crew than other German warships. Ships are powered by two Humboldt-Deutz diesel engines, developing 4 400 hp each and delivering power to two shafts. Vessels have a range of 5 000 nautical miles (more than 9 000 km).

Yuri Ivanov Class (Project 18280 Class) Russian SIGINT Intelligence Collection Ship

Tiers:

Variants:

- **Yuriy Ivanov:** Commissioned: 2015 Fleet: Northern Fleet
- **Ivan Khurs:** Commissioned: 2018 Fleet: Black Sea Fleet
- **Note:** Two Additional Vessels are scheduled to be built.

System

Alternative Designation: Yury Ivanov Class; Project 18280 Class

Total Built: 2 built, 2 more are scheduled to be built as of 2020.

Type: SIGINT Intelligence Collection Ship.

Builder: Severnaya Verf, Sankt Petersburg

In Service: 2015-Present

Crew: 120

Note: The YURI IVANOV is reportedly equipped with equipment specifically designed to track U.S. missile defense systems. It is also said to be able to serve as a communications hub; electronic warfare platform; and conduct electronic and signals intelligence missions.

Dimensions

Length: 95.0 m

Beam: 16.0 m

Draft: 6.0 m

Displacement, Standard: 2,500 tons

Displacement, Full Load: 4,000 tons

Propulsion System

Engine Name: 2 x 5DRA Diesels
Engine Type: Diesel
Engine Power: 5,440 hp total
Shafts: 2
Endurance: INA
Maximum Range: 8,000 mi (13,000 km)
Maximum Speed: 16 kn

Gun Weapon System

↳*System*

Name: AK-630
Type: Close-In Weapon System
Caliber: 30mm
Quantity: 1 x 6-barrel 30-mm/65-cal AK-630M Gatling CIWS
Main Armament: 1 or 2 AO-18 autocannons
Secondary Armament: 4 x 9A4172 missiles (Vikhr-K upgrade)
Missile Basic Load: 4 x 9A4172 missiles
Barrel Length: 1,629 mm (64 in) (total) 1,460 mm (57 in) (rifled)
Width: 1,240 mm
Height: 1,070 mm (42 in) (above deck) 2,050 mm (81 in) (below deck)
Weight: Gun mount: 1,000 kg (2,200 lb) (AK-630) 1,800 kg (4,000 lb) (AK-630M) 2,500 kg (5,500 lb) (AK-630M-2) External nodes: 800 kg (1,800 lb) (AK-630) 2000 rounds in belt: 1,918 kg (4,228 lb)
Crew: 1
Barrels: 6
Action: Gas-operated rotary cannon
Elevation: +88° ... -12° (50°/sec)
Traverse: ±180° (70°/sec)
Rate of Fire: 4,000–5,000 rounds/min
Muzzle Velocity: 880–900 m/s
Maximum Firing Range: the projectiles self-destruct past 5,000 m (16,000 ft) range
Effective Firing Range: 4,000 m (13,000 ft) (aerial) 5,000 m (16,000 ft) (maritime
Feed System: Belt: 2,000 rounds (additional 1,000 rounds in reserve feed bin
Sights: Radar / TV-optical

↳*Ammunition*

Type: Rifle

Notes:

The first Project-18280 large reconnaissance ship Yury Ivanov has been signed over to the Russian Navy, spokesman for the St. Petersburg-based Severnaya Verf shipyard told TASS on 14 January 2015. “The vessel has already been signed over to the Navy - the acceptance act was signed at the end of last year,” the shipyard source said. The communication ship (medium reconnaissance ship, 2nd rank) of Project 18280 is the largest Russian vessel of this class. As of 2015, the Yury Ivanov was the Russian Navy's largest intelligence collection ship. Project 18280 vessels feature high versatility, automation and integration of onboard systems. A ship of the series has a displacement of about 4,000 tons, 312 feet (95 meters) long and 53 feet (16 meters) wide; with draft of 4 meters. Project 18280 has a range of 8,000 nautical miles on 16 knots cruise speed and a crew of 120. “The vessel is designed to provide communication and control of fleet forces, conduct electronic warfare, radio and electronic intelligence, tagging of surveillance components of the US missile defense system and naval SAM components,” Anatoly Shlemov, the head of the Defense Procurement and Acquisition department of the United Shipbuilding Corporation (USC), told RIA Novosti on 02 July 2015. The ships are designed to provide communications and fleet management, the SIGINT and electronic warfare. Reconnaissance ships get a large set of different equipment dedicated to the implementation of electronic intelligence. Reconnaissance complex ships are able to keep track of a large number of radio signals over a wide frequency range, and determine the location and type of their sources. Project 18280 vessels have vast pre-designed potential for further modernization of the onboard electronic equipment. In late 2015 Russia completed the transfer of its biggest intelligence-gathering ship from the Baltic to the Northern Fleet, where it will use its powerful instruments to collect secret information (including for breaking into the U.S. anti-missile system), the Northern Fleet’s press service head, Captain First Rank Vadim Serga, told journalists on 17 November 2015. The Yury Ivanov (Project 18280) had successfully passed all seaworthiness tests and was now permanently stationed beyond the Arctic Circle, at the naval base in Severomorsk. The ocean-going ship’s technical capabilities allow it to expand the scope of the Northern Fleet, not only in different areas of the world’s oceans, but also in the Arctic, according to the Ministry of Defense. This is evidenced by the permanent registration of the ship on the Kola Peninsula (in the Murmansk Region in Russia’s northwest). The intelligence collection ship is tasked with observing ballistic and cruise missile launches conducted by foreign states (including submarine launches). The Yury Ivanov is able to detect even hypersonic missiles and transmit this information to the military high command. The ship can also act as a relay for closed communication channels, and as a radio interceptor of sensitive enemy information. However, its most important function is to penetrate the U.S. missile defense system (its sea-based component, the Aegis Combat System), and provide the possibility for Russian missiles to reach the enemy target and destroy it. Given US. plans to station a missile defense system near Russia’s borders, it was planned to construct at least four ships of this type – according to the number of Russian fleets. The spy ships will join the Pacific, Baltic and Black Sea fleets. A second Project 18280 ship – the Ivan Khurs – had been already laid down at the Severniye Verfi shipyard in St. Petersburg. One vessel is being built for each of Russia’s four fleets. The lead ship of Project 1820 - Yury Ivanov (hull #787) - was laid down in late 2004 and launched in autumn 2013. The ship was commissioned with the Northern Fleet. The second vessel of the series - the Ivan Khurs ship - was laid down in November 2013 and was expected to be floated out in 2015. By July 2015 the construction of the intel-gathering ship Ivan

Khurs (Project 18280, hull #788) was nearing an end at the Northern Shipyard (Severnaya Verf) in St Petersburg. The ship's seagoing tests were expected take place in autumn 2016. The second intelligence ship Project 18280 "Ivan Khurs" was launched at the "Severnaya Verf" in St. Petersburg 16 May 2017. General Director of "Severnaya Verf" Igor Ponomarev gave the command to be launched vessel. When a ship in the submersible dock, hit the water, his board broke a bottle of champagne. Factory sea trials, "Ivan Hursa" were scheduled for September. Mooring trials will begin in late May. Until the end of this year, it should be handed over to the Navy. The second ship of the project 18280 "Ivan Khurs" was laid in autumn 2013. It was named in honor of Vice Admiral Ivan Hursa who has made an outstanding contribution to the creation and development of a permanent exploration of the Navy. State tests on the newest reconnaissance ship-vessel "Ivan Hurs" project 18280 completed 20 June 2018. The corresponding act was endorsed by Captain 1st Rank Vyacheslav Makhorin, who is the chairman of the State Acceptance Commission. As the press service of the St. Petersburg developer enterprise "Northern shipyard" reports, the ship is equipped with the most advanced electronic intelligence systems. The ship of this project will be the second in a row. The first - "Yuri Ivanov" - had been in service with the Russian Navy since 2014. It was noted that the reconnaissance ships of this project are designed to provide communication and fleet management. The reconnaissance ship was laid in November 2013, and launched in May of the past. Displacement of "Ivan Khursa" - 4 thousand tons, the range of navigation - 8 thousand nautical miles, the crew - 131 people. The reconnaissance ships of this series, in addition to the Northern Fleet, are planned to be included in the Pacific, Baltic and Black Sea fleets.

Dupuy De Lome Class French Intelligence Collection Ship

Tiers:

System

Alternative Designation: Dupuy de Lôme (A759)
Total Built: 1 Ship Built
Type: Intelligence Collection Ship
Builder: France
In Service: 2006-Present
Crew: 30 total (8 off. + 22 enl.) + 80 technicians

Dimensions

Interceptor #3: 1 x Egide Naval interceptor-goniometer transmissions

NBC Protection: Yes

Notes:

Dupuy de Lôme (A759), named after the 19th century engineer Henri Dupuy de Lôme, is a ship designed for the collection of signals and communications beyond enemy lines, which entered the service of the French Navy in April 2006. In contrast to Bougainville, the ship that she replaced, Dupuy de Lôme was specifically designed for sea intelligence, pursuant to the MINREM project (Moyen Interarmées Naval de Recherche ElectroMagnétique, "Joint Naval Resources for Electromagnetic Research"). Dupuy de Lôme was designed and built by Royal Niestern Sander shipyards in Delfzijl, The Netherlands with yard number 816. The Thales Naval France designed the electromagnetic intellegence part of the vessel. She provides a 350-day-operational availability a year, out of which 240 can be spent at sea. The ship is operated by two naval crews, each composed of thirty-three sailors and another thirty-three technicians, and an optional complement of up to thirty-eight specialists, depending on the mission. The specialised personnel operates under the Direction du renseignement militaire. On 21 June 2015, Dupuy de Lôme entered the Black Sea along with USS Laboon as part of NATO's presence missions following the Annexation of Crimea by the Russian Federation.

Notes:

China has commissioned its newest and largest naval supply ship as the country tries to beef up its capacity to protect its maritime interests. The Type 901 replenishment vessel – which helps supply naval ships with oil, ammunition, food and water – was seen at a port in Zhanjiang, Guangdong province on 31 July 2017 bearing the number 965, indicating it has been commissioned into the PLA Navy. The new supply ship has almost double the displacement tonnage of the Type 903 supply ships currently being used for escort and anti-piracy missions off Somalia. China’s ambitious program to build more capable ocean-going fleet replenishment vessels is too often overlooked. In recent years, new units of the Type-903 (plus the improved 903A variant) replenishment vessels have entered service. An even more capable successor, touted the Type-901, which is said to displace some 40-45,000 tons (just slightly smaller than the new carrier itself), was at an advanced stage of construction. The class designator for the ship appeared to be Type 901. Details were initially limited, but the ship's estimated dimensions are a displacement of 40,000-45,000 tonnes and a beam of 31.5 m. Although photographs - shown on the cjdby.net website, for example - had only just emerged, the ship was at an advanced state of construction and a launch in early 2016 seemed probable. The photos showed the largely completed hull of the ship docked side-by-side with a similar-sized Type 903A, also known as the "Qiandaohu-class" replenishment ship, with a light displacement of 23,000 tonnes. The new ship appears to be a modified 903A with many different design features. China since 2008 began to develop large-scale comprehensive supply ship and rapid combat support ship. The new 40,000-ton comprehensive supply ship has been started in 2013 construction, and 50,000-ton fast combat support ship also started construction in 2014 to 2015. It is reported that China's new generation of large-scale comprehensive supply ship and fast combat support ship with a new power system, equipped with China's own development of a new generation of integrated supply system, will provide a comprehensive combat capability comparable with the US military. A new breakthrough of Chinese naval shipbuilding - the lead ship (name yet unknown putative number "956"??) was launched on 15 December 2015 and left the factory for sea trials on 19 December 2016. The PLA Navy large complex supply ship was built in Guangzhou shipyard of China Shipbuilding State Corporation (CSSC). The two-level ship can be used as a one-stop logistics center for aircraft carrier formation, capable of receiving, storing, delivering fuel, ammunition, dry goods and other supplies, with the ability to receive directly from the base and re-supply from the ship. It is said that the large-scale comprehensive supply ship will play the role of large-scale oil tanker and comprehensive supply vessel in our Navy. The rapid combat support ship is mainly for our aircraft carrier battle group service. In the next few years, with the new generation of large-scale comprehensive supply ship And fast combat support ships have been serving, China's offshore combat capability will see an unprecedented increase. The Chinese Navy has accepted the first in a class of fast, giant resupply ships that will refuel, resupply, and rearm its aircraft carriers and destroyers on the high seas. The Type 901 class was built at the Guangzhou Shipyard International (GSI) Longxue. Thirty-one-and-a-half meters wide and over 200 meters long, the first Type 901 class supply ship woulf have a full displacement of around 40,000-45,000 tons. That's a similar size to the US Navy's 49,000-ton Supply class replenishment ships, which can carry over 17,000 tons of jet and ship fuel, and 1950 tons of ammunition. The Type 901 is thought to have 4 gas turbine engines, which would give it a top speed of around 25 knots, enabling it to keep pace with Chinese aircraft carriers like the Liaoning. It will have up to five resupply gantries located midship, each of which can deploy palletized ammunition and supplies via cables, or fuel lines. This will allow the Type 901 to replenish multiple warships simultaneously while under sail, a key capability for modern navies. It will also be able to operate helicopters and drones from

its helipad and hangar. While not a combat ship, it is expected, like US Navy ships, to carry some weapons for self-defense, most likely 30mm auto-cannons used in an air defense, anti-missile role. The Type 901 will offer a great leap in capacity over the current 25,000-ton Type 903A Qiandaohu, of which the PLAN has eight. The Type 901's larger supply carrying capacity means that it can refuel and rearm Chinese warships, including destroyers and carriers, in combat operations far from the Chinese mainland. Also, its larger size gives the Type 901 a greater range than its predecessor, thus reducing the need for foreign facilities to refuel and replenish, both for the Type 901 and the warships it supports. While China's interest in building long-range carriers, destroyers and submarines and leasing foreign bases (like Djibouti) are getting a lot of attention, Beijing is also clearly at work solving the logistics challenges needed to make the PLAN a true global power. The new Type 901 replenishment ship began sea trials on 18 December 2016, according to Chinese media. The 45,000-tonne vessel, which was built at Guangzhou Shipyard International's Longxue shipyard on the Pearl River, was expected to provide logistics support to the PLAN's carrier force. Imagery of the ship's construction emerged in late 2015, before it was launched on 15 December 2015. The vessel is equipped with three gantries and a fourth high-point structure port side aft, configured with five hose rigs for liquid refuelling on the port side and four on the starboard side. The central gantry provides a transfer station for solids on each side. From official photos released 24 Mrch 2017 it can be seen that the second 901-type supply ship, which was reported in January 2017, had been hoisting. This led to speculation that it will be launched within six months. The 901-type high-speed supply ship is specialized in the aircraft carrier formation of the new supply ship, currently only the two countries have built similar ships.

Qiongsha-Class Chinese Cargo Ship

Tiers:

Variants:

- **Note:** Qiongsha class in PLAN service are designated by a combination of two Chinese characters followed by three-digit number. With the exception of the ambulance transport, the second Chinese character for all others is Yun (□), meaning transport in Chinese, because these ships are classified as cargo ship to transport solid cargo and freshwater.. The first Chinese character denotes which fleet the ship is service with, with South (Nan, □) for South Sea Fleet, because all units are in service with South Sea Fleet. However, the pennant numbers may have changed due to the change of Chinese naval ships naming convention.
- **Pennant # Nan-Yun 830:** Commissioned: 1980s Status: Active
- **Pennant # Nan-Yun 831:** Commissioned: 1980s Status: Active
- **Pennant # Nan-Yun 832:** Commissioned: 1980s Status: Active
- **Pennant # Nan-Yun 834:** Commissioned: 1980s Status: Active
- **Pennant # Nan-Yun 835:** Commissioned: 1980s Status: Active
- **Pennant # Nan-Kang 833:** Commissioned: 1980s Status: Active

System

Alternative Designation: Qiongsha-Class

Total Built: Built: 6 total

Type: Cargo Ship/Ambulance Transport

Builder: Guangzhou Shipyard International

In Service: 1980s-Present

Crew: INA

Cargo Capacity (Cargo Ship Version): Cargo capacity of the military version is identical to that of civilian version: 200 tons of solid cargo, 150 tons of freshwater.

Medical Capacity (Ambulance Ship Version): Two ships, Nan-Yun 832 and Nan-Yun 833 were converted, and this medical version is capable of handling up to 130 patient simultaneously. The passenger carrying capability no longer existed as a result of the conversion, but these ships retained the cargo carrying capacity of 350 tons. The armament is reduced by a half, from the original eight heavy machine guns to four.

Troopship (Troopship Ship Version): Some of the Qiongsha class cargo ship are converted to troopships, though the exact number remain unknown. These troopships still maintained the original cargo carrying capacity of 350 tons, but lack the emergency medical treatment capability because the clinical care facility on board the cargo version is deleted to make more rooms for additional troops, with the number of passengers carried is increased to 400.

Notes:

Qiongsha (□□)-class cargo ship is a class of Chinese ship developed by China for its People's Liberation Army Navy (PLAN). These ships are mainly used for supplying garrisons in South China Sea. There are three versions of this class, including cargo ship, ambulance transport, and troopship versions. The general designers of all versions of Qiongsha class were Mr. Pan Hui-Quan (□□□) and Mr. Huang Zhong-Fu (□□□). Cargo Ship Qiongsha class cargo ship in PLAN service is directly based on Qiongsha 1 cargo ship in civilian service, which performs the same supply missions. The difference between the military and civilian version besides the fact that the military version is armed with heavy machine guns is that in addition to cargo, the civilian version also carried 219 passengers in cabins divided into two classes. The military version does not have any classification of cabins, but instead, they also act as emergency medical ships. Its secondary assignment as emergency medical provider is resulted from experience of deployment of island garrisons: once a soldier became sick, he must be transported to mainland for treatment, but even when transported by the fastest speedboat, it would still take two days to reach Hainan. Qiongsha class cargo ship is equipped with medical facility for preliminary treatment en route to mainland and thus providing better treatment. The number of passengers that can be carried is decreased accordingly. Cargo capacity of the military version is identical to that of civilian version: 200 tons of solid cargo, 150 tons of freshwater. Of the six ships of this class, all of them were built as cargo ship version to begin with, and it was only later some of them were converted to different versions. Ambulance transport Experience of deployment of Qiongsha class cargo ship revealed that the medical service was not sufficient because in addition to island garrisons, there was also a great demand from local fishermen population. Rudimentary treatment does not meet the demand, and a more dedicated version to provide better medical treatment was needed. As a result, decision was made to convert two of the six cargo ships to medical ships. Two ships, Nan-Yun 832 and Nan-Yun 833 were converted, and this medical version is capable of handling up to 130 patient simultaneously. The passenger carrying capability no longer existed as a result of the conversion, but these ships retained the cargo carrying capacity of 350 tons. The armament is reduced by a half, from the original eight heavy machine guns to four.[2] However, deployment of these ships revealed the inherent problem resulted from the original design: the cargo ship design meant that the stability of the ship in harsh sea state in poor, and in severe bad weather, the ships would move violently and some medical operations such as surgeries could not be performed. Consequently, Nan-Yun 832 was converted back into cargo ship role and only one ship Nan-Kang (□□, meaning South Health in Chinese) is left in the service to play the role of medical provider. This is why the official Chinese classification of this version is ambulance transport, instead of hospital ship, because it cannot carry out some of the medical assignment due to limitations of weather. The experience gained from these ambulance transport, however, provided valuable lessons in the development of true hospital ship, Type 920 hospital ship. Troopship Some of the Qiongsha class cargo ship are converted to troopships, though the exact number remain unknown. These troopships still maintained the original cargo carrying capacity of 350 tons, but lack the emergency medical treatment capability because the clinical care facility on board the cargo version is deleted to make more rooms for additional troops, with the number of passengers carried is increased to 400.

Type 920 Class (Daishan Dao Class) Chinese Hospital Ship

Tiers:

System

Alternative Designation: Type 920 Class; Daishan Dao Class

Total Built: 1 built

Type: Hospital Ship

Builder: CSIC (Guangzhou Shipyard International Company Limited)

In Service: 2008-Present

Crew: China did not give out any statistics, but based on Western hospital ships, the Type 920 probably has a ship crew of about 200 and a medical crew of about 600.

Capacity: She has a capacity of 300 beds, 20 ICU beds, 8 operating theatres, and can perform 40 major surgeries a day, in addition to X-ray, ultrasound, CT, hypothermia, hemodialysis, traditional Chinese medicine, and dental facilities.

Dimensions

Length: 178 m

Beam: approximately 25 metres

Draft: INA

Displacement, Full Load: approximately 14,000 tons

Propulsion System

Engine Name: INA

Engine Type: Twin Diesel engines

Engine Power: INA

Maximum Range: INA

Maximum Speed: INA

Endurance: INA

Communications

Note: She is also equipped with a remote networking and communications system to allow teleconferencing with doctors and specialists on land.

Main Weapon System

Note: In accordance with the Geneva Conventions, Daishan Dao and her crew do not carry any offensive weapons, while the ship is painted white with red crosses to mark her as a hospital ship.

Onboard Aviation Facilities

Facilities: Helicopter Hanger

Helicopter: 1 x Z-8JH (27 passengers or 15 stretchers)

NBC Protection: Yes

Notes:

PLA's first new large Hospital Ship was launched in Guangzhou on 29 August 2007. In August 2008 the Type 920 Hospital ship was reported to have successfully conducted a sea trial. The PLA Navy lists this ship as "Type 920" hospital ship. The ship name is “Yushan Island”, and the number is 866. Because of the ship's function, the media reports use the term "Square Boat" and "Peace Ark" - Daishandao. This vessel was launched in the ship yard of CSIC (Guangzhou Shipyard International Company Limited), which is a subsidiary of CSSC (China State Shipbuilding Corporation). The Type 920 Hospital Ship has a transom stem, a bulbous bow, an extended deckhouse with a forward bridge. A helicopter landing deck is on the stern of the vessel. Six Large Red-crosses have been painted on the ship body. The ship is approximately 170 meters long and 25 meters in beam and about 20,000-23,000 tons displacement [other estimates place the displacement at only 14,000 tons, while Xinhua reports 10,000 tons]. China did not give out any statistics, but based on Western hospital ships, the Type 920 probably has a ship crew of about 200 and a medical crew of about 600. A hospital ship would not seem necessary equipment in an amphibious invasion to Taiwan, since the island is so close to the mainland. However, for operations in the more distant waters of the South China Sea, it would be essential. The simultaneous appearance of the large Type 920 Hospital Ship and the Type 071 Yuzhao class amphibious transport seem to mark the beginnings of a major buildup in China's ability to project power into the South China Sea. The primary mission of a U.S. Navy hospital ship is to provide rapid, flexible, and mobile acute medical care to support a Marine air/ground task force (MAGTF) deployed ashore, Army and Air Force units deployed ashore, and naval amphibious task forces and battle forces afloat. The Medical Treatment Facility provides a mobile, flexible and rapidly responsive afloat medical capability for acute medical and surgical care in support of amphibious task forces, Marine Corps, Army and Air Force elements, and forward deployed Navy elements of the fleet and fleet activities located in areas where hostilities may be imminent. As a secondary mission, they are capable of providing full hospital services for use of other government agencies involved in the support of relief and humanitarian operations worldwide. During World War II, in the final phases of the Pacific campaign, tactical doctrine for employment of Navy hospital vessels changed, allowing them to function as mobile, definitive-care combat hospitals in direct support of amphibious operations, rather than as transports only. Specially designed ships of the Haven (AH 12) class were built to support this concept. Driven by the development of China’s overall economic strength, naval equipment construction, and even the Chinese army, the team's entire equipment construction achieved rapid development. At the same time, the development of the navy also greatly improved its concept. The Central Military Commission made a major decision on the strategic transformation of the navy, that is, the navy's defense from the offshore to the defense of the sea. In the process of such a big strategic change, the naval equipment construction, including the construction of the navy's medical service, has achieved great development. Reflected in this aspect of maritime medical care. In the construction of marine medical equipment, the "one ship, five boats, four machines" marine medical three-dimensional rescue equipment system

including the first standard hospital ship in China. In 2005, the design and launch of the Chinese Navy's 920 large medical vessel was launched. In 2006, the 920 hospital ship was started and was built by Guangzhou Shipyard International. In August 2007, the 920 hospital ship was launched. In October 2008, after a series of hull and shipboard medical equipment acceptance, 866 ships were delivered to the troops. The hospital ship is a 14,000-ton large-scale professional hospital ship designed and developed by China. The ship has a total length of 178 meters, a maximum width of 24 meters and a full displacement of more than 14,000 tons. The ship has 10 departments and medical information centers such as rescue room, X-ray room, CT room, examination room and blood preparation room. The medical facilities are advanced, the nursing system is complete, and the medical equipment configuration is equivalent to the level of domestic third-class hospitals The hospital boat is the most advanced type of equipment in the entire medical system architecture. With the hospital ship, the entire chain of the marine three-dimensional rescue is complete, and the capability level is a rapid development, which has reached a considerable level. As of 2013, only a few countries in the world, such as the United States, Japan, and the United Kingdom, have hospital boats with remote medical rescue capabilities, but most of these hospital ships have been converted from civilian ships. The birth of the first domestic 10,000-ton hospital ship marked a major breakthrough in China's maritime medical support capacity building.

Gun Weapon System

↳*System*

Name: Type 76

Type: Twin 37mm Naval Gun

Caliber: 37mm

Note: The Type 76 twin 37mm naval gun is a small caliber naval artillery piece created by China for anti-aircraft and anti-surface purposes. The Type 76 is a further development of the Type 65. The Chinese military wanted to further improve the Type 65 by incorporating a fully automatic operational mode, but political turmoil from the Cultural Revolution delayed development of the Type 65's successor until its eventual release in 1976. The Type 76 incorporated a fully automatic operational mode, though the semi-automatic operational mode was retained as a backup measure. The model's rate of fire could reach a maximum rate of 400 rounds per minute per barrel (cyclic). The gun saw military action in the 1988 Spratly Islands naval battle and received positive feedback from the Chinese navy.

Notes:

In 1996 the Thai Navy ordered the "Similan" supply ship. The ship started in 1997 mainly for serving Thai Navy's light aircraft carrier and resupply convoy. "Similan" was built by China, with a full load displacement of 23,000 tons, the hull has two central depot systems, either oil-water supplies can also be dry supplies. For vertical replenishment, a helicopter deck and hangar was installed in the rear of the ship. The ship can carry 9,000 tons of oil and water, ammunition and other supplies. Once the start of construction in Fuqing-class supply ship had already passed a quarter of a century, the Chinese finally began construction at the Shanghai East shipyard in 2002 of a new naval supply ship, similar to the Thai Navy's "Similan". Fu Chi class and "Similan" was both hull shape, the main structure is very similar. In fact, according to "Jane's warships Yearbook)), the two main hull dimensions are basically the same. Of course, on board equipment is different. , Fu Chi class and "Similan" was the same size as the main hull, but the stern of different shapes, probably because of the helicopter deck equipment is not the same. The shape of the hull below the waterline and the hull structure may be largely follows the "Similan" sign design. Because in the midships also designed the porthole, there may be a considerable portion of installed residential facilities. From the exterior view, Fu Chi class supply ship, including the bridge, helicopter base and superstructure rear chimney larger, distinct from "Similan" was almost complete absence of other large porthole design differences. Fu Chi class and "Similan" was installed in the same location two groups maritime depot system, but with the latter two groups are oil and water, dry dual-use staging systems, Fu Chi class the oil depot system is front mounted, the rear is a dry goods depot system. In addition, Fu Chi-grade oil depot system and the "Nacang" use the same model. On 29 March 2003 the PLA launched a newly designed AOR, Qiandaohu No. 886, at which time a second was reported building. Initially it was suggested that the ships were probably from the Dalian Shipyard, but later sources report they were from Hudong-Zhonghua Shipyard in Shanghai. Her sister ship Weishanhu (887) was built by Huangpu Shipyard based in Guangzhou. The first-of-class was commissioned by the East Sea Fleet in April 2004. The second hull was launched in June 2003 and commissioned by the South Sea Fleet in late 2004. This class of ship was given the reporting name Fuchi class by NATO. The ships are 171 meters long and displacing 22,000 tons at full load, with an armament of two Type 76A 37mm twin guns. The new oiler are of the same design as the Similan class (Hudong-Type R22T, named after the Similan Islands National Park off Thailand's West Coast, the best diving in Thailand) built for the Royal Thai Navy in 1995, and is comparable to the smaller French DURANCE class AOR. Like the Similan oiler, the ship has a flight deck and a hangar for one helicopter. The No. 886 class is powered by two license-built French-designed SEMT-Pielstick 12,000 brake-horsepower [BHP] diesel engines. The pair of new No. 886 class AORs brought to five the total number of PLA Navy underway supply ships. The new class followed the Fuqing class, of which two units were built, and was needed to support the new Guangzhou-class (Type 052B/C) destroyers. Japan increased its Exclusive Economic Zone (EEZ) out to 200 miles around its islands in 1996, and it overlapped China's EEZ in this area. After that began a noticeable increase in Chinese warships, research vessels and oil exploration vessels operating in and around the EEZ. China escalated its visibility when it sent a Sovremenny-Class ship, the most modern PLAN warship, into the waters of the Chunxiao oil-field on January 22, 2005. There was further escalation in September 2005 when a task group of five ships cruised Japanese EEZ oil-field waters. The flagship was Sovremenny hull 137, accompanied by Jianghu frigates 515 and 517, the 23,000-ton replenishment support ship Fuchi hull 886 and the 6,000-ton space event/intelligence ship Dongdiao, which bore hull number 851. Dongdiao, was hull number 232 when it intruded in 2000, indicating that Dongdiao had moved from the East Sea Fleet to the North Sea Fleet. Then in 2008, these ships became heavily used, supporting 13 task forces sent to the anti-piracy patrol off Somalia. Usually, one Type 903 accompanied two warships (usually a frigate and a destroyer), supplying fuel, water, food, and other supplies as needed. The replenishment ship would go to local ports to restock its depleted stores of fuel, water, food, and other necessities. China needed more Type 903s to support the growing number of long distance training operations into the Western Pacific. One new Type 903 was launched in March 2012, and a second one two months later. Both underwent fitting out and sea trials. The first one launched in 2012 completed trials in nine months and the second one was apparently on the same fast track. Both Type 903s entered service in 2013. China launched another Type 903 replenishment ship in mid-2013, around the same time the third one completed its first sea trials. China built and put into the water three more Type 903 replenishment ships in less than two years. A supply ship was commissioned for the East China Sea fleet of the People's Liberation Army (PLA) Navy on 12 September 2013. The supply ship Chaohu is a Chinese-made ocean-going vessel capable of replenishing both dry and liquid cargo, said Zhang Weidong, the ship's captain. The ship, with hull number 890, successfully completed supply missions to two naval vessels during a trial voyage conducted recently, according to military sources. Chaohu has a displacement of more than 20,000 tons and is able to sail to all kinds of sea areas except polar and ice regions, according to Zhang. Early 903 combined a number of Russian-made supply equipment, including the key horizontal supply system; the system by the Chinese Navy General Equipment Department and Russia contact, technical and price negotiations, by the China Poly Company is responsible for the purchase. Russia in addition to providing horizontal supply device, but also put forward the appearance of the supply mast and the force diagram, as well as the supply tank of the outline. The second batch of 903 type built in the 1920s (see below) began to use the Chinese-made horizontal supply device, and the first batch of 903 will also switch to domestic horizontal supply device. Compared with Thailand's Similan, 903 type of front and rear ship structure volume are slightly expanded, these signs show 903 type of living space after the increase, so speculation 903 also have to accommodate the command staff and personnel transport function; In addition, the structure of the 903 and the tin milan below the helicopter deck is also different. And the same number of the South warehouse, 903 is also equipped with a number of medical facilities and maintenance factories, both medical and repair ship part of the function. And China's second-line service ships the same, 903-type superstructure is also full of square portholes (tin Milano no). It is noteworthy that the tinmilan previously built for

Thailand in order to tie in with the same period Thailand to Spain to buy light ship, and China from the beginning of 2000 began to plan to build aircraft carrier, so the 903 type of internal support configuration may Has been considered to the needs of the ship combat group. 903-type tail with a helicopter library and flight deck, can carry a Russian-made Ka-27 transport helicopters, or two straight -9 helicopters, effective vertical filling operations. In addition, the tin milan on both sides of the stern are equipped with a boat pendant, 903 type is increased to two side of each boat pylon. Armed, the 903 has a four-door 76F double-mounted 37mm 63-speed fast gun, respectively, located in front of both sides of the bridge and helicopters on both sides of the top. Compared with the Fuqing level 76, 903 type 76F improved, with a closed turret cover, with automatic and manual operation of the two models, the maximum firing rate of 180 rounds / min, a range of 8.5km, but the ship is not set up supporting Of the radiation control radar (may only be equipped with a simple optical electronic control system), so the lack of night combat capability. On March 22, 2012, Guangzhou Shipbuilding International built the third 903 type ship. The hangar was significantly larger than the original. At the beginning of 2012, pictures on the Internet showed that the Guangzhou Shipyard International Shipyard began construction of a new oil-oil supply ship, launched on March 22, 2012, its appearance is clearly 903 type of follow-up model, called 903A, the overall configuration was roughly the same, with many details and equipment improved, the appearance can be found in the helicopter door widened, can accommodate more helicopters; the original four 76A dual-mounted 37mm cannon also replaced by four in China in the early 2010 H / PJ-17 30mm cannon (see 056 frigate one), the ship was named Taihu Lake (889); and in the same period, Shanghai and Shanghai also built a homogeneous supply ship, and in May 7, 2012 The water was named Nest Lake (890). Taihu Lake on June 18, 2013 entered the North Sea Fleet service, Chaohu No. in September 12, 2013 into the East China Sea Fleet service. On 31 May 2014, the People's Liberation Army Navy's (PLAN) fifth Fuchi class Type 903A replenishment ship was launched at the Guangzhou International Shipyard in Guangzhou, China. With a 23,000 ton displacement capable of carrying 11,000 tons of supplies, the Type 903 class is China's most modern and largest indigenous replenishment oiler ship*, which resupplies warships at sea with fuel and other supplies. This 903A ship still needs to be fitted out with refueling and cross ship transfer conveyer belts. The Fuchi class's ability to transfer fuel and dry supplies to warships on the high seas in Underway Replenishment (UNREP) missions means that PLAN warships can remain on patrol instead of returning to port for fuel and food. With the continuous service of large and medium-sized combat ships, the Chinese navy had a large number of ocean going vessels to supply and security capabilities put forward higher requirements, a large number of construction of new integrated supply ship has become a reasonable choice. On 27 December 2015, hull number 960 "Dongping Lake" ship formally entered service, so far, the Chinese Navy active duty 903A supply ship has reached 3 ships. According to the internet pictures, a follow-up of at least 3 ships with the type of ship in service, plus two aircraft 903 basic type, in shortly before July 15, 2016 China designed manufacturing new offshore supply ship Honghu ship, ship Luoma Lake into the column naming ceremony held at a naval base in Zhanjiang, Guangdong. Since then, two offshore supply ship officially joined the Navy South Sea Fleet battle sequence, but also marked the people's navy ability to carry out tasks.

Type 908 Class (Fusu-Class) Chinese Replenishment Ship

Tiers:

Variants:

- **HTMS Similan:** In January, 1993, China received the notification from Thai government, informing the former's intention to purchase a replenishment ship for its light aircraft carrier fleet. China decided to join the bid, among other western shipbuilders including DCNS, Fincantieri, BAZAN, Hyundai and Dutch Schelde shipyards, and the Chinese design would be very similar to the converted former-Soviet ship, with work on both ships would be performed simultaneously. The original chief designer of the cancelled second generation domestic Chinese replenishment ship, academician Zhang Wende (□□□), who was named as the chief designer and the program manager of the conversion project for the Chinese navy, was also assigned an additional task, as the chief designer of second ship China would be building for export to the Thai navy. China managed to beat its western competitors and won the Thai contract. Work on the ship built for the Royal Thai Navy went well and the ship was completed on August 12, 1996. Zhang Wende, the chief designer personally stayed on board the ship for twelve days during the voyage to Thailand, gathering information at the very last moment, so that it would help in the future design of the next generation Chinese replenishment ship. Whenever possible, Zhang personally operated the ship, including radars, handling boats the ship carried, and other tasks. The ship was formally accepted to the Thai naval service on September 12, 1996, and was named HTMS Similan (pennant number 187). HTMS Similan is very similar to its sister ship in Chinese service, except it uses a Chinese hull. The most important difference, however, is in upgrading its replenishment capability. Despite being able to replenish solid supplies, the capability to resupply ammo is still rather limited for the Chinese ship. The Thai ship has further overcome this problem by increasing the ammunition resupply capability. Despite the difference between two ships, most of the technologies and components, especially those core technologies for both ships remain the same, and for this reason, China has placed HTMS Similan and the Chinese ship Qinghaihu (□□□) in the same class. This class would eventually evolve into Type 903 replenishment ship (Fuchi class).

System

Alternative Designation: Type 908 Class; Fusu Class

Type: Replenishment Ship

Builder: Kherson Shipyard, refitted at Dalian Shipyard

In Service: 1993-Present

Crew: 125

Cargo Capacity: There are a total of four transfer stations, with dry cargo transfer station followed by liquid cargo transfer station, which is exactly the opposite of arrangement of other replenishment ships in Chinese service, which is the major reason for China to indigenously develop the third generation replenishment ship. A total of 9,630 tons of fuel can be carried, and with other dry cargoes such as food and ammunition, the total provision Type 908 can supply is 23,000 tons.

Dimensions

Length: 188.9 m

Beam: 25.33 m

Endurance: INA

Onboard Aviation Facilities

Facilities: Hangar and flight deck

Aircraft: No

Helicopters: 1 x Z-8 helicopter

Protection

Active Protection System: No

Countermeasures: INA

NBC Water Washdown System: Yes

Notes:

The Type 908 (NATO reporting name Fusu-class, also known as Nancang-class) replenishment ship is a class of multi-product replenishment oilers commissioned into the People's Liberation Army Navy and the Royal Thai Navy.[1] The first Type 908 replenishment ship, Qinghaihu, was originally laid down for the Soviet Navy as a Komandarn Fedko-class merchant tanker, but construction was halted due to insufficient funds. The ship was then purchased by China as an incomplete vessel in 1993 from post-Soviet Ukraine. The ship has a near sister ship (INS Jyoti) operating with the Indian Navy. After significant refit, the ship was consecutively renamed Qinghaihu (885), formerly ex Nancang (Nanyun 953) and ex-Vladimir Peregudov. Another similar ship was built and sold to Thailand and currently in service with the Royal Thai Navy as HTMS Similan (871). The Type 908 AOR is the second generation Chinese replenishment ship that is outfitted with a total of six cranes, four oil refuelling stations, and two stores stations. This allows the ship to replenish three warships simultaneously. The ship, through her helicopter facilities, is able to replenish warships operating nearby via vertical replenishment (VERTREP). The Type 908 was the second stage in Chinese replenishment ship development and construction. Although considered somewhat successful, the first Type 905 replenishment tanker (Fuqing class) could not completely satisfy the requirements of the People's Liberation Army Navy (PLAN). One of the primary drawbacks of this class was that they are mainly for replenishment of liquid supplies, i.e. fuel and water. These ships of the first stage of the development of Chinese replenishment ships could only replenish extremely limited dry supplies, and are virtually incapable of resupply of ammunition, because the Chinese industry at the time lacked the capability to provide sounding safety measures for resupplying and storing ammunition with fuels. This is one of the two primary constrains that despite the fact that on August 28, 1977, the Central Military Commission ordered the resumption of the development of fleet replenishment ship that is capable of one-stop replenishment, (i.e. being capable of resupply ammunition, fuels, water, and solid supplies together by a single ship, a concept first pioneered by United States Navy), the project was eventually put on hold. The other primary constrain was budget constraints as Chinese economy was near the verge of total collapse resulting from the Cultural Revolution. Eventually, as the economic reform in the People's Republic of China in 1979 rapidly improved the Chinese economy, the second stage of the development of the Chinese fleet replenishment ship was resumed in 1988, after around a decade of dormancy. PLAN had a lot of expectations for the new class of ship: in addition to being capable of one-stop replenishment, the new ship was also required to be capable of serving as a hospital ship. However, to meet such high expectation of PLAN, costs was driven up multiple times. As the design was completed, the price of the proposed new ship exceeded what PLAN could afford and the project was in danger of being cancelled again. On May 1, 1993, the uncompleted former Soviet naval ship was towed to Dalian shipyard from Ukrainian Kherson shipyard. In addition to the hull and subsystems, China also purchased the design, which was immediately modified to meet the Chinese needs. Chinese

Academy of Sciences academician Zhang Wende (□□□), the original chief designer of the second generation domestic Chinese replenishment ship was named as the chief designer and the program manager of this conversion project. The deputy general designer is Mr. Huang Wei (□□), another general engineer of the 701st Institute of China Shipbuilding Industry Corporation (CSIC). On May 8, 1996, it entered Chinese service in South Sea Fleet, where it has remained until today. The pennant number was originally Nanyun (□□)-953, but later changed to 885, with name Qinghaihu (□□□), and this upgraded ship became the second generation Chinese replenishment ship, replacing the originally planned indigenous one. The conversion project was deemed successful and worthy but Chinese, who had gained important insights on Soviet design principle, core technologies, important subsystems, layout, and other expertise that were difficult for Chinese to obtain, and these valuable knowledge would later help China in designing its next generation replenishment ships. The most important gain, however, was financial. The original funding that was insufficient to develop a proposed indigenous 2nd generation Chinese replenishment ship was not only enough to buy the uncompleted former Soviet ship, but also had enough left to cover the following conversion work. One of the primary areas of improvement of the original former-Soviet design was in damage control, which was woefully inadequate (Rumored due to its original civilian merchant tanker design). Some of the interior wiring was exposed, and the ship's battle damage control system was very limited, with a near absence of internal damage limitation, insufficient fire-suppression system and water-tight locks. Incorporate the experienced gained from the rework of Type 053 frigates exported to Royal Thai Navy, the damage control of the ship was upgraded to western (mostly German and American) standards. There are a total of four transfer stations, with dry cargo transfer station followed by liquid cargo transfer station, which is exactly the opposite of arrangement of other replenishment ships in Chinese service, which is the major reason for China to indigenously develop the third generation replenishment ship. A total of 9,630 tons of fuel can be carried, and with other dry cargoes such as food and ammunition, the total provision Type 908 can supply is 23,000 tons.[

Type 904 Class (Dayun Class) Chinese General Stores Issue Ship

Tiers:

Variants:

- **Dongting Lake:** Commissioned: 1992 Fleet: South Sea Fleet
- **Jingpo Lake:** Commissioned: 1992 Fleet: South Sea Fleet
- **Fuxian Lake:** Commissioned: 2007 Fleet: South Sea Fleet
- **Junshan Lake:** Commissioned: 2015 Fleet: South Sea Fleet
- **Luguhu:** Commissioned: 2015 Fleet: South Sea Fleet

System

Alternative Designation: Type 904 Class; Type 904A Class; Type 904B Class; Dayun Class
Total Built: Type 904: 2 Built; Type 904A: 1 Built; Type 904B: 2 Built, 1 under construction
Type: General Stores Issue Ship
Builder: Jiangnan Shipyard
In Service: 1992-Present
Crew: 240
Type 904: Built by Qiuxin (□□) Shipyard of Jiangnan Shipyard in Shanghai, Type 904 (and its successor Type 904A) are frequently but erroneously referred by many as underway replenishment ships. However, this is incorrect because these ships are designed as general stores issue ships, and they lack the gentries and transfer stations, and thus are not capable of performing any underway replenishment duties. Type 904 and Type 904A are equipped with four davits each housing a small boat, with two on each side, and these boats are the primary means of transfer supplies. Type 904 and Type 904A are intended to supply garrisons on offshore islands without any port facilities. Helicopter can be carried, but it platform only, without any hangars, and helicopter is the secondary mean of transferring supplies. Specification:
Type 904A: After two Type 904 were completed, production was transferred to an improved version designated as Type 904A that is more than 50% larger in terms of displacement (up to 15000 tons), but armament was reduced by half.[2] Type 904A has been temporarily loaned to China Fishery Law Enforcement Agency as its largest patrol ship.[3] Specification: Specification (for Type 904)
Type 904B: Only a single Type 904A was built before production is switched to Type 904B, two of which are currently under

construction. The biggest difference between Type 904B and its predecessor Type 904A is the addition of hangar onboard Type 904B, where TYpe 904A only had a landing platform. Other improvements include the replacement of older twin gun mounts by new H/PJ15 single 30 mm gun mounts and more advanced electronics such as radars.

Name: Type 76

Type: Twin 37mm Naval Gun

Caliber: 37mm

Quantity: 4 x Type 76 Twin 37mm Naval Guns

Note: The Type 76 twin 37mm naval gun is a small caliber naval artillery piece created by China for anti-aircraft and anti-surface purposes. The Type 76 is a further development of the Type 65. The Chinese military wanted to further improve the Type 65 by incorporating a fully automatic operational mode, but political turmoil from the Cultural Revolution delayed development of the Type 65's successor until its eventual release in 1976. The Type 76 incorporated a fully automatic operational mode, though the semi-automatic operational mode was retained as a backup measure. The model's rate of fire could reach a maximum rate of 400 rounds per minute per barrel (cyclic). The gun saw military action in the 1988 Spratly Islands naval battle and received positive feedback from the Chinese navy.

Notes:

As the 904 supply ship is emergency construction, there were many deficiencies in the design, especially in the high sea conditions, the supply capacity is very limited. Fuxianhu (888) is a fixed-point [ie, island] supply ship built by the Guangzhou Shipyard International (GSI) for the PLA Navy. The ship was launched on 25 December 2006 and commissioned by the South Sea Fleet in 2007. Fuxianhu was based on the hull design and propulsion system of the Qiandaohu (Fuchi) class fleet replenishment ship, but with a smaller displacement (~15,000 tonnes). The ship was designed to transport personnel and supplies from mainland to the remote islands in the South China Sea. Unlike the normal replenishment ship, Fuxianhu does not have the fuel and stores rigs for underway replenishment. Instead, the ship carries six four landing craft (LCVP) at amidships and two small utility boats at stern to ferry personnel and supplies between the mother ship and shore. The ship replaced the older Dayuan class supply ships built in the 1980s for the similar role. Fuxianhu has a large single-spot flight deck to support one medium-size helicopter such as Z-8 and Ka-28, but has no hanger. Its armament includes a Type 76F twin-37mm AAA gun, with a range of 8.5km for airborne targets. NATO codename is DANYAO class [Danyao = ammunition]. Support ship built at Guangzhou, and launched on 28 December 2006. The ship is equipped with two pairs of davits, capable of handling small

landing craft, and a flight deck for medium helicopters. Potential roles for the ship include resupply of the Spratly and Paracel Islands in the South China Sea. Following sea trials in 2007, the ship is reported to have been commissioned in late 2007 and to be based in the South Sea Fleet. Rather than fleet replenishment missions, this type combined with comprehensive supply ship in the Chinese Navy as an island replenishment ship, the same as a supply ship, but the primary duty is to transport goods to islands. Because this ship is built like a replenishment ship, the hull and superstructure arrangement is similar to the underway replenishment type. However, the center of the ship has boat davits, fro a total of four units are equipped with a transport craft to land supplies. As large ships cannot approach an atoll, transport craft are used for replenishment of the port facility. The ship had 76 F type 37 mm twin mount guns, and 14.5 mm twin machine guns mounted on the rear structure. Hangar with a Z-8A transport helicopter was set up, but the Fushun Lake is replaced the hangar with a helicopter flight deck. Fushun Lake is designed with emphasis on military capacities and goods transport capacity to advance base (Spratly Islands, such as personnel and supplies). Type 904B fixed-point supply ship On September 26, 2014, the Guangzhou Shipyard International Shipyard launched the first modified 904B fixed-point supply ship, its basic design and Fuxian Lake similar, but back to the helicopter hangar, to further strengthen the helicopter operating capacity; 904B in July 10, 2015 enlisted, named the mountain Hill (961). In January 2015, internet photos showed the Guangzhou Shipyard International plant there were more 904-type fixed-point supply ship in the construction. As the sovereignty issue intensified between China and Vietnam, the Philippines and other countries in the South China Sea, China also expanded the island of reefs, the island reef fixed supply demand increased, so 904B fixed-point supply ship will continue work. The biggest differences between the Type 904B supply ship Luguhu (Hull No. 962) and its predecessor Type 904A supply ship Fuxianhu are that, instead of the portal frame type platform, which is specific to the comprehensive supply ship, on the supply ship Luguhu, there are two davits mounted on each side in the middle section of the ship and a hangar which enhances the vertical replenishment capacity. The ship is designed to provide material supply for the troops stationed in the Nansha islands, and undertake such tasks as providing supply for a ship formation and maritime medical aid at a certain degree. The hull and bridge fuller, the chimney also changed from the previous two, the rear mast is between the two chimney. The installation of the helicopter hangar, apparently in order to stay away from the mainland where the vertical supply is needed. The power system may also be improved. The 904B-type transport supply ship relative to the A-type has improved performance. Sea supplies are mainly to supplement the warships in combat or sailing in the consumption of oil supplies and so on. Supply the main sub-cargo and dry goods two categories. Liquid cargo is mainly warships of diesel, aviation fuel, machine lubricants, fresh water and so on. Dry goods are mainly a variety of models of ammunition, food, machinery spare parts, spare weapons, additional soldiers, etc. Its displacement is still 15,000 tons, storage of fuel and fresh water more than 10,000 tons, food, ammunition and other materials more than 1,000 tons. The 904 B-type self-defense firepower has significantly enhanced. The ship and the ship's two 37-mm machine guns, facelift into 2011 just developed H / PJ15 single tube 30 mm hand-mounted naval gun. The gun uses the LLP12A new fire control system developed by Northern Industries 206, with radar and optoelectronic channels, equipped with automatic photoelectric guidance station, all aspects of performance are far above the 37 mm machine gun. The supply ship is also equipped with a number of 14.5 mm machine guns, used to deal with the threat of close range. The internal facilities are more complete. 904B-type superstructure is much larger, the internal space is also larger, staff living area and equipment are stronger than the older generation. It can not have a complete processing workshop, repair shop, and even a female dedicated cabin. The ship's self-defense capability is relatively weak, in fact, from the use of 904A point of view, 904B no need to focus on independent combat capability. These supply ships are basically in the first island chain within the supply activities, and these waters is basically the Chinese Air Force's combat power is easy to cover, as the comprehensive supply ship do their own work.

Propeller: Shrouded Impeller

Maximum Payload, inlcuding fuel: kg1,250

Notes:

The F470 Zodiac can be used for over-the-horizon transportation, inserting lightly armed raiding parties or reconnaissance teams onto beaches, piers, offshore facilities and larger vessels. The CRRC can be inflated in minutes by foot pump, compressor or CO2 tank and can be deployed from shore and a variety of vessels. Additionally, it can be launched from several types of aircraft and submarines equipped with a special lockout chamber or a Dry Deck Shelter. Its chief advantages are light weight, compact size when stowed, stealth, versatility, and the safety imparted by its super-buoyant nature (which gives it the ability to operate in relatively high seas). A total of six individual airtight chambers comprise the Wing P4.7. The main hull or gunwale contains five intercommunicating chambers, which are separated by internal baffles and valves. This means that a single leak will not result in loss of pressure throughout the boat, and that air can be bled between chambers to compensate for loss in one. The final chamber is an inflatable keel tube which runs the length of the craft and gives the bottom of the hull a "V" shape, imparting directional stability and additional shock absorption. A composite decay proof "transom" board at the stern provides a mounting point for the outboard engine(s) . The deck (floor) is composed of four interlocking composite plates, which are fixed to the "thrust board" at the bow end and the transom at the stern. This rigid structure, spanning the entire internal area of the boat, prevents the hull from collapsing or "taco-ing" under power. U.S. Marines from the Battalion Landing Team 2/2 go ashore in a CRRC during a 2003 exercise. A ready-for-use craft includes an outboard engine (two in some configurations); removable composite deckplates or roll-up slatted decking; paddles; a bow line for securing the docked boat and a "righting" line which is used to flip the boat in the event of capsizing. At the bow of the boat are storage bags for equipment (foot pumps, extra lines, etc.) and a special fuel bladder, which can be of either 6- or 18-gallon capacity and which feeds the engine via a flexible hose. Deflated and rolled up, the boat and all necessary equipment can easily fit into the bed of a small pickup. Most military CRRC's use a 55 horsepower (41 kW) two-stroke engine with a pumpjet propulsor, which consists of a shrouded impeller.[4] This design reduces the risk of serious injury to personnel in the water when compared to the traditional open propeller. It also reduces the risk of the propulsion system being seriously damaged by submerged objects. A specially-trained coxswain sits at the stern (rear) of the boat and controls it via the tiller arm, attached to an outboard engine. The coxswain is considered the commander of the craft and is ultimately responsible for its operation, regardless of whether a senior-ranking individual is on board. Across from him sits the assistant coxswain, who relays hand signals from other boats and aids the coxswain as required. The remaining passengers (six raiders plus the two coxswains make up a full team) normally lay on and straddle the gunwale, keeping a low silhouette to help avoid detection and leaving room on the deck for weapons, equipment and (if necessary) additional fuel bladders.

C14 Class Russian Missile Boat

Tiers:

Variants:

- **Ships:** INA

System

Alternative Designation: China Cat
Description: Crew: 10, and passengers Displacement (tons): 20 full load Length Overall (m): 23 Height of hull (m): 3.6 Beam (m): 4 Draft (m): 1
Performance: Speed (knots): 50 Range (nautical miles): 300 Propulsion: 2 x props and 2 x diesel engines
Protection: Armor: See CB90HS variant Buoyancy: Sealed compartment in aft area NBC: Collective in forwardmid areas Auxiliary Power Unit: Yes
Fire Control: Electro-Optics: Photoelectric camera in mast substructure Sonar: INA Radar: 1 x POT HEAD light surface search
Weapons: Missile: C-701/YJ-7/TL-10A and B, Kosar in Iran Type: The C-701 is a multi-role cruise. Primary targets are light craft and patrol boats. It can also be used against land targets. The TL- 10 name series is more often referred to as specifically anti-ship. Launchers: 4 can be seen Weight (kg): 100 Dimensions (m): 2.5 length x .18 diameter Warhead: 29 kg semi-armor-piercing Speed: Mach 0.8 Range (km): .5-20 Guidance: TV guided initial version, as C-701T, TL-10A in Iran MMW-homing recent option, as C-701R, TL-10B in Iran Infrared (IR)-homing is an option not currently fielded P-hit (%): 90 Missile: C-704/JJ/FL-9/TL-6B in China, Nasr in Iran Type: Anti-ship cruise Launchers: 2 Weight (kg): 350-360 Dimensions (m): 3.5 length x .28 diameter Warhead: 30 kg SAP Speed: Mach 0.8-.9 Range (km): 4-35 Guidance: Radar-homing
Other Weapons: 1 x 12.7-mm MG (Type 89 likely). Guns are optional, and may be removed for stealth operations. A likely addition is a Chinese or Iranian MANPADS missile launcher.

Ammunition

C-701 Cruise missile: 4-8 combat load
TL-10 Anti-ship missile: 4-8 combat load
C-704 Anti-ship missile: 2-4 combat load
12.7mm linked MG ammunition if craft is equipped with HMG maritime variant.: INA
MANPADs (possible): INA

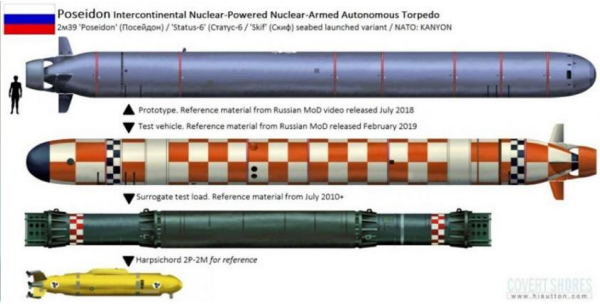
Notes:

The C 14 class missile boat is a light missile boat of catamaran designed for use in the Middle East, also known as the China Cat class. The small size of the ship, along with some stealth features provide it with good protection against enemy detection, and

it can be armed with a variety of light anti-ship missiles. In addition to the low radar cross section, the boat is also extremely fast with an aluminum monohull with stepped planning. The catamaran design also provides better seaworthiness in comparison to the other boats of similar displacement with a conventional hull. The missile boats have been exported to Iran, where since 2000 it has been in service with the Islamic Revolutionary Guards Navy Corps. In Chinese service it primarily serves as a trial boat, including testing various light anti-ship missiles and other weaponry for catamarans. During the 1990s, the Chinese Navy started two indigenous fast-attack craft programs, while also considering the acquisition of Russian-built fast-attack craft. The China Cat-class 20-ton missile boat was developed for use in the Middle East, but was also to be built for Chinese naval service. In 2002 the China State Shipbuilding Corporation (CSSC) demonstrated the "China Cat" high speed boat prototype, for which Iran was the first customer. This ship uses the catarmaran hull, 23 meters long, with a water line length of 14 meters. Powered by two diesel engines, the maximum speed was approximately 50 knots. The Cat has a lightweight search radar in the mast crown, a photoelectric surveillance installment in the mast substructure platform. It was not initially clear which model missile would be carried, possibly the short-range C-701 guided missile, which the China National Precision Machinery Import & Export Corporation CMPIEC developed. CMPIEC had already completed the shipborne C-701 testing by 2000. Providing the equipment for the fast assault boat was a way to push this guided missile to exports the market. The boats delivered to Iran were equipped with this missile. In May 2002 it was reported that China had sold Iran high-speed catamaran missile patrol boats. The first of the new C-14 patrol boats was reportedly observed by US military intelligence in an Iranian port. A Chinese delegation of technicians was in Iran to help the Iranian navy train and equip the new boats. The boats for Iran were designed to carry up to eight C-701 anti-ship cruise missiles and usually had one gun. Reports appeared at the same time suggesting that the PLAN was interested in the type as well. Assuming the pre-existing force structure of 150 missile-and gun-equipped fast-attack craft, the Chinese Navy's future force could include 30 China Cat Class. As of 2008 there was no indication that the PLAN had or was looking to acquire this type.

→Autonomous Undersea Vehicle (AUVs)

Poseidon Russian Unmanned Underwater Vehicle



Tiers:

1 2 3 4

System

Alternative Designation: Status-6, Kanyon, UUV, UUD, AUV

Total Built: Not proliferated; 30-32 Poseidon UUVs are planned to be built

Primary Function: Second strike radioactive tsunami initiator and/or fleet destroyer

Crew: ea0

Delivery Vehicles: The B-90 Sarov and Zvezdochka 600 for R&D, and the Oscar-class submarines Project 09852, Belgorod, and the Project 09851, Khabarovsk. Each could carry four Poseidon UUVs for a total yield of 400 megatons

Dimensions

Length: m24

Diameter: 1.6–2 metres

Automotive

Engine Type: Low weight, compact, gas-cooled, low-power reactor

Engine Power: Nuclear

Cruising Range: km10,000

Speed, Maximum: km/h100

Maximum Depth: m1,000

Note: Typical depth of the drone may be about 50–100 meters for increased stealth features in low-speed stealth mode. Low depth in stealth mode is preferred because sound waves move to ocean floor and reduce radius of detection. Submarines use the same strategy in silent running mode.

Warhead

↳*Warhead Charachteristics*

Material: Toxic Cobalt, containing Cobalt -60

Shape: Cylinder

Diameter: m1.5

Length: m4

Volume: m37

Yield: mT~100

Size of Radioactive Area: 1700×300 kilometers.

Protection

Low-speed Stealth Mode: Yes

Silent Running Strategy: Yes

Stealth Properties: Yes

Notes:

The Poseidon, previously known by Russian codename Status-6 (Russian: Статус-6), is a nuclear-powered and nuclear-armed unmanned underwater vehicle under development by Rubin Design Bureau, capable to deliver both conventional and nuclear payloads. The Poseidon is one of the six new Russian strategic weapons unveiled by Russian President Vladimir Putin on 1 March 2018. The Poseidon is intended as an asymmetric counter to U.S. missile defense systems, such as anti-ballistic missiles, railguns, or laser weapons, ensuring Russia's capability to overcome such systems. The Poseidon warhead can contaminate a large area with radiation. According NukeMap simulations, the size of the radioactive area will be about 1700×300 kilometers. For this purpose, the Poseidon is believed to be equipped with a toxic cobalt bomb, containing cobalt-60. Poseidon appears to be a deterrent weapon of last resort. An aircraft carrier battle group would have reduced chances of defending itself against it. The drone could detonate its very large warhead at standoff range, and anti-submarine warfare units would have very little time to react because of the speed at which it travels. he Poseidon appears to be a torpedo-shaped robotic mini-submarine which can travel at speeds of 185 km/h (100 kn). More recent information suggests a top speed of 100 km/h (54 kn), with a range of 10,000 km (5,400 nmi; 6,200 mi) and a depth maximum of 1,000 m (3,300 ft). Typical depth of the drone may be about 50–100 meters for increased stealth features in low-speed stealth mode. Low depth in stealth mode is preferred because sound waves move to ocean floor and reduce radius of detection. Submarines use the same strategy in silent running mode. It is 1.6–2 metres in diameter, and 24 metres long. The warhead shown in the leaked figure is a cylinder 1.5 metres in diameter by 4 metres in length, giving a volume of 7 cubic meters. Comparing this to the volumes of other large thermonuclear bombs, the 1961 Soviet-era Tsar Bomba itself measured 8 metres long by 2.1 metres in diameter, indicates that the yield is at least several tens of megatons, generally consistent with early reports of 100 megatons. Some reports suggest the yield of the Poseidon's warhead is as low as 2 Mt. The National Interest compiled several unclassified defense sources from General Electric experts about the similar 601B project and they predicted low weight and compact gas-cooled nuclear reactor in the drone. Russian submarine designers say that a low-power reactor is preferred for Poseidon because a smaller reactor is less noisy. he development includes also use of stealth technology, to elude acoustic tracking devices.[25][30][38] Poseidon uses a silent running strategy like other submarines. Its main stealth feature is its very low speed before it reaches the target area. Its high-speed mode activates upon reaching a short finish range (2-3 kilometers), when the probability of detection of the drone is considerably higher. It could travel for weeks toward enemy port cities, reaching high-speed only in the final stage. Russian designers estimated the radius of detection of the drone will be about 2–3 km (1.2–1.9 mi) for 55 km/h (34 mph). A second important stealth feature of the drone is the special design of the pump-jet for clearance of the drone's acoustic signature to imitate the noise of civil ships. The Poseidon is a family of drones rather than a single type, with some Poseidon's designed only for destroying coastal cities and thus relying on "stealth" capabilities rather than on high speed,and other ones primarily designed to attack carrier battle groups, where the later ones may use the supercavitation, like the VA-111 Shkval torpedo, to be able to gain extremely high speed in attack mode (more than 200 km/h (120 mph)). However, supercavitation devices have not been observed on the available footage of Poseidon. Pentagon estimates maximum speed of the Poseidon about 56 kn (104 km/h; 64 mph) without the supercavitation option. wo vessels that are speculated to carry the Poseidon, the Project 09852 Oscar-class submarine Belgorod and the Project 09851 Khabarovsk submarines, are new boats deployed in 2012 and 2014, respectively. Oscar-class submarines could carry four Poseidon torpedoes at the same time for a total yield of up to 400 megatonnes. According to some reports, the Poseidon may also have a seabed or mobile sites launch option. In the seabed option, known as Skif (Скиф), Poseidon can wait on the sea floor in a special container for as long as necessary. It is known that the Russian auxiliary vessel ZVEZDOCHKA 600 (Project 20180) with ice-breaking capability is being used for testing of the Poseidon drones, thus it's believed the ship can be also used as the platform for deploying and retrieving a seabed version of the drone. The seabed launch option was patented (RU 2135929 patent) by the Poseidon designer Alexander Shalnev.

SR.N6 Class (Winchester Class) British Hovercraft

Tiers:

Variants:

- **Kongbang-class hovercraft:** The North Korean Kongbang-class hovercraft is derived from the SR.N6. Currently the North Korean Navy fields 130 such hovercraft.

System

Alternative Designation: SR. N6; Class Winchester Class
Type: Hovercraft
Builder: British Hovercraft Corporation
Crew: 3
Passengers: 58

Dimensions

Length: 17.78 m
Beam: 7.97 m
Draft: INA
Displacement, Full Load: 10.9 tons

Propulsion System

Engine Name: 1 x Rolls-Royce Gnome turbine engine
Engine Type: Turbine Engine
Engine Power: 1,050 hp (780 kW) for lift and propulsion driving single four-bladed variable-pitch propeller
Maximum Range: 170 miles at 30 knots
Maximum Speed: 50 kn (93 km/h)

Radar Systems

Name: INA

Type: Surface Search

Frequency: INA

Range: INA

Protection

Active Protection System: No

Countermeasures: INA

NBC Water Washdown System: INA

Notes:

The Saunders-Roe (later British Hovercraft Corporation) SR.N6 hovercraft (also known as the Winchester class) was essentially a larger version of the earlier SR.N5 series. It incorporated several features that resulted in the type becoming one of most produced and commercially successful hovercraft designs in the world. While the SR.N2 and SR.N5s operated in commercial service as trials craft, the SR.N6 has the distinction of being the first production hovercraft to enter commercial service. In comparison to the SR.N5, the SR.N6 was stretched in length, providing more than double the seating capacity. Some models of the craft were stretched further, enabling an even greater capacity. Experience gained in the development of the SR.N6 has been attributed as heavily contributing towards the design and production of the largest civil hovercraft to be ever produced, the SR.N4. Several major design features of the SR.N6 appeared on both the SR.N4 and further hovercraft designs by Saunders-Roe and its successor, the British Hovercraft Corporation. The Saunders-Roe SR.N6 (also known as the Winchester class) is a medium-sized hovercraft primarily designed for passenger service. The initial models of the type were capable of accommodating up to 38 passengers, which was greater than the maximum capacity of 18 that could be carried by the smaller SR.N5. The SR.N6 was subsequently further stretched to accommodate a further 20 passengers; this capacity upgrade let to it being considered to be more viable for commercial operations than any previous hovercraft design. By eventually increasing the capacity to 58 seats, the SR.N6 Mk.1S became the first hovercraft to be capable of transporting a typical coach load of people. In a military configuration, the SR.N6 is capable of carrying up to 55 fully equipped troops, or alternatively up to 6 tons of equipment. The SR.N6 was powered by a single marinised model of the Bristol Gnome turboshaft engine; this drove both a single rear-facing 9 ft (2.74 m) diameter 4-bladed Dowty Rotol variable-pitch propeller along with a 7 ft (2.13 m) diameter centrifugal lift fan. The Gnome engine was an expensive component for operators, leading to some establishing their own internal overhaul facilities and making arrangements with other Gnome operators, including the Royal Navy, to reduce costs from relying on costly services from Rolls-Royce Limited.[9] Around 20 per cent of the operating costs of the type have been attributed to maintenance of the 4 ft flexible skirt, which reportedly lasted for up to 500 hours, while similar cost levels have been reported for fuel. Early on, the SR.N6 was outfitted with an improved skirt, featuring fingers and forward puff ports, which resulted in improved forward control and reduced skirt wear; fingers had not been present upon the initial version of the skirt used prior to 1966. The endurance of the fingers would be progressively improved over time, issues with salt spray negatively affecting both the engine and propeller were also encountered early on. An initial experience of some components having short overhaul lifespans or being unreliable was encountered during early days. During the early years of not only the SR.N6 but other hovercraft as well, the hovercraft skirt remained an unresolved area of difficulty during this era. The SR.N6 was piloted from a forward-seated position at the front of the main passenger cabin. The pilot would exercise control over the direction of the craft via a series of control surfaces that was located immediately behind the variable pitch propeller. Early on, pilots were normally aviators which had been recruited from the Royal Air Force and Fleet Air Arm, however it has been claimed that experienced mariners would often be more skilled at operating the type, if not taking more time to adapt to its atypical form of propulsion, in part due to their familiarity at safely navigating within uncontrolled maritime environments. For navigation purposes, some SR.N6s were outfitted with onboard radar; multiple radar arrangements were used with the type, including pilots receiving radio guidance from on-shore radar operators in some circumstances.

Zubr Class (Pomornik) Russian Air-Cushion Landing Craft (LCAC)

Tiers:

System

Alternative Designation: Project 1232.2, POMORNIK-Class; DONETS'K Class Ukraine

Description: Crew: 27-31 Displacement (tons): 362; 550 with full load Length Overall (m): 56.2 Height of hull (m): 21.9 Beam (m): 22.3, 25.6 on inflated air cushion Draft (m): 1.5 when not in lift mode

Performance: Speed (knots): 60, 55 cruise Range (nautical miles): 300-400 Propulsion: 3 x variable-pitch air propellers (aka: blowers) 50,000 bhp from 5 x Ukrainian M-70 gas turbine engines Lift Engines: 4 x NO-10 engines Ship Power: 2 x 100kW gas turbine generator APUs Lift Capacity: 3 x tanks, 8 x BMP-2 IFVs, or 10 x BTR-80 APCs or up to 140 troops and 130 tons of cargo Bow and stern ramps assist loading.

Protection: The hull and super-structure have light armor plating.

Fire Control: Radar systems: Navigation radar EW station Other Fire Control: See weapons F/C

Weapons (gun systems): Name: AK-630M AD gun mount Gun: GSSh-6-30K (AO-18) Type: 6-barreled 30-mm Gatling gun Fire Control: EO camera and MR-123 fire control radar Rate of fire: 5,000 rounds/minute, in 400-rd bursts Range (m): 0-5,000 Ammunition: See above, 2,000 ready and 1,000 stowed Targets: Boats, other sea and coastal targets, aircraft, UAVs, mines

Weapons (rocket systems): Name: A-22/Ogon Ship-borne Rocket System Launcher: MS-227 Type: 22 x 140-mm launch tubes Fire Control: DVU-3-BS rangefinder sight Rate of fire: Ammunition: OF-45 140-mm Frag-HE rocket; ZZhS-45 140-mm incendiary rocket

Weapons (missile systems): SA-N-8 (aka SA-14 MANPADS) Launcher: 4-missiles Warhead: 1.0 kg Frag-HE Speed: Mach 0.56 Range (km): .6-6.0 Guidance: IR-homing P-hit (%): 50

Ammunition

2x30mm mounts: 3000 rds combat load

2x140mm rocket launchers, both frag and incendiary: 132 rds, combat load

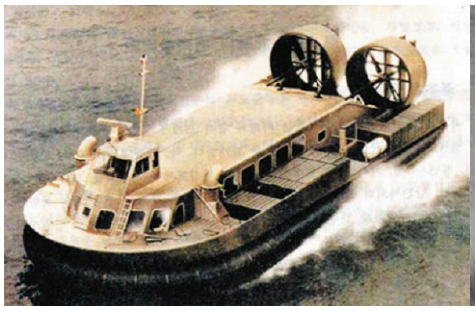
2xSA-N-8 launchers; this is the Naval variant fired from a deck mounted launcher of the SA-14/Strela 3 MANPAD: 24 rds, combat load

Notes:

The Zubr class (Project 1232.2, NATO reporting name "Pomornik") is a class of Soviet-designed air-cushioned landing craft (LCAC). This class of military hovercraft is, as of 2012, the world's largest, with a standard full load displacement of 555 tons. The hovercraft was designed to sealift amphibious assault units (such as marines and tanks) from equipped/non-equipped vessels to non-equipped shores, as well as to transport and plant naval mines. Ten Zubr-class hovercraft remain in service. There are two vessels in the Russian Navy and four with the Hellenic Navy. In 2009 China placed an order for four vessels from Ukraine [order transferred to Russia now] as part of a deal worth 315 million USD. Two updated versions of the vessels were built by Crimea's Feodosia Shipbuilding Company, followed by two advanced models of the surface warship. The purchase of HS Cephalonia (L 180) for the Hellenic Navy marked the first time a Soviet-designed naval craft had been built for a NATO member.

n June 2017 Russia announced the restarting of production of Zubr-class craft. Representatives from the Russian shipbuilding industry soon after responded by stating production could not possibly resume in 2018 and would only be possible by 2019–2021, refuting the government position. Representatives cited the lack of availability of and inability to mass-produce components, notably gas-turbine engines and reduction gears as the main obstacles. NPO Saturn (ODK GT) and Turboros developed marine gas turbine engines M70FRU (D090), FR RU, M70FRU2 (DP/DM71) along M90FR, M75RU, E70RD8 and Elektrosila, AO Zvezda, Metallist, Samara and others developed redactors and gears. High strength and buoyancy is provided by a rectangular pontoon, the main load-carrying part of the ship's hull. The superstructure built on the pontoon is divided into three compartments with two longitudinal bulkheads: combat material compartment in the midsection fitted with tank ramps, and outboard sections housing main and auxiliary propulsion units, troop compartments, living quarters, and NBC protection systems. To improve working conditions in the battle stations, troop compartments and living quarters are fitted with air-conditioning and heating-systems, sound/heat-insulating coatings, and structures made of vibration damping materials. The ship provides normal conditions for the crew to make meals and rest. Personnel are protected against the effects of weapons of mass destruction by airtight sealing of combat stations, crew and troop compartments, augmented with individual gas masks and protection suits. The ship is also protected from magnetic influence mines with an active system to compensate for the magnetic fields generated by the ship and transported materials. The central command post and MS-227 device compartments are strengthened with alloy armor. The Zubr-class landing craft has a cargo area of 400 square metres (4,300 sq ft) and a fuel capacity of 56 tons. It can carry three main battle tanks (up to 150 tonnes), or ten armoured vehicles with 140 troops (up to 131 tonnes), or 8 armoured personnel carriers of total mass up to 115 tonnes, or 8 amphibious tanks or up to 500 troops (with 360 troops in the cargo compartment). At full displacement the ship is capable of negotiating up to 5-degree gradients on non-equipped shores and 1.6 m (5 ft 3 in)-high vertical walls. The Zubr class remains seaworthy in conditions up to Sea State 4. The vessel has a cruising speed of 30–40 knots (56–74 km/h; 35–46 mph).

Kongbang Class North Korean Hovercraft



Tiers:

Paluma Class (A 01) Australian Coastal Survey Ship

Tiers:

Variants:

- **HMAS Paluma:**
- **HMAS Mermaid:**
- **HMAS Shepparton:**
- **HMAS Benalla:**

System

Alternative Designation: HMAS Paluma Class
Total Built: 4 ships it total
Type: Survey Ship
Builder: Eglo, Adelaide
In Service: 1989-Present
Crew: 15

Dimensions

Length: 36.6 m
Beam: 12.8 m
Draft: 2.65 m
Displacement, Full Load: 325 tons

Propulsion System

Engine Name: 2 x Detroit 12V-92T
Engine Type: Diesel
Engine Power: INA
Maximum Range: 3,600 nautical miles
Maximum Speed: 11 knots
Endurance: INA

Gun Weapon Systems

Note: There are no weapon systems fitted onboard the Paluma Class

Onboard Aviation Facilities

Facilities: None

Aircraft: None

Helicopters: None

Radar Systems

Name: Kelvin Hughes 1007

Type: Naval/coastal surveillance and navigation radar

Frequency: 9 410 MHz

Range: 300 km

Note: The Kelvin Hughes Type 1007 family of naval radars are high-definition surface warning and navigational radar systems in service with the U.K. Royal Navy and several other world navies. The radars are available in I-band and F-band versions. It consists of a range of navigation, surface and air search equipment for naval use. It includes a choice of antennas, I-band and F-band transmitter/receivers and a range of displays. Reduced magnetic signature variants are available for use on mine countermeasures vessels. The transmitter/receivers are solid-state, with the exception of the magnetron, and operate at frequencies of 9,410 and 3,050 MHz (I- and F-Band) with a transmitter power output of 25 kW. A wide dynamic range logarithmic receiver is provided. A built-in monitoring system is included to check that the equipment is operating at peak performance. A low leakage dummy load allows for system testing during periods of radar silence. Centralised emission control circuitry enables command to inhibit transmission immediately. Sector transmission is also incorporated with direct control from the CTD main display (optional for the F-band radar). Blanking pulses are incorporated to safeguard sensitive electronic support measures equipment.

Sonar Systems

Name: Thales Petrel three-dimensional forward looking active high frequency

Type: High Frequency Sonar

Protection

Active Protection System: INA

NBC Water Washdown System: Yes

Notes:

HMAS Paluma (IV) is the first ship of the Paluma Class (SML) and the fourth to bear the name Paluma. HMAS Paluma is a custom built survey vessel, designed for surveying in the shallow coastal waters of the Great Barrier Reef and Northern Australia. She was built by Eglo Engineering of Adelaide in November 1987 and Commissioned on the 27 February 1989. Her catamaran design provides good stability in rough weather and allows her to sit well out of the water, drawing only 2.2 metres (a favourable design for operating in shoaling and reef waters). She has three sister ships: HMAS Mermaid, Shepparton (II) and Benalla (II) and operates in a pair with her sister ship HMAS Mermaid. This teaming of the two ships provides mutual support allowing them to operate safety in the remote areas they are required to survey. HMAS Paluma (IV) carries the very latest in survey equipment. Position fixing on the survey grounds is carried out by Wide Area GPS and Differential GPS navigation systems. The positional data is integrated with depth information obtained from Paluma's two echo sounders (one in each demi-hull). Each demi-hull also has a side scanning sonar in order to detect bottom features missed by the echo sounders as she steers down a survey line. All depth information is corrected for heave by heave compensators, (also one in each demi-hull). A Skipper searchlight sonar, located in the starboard demi-hull gives the Officer of the Watch early warning of dangers lying ahead of the ship.

Cheonghaejin Class South Korean Submarine Rescue Ship

Tiers:

Variants:

- **Note:** Only one ship has been built in her class, ROKS Cheonghaejin (ASR 21), in 1995.
- **ROKS Cheonghaejin:** Pennant Number: ASR 21

System

Alternative Designation: Cheonghaejin Class
Type: Submarine Rescue Ship
Builder: South Korea; Shipyard: INA
Crew: 140

Dimensions

Length: 102.8 m
Beam: 16.4 m
Draft: 4.6 m
Displacement, Full Load: 4,300 tons

Notes:

The Cheonghaejin-class ASR (Hangul: □□□□ □□□ □□□; Hanja: □□□□□□□□□□) is a submarine rescue ship class of the Republic of Korea Navy. Only one ship has been built in her class, ROKS Cheonghaejin (ASR 21), in 1995. Its operations include rescuing trapped sailors in submarines, naval operation support for submarines, underwater research and mapping support, and recovery of sunk vessels. It is equipped with a deep submergence rescue vehicle (DSRV) that operates up to 500 metres (1,600 ft), and a rescue chamber that holds up to nine people. Once all nine Son Wonil-class submarines are delivered to the Republic of Korea Navy, another ASR ship of the same class is planned to be built. Notable operations salvaged a North Korean Yugo-class submarine in 1998 salvaged Chamsuri-class patrol boat #357 that was sunk during the naval clash in 2002 with North Korea

Alkmaar Class Dutch Minehunter

Tiers:

Variants:

- **Alkmaar:** Commissioned: 1983 Status: Decommissioned in 2000, sold to Latvia
- **Delfzijl:** Commissioned: 1983 Status: Decommissioned in 2000, sold to Latvia
- **Dordrecht:** Commissioned: 1983 Status: Decommissioned in 2000, sold to Latvia
- **Haarlem:** Commissioned: 1984 Status: Decommissioned in 2011
- **Harlingen:** Commissioned: 1984 Status: Decommissioned 2003, sold to Latvia
- **Scheveningen:** Commissioned: 1984 Status: Decommissioned 2003, sold to Latvia
- **Maasluis:** Commissioned: 1984 Status: Decommissioned in 2011
- **Makkum:** Commissioned: 1985 Status: Active
- **Middelburg:** Commissioned: 1986 Status: Decommissioned in 2011
- **Hellevoetsluis:** Commissioned: 1987 Status: Decommissioned in 2011
- **Schiedam:** Commissioned: 1986 Status: Active
- **Urk:** Commissioned: 1986 Status: Active
- **Zierikzee:** Commissioned: 1987 Status: Active
- **Vlaardingen:** Commissioned: 1989 Status: Active
- **Willemstad:** Commissioned: 1989 Status: Active

System

Alternative Designation: Alkmaar Class

Type: Minehunter

Builder: Van der Giessen-de-Noord yard in Amsterdam,

Crew: The complement of the Belgian ships varies between 33 and 46 depending on mission.

Mine Warfare System: Mine countermeasures equipment originally included two PAP-104 Mark 4 remote-controlled submersibles, EVEC 20 plot table, autopilot, Toran and Sydelis radio navigation aids, as well as the Decca HiFix Mark 6 precision navigation system. The mine-detection range of the sonar is greater than 1,640 ft (500 m). An autopilot system is provided. Starting in 1999, the class was fitted with new Consilium Selesmar NN 950 navigational radars.

Mine Identification: Atlas Seafox Mine Identification and Disposal System

ROV: Double Eagle Mk III Mod 1 ROV

Note: Beginning in 2003, the remaining Dutch Alkmaar-class minehunters were upgraded with improved electronics, including Atlas Elektronik INCMS combat data system, Thales 2022 Mk III hull-mounted sonar, Atlas Seafox Mine Identification and Disposal System and a Double Eagle Mk III Mod 1 ROV.

Dimensions

Length: 51.6 m

Beam: 9.0 m

Draft: 2.6 m

Displacement, Standard: 510 tons

Displacement, Full Load: 540 tons

Propulsion System

Engine Name: 1 x Brons-Werkspoor A-RUB 215 x 12 diesel

Engine Type: Diesel

Engine Power: 1,900 total bhp; 1 shaft

Auxiliary Power: 2 x 120-shp ACEC active rudders (for minesweeping)

Bow-Thrusters: 2 x 75-shp bow-thrusters

Maximum Speed: 15 kts (7 kts hunting)

Maximum Range: 3,500 nm at 10 kts

Endurance: 15 days

Gun Weapon Systems

↳*Gun Weapon System #1*

Name: 20 mm modèle F2 gun

Type: Naval Gun

Caliber: 20mm

Quantity: 1 x 20 mm modèle F2 gun

Length: INA

Weight: 332 kg (732 lb) (without ammunition)

Action: Gas unlocked, delayed blowback[1

Elevation: −15° to + 65°

Rate of Fire: 720 round/min

Muzzle Velocity: 1,050 m/s

Effective Firing Range: 1,500 m (4,900 ft) against aerial targets

↳*Gun Weapon Systems #1 Ammunition*

Type: Rifle

Caliber: mm20

Cartridge: 20×139mm

Basic Load: INA

Fire Control Systems

FCS Name: INA

Computerized FCS: No

Combat Data System: They are equipped with an Atlas Elektronik IMCMS combat data system.

Radar Systems

Navigation Radar: 1 x Decca TM 1229C navigation; or 1 x Consilium Selesmar NN 950 navigation radar

Sonar Systems

Hull Mounted Sonar: 1 x Thales 2022 Mk III Sonar

Minehunting Sonar: 1 x Thales PVDS Minehunting Sonar

Protection

Active Protection System: INA

Countermeasures: INA

NBC Water Washdown System: Yes

Notes:

In the Royal Netherlands Navy, the Tripartites are known as the Alkmaar class. The Alkmaars were originally of similar design to the Belgian and French versions, with a standard displacement of 520 tonnes (510 long tons) and 553 tonnes (544 long tons) at full load. The displacement later increased to 571 tonnes (562 long tons) standard and 605 tonnes (595 long tons) at full load and then 630 tonnes (620 long tons) standard and 660 tonnes (650 long tons) at full load. The 20 mm gun that was initially mounted was removed, leaving only three 12.7 mm machine guns. Beginning in 2003, the remaining Dutch Alkmaar-class minehunters were upgraded with improved electronics, including Atlas Elektronik INCMS combat data system, Thales 2022 Mk III hull-mounted sonar, Atlas Seafox Mine Identification and Disposal System and a Double Eagle Mk III Mod 1 ROV. The minehunters were constructed at the Van der Giessen-de-Noord yard in Amsterdam, a specially constructed site completed in 1978. Middelburg and Hellevoetsluis were optioned by Egypt, but due to financial issues, were instead completed for the Royal Netherlands Navy. Two ships of a modified design were built for the Indonesian Navy which led to the delay of Vlaardingen and Willemstad's construction. Ships in class (Netherlands) In 2000, three ships (Alkmaar, Delfzijl and Dordrecht) were withdrawn from service, followed by two more (Harlingen and Scheveningen) in 2003. All five were sold to Latvia with handovers beginning in 2007. Four more ships, (Haarlem, Maasluis, Middelburg and Hellevoetsluis) were decommissioned in 2011 following a series of deep budget cuts to the navy.

Land Based Electronic Warfare (EA) Systems

→Land Based Electronic Attack (EA) Systems

Optima-3 Belarusian GNSS Distributed Jamming Complex

Tiers:

System

Alternative Designations: GPS / GLONASS Jammer
Jammer Range: km100
Power Supply AC/DC: 220/24
Weight Transmitter: kg10
Frequency range:
Civilian: MHz1,575.42
Military: MHz1,227.6
Antenna and Transmitter: INA
Mount: Remote-Controlled
Fixed: Yes
Vehicle: Yes
Antenna Type: Omni directional
Transmitter: Continuous-wave with cable link to antenna
Signal: Complex frequency and interval waveform degrade the GNSS code.
Output Power: W20
Width of radiation pattern lobe: deg60 - -10
Vertical: deg40 - -10
Components: The main components are the operator's automated workstation and a control unit for each transmitter. .
Number of Transmitters: 9
Control System: ASU-PP automated control system. System status and situational awareness is monitored by the operator at the remote workstation
Command VHF: Yes

Command GSM: Yes

Control Link Range: km30-50

Command VHF: sec5

Command GSM: sec≤ 60

Operation: Designed to affect C2, maneuver and fire support activities. May affect high precision munitions.

Notes:

This variant is a remote-controlled distributed jamming system. The baseline system consists of nine transmitters (with some commonality with the Optima-2) and an ASU-PP (avtomatizirovannaya system upravleniya peredatchikami pomekh) automated control system. The number of elements is variable according to customer requirements. The ASU-PP runs off a 220 V, 50 Hz AC power supply and is used for remote activation of the distributed jammer fields. Situation data are monitored on the operator's workstation, including the jammer position information, which is shown on a terrain map. The jamming zones are presented in electronic form, showing the transmitter status and serviceability. The main elements of the Optima-3 are the operator's automated workstation and a control unit for associated command links. The workstation includes a computer with application software, LCD monitor, keyboard, mouse and uninterruptible power supply. The command link includes VHF radio and mobile telephone control equipment, a GSM antenna and a power supply unit. When controlled from a mobile telephone network (GSM-900/1800 standard), the Optima-3's remote-control range is limited only by the network coverage area, while its radio link gives a stand-off control range of 19-31 mi (30-50 km). Activation delay through the radio channel is no more than 5 seconds and less than 60 seconds through the GSM channel. The jamming subsystems includes a BPSS antenna unit, BPK power supply and control unit and BUS (blok upravleniya i svyazi) control and communications unit and jamming transmitter. Other equipment includes a directional VHF antenna with a 10-ft (3-m) long connection cable, a GSM antenna with a 3-ft (1-m) long connection cable, mains and battery power-supply cables. The Optima-3 is a dual-frequency system, with the output of its jammer reaching 20 W in each frequency. Its jamming waveform has a complex frequency and time structure that affects the GPS signal information component.

RB-531B Infauna Russian EA Jammer

Tiers:

1 2 3 4

System

Alternative Designations: None

Description: Modified BTR 80 chassis identified as the K1Sh1.

Height: m2.21

Weight: kg12,000

Length: m7.65

Crew: ea2

Troop Capacity: ea8

Combat Weight: mt14

Chassis Length Overall: m7.55

Height Overall: m2.41

Width Overall: m2.95

Ground Pressure: kg/cm2INA

Drive Formula: 8 x 8

Performance

Engine Type: INA

Cruising Range: km600

Protection: Against 5.56 ball 5.56, all-around

Speed: km/h

Max Road: 85

Max Off-Road: 60

Average Cross-Country: 40

Max Swim: 10

Fording Depths: mAmphibious

EW/JAMMING SYSTEM: INA

Frequency Jamming Range: MHz20 - 2020

Output Power: W60

Voltage Supply: V12.6

Weight of System (Separated from vehicle) (kg): 14

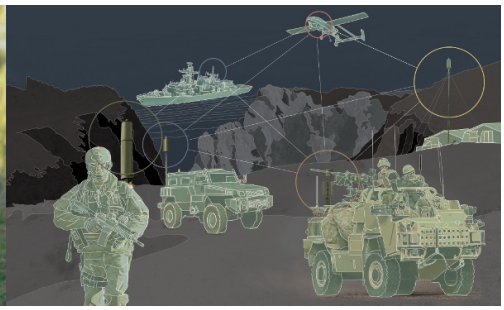
Deployment: Protects combat vehicles and troops against radio controlled mines and explosives (IEDs).

APS Capability: Softkill aerosol interference against high-precision weapons with laser and video-management systems.

Notes:

Fielded to: EW battalions in airborne forces of the Russian army. As part of the airborne forces, this system will be used to accompany initial entry troops and assist with securing key terrain to enable follow-on forces (motorized, mechanized, and armor) to deploy into combat areas.

RESOLVE British Portable Electronic (EW) System



Tiers:

System

Alternative Designation: RESOLVE EW
Microsoft Windows Capable: Yes, Windows-based analysis software (RTSAN)
Software: Mission Information System (RTMIS) software
Configurations: On-the-March/Short Halt, On-the-Move, and Static
Weight (Total): 15 kg (on-the-march configuration)
Battery Life (Standard 2590 battery): hours8-15
Intercept: 1 MHz-3 GHz
DF: 2 MHz-3 GHz
DF Accuracy: 5 deg (RMS) Typical
Wideband Stare: MHz40
Scan Rate: GHz1.5
Demodulation: AM, FM, SSB, CW
Enhanced Capabilities: Civilian Waveforms
Operating Temperature: -20° to +50° C
Note #1: THe RESOLVE is a modular system that consists of a number of nodes which can either operate as stand-alone or as a networked multi-node baseline for collaborative position fixing.
Note #2: Each Node Consists of: 1 x acquisition and Geolocation Sensor (AGS); 1 x Optional integrated EA capability; a Range of lightweight antennas; a PDA or laptop computer with modular software for operator control (for UK SEER contract these are rugged TEMPEST laptops from Secure Systems & Technologies Ltd), wireless capability for networking and signal analysis tools; and 1 x Dedicated back-pack.

↳*Acquisition and Geolocation Sensor (AGS)*

Receiver Type: two-channel wideband receiver
Frequency Range: 1 MHz to 3 GHz
Bandwith: 40 Mhz instantaneous bandwidth per channel
Burst Transmission Capable: Yes
Frequency Hopping Enabled: Yes
Software Algorithms: Roke's Software Defined Radio (SDR) algorithms
HF/VHF Frequency Range: MHz1-100
Low Noise Amplifiers: Yes
PMR Intercept Enabled: Yes
Geolocation Enabled: Yes
Low Probability of Intercept (LPI) Transmissions Capable: Yes
Signal Acquisition: Multiple simultaneous signal acquisition and processing
Two Channel DF Algorithms Enabled: Yes
Channels: Five time Multiplexed Channels
Digital Channels: Four Digital Down Converter (DDC) channels
GPS Enabled: Yes
Electronic Compass Enabled: Yes
USB 2.0 Interfacing Capable: Yes
N-Channel AGS Capable: Yes, RESOLVE provides the ability to discriminate nearby tactical HF groundwave transmissions from more distant strategic skywave and NVIS transmission

↳*Electronic Attack (EA)*

Units: Two manpack units
Frequency Range: 25 MHz to 2.5 GHz
Additional Amplifiers Capable: Yes, to achieve higher power outputs
Electronic Support (ES) Sensor Tasking and Monitoring: Yes
Electronic Attack (EA) System Cueing: Yes
Geolocation Enabled: Yes
Cellular Survey Enaabled: Yes
Wireless Network Manager: Yes
Management Information System (MIS): Yes
Geospatial Information System (GIS): Yes
COTS Target Signals Analysis packages: Yes

↳*Antennas*

QuadTac V/UHF Tactical DF Antenna Frequency: 30 MHz-3 GHz

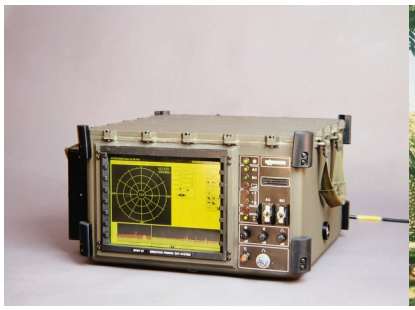
QuadTac-Mini Tactical DF Antenna Frequency: MHz30-700
MicroQuad HF/VHF Tactical DF Antenna Frequency: MHz2-100
TriQuad Tactical DF Antenna Frequency: 2 MHz-3 GHz
MastQuad V/UHF Mast Mounted DF Antenna Frequency: 30 MHz-3 GHz

↳

Notes:

The RESOLVE EW Manpack is a 100% UK state-of-the-art field proven Electronic Surveillance and Attack system. It benefits from having both the software and hardware developed in conjunction with Roke’s operational experts. RESOLVE is designed for the intercept, geolocation, exploitation and denial of tactical communications in the HF to UHF frequency bands, including ‘modern waveforms’. A single RESOLVE EW Manpack can be used in isolation to provide both full spectrum surveillance and Direction Finding (DF) capabilities. When networked with other RESOLVE systems it is then possible to position fix targets using Angle of Arrival (AOA) techniques.With fully integrated wireless network connectivity, the RESOLVE EW Manpack enables target data-fusion across the deployed baseline. This provides rapid target resolution, correlation and geolocation, through the use of the dedicated Management Information System (MIS) and Geospatial Information System (GIS) applications. RESOLVE is a modular system designed for intercept, geolocation and exploitation of tactical communications signals from 1-3,000 MHz, developed by Roke Manor Research, now Chemring Technical Solutions (TS). The system can exploit a range of signals, including Personal Mobile Radio and Cellular Communications (such as GSM). It consists of a number of nodes which can either operate as stand-alone or as a networked multi-node baseline for collaborative Position Fixing.

DFINT-3T2 Turkish Transportable Direction Finding (DF) System



Tiers:

System

Alternate Designation: DFINT-3T2 communications DF system
Type: Transportable Direction Finding (DF) System
Organization: ASELSAN A.S., Radar, Electronic Warfare and Intelligence Systems Division
In Service: 2000-present
Demodulation: AM, FM (SSB optional)
Frequency Range: MHz20-1,200
DF Accuracy: <1.5 deg RMS
LOB Resolution: deg0.1
Frequency (FFT) Resolution: 500 Hz-160 kHz selectable
Hopper Performance: better than 1,000 hops/s
Scan speed (with DF): better than 1,000 MHz/s
Power Generator Weight: kg8.8
Antenna Weight: kg10.5
Antenna Mast Weight: kg12
System Weight (Total): kg29.6
Dimensions: m6.25
GPS Receiver: External or built in
Power Generator: 220 V AC
Environment: MIL-STD-810E
Operating Temperature Range: -20 to +50°C
Storage Temperature Range: -40 to +70°C
Power Supply: 24 V DC or 110/220 V AC or Both
Monitor: 640mm x 480mm (8 colors)

Notes:

The tri-service DFINT-3T2 system is a transportable direction finding (DF) equipment that can intercept, take a bearing on, and analyse V/UHF band communications traffic. Emitter location is achieved via collaboration with other DFINT systems (with intercommunication being by radio or landline) and, according to the contractor, the equipment can handle state-of-the-art emitter types including frequency hoppers and burst transmitters. The system can be deployed with a standard lightweight, high-gain antenna, sub-band arrays and/or a range of application specific antennas that include disguised low-profile, airborne and heliborne types. In rough terrain land-based applications, the environmentally ruggedised DFINT-3T2 equipment can be deployed by a two-man team and the system presents data in either graphical or list formats.

1RL257 Krasukha-4 6x6 Mobile Russian Broadband Multifunctional Jamming Station

Tiers:

Variants:

- **Krasukha-2:** The Krasukha-2 is intended to jam AWACS at ranges of up to 250 kilometres (160 mi). The Krasukha-2 is also able to jam other airborne radars, such as radar guided missiles. The missiles, once jammed, are then provided a false target away from the original to ensure that the missiles are no longer a threat. The Krasukha-2 guards mobile high priority targets such as the 9K720 Iskander SRBM.

System

Alternative Designation: 1RL257 Krasukha-4; Krasukha-4
Type: Broadband Multifunctional Jamming Station
Manufacturer: KRET corporation, BAZ (for wheeled platform of Krasukha-4)
Family: Krasukha
In Service: 2010-Present
Chassis: Kamaz 6350 8x8 military truck chassis
Crew: ea3
Passenger Capacity: INA
Maximum Effective Range: km300
Turret Antenna: 2 Circular Antenna
Telescopic Mast: Yes, located at the rear of the vehicle
Hydraulic Stabilisers: Yes, 2 Hydraulic Stabilisers
Capability to Suppress Spy Satellites: Yes
Capability to Suppress Ground-Base Radars: Yes
Capability to Suppress Airborne Systems: Yes
Capability to Render Radio-Controlled Missile Attacks Ineffective: Yes
Note #1: A large turret is mounted at the top of a shelter mounted at the rear of an 8x8 military truck chassis.
Note #2: The Krasukha-4 system works by creating powerful jamming at the fundamental radar frequencies and other radio-emitting sources

Dimensions (Chassis)

Length: m9.3

Width: m2.5

Height: m3.25

Weight, Combat (Chassis Only): kg12,450

Automotive

Engine Name: KamAZ-740.50-360

Engine Type: Diesel

Engine Power: hp360

Cruising Range: km1,000

Speed, Maximum Road: km/h95

Speed, Average Cross: km/hINA

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.6

Trench: m1.4

Fording Depth: m1.75

Fire Control

Laser Target Desinator: INA

Protection

Armor: The cab can be fitted with a class 5a armour which provides a protection against firing of small arms AKM 7.62mm

Applique Armor: Available

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

IR Signature: INA

Notes:

The Krasukha-4 broadband multifunctional jamming station is mounted on a BAZ-6910-022 four-axle-chassis. Like the Krasukha-2, the Krasukha-4 counters AWACS and other airborne radar systems. The Krasukha-4 has the range to effectively disrupting low Earth orbit (LEO) satellites and can cause permanent damage to targeted radio-electronic devices. Ground based radars are also a viable target for the Krasukha-4. The Krasukha-4 is intended to neutralize Low-Earth Orbit (LEO) spy satellites, ground-based radars and airborne radars (AWACS) at ranges between 150 to 300 kilometers. The system is also able to cause damage to the enemy's EW (Electronic Warfare) systems and communications.

Hummel German VHF Jamming System

Tiers:

Variants:

- **Fuchs TpZ 1A1:** This version is a Hummel jammer mounted on a HELAS direction-finding vehicle.

System

Alternative Designations: Hummel
Description: Threat multi-range jammer.
Vehicle Range: km150-200
Power Supply: ac/dc6 / 15
Weight: kg8 – 12
Frequency Range: MHz1.5 - 3,000
JAMMING TRANSMITTER:
Transmit modulation: deception and burn through
FM Voice: YES
FM Telegraph / Teletype: YES
FMFacsimile: YES
AM Telegraph: YES
AM Voice: YES
PRESET FREQ: YES
BROAD JAM: YES
ATTACK JAM: YES
MANUAL JAM: YES
DECEPTION: YES
Broad jam bandwidth: up to 240 MHz, in 0.1 MHz steps, simultaneous generation of up to 16 separate broadband segments
Jamming efficiency: up to 16 simultaneously active radio nets
Mount: Fixed site, vehicle and airborne platforms available.

Antenna Type: Omni directional or directional yagi
FM Facsimile: YES
FM Morse Code: YES
AM Morse Code: YES
AM Facsimile: YES
Fast scan speed: MHz/s250 / 1000 (upgraded variant)
Passive Antennas: dipole or monopole antennas vertical or horizontal polarized omnidirectional antennas antennas for operation on the move
Amplifier types: broadband, solid-state, liquid cooled
Max output power kW into 50 Ω: kW10
Transmitter: Continuous-wave with cable link to antenna
Amplifier Power Consumption: kW25.4
Width of radiation pattern lobe: deg360
Automatic computer controlled jamming sequences: YES
High power Amplifier MAX: kWYES
“Look Through” Capability ensures jammer is only active when target signal is on the air: YES
Deception jamming: YES
Broadband TDM (barrage) jamming against simultaneous spread spectrum transmitters: YES
Programming protected frequencies: YES
Local or remote control: YES
Operation Temp: deg-25 - + 55
Storage Temp: deg-40 - +70
Frequency range: GHz6-18

Notes:

The Hummel is a tactical Very High Frequency (VHF) jammer with look through jamming capability. It is mainly intended to jam enemy multichannel links. The Hummel is the first generation of the Cicada-C family of jammers.

Meerkat-SA British Electronic Support Measures (ESM) and Electronic Intelligence (ELINT) System

Tiers:

System

Alternative Designation: Meerkat-SA

Type: Electronic Support Measures (ESM) and Electronic Intelligence (ELINT) System

Family: INA

Crew: INA

System Features: ·24hr, 365 days/year strategic Surveillance and Analysis ·Complements Radar Recognised Air and Surface picture: Identifies targets ·Early warning: Much longer detection range than target radars ·Automatic update of EOB ·Effective under local EMCON conditions ·Very high reliability + no on-site operators = low through-life costs ·Scaleable: up to 12 sensors

Sensor Features: ·Dual receivers and antennas for concurrent Surveillance and Analysis ·Optional digital receiver for increased sensitivity and in-depth ELINT collection & analysis

Surveillance Objectives: ·Monitoring cross-border activity: -assess possible military or political change -identify enemy weaknesses -counter intentions of enemies -detect incursions into EEZs ·Technical ELINT Collection (Digital Receiver Option) - precision parameter measurement,including “fingerprinting” -track movements, and/or assess the maintenance states of, specific instances of selected emitters -maintain national EW Intelligence Library Data Base for programming own Radar Warning, ESM and ECM systems (land, sea and air).

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Automotive

Prime Mover: INA

Notes:

Meerkat-SA is a network of high reliability ESM-ELINT sensors under remote control that detects, identifies and locates all radar emissions. It provides a fully automatic, real-time national air and surface picture of radar activity Meerkat-SA consists of a number of remote fixed site sensors that connect to a central command & control site via a national Wide Area Network. At this site operators control the remote sensors and local processors that identify the intercepts, fuse the data and maintain a

dynamic Electronic Order Of Battle picture.

R-330K Russian Mobile Automated Control Station

Tiers:

1 2 3 4

System

Automated Jamming Station

Quantity of controlled jamming stations: Up to 4 pairs

Quantity of automated work stations: 2

Quantity of automated tasks being solved: 30

Quantity of independent channels of telecode data exchange: 4

Quantity of radio channels for voice message exchange: 4

Setup time by a 4-person crew, min: not more than 15 min

Power consumption from embedded power station or from industrial alternating-current network: 220/380V, 50 Hz, kW

Protection

Armor: INA

Applique Armor: Available to protection against small arms fire and artillery shell splinters

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Personal CBRN equipment

Smoke Equipment: No

IR Signature: No

Notes:

R-330K mobile automated control station (CS) is intended for automated centralized handling of automated jamming stations (AJS) of R-325U, R-378A, R -330T, R-934B types and their modifications. Chassis: Ural-43203

Sapsan-Bekas Russian Mobile Anti-Drone System

Tiers:

System

Alternative Designation: Sapsan-Bekas

Type: Mobile Anti-Drone System

Operation: Sapsan-Bekas mobile system for detecting and disabling unmanned aerial vehicles (UAVs)

Crew: ea1

Chassis: The system is highly maneuverable since it is installed on an automobile chassis — this is a key requirement for various security agencies. Mobility is also important for civilian customers, since it allows you to quickly move the system from one facility to another

Maximum Range: The system can detect an UAV at a distance of 10 km, track its movement and disable it at a distance of over 6 km by suppressing communications and control of the UAV.

Subsystems: The device consists of three subsystems: signals detection and direction finding of drones, active radar, video and optoelectronic tracking, as well as a subsystem of radio suppression.

Monitoring: Sapsan-Bekas is capable of round-the-clock monitoring of the airspace and recognizing airborne objects using video and thermal imaging tools.

Modes of Operation: Sapsan-Bekas is capable of countering UAVs both in manual and automatic modes

Frequency Range: from 400 MHz to 6 GHz.

Friend or Foe: The system works on the “friend or foe” principle and does not affect UAVs, information about which is entered into the system’s database in advance. The subsystem can also work autonomously outside the system configuration due to a separate control panel.

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Notes:

Avtomatika Concern (part of Rostec) has presented the Sapsan-Bekas mobile system for detecting and disabling unmanned aerial vehicles (UAVs) at the International Military-Technical Forum ARMY-2019. The system can detect an UAV at a distance of 10 km, track its movement and disable it at a distance of over 6 km by suppressing communications and control of the UAV. The design has much better tactical and technical characteristics compared to all similar Russian and foreign systems that are

currently available. The device consists of three subsystems: signals detection and direction finding of drones, active radar, video and optoelectronic tracking, as well as a subsystem of radio suppression. Sapsan-Bekas is capable of round-the-clock monitoring of the airspace and recognizing airborne objects using video and thermal imaging tools. “This new system by the Avomatika Concern will become a part of Rostec’s products intended for countering both civilian and military UAVs. Sapsan-Bekas is capable of countering UAVs both in manual and automatic modes in a wide frequency range — from 400 MHz to 6 GHz. The system is highly maneuverable since it is installed on an automobile chassis — this is a key requirement for various security agencies. Mobility is also important for civilian customers, since it allows you to quickly move the system from one facility to another”, said the Executive Director of Rostec, Oleg Evtushenko. The UAV radio suppression subsystem used in the Sapsan-Bekas is called Luch (Russian: ray, beam), which will also be presented for the first time in ARMY-2019. It affects the drone’s channels of navigation, control and transmission of information, simultaneously blocking eleven wave frequency bands. The system works on the “friend or foe” principle and does not affect UAVs, information about which is entered into the system’s database in advance. The subsystem can also work autonomously outside the system configuration due to a separate control panel. “One of the main advantages of the Sapsan-Bekas is its versatility and flexibility. The functionality of the system is easy to adapt to the needs of customers. For example, civilian companies, including energy companies, are mostly interested in signals intelligence equipment, and often don’t need radiolocation capabilities — the concern is ready to make a product for them in the required configuration”, said Vladimir Kabanov, CEO of the Avtomatika Concern. The company is already prepared to deliver Sapsan-Bekas to civilian customers. Before supplying to security agencies is possible, the system must first pass the testing scheduled for autumn 2019.

R-934B Russian VHF Air Communication Automated Jamming Station

Tiers:

1 2 3 4

System

Trench: m1.2

Fording Depth: m1.75

Jamming Station

Operating Frequency Range: MHz 100 - 399,995

Transmitter Output Power: not less, W - 500

Quantity of Simultaneously Jammed Frequencies: In fixed frequencies mode – up to 4; In POFC mode - 1;

Frequency Spacing: kHz - 4,16

Root-mean-square error of direction finding, degree (not more than): 2 Deg

Frequency Range Scanning Rate (without difection finding): MHz /s 7500

Mean time of station reaction during jamming in autonomous mode (during operation by list of 200 preset frequencies in simultaneous scanning band, not more): 5 ms

Accuracy of carrier frequency definition (not more): 4 kHz

Relative frequency deviation from the nominal (not more): 3 x 10

Receiver sensitivity (not worse): mV 1,5

Protection

Armor: INA

Applique Armor: Available to protection against small arms fire and artillery shell splinters

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Personal CBRN equipment

Smoke Equipment: No

IR Signature: No

Notes:

R-934B automated jamming station is intended for jamming of VHF air communication means, air guidance tactical systems and also for jamming of ground fixed and mobile communication lines, cellular and trunk networks which operate at fixed frequencies as well as in program operating frequency change (POFC) mode and short telecode data messages transfer.

Kvant 1L222 Avtobaza Russian 6x6 Electronic Support (ES) Electronic Intelligence (ELINT) System

Tiers:

System

Alternative Designations: Kvant 1L222 Avtobaza
Description: Passive ELINT signals intercept system designed to intercept and locate pulsed airborne radars including fire control radars, terrain following radars and ground mapping radars as well as weapon (missile) data links.
Manufactuer: Kvant
In Service: 1980s-Present
Crew: ea4
Max ELINT Range: km150
Radar Detection Frequency Range: MHz8000-17544
Jamming Module Capable: Yes, capable of disrupting airborne radars including fire control radars, terrain following radars and ground mapping radars as well as weapon (missile) data links
Coverage: deg360
Number of Targets Simultaneously: ea60
Target detection/data transmission-to-APUR delay: 500 Microseconds
Probability of Radar Type Classification: 0.8 (with 1.0 being 100%)
Into/out-of-action time in minutes: not more than 25 minutes
Power Consumption: not more than 12 kilowatts

Dimensions (Chassis: Ural-4320)

Length: m7.37
Width: m2.5
Height: m4.35
Weight, Empty: tons8
Payload capacity (on road): tons6
Payload capacity (off road): tons4.5
Maximum Tow Capacity: tons12

Operation Temperature: -45 - 40

Humidity: %98

Notes:

The Kvant 1L222 Avtobaza is an ELINT system designed to detect Side looking airborne radars, air-to-ground fire-control radars and low-altitude flight control radars, as well as to provide intelligence data for the 1L125M APUR. The ELINT system displays on the TV screen acquired targets with data on their direction finding, angular coordinates (azimuth and elevation), radiation signal parameters (carrier frequency, duration, pulse repetition frequency) and radar type classification (sidelooking, fire control, low-altitude flight control radar). The APUR automated jamming control system is fed with target data (frequency band number according to frequency assignment of jamming systems, type of emitting radars and their angular coordinates) via cable at a range of up to 100 meters. There are unconfirmed reports of the system being used in the capture of an RQ-170 UAV by the Iranian forces on 4 December 2011. There are also unconfirmed reports of it being used by the Russian forces during the Crimean Crisis in March 2014 to overtake controls of an American drone.

R-330Zh Zhitel Russian Cellular Jamming and Direction Finding System

Tiers:

System

Alternative Designation: Zhitel

Crew: ea3

Troop Compartment Capacity: NA

Maximum Effective Range: km25

Time Required to Deploy the System: minLess than 40

Power Source: Diesel electricity generators

Navigation equipment: KS-100M

Height: m2.71 m

Weight, Combat: kgINA

Automotive

Prime Mover: Ural-43203 (May also be on the KAMAZ-43114, 6 x 6)

Engine Name: YaMZ-236M2 / YaMZ-238M2

Engine Type: V-6 Diesel / V-8 Diesel

Engine Power: hp180 / 240

Cruising Range: kmINA

Speed, Maximum Road: km/h85

Speed, Average Cross: km/hDue to fragile state of trailer, crew avoids cross country travel

Speed Maximum Swim: km/hNA

Fording Depth: mINA

Maximum Payload: kg4,500

Protection

Armor: N/A

Applique Armor: N/A

Active Protection System: N/A

NBC Protection: Yes

Smoke Equipment: No

Basic EW Specifications

Operation frequency range: From 100 to 2000 MHz

Azimuth search coverage: -90 to 120°

Elevation search coverage: -15 to +20°

Jamming: From 1227.6 MHz; 1575.42 MHz and 1500 to 1900 MHz

Main power supply: 220/380V 50 Hz

Emergency power supply: With two batteries 6CT-190

Radar type: Phase array (4 each)

Notes:

The R-330Zh also named Zhitel is a jamming communication station designed and manufactured by the Russian Company Protek. The system is in service with the Russian army. The whole system includes one Ural-43203/KAMAZ-43114 truck and one shelter with four telescopic masts. The truck is the control center for the operators. The shelter is equipped with four telescopic active phased array transmitter antennas mounted on a four-wheel trailer. The R-330Zh is designed for detection, analysis, direction-finding and jamming of satellite and cellular phone communication systems operating in the frequency band from 100 MHz to 2,000 MHz. The jamming system provides analysis and selection of emitters' signal parameters. The R-330Zh jamming station was used by the Russian army during the Crimean crisis in March 2014. The system is designed to accomplish the following tasks: detection, direction finding, and jamming of wearable mobile stations of mobile satellite communications such as Inmarsat and Iridium; detection, direction finding, and jamming base stations of cellular communication, standard GSM 1900, consumer navigation equipment; and jamming of satellite communications systems NAVSTAR (GPS). The R-330Zh can operate in stand-alone mode as well as in pairs, both master and slave under the control of the primary R-330Zh. Because the system in the trailer is fragile, it will likely be found close to a road; it is unlikely that the system will be taken cross-country. The Zhitel system is part of the inventory of the EW brigades' REB-S battalions, and, in addition to the tasks listed above, can be used for jamming an aircraft's communication and satellite navigation (GPS, Galelo, BeiDou, etc.). T he Zhitel system attracted an extraordinary amount of attention in 2015 when it was reported by the Organization for Security and Co-operation in Europe to have been used in eastern Ukraine, supposedly to impede the use of drones by suppressing GPS signals (OSCE 2015).

Murmansk-BN Russian Long-Range Communications Jamming System

Tiers:

System

Alternative Designation: Murmansk-BN

Type: Long-Range Communications Jamming System

Manufacturer: KRET

In Service: 2016-Present

Crew: INA

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Note: Chassis not identified

Automotive

Note: Chassis not identified

Jamming System

Maximum Coverage: 3,000 km

Frequency: INA

Target: The primary target of the Murmansk-BN is the West's High Frequency Global Communications System (HFGCS).

Note: The HFGCS is a worldwide network of transmitters which provides command and control communications between ground agencies and US military aircraft and ships. Washington’s military partners in NATO are said to have access to this network.

Protection

Note: Chassis not identified

Notes:

The Murmansk-BN is a long-range communications jamming system specially designed to take out NATO and United States (US) high frequency military satellite communications. The Murmansk-BN electronic warfare (EW) system is being developed by KRET and has a maximum coverage of 3,000 kilometers (5,000 km or 8,000 km from other sources). This system was developed as part of a Russian strategic electronic warfare system and operates as a network centric capability. The primary target of the Murmansk-BN is the West's High Frequency Global Communications System (HFGCS). It was unveiled in November 2016 as the system prototype was achieving some test successes.

RP-377UVM3 Russian Man-Portable Automated Jammer

Tiers:

System

Alternate Designation: RP-377UVM3

Type: Man-Portable Automated Jammer

Manufacturer: INA

In Service: 2009-Present

Crew: 1

Dimensions

Length: mm300

Width: mm170

Height: mm162

Weight, without Battery: 7 kg

Jamming System

Frequency Jamming Range: 26MHz -1 950 MHz

Output Power: 24 W

Supply Voltage: 12.6 v

Summed Current Consumption: 8.8 A

Operating Temperature Range: -20°C - +40°C

Notes:

RP-377UVM3. The items are designed for jamming and blocking local radio communication lines and control both in stationery conditions and in movement and also for protection from radio-controlled explosive devices. The equipment can be placed in armoured vehicles, automobiles, manpacks and in case.

mobile automated KTK, radioelectronic imitation and jamming system (mobilnyi avtomatizirovannyi KTK, radioelektronnoi imitatsii i postanovki pomekh, MKTK REI PP

Tiers:

1 2 3 4

System

Alternative Designation: Tigr-M MKTK REI PP Leer-2 VPK-233114 Mobile Electronic Warfare system EW vehicle

Type: Mobile Electronic Warfare system EW vehicle

Manufacturer: designed and manufactured by two Moscow-based companies, VPK (Voyenno-promishlennaya kompaniya - Military-industrial company) for the vehicle and VNII Etalon (Vserossiyskiy naucsno-issledovatelskiy institut - Russian Scientific-Research Institute) for the Electronic Warfare (EW) system

Family: Leer

In Service: 2012-Present

Crew: 2 + 4 Soldiers

Liter/Stretcher Capacity: INA

Winch: The Leer 2 carries an electric winch with a pulling force of 4,000 kg and 20 m of wire rope

Note: This high mobility vehicle was modeled after the US HMMWV

Dimensions (Chassis: GAZ Tigr-M)

Length: m5.7

Width: m2.3

Height: m2.3

Weight, Combat: kg7,800

Automotive (Chassis: GAZ Tigr-M)

Engine Name: YaMZ-5347-10

Engine Type: Turbol-Charged Diesel

Engine Power: hp215

Side Slope: %40

Vertical Step: m0.4

Trench: m0.5

Fording Depth: m1.3

Note: To protect the engine from small-arms fire, the bonnet is armoured

Communications

Primary: INA

Electronic Warfare Equipment

Electronic Warfare Equipment Name: Lorandit

Mission Sets: ESM, EA

Electronic Warfare (EW) Type: The Leer 2 is a mobile technical control, electronic emulation and electronic countermeasures system Leer-2 is designed for developing radio emitters, jamming and suppressing radio-electronic means including cellular phone systems

Operate on the Move: Yes

Operate Stationary: Yes

Antennas: All the antennas of the electronic warfare system Leer-2 are mounted on a platform fitted on the vehicle roof. In static position, two telescopic antennas can also be deployed on the vehicle roof

Maximum Range: INA

EW Components: The Lorandit system of the Tigr-M MKTK REI PP includes technical control and electronic intelligence automated workstation, electronic countermeasures equipment, communication and power supply equipment and a specialized mission software

Note #1: In addition, the system can be used as part of field tests to create realistic tactical electronic situations and imitating the operation of various radio-electronic systems

Main Gun

Note: The Leer 2 is not equipped with any Armament, due to the EW equipment

Fire Control

FCS Name: INA

Computerized FCS: Yes

Gunner Sight System: PC-SU IPTSYU.201219.026

TV Camera: Yes, low-level TV camera that provides a range of detection and identification of the target sample with a narrow field of vision - not less than 2500 m

Laser Rangefinder: Yes, with a range of 100-3,000 m

Protection

Armor: The hull of Leer 2 provides protection against small-arms fire, shell fragments and IED blasts

Applique Armor: Available

Amored Hood: Yes

Doors and Windows: The hull and door windows are bulletproof and the vehicle’s spall liners protect personnel against spalls if the hull is hit by bullets or fragments and exclude ricochet from the opposite side if the hull is pierced

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes

Fire Extinguishing System: Yes

Notes:

The Leer-2 is a jamming system based on the Lorandit family of electronic warfare systems Tigr armored vehicle and capable of imitating electronic weapon systems and monitoring the electromagnetic environment during combat training. The Leer-2 is designed for developing radio emitters, jamming and suppressing radio-electronic means including cellular phone systems. In addition, the system can be used as part of field tests to create realistic tactical electronic situations and imitating the operation of various radio-electronic systems. The Leer-2 is based on the 8-ton class Tiger-M 4x4 high mobility tactical armored vehicle.

1L269 Krasukha-2 Russian 8x8 Mobile Electronic Warfare (EW) System

Tiers:

Variants:

- **1L269 Krasukha-4:** The Krasukha-4 broadband multifunctional jamming station is mounted on a BAZ-6910-022 four-axle-chassis. Like the Krasukha-2, the Krasukha-4 counters AWACS and other airborne radar systems. The Krasukha-4 has the range to effectively disrupting low Earth orbit (LEO) satellites and can cause permanent damage to targeted radio-electronic devices. Ground based radars are also a viable target for the Krasukha-4

System

Alternative Designation: 1L269 Krasukha-2
Type: 8x8 Mobile Electronic Warfare System
Manufacturer: KRET corporation, BAZ (for wheeled platform of Krasukha-4)
Family: 1L269 Krasukha
Mission: The Krasukha-2 is intended to jam AWACS at ranges of up to 250 kilometres (160 mi)
Crew: ea3
Payload Capacity: tons18-20
Chassis: BAZ-6909
Note: The Krasukha-2 guards mobile high priority targets such as the 9K720 Iskander SRBM

Dimensions (Chassis: BAZ-6909)

Length: m11.3
Width: m2.75
Height: m2.85
Weight, Empty: tons22

Automotive (Chassis: BAZ-6909)

Engine Name: YaMZ-8424.10

Engine Type: Diesel

Engine Power: hp470

Cruising Range: km1,000

Speed, Maximum Road: km/h70

Speed, Average Cross: INA

Trench: m2.0

Fording Depth: m1.2

Communications

Primary: INA

Radar Jamming System

Type: Krasukha-2

Purpose: The Krasukha-2 is intended to jam AWACS

Jamming Maximum Range: km250

Radar Guided Missile Jamming: Yes

Note: The missiles, once jammed, are then provided a false target away from the original to ensure that the missiles are no longer a threat

Protection

Armor: It is also proposed with concealed built-in internal armor

Applique Armor: Available

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: No

IR Signature: No

Notes:

The 1L269 Krasukha-2 is ground-based electronic warfare (EW) system intended to neutralize Airborne Warning and Control Systems (AWACS) by jamming its radar at ranges of up to 250 kilometers. Besides, the Krasukha-2 can provide protection to ground forces on the march by jamming any airborne radar, radar-guided weapon system or radar-guided missile. The missiles jammed by the 1L269 are unable to reach their intended target because they are provided with a false target away from the

real one. The false target is finally hit by the jammed missile or weapon system. The Russian Armed Forces use the 1L269 Krasuha-2 to protect the Iskander tactical ballistic missile units. The KRET corporation produces this EW system integrated onto a tactical truck system. The 1L269 Krasukha-2 is mounted on a BAZ-6909 Special Wheeled Chassis.

Groza R-934UM2 Russian 6x6 HF/VHF Electronic Warfare (EW) System

Tiers:

1 2 3 4

Variants:

- **R-934UM:** INA
- **R-378AM:** INA

System

Alternative Designation: Groza R-934UM2

Type: HF/VHF Electronic Warfare (EW) System

Family: R-934 Family

Crew: INA

Purpose: detecting emission sources, higher direction-finding accuracy, digital jamming signal generation, positioning and jamming of radio lines with programmed operational frequency readjustment or simultaneously 16 radio lines operating at fixed frequencies

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Automotive

Prime Mover: MT-LB

Electronic Warfare System

↳*System*

Name: Groza R-934UM2

Type: Seach, Detection and Jamming

Frequency-Hopping radio Communication Links: Yes

Manufacturer: KB Radar

Radio Lines: ea16 radio lines operating at fixed frequencies
VHF/UHF Fixed-Frequency: Yes
Detector/Direction-Finder: Yes, with receiving and direction-finding antenna-feeder system
Workstations: two automated operator workstations
Channel Radio Transmitter: Nine-channel radio transmitter
Transmitting Antenna-Feeder Systems: seven transmitting antenna-feeder systems
Generators: transporter truck with two power generators and shelter

Notes:

The R-934UM2 Groza is a jamming stations is part of electronic warfare system developed by “KB Radar”. The R-934UM2 Groza is a similar to the R-934UM and R-378AM, but it enables higher speed of detecting emission sources, higher direction-finding accuracy, digital jamming signal generation, positioning and jamming of radio lines with programmed operational frequency readjustment or simultaneously 16 radio lines operating at fixed frequencies.

TRC 274 French Mobile Multirange Communications Jamming System

Tiers:

System

Alternative Designation: TRC 274

Type: Multirange Communications Jamming System

Manufacturer: INA

Chassis: INA

Crew: eaINA

HF: 1.5-30 MHz

Operation: The modular TRC 274 digital jamming system is designed to neutralise military, paramilitary and civilian communication links and networks operating in the 1.5 MHz to 1 GHz (extension up to 3 GHz if required) frequency range. The equipment comprises electronic countermeasures and support subsystems and is capable of intercepting and monitoring signals, establishing their frequencies and setting up an optimum jamming strategy based on integral emitter and jamming mode databases. TRC 274 can operate as a stand-alone unit or as part of an integrated electronic combat architecture and can identify targets via its own electronic support subsystem or from cues supplied by external battlefield electronic warfare equipments.

Jamming Functions: The system incorporates automatic jamming functions and makes use of programmable algorithms to generate the best output for the particular emitter type (fixed-frequency, frequency hopper or burst) in the particular environment (high- or low-density network).

C/UHF: 20-3000 MHz

Embedded ESM for Smart Jamming: 80 MHz bandwidth

High ECM Performances: 60 MHz bandwidth

Waveforms: Open library of jamming waveforms

Frequency Range: 1.5-1,000 MHz (1.5-30 MHz and 20-1,000 MHz sub-bands, 3 GHz option)

Output: up to 1 kW

Chirp: <1 MHz

Note: Other system features include a Windows NT man/machine interface, 100 W to 1 kW amplifier output power (other values available as options) and emitter specific jamming and deception modes.

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Notes:

TRC 274 is a high performance wideband tactical jammer designed to degrade, disrupt, deny, neutralize or deceive all types of radio communications, from VHF to UHF frequency bands. HF and SHF versions are also available. It can be integrated in a comprehensive Electronic Warfare system or rely on its own ESM capacity to carry out in autonomous mode any terrestrial, naval or airborne communication jamming missions. *High performance ESM capacity to provide efficient detection of targets *Powerful up to 1kW effective power *Able to be integrated in all kinds of platforms (land, air, naval) *Compatible with mission planning solution for jamming optimization *HF: 1.5-30 MHz *V/UHF: 20-3000 MHz Multi-modes ECM capacity: *Selective jamming (spot, responsive) *Smart barrage jamming *Deception *Follower-jamming *DRFM repeater

Groza-R2 Russian Counter-Multicopter Jammer

Tiers:

System

Alternative Designation: Groza-R2
Type: Counter-Multicopter Jammer
Manufacturer: INA
Crew: ea1
Frequency Bands of Control Channels Jammed: 2400-2480 MHz 5725-5850 MHz
Frequency Band of Satellite Radio Navigation Systems Jammed: 1570-1610 MHz
Jamming Range of UAV Satellite Radio Navigation Systems: minimum 1 km
Jamming Range of UAV Control Channel: up to 1 km (when a multicopter is at least 200 m away from the operator's control console)
Output Power at Frequencies of 2.4 GHz: minimum 4 W
Output Power at Frequencies of 5.8 GHz: minimum 3 W
Output Power at Frequencies of GPS and GLONASS Satellite Radio Navigation Systems: minimum 1 W
Continuous radiation time: minimum 30 min.
Power supply: storage battery
Protection rating IP: IP54

Dimensions

Length: INA
Width: INA

Height: INA

Weight, Combat: maximum 6.5 kg

Notes:

The “Groza-R2” counter-multicopter jammer is designed for prevention of trespassing by multicopters into the territory of the protected facilities. The “Groza-R2” fulfills the following tasks: - jamming of multicopter control channels; - jamming of on-board equipment of GPS and GLONASS satellite navigation systems.

Notes:

The Rtut-BM, 'Mercury-BM' in English, is an electronic warfare (EW) system intended to protect troops and equipment from artillery rockets and shells equipped with proximity fuses which explode at 3-5 meters of altitude. The Rtut-BM affects the proximity/radio-controlled fuse making it explode at higher altitudes keeping the troops and equipment safe. Besides, the system is able to neutralize radio-frequencies employed by the enemy's communications. The Rtut-BM system is deployed on an MT-LB armored vehicle fitted with a television antenna which provides coverage for an area of 50 hectares (500,000 square meters) or a semi-sphere of 400 meters radius. The antenna can rotate -/+150-degree and its jamming signal can last for six minutes. This EW system requires a crew of two-man and can be ready for jamming within 10 minutes. The KRET corporation has been manufacturing and delivering KRET systems to the Russian Armed Forces since 2011.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

Mission: The 85V6-V ELINT system is designed to perform radio reconnaissance and location of ground, surface and airborne radio-emitting sources, disclosure of command, control and communications systems, radio control and detection of radio-emitting sources. Composition • three detection and direction-finding stations providing radio-emitting sources detection, direction finding, classification, analysis and registering • central classification and control station Each station has autonomous power supply and is accommodated in two air-conditioned box-bodies mounted on KamAZ trucks. The detection and direction-finding station is designed for all-round detection and direction finding of radio-emitting sources, radio transmission classification, signal analysis and intercept. Stations can be used both autonomously and make part of the 85V6-V ELINT system. The central automated classification and control station is designed to control operation of detection and direction-finding stations, to locate radio-emitting sources, to collect, process and display electronic situation data within coverage of the 85V6-V system. It ensures the system's autonomous operation and integration into other automated SIGINT/EW systems. The central control station executes the following operations: digital processing of bearings data, determination of radio-emitting sources coordinates, and their mapping on cartographic background; two-way coded voice/data communications between detection/direction-finding stations and SIGINT/EW system control post stationed at the range of up to 15 km; mission planning and control for up to three detection/direction finding stations; automated ELINT data collecting, processing, classification and database management; comparative electronic situation analysis for different data combinations and change dynamics; recording of operation results. In general, the 85V6-V system provides: • automatic panoramic search, detection, measurement of signal parameters and classification of types of radio transmissions; • radio-emitting source detection, direction finding and location, and position display against map background; • collection, accumulation and comparative analysis of electronic situation data for different combinations and change dynamics; • radio intercept with data recording; • technical analysis of radio-emitting source signals; • automated preparation of standardized messages. The 85V6-V system can be used both autonomously and within automated SIGINT/EW systems.

Vera-E Czech Republic Electronic Support Measures System

Tiers:

Variants:

- **Tactical PSS VERA-E:** This is a variant of the export VERA-E PSS. System components are housed in a vehicle for faster cell transfer and implementation hiding. The system usually comprises three ESM receivers arranged in an equilateral triangle, with each station covering a 120-degree, fan-shaped area, for a total of 360 degrees.
- **VERA-Next Generation (VERA-NG):** This is the successor system to the VERA-E. VERA-NG utilizes new ESM technology that uses the combined time difference of arrival (TDOA) features of the VERA-E with user-friendly features providing faster deployment, according to Jane's Defence Weekly for May 6,2009.
- **VERA-P3D:** The VERA-P3D is a commercialized variant with a shorter range. Its primary use is to monitor the response of the transmitter ground facilities at airports.
- **VERA-AP:** The VERA-AP is a commercialized variant used in long-range surveillance for air traffic and civil works. It operates in the band range from 1030-1090 Mhz.
- **VERA S/M:** The first of two mobile VERA S/M systems was delivered on Dec. 7, 2004, to the 53rd Passive Surveillance Center at the ceremony in Ceske Budejovice, Czech Republic. In 2006, the system joined a spearhead within the NATO Response Force (NRF) that is known as a Very High Readiness Joint Task Force (VJTF). It also serves as a back-up for radar systems of the Air Traffic Control Center of the Czech Republic, according to the Czech Ministry of Defense.

System

Alternative Designation: Vera-E

Type: Electronic Support Measures System

Crew: INA

Maximum Range: 450 km

Power COnsumption: 250 W

Field of View: 120-deg 360-deg (option)

Frequency Range: 1-18 GHz, 0.1-1 GHz (option), 18-40 GHz (option)

Mode Of Operation: The deployed system typically comprises a central site (containing the signal processing equipment and an ESM receiver) and two or three side sites containing only an ESM receiver. The side sites relay the signals received to the central site over a point-to-point microwave link. The central site uses the known propagation delay from the side sites to estimate the TDOA of the pulses at each site. The TDOA of a pulse between one side site and the central site locates the target on a hyperboloid. A second side site provides a second TDOA and hence a second hyperboloid. The intersection of these two hyperboloids places the target on a line, providing a 2D measurement of the target's location (no height). A third side-site provides a third hyperboloid, which, when intersected with the line provided by the other two side sites, provides a full 3D location of the target. This process is known as multilateration. The height of a target with an SSR Mode C or Mode S transponder can also be provided by decoding the Mode C or Mode S response directly, which is the normal mode of operation for the civilian VERA-AP system.

System Accuracy: System accuracy is typically better than a microwave surveillance radar, and is a function of the deployment geometry, the inherent timing accuracy of the central site, the bandwidth of the pulse being detected and the

signal-to-noise ratio. Wider separations of the side sites from the central site provide better accuracies – but at the expense of a reduced area of common coverage. Typically side sites are deployed 15-40 km from the central site, providing a reasonable compromise of coverage and accuracy. The system is generally line-of-sight limited, with a nominal range of 450 km, the normal radio horizon. Detection of targets is within a sector of approximately 120 degrees, although IFF and SSR targets are detected using a dedicated omnidirectional antenna, and hence may be seen over 360 degrees. Up to 200 targets can be automatically tracked simultaneously, with an output rate adjustable from 1 to 5 seconds.

Exploited Emitters: The current generation sensor can only detect and track pulsed emissions, due to the requirement to measure the time of arrival of pulses. The receivers operate in the frequency range of 1-18 GHz and typically exploit secondary surveillance radar (SSR) transponders, identify friend or foe (IFF) transponders, airborne radars, weather radars, tactical air navigation (TACAN) transponders, distance measurement equipment (DME) beacons, digital communications signals and pulsed jamming signals.

Dimensions

Receiving Station Length: 1.3 m

Receiving Station Width: 0.9 m

Receiving Station Weight: 120 kg

Antenna Unit Length: 2.0 m

Antenna Unit Width: 0.9 m

Antenna Unit Weight: 300 kg

Notes:

VERA-E is the export version of the military ESM version of the system, also referred to as the VERA-S/M in its national mobile version. In addition, the shorter range VERA-P3D system is marketed for highly accurate monitoring of transponder-equipped ground vehicle movement at airports. The manufacturers also market an ESM triangulation system known as BORAP. VERA - VERA passive radar (in Czech known as Věra) is an electronic support measures (ESM) system that uses measurements of time difference of arrival (TDOA) of pulses at three or four sites to accurately detect and track airborne emitters. It is reportedly able to detect military "invisible aircraft".

Borisoglebsk-2 (RB-301B) Russian Multi-Functional Electronic Warfare (EW) Weapon System

Tiers:

System

Alternative Designation: Borisoglebsk 2
Family: Borisoglebsk
Manufacturer: UIMC to the Russian armed forces
In Service: 2015-Present
Mission: esigned to disrupt communications and GPS systems
Crew: eaINA
Note: esigned to disrupt communications and GPS systems

Dimensions (Chassis: MT-LB)

Length: m6.45
Width: m2.86
Height: m1.86
Weight, Combat: kg11,000
Ground Pressure: kg/cm20.46 standard track / 0.28 wide track

Automotive (Chassis: MT-LB)

Engine Name: YaMZ 238 (Newer versions have the KamAZ-740.50 engine / 360 horsepower)
Engine Type: Diesel
Engine Power: hp240

Cruising Range: km500

Speed, Maximum Road: km/h60

Speed, Average Cross: 30

Speed Maximum Swim: km/h5

Fording Depth: mAmphibious

Communications

↳*R-173*

Frequency Range: 30.00 - 75.99 MHz

HF Output: W30

Mudulation: FM

Display: Digital

Entry of Frequency: Touchpad

Preset Channels: 10

Digital Transmission: INA

Sensitivity: 1.5 uV

Range: K50

Operational Voltage: 27+-2v

Weight: kg43

Dimensions: mm428 × 222 × 238

Electronic Warfare System

Maximum Range: INA

Note #1: "The 'Borisoglebsk-2' when compared to its predecessors has better technical characteristics: wider frequency bandwidth for conducting radar collection and jamming, faster scanning times of the frequency spectrum, and higher precision when identifying the location and source of radar emissions, and increased capacity for suppression."

Note #2: "Borisoglebsk-2 can suppress all modern radio communications from the world’s most developed countries" (stated by Mikhail Artemov, Chief Designer of Electronic Warfare and weapon control systems)

Primary Weapon System on Most Variants

↳*System*

Name: PKT

Type: 7.62 mm, machine-gun

↳*Ammunition*

Type: API, API-T

Caliber: mm7.62

Muzzle Velocity: m/sINA

Basic Load: rounds1,500

Max Effective Range (Day): m1,000

Max Effective Range (On the move): m500

Maximum Aimed Range: m1,500

Min Range: kmINA

Armor Penetration: 8mm of RHA at 500m

Other Ammunition Types: Light Ball, Ball-T, Heavy Ball, Incendiary

Fire Control

Name: PP-61AM, 2.6x

Protection

Hull Armor: mm14

Turret Armor: mm14

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: Optional

NBC Protection: Yes

Smoke Equipment: No

Night Vision Device Capable: Yes. Some versions have spot lights.

Notes:

Borisoglebsk 2 is a Russian, MT-LB ground vehicle-mounted, multi-functional electronic warfare (EW) weapon system. It was developed by Sozvezdie over a six-year period, from 2004 to 2010. The system was however not ordered, or for other reasons not manufactured or delivered, at once to the Russian military. Starting in February 2015, it has been manufactured and delivered by UIMC to the Russian armed forces. It is designed to disrupt communications and GPS systems. Borisoglebsk 2 achieved initial operating capability in 2010 but was not ordered and delivered to the Russian military until February 2015. Rossiyskaya Gazeta reported that Borisoglebsk 2 was the core system for electronic warfare in the Russian Army, controlling four types of jamming units from a single point. Experimentation and testing were conducted after the first deliveries to the Russian armed forces. The system was in active use by the summer of 2015, in eastern Ukraine. It has been claimed that the system has caused difficulties for NATO, supposedly defeating GPS and mobile telephony systems in parts of that country. The United States military commander in Europe, general Frederick Hodges stated to Defense News, that Russia is conducting electronic warfare in eastern Ukraine that even NATO would have difficulties resisting, but did not mention Borisoglebsk 2. US

advisers sent to Ukraine have learned about Russian electronic warfare from the Ukrainian Army, though Ukraine never has had access to this new EW-technology. The American advisers are nevertheless impressed even with earlier Russian EW-technology in the hands of the Ukrainian Army

RP-377L (Lorandit) Russian Compact Multifunctional Radio Monitoring, Direction-Finding and Jamming Complex

Tiers:

System

Alternative Designation: RP-377L (LORANDIT)

Type: Compact Multifunctional Radiomonitoring, Direction-Finding And Jamming Complex

Chassis: The RP-377L complex can be vehicle mounted or placed in two cases and four canvas bags, and be carried by 2-3 persons.

Crew: 2-3

Displacement: Less than 15 min

Emplacement: Less than 15 min

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Note: The RP-377L complex can be vehicle mounted or placed in two cases and four canvas bags, and be carried by 2-3 persons.

Electronic Warfare System

Frequency Range, Search and Detection: 20-2000 MHz

Frequency Range, Direction and Finding: 25-2000 MHz

RMS Direction-Finding Error: not more than 3 degrees

Instant Monitoring Bandwidth: 180-1200 kHz

Types of Searching Signals: FM, AM, SSB, FSK, PSK

Transmitter Output: greater than 100 W

Automotive

Note: The RP-377L can be vehicle mounted or carried by 2-3 people.

Notes:

The RP-377L (LORANDIT) Compact Multifunctional Radio monitoring, Direction-Finding and Jamming Complex provides for the search of, position location, and jamming of VHF/UHF radio electronic communications. The RP-377L complex can be vehicle mounted or placed in two cases and four canvas bags, and be carried by 2-3 persons. Depending on mission requirements, multiple complexes can work together, with one complex configured as a command post.

85V6-A Vega Russian Electronic Intelligence System

Tiers:

1 **2** 3 4

System

Alternative Designation: Vega 85V6-A
Type: Electronic Intelligence System
Crew: INA

Dimensions (Ural 375)

Length: 7,350 mm
Width: 2,960 mm
Height: 2,980 mm
Curb Weight: 8,400 kg

Automotive (Ural 375)

Engine Name: 7.0L ZIL-375YA
Engine Type: V-8 Diesel
Engine Power: hpINA
Transmission: 5-speed manual + 2-speed transfer case
Cruising Range: INA
Speed, Maximum Road: 76 km/h
Speed, Average Cross: INA
Speed Maximum Swim: Not Amphibious
Fuel Capacity: 79+16 gal. Fuel economy: 4.9 mpg (at 19-25 mph), 2.94 mpg (city cycle).

Electronic Warfare System

↳*System*

Name: 85V6-A Vega
Type: Electronic Intelligence System

Number of Radio emitting sources simultaneously reported to superior CP: up to 60

ELINT update rate: s10

ELINT Frequency Range, Basic: 0,2 – 18

ELINT Frequency Range, Expanded: up to 40

Scanning Range, Azimuth: deg360

Scanning Range, Elevation: deg0-20

Minimum Scan Period: s2

Above-Horizon Target Detection Range: kmnot less than 400

Number of Vehicles with Trailers: 4

Protection

Armor: INA

Applique Armor: INA

Active Protection System: No

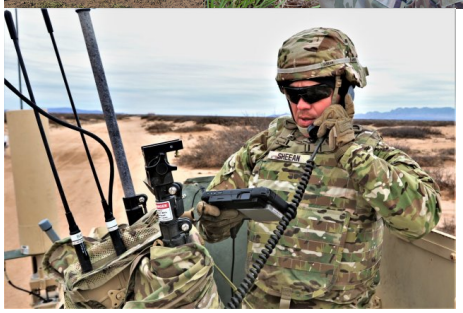
NBC Protection: INA

Smoke Equipment: INA

Notes:

Mission The 85V6-A Vega ELINT system is designed for detection, location, identification, classification and tracking of ground/air/maritime targets by their radio emissions. The 85V6-A Vega system can provide radio control and information support to groupings of AD, ELINT and EW units, as well as to early warning, air traffic control, and jamming source detection systems. Composition: • three signal detection/direction finding/ classification stations • ELINT system control post In combat the Vega stations are placed up to 30 km apart with the control post usually deployed near one of them.The Vega station can be used autonomously and within AD, EW, border guard and other combat units. The ELINT system's control post is designed to define planar coordinates and motion parameters of radio emitting sources based on data provided by the three stations, as well as to couple with the superior control centre. Bearings and other target data are transferred from the detection and direction finding stations to the control post via data links. Based on these data, target locations and tracks are calculated by means of triangulation and visualized on the digital map of the monitored region with false tracks eliminated by programme methods and identified with bearings of objects. Functional testing of the station is to be accomplished and ELINT summaries registered periodically.

VROD/VMAX American Versatile Radio Observation and Direction System



Tiers:

1 2 3 4

System

Alternative Designation: VROD/VMAX; Valcour Max (VROD Modular Adaptive tX)
Crew: ea1
Length: in12
Width: in5
Height: in2
Weight (with Battery): lbs22
DF Antenna Dimensions: 11in x 17in
Man-Portable: Yes
VHF Capable: Yes
Vehicle Mounted Capable: Yes
Controller Type: Android Controller with standard swipe/touch gestures (wired/wireless)
Spectrum Display: MHz10-200
RX/TX Bandwidth (Instantaneous): MHz20
Bandwidth: MHz20-40
UHF Capable: Yes
Global Position System (GPS): Yes
Wi-Fi Capable: Yes
SDR Architecture: Yes
Fast Scanning ES/EA/DF Capable: Yes

Modular Amplifiers: 5 watt and 100 watt
ECM Interoperable: Yes
Note: The software of the VROD/VMAX can be upgraded in the field by the individual user

Notes:

Description: VMAX is a low-power, wideband, fast-scanning, software defined transceiver and direction finding system that can detect, locate, monitor, and jam Radio Frequency (RF) signals. The system can be utilized in multiple configurations: man-worn/pack, vehicle based, and fixed site. Barely the size of “a lightweight backpack,” the vehicle- and -infantry portable kits come with two primary capabilities: VROD (Versatile Radio Observation & Direction) to “detect and understand” enemy electromagnetic signals, and the so-called VMAX to “search and attack” with “electronic attack effects”. Operational Relevance: Networked VROD & VMAX sensors at the squad level provides the ability to identify Signals of Interest (SOI), and leverage the system’s signal intercept, monitoring, direction finding (DF), and Time Difference of Arrival (TDOA) capabilities to provide near real time indications & warning (I&W) threat tipping, electromagnetic spectrum monitoring (ESM), and geolocation information to the operational commander.

Moskva-1 (1L265) Russian Electronic Warfare Vehicle

Tiers:

System

Alternative Designation: Moskva-1; 1L265
Type: Electronic Warfare Vehicle
Manufacturer: KRET corporation,
Family: Moskva
In Service: 2014-Present
Chassis: Kamaz 6350 8x8 military truck chassis
Crew: ea4
Passenger Capacity: INA
Maximum Effective Range (Airborne Targets): km400
Radar Type: Passive Radar, capturing a targets radiation, while remaining invisible to the enemy.
Scan Airspace: Yes
Control and Reconnaissance Command Center: Yes
Capability to detect Enemy Shells: Yes
Recongintion Module: 1L265E
Control/Radar Station: 1L266 / 1L266E
Emplacement: min45
Displacement: minINA
Operational Temperatures: 40 to 50 degrees Celsius

Dimensions (Chassis)

Length: m9.3
Width: m2.5
Height: m3.25
Weight, Combat (Chassis Only): kg12,450

Automotive

Engine Name: KamAZ-740.50-360

Notes:

R-381T3 Automatic Data Processing Station. The 381T3 Automatic Data Processing Station is part of the R-381T Taran Complex. The R-381T Taran complex consist of 7 vehicles: 1 x R-381T3 – automatic data processing station 4 x R-381T2 – UHF radio monitoring station (30-100 MHz) 2 x R-381T1 – VHF radio monitoring station (1.5-30 MHz), aviation radio communication monitoring (100-400 Mhz), radio relay link monitoring (300-1000 MHz) The efficient range of the complex is 40 km (100 km for aviation frequencies monitoring). Radio station detecting time is 0.3 sec. Another variant of the complex consist of 5 vehicles: x1 R-381T3 x2 R-381T2 x2 R-381T1 It is also possible to use separate stations.

AZK-7M Russian 6x6 Automatic Sound Ranging System

Tiers:

System

Alternative Designation: AZK-7M

Type: Sound Ranging System

Manufacturer: INA

Configuration: 6x6

Chassis: Ural-43203

Mission: The AZK-7M automatic sound ranging system is intended to locate artillery batteries (guns) and mortars from the sound of gunfire and adjust friendly artillery fire from the sound of shell bursts. The system provides: search, direction finding and position-finding of the acoustic signal sources in a given zone of surveillance; display of the surveillance results on the monitor of the system commander's workstation; transmission of the surveillance information to higher authorities over radio and wired links.

Crew: CPs and CPs: 5 each

AZK-7m Package: The AZK-7M consists of one central point (CP) and three base points (BP). Its equipment is installed in four Ural-43203 trucks having special K2.4322M van bodies. Three vehicles accommodate equipment of the base points and one vehicle houses the central point.

Central Points: The main functions of the central point are: to receive telecode messages with the results of the processing of acoustic signals from all the base points of the system over radio and wired links; to determine the rectangular coordinates of targets when conducting reconnaissance and the rectangular coordinates of shell bursts when adjusting artillery fire; to provide information and technical exchange over radio and wired links with two external users.

Base Point: The main functions of the base point are: to deploy two sound stations (SS) on the terrain, with each SS including three sound locators (SL) and power supply; to survey the SS; to measure the surface meteorological parameters; to receive sound signals and determine the time of their arrival at the center of each SS and bearings of detected objects from the center of each SS; to transmit telecode data messages from each SS to the CP of the system over a radio or wired link.

Localization Range, Mortars: 5-8 km

Localization Range, Artillery Guns: 12-16 km

Localization Range, Ground Burst of Shells fired by 122mm and Larger Caliber Guns: 12 km

Localization Range, Air Bursts: 12-16 km

Surveillance Frontage, Three BPs Deployed: 10-12 km

Surveillance Frontage, Two BPs Deployed: 5-6 km

Time to Locate a Target: No more than 15 seconds

Time to Deploy, using Radio Communications: 1 hour

Time to Deploy, using Wire Communications: 2 hour

Number Of External Subscribers: 2

Range of Robust Wired Communications between CP and BP: Up to 5 km

Range of Robust Radio Communications between CP and BP: On the Move: 1 KM At the Halt: 10 km

Dimensions (Chassis: Ural-43203)

Length: m7.37

Width: m2.5

Height: m4.5

Weight, Empty: tons8

Payload capacity (on road): tons6

Payload capacity (off road): tons4.5

Maximum Tow Capacity: tons12

Automotive (Chassis: Ural-43203)

Engine Name: YaMZ-740

Engine Type: Diesel

Engine Power: hp210

Cruising Range: km1,000

Speed, Maximum Road: km/h85

Speed, Average Cross: km/h50

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg62

Side Slope: deg40

Vertical Step: m0.55

Trench: m1.2

Fording Depth: m1.75

Protection

Armor: INA

Applique Armor: Available to protection against small arms fire and artillery shell splinters

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Personal CBRN equipment

Smoke Equipment: No

IR Signature: No

Notes:

The AZK-7M automatic sound ranging system is intended to locate artillery batteries (guns) and mortars from the sound of gunfire and adjust friendly artillery fire from the sound of shell bursts. The system provides: search, direction finding and position-finding of the acoustic signal sources in a given zone of surveillance; display of the surveillance results on the monitor of the system commander’s workstation; transmission of the surveillance information to higher authorities over radio and wired links. R-381T2 Russian UHF Radio Monitoring Station

Tiers:

System

Alternative Designation: R-381T2	
Type: UHF Radio Monitoring Station	
Manufacturer: Proton’ engineering bureau in Kharkov	
Description: For intercept and direction finding units. 5 to 7 seconds for recognition of targeted voice and data transmissions.	
Chassis: KamAZ-5350	
Cab Seating: 1+2 Men	
Crew: INA	
Passenger Capacity: INA	
Configuration: 6x6	
UHF Frequency: 30-100 MHz	
Displacement Time: Less than 10 minutes	
Emplacement Time: Less than 10 minutes	
UHF Interception Range: Greater than 40 km	
Direction Finding Range: 30 - 40 km depending location and optical verification	
Average Accuracy: 1.8 deg	

Dimensions (Chassis: KamAZ-5350)

Length: m7.85	
Width: m2.5	
Height: m3.29	
Weight, Combat: tons9.2	
Maximum Load: tons6	

Automotive (KamAZ-5350)

Engine Name: KamAZ-740.13-260 Diesel

Engine Type: Diesel

Engine Power: hp260

Cruising Range: km1,000

Speed, Maximum Road: km/h100

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %40

Vertical Step: m0.6

Trench: m0.6

Fording Depth: m1.75

Maximum Load: tons6

Note #1: Engine is also equipped with cold weather starting device and can be started at temperatures down to -50°C

Note #2: Vehicle has a full-time all-wheel drive and is fitted with a central tyre inflation system

Protection

Armor: Protection from small arms fire and shell splinters.

Applique Armor: INA

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The R-381T2 Russian UHF Radio Monitoring Station is part of the R-381T (Taran) Automatic Radio Intelligence Complex. The R-381T Taran complex consist of 7 vehicles: 1 x R-381T3 – automatic data processing station 4 x R-381T2 – UHF radio monitoring station (30-100 MHz) 2 x R-381T1 – VHF radio monitoring station (1.5-30 MHz), aviation radio communication monitoring (100-400 Mhz), radio relay link monitoring (300-1000 MHz) The efficient range of the complex is 40 km (100 km for aviation frequencies monitoring). Radio station detecting time is 0.3 sec. Another variant of the complex consist of 5 vehicles: 1 x R-381T3 2 x R-381T2 2 x R-381T1 It is also possible to use separate stations.

Kolchuga Russian Electronic Warfare Support Measures System

Tiers:

Variants:

- **Exports:** Pakistan has expressed interest in purchasing the Kolchuga radar. Ukraine has offered it to Pakistan to counter India's Swordfish Long Range Tracking Radar. In 2002 the U.S. State Department accused Ukraine of selling Kolchuga to Iraq, based on recordings of the then Ukrainian president Leonid Kuchma supposedly made by Mykola Mel'nychenko. This was followed by political steps from United Kingdom and the United States. No material confirmation has been found in Iraq. See Cassette Scandal for further information. Unconfirmed reports in September 2006 suggested a sale was made to Iran although this was denied by the Ukrainian government. On 20th of January 2019, Ukrainian news Sources confirmed a Sale of Systems to Israel and Saudi Arabia.

System

Alternative Designation: Topaz Kolchuga

Type: Electronic Warfare Support Measures System

Crew: INA

Band: X/Ku-bands.

Mode of Operation: Kolchuga is an electronic support measures system that employs two or more sites to locate emitters by triangulation. The system is vehicle mounted and comprises a large vertical meshed reflector, with two smaller circular parabolic dishes beneath and a pair of VHF-to-microwave log periodic antennas above. The dishes may exploit amplitude monopulse techniques for improved direction finding, whilst the angled spacing of the log-periodic antenna suggests that they may use phase interferometry to improve angle measurements. Various smaller antennas, presumably for inter-site communications are to the side and rear of the dish. The detection range is one of the best in its class, but it is highly dependent on the emitted power of the transmitter being tracked, and requires satisfaction of the line of sight condition to at least two receiving sites for triangulation (compared with three sites for a multilateration system such as the VERA passive sensor). A Kolchuga complex can detect and locate air and surface targets and trace their movement to a range generally limited only by the common line-of-sight of the stations.

System Parameters: According to the manufacturer's brochure (from AIDEX 1997), the upgraded Kolchuga-M is equipped: *With four antennas in the VHF, UHF and SHF radio bands with narrow and wide beams *With parallel receivers allowing the instant discovery and analysis of signals of radio technical equipment (RTE) in the range 100 MHz -18 GHz and continual tracking across the entire band. [Other sources claim from 130MHz to 18GHz, and a 36 channel preset receiver]. *With sensitivity of approximately -145 dBW *With equipment for the analysis, processing and continual calculation and tracking of coordinates by triangulation and chronometrical-hyperbolic method. *With equipment for the identification, operative displaying of information, long term memory and recording of the results of processing. The brochure also claims that the system provides: *The detection, analysis of signals with pulsed and continuous waves and resolution of practically all known radio technical equipment (RTE) deployed on ground, sea and air platforms, including radar units of all classes, identification systems, air traffic control system and navigation systems *The composition, character of operation and flight paths of RTE in a zone 600 km deep with complete exception of blind zones and continual high accuracy *The detection of take-off of aerial targets and their formation in groups at a distance exceeding that of modern radars. *The direction of arrival of solitary and group targets and target indication to active facilities of anti-aircraft systems. Special inhibitory sorters omit up to 24 interfering signals, and tracking sorters make it possible to synchronously sort out and track signals from 32 targets

Maximum Range: INA

Maximum Altitide: INA

Target Identification: Kolchuga is able to detect and identify many types of radio devices mounted on ground, airborne, or marine objects. Target detection relies only on an emitter having sufficient power and being within Kolchuga's frequency range. Target identification, however, is more complex and is based on the measurement of different parameters of the transmitted signal—such as its frequency, bandwidth, pulse width, pulse repetition interval, etc. Kolchuga has been reported to use around forty different parameters when identifying a target. These parameters are compared to a database in order to identify both the type of emitter and, in some cases, even the specific piece of equipment (by identifying the unique signature or "fingerprint" that most transmitters have, due to the variations and tolerances in individual components). The database within Kolchuga is said to have the capacity to store around three hundred different types of emitter and up to five hundred specific signatures for each type.

Claimed Band Coverage: Claimed band coverage extents from 130 MHz (VHF) up to the X/Ku-bands.

Claimed Sensitivity: Claimed sensitivity is -110dBW to - 155 dBW. Track capability is claimed to be 32 concurrent targets.

Emplacement Time: INA

Displacement Time: INA

Speculation of Performance: Since becoming publicly known following the Cassette Scandal, the capabilities of Kolchuga have been the source of many rumours and uninformed speculation in forums such as. Many observers have a tendency to credit it with magical powers of detection. Many of these do not stand up to detailed engineering analysis, or have not been confirmed, but are recorded in this section for completeness, together with reasons for doubting the claim. Note that the material in this section should not be regarded as accurate. Claims include: *That Kolchuga has a range of 800 km. It will certainly have the sensitivity to see high power sources at such a range. However, basic line-of-sight arguments outlined in the sections above show that this would require aircraft to be flying at impractically high altitudes and/or for the Kolchuga stations to be deployed on very high mountains. The claim is thus technically possible but operationally very unlikely. *That Kolchuga can detect US stealth aircraft by their radio and radar emissions. Whilst technically possible, stealth aircraft do not radiate when in battle, so this mode of operation is militarily irrelevant. *Kolchuga is sufficiently sensitive to detect US stealth aircraft from unconventional sources of RF emissions, including radiation from exhaust trails and electromagnetic interference from the engine. (Technically the power levels of these sources are likely to be so small, if at all, that there would be insufficient energy for Kolchuga to measure these effects at one site, let alone the two or more required for triangulation. They would also be almost impossible to distinguish for normal background RF noise and would not appear like the conventional emissions types *Kolchuga is designed to receive and analyse). Kolchuga is sufficiently sensitive to operate as a bistatic radar receiver and hence exploit other transmitters in the environment. (This is likely to be true for the specific case of forward scatter in which the radar cross section of even a stealth aircraft can become very large for a few moments. However, achieving forward scatter simultaneously in two or more receivers is geometrically impossible, so triangulation would not work. Secondly, unless Kolchuga has been specifically designed to work as a bistatic radar receiver with a certain radar type—and there's no evidence of Kolchuga being deployed in conjunction with specific radar types—then it will lack the essential matched filter required to reliably detect reflected pulses in the presence of noise. Therefore, if this effect works at all, it is likely to be unreliable and fleeting). *Ukrainian sources often make claims such as "[Kolchuga] is head and shoulders above all American, Russian, French, Czech, or Brazilian developments in this field". Such claims are unsubstantiated and pure speculation, as the performance and even existence of many ESM systems are highly classified and not deducible by ELINT. It may or may not be true, but must be regarded with caution, particularly as those making the claims are often either journalists or those with an interest in exporting the system.

Notes:

The Kolchuga (Кольчуга Chainmail) passive sensor is an electronic-warfare support measures system developed in the Soviet Union and manufactured in Ukraine. Its detection range is limited by line-of-sight but may be up to 800 km (500 mi) for very high altitude, very powerful emitters. Frequently referred to as Kolchuga Radar, the system is not really a radar, but an ESM system comprising three or four receivers, deployed tens of kilometres apart, which detect and track aircraft by triangulation and multilateration of their RF emissions. Original Kolchuga was developed in 1980s by Rostov military institute of GRU and Topaz radioelectronics factory in Donetsk. Serial production since 1987. 44 units were produced before 1 January 1992, 14 of them left in Ukraine. After break up of Soviet Union, Kolchuga-M was modernized by the Special Radio Device Design Bureau public holding, the Topaz holding, the Donetsk National Technical University, the Ukrspetsexport state company, and the Investment and Technologies Company. It took them eight years (1993–2000) to conduct research, develop algorithms, test solutions on experimental specimens, and launch serial production. The relatively cheap Ukrainian Kolchuga-M passive radar station is able to detect and identify practically all known active radio devices mounted on ground, airborne, or marine objects.

KRTP-91 Tamara (Trash Can) Czechoslovakian Electronic Support Measures System

System

Alternative Designation: KRTP-91 Tamara; NATO: Trash Can

Type: Czechoslovakian Electronic Support Measures System

Crew: INA

Chassis: Tatra T815

Appearance: Unlike its predecessors, Tamara was a mobile system deployed on eight large Tatra T815 trucks and mounted upon a powerful 25 m hydraulic mast. Setup was completely automated and claimed to be of the order of twenty minutes from the moment of arrival at a site.

Unit: A single system is carried by eight Tatra 815 8x8 trucks (Equivalent to the MAZ-543), comprising three RS-AJ/M receiver systems with telescoping masts, and a mix of RS-KB hardware containers, RS-KM signal processing equipment container and a ZZP-5 command van.

Band: INA

Band Coverage: Cited band coverage is 820 MHz to 18 GHz.

Mode of Operation: The deployed system typically comprises a central site (containing the signal processing equipment and an ESM receiver) and two or three side sites containing only an ESM receiver. The side sites relay the signals received to the central site over a point-to-point microwave link. The central site uses the known propagation delay from the side sites to estimate the TDOA of the pulses at each site. The TDOA of a pulse between one side site and the central site locates the target on a hyperboloid. A second side site provides a second TDOA and hence a second hyperboloid. The intersection of these two hyperboloids places the target on a line, providing a 2D measurement of the target's location (no height). A third site provides a third hyperboloid and hence a measurement of height. Tamara could automatically track 23 radar and 48 IFF targets simultaneously. Its frequency band is 0.8-18 GHz. The nominal range of the system is 450 km, and it is generally limited by the radio horizon. It provides surveillance over a sector of approximately 100 degrees, with the later KRTP-91 system offering a wider 120 degree sector of surveillance.

Displacement Time: INA

Emplacement Time: INA

Deployment Distance: In a typical deployment the receivers are stationed at distances of 5 to 20 NMI.

Cited Maximum Range: cited range limit being 240 NMI and limited primarily by the curvature of the earth.

Tracked Targets: Russian sources claim that 72 targets can be tracked within a 100° angular sector, these including emitting JTIDS/Link-16 terminals. In 1991 the baseline KRTP-86 was superceded in production by improved the KRTP-91 Tamara-M.

Notes:

Tamara was the third generation Czechoslovak electronic support measures (ESM) system that used measurements of time difference of arrival (TDOA) of pulses at three or four sites to accurately detect and track airborne emitters by multilateration. Tamara's designations were KRTP-86 and KRTP-91 and it carried the NATO reporting name of Trash Can. The designation was derived from the Czech phrase "Komplet Radiotechnického Průzkumu" meaning "Radio Technical Reconnaissance Set". It was claimed to be the only one in the world able to detect military "invisible aircraft".

R-330B Russian VHF Frequency Jamming System

Tiers:

System

Alternative Designation: R-330B

Type: VHF Jamming System

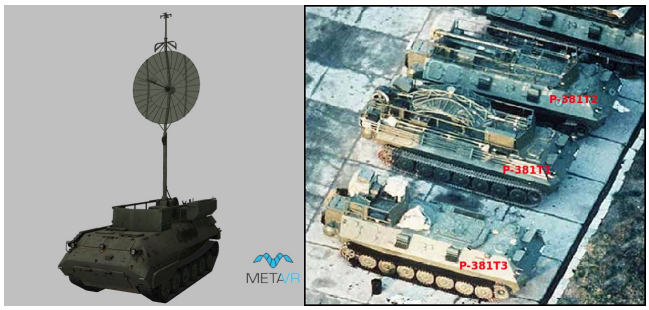
Notes:

The upgraded R-330B/R-330T VHF jamming system is designed for detection, direction-finding and jamming of VHF communication facilities operated at tactical command level at fixed frequencies with conventional waveforms, in programmed and automatic frequency tuning modes, as well as for transmitting short encoded messages. The jamming system provides analysis and selection of emitters' signal parameters. The R-330B/R-330T VHF jamming system consists of an equipment vehicle on a wheeled (R-330T) or tracked (R-330B) chassis, a diesel electric power station mounted on a two-axle trailer (R-330T), or MT-Lbu armoured tracked chassis (R-330B), a set of operational documentation, and a single spare parts, tools and accessories set.

R-381T1 Russian VHF Radio Monitoring Station



Tiers:

IR Signature: INA

Notes:

Russia’s new drone-based electronic-warfare system, the Leer-3, RB-341V combines jammers and Orlan-10 unmanned aerial

vehicles to disable cellular networks, and allow the Russian military to send fake messages to subscribers. The Leer-3 UAV can effectively become a ‘virtual cellular station’ by sending messages and controlling a subscriber’s devices once it replaces a base station. If it manages to take the place of a cellular communications tower, it can also send audio messages and small video clips to subscribers. The Leer-3 has some psychological warfare mission implications. The Leer-3 can block enemy mobile telephones while, simultaneously, not impeding the operation of friendly mobile phones. The system can collect telephone numbers and call these numbers while blocking other phones’ signals. It may also be able to remotely connect user devices. The Leer-3 complex is composed of three Orlan-10 UAVs and a command and control post on a KamAZ-5350 truck. The unmanned aerial vehicles’ primary mission is to suppress cellular communication towers. To do this, special ‘jammers’ have been installed onboard the Orlan-10 UAVs, along with disposable jammers, which they drop onto the ground. After jamming the base stations, the Orlan-10 UAVs are able to send instant messages to subscribers given the necessary conditions. A single KAMAZ heavy truck controls three Orlan-10s, one of which acts as a communications relay while the others carry both airborne jammers and disposable jammers they drop to the ground.

J-16D Chinese Radar-Jamming Electronic Warfare Aircraft

Tiers:

Variants:

- **J-16:** Strike variant.
- **J-16D:** Electronic warfare variant. Equipped with wingtip electronic warfare pods, and no IRST or 30 mm cannon. It reportedly made its first flight in December 2015.

System

Alternate Designation(s): J-16D
Primary Function / Type: Multirole Strike Fighter
Manufacturer: Shenyang Aircraft Corporation
Crew: 2
Number of Engines: 2
Number of Hard Points: Even with a maximum load of electronic-warfare gear, the J-16 would have six of its twelve hardpoints free to carry weapons.
Note: The J-16D has had its thirty-millimeter cannon and infrared sensor removed; this is not a plane intended to get into short-range dogfights! Instead, there are several new antennas and conformal electronic-warfare arrays along the fuselage.

Dimensions

Length: 21.9 m
Width (Wing Span): 14.7 m
Height: 6.36 m
Wing Area: 62.04 m2
Empty Weight: 17,700 kg

Gross Weight: 26,000 kg

Maximum Takeoff Weight: 35,000 kg

Automotive

Engine Name: 2 × Shenyang WS-10B afterburning turbofans

Number of Engines: 2

Engine Type: Afterburning turbofans

Engine Power: 96 kN (22,000 lbf) thrust each dry, 145 kN (33,000 lbf) with afterburner

Maximum Speed: Mach 2.4

Maximum Range: 3,000 km

Combat Range: 1,500 km

Ferry Range: 4,500 km

Service Ceiling: 20,000 m

Rate of Climb: 325 m/s

Main Missile Systems

↳*Main Missile System #1*

Name: YJ-91

Type: Anti-Radiation Missile

Manufacturer: Hongdu Aviation Industry Corporation

Length: 4.7 m

Diameter: 0.3602 m

Weight: 0.6 ton

Warhead: 165 kg

Detonation Mechanism: Semi-armor-piercing and other

Engine: Ramjet

Propellant: Liquid fuel

Operational Range: 50-120 km

Maximum Speed: Mach 4.5

Guidance System: ARH / PRH

↳*Main Missile System #2*

Name: CM-103

Type: Air-to-Surface Missile

Operational Range: 99 km

Warhead: 80 kg

Basic Load: INA

Bomb Weapon Systems

Note: Various bombs and rockets including BeiDou satellite-guided bombs and laser-guided bombs

Fire Control / Avionics

Fire Control System Type: INA

Fire Control Radar: INA

Navigation Radar: AESA radar

Protection

Stealth Properties: Yes

Heat Signature Reduction: Yes

Add on Armor: INA

NBC Protection: INA

EW Counter Measures: Electronic countermeasure (ECM) pods

Radar Jamming: If the J-16D's airframe has integrated hardware to make jamming and anti-radar missiles more effective, it probably is designed to use jammers and anti-radar missiles. Most likely, it would carry two to three jamming pods the under the wings and fuselage, each optimized versus different radar frequencies. It is thought that these jammers may also use AESA technology.

Chaffs/Flares: Yes

Note #1: New electronic-warfare pods are mounted on the wingtips that resemble the American ALQ-218 electronic support measure pods on the wingtips of the EA-18G Growler. These are electromagnetic sensors that can analyze radar frequencies and help determine the position of radar-transmitting devices—data that would be highly useful both for jamming radars and for targeting them for destruction.

Notes:

The J-16D variant—the "D" in the designation comes from the Chinese word for "electronic," diànzǐ—made its first flight on December 18, 2015. Photos were released to the public three days later. The J-16D has had its thirty-millimeter cannon and infrared sensor removed; this is not a plane intended to get into short-range dogfights! Instead, there are several new antennas and conformal electronic-warfare arrays along the fuselage. The J-16D's nose radome is reshaped, possibly to accommodate a more advanced AESA radar. Most importantly, new electronic-warfare pods are mounted on the wingtips that resemble the American ALQ-218 electronic support measure pods on the wingtips of the EA-18G Growler. These are electromagnetic sensors that can analyze radar frequencies and help determine the position of radar-transmitting devices—data that would be highly useful both for jamming radars and for targeting them for destruction. If the J-16D's airframe has integrated hardware to make jamming and anti-radar missiles more effective, it probably is designed to use jammers and anti-radar missiles. Most likely, it would carry two to three jamming pods the under the wings and fuselage, each optimized versus different radar frequencies. It is thought that these jammers may also use AESA technology. The J-16 is a twin-engine, twin-seat multi-role fighter jet that is also capable of air-to-air combat. It made its debut during the Army Day parade on July 30, 2017 at the Zhurihe military training base in North China's Inner Mongolia Autonomous Region, Before the 30 July 2017 parade, the J-16 was never shown to the public. Developed by the Shenyang Aircraft Corporation, it is based on the J-11B, a modification of Russia's Sukhoi-30MKK. Almost half of the equipment seen at the parade to mark the PLA's 90th birthday was being displayed for the first time, and all of it was indigenously made, according to the Ministry of Defence. The fighter is designed for a naval role, and will carry "stand-off" missiles that can attack ships from beyond visual range. Contracry to initial reports, it has a conventional layout, and does nto incorporate notable stealth features. The J-16, built by the Shenyang Aircraft Corporation (SAC), is reportedly a stealthy dedicated attack version of the J-11B (Su-27) multirole fighter featuring active electronically scanned array [AESA] radar and an internal weapons bay. Chinese authorities had not formally released informtion on these developments. It was rumored in November 2010 that SAC was developing a 4.5th generation heavy multi-role fighter with a conventional layout based on J-11B. First flight of this reportedly "Silent Flanker" was rumored at that time to be within 2011. According to Hui Tong, the J-16 is a version of the J-11BS comparable to American F-15E. Sort of a 'strike flanker'. "The aircraft can be viewed as an upgraded

version of Su-30MKK based on its mission and capability, which is comparable to American F-15E. First flight was rumored to be between 2011-2012. J-16 has tandem seats with a WSO sitting in the backseat. It features an enhanced fire-control system with additional AG modes. Besides PL-8 and PL-12 AAMs, it could also carry the same precision guided weapons being carried by JH-7A, such as KD-88 ASM and LS-500J LGB. Compared to JH-7A, J-16 is expected to have a more powerful radar, a greater weapon load (8t) and a longer range (4,000km). " In May 2011 China Military Report stated that "China's new 4.5 generation heavy fighter (Chinese name "Red Eagle"). August 2008 had been officially off the assembly line in Shenyang Aircraft Factory, in October 2008 in Beijing, an Air Force base in the outskirts of the first flight, October 12, 2009 conducted a second test, a complete success. J-18 is the 4.5 generation fighter aircraft are air superiority fighter heavy. Forward-swept wing fighter design using ultra-stealth characteristics, and install a laser active phased array radar, built-in weapons bay and two large thrust-vectoring engines. Service time is expected around 2015. So far there is no any official information about the machine, nor any information to prove the real existence of the aircraft. Only some information from some people speculate, and speculation of official news." In fact, the J-16 fighter's first flight had been pushed and pushed again. The main reason is that the weight of the design is overweight, but the greater headache was the funding constraints.

Y-8XZ (High New 7) Chinese Psychological Operations Aircraft

Tiers:

Variants:

- **Note:** Y-8 This was the original version. It was little different from the An-12 with a slightly modified glass nose copied from the design of the H-6 bomber. The cargo hold was not pressurized. Early production variants inherited the An-12 's tail turret, which mounts a twin 23-mm cannon, but this was later removed. Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. Y-8B This is the civilian version. First flight took place in 1990 and it was certified in 1993. Y-8C This variant has the pressurized cabin volume increased from 1,000 cu ft (28.3 cu m) to 7,500 cu ft (212.4 cu m). Landing gear and air conditioning are upgraded. The original inward-open two-piece cargo loading doors were replaced by a single-piece flat loading ramp similar to that of the C-130 . First flight occurred on Dec. 17, 1990. Shaanxi has also developed the Y-8CA radar testbed and Y-8CI export variant transport, the latter with Western avionics. Y-8D This is the export variant, fitted with Western avionics to meet the requirements for commercial flights. Onboard avionics include Collins flight director system (FDS), air data computer, VOR/ILS, comparing warning, TDR-90 air-traffic control receiver, VHF radio, Honeywell P-400 color weather radar, Litton LTN-311 Omega navigation system, Bendix/King HF communication, Sundsstrand universal flight data recorder (UFDR) and cockpit voice recorder (CVR). It is in service in Burma (Myanmar), Sri Lanka and Sudan. Y-8D II This is the latest export variant with avionics similar to those in the Y-8C. Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. Y-8F This is a livestock transport. It was certified on Jan. 26, 1994. Y-8F100 This is a commercial freighter version of the Y-8, featuring improved avionics. The aircraft features a redesigned cargo compartment, which can carry four international standard pallets of 88 in x 108 in, or eight pallets of 88 in x 54 in, or three pallets of 96 in x 125 in. The cargo compartment is also fitted with a modernized cargo handling system, allowing fast loading/unloading. Y-8F200 This is a commercial freighter version of the Y-8C, with upgraded avionics and a redesigned cargo compartment. The cargo handling system and large flat ramp enable rapid loading and unloading. Y-8F200W This variant features a fuselage that is 7 ft 3 in (2.2 m) longer than the baseline aircraft. The aircraft can take off from gravel or snow-covered runways at altitudes up to 9,840 ft (3,000 m) above sea level. It can also operate from unprepared runways. Y-8F400 This is a modernized freighter variant with upgraded avionics. It requires a three-man flight crew instead of the original five-man crew. The original glass nose was replaced by a solid nose. The cargo compartment is equipped with a 2,000-lb (1,000-kg) payload overhead cargo system, where the cargo can be suspended from an electrically powered rail. Rollers in the floor of the cargo compartment enable quick and easy handling of cargo pallets and can be removed to leave a flat surface. The compartment is fully pressurized. Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14, 2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system.The transport is powered by four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport

noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the undernose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. Y-8H This is an aerial survey and photography variant. Y-8J maritime surveillance aircraft These are Y-8C transports fitted with British Skymaster radars for maritime surveillance missions. China procured six to eight of the radars from Racal (now Thales) in 1996 deal worth US$66 million. At least two of the aircraft remain in Chinese naval service and are deployed at Dachang naval air base near Shanghai. The original glass nose on the Y-8 is replaced by a large radome to accommodate the radar antenna on the Y-8J. The rear cargo door and loading ramp are also removed. Y-8JB This is an electronic intelligence (ELINT) variant first seen in mid-2004 near Shanghai. A prototype first flew on Aug. 26, 2003, and four aircraft are in service with the Chinese navy. The aircraft has a large chin-mounted radome that could house a large ELINT antenna. Another SATCOM antenna may be installed inside a large semi-spherical dorsal fairing forward of the vertical tailfin providing real-time transmission to the ground base. Numerous smaller fairings can be seen on top of the cabin and along the upper sections of the aft fuselage, as well as at the nose tip. The loading ramp appears to have been sealed. The aircraft has been fitted with a BM/KZ800 ELINT system. Y-8X maritime patrol aircraft (MPA) This Y-8X is fitted with a Litton Canada APS-504 search radar, dual Litton LTN-72R inertial navigational system and a single LTN-211 Omega navigation set. The first example was delivered to the Chinese navy in late 1984, and the aircraft received national design certification in 1985. A small number have been in service since the mid-1980s. The aircraft is equipped with search radar, navigation system, self-defense electronic countermeasures (ECM) suite, optical/infrared cameras, sonobuoys and sonar receiver. The rear cargo door was removed and replaced by a large mission equipment window for sonobuoys racks and cameras. The rear turret was also removed and replaced by the sonar operator seat. A canoe-shaped fairing plus a couple of blade antennas appear to have been attached to the bottom of the middle and aft fuselage, suggesting the aircraft's electronic intelligence mission has been enhanced with a new synthetic aperture radar (SAR) capability. Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. KJ-200 This is an airborne early warning and control aircraft based on the Y-8F600 airframe. See separate record for more information. Y-8 tanker Flight Refueling Ltd. of the U.K. studied the possibility of converting the Y-8 into an in-flight refueling aircraft. No Y-8Ts are known to be in service. Y-8 airborne early warning aircraft This is a third Chinese airborne early warning aircraft program, following the KJ-2000 and KJ-200 (see separate records); it was revealed in 2005. Based on the Shaanxi Y-8F400 airframe, the aircraft features a conventional rotodome mounted above the fuselage. At least one prototype has been built and the program may be aimed at the export market. Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. ZDK-03 This variant, based on the Y-8F600, was designed specifically for the Pakistani air force for airborne early warning missions. It features an active electronically scanned array (AESA) radar. Islamabad has ordered four of the aircraft. The first unit was scheduled to be delivered by the end of 2010. See separate record for more information. GX-7 This is a Y-8 aircraft modified for psychological warfare missions. It is designed to broadcast messages over radio and television signals and can jam enemy communications. The GX-7 was first made public by Chinese media in July 2013. Y-8Q/Y-8GX6 This variant was first revealed in November 2011 and was reported in service in mid-2015. The Y-8Q features a redesigned wing and pressurized fuselage with composite structures; WJ-6C turboshaft engines; and high-efficiency, six-bladed propellers. It is distinguishable from other Y-8/Y-9 variants by a large chin-mounted sea search radar; electro-optical system behind the nose wheel; and a weapons bay just ahead of the main wheels. There is also a magnetic anomaly detector (MAD) boom and domed windows in the aft fuselage for observation. A fuselage weapons bay, located ahead of the main landing gear, would likely carry torpedoes. It has been speculated that the Y-8Q has fuselage sonobuoy dispensers and hardpoints on the wings for anti-ship missiles.

System

Alternate Designation(s): Y-8XZ

Primary Function / Type: Psychological Operations Aircraft

Manufacturer: Shaanxi Aircraft Corporation

Crew: 6

Passengers: 96

Number of Engines: 4

Number of Hard Points: INA

Dimensions

Length: 34.02 m

Height: 11.16 m

Width (Wing Span): 38.00 m

Wing Area: 121.86 sq m

Cargo Area, Length: 13.5 m

Cargo Area, Width: 3.0 m

Cargo Area, Height: 2.4 m

Empty Weight: 35,500 kg

Maximum Payload Weight: 20,000 kg

Maximum Takeoff Weight: 61,000 kg

Automotive

Engine Name: 4 x Wojiang-6 turboprop

Number of Engines: 4

Engine Type: Turboprop

Engine Power: 4,250 equivalent hp each

Maximum Range: 5,615 km

Cruise Speed: 550 km/h

Maximum Speed: 662 km/h

Service Ceiling: 10,400 m

Rate of Climb: 600 m/min

Endurance: 10.5 hours

Notes:

Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. The Shaanxi Y-8 or Yunshuji-8 (Chinese: □-8) aircraft is a medium size medium range transport aircraft produced by Shaanxi Aircraft Corporation in China, based on the Soviet Antonov An-12. It has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. Although the An-12 is no longer made in Ukraine, the Chinese Y-8 continues to be upgraded and produced. An estimated 169 Y-8 aircraft had been built by 2010. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with license to assemble the aircraft locally. However, due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance. The Xi'an Aircraft Company and Xi'an Aircraft Design Institute worked to reverse engineer the An-12 for local production. Design of the aircraft was completed by February 1972. Major features of the Y-8 included a glazed nose and tail turret derived from that of the H-6 bomber, a roller-type palletized-cargo-handling device instead of the overhead conveyor, and a gaseous oxygen system as opposed to a liquid oxygen system. The original Y-8 inherited the An-12's twin 23mm cannon tail turret, but this was removed on subsequent variants. The Y-8 equipped with four turboprop engines mounted under the leading edges of non-swept wings. The wings are attached high on the fuselage, and the tricycle landing gear is equipped with low pressure tires. The earliest versions used for the transportation of freight or troops had two side-hinged, inward-opening doors, while later variants used a rearward-facing ramp to facilitate loading and unloading of the payload. Some specialized versions omit the cargo ramp entirely. The Y-8 is capable of carrying troops, dropping supplies, parachute drops, and functioning as an air ambulance. It also can be used for commercial uses as a freighter. It is capable of hauling 20 tons of cargo, approximately 96 soldiers, or about 82 paratroopers in the cargo compartment which is 13.5 metres long, 3 metres wide and 2.4 metres high. It can also carry 60 severely wounded soldiers with their stretchers, 20 slightly injured soldiers and 3 medical attendants. Many variants for specialized roles have been built, but information on them can be vague or difficult to obtain due to the secretive nature of the Chinese military. The Y-8 transport aircraft was put into trial production in the Xi'an Aircraft Factory in June 1972. By December 1974, the first Chinese-assembled Y-8 conducted its maiden flight. Following trial production of the first Y-8s, operations were transferred to the Shaanxi Aircraft Factory. The Shaanxi-produced Y-8s conducted their test flights in December 1975. After a regime of 66 test flights the Y-8 was officially certified for use by the Chinese government. By 1981, the Y-8 entered serial production.[2] Mr. Ouyang Shaoxiu (□□□□) would eventually become the general designer, designing many variants of Y-8, including KJ-2000. In the early 1980s, Chinese officials saw US Army recruiting advertisements featuring parachute extraction of an Army jeep along with troops. The PLA was told to develop this kind of capability. But there were two design problems. One, Y-8 wings have very sharp leading edges, so one wing tends to stall before the other, causing the aircraft to roll inverted as it stalls. The second design flaw as that the cargo deck of the Y-8 had a 10 degree downward slope starting at the landing gear. When the PLA Air Force started to test parachute extraction, these two design flaws caused a near disaster. The aircraft was flying too fast, and when the parachute started to extract cargo from the hold, the cargo rolled on the deck until it got to the 10 degree downward slope, and there it became airborne while still inside the aircraft. The cargo hit the top of the cargo door on the way out, making it clear that the Y-8 could not do parachute cargo extraction. In 1986, two engineers from Beijing's Ministry of Aviation visited Lockheed. They could not speak very much English, and the Lockheed-Georgia sales person who met them could not speak Chinese. So for half a day, they did a point-and-grunt tour until they were lucky enough to find a Lockheed employee who could speak Chinese. The Chinese wanted to purchase Lockheed wind tunnel testing on the Y-8 in order to address the stall problem. As a result of these wind tunnel tests, conducted in 1986, Lockheed was given a contract to do a flight test series on the Y-8. Lockheed was told that flight test data was not provided by the Soviets when they helped China build the Y-8 factory. The flight test series was flown by Lockheed test pilot Hank Dees. Hank had flown the test flight series for the Lockheed L-1011 and later for China's Y-12 in Harbin. During this flight test series, Hank Dees flew the aircraft to stall speed and taught Chinese pilots how to anticipate a stall in order to prevent letting the aircraft go inverted. As a result of this test flight series, Chinese pilots started to use the 45 degree flap position. Lockheed's motive for doing flight tests was to demonstrate that China would be better off buying the C-130 rather than trying to improve the Y-8. China did buy C-130's, but the flight test series actually demonstrated that the Y-8 was a more capable aircraft than previously believed. In the late 1980s, Lockheed Martin, the American manufacturer of the C-130 Hercules, helped China to develop a pressurized cabin for the passenger version of Y-8, resulting in two versions: the first had half of the cabin pressurized and later, the second version in which the complete cabin was pressurized. In 2001 and 2002, new consulting arrangements between Antonov and Shaanxi resulted in modernized redesigns to the Y-8's wing and fuselage.

As a consequence the redesign allows the Y-8's fuel capacity to be increased by 50 percent.

Y-8CB (High New 1) Chinese Electronic Countermeasures (ECM) Aircraft

Tiers:

Variants:

- **Note:** Y-8 This was the original version. It was little different from the An-12 with a slightly modified glass nose copied from the design of the H-6 bomber. The cargo hold was not pressurized. Early production variants inherited the An-12 's tail turret, which mounts a twin 23-mm cannon, but this was later removed. Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. Y-8B This is the civilian version. First flight took place in 1990 and it was certified in 1993. Y-8C This variant has the pressurized cabin volume increased from 1,000 cu ft (28.3 cu m) to 7,500 cu ft (212.4 cu m). Landing gear and air conditioning are upgraded. The original inward-open two-piece cargo loading doors were replaced by a single-piece flat loading ramp similar to that of the C-130 . First flight occurred on Dec. 17, 1990. Shaanxi has also developed the Y-8CA radar testbed and Y-8CI export variant transport, the latter with Western avionics. Y-8D This is the export variant, fitted with Western avionics to meet the requirements for commercial flights. Onboard avionics include Collins flight director system (FDS), air data computer, VOR/ILS, comparing warning, TDR-90 air-traffic control receiver, VHF radio, Honeywell P-400 color weather radar, Litton LTN-311 Omega navigation system, Bendix/King HF communication, Sundsstrand universal flight data recorder (UFDR) and cockpit voice recorder (CVR). It is in service in Burma (Myanmar), Sri Lanka and Sudan. Y-8D II This is the latest export variant with avionics similar to those in the Y-8C. Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. Y-8F This is a livestock transport. It was certified on Jan. 26, 1994. Y-8F100 This is a commercial freighter version of the Y-8, featuring improved avionics. The aircraft features a redesigned cargo compartment, which can carry four international standard pallets of 88 in x 108 in, or eight pallets of 88 in x 54 in, or three pallets of 96 in x 125 in. The cargo compartment is also fitted with a modernized cargo handling system, allowing fast loading/unloading. Y-8F200 This is a commercial freighter version of the Y-8C, with upgraded avionics and a redesigned cargo compartment. The cargo handling system and large flat ramp enable rapid loading and unloading. Y-8F200W This variant features a fuselage that is 7 ft 3 in (2.2 m) longer than the baseline aircraft. The aircraft can take off from gravel or snow-covered runways at altitudes up to 9,840 ft (3,000 m) above sea level. It can also operate from unprepared runways. Y-8F400 This is a modernized freighter variant with upgraded avionics. It requires a three-man flight crew instead of the original five-man crew. The original glass nose was replaced by a solid nose. The cargo compartment is equipped with a 2,000-lb (1,000-kg) payload overhead cargo system, where the cargo can be suspended from an electrically powered rail. Rollers in the floor of the cargo compartment enable quick and easy handling of cargo pallets and can be removed to leave a flat surface. The compartment is fully pressurized. Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14, 2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system.The transport is powered by four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport

noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the undernose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. Y-8H This is an aerial survey and photography variant. Y-8J maritime surveillance aircraft These are Y-8C transports fitted with British Skymaster radars for maritime surveillance missions. China procured six to eight of the radars from Racal (now Thales) in 1996 deal worth US$66 million. At least two of the aircraft remain in Chinese naval service and are deployed at Dachang naval air base near Shanghai. The original glass nose on the Y-8 is replaced by a large radome to accommodate the radar antenna on the Y-8J. The rear cargo door and loading ramp are also removed. Y-8JB This is an electronic intelligence (ELINT) variant first seen in mid-2004 near Shanghai. A prototype first flew on Aug. 26, 2003, and four aircraft are in service with the Chinese navy. The aircraft has a large chin-mounted radome that could house a large ELINT antenna. Another SATCOM antenna may be installed inside a large semi-spherical dorsal fairing forward of the vertical tailfin providing real-time transmission to the ground base. Numerous smaller fairings can be seen on top of the cabin and along the upper sections of the aft fuselage, as well as at the nose tip. The loading ramp appears to have been sealed. The aircraft has been fitted with a BM/KZ800 ELINT system. Y-8X maritime patrol aircraft (MPA) This Y-8X is fitted with a Litton Canada APS-504 search radar, dual Litton LTN-72R inertial navigational system and a single LTN-211 Omega navigation set. The first example was delivered to the Chinese navy in late 1984, and the aircraft received national design certification in 1985. A small number have been in service since the mid-1980s. The aircraft is equipped with search radar, navigation system, self-defense electronic countermeasures (ECM) suite, optical/infrared cameras, sonobuoys and sonar receiver. The rear cargo door was removed and replaced by a large mission equipment window for sonobuoys racks and cameras. The rear turret was also removed and replaced by the sonar operator seat. A canoe-shaped fairing plus a couple of blade antennas appear to have been attached to the bottom of the middle and aft fuselage, suggesting the aircraft's electronic intelligence mission has been enhanced with a new synthetic aperture radar (SAR) capability. Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. KJ-200 This is an airborne early warning and control aircraft based on the Y-8F600 airframe. See separate record for more information. Y-8 tanker Flight Refueling Ltd. of the U.K. studied the possibility of converting the Y-8 into an in-flight refueling aircraft. No Y-8Ts are known to be in service. Y-8 airborne early warning aircraft This is a third Chinese airborne early warning aircraft program, following the KJ-2000 and KJ-200 (see separate records); it was revealed in 2005. Based on the Shaanxi Y-8F400 airframe, the aircraft features a conventional rotodome mounted above the fuselage. At least one prototype has been built and the program may be aimed at the export market. Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. ZDK-03 This variant, based on the Y-8F600, was designed specifically for the Pakistani air force for airborne early warning missions. It features an active electronically scanned array (AESA) radar. Islamabad has ordered four of the aircraft. The first unit was scheduled to be delivered by the end of 2010. See separate record for more information. GX-7 This is a Y-8 aircraft modified for psychological warfare missions. It is designed to broadcast messages over radio and television signals and can jam enemy communications. The GX-7 was first made public by Chinese media in July 2013. Y-8Q/Y-8GX6 This variant was first revealed in November 2011 and was reported in service in mid-2015. The Y-8Q features a redesigned wing and pressurized fuselage with composite structures; WJ-6C turboshaft engines; and high-efficiency, six-bladed propellers. It is distinguishable from other Y-8/Y-9 variants by a large chin-mounted sea search radar; electro-optical system behind the nose wheel; and a weapons bay just ahead of the main wheels. There is also a magnetic anomaly detector (MAD) boom and domed windows in the aft fuselage for observation. A fuselage weapons bay, located ahead of the main landing gear, would likely carry torpedoes. It has been speculated that the Y-8Q has fuselage sonobuoy dispensers and hardpoints on the wings for anti-ship missiles.

Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. The Shaanxi Y-8 or Yunshuji-8 (Chinese: □-8) aircraft is a medium size medium range transport aircraft produced by Shaanxi Aircraft Corporation in China, based on the Soviet Antonov An-12. It has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. Although the An-12 is no longer made in Ukraine, the Chinese Y-8 continues to be upgraded and produced. An estimated 169 Y-8 aircraft had been built by 2010. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with license to assemble the aircraft locally. However, due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance. The Xi'an Aircraft Company and Xi'an Aircraft Design Institute worked to reverse engineer the An-12 for local production. Design of the aircraft was completed by February 1972. Major features of the Y-8 included a glazed nose and tail turret derived from that of the H-6 bomber, a roller-type palletized-cargo-handling device instead of the overhead conveyor, and a gaseous oxygen system as opposed to a liquid oxygen system. The original Y-8 inherited the An-12's twin 23mm cannon tail turret, but this was removed on subsequent variants. The Y-8 equipped with four turboprop engines mounted under the leading edges of non-swept wings. The wings are attached high on the fuselage, and the tricycle landing gear is equipped with low pressure tires. The earliest versions used for the transportation of freight or troops had two side-hinged, inward-opening doors, while later variants used a rearward-facing ramp to facilitate loading and unloading of the payload. Some specialized versions omit the cargo ramp entirely. The Y-8 is capable of carrying troops, dropping supplies, parachute drops, and functioning as an air ambulance. It also can be used for commercial uses as a freighter. It is capable of hauling 20 tons of cargo, approximately 96 soldiers, or about 82 paratroopers in the cargo compartment which is 13.5 metres long, 3 metres wide and 2.4 metres high. It can also carry 60 severely wounded soldiers with their stretchers, 20 slightly injured soldiers and 3 medical attendants. Many variants for specialized roles have been built, but information on them can be vague or difficult to obtain due to the secretive nature of the Chinese military. The Y-8 transport aircraft was put into trial production in the Xi'an Aircraft Factory in June 1972. By December 1974, the first Chinese-assembled Y-8 conducted its maiden flight. Following trial production of the first Y-8s, operations were transferred to the Shaanxi Aircraft Factory. The Shaanxi-produced Y-8s conducted their test flights in December 1975. After a regime of 66 test flights the Y-8 was officially certified for use by the Chinese government. By 1981, the Y-8 entered serial production.[2] Mr. Ouyang Shaoxiu (□□□) would eventually become the general designer, designing many variants of Y-8, including KJ-2000. In the early 1980s, Chinese officials saw US Army recruiting advertisements featuring parachute extraction of an Army jeep along with troops. The PLA was told to develop this kind of capability. But there were two design problems. One, Y-8 wings have very sharp leading edges, so one wing tends to stall before the other, causing the aircraft to roll inverted as it stalls. The second design flaw as that the cargo deck of the Y-8 had a 10 degree downward slope starting at the landing gear. When the PLA Air Force started to test parachute extraction, these two design flaws caused a near disaster. The aircraft was flying too fast, and when the parachute started to extract cargo from the hold, the cargo rolled on the deck until it got to the 10 degree downward slope, and there it became airborne while still inside the aircraft. The cargo hit the top of the cargo door on the way out, making it clear that the Y-8 could not do parachute cargo extraction. In 1986, two engineers from Beijing's Ministry of Aviation visited Lockheed. They could not speak very much English, and the Lockheed-Georgia sales person who met them could not speak Chinese. So for half a day, they did a point-and-grunt tour until they were lucky enough to find a Lockheed employee who could speak Chinese. The Chinese wanted to purchase Lockheed wind tunnel testing on the Y-8 in order to address the stall problem. As a result of these wind tunnel tests, conducted in 1986, Lockheed was given a contract to do a flight test series on the Y-8. Lockheed was told that flight test data was not provided by the Soviets when they helped China build the Y-8 factory. The flight test series was flown by Lockheed test pilot Hank Dees. Hank had flown the test flight series for the Lockheed L-1011 and later for China's Y-12 in Harbin. During this flight test series, Hank Dees flew the aircraft to stall speed and taught Chinese pilots how to anticipate a stall in order to prevent letting the aircraft go inverted. As a result of this test flight series, Chinese pilots started to use the 45 degree flap position. Lockheed's motive for doing flight tests was to demonstrate that China would be better off buying the C-130 rather than trying to improve the Y-8. China did buy C-130's, but the flight test series actually demonstrated that the Y-8 was a more capable aircraft than previously believed. In the late 1980s, Lockheed Martin, the American manufacturer of the C-130 Hercules, helped China to develop a pressurized cabin for the passenger version of Y-8, resulting in two versions: the first had half of the cabin pressurized and later, the second version in which the complete cabin was pressurized. In 2001 and 2002,

new consulting arrangements between Antonov and Shaanxi resulted in modernized redesigns to the Y-8's wing and fuselage. As a consequence the redesign allows the Y-8's fuel capacity to be increased by 50 percent.

Y-8G (High New 3) Chinese Long-Range Electronic Jamming Aircraft

Tiers:

Variants:

- **Note:** Y-8 This was the original version. It was little different from the An-12 with a slightly modified glass nose copied from the design of the H-6 bomber. The cargo hold was not pressurized. Early production variants inherited the An-12 's tail turret, which mounts a twin 23-mm cannon, but this was later removed. Y-8A This variant was transformed into a helicopter carrier, serving as a general transport. It was designed to carry S-70C helicopters between their inland bases and the frontier airfields in Tibet. The airframe was specially modified to accommodate a single S-70C helicopter. The internal cargo handling system was determined to be unnecessary and was removed. Y-8B This is the civilian version. First flight took place in 1990 and it was certified in 1993. Y-8C This variant has the pressurized cabin volume increased from 1,000 cu ft (28.3 cu m) to 7,500 cu ft (212.4 cu m). Landing gear and air conditioning are upgraded. The original inward-open two-piece cargo loading doors were replaced by a single-piece flat loading ramp similar to that of the C-130 . First flight occurred on Dec. 17, 1990. Shaanxi has also developed the Y-8CA radar testbed and Y-8CI export variant transport, the latter with Western avionics. Y-8D This is the export variant, fitted with Western avionics to meet the requirements for commercial flights. Onboard avionics include Collins flight director system (FDS), air data computer, VOR/ILS, comparing warning, TDR-90 air-traffic control receiver, VHF radio, Honeywell P-400 color weather radar, Litton LTN-311 Omega navigation system, Bendix/King HF communication, Sundsstrand universal flight data recorder (UFDR) and cockpit voice recorder (CVR). It is in service in Burma (Myanmar), Sri Lanka and Sudan. Y-8D II This is the latest export variant with avionics similar to those in the Y-8C. Y-8E This version is used for unmanned aerial vehicle (UAV) launch and control. Development began in October 1988 and the first prototype was completed in March 1990. The first UAV launch test was carried out successfully in October of that year. The aircraft entered service with the Chinese air force in late 1990. Y-8F This is a livestock transport. It was certified on Jan. 26, 1994. Y-8F100 This is a commercial freighter version of the Y-8, featuring improved avionics. The aircraft features a redesigned cargo compartment, which can carry four international standard pallets of 88 in x 108 in, or eight pallets of 88 in x 54 in, or three pallets of 96 in x 125 in. The cargo compartment is also fitted with a modernized cargo handling system, allowing fast loading/unloading. Y-8F200 This is a commercial freighter version of the Y-8C, with upgraded avionics and a redesigned cargo compartment. The cargo handling system and large flat ramp enable rapid loading and unloading. Y-8F200W This variant features a fuselage that is 7 ft 3 in (2.2 m) longer than the baseline aircraft. The aircraft can take off from gravel or snow-covered runways at altitudes up to 9,840 ft (3,000 m) above sea level. It can also operate from unprepared runways. Y-8F400 This is a modernized freighter variant with upgraded avionics. It requires a three-man flight crew instead of the original five-man crew. The original glass nose was replaced by a solid nose. The cargo compartment is equipped with a 2,000-lb (1,000-kg) payload overhead cargo system, where the cargo can be suspended from an electrically powered rail. Rollers in the floor of the cargo compartment enable quick and easy handling of cargo pallets and can be removed to leave a flat surface. The compartment is fully pressurized. Y-8F600 This is the latest variant. Developed with the assistance of Antonov in Ukraine and Pratt & Whitney Canada, the aircraft is configured as a platform for airborne early warning and other special missions. First flight on occurred on Jan. 14,

2005. The aircraft has been extensively modified and upgraded with Western technologies including turboprop engine and avionics. Development began in 1999, with Antonov and Pratt & Whitney Canada joining the program in by 2002. Under a 2002 contract, Shaanxi and Antonov are responsible for the joint design and assembly of prototypes, certification and series production. Pratt & Whitney was responsible for providing its PW150B engine. Antonov provided Shaanxi with aerodynamic research, as well as documents on aircraft maintainability and service life. The company also designed the new wing with fuel tanks. The Y-8F600 features an advanced two-man glass cockpit. The aircraft is equipped with data link, flight management and control, and near ground warning system.The transport is powered by four P&W PW150B turboprop engines. All-composite six-blade R-408 propellers are fitted. The new propulsion system provides for improved takeoff performance at hot and high conditions and high-altitude cruise performance, extended engine service life and lower engine operating and maintenance costs. Noise levels are also reduced to meet airport noise restrictions. The Y-8F600's maximum takeoff weight is increased to 65 tons. Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the undernose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. Y-8H This is an aerial survey and photography variant. Y-8J maritime surveillance aircraft These are Y-8C transports fitted with British Skymaster radars for maritime surveillance missions. China procured six to eight of the radars from Racal (now Thales) in 1996 deal worth US$66 million. At least two of the aircraft remain in Chinese naval service and are deployed at Dachang naval air base near Shanghai. The original glass nose on the Y-8 is replaced by a large radome to accommodate the radar antenna on the Y-8J. The rear cargo door and loading ramp are also removed. Y-8JB This is an electronic intelligence (ELINT) variant first seen in mid-2004 near Shanghai. A prototype first flew on Aug. 26, 2003, and four aircraft are in service with the Chinese navy. The aircraft has a large chin-mounted radome that could house a large ELINT antenna. Another SATCOM antenna may be installed inside a large semi-spherical dorsal fairing forward of the vertical tailfin providing real-time transmission to the ground base. Numerous smaller fairings can be seen on top of the cabin and along the upper sections of the aft fuselage, as well as at the nose tip. The loading ramp appears to have been sealed. The aircraft has been fitted with a BM/KZ800 ELINT system. Y-8X maritime patrol aircraft (MPA) This Y-8X is fitted with a Litton Canada APS-504 search radar, dual Litton LTN-72R inertial navigational system and a single LTN-211 Omega navigation set. The first example was delivered to the Chinese navy in late 1984, and the aircraft received national design certification in 1985. A small number have been in service since the mid-1980s. The aircraft is equipped with search radar, navigation system, self-defense electronic countermeasures (ECM) suite, optical/infrared cameras, sonobuoys and sonar receiver. The rear cargo door was removed and replaced by a large mission equipment window for sonobuoys racks and cameras. The rear turret was also removed and replaced by the sonar operator seat. A canoe-shaped fairing plus a couple of blade antennas appear to have been attached to the bottom of the middle and aft fuselage, suggesting the aircraft's electronic intelligence mission has been enhanced with a new synthetic aperture radar (SAR) capability. Y-8XZ psychological operations aircraft This version was unveiled publicly in April 2008, although it reportedly entered Chinese air force service in late 2007. The aircraft features large fairings located forward of the main landing gear compartments as well as two large plate antennas on each side of the rear fuselage. Other features include two blade antennas on both sides of the vertical tailfin, a wire antenna underneath the rear fuselage and a large SATCOM antenna on top of the rear fuselage. The Y-8XZ has high-power broadcast equipment covering AM, FM, SW, TV plus various civilian and military communication bands, and is able to jam enemy communications as well as deliver propaganda broadcasts. KJ-200 This is an airborne early warning and control aircraft based on the Y-8F600 airframe. See separate record for more information. Y-8 tanker Flight Refueling Ltd. of the U.K. studied the possibility of converting the Y-8 into an in-flight refueling aircraft. No Y-8Ts are known to be in service. Y-8 airborne early warning aircraft This is a third Chinese airborne early warning aircraft program, following the KJ-2000 and KJ-200 (see separate records); it was revealed in 2005. Based on the Shaanxi Y-8F400 airframe, the aircraft features a conventional rotodome mounted above the fuselage. At least one prototype has been built and the program may be aimed at the export market. Y-8CB This is an electronic countermeasures (ECM) variant first seen publicly in July 2005. First flight was on Jan. 26, 2000. At least four are thought to be in air force service, replacing the obsolete HD-5 ECM aircraft. Some may have been upgraded with additional equipment, including a dorsal satellite communications (SATCOM) antenna. The aircraft features a ventral canoe fairing underneath the forward fuselage, which may house a large ECM or synthetic aperture radar (SAR) antenna. An antenna array consisting of several rows of smaller ECM antennas can be seen protruding out of the rear loading ramp, which is thought to have been sealed. A few more antennas are located under the fuselage between the main landing gear cabins. The aircraft may carry the 300 and 308 systems to jam enemy communication networks and radar systems. Y-8T command post aircraft This is a command post aircraft. First flight occurred in August 2004. Three aircraft are in service with the Chinese air force. The Y-8T features a redesigned fuselage with the loading ramp and tail gun turret removed. A dorsal fairing is located aft of the wing section, which may house a SATCOM antenna. Multiple antenna arrays can be seen along the top and bottom of the fuselage, as well as on the vertical tailfin. ZDK-03 This variant, based on the Y-8F600, was designed specifically for the Pakistani air force for airborne early warning missions. It features an active electronically scanned array (AESA) radar. Islamabad has ordered four of the aircraft. The first unit was scheduled to be delivered by the end of 2010. See separate record for more information. GX-7 This is a Y-8 aircraft modified for psychological warfare missions. It is designed to broadcast messages over radio and television signals and can jam enemy communications. The GX-7 was first made public by Chinese media in July 2013. Y-8Q/Y-8GX6 This variant was first revealed in November 2011 and was reported in service in mid-2015. The Y-8Q features a redesigned wing and pressurized fuselage with composite structures; WJ-6C turboshaft

engines; and high-efficiency, six-bladed propellers. It is distinguishable from other Y-8/Y-9 variants by a large chin-mounted sea search radar; electro-optical system behind the nose wheel; and a weapons bay just ahead of the main wheels. There is also a magnetic anomaly detector (MAD) boom and domed windows in the aft fuselage for observation. A fuselage weapons bay, located ahead of the main landing gear, would likely carry torpedoes. It has been speculated that the Y-8Q has fuselage sonobuoy dispensers and hardpoints on the wings for anti-ship missiles.

System

Alternate Designation(s): Y-8G

Primary Function / Type: Long-Range Electronic Jamming Aircraft

Manufacturer: Shaanxi Aircraft Corporation

Crew: 6

Passengers: 96

Number of Engines: 4

Number of Hard Points: INA

Dimensions

Length: 34.02 m

Height: 11.16 m

Width (Wing Span): 38.00 m

Wing Area: 121.86 sq m

Cargo Area, Length: 13.5 m

Cargo Area, Width: 3.0 m

Cargo Area, Height: 2.4 m

Empty Weight: 35,500 kg

Maximum Payload Weight: 20,000 kg

Maximum Takeoff Weight: 61,000 kg

Automotive

Engine Name: 4 x Wojiang-6 turboprop

Number of Engines: 4

Engine Type: Turboprop

Engine Power: 4,250 equivalent hp each

Maximum Range: 5,615 km

Cruise Speed: 550 km/h

Maximum Speed: 662 km/h

Service Ceiling: 10,400 m

Rate of Climb: 600 m/min

Endurance: 10.5 hours

Fire Control / Avionics

FCS Name: INA

Computerized FCS: No

Navigation Radar: INA

Protection

Stealth Properties: No

Heat Signature Reduction: No

Add on Armor: No

NBC Protection: INA

EW Counter Measures: INA

Chaffs/Flares: INA

Y-8G This variant was first revealed in April 2005. First flight took place in late 2004. Seven aircraft are known to be in service with the Chinese air force. The aircraft features two large cheek fairings of an arch shape, which might house a large ECM antenna array for long-range electronic jamming purpose. It also has a redesigned solid nose with the under nose radome removed. A large tail fairing may provide 360-degree coverage. Another cylindrical fairing can be seen on top of the vertical tailfin. The Shaanxi Y-8 or Yunshuji-8 (Chinese: □-8) aircraft is a medium size medium range transport aircraft produced by Shaanxi Aircraft Corporation in China, based on the Soviet Antonov An-12. It has become one of China's most popular military and civilian transport/cargo aircraft, with many variants produced and exported. Although the An-12 is no longer made in Ukraine, the Chinese Y-8 continues to be upgraded and produced. An estimated 169 Y-8 aircraft had been built by 2010. In the 1960s, China purchased several An-12 aircraft from the Soviet Union, along with license to assemble the aircraft locally. However, due to the Sino-Soviet split, the Soviet Union withdrew its technical assistance. The Xi'an Aircraft Company and Xi'an Aircraft Design Institute worked to reverse engineer the An-12 for local production. Design of the aircraft was completed by February 1972. Major features of the Y-8 included a glazed nose and tail turret derived from that of the H-6 bomber, a roller-type palletized-cargo-handling device instead of the overhead conveyor, and a gaseous oxygen system as opposed to a liquid oxygen system. The original Y-8 inherited the An-12's twin 23mm cannon tail turret, but this was removed on subsequent variants. The Y-8 equipped with four turboprop engines mounted under the leading edges of non-swept wings. The wings are attached high on the fuselage, and the tricycle landing gear is equipped with low pressure tires. The earliest versions used for the transportation of freight or troops had two side-hinged, inward-opening doors, while later variants used a rearward-facing ramp to facilitate loading and unloading of the payload. Some specialized versions omit the cargo ramp entirely. The Y-8 is capable of carrying troops, dropping supplies, parachute drops, and functioning as an air ambulance. It also can be used for commercial uses as a freighter. It is capable of hauling 20 tons of cargo, approximately 96 soldiers, or about 82 paratroopers in the cargo compartment which is 13.5 metres long, 3 metres wide and 2.4 metres high. It can also carry 60 severely wounded soldiers with their stretchers, 20 slightly injured soldiers and 3 medical attendants. Many variants for specialized roles have been built, but information on them can be vague or difficult to obtain due to the secretive nature of the Chinese military. The Y-8 transport aircraft was put into trial production in the Xi'an Aircraft Factory in June 1972. By December 1974, the first Chinese-assembled Y-8 conducted its maiden flight. Following trial production of the first Y-8s, operations were transferred to the Shaanxi Aircraft Factory. The Shaanxi-produced Y-8s conducted their test flights in December 1975. After a regime of 66 test flights the Y-8 was officially certified for use by the Chinese government. By 1981, the Y-8 entered serial production.[2] Mr. Ouyang Shaoxiu (□□□□) would eventually become the general designer, designing many variants of Y-8, including KJ-2000. In the early 1980s, Chinese officials saw US Army recruiting advertisements featuring parachute extraction of an Army jeep along with troops. The PLA was told to develop this kind of capability. But there were two design problems. One, Y-8 wings have very sharp leading edges, so one wing tends to stall before the other, causing the aircraft to roll inverted as it stalls. The second design flaw as that the cargo deck of the Y-8 had a 10 degree downward slope starting at the landing gear. When the PLA Air Force started to test parachute extraction, these two design flaws caused a near disaster. The aircraft was flying too fast, and when the parachute started to extract cargo from the hold, the cargo rolled on the deck until it got to the 10 degree downward slope, and there it became airborne while still inside the aircraft. The cargo hit the top of the cargo door on the way out, making it clear that the Y-8 could not do parachute cargo extraction. In 1986, two engineers from Beijing's Ministry of Aviation visited Lockheed. They could not speak very much English, and the Lockheed-Georgia sales person who met them could not speak Chinese. So for half a day, they did a point-and-grunt tour until they were lucky enough to find a Lockheed employee who could speak Chinese. The Chinese wanted to purchase Lockheed wind tunnel testing on the Y-8 in order to address the stall problem. As a result of these wind tunnel tests, conducted in 1986, Lockheed was given a contract to do a flight test series on the Y-8. Lockheed was told that flight test data was not provided by the Soviets when they helped China build the Y-8

factory. The flight test series was flown by Lockheed test pilot Hank Dees. Hank had flown the test flight series for the Lockheed L-1011 and later for China's Y-12 in Harbin. During this flight test series, Hank Dees flew the aircraft to stall speed and taught Chinese pilots how to anticipate a stall in order to prevent letting the aircraft go inverted. As a result of this test flight series, Chinese pilots started to use the 45 degree flap position. Lockheed's motive for doing flight tests was to demonstrate that China would be better off buying the C-130 rather than trying to improve the Y-8. China did buy C-130's, but the flight test series actually demonstrated that the Y-8 was a more capable aircraft than previously believed. In the late 1980s, Lockheed Martin, the American manufacturer of the C-130 Hercules, helped China to develop a pressurized cabin for the passenger version of Y-8, resulting in two versions: the first had half of the cabin pressurized and later, the second version in which the complete cabin was pressurized. In 2001 and 2002, new consulting arrangements between Antonov and Shaanxi resulted in modernized redesigns to the Y-8's wing and fuselage. As a consequence the redesign allows the Y-8's fuel capacity to be increased by 50 percent.

AN/SSQ-47B American Active Non-Directional Sonobuoy

Tiers:

System

Alternative Designation: AN/SSQ-47B
Type: Active Non-Directional Sonobuoy
Size: A
Hydrophone Depth: 18.3 or 244 m
Launch Conditions Altitude: 152 m-3,048 m
Launch Conditions Sea State: 5 (maximum)
Operating Life: 30 minutes
RF Power: 0.25 W
Sonar Modes: Automatic keyed CW
Sonar Channels: 6 (HF)
RF Channels: 12
Power Source: seawater battery
Activation Time: < 30 seconds
Scuttling Time: 1-10 hours after water entry
RF Transmsiion Channels: 12 fixed
Transmitter RF Power: 0.25 watts minimum
Operating Depth: Selectable (60 or 800 feet)
Sonar Pulse Repetition Rate: 10 seconds

Dimensions

Length: INA
Diameter: INA
Weight, Combat: 9.5 kg

Notes:

The AN/SSQ-47B active buoy, also referred to as a ranger buoy, is the predecessor of the AN/ASQ-62 family. It automatically begins pinging upon water entry, and operates from fixed RF frequency channels at an RF power output of 1/4 Watt, depth settings being 60 or 800 feet. The sonic transmissions operate on one of six sonic frequencies in the 13.0 to 19.0 kHz band with an expected life of 30 minutes.

LDM-2 Russian Man-Portable Laser Rangefinder

Tiers:

System

Alternative Designation: LDM-2
Type: Man-Portable Laser Rangefinder
Crew: ea1
Measurement range (at an accuracy no more than ±10 m): 50...9,000
Recognition range of “tank-sized” target and burst ranging: 4,000
Magnification: x7
Field of view: 6°
Angular resolution: 7 Seconds of Arc
Exit pupil diameter: 5 mm
Removal of exit pupil: 18 mm
Dioptric adjustment: ±4 Diopters
Operation per battery (number of shots/charge): 300
Laser wavelength: 1.54 um
Azimuth range (at accuracy of ±0-15 d.g.): from +30-00 to -30-00 deg
Elevation range (at accuracy of ±0-06 d.g.): from +3-00 to -3-00 deg

Dimensions

Length: INA
Width: INA
Height: INA

Weight, Combat: kg1.8

Notes:

The LDM-2 Laser Rangefinder Module is designed for flash ranging of terrain, target recognition and acquisition, determination of spherical coordinates with automatic determination of magnetic azimuth and elevation as well as automated transmission of the measured coordinates to external users. SYSTEM COMPOSITION *PPU-21 transmitting/receiving module *Accessory set *Transport case *Operation manual The LDM-2 Laser Rangefinder Module displays first, second and last targets (as an operator’s option) in the range of a laser beam. Mode of operation, readiness to measure a target range, azimuth and elevation, operating time, battery charge are displayed in the eyepiece.

LTSD-4-3 Russian Laser Rangefinder/Designator

Tiers:

System

Alternative Designation: LTSD-4-3
Type: Laser Rangefinder/Designator
Crew: ea2
Tank-sized target in the daytime: m5,000...7,000
Surface Target: m5,000...15,000
Night Vision, Tank-sized Target at Night: m1,000...3,000
Thermal Imager, Tank-Sized Target at Night: m3,000...4,000
Measurement Range at 5m Accuracy: m100...20,000
Boresight Magnification: x10
Field of View: 5°
Dioptric adjustment: ±5 diopters
Maximum duration of laser designation, Artillery Mode: 15 sec
Maximum duration of laser designation, Air Mode: 100 sec

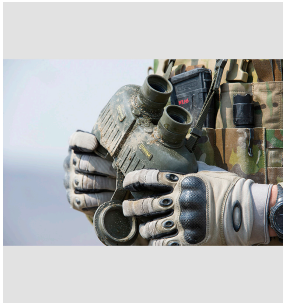
Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: kg14

Notes:

The LTSD-4-3 Laser Rangefinder/Designator is designed for ground target reconnaissance, correction of artillery and air firing in daylight and at night including the use of high-accuracy ammunition fitted with laser homing heads when illuminating the stationary and moving targets, military equipment and offensive fortifications by a laser light from ground observation points. It may be also used in automated fire control systems. SYSTEM COMPOSITION *PP-20 transceiver *Set for fastening PP on terrain *1E77 synchronization unit *1E67M accumulator battery (2 pcs.) *Accessory set *Transport case including two flexible packs for carrying *Instruction manual

M830r LRF American 8x30 Laser Rangefinder



Tiers:

1 2 3 4

System

Alternative Designation: M830r LRF
Type: 8x30 Laser Rangefinder
Crew: ea1
Magnifaction: 8x
Ergonomic Design: shifts the center of gravity into the palms for comfortable, long-time observation and round-the-shoulder shape won't hang up on hatches and doors in urgent situations.
Floating Prism System: uses flexible silicone lens mount to absorb severe shock, impact and abuse without damage
N2 Injection system: seals 14-psi pressurized dry nitrogen into the optic, for fogproof clarity in any condition - from artic cold to desert heat.
Sports-Auto Focus System: lets you focus each eyepiece to your vision once, then keeps images razor sharp from 20 yards to infinity. No more chasing focus on moving objects.
NBR Rubber Armoring: is durable, slip-proof and noiseless to ensure secure, chassis-protecting grip in all conditions.
Makrolon Housing: is durable polycarbonate with NBR Long Life rubber armoring, creating a lightweight, rugged chassis that withstands 11 Gs of impact. Impervious to harsh conditions for generations of trusted use.
Field of View: 319 feet at 1,000 yards
Ranging Distance: 27 to 1,860 Yds.

Dimensions

Length: INA
Width: 6.7 In
Height: 4.5 in
Weight, Combat: 26.5 oz

Notes:

This compact, powerful laser rangefinder is universally suited for all military services and tactical units. It’s the perfect combination of premium Steiner binoculars with a powerful class 1/eye safe laser for determining range to targets, plus a SUMR reticle for targeting redundancy in case of battery failure or out-of-range target. No other bino/rangefinder combo will deliver the image and ranging accuracy and reliability of these military veterans. Perfect for mobile troops who travel light. Lenses and prisms are combined with state-of-the-art coatings to provide bright, crisp images at any range. Ranges can be set to meters or

yards.

FLIR Recon V American Multi-Sensor Thermal Binoculars

Tiers:

Variants:

- **Recon V Ultra Lite:** Fully operational at less than three pounds, the breakthrough Recon V Ultra Lite provides long-range target detection, recognition, recording and geo-location with an HD color camera and dual FOV thermal channels. Powered by commercially available AA batteries, the unit has a run time greater than four hours with smart power management. Combined with a highly accurate laser range finder, GPS, digital magnetic compass and intuitive user interface, targets can be quickly located 24/7.

System

Alternative Designation: FLIR Recon V
Type: Multi-Sensor Thermal Binoculars
Crew: ea1
Sensor Type: 640 x 480 InSb
Telescope: 10X Zoom 27-275mm
WFOV: 20° x 15°
NFOV: 2° x 1.5°
Display Type: OLED, Full Color
Display Resolution: 1280x720, (720p) 16:9
Frame Rate: 60Hz
Image Controls: Cal, Pol, Auto/ Man Gain, Display, Auto Focus, Palettes
Global Positioning System (GPS): C/A code
SAASM GPS: supports military GPS plug-in (optional)
Digital Magnetic Compass: 360° Az, +/- 90° El, 0.2° resolution
Laser Rangefinder (LRF): 1.54 µm, Eyesafe, class 1, 10km
Laser Pointer (LP): 852 nm, Class 3B, .5/30mW (optional)
Image Storage: Yes, 1000 png
E-Stabilization: MEMS Gyro, No image latency
Battey Type: AA Lithium

Run Type: 6 hours (Hot Swap)

External Power: 9-32VDC

Video: NTSC/ PAL & HD-SDI

Optional Accessories: Remote LRF Cable; Communications Cable; DAGR Cable

Dimensions

Length: 8.7 in

Width: 7.4 in

Height: 3.5 in

Weight, Combat: 4.25 lbs

Notes:

The Recon V is a compact and light yet rugged multi-sensor thermal binocular designed for 24/7 day and night field operations that require enhanced imagery and long standoff range. Its internal GPS, DMC, and long-range laser pointer provide accurate range to target as well as precise location. The 10x continuous zoom optics, MEMS based electronic stabilization, and high-definition color video display combine to provide unmatched image quality and flexibility. Powered by AA Li batteries, the unit has a run time of up to six hours. It’s SWaP-optimized and qualified to MIL-STD 810G for easy portability under rigorous mission demands. An intuitive interface reduces training time and simplifies usability in high-stress field operations. While operators provide mission-critical situational awareness data they remain safe by always being connected to their extended team. Features: *BEST-IN-CLASS THERMAL IMAGING Combining 640x480 MWIR image quality with industry-leading processing and a high-definition display, Recon V provides the clarity your mission demands. *POWERFUL TACTICAL CAPABILITIES Built-in stabilization, digital magnetic compass, GPS, and laser pointer provide accurate range-to-target, precise geo-location, and rock-solid imagery. *FLEXIBLE, TOUGH, AND POWERFUL SWaP-optimized and easy to use, Recon V minimizes operator fatigue and is rugged enough to survive everything your mission may throw at it. *INCREASED SITUATIONAL AWARENESS 10x continuous zoom provides long-range narrow FOV as well as wide-angle FOV for battlefield flexibility. *EASY, INTUITIVE OPERATION An intuitive interface includes electronic stabilization (E-Stab), one shot image save, auto fall-of-shot, auto image optimization, auto focus and BIT,

LPR-4 KOMZ Russian Man Portable Scout Laser Rangefinder

Tiers:

System

Weight: kg4.5
Battery Life: hrs12
Vehicle Compatible 12V, 24-27V: Yes
Operating Temperature: C-50 to +50
Handheld Operation: Yes
GLONASS: Yes
GPS: Yes
Daytime Magnification: 7x and 14x
3G Night Operation: Yes
FMV Display: Yes
Maximum Measurement Range: m2000
Minimum Measurement Range: m150

Notes:

The LPR-4 manportable scout laser instrument is designed for Army scouts to more effectively detect, identify, TV-control (automatically or manually), and pinpoint objects automatically round the clock and to automatically detect changes to the situation, process and store data on objects reconnoitered and quickly transmit the data to external devices in the digital and text forms.

RGB-3 Russian Remote Sensing System

Tiers:

1 2 3 4

System

Alternative Designation: RGB-3
Type: Remote Sensing System
Crew: INA
Power: 9.0 to 16.5 Volts (DC), 500 mA Typical Current Draw
Lenses: Four lenses (9.6 mm focal length each)
Effective Sensor Range: 425 nm to 950 nm (Filters field changeable by users)
Color Bands: Red: 570 nm – 700 nm, Green: 480 nm – 550 nm and Blue: 400 nm – 470 nm
Narrow Bands: 680 nm (NDVI Red), 700 nm (Red Edge) and 800 nm (NDVI NIR) (each 20 nm wide)
Image Memories: Four 16 GB Micro SD cards (up to ~8000 images/card)
Control Panel Buttons: Take Picture, Move System Menu Up, Down or Select
Status Indicator: System Ready (Green) / System Busy (Red)
Interface Connections: USB: USB 2.0 (Able to transfer images & data @ 60 MB/Second)
Video: NTSC Multi-IO (HDMI-Type Remote trigger, Serial (Receive, Transmit & Sync), NTSC Video
Included Software: Tetracam PixelWrench2

Dimensions

Length: 115.6 mm
Width: 80.3 mm
Height: 50 mm
Weight, Combat: 400 grams

Notes:

Based on the Micro-MCA4 architecture, the RGB+3 is a remote sensing workhorse. This system consists of four cameras: one RGB color camera that senses broad bands of red, green, and blue; and three monochrome cameras that sense the following narrow bands: 680 nm, 700 nm, and 800 nm; these are generally understood as NDVI red, the "red edge," and NDVI NIR, respectively. This configuration allows you the advantage of an RGB color camera as well as very precise analyses, such as NDVI and SAVI, via the narrow bands. The RGB+3 snap shutter sensors produce crisp images at very short exposures that are ideal for mosaic building or operation aboard fast or low-flying aircraft. The RGB+3 is equipped with standard Micro-MCA

interfacing which includes a USB 2.0 interface for rapid system configuration and image transfer, a serial interface for tagging each image with GPS coordinates, live video interfacing, and a multi-IO connector (HDMI) with links to remote controls such as a remote image trigger.

ENVG III/FWS-I American Night Vision Mobility and Targeting System

Tiers:

1 2 3 4

System

Alternative Designation: ENVG III/FWS-I
Type: Enhanced Night Vision Goggle III/ Family of Weapon Sight-Individual
Crew: ea1
Rapid Target Acquisition (RTA) Technology: Quickly locate and engage targets from any location without raising the weapon to the eye, keeping soldiers both safe and more lethal
12-micron Technology: Provides the sharpest image quality in a smaller and lighter package, allowing soldiers to identify and engage targets day or night, and in smoke, dust, haze, or fog
Intuitive Design: Easily switch between modes of use with a touch of a button, improving situational awareness, and soldier confidence.
Modes: Image overlay, picture in picture and scope only view options tailored to meet the multi-environmental conditions today’s soldier encounters
Transmission: Enables multiple units to work in close proximity without interference and jamming
Battery Life: Extends mission time without adding to pack load.

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

Enhanced Night Vision Goggle III/Family of Weapon Sight-Individual ENVG III/FWS-I. In today’s battlefield environment, it is

critical for soldiers to be able to quickly locate and identify targets, especially during nighttime operations or when visibility is compromised. Currently soldiers use two different devices – night vision goggles for situational awareness and the thermal weapon sight for aiming, which impacts how quickly the soldier can acquire and engage the target. BAE Systems' ENVG III/FWS-I provides dismounted soldiers with an integrated thermal targeting system to illuminate the night. ENVG III/FWS-I eliminates the need to switch between night vision goggles and weapon mounted thermal sights when acquiring or engaging threats, improving soldier safety and mission effectiveness.

MP-DF 100 Israeli Manpack DF/COMINT system

Tiers:

System

Name: MP-DF 100
Type: Manpack DF/COMINT system
Alternative Designation: INA
GPS Enabled: Yes
Note: The MP-DF 100 can operate in two main modes: Hand-held mode or Manpack mode.

↳*MP-DF 100, Hand-Held Mode*

Frequency Range: MHz25-3,000

Weight: 14 kg excl vest
Power Consumption: 40 W (excl PDA)
SHock and Vibration: MIL-STD-810 (except PDA)
Antenna TYpe: 90 deg front sector (homing)
DF Method: sum-null comparison
Bandwidth Resolution: kHz typ25
Max Signal at Input (no damage): dBm+20

↳***MP-DF 100, Manpack Mode***

Frequency Range: MHz25-3,000
Weight: 20 kg excl vest
Power Consumption: 40 W (excl PDA)
Shock and Vibration: MIL-STD-810 (except PDA)
Antenna Type: 360 deg and +15 Elevation
DF Method: Interferometer
Accuracy: typ 4° RMS @ SNR IF=10 dB
Resolution: deg0.5
Instantaneous Bandwidth: MHz2 x 2
Max Input Signal (no damage):: dBm+20
Software Interface: wireless Bluetooth networking
Display: activity map (signal level vs frequency graph or list); DF map vs frequency (DOA vs frequency, strip graph or list); DF activity vs time at specified frequency (for net radio)

Notes:

Designed for use by ground forces gathering intelligence in the field, the MP-DF 100 manpack DF/COMINT system is used for interception and direction finding on a range of frequencies in the band from 25 to 3,000 MHz. Performing wide-spectrum scanning, the MP-DF 100 detects, locates and monitors signals of interest from specific locations. The MP-DF 100 can be configured to operate in two main modes: hand-held or manpack. These modes are differentiated by the size and type of their antennas. The hand-held mode, which uses a 90° front sector antenna and sum-null DF, enables soldiers to locate nearby emitters by advancing in the emitter's general direction and aiming the sensor in the direction of the emitter (homing mode). The manpack mode, which uses two types of small tripod-mounted antennas and interferometer-based DF, enables mapping of the direction and frequency of existing emitters in the area. This configuration, which includes GPS capabilities integrated in a PDA, can be carried in a specially-designed vest or backpack, and used as a standalone sensor or remotely controlled.

KDU-1 Polyus Russian Man-Portable Rangefinder/Goniometer

Tiers:

System

Alternative Designation: KDU-1 Polyus
Type: Man-Portable Rangefinder/Goniometer
Crew: ea1
Measurement Range at ±10 m Accuracy,: 50...9,000 m
Recognition Range of “Tank-Sized” (frontal area) Target: 4,500 m
Burst Ranging: 4,000 m
Magnification: x7
Field of View: 6°
Dioptric Adjustment: ±4 Diopters
Azimuth Range: from +30-00 to –30-00 deg
Elevation Range: from +3-00 to – 3-00 deg
Angular Accuracy: 0-04 deg
Angular Accuracy: 0-12 deg

Dimensions

Length: INA
Width: INA
Height: INA
Height of Periscope: 250 mm
Weight, Combat: kg14

Notes:

The KDU-1 rangefinder/goniometer is designed for ground target reconnaissance, correction of artillery and air firing from ground, air, ship control centers as well as for use in automated fire control systems. SYSTEM COMPOSITION *LDM-2 (1D39) laser rangefinder module *SN-3 aiming system *1D26 TR tripod *Periscope *LGK-4M laser gyrocompass *1E77 synchronization unit (2 pcs.) *1E67M accumulator battery (2 pcs.) *Accessory set *Transport case including two flexible packs for carrying *Operation manual

LTSD-4-1 Russian Laser Rangefinder/Designator

Tiers:

1 2 3 4

Variants:

- **LTSD-4 LASER RANGEFINDER/DESIGNATOR:** The LTSD-4 Laser Rangefinder/Designator is designed for ground target reconnaissance, correction of artillery and air firing in daylight and at night including the use of high-accuracy ammunition fitted with laser homing heads when illuminating the stationary and moving targets, military equipment and offensive fortifications by a laser light from ground observation points. It may be also used in automated fire control systems.

System

Alternative Designation: LTSD-4-1
Type: Laser Rangefinder/Designator
Crew: ea2
Tank-sized target in the daytime: m5,000...7,000
Surface Target: m5,000...15,000
Night Vision Device Tank-Sized Target at Night: m1,000...3,000
Thermal Imager, Tank-Sized Target at Night: m3,000...4,000
Measurement Range at 5 m Accuracy: m100...20,000
Boresight Magnification: x10
Field of View: 5°
Dioptric Adjustment: +5 diopters
Maximum duration of laser designation, Artillery Mode: 15 sec
Maximum duration of laser designation Air Mode: 100 sec
Azimuth Range: +30-00...-30-00 deg
Elevation Range: +3-00...-3-00 deg
Angular Accuracy, Magnetic Azimuth: 0-12 deg
Angular Accuracy, Elevation: 0-04 deg

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: kg20

Notes:

The LTSD-4-1 Laser Rangefinder/Designator is designed for ground target reconnaissance, correction of artillery and air firing in daylight and at night including the use of high-accuracy ammunition fitted with laser homing heads when illuminating the stationary and moving targets, military equipment and offensive fortifications by a laser light from ground observation points. It may be also used in automated fire control systems. SYSTEM COMPOSITION *PP-20 transceiver *BNV-3 night vision unit * *SN-3 aiming system *1D26 TR tripod *1E77 synchronization unit (2 pcs.) *1E67M accumulator battery (2 pcs.) *Accessory set *Transport case including two flexible packs for carrying *Instruction manual

LTSD-4 Russian Laser Rangefinder/Designator

Tiers:

System

Alternative Designation: LTSD-4

Type: Laser Rangefinder/Designator

Crew: ea2

Tank-sized target in the daytime: m5,000...7,000

Surface Target in the daytime: m5,000...15,000

Tank-Sized Target at Night using Night Vision: m1,000...3,000

Tank-Sized Target at Night using Thermal Imager: m3,000...4,000

Measurement Range at 5m Accuracy: m100...20,000

Boresight magnification: x10

Field of view: 5°

Width: INA

Height: INA

Weight, Combat: kg20

Height of Persciope: mm250

Notes:

The LTSD-4 Laser Rangefinder/Designator is designed for ground target reconnaissance, correction of artillery and air firing in daylight and at night including the use of high-accuracy ammunition fitted with laser homing heads when illuminating the stationary and moving targets, military equipment and offensive fortifications by a laser light from ground observation points. It may be also used in automated fire control systems.

MP007 American Man-Portable Direction Finding System

Tiers:

System

Alternative Designation: MPOO7
Type: Man-Portable Direction Finding System
Crew: ea1
DF Accuracy: Outstanding DF accuracy in compact design due to use of the correlative interferometer DF method in the range above 173 MHz
Frequency Range: Wide frequency range from 20 MHz to 6 GHz (DF mode)
Position Fixing: Realtime position fixing for detected transmitters through networking of multiple R&S®MP007 systems
Operation: Extended operating time thanks to high-power battery and optional solar module
Intergration: Integration into existing Rohde & Schwarz DF systems
Software: Tried and tested R&S®RAMON control software
Web-Based Interface: Special web-based user interface for tablets and touchscreen operation
Wireless Communications: Networking via wireless communications
Transmitters: Master/slave position fixing of fixed-frequency transmitters. Integration of R&S®MP007 into existing Rohde & Schwarz radiolocation systems

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

The R&S MP007 direction finding system is based on the R&S DDF007 portable direction finder upgrade kit in combination with the R&S®ADDx07 compact DF antennas. The result is a unique combination of functionality and performance in a system of this size. It can be used as a stationary or mobile DF station or as a portable manual direction finder, and can be reconfigured within minutes to meet the requirements of the current situation. The R&S®MP007 comes with a wide range of powerful software options and add-ons, making it an excellent choice for all applications that call for a compact and flexible yet powerful DF system. Key Facts Outstanding DF accuracy in compact design due to use of the correlative interferometer DF method in the range above 173 MHz Wide frequency range from 20 MHz to 6 GHz (DF mode) Realtime position fixing for detected transmitters through networking of multiple R&S®MP007 systems Extended operating time thanks to high-power battery and optional solar module Integration into existing Rohde & Schwarz DF systems

Flexnet French Wireless Protection and Surveillance Platform

Tiers:

System

Alternative Designation: Flexnet

Type: Wireless Protection and Surveillance Platform

Crew: ea1

Autonomous: • Long battery lifetime • Autonomous communication • No existing power or network required • Auto configuration

Intelligent: • Automatic detection • Target classification & recognition • Threat characterization • Easy to deploy and use • Remote control & setting

Scalable: • Suitable for small & large protection networks • C2 system with API for easy integration • Compatible with 3rd party sensors

Invisible: • Small & portable • Easy to hide & covert sensors • Silent secured network • Passive sensors (no signal sent to detect)

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Notes:

Flexnet is a modular sensor solution offering strength protection and monitoring of critical sites. Developed by Exensor, Flexnet combines a comprehensive toolbox of sensors for Military and Homeland protection applications. Launched in 2008, the Flexnet solution is a flexible and user-friendly, comprehensive surveillance solution composed of a portfolio of intelligent, wireless Unattended Ground Sensors (UGS) and cameras allowing the detection, classification, identification and tracking of moving objects on the ground. Ensuring a full 360° 24/7 perimeter protection for all kinds of security operations, the Flexnet solution is one of the most reliable sensor solutions available on the market. Thanks to its flexible toolbox architecture, the solution can easily be extended by integrating external sensors for multi-surveillance missions. Suited for harsh environmental conditions, the Flexnet wireless platform is adapted for military force protection, area surveillance as well as intelligence gathering. The Flexnet solution, developed by Exensor, is a user-friendly, flexible, comprehensive surveillance solution combining a wide range of sensors (passive infrared, seismic and acoustic, and intelligent motion cameras) with a proprietary command & control software. This self-healing Mesh network allows for detection, classification & identification of any threat. The Flexnet sensor platform is a Force Multiplier that can be used for several applications, ranging from force protection tasks, such as airbase protection, camp protection, patrol and self-protection tasks, to Intelligence Gathering, Surveillance, Reconnaissance and Target Acquisition (ISTAR) tasks.

SIMRAD GN 1/GN 2 Norwegian Night Vision Goggles

Tiers:

1 2 3 4

System

Alternative Designation: GN 1/GN 2
Type: Night Vision Goggles
Manufacturer:
Crew: ea1
Magnification: 1x
Field of View: 40 deg
Focus Range: 0.2m to infinity
Battery: 2 x 1.5V AA cells
Battery Life: >80h at 20°C
IR Source On: >40h at 20°C
IR Source: LED
Operating Temperature: –40°C to +55°C
Storing Temperature: –40°C to +65°C

Dimensions

Length: mm58
Width: mm155
Height: mm73
Weight, Combat: g390

Notes:

The GN Night Vision Goggles are among the smallest and lightest night vision goggles ever produced. Their unique design makes them comfortable and easy to use, whilst retaining a high performance night vision capability. Advanced features include *Range focus *Eyepiece focus *IR illuminator *Lightweight, ergonomic head mount or helmet mount *Flip-up mechanism *Waterproof to 10m *NATO codification *Easy and quick mounting *Compatible with 2nd or 3rd generation 18mm *image intensifier tubes Applications *Vehicle driving/commanding *Patrolling *Surveillance *Weapon handling *Parachuting *Reconnaissance *Logistical operations *Search and rescue *Map reading

LTSD-4-2 Russian Laser Rangefinder/Designator

Tiers:

System

Type: Laser Rangefinder/Designator
Crew: ea2
Tank-sized target in the daytime: m5,000...7,000
Surface Target: m5,000...15,000
Night Vision Tank-Sized Target at Night: m1,000...3,000
Thermal Imager Tank-Sized Target at Night: m3,000...4,000
Measurement range at 5 m accuracy,: m100...20,000
Boresight Magnication: x10
Field of View: 5°
Dioptric adjustment: ±5 Diopters
Maximum duration of laser designation, Artillery Mode: 15 sec
Maximum duration of laser designation, Air Mode: 100 sec
Azimuth Range: +30-00...-30-00 deg
Elevation Range: +3-00...-3-00 deg
Angular Accuracy, Magnetic Azimuth: 0-12 deg
Angular Accuracy, Elevation: 0-04 deg

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: kg15.9

Notes:

The LTSD-4-2 Laser Rangefinder/Designator is designed for ground target reconnaissance, correction of artillery and air firing in daylight and at night including the use of high-accuracy ammunition fitted with laser homing heads when illuminating the stationary and moving targets, military equipment and offensive fortifications by a laser light from ground observation points. It may be also used in automated fire control systems. SYSTEM COMPOSITION: *PP-20 transceiver *BNV-3 night vision unit * *Set for fastening PP on terrain *1E77 synchronization unit *1E67M accumulator battery (2 pcs.) *LDM-2 laser rangefinder module *Accessory set *Transport case including two flexible packs for carrying *Instruction manual

PKI 9120 German Mine Detector

Tiers:

System

Alternate Designation: PKI 9120
Type: Mine Detector
Manufacturer: INA
Crew: 1
Power Supply: Power supply: 8 alkaline batteries 1,5 V type LR 14 (operating time 40 h) or 8 rech. batteries NiMH 1,2 V – 3,5 Ah (operating time 10 h) or battery pack 9,6 V – 3,8 Ah (operating time 10 h)
Operating Temperature: from -21°C to + 55°C approx.

Dimensions

Circular Search Head: 230 mm diam
Optional Search Head: 450 mm diam
Electronic Cylinder: 35 x 460 mm
Extension Rod: 25 x 600 mm
Battery Container: 30 x 360 mm
Short Version: 1000 mm and 2,1 kg
Long Version: 1700 mm and 2,4 kg
Weight in Satchel: 3,8 kg
Weight in Carrying Case: 8,5 kg

Notes:

The PKI 9120 mine detector is designed for use on all grounds even on compact soils such as volcanic soil or laterit, which makes it suitable for use everywhere in the world. In many regions mine detectors can be influenced by a mixture of soils such as laterit, magnetic rock and by soil conductivity due to monsoon rain. The wide band compensation of this PKI mine detector meets such environmental working conditions and also rejects interference from saltwater due to its pulse induction operating principle. Components subject to wear and tear can easily be exchanged without further calibration work. This eases fault definition and significantly improves equipment availability in the field. Rugged design and constructional features, coupled with various accessories make the PKI mine detector a very versatile equipment, which allows use in lying, kneeling or upright position.

Fara-1 Russian Small Arms Radar Sight

Tiers:

1 2 3 4

System

Alternative Designation: Fara-1
Type: Small Arms Radar Sight
Manufacturer: NPO Strela, Tula
Crew: ea1
Scan Sector Range: 5,000 m
Scan Sector Azimuth: 24; 45; 90; 120 deg
Moving Target Detection Range, Person: 2 km
Moving Target Detection Range, Tank: 4 km
Moving Target Location Accuracy, Range: 20 m
Moving Target Location Accuracy, Azimuth: 0-20 deg
Resolution Range: 50 m
Resolution Azimuth: 0-80 deg
Power Consumption: 12 watts
Mean Time Between Failures: 5,000 hours

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: kg16.5

Notes:

Russian army use also close combat, weapons equipped by radar sights along with the optoelectronic sights. Radar sights work in centimeter and millimeter wave bands that make it possible detecting targets and providing weapons guidance at any time, in all weather conditions as well as smokescreen and dustiness of atmosphere. Portable Multiple Target Surveillance and Weapon Guidance Radar «Fara-1» (1L111) is used as a radar sight in the Russian Armed Forces and was adopted in 1999. Radar Sight Fara-1 is designed for moving land objects surveillance (single person, group of people, armoured vehicles) and guidance of automatic grenade launcher AGS-17 type, single and heavy machine guns such as Pecheneg and Kord. Weapons

guidance at a moving target is fulfilled by operator at the signal maximum from the target reflection and with it the target range is determined by the radar indicator. The radar sight manpack set is a portable device carried by one person in the folded state behind an the pack. Radar sight works in continuous emission mode. Complex signal with double modulation is used for rain influence and flying birds avoidance in the radar near-field.

Joint Readiness Training Center (JRTC)

JRTC VISMOD: T-80B Main Battle Tank (MBT)

Tiers:

Variants:

- **T-80BK:** This is the command version of the T-80B with additional communications equipment. It could not fire the Kobra guided missile.
- **T-80BV:** This is a development of the T-80B equipped with Kontakt explosive reactive armor. It had a combat weight of 93,700 lb (42,500 kg), top road speed of 44 mph (70 kph) and a road range of 230 mi (370 km). The T-80BVK is the commander's version.

System

Alternative Designation: NA

Total Built: The T-80B is the first variant produced in quantity. Russia: 5,391

Type: Main Battle Tank

Family: T-80 Series

Crew: ea3

Maximum Effective Range: m1,500

Dimensions

Length: m9.65

Width: m3.58

Height: m2.22

Weight, Combat: tons43.7

Ground Pressure: INA

Admin Note:: The dimensions provided above are the dimensions of the actual T-80B. The dimensions of the VISMOD should be provided here IOT facilitate BLUFOR range estimation.

Automotive

Engine Name: GTD-1000T

Engine Type: Gas turbine engine

Engine Power: hp1,100

Power to Weight Ratio: hp/ton25.8

Cruising Range: km335 (Actual T-80B)

Speed, Maximum Road: km/h70 (Actual T-80B)

Speed, Average Cross: 55

Speed Maximum Swim: Not Amphibious

Gradient: deg60

Side Slope: deg40

Vertical Step: m1

Trench: m2.85

Fording Depth (No Preparation): m1.8

Fording Depth (With Preparation): m5

Cold Start Ability: Yes

Deep Water Snorkel: Available

Admin Note:: Values listed above are for the actual T-80B. Where appropriate, the values of the VISMOD should be input to assist in developing ENY COAs

Mazimum Pressure: bar5,100

Loading System: Korzina electric and hydraulic automatic loading system

Carousel Reloading Time: minutes13-15

Note: The L48 2A46M-1 has been extensively developed into 10 different variations and remains the primary armament of Russian front-line tanks.

↳*Ammunition (Main Gun)*

Name: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Type: Smoothbore 125mm Projectile

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Maximum Effective Range: m1,500

Maximum Range: m5,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Weight: kg11

Projectile Dimension: mm900

Admin Note: If not FOUO, ranges used here should match the range of the MILES system being used by the OPFOR

Anti-Tank Guided Missile

↳*System*

Name: Kobra (AT-8 Songster)

Type: SACLOS Anti-Tank Missile System

Caliber: mm125

Basic Load: rounds5

Rate of Fire: rd/min2-3

Guidance System: SACLOS Radio

Effective Firing Range: m100-4,000

Manufacturer: KB Tochmash

In Service: 1976-present

Weight: kg23.2

Warhead Weight: kg4.5

Muzzle Velocity: m/s125, which increases to 800m/s at its peak

Flight Time to a 4,000 Meter Targetsec: 9-10

Armor Penetration: 600mm of RHA

Hit Probability: %80

Note: ATGM can only be fired when the vehicle is stationary

Admin Note: If not FOUO, ranges used here should match the range of the MILES system being used by the OPFOR

Commander's Weapon / Air Defense Weapon

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: 12.7mm Anti-Aircraft Machine Gun

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Weight (Gun Only): kg25

Muzzle Velocity: m/s845

Max Rate of Fire: rds/min200-600

Length (Total): mm1,560

Action: Gas Operated

Feed System: 50-Round Belt

↳*Ammunition*

Type: AP-I

Caliber: mm12.7

Cartridge: 12.7×108mm

Muzzle Velocity: m/s845

Basic Load: ea500

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Admin Note:: If not FOUO, ranges used here should match the range of the MILES system being used by the OPFOR

Coaxial Machine Gun

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: 7.62mm Machine Gun

Manufacturer: Degtyaryov plant

Rate of Fire: rds/min200-600

Weight (Gun Only): kg9

Length (Total): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea1,250

Effective Range: m2,000

Admin Note:: If not FOUO, ranges used here should match the range of the MILES system being used by the OPFOR

Fire Control

Name: 1A33 FCS

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, the T01-KOIR

Commander Day Mode Sight: 10^0 FOV and ×5 magnification

Thermal Sight Gunner: Yes

Main Gun Stabilization: Yes, 2E26M electro-hydraulic dual plane stabilisation system

Main Gun Stabilization Deployment Time: minutes2

Range, Day Sight: m1,000

Range, Thermal Sight: m2,600

IR Searchlight: Yes, L-4A "Luna" IR Searchlight

TNPO-160 Periscopes: ea2

TNPA-65 Periscopes: ea2
Range Finder: IG42 rangefinder sight with an electronic control panel
Ballistic Computer: 1V517 tank ballistic computer
Fire Selection Panel: 1G43
Weapon Stabilizer: 2Eh46M
Input Sensors: Wind-speed, tank speed, cant, and bearing
Admin Note:: If not FOUO, the above data should match the actual capabilities of the VISMOD

Protection

Armor Type: The T-80B is protected by a third iteration Soviet laminate armor that is known as Combination K
Applique Armor: Yes, Hull side; track skirts
Explosive Reactive Armor: Yes, Kontakt-1 System
Active Protection System: Arena Available
Mine Clearing: Roller-plow available
Self-Entrenching Blade: Yes
NBC Protection: Yes, ZETS-11-2 detection system collective overpressure system
Smoke Equipment: Yes, two banks of four 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade
Smoke Grenade Range: m250-300
Smoke Screen: 30m wide and 10m high for 60 seconds per grenade.
IR Signature: The exhaust is box-shaped and designed to direct heat away from the tank
Anti-Radiation Material: Installed as a inside protective layer
Personal Breathing Apparatus: Equipment
Automatic Fire Extinguisher System: Yes
Upper Glacis: 200mm at 22 degrees
Lower Glacis: 80-100 mm at 30 deg
Side Hull Armor: 60-80mm
Rear Hull Armor: 30-40mm
Floor Hull Armor: 100mm
Front Turret Armor: 400-450mm
Side Turret Armor: 90-120mm
Rear Turret Armor: 60-90mm
Top Turret Armor: 40-50mm

Notes:

The T-80B is a front-line combat vehicle which combines operational mobility and tactical offensives and defensive capabilities. This variant features the 9K112 Kobra missile system. It also has improvements to the computerized fire-control system, including a laser rangefinder. The T-80B main battle tank is a further development of the original T-80, which was produced only in small numbers. The T-80B is the first variant produced in quantity. Small scale production of this tank commenced in 1978. At least 5,391 T-80B and improved T-80BV tanks were produced. Due to expensive maintenance the Russian Army planned to retire all T-80 series tanks by 2015. However in 2017 upgraded versions of this tank was publicly revealed.

Protection of the T-80B was improved comparing with the T-80. The tank is fitted with a composite armor at the front of the hull and turret. Its hull provides protection equivalent to 570-820mm of Rolled Homogeneous Armor (RHA) against armor piercing rounds, depending on the projectile type. Turret provides protection equivalent to 420-760mm or RHA. This tank is fitted with NBC protection and fire suppression systems. The original T-80B tanks lacked explosive reactive armor, which was fitted to improved models and were painted olive drab. Fording depths (m): 12.0 with BROD-M system. The night sight cannot be used to launch the ATGM. The day sight can be used at night for launching ATGMs if the target is illuminated. A variety of thermal sights are available. They include the Russian Agava-2, French Sagem-produced Alis and Namut sight from Peleng. There are thermal sights available for installation, which permit night launch of ATGMs. The 12.7mm MG NSVT has both remote electronically operated sight PZU-5 and gun-mounted K10-t reflex sight. The more recent BK-27 HEAT round offers a triple-shaped charge warhead and increased penetration against conventional armor and ERA. The BK-29 round, with a hard penetrator in the nose is designed for use against reactive armor, and as an MP round, has fragmentation effects. If the BK-29 HEAT-MP is used, it may substitute for FRAG-HE (as with NATO countries) or complement FRAG-HE-he. With three round (APFSDS-T, HEAT-MP, ATGMs) in the auto loader versus four, more antitank rounds would be available for the higher rate of fire. The ATGM may be launched while moving slowly. The AT-8 can be auto-loaded with the two halves mated during ramming; but the stub charge is manually loaded. The GTA-18A auxiliary power unit is used when the engine is off

JRTC VISMOD: Technical Fighting Vehicle

Tiers:

1 2 3 4

System

Crew: 2+

Description: Civilian truck modified for military use

:

↳*Dimensions and Automotive Characteristics*

Note: Varies by make and model

Armament

↳*Weapon Option 1*

Cailber/Length: mm14.5

Name: KPV-14.5

Type: Heavy machine-gun

Ammunition: 500 x 14.5mm

Rate of Fire: 600 rounds / minute

↳*Weapon Option 2*

Name: M2 Heavy Barreled Machine Gun

Type: 50 Caliber Machine Gun

Ammunition: 500 x .50mm

↳*Weapon Option 3*

Cailber/Length: mm30

Name: AGS-17

Type: Automatic grenade launcher

↳*Weapon Option 4*

Caliber: mm82

Name: 2B14 Podnos

Type: Mortar

↳*Weapon Option 5*

Name: Konkurs or Kornet

Type: Anti-tank missiles

↳*Weapon Option 6*

Name: SPG-9 (Spear)

Type: 73mm Recoilless Gun

↳*Weapon Option 7*

Name: DShK

Type: 12.7mm Heavy Machine Gun / AA Gun

Notes:

A "Technical" is a type of improvised fighting vehicle, typically a civilian or military non-combat vehicle, modified to provide an offensive capability similar to a military gun truck. It is usually an open-back civilian pickup truck or all terrain vehicle mounting a machine gun, anti-aircraft gun, recoilless rifle, or other support weapon. Due to the simplicity in which a technical can be built as well a the high maneuverability that they provide, it is likely that this weapon platform will be heavily utilized by insurgent and special purpose forces. The armor protection of a technical fighting vehicle is non-existent unless added after market. Therefore, most weapon systems can destroy a technical and all can disable them.

JRTC VISMOD: T-72 Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-72B:** Second Russian main variant of the T-72 after the T-72A.
- **T-72B1:** In 1986, a limited production variant without an ATGM launch capability. Some do not have ERA.
- **T-72BK:** The Commander's variant with additional radios.
- **T-72BM:** Russian T-72B upgrade with 2nd gen ERA. The system is fielded, available for export, and upgraded. Tier 2 and some Tier 3 tanks can challenge US forces under favorable conditions when using modern ammunition and employed by well-trained units with sound tactics. A variety of upgrades are available for the T-72B. They include protection upgrades, such as improved ERA, APS, defensive aids suites with IR jammers, plate armor, welded turret, and grill armor around tracks and grill. Mobility upgrades include a new power train, improved steering, improved mine plows and rollers, and electronic mine spoofing system. Fire control system upgrades include new sights, gun, ammunition, and improved stabilization. With the expanding number of upgrades offered by former Warsaw Pact, Asian, Israeli, and other firms, most T-72-type tanks have some level of upgrade from the basic T-72 MBT. The more affordable upgrade approach for most countries is to execute specific upgrades during maintenance work. But this approach may result in only partially modernized tanks at any one point in the life of the vehicle, and which are not as modern as more recent competitors. An alternative is to produce modernized tanks in small numbers, resulting in high per-unit production costs.
- **T-72BU:** Upgrade variant with the fire control system from the T-80U as well as well as a variety of other changes.
- **T-72BU renamed T-90:** With the limited market for new tanks, the world tank industry has developed upgrades and whole vehicle upgrade packages to tap into the market. Older T-72 tanks can be brought up to the T-72B standard. Some approach the T-90 standard. Most T-72-type tanks fielded reflect some level of upgrade. Upgrade options are expanding from former Warsaw Pact, Asian, Israeli, and other international firms.
- **T-72S / Shilden:** Russian export T-72A upgraded to the T-72B standard. Although visually similar to T-72B, it has slightly less chassis and turret protection. Former Warsaw Pact countries such as Slovakia and Middle Eastern countries like Iran have upgraded their tanks to the T-72S standard.
- **M-84AB1:** Yugoslav upgrade to the M-84, bringing it close to the T-90, and the latest T-72B improved tanks.
- **M-95 Degman:** Croatian M-84 upgrade with box composite armor, ERA, 1200hp and thermal FCS. An export upgrade conversion, AKA M-84D, is offered for Kuwaiti M-84A tanks.
- **PT-91:** Polish upgrade tanks with ERA, Drawa improved FCS, Savan-5 thermal sight, improved gun stabilization, and countermeasures.
- **PT-91M:** Has a 1000hp engine, new guns and FCS, armor changes, and other improvements. PT-91M exported to Singapore. PT-91P is designed for export to Peru.
- **T-72M1:** Demonstrator with 2nd generation ERA and other upgrades were displayed at military shows.
- **T-72M1M:** Includes 3rd generation Relikt ERA and optional Arena Active Protection System (APS). Alternative designations: Rogata and SMT M1988. It is almost the same as the T-72S (Export), except more ERA on the side skirts.
- **AJEYA MK 2:** India is upgrading T-72A tanks close to a Bhishma (T-90S) standard.

System

Alternative Designation: NA
Manufacturer: Uralvagonzavod
Type: Main Battle Tank (MBT)

Crew: ea3

Passenger Capacity: INA

Maximum Effective Range: m500

Note #1: The T-72 Ural main battle tank was developed as a cheaper and more reliable, however less capable alternative to the T-64.

Note #2: 25,000+, one of the most widely produced post-World War II tanks, second only to the T-54/55 family. The T-72 was exported to around 30 countries.

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 39 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 39 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Tank Commander's Weapon System

↳***System***

Name: Type 54 DShK Anti-Aircraft Machine Gun
Type: 12.7 Anti-Aircraft Machine Gun
Proliferation: over 1 Million
Length (Total): mm1,625
Length (Barrel): mm1,070
Weight (Gun Only): kg34
Weight (on Wheeled Mounting): kg157
Max Rate of Fire: rds/min600
Range Finder Type: Optical
Action: Gas-Operated, Flapper Locking
Feed System: 50 Round Belt
Sights: Iron/Optical
Turret: Single seat and placed at the rear of the vehicle roof. It is sharp-pointed at the front.
Variants: DK, DShKM, DSHKS, Type 54 HMG
Fire on the Move: Yes

↳***Ammunition***

Type: Rifle
Caliber: mm12.7x108
Muzzle Velocity: m/s850
Basic Load: ea1,200
Effective Range: m2,500
Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Loader's Weapon System

↳***System***

Name: 7.62mm PK (Kalashnikov's Machine Gun)
Type: mm7.62
Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
In Service: 1961-present
Manufacturer: Degtyaryov plant
Proliferation: 1 Million +
Max Rate of Fire: rds/min650
Range Finder Type: INA
Time the Max Rate of Fire can be Sustained: INA

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length: mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.60

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea1,500

Effective Range (Iron Sights): m1,000

Effective Range (with Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: 1A40-1

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, Type INA

Thermal Sight Gunner: 1K13-49

Main Gun Stabilization: 2Eh42-2, 2-plane

Range, Day Sight: m5,000

Range, Thermal Sight: m1,000

Infrared: Yes

Protection

Hull Armor: Steel and composite armour with ERA, equivalent to 500-600 mm of Rolled Homogenous Armor (RHA)

Turret Armor: Steel and composite armour with ERA, equivalent to 500-600 mm of Rolled Homogenous Armor (RHA)

Applique Armor: Available, Turret top and track skirts

Explosive Reactive Armor: Yes, Kontakt-5

Active Protection System: Yes, Arena available

Mine Clearing: Yes, Roller and plow (optional)

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: Yes, Grenade launcher 8x; VESS

IR Signature: INA

Automatic Fire Extinguishing Equipment.: Yes

Notes:

The T-72 is a family of Soviet main battle tanks that first entered production in 1971. About 20,000 T-72 tanks were built,making it one of the most widely produced post-World War II tanks, second only to the T-54/55 family. The T-72A version introduced in 1979 is considered a second-generation main battle tank. It was widely exported and saw service in 40 countries and in numerous conflicts. The T-72B3 version introduced in 2010 is considered a third-generation main battle tank.

JRTC VISMOD: Starstreak British Short-Range Man-Portable Air-Defense System (MANPADS)

Tiers:

Variants:

- **Starburst:** Javelin SAM launcher adapted for Starstreak LBR guidance- in production
- **Lightweight Multiple Launcher (LML):** Pedestal launcher for three missiles. The launcher can also mount on a light vehicle, e.g., TUV. A demonstrator is LML on a Panhard tactical truck.
- **Starstreak II:** Improved launcher uses Starstreak or Starstreak II missile. It has an auto-tracker for hands-free guidance. It was fielded in 2010.
- **Starstreak Lightweight Vehicle (LWV):** Land Rover truck converted into an SP SAM system with a 6-canister launcher, ADAD auto-tracker, and TV/ thermal FCS. This launcher can be mounted on other vehicles.
- **Armored Starstreak or (SP HVM):** Vehicle is a Stormer tracked APC chassis, with an 8-missile launcher. The passive IR fire control system uses ADAD, an auto-tracker and thermal sight. The launcher can be mounted on other vehicles.
- **Seastreak:** Single-stage missile naval variant in a 12-missile launcher, with mm-wave radar FCS.
- **Thor:** British Multi-Mission Air Defense System is a RWS, with 4 missile launchers, TV, FLIR, and an auto-tracker. Weighing .5 mt, it mounts on trucks, vans, TUVs, APCs, etc., with a remote operator. Designed for Starstreak, launchers, it can also mount other MANPADS, and ATGMs, such as Ingwe, TOW, HELLFIRE, Mokopa, Spike, etc.
- **Lightweight Multi-Role Missile/LMM:** A multi-role missile options with a single 3-kg tandem (HEAT/HE) warhead and proximity fuse. At 13 kg, the lower-cost missile flies 8-km at 1.5 Mach. It was due in 2013 and was successfully launched by a Camcopter S-100 UCAV variant. Other projected upgrades are semi-active laser- homing and/or dual-mode (LBR/SAL-H).
- **Low-cost air defense/anti-armor (multi-role) system.:** Optional use: as a low-cost air defense/anti-armor (multi-role) system, STARSTREAK can be employed against ground targets, such as light armored vehicles, and snipers in bunkers or buildings. The missile and its darts, with a unique combination of penetrator and following frag-he, have been successfully tested against vehicle targets. With a missile cost of 1/2 to 1/3 of competing MANPADS, the system could be used as a fire support asset to complement ATGM launchers and vehicle weapons

System

Alternative Designation: ForceSHIELD
Country of Origin: Great Britain.
Crew : ea2.0
Reaction Time : secLess than 6
Reload Time : secLess than 25 est
Time between Launches : minLess than 30 sec
Primary Targets: Fixed wing aircraft, rotary wing aircraft, cruise missiles, and vehicles
Combat Load: rounds5
Combat Load, Dismount: rounds3
Fire on Move: No

Maximum Effective Range: km7

Flight Speed: Mach 4

Dimensions

Missile Weight: kg16.8

Warhead Weight: kg0.9

↳*Night Sight*

Name: Thales clip-on thermal sight

Acquisition Range : km4 to 5 est

Ammunition

↳*Starstreak Missile*

Type: Three 25mm darts: Tungsten KE tip and case; HE fill

Altitude : m0-5000

Flight Time : sec5 to 7

Fuze Type: Contact with time delay

Guidance: Laser beam rider SACLOS

Penetration : mm KE120+ all LAVs (equal to 3 x 40- mm APFSD-T rds) HE detonates after for frangible effects

Probability of Hit: 60% FW, more than 95% helicopters (each dart 67% for helicopters)

Propulsion: Canister launch booster, bus missile, and 3 darts (sub-missiles)

Range, Maximum : 7000m (guided)

Range, Minimum : m300

Self-Destruct Range: km5.5

Speed : 1364m/s, Mach 4

Other: Starstreak II: Improved missile has 8-km range and better precision. Fielded 2010

Notes:

Starstreak is a British short range man-portable air-defense system (MANPADS) manufactured by Thales Air Defence (formerly Shorts Missile Systems), in Belfast. It is also known as Starstreak HVM (High Velocity Missile). After launch, the missile accelerates to more than Mach 4, making it the fastest short-range surface-to-air missile in the world. It then launches three laser beam riding submunitions, increasing the likelihood of a successful hit on the target. Starstreak has been in service with the British Army since 1997. In 2012 Thales rebranded the system under the ForceSHIELD banner. The Starstreak missile is transported in a sealed launch tube. This tube is attached to an aiming unit for firing. The operator tracks the target using the aiming unit's optically stabilized sight. The process of tracking the target allows the aiming unit to compute the right trajectory to bring the missile together with the target. The operator can indicate wind direction to the unit and, in the case of a long range target, provide superelevation. When the initial tracking is complete, the operator fires the missile by pressing a button. The missile then fires the first-stage rocket motor, which launches the missile from the tube – but burns out before leaving the tube to protect the operator. Four meters away from the operator, when the missile is a safe distance away, the second stage fires, which rapidly accelerates the missile to burn out velocity of more than Mach 4. As the second stage burns out, three dart sub-munitions are released. The dart housing is made from a tungsten alloy. The darts are each 396 millimetres (15.6 in) long with a diameter of 22 millimetres (0.87 in) and weigh about 900 grams (32 oz). Around half the weight of each dart approximately 450 g (16 oz), is its explosive charge, detonated by a delayed-action, impact activated fuze. Each dart consists of a rotating fore-body with two canard fins attached to a non-rotating rear assembly which has four fins. The rear assembly of each dart also houses the electronics that guide the missile, including a rearwards facing sensor. The darts do not home in on laser energy reflected from the target but instead the aiming unit projects two laser beams which paint a two dimensional matrix upon the target. The lasers are modulated and by examining these modulations the sub-munition's sensor can determine the dart's location within the matrix, the dart is then steered to keep it in the center of the matrix. The sub-munitions steer by briefly decelerating the rotating fore-body with a clutch. The front wings then steer the missile in the appropriate direction. The three sub-munitions fly in a formation about 1.5 meters in radius, and have enough kinetic energy to maneuver to meet a target evading at 9 g at 7,000 meters. Earlier laser guidance systems used a single beam that had to be kept on the target at all times, the missile homing in on laser energy reflected off the target, if it moved off the target, the reflection would end and guidance would be lost until the target was regained. The problem could be reduced by making the laser's beam wider, but only at the cost of lowering accuracy and reducing the amount of energy being reflected. Starstreak's system allows for the beam area to be much larger than the target while retaining pinpoint accuracy. On impact with the target, a delayed action fuse is triggered. This gives time for the projectile to penetrate the target before the explosive warhead detonates. The tungsten housing is designed to fragment and produce maximum damage inside the target. A demonstration was conducted in September 1999 that showed the missile being used against an FV432 armored personnel carrier, showing the missile's effectiveness as a surface-to-surface weapon. Each sub-munition dart travelling at 4,500 km/h (1,250 m/s, 4,100 ft/s, 2,800 mph) has comparable kinetic energy to a shell from a Bofors 40 mm gun and probably has sufficient energy to penetrate the front armor of an infantry fighting vehicle. However, it lacks the armor penetration capabilities of a purpose-built anti-tank guided missile or of a dual purpose missile (such as the Air Defense Anti-Tank System).

JRTC VISMOD: UR-77 Meteorit Russian Mine Clearing Vehicle

Tiers:

System

Notes:

The UR-77 Meteorit (Russian: УР-77 Метеорит, lit. 'Meteorite') is a Soviet mine clearing vehicle, based on a variant of the 2S1 Gvozdika chassis. The vehicle is armed with a launcher and two mine-clearing line charges. When launched, a charge causes a shock wave that destroys or disables all the shells or mines along the area of the line charge. (with a width of 6 metres and length up to 90 metres). The vehicle has also been used offensively, where its line charge has been used to destroy entire streets in urban combat.

JRTC VISMOD: Ural-375 Russian 6x6 General-Purpose Cargo Truck

Tiers:

Variants:

- **Ural-375:** Ural-375 has an open cab roof that could be covered by a canvas - i.e.: a softtop cab rather than a hardtop.
- **Ural-375A:** Ural-375A has a fully enclosed all-steel cab, was a chassis for wagon-style body, payload 12,787 lb (5,800 kg), framework shortened to 13.2'
- **Ural-375D:** Ural-375D Most produced 375.
- **Ural-375E KET-L:** Ural-375E KET-L was a recovery vehicle equipped a front-mounted and a rear-mounted winch along with a jib crane.
- **Ural-375S:** Ural-375S was a tractor-trailer truck with framework shortened to 5.3'.
- **Ural-377:** Ural-377-civilian 6×4 truck
- **Ural-377S:** Ural-377S was a civilian 6×4 tractor-trailer.

System

Notes:

The 2B11 is a 120mm mortar of Russian origin. The 2B11 has the nickname Sani and is a much improved version of the World War 2 era M43 120mm mortar. It was developed to provide a longer range and better mobility than the World War 2 era M43. The 2B11 is a muzzle loaded smoothbore mortar of a conventional design. It features a longer and stronger barrel. The 2B11 can be dismantled in a base plate, barrel and tripod, but is normally transported in an assembled state on a two wheel carriage. Some sources state that the 2S12 is the nomenclature for the system which includes one each prime mover, Ural 4x4 truck, and one each mortar, 2B11.

JRTC VISMOD: Type 63-1 Chinese 60mm Mortar

Tiers:

1 2 3 **4**

Variants:

- **Type 31:** The Type 31 is the original Chinese "copy" of the US M2, 60mm mortar which is a copy of the French Modele 1935 60mm mortar. Improvements of the Type 31 became the Type 63.
- **Type 63:** The Type 63 has a rectangular base plate in comparison to the Type 31's oval base plate.

System

Crew: ea1
Carriage: Man-portable
Emplacement Time: Less than 1 minute
Displacement Time: Less than 1 minute
Maximum Effective Range: m1,550
Action: Manually operated, pin strike
Caliber: mm60
Maximum Rate of Fire: rounds/min30

Dimensions

Computerized FCS: No

Direct Fire: Yes

Collimator: Yes

Sights: Adjustable elevation mechanism

Notes:

China produced a version of the US's M2 mortar, which was designated as the Type 31. Some were supplied to North Korea and North Vietnam. It was later modified as the Type 63 and then as the Type 63-1. This latter type has been produced under license by Pakistan Machine Tool Factory Limited in Pakistan and by Helwan Machine Tools Company in Egypt.

JRTC VISMOD: SA-18 Grouse (9K38 Igla) Russian Man-Portable Air-Defense Missile System (MANPADS)

Tiers:

Variants:

- **SA-N-18 Grouse Igla-1M:** Improved version of 9K38 Igla. Entered service in Soviet Military during the late 1980s.
- **Djigit/Dzhigit:** This is pedestal launcher for two 9K38 Igla missiles.
- **9K338 Igla-S:** This is a variant of the 9K38 Igla (NATO designation SA-24 Grinch**). Russia is replacing the Igla -S with the new Verba MANPAD system, which is capable of detecting its target despite interference.
- **9K310 Igla-1 (SA-16 Gimlet):** This variant was produced through a simplified production process. First identified in 1981. See separate database record.
- **9K338 Igla-S (SA-24 Grinch):** This is an upgraded variant of the 9K38/SA-18 series. It is also known informally as the Igla -Super. It has been exported to Armenia, Azerbaijan, Brazil, Iraq, Libya, Slovenia, Thailand, Venezuela and Vietnam. The Igla -S may also have been exported to unidentified nations.
- **Igla-V:** This is an air-to-air variant for helicopters.

System

Alternative Designation: 9K38 Igla 2 (Russian system designation) 9M39 Igla (Russian missile designation)

Type of Targets: Tactical aircraft, helicopter, UAV and cruise missile

Crew: ea1

Reaction Time: 5-10 Seconds

Reload Time: secs10 (each launch tube can be used up to 5 times)

Note: The Igla–1M missile consists of a Ground Power Supply Source (GPSS), Launching Tube, Launching Mechanism & Missile (9M 313–1)

Dimensions

Length, Launcher: m1.71

Diameter, Missile: mm72

Weight, Combat: See Missile Information

Missile System

↳*Missile Launcher*

Name: 9M 313–1 launching mechanism

Type: Portable Air-Defense Missile System (MANPADS)

Note: There is also a two-barrel 9K38 missile launcher called Djigit

↳***Missile***

Name: 9M39 Missile
Type: Portable Air-Defense Missile System (MANPADS)
Engine: 2 stage, solid fuel rocket motor
Length: m1.7
Diameter: mm72
Weight, Full System: kg17.9
Weight, Missile: kg10.8
Weight, Warhead: kg1.7
Warhead Type: Directed-energy blast fragmentation
Fuze Type: Delayed impact, magnetic and grazing
Speed: m/s600
Maximum Effective Range: m5,200
Maximum Target Speed, Receding: m/s360
Maximum Target Speed, Approaching: m/s320
Seeker Head Type: Nitrogen-cooled, Indium antimonide (InSb) and uncooled lead sulfide (PbS)
Seeker Scanning: FM-modulated
Maximum Altitude: m3500
Minimum Altitude: m10
Guidance System: Passive IR homing device and night vision (operating in the medium IR range)
NOTE: Missile is pitched by guidance unit over the lead point to avoid premature ground detonation when engaging targets at less than 10m. This slows engagement time.

Notes:

The SA-18 Grouse (Igla or 9K38) is a Russian made man-portable infrared homing surface-to-air missile defense system (SAM/MANPAD). This is a third-generation, man-portable, surface-to-air missile system and it is given the Russian industrial index number 9K38, for the complete system. The SA-18 Grouse with its 9M39 missile was accepted into service in the Soviet Army in 1983. The main improvements over the Igla-1 included much improved resistance against flares and jamming, a more sensitive seeker, expanding forward-hemisphere engagement capability to include straight-approaching fighters (all-aspect capability) under favorable circumstances, a slightly longer range, a higher-impulse, shorter-burning rocket with higher peak velocity (but approximately same time of flight to maximum range). The naval variant of 9K38 Igla has the NATO reporting name SA-N-10 Grouse. The Igla–1M missile consists of a Ground Power Supply Source (GPSS), Launching Tube, Launching Mechanism & Missile (9M 313–1). There is also a two-barrel 9K38 missile launcher called Djigit.

JRTC VISMOD: D-30 122mm Towed Howitzer

Tiers:

Variants:

- **D-30A:** This variant, also known as the 2A18M, features several minor improvements including a new cradle and muzzle brake and modified recoil system. It has a traveling width of 7 ft 3 in (2.2 m), height of 5 ft 11 in (1.8 m) and a rate of fire of 6-8 rds/min.
- **D-30M:** These are late production models with a new double-baffle muzzle brake, a new square (rather than round) central baseplate and a towing lunette assembly. The cradle, carriage and recoil systems have also been modified.
- **Iraqi Saddam:** This is a locally produced version of the D-30. The Iraqi weapon was slightly heavier, having a firing weight of 7,352 lb (3,335 kg) and traveling weight of 7,584 lb (3,440 kg). The Saddam fired a 48-lb (22-kg) projectile to a maximum range of 18,736 yd (17,133 m).
- **Yugoslavian D-30J:** This was a locally produced variant weighing 7,385 lb (3,350 kg) ready for firing, 7,584 lb (3,440 kg) in traveling order. Double-baffle muzzle brake is simplified. The range with the “Yugoslav” M76 HE projectile is 18,919 yds (17,300 m).
- **Egyptian SP 122:** The SP 122 combines the United Defense-produced M109A2 chassis and turret with an Egyptian made D-30 howitzer. United Defense produced 76 SP 122 systems under a US$96 million contract awarded following completion of competitive trials in 1987. Performance is similar to the standard D-30, although elevation is limited to -5 degrees (-89 mils). The last SP 122s were delivered in 1995. Egypt received a total of 124 systems.
- **Chinese Type 86:** This variant, also known as the W86, is a Chinese copy of the D-30. It is fielded by the airborne corps, marines and light/mountain infantry units in the People's Liberation Army (PLA) as a division-level general-purpose artillery weapon. The Type 86 was developed in the mid-1980s, possibly by reverse-engineering Soviet D-30s. It was adopted by the PLA as a replacement for obsolete Type 54 122-mm guns.
- **Chinese Type 85:** China has produced a self-propelled howitzer based on the marriage of the Type 85 APC chassis and the licensed produced version of the D-30. The howitzer has not been placed in a turret, but in a semi-open superstructure that uses a canvas cover for protection from inclement weather. The Type 85 SP howitzer carries 40 rounds of ammunition.
- **122-mm SH2:** This is a Chinese self-propelled artillery system utilizing the D-30.
- **122-mm Semser (sword):** Developed by Soltam for the Kazakhstan Ministry of Defense, this system utilizes a modified D-30. See separate database record.
- **122-mm D-30/04:** This is a Serbian variant of the D-30. See separate record.
- **ATMOS D-30:** This is a wheeled self-propelled artillery system using the D-30 gun developed by Soltam of Israel. It can be mounted on nearly any 6 x 6 or 8 x 8 military truck. It can also be integrated with an electronics suite, enabling accurate and semi-autonomous operation, reduced crew, increased fire power and accuracy using precise and modern tactical computers and sensors.
- **Khalifa-1:** This Sudanese army self-propelled howitzer incorporates the 122-mm D-30 into the upper part of the vehicle’s chassis.

Notes:

The D-30, also known as the M1963, replaced the older 122mm howitzer M-30 (M1938). The original D-30 was fielded in 1963 and the midlife product improvements occurred in the mid to late 1970’s. The original D-30 is in use with at least 50 different countries. The 2A18M, D-30A and D-30M are midlife product improvements of the D-30 that are currently in production. The

D-30 features a unique three-trail carriage, a conspicuous boxy shield for the recuperator above the tube, and a small protective shield between the wheels. The gun has a semiautomatic, vertically sliding, wedge-type breechblock. It is towed muzzle-first by a truck or armored tractor, at speeds up to 80 kilometers per hour, with its trails folded under the barrel. Distinctive features of the D-30 include its low mobile mounting and above-barrel recoil system. The three-legged mobile mount is unusual for field artillery, with stabilizers that are clamped together for towing and deployed when in action. A large tow linkage is fixed to the muzzle; in transport the barrel serves as a trail. Similar mounts were a feature of several 76-mm pre-war (1931–1935) universal (both field and anti-aircraft) guns designed by Leningrad's Kirov Plant (L-1, L-2 and L-3). Other examples were the 1939 French 47SA39 APX, and 1943 German 105-mm light field howitzers designs by Skoda and Krupp; neither entered service. The Bofors 105 mm L28 Light Field Howitzer 4140 was similarly arranged with four legs and did enter Swedish service. The 1930s-designed British 2-pdr. anti-tank gun was another piece featuring a three-legged mounting. Compared to the M-30, the new howitzer had a significantly longer 35 calibre gun barrel, just short of being a gun-howitzer by Soviet definition. Like other guns of the period, it had a high efficiency muzzle brake; this improved muzzle velocity by 175 m/s to a total of 650 m/s for HE, and raised maximum range by 3,500 m beyond the similar M-30. Maximum range was 2 km better than the 76 mm M1942 at 15.3 km. Weight increased by 650 kg over the M-30, to 3,150 kg; the D-30 is over twice the weight of the 76mm M1942. Accuracy improved, with mean error at about 10 km dropping from 35 m with the M-30 to just 21 m. Effective stabilisation length is a fundamental aspect of a gun mount, and legs 120° apart need to be longer than those with a smaller angle. The D-30's design minimises this problem in several ways. Trunnions are close to the ground, as a result of placing the recoil system and cradle above the barrel. The trunnions are also at the very rear of the breech; this maximises the recoil space when firing at higher elevation angles. Their rearward position also pushes the recoiling element forward on the mount, maximizing relative rearward span of the stabilizers and so stability during recoil. Additionally there is a very efficient muzzle brake, which absorbs about half the recoil. There is no mechanism to reduce recoil length as the angle of elevation increases. Some of the design decisions have a price. The muzzle brake produces about twice the overpressure in the area around the gun that is acceptable to Western armies, and is the reason it is often seen being fired with a long lanyard, which reduces rate of fire. Furthermore, the maximum elevation angle is restricted to 18° (early versions) or 22° (later versions) when the breech is over a trail leg. This is enforced by a mechanical cam that prevents the piece firing for about 60% of the total top traverse, and limits range to about 12 km, with full maximum range only possible in the central arc of about 48° between each pair of legs. The extreme rearward location of the trunnions means the elevating mass is unbalanced, requiring a strong balancing mechanism to enable manual elevation. To do this, the D-30 uses compression balancing gears. A central jack is powered by hand-operated hydraulics. This jack is lowered while the wheels are raised to permit two of the stabiliser legs to be swung 120° rearwards. The mounting is then lowered and the ends of the legs spiked to the ground. This mounting provides for quick traversing to fire in any direction. The pair of large tires are suspended on a single trailing arm; maximum towing speed is 60 km/h on the road. As was normal in Soviet designs, the tyres were filled with foam. Initially, the D-30 had no brakes and no seat for the layer—non-essential luxuries. A sliding block breech was adopted instead of the M-30's pre-1914 screw pattern, giving a slight increase in the rate of fire. It is a semi-automatic vertical sliding block breech, with a tied jaw; the block moves down to open and opens automatically ejecting the empty cartridge case as the recuperator forces the gun tube back into battery after a round is fired. The design is closely related to those of breeches on other Soviet post–World War II guns and howitzers. The non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope, a panoramic periscopic indirect-fire sight (dial sight) in a reciprocating mounting, an angle of sight scale, and a range drum for each charge engraved with the range (distance) scale. The elevation leveling bubble is mounted on the dial sight mount. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. Soviet 122 mm howitzers used different ammunition to 122 mm guns, although there was some compatibility. In the case of ammunition for the D-30, the standard 122 mm howitzer shell weight of 21.8 kg was retained, with a metal cartridge case holding variable propelling charges. Cartridge and shell are loaded separately; this means that the shells have to be hand-rammed by a man to the right of the breech with a ramming rod. The D-30 could fire the older M-30 ammunition; however, new shells were also introduced, eventually including a rocket assisted projectile with a range of 21.9 km. The M-30's range of propelling charges, comprising base and eight increments, was replaced by a new set comprising base and four increments; single base propellant was retained. A more effective High Explosive (HE) shell was developed, as well as smoke, illumination and chemical filled projectiles. In keeping with Soviet doctrine, the anti-tank role is important; there is a HEAT shell capable of penetrating 460 mm of steel armour plate. The maximum rate of fire of the D-30 is 6–8 rounds per minute, and about 75 rounds per hour. There is disagreement as to whether this maximum rate of fire is achievable for indirect fire. Based on reloading speeds of similar guns using separate charges, solo re-laying, and given a stable emplacement, semi-automatic breech and no long lanyard, (examples are the 25-pdr. and 105mm L118), and assuming concurrent lay adjustment during reloads, then it probably is when in the hands of a competent detachment. However, 5-6 rounds per minute may be more realistic with a poorly trained gun crew. The D-30 is noted for simplicity of maintenance by its users; reputedly there are no special tools, all jobs can be done with a wrench and large hammer. However, like any other gun, routine maintenance is essential, and western troops in Afghanistan have reported Afghan manned D-30s having problems with shells sticking in the barrel due to lack of cleaning. A location chosen for emplacement of the D-30 should be as level as reasonably possible. Firstly, the carriage is raised via an internal hydraulic jack located under the cradle of the gun. Once the gun is at the required height, the wheels are raised via the wheel lifting lever; this allows the two split stabilizer legs to be separated from the mono stabiliser leg and brought rearward into firing configuration. The legs are then locked in place with locking pins. The carriage is lowered via the hydraulic jack so that the legs touch the ground; integral stakes are then hammered into the ground. At this point, the gun is ready for direct fire using the OP4 direct fire sight, or can be orientated and have its position fixed via the aiming circles for subsequent indirect fire using the Pantel sight.

Explosive Type & Weight/Total Weight (kg): kgTNT 5.6 Total: 8.7
Operating Pressure: 130 to 420 kg
Comment: Commonly surface laid and use extensively in roadblocks. Limited underwater to .25 m

Notes:

The TMM-1 is a circular, metal-cased, Yugoslavian anti-tank blast mine. It is a direct copy of the German Tellermine 43. The mine has a central fuze well that is covered by a screw on pressure plate. Two secondary fuze well are fitted to the side and bottom of the mine allowing the installation of anti-handling devices. The mine is found in Bosnia, Croatia, and Kosovo.

JRTC VISMOD: Ural-63708 Russian Heavy Equipment Transport Truck

Fording Depth, Loaded: m~0.7

Fording Depth, Tractor: mUp to 1.8

Notes:

The Ural-63708 is a new Russian tractor truck with 8x8 configuration. It is a version of the Ural-63704-0010 military truck with an added axle at the rear and fitted with a more powerful engine. It was first publicly revealed in 2016. This tractor truck is a member of Tornado-U family of military vehicles. In this case letter "U" in the designation stands for "Ural", as there is also a similar KamAZ-U family, developed by another Russian truck manufacturer KamAZ.

mobile automated KTK, radioelectronic imitation and jamming system (mobilnyi avtomatizirovannyi KTK, radioelektronnoi imitatsii i postanovki pomekh, MKTK REI PP

Tiers:

System

Alternative Designation: Tigr-M MKTK REI PP Leer-2 VPK-233114 Mobile Electronic Warfare system EW vehicle

Type: Mobile Electronic Warfare system EW vehicle

Manufacturer: designed and manufactured by two Moscow-based companies, VPK (Voyenno-promishlennaya kompaniya - Military-industrial company) for the vehicle and VNII Etalon (Vserossiyskiy naucsno-issledovatelskiy institut - Russian Scientific-Research Institute) for the Electronic Warfare (EW) system

Family: Leer

In Service: 2012-Present

Crew: 2 + 4 Soldiers

Liter/Stretcher Capacity: INA

Winch: The Leer 2 carries an electric winch with a pulling force of 4,000 kg and 20 m of wire rope

Note: This high mobility vehicle was modeled after the US HMMWV

Dimensions (Chassis: GAZ Tigr-M)

Length: m5.7

Width: m2.3

Height: m2.3

Weight, Combat: kg7,800

Automotive (Chassis: GAZ Tigr-M)

Engine Name: YaMZ-5347-10

Engine Type: Turbol-Charged Diesel

Engine Power: hp215

Cruising Range: km1,000

Speed, Maximum Road: km/h140

Speed, Maximum Off-Road: km/h80

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %40

Vertical Step: m0.4

Trench: m0.5

Fording Depth: m1.3

Note: To protect the engine from small-arms fire, the bonnet is armoured

Communications

Primary: INA

Electronic Warfare Equipment

Electronic Warfare Equipment Name: Lorandit

Mission Sets: ESM, EA

Electronic Warfare (EW) Type: The Leer 2 is a mobile technical control, electronic emulation and electronic countermeasures system Leer-2 is designed for developing radio emitters, jamming and suppressing radio-electronic means including cellular phone systems

Operate on the Move: Yes

Operate Stationary: Yes

Antennas: All the antennas of the electronic warfare system Leer-2 are mounted on a platform fitted on the vehicle roof. In static position, two telescopic antennas can also be deployed on the vehicle roof

Maximum Range: INA

EW Components: The Lorandit system of the Tigr-M MKTK REI PP includes technical control and electronic intelligence automated workstation, electronic countermeasures equipment, communication and power supply equipment and a specialized mission software

Note #1: In addition, the system can be used as part of field tests to create realistic tactical electronic situations and imitating the operation of various radio-electronic systems

Main Gun

Note: The Leer 2 is not equipped with any Armament, due to the EW equipment

Fire Control

FCS Name: INA

Computerized FCS: Yes

Gunner Sight System: PC-SU IPTSYU.201219.026

TV Camera: Yes, low-level TV camera that provides a range of detection and identification of the target sample with a narrow field of vision - not less than 2500 m

Laser Rangefinder: Yes, with a range of 100-3,000 m

Protection

Armor: The hull of Leer 2 provides protection against small-arms fire, shell fragments and IED blasts

Applique Armor: Available

Amored Hood: Yes

Doors and Windows: The hull and door windows are bulletproof and the vehicle’s spall liners protect personnel against spalls if the hull is hit by bullets or fragments and exclude ricochet from the opposite side if the hull is pierced

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes

Fire Extinguishing System: Yes

Notes:

The Leer-2 is a jamming system based on the Lorandit family of electronic warfare systems Tigr armored vehicle and capable of imitating electronic weapon systems and monitoring the electromagnetic environment during combat training. The Leer-2 is designed for developing radio emitters, jamming and suppressing radio-electronic means including cellular phone systems. In addition, the system can be used as part of field tests to create realistic tactical electronic situations and imitating the operation of various radio-electronic systems. The Leer-2 is based on the 8-ton class Tiger-M 4x4 high mobility tactical armored vehicle.

JRTC VISMOD: Ural-375 Russian 6x6 Fuel Truck

Tiers:

Variants:

- **Ural-375A:** Ural-375A has a fully enclosed all-steel cab, was a chassis for wagon-style body, payload 12,787 lb (5,800 kg), framework shortened to 13.2'
- **Ural-375D:** Ural-375D Most produced 375.
- **Ural-375E KET-L:** Ural-375E KET-L was a recovery vehicle equipped a front-mounted and a rear-mounted winch along with a jib crane.
- **Ural-375S:** Ural-375S was a tractor-trailer truck with framework shortened to 5.3'.
- **Ural-377:** Ural-377-civilian 6×4 truck
- **Ural-377S:** Ural-377S was a civilian 6×4 tractor-trailer.

System

Alternative Designation: NA
Type: 6x6 General-Purpose Cargo Truck
Manufacturer: Ural Automobile Plant, Miass
Cab Capacity: 1 driver, 1 passenger
Passenger Capacity: INA
Payload Capacity: 4500 kg (plus trailer: 22,050 lb, 10,002 kg)

Dimensions

Gradient: 65%

Side Slope: 40%

Vertical Step: m0.8

Trench: m0.7

Fording Depth: m1.2

Suspension: Solid axles, leaf springs, rear wheels at balance-cart.

Fuel Capacity: 79 gallon tank and 16 gallon tank

Fuel Economy: 4.9 mpg (19-25 mph), 2.94 mpg (city)

Protection

Armor: Protection from small arms fire and shell splinters

Applique Armor: INA

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The Ural-375 is a general purpose 4.5 ton 6×6 truck, produced at the Ural Automotive Plant in the Russian SFSR since 1961. The Ural 375 replaced the ZIL-157 as the standard Soviet Army truck in 1979. It was itself replaced by the Ural-4320. The Soviets found the trucks an ideal platform for the BM-21 Grad rocket launcher. Other modes for the Ural-375D included troop carrier, supply carrier, etc.

JRTC VISMOD: D-20 Russian 152mm Towed Gun-Howitzer

Tiers:

Variants:

- **Type 66:** This is the licensed version of the D-20. The improved version is known as the Type 66-1.
- **Type 83:** Self-propelled version of the Type 66, very similar in layout to the 2S3.

System

Family: D-20
Type: 152mm Towed Gun-Howitzer
Manufactuer: Artillery Plant Number 9, Yekaterinburg
In Service: 1955-Present

Fuze Type: PD

Fire Control System

Indirect Fire: PG-1M Pantel

Direct Fire: OP 4M

Collimator: K-1

Notes:

The 152 mm gun-howitzer M1955, also known as the D-20, (Russian: 152-мм пушка-гаубица Д-20 обр. 1955 г.) is a manually loaded, towed 152 mm artillery piece, manufactured in the Soviet Union during the 1950s. It was first observed by the west in 1955, at which time it was designated the M1955. Its GRAU index is 52-P-546. The D-20 has a 34 calibre (5.195 m) barrel, with a double baffle muzzle brake and a semi-automatic vertical sliding-block breech, with a tied jaw and the block moving down to open. The barrel is mounted in a long ring cradle with the trunnions just forward of the breech. The recoil system (buffer and recuperator) is mounted on the cradle above the barrel. Compression balancing gear is attached behind the saddle support, passing through the complex shaped saddle to connect to the cradle just forward of the trunnions. This can be manually re-pressured by a pump below the breech. The breech has a projectile retaining catch to prevent the shell sliding out at higher elevations before it is rammed with a manual rammer. Top traverse totals 58° and the vertical elevation range is −5° to 45°. Box girder section split trail legs are hinged to the cradle support, with bolts to lock them into either the open or closed position. The cradle support also has a bolt for locking the barrel in the centre for traverse before towing the gun. Large spades are permanently fixed close to the end of each trail; these are hinged and it appears that the gun can be fired with them up or down depending on the terrain, but they are always up when the gun is towed. To assist with all-round carriage traverse, there is a pivot jack mounted at the front of the cradle support. The pivot jack is not a sole plate and the gun fires with its foam filled rubber tyred wheels supporting the gun on the ground. When the gun is brought into action, the pivot jack is folded down and adjusted to be on the ground. If a large traverse is required, small jacks on each trail leg are rotated downwards, and the trails jacked up until the main wheels are lifted clear of the ground and the bogey wheels mounted on each trail leg swung downwards and the trail jacks raised, the carriage is then traversed, and the trail jacks re-used to lift the bogey wheels and then place the piece back on its main wheels. The pivot jack is also used to secure the barrel against vertical movement when the gun is being towed. The barrel is locked in the centre for traverse with a bolt on the cradle support. The jack is folded upwards, lugs on the ring cradle engage the jack base and two tensioners fixed to the saddle support are hooked to the cradle, these are tightened to lock the cradle onto the jack base. As was normal for the period, the gun has a shield, including a folding piece below the cradle support. The centre section of the upper shield slides both up and down and folds to accommodate the barrel at higher elevation angles of fire. The shield may offer some protection against muzzle blast to the sights and layer, although it is usually shown being fired with a long lanyard, but is probably mostly for defence against machine gun fire. The non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope (OP4M), a panoramic periscopic indirect-fire sight, a dial sight, (PG1M) in a mounting, an angle of sight scale, and a range drum for each charge engraved with the range (distance) scale, coupled to an elevation leveling bubble mounted on dial sight mount.

The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. Like most Soviet artillery, the gun fires separate ammunition using metal cartridge cases that also provide obturation. The ammunition is interchangeable with that used with other 152 mm guns, although the more modern ones also have a third, much larger cartridge. The D-20 uses two types of cartridge; one has a base charge and up to five increments, the other is a single 'super' charge cartridge. The standard shell weight is 44 kg with a muzzle velocity of 655 m/s, but some projectiles are more or less than this. The basic shell is HE-Fragmentation, other projectiles include smoke, illuminating, chemical and probably incendiary. Later projectiles include bomblet, anti-personnel mine, flechette, Krasnopol precision munition, communications jammer, and extended range HE using rocket assistance (RAP). The normally maximum range is 17.4 km, RAP being greater. Two direct-fire anti-tank projectiles have been used, HEAT and APHE, the latter being 5.2 kg heavier and with a lower muzzle velocity. The maximum rate of fire is usually stated as five rounds/minute, and 65 rounds/hour sustained. In Soviet service, the unit of fire was 60 rounds. The detachment was either 8 or 10 men, probably differing between armies and the time period. In Soviet service, the 5,700 kg gun was usually towed by a URAL-375 6×6 truck or, in some regions, an AT-S or AT-L medium tractor.

JRTC VISMOD: HQ-7B (FM-90) Chinese 6x6 Short-Range Air Defense Missile System

Tiers:

Variants:

- **FM-80 / HQ-7:** Improved version with E/F band TA radar, EO range of 15km, IR localizer and HQ-7 missile range of 7km

System

Alternative Designation: HQ-7B (FM-90)
Chassis / TELAR: P4R 4x4
Crew: ea3
Target: Helicopters, fixed wing aircraft, and cruise missiles, ARM missiles, ASM missiles
In Service: 2009-Present
Note: This air defense system is widely used by the Chinese armed forces. It is also being proposed for export customers as the FM-90. This air defense system has been exported to Pakistan

Reload Time: min2

↳*Missile*

Name: Crotale EDIR

Type: All-weather short-range anti-air missile

Purpose: Can be used to intercept low-flight anti-ship missiles and aircraft

Manufacturer: Thales Group Samsung Group

Length: m2.35

Diameter: m0.166

Missile Weight: kg76

Warhead Type: HE-FRAG

Warhead Weight: kg13

Detonation Mechanism: Infrared fuse radio fuse

Engine: Solid-propellant fuel

Operational Range: km11

Flight Ceiling: m6,000

Speed: m/s1,200

Guidance System: Semi-active radar homing electro-optical sensors Infra-red search and track

Hit Probability: Single shot is more than 85%

Fire Control System

IFF: Yes, dipole on ACU

Countermeasures: Digital C2 and ECM

Missile Tracker: IR, for remote control

↳*Day Camera*

Specification: TV tracker, low elevation, range: 14km

↳*Optical Sight*

Specification: Back-up binocular tracker

↳*Day / Night Camera*

Specification: Thermal sight

Field of View: degrees8.1 / 2.7

Elevation: degrees5.4 / 1.8

Range: km19

Protection

Armor Protection: Protection against small arms fire and artillery shell splinters

NBC Protection: Yes

Notes:

The original HongQi 7 (HQ-7) short-range air defense missile system has been developed in China in the 1980s. It was a copy of the French Crotale. In 1978-1979 China imported some of the Thomson-CSF Crotale systems for evaluation and reverse

engineered them. First Chinese clone was produced for testing in 1983. Its production commenced in the late 1980s. Sometimes it is referred as Sino-Crotale. Its improved variant, the HQ-7A, was introduced in 1998. The HQ-7B is the latest version, based on an indigenous 6x6 armored chassis. It was first revealed somewhere in 2009. This air defense system is widely used by the Chinese armed forces. It is also being proposed for export customers as the FM-90. This air defense system has been exported to Pakistan. A TELAR vehicle carries four missiles and is fitted with engagement radar. It appears that engagement radar is similar to that of the previous HQ-7A.

JRTC VISMOD: T-90 Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-90K:** Commander's version of the T-90, with additional communication (station R-163-50K) and navigation equipment (TNA-4-3)
- **T-90A:** Russian army version with welded turret, V-92S2 engine and ESSA thermal viewer. Sometimes called T-90 Vladimir, in honor of its chief designer Vladimir Potkin
- **T-90AK:** Command version of T-90A.
- **T-90AM:** Latest version of the T-90A.[77] The main features include the modernisation of the old turret design, which is equipped with a new advanced fire control system "Kalina" (with integrated combat information and control systems), a new automatic loader and a new upgraded gun 2A46M-5, as well as a remote-controlled anti-aircraft gun "UDP T05BV-1". The new version also includes the Relikt (Реликт (динамическая защита) ERA bricks instead of the Kontakt-5 ERA bricks.
- **T-90M:** New modernized version of T-90A. It's a program of modernization of Vladimir tanks and will include 400 tanks currently in service. Tanks will receive 2A82-1M gun (same as in T-14) and fire control system Kalina. They will be upgraded with Afghanit APS and Relikt ERA. The upgrades are also aimed at improving network-centric warfare capabilities and coordination with Armata project vehicles. The first contract was signed in 2017 and serial production started in 2018.
- **T-90S:** Export version of the T-90, later adopted by the Russian Armed Forces as the T-90A. These tanks were made by Uralvagonzavod and were updated with 1,000 hp (750 kW) engines made by Chelyabinsk Tractor Plant. These tanks carry a leaner version of the Shtora-1 passive/active protection system which lacks the infra-red dazzlers carried on the turret. Sometimes called T-90C (Cyrillic letter es looks like a Latin c). These were initially supplied with cast turrets of the early T-90, and when stocks were depleted, new, welded turrets were fabricated.
- **T-90SK:** Commander's version of the T-90S, with additional communication and navigation equipment. It differs in radio and navigation equipment and Ainet remote-detonation system for HEF rounds.
- **T-90S:** "Bhishma" – modified T-90S in Indian service.
- **T-90MS:** Also known as T-90SM is an updated version of the T-90S. It is equipped with a 1,130 hp engine, a PNM Sosna-U gunner view. a UDP T05BV-1 RWS with a 7.62 mm machine gun, GLONASS, inertial navigation systems, new Relikt explosive reactive armour (ERA) that covers more of the tank, and a steering wheel. A new removable turret bustle is included, which provides storage for eight additional rounds. The T-90MS is ready for serial production.[88] 4 video cameras provide a 360° view of the environment, while the tank is more connected to command. The T-90MS has an upgraded thermal imager that can detect tanks over 3300 meters away.
- **BREM-1M:** Armoured recovery vehicle.
- **IMR-3M:** Combat engineer vehicle.
- **MTU-90:** Bridge layer tank with MLC50 bridge.
- **BMR-3M:** Mine clearing vehicle.
- **MTU-2020:** Bridge layer tank based on the T-90A whose chassis has been extended, along with the addition of a road wheel.

System

Alternative Designation: T-90

Type: Main Battle Tank

Family: T-90 Family of Main Battle Tanks

Action: Gas-operated, rotating bolt

Feed System: 50-round linked belt

Sights: Iron Sights

Variants: 6P50-1, 6P50-2, 6P50-3, 6P49

↳***Ammunition***

Cartridge: 12.7×108mm

Caliber: mm12.7mm

Muzzle Velocity: m/s860

Basic Load: ea300

Effective Range: m2,000

Loader's Weapon System

↳***System***

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: 7.62mm Machine Gun

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Sustain Rate of Fire: rds/min500

Range Finder Type: INA

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Total): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳ ***Ammunition***

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mm

Muzzle Velocity: m/s825

Basic Load: ea1,500

Effective Range (Iron Sights): m1,000

Effective Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Tank Commander: No

Thermal Sight Gunner: No

Panoramic Commander's Sight: No

Main Gun Stabilization: Yes, 2E42-4 Zhasmin System

Note: The Fire Control System is outdated and is from the late 1990s.

Protection

Hull Armor: Steel-composite-reactive blend APFSDS: 550 mm + 250–280 mm with Kontakt-5 = 800–830 mm HEAT: 650–850 mm + 500–700 mm with Kontakt-5 = 1,150–1,550 mm

Turret Armor: Steel-composite-reactive blend APFSDS: 550 mm + 250–280 mm with Kontakt-5 = 800–830 mm HEAT: 650–850 mm + 500–700 mm with Kontakt-5 = 1,150–1,550 mm

Applique Armor: Available

Explosive Reactive Armor: Yes, Kontakt-5 explosive reactive armor blocks, equivalent to up to 500mm of steel armor

Active Protection System: Yes, the Shtora-1 countermeasures system

Mine Clearing: INA

Self-Entrenching Blade: Yes

NBC Protection: Yes, GO-27 PRKhR radiation and chemical agent detection system.

Deep Wading Kit: Available

Jammer: Yes, TShU1-7 IR jammers located either side of the main gun

Laser Radiation Sensors: Yes

IR dazzlers: Yes

Nakidka Signal Reduction Kit: Available

Smoke Equipment: Yes, banks of 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.

Grenade Maximum Range: m250-300

Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade.

Fire Suppression System: Yes, the Raduga-2 fire-suppression system

Notes:

The T-90 is a third-generation Russian battle tank that entered service in 1993. The tank is a modern variation of the T-72B and incorporates many features found on the T-80U. Originally called the T-72BU, but later renamed to T-90, it is an advanced tank in service with Russian Ground Forces and the Naval Infantry. The T-90 uses a 125 mm 2A46 smoothbore main gun, the 1A45T fire-control system, an upgraded engine, and gunner's thermal sight. Standard protective measures include a blend of steel and composite armour, smoke grenade dischargers, Kontakt-5 explosive-reactive armour and the Shtora infrared ATGM jamming system. It was designed and built by Uralvagonzavod, in Nizhny Tagil, Russia. Since 2011, the Russian armed forces have ceased any further orders for the T-90, and are instead increasing their numbers of the T-14 Armata that began production in 2016. Variants T-90: Successor to T-72BM, originally called T-72BU, with fire control and armor upgrades similar to those on the T-80U. Despite using the lower cost T-72 chassis, this tank incorporated more recent components than the T-80U and is in some ways superior. The original tank had an II night sight, not the thermal sight upgrade, and the under-powered 840hp engine. Upgrades have been added. T-90A: originally known as T-90SM or T-90M, it is now accepted for Russian service as the standard tank. T-90MS: export variant: improved armor protection and ERA; remote control weapon station on turret rook with 12.7 mm MG; traverse forward 316 degrees; elevate -10 to +45 degree. Improved fire control system for engagement of stationary and moving targets while tank is moving. TC panoramic sight for TC-gunner display linked to laser rangefinder; thermal and 4 television camera-each 95 degree wide/45 degree elev. Improved battle management and land navigation tracking system. External auxiliary diesel power unit for fuel conservation. Some reserve main gun ammo in bustle with blowout panels. Turret and hull rear with bar (lourve) armor; anti-laser warning and protection. 125 mm main gun improved accuracy with 2A46M-5 rather than previous 2A46M in T-90s. T-90S: export variant with option for upgrades. Several subsystem changes, such as upgraded FCS, new engine, removal of SHTORA-1, etc., have been added based on customer preferences, and are included in export versions of the tank. Some early T-90S have been upgraded to this standard. Most of these are being sold to India, with the 1,000hp engine upgrade, and with addition of air conditioning. T-90SK: T-90S command variant Bhishma: Indian variant produced from T-90A knockdown kits. It does not use the SHTORA-1 IRCM system. Engine is T-90A upgrade. The tank is sometimes erroneously called T-90S. Various stages of upgrades will be employed in Indian forces. Russia has provided T-90S tanks with Indian intent to upgrade almost all of its T-90 and T-90S remaining versions in knock-down kits with upgrades to meet the Bhishma standard. An issue remains of no air conditioning system in some export MBT to India cause overHEATing of system components and debilitating environment for tank crew in some environments. Project Rhino: most T-90 and T-90S tanks imported by India to be upgraded as Bhishma under this program and agreement with Russia. Other upgrade versions of the T-72 include features of the T-90A such as the improved gun stabilization, improved fire control system, improved engine, and improved ammunition such as the Ainet and the Invar. Other tanks which provide similar capabilities are the Ukrainian T-72AG and T-72mp. The Czech T-72CZM4 also has a 2nd generation thermal sight. Recent Russian tank upgrade packages for the T-72 are the T-72M1, and the T-72M1M. The above Russian upgrades are for modernizing older tanks, versus T-90/T-90A, which are newly produced tanks. Upgraded T-80U, T80UK, and T-84 tanks also have similar capabilities. Weapons & Ammunition Types And Typical Combat Load 125-mm smoothbore gun (est): 43 APFSDS-T: 14 HEAT-MP/HEAT: 3 Frag-HE: 12 Focused Frag Ainet (available) :8 ATGM: 6 Main Armament Ammunition Caliber, Type, Name: 125-mm APFSDS-T, BM-42M Maximum Aimed Range (m): 3,000-4,000 Max Effective Range (m): Day: 3,000-4000 Night: 2,600 Armor Penetration (mm KE): 590-630 at 2,000 meters 125-mm HEAT-MP, BK-29m Maximum Aimed Range (m): 4,000 Max Effective Range (m): Day: 4,000 Night: 2,600 Armor Penetration (mm CE): 650-750 it has some HE effects similar to Frag-HE rounds against personnel and materiel targets. 125-mm HEAT, BK-27 Maximum Aimed Range (m): 4,000 Max Effective Range (m): Day: 3,000+ Night: 2,600 Armor Penetration (mm CE): 700-800 125-mm HE-shrapnel Focused-Fragmentation, Ainet Maximum Aimed Range (m): 5,200 Max Effective Range (m): Day: 5,000 Night: 2,600 Tactical AA Range: 4,000-5,000 Armor Penetration (mm): can defeat IFV and APC 125-mm Frag-HE-t, of-26 Maximum Aimed Range (m): 5,000 Max Effective Range (m): Day: 5,000 Night: 2,600 Armor Penetration (mm): can defeat IFV and APC. A near miss will seriously damage or destroy most IFVs and APCs. Other Ammunition Types: French Giat 125G1 APFSDS-T, Russian BM-42 and bm-32 APFSDS-T. Note: the Russians may have a version of the BM-42M with a DU penetrator. Russian BM-48 APFSDS-T penetrates 650-700 mm Sokol-1 Guided Antitank Round Antitank guided missiles: AT-11B/INVAR Warhead Type: tandem shaped charge (HEAT) Armor Penetration (mm CE): 900, 850 behind ERA Range (m): Day: 5,000 Night: 2,600 AT-11/Refleks: missile with Frag-HE warhead to 5,000 m Notes T-90AM: the Russian military decided against T90A for its forces. In SEP 2011, they displayed T-90AM as a deep modernization of T-90A. They include a low-profile turret with a bustle autoloader and blow-out panels. The new 2a82 gun fires a longer (700+ mm est) and heavier APFSDS-T round to 3,500+ m. The original version of the tank has an 840-hp diesel engine. The engine in subsequent models is upgraded. Engine options include 950, 1,000 and 1,100 hp. The original tank had an II sight from the T-80 series (Buran-PA, 800-1300 meters range). However, marketing materials feature the Agava-2 thermal sight. Recent Gen3 sights are available. These night sights permit night launch of ATGMs. Relikt 3d gen ERA is offered to replace Kontakt-5 in several upgrade packages, or as a separate upgrade. The ERA adds up to 600 mm CE protection and 300 mm KE to turret base armor protection, or about 150 mm more than Kontakt-5. Active protection systems. Arena APS is available. Defensive aides suite is Shtora-1 (laser warning receiver with gun auto-slew, LWR-directed smoke grenade launchers, and EO-IR jammer), or partial package excluding IR jammers. None is on Bhishma. The Shtora-1 IR ATGM countermeasure illuminators can be detected with night sights. Shtora-1 has no effect against most modern ATGM systems, with encoded tracker beacons. Exclusion of Shtora-1 offers more ERA on the turret front and reduces costs. Protection probably includes radar-absorbent materials and IR-resistant

paint. The T-90 may be fielded with full Shtora-1 package (laser warning receiver with auto-slew gun capability, LWR-directed smoke grenade launchers, and EO-IR jammer), with a partial package, or without Shtora-1. Shtora-1 illuminators can be used for night illumination. An improved gun, 2A46M-4, with improved accuracy and use life is available for fitting to the T-90. The BK-29 round, with a hard penetrator in the nose is designed for use against reactive armor, and as an MP round has fragmentation effects. The BK-27 HEAT round offers a triple-shaped charge warhead and 50mm more penetration. The 12.7-mm MG NSVT has both remote electronically operated sight PZU-5 with vertical stabilization, night acquisition, and a gun-mounted K10-T reflex sight.

JRTC VISMOD: GAZ-2975 Tigr Russian Combat Support Vehicle / Light Utility Vehicle

Tiers:

Parent:

GAZ-2330 Tigr Russian Light Utility Vehicle

Variants:

- **GAZ-2330:** Standard unarmoured production variant
- **GAZ - 29651 "Punisher":** A simplified version of GAZ - 2975. The result of the project " Punisher ", concludes in the creation of a family of cars with carrying capacity from 1 to 2.5 tons, allegedly became the armored vehicle Wolf.
- **Tigr-2:** GAZ-3121 "Tiger-2" - an experimental rebodied civilian style SUV, presented for the first time in September 2006 at the Moscow Motor Show in the exhibition "Russian cars". Released a small series from 2008, mainstream sales at dealers were planned to start in 2009.
- **SP46:** In 2007, a ceremonial parade variant was designed, the СП46 (SP 46) ceremonial Tigr is a two-door convertible with a removable rigid roof. It features two seats in the front and one in the back, and is finished with modern luxury car appointments. This Tigr is equipped with an automatic Allison 1000 series transmission and Cummins B205 turbo diesel. Vehicle weight was reduced to 4,750 kg (10,470 lb), as this version is unarmored.
- **STS:** The CTC (English:STS) GAZ-233014 "Tiger" - a special vehicle -The Russian Army's armored version. Winged sheathed hull of anti-splinter coating AOD based aramid fiber. 4-stroke diesel engine Cummins B 205 turbo provides a specific power of at least 205 hp. STS GAZ-233014 was accepted for the supply of units State of the General Staff of the Russian Federation Order of the Minister of Defense of the Russian Federation March 6, 2007. The STS took part in 2014, the Crimean operation.[
- **SPM-1:** GAZ-233034 Tigr is used by the Russian Interior Ministry OMON in counter-terrorism operations and territorial defense. It is armored, with IEC 50963-96 Class 3 side/rear protection and Class 5 frontal protection (GOST P 50963-96, level 1 corresponds to the STANAG 4569).
- **SPM-1 AAV:** The SPM-1 Aircraft Assault Vehicle is an SPM-1 fitted with a large remote-control hydraulic ladder system. It is designed to provide access to the second or third floors of buildings and aircraft.
- **SPM-2 "Tigr-Alpha-BB":** Special Police Vehicle SPM-2) ГАЗ-233036 Tigr-Alfa-BB (Tiger-Alpha-VV) is an SPM-1 with GOST 50963-965 level 5 ballistic protection all around (instead of a mixture of level 3 and 5).
- **R-145BMA:** This variant is designed as a command center for special events and crises. It is a SPM-2 fitted with extensive communications equipment.
- **Kornet-D:** In 2011, the Tula Instrument Design Bureau demonstrated an upgraded Kornet-EM antitank missile system. Two such units were mounted on a modified chassis of the SPM-2 Tigr.
- **"Project 420":** In early 2010, an improved Tigr armored vehicle with a 420-horsepower 5.9 litres (360.0 cu in) Cummins ISB and a Chrysler 545RFE automatic transmission was created. This engine/transmission combination was originally designed for a Dodge Ram pickup. Externally, the vehicle featured an additional air intake on the bonnet and enlarged brakes. Acceleration time to 100 km/h (62 mph) was reduced from 35 to 23 seconds compared to the standard version, and the top speed increased from 140 km/h (87 mph) to 160 km/h (99 mph).
- **Tigr-M:** During the 2010 Interpolitex exhibition, the Multi-purpose Armored Vehicle (Ru:автомобиля многоцелевого назначения (АМН)) AMS 233 114 Tigr-M was presented by the Military Industrial Company. It featured a new YaMZ-534 diesel engine, a new armored hood, air filter installation, an increase in the number of rear passenger seats (from 8 to 9) and the replacement of the bicuspid rear hatch with a large square hatch.
- **Tigr-6A SPV:** The CTC GAZ-233014 "Tiger" SPV prototype vehicle was first shown at the Bronnitsi Armored Vehicles Show on June 10, 2011. Based on the SPM-2, the SPV is designed for combat officer transport. It has a four-door station wagon body with increased GOST 6A armor protection (heavy mine protection and special shock-absorbing

seats/footrests which are not attached to the floor). As of November 2012, tests are being conducted.

- **GAZ-29751:** 3 door wagon
- **GAZ-29752:** 5-door wagon designed to carry four people and from 500 to 1000 kilograms of cargo
- **GAZ-297533:** Two door with tilt covered load platform

Notes:

The "Tigr" ("Tiger"), which is often referred to as the "Russian Hummer", was developed by the GAZ Automobile Works for special-purpose militia units. The GAZ-2975 Tigr was officially taken into service at the end of 2006 and manufactured in 2007.

The vehicle is intended to carry and protect personnel. It can accommodate up to 10 officers armed and in full gear. The vehicle has been field- and combat-tested before being sent to serve with OMON. Its armor can defeat 7.62-caliber ammunition and can withstand shell fragments. The vehicle was designed to transport troops and various equipment quickly on road and off-road. It has a chassis frame construction, with a traditional layout of front engine, middle crew compartment, and rear cargo area. Standard features include: power steering, independent all-wheel torsion suspension with hydraulic shock absorbers and stabilizer bars, a transfer case with a locking center differential, limited slip differentials, two-speed transfer case, automatic tire inflation, engine block heater, and electric winch. The GAZ-233001 has optional air conditioning, stereo, electric windows, and an anti-lock braking system. Armored versions of the Tigr feature 5 mm (0.20 in) (7 mm (0.28 in) for the SPM-2) heat-treated and stress-relieved armor plates. The Tigr can carry a half ton of cargo. The available engines are a Cummins 5.9 L (360 cu in) B180 turbodiesel with 180 hp (130 kW); a Cummins 5.9 L (360 cu in) B205 turbodiesel producing 180 hp (130 kW); a Cummins 5.9 L (360 cu in) B-214 turbodiesel making 215 hp (160 kW); or a GAZ-562 3.2 L (200 cu in) turbodiesel with 197 hp (147 kW). Designed for performance in mountain, arctic, and desert environments, the Tigr is capable of operating at ambient temperatures ranging from −14–50 °C (7–122 °F). Moreover, the vehicle has approach and departure angles of 52 degrees and a wading depth of 1.2 m (3.9 ft).

JRTC VISMOD: RPG-27 Russian 105mm Disposable Anti-Tank Grenade Launcher (ATGL)

Tiers:

Variants:

- **RMG Variant:** The RMG is a smaller, multipurpose variant of the RShG-1 that is optimized for the bunker buster role and defeating light vehicles and infantry in cover. As a result, its penetration performance against tank armor is reduced. The launcher carries a tandem warhead. The precursor high-explosive anti-tank (HEAT) warhead penetrates armor or other obstacles (reinforced concrete, masonry, etc.). The main warhead creates a fine explosive cloud and takes into the interior through the hole, pierced by the precursor charge. Detonation of the main warhead explosive boasts a multiple effects (high-explosive and incendiary). The RMG rocket launcher ('RMG' stands for “Reaktivnaya Mnogotselevaya Granata” or rocket-propelled multi-purpose grenade) was developed by Bazalt in the early 2000s. As is the case with disposable anti-tank rocket launchers and multi-purpose assault weapons, the designation of the new rocket launcher is the designation of its round. The design project was supervised by leading designer S. Kh. Irtuganov. Officially adopted by the Russian Government in December 2011.
- **RSHG-1:** INA

System

Alternative Designation: Tavolga (Meadow Grass)
Cailber/Length : mm105
Crew : ea1

Available: No

↳*Sights*

Notes: (Can be used with NVG found in Hybrid Threat units). Other sights can be adapted, such as the strap-on British Ring Sight, with NVG.

Type: Raised iron peep sight

Notes:

The RPG-27 is a Soviet disposable rocket launcher. The RPG-27 shares a close resemblance with the previous RPG-26 in that it is a man-portable, disposable anti-tank rocket launcher with a single shot capacity. The RPG-27 has a larger diameter round than the RPG-26 which enables the RPG-27 to achieve higher armor penetration performance. The RPG-27 fin stabilized round is a 105 mm tandem-charge HEAT warhead with a range of 200 meters. The round has a stated penetration capability in excess of 600 mm of RHA (after ERA) and 1500 mm of brick or concrete and 3700 mm of earth. The RShG-1 is very similar in operation to the RPG-27 but carries a thermobaric warhead with a lethal radius of 10 meters and a larger range of 600 meters. Officially adopted by the Russian Government in December 2011.

JRTC VISMOD: Type 63 Chinese 107mm Multiple Rocket Launcher (MRL)

Tiers:

Variants:

- **Type 63 for mountain/airborne warfare:** This variant can be disassembled into manpack loads
- **Type 63 -1:** This variant's launcher is modified to four rows of three tubes; it has smaller road wheels. Tube construction is cast aluminum. The weight of the Type 63 -1 is reduced by 300 lb (136 kg) and it has a covered crew cabin.
- **Type 81:** This variant is a Type 63 on a turntable mounted on rear bed of 4 x 4 truck.
- **Iraqi 107-mm MRS:** The version is an Iraqi copy of the Type 63
- **South African 107-mm MRS:** South African 107-mm MRS
- **VTT-323:** The VTT-323 is the North Korean designation for the weapon.
- **107MM SP MRL 18 M1992:** North Korea Version
- **107MM SP MRL 24 M1992:** North Korea Version
- **Type 85:** This type incorporates 107-mm rockets mounted on a 0.9 m-long Type 85 single man-portable tripod launcher tube. The Type 85 is used by commandos, special operations troops and guerrillas. It can be engaged and disengaged in 30 seconds and weighs 49.6 lb (22.5 kg).
- **Single-tube launcher:** This was exported to guerrilla groups.

Notes:

The Type 63 multiple rocket launcher is a towed, 12-tube, 107mm rocket launcher produced by the People's Republic of China in the early 1960s and later exported and manufactured globally. Although no longer serving with active infantry units, the Type 63 is still in People's Liberation Army service with specialized formations such as mountain infantry units and special forces detachments. The Type 63 was widely used in the PLA until the late 1980s. It was adopted as the successor of the Type 50-5, 102mm. China has also developed a Type 63 multiple rocket launcher, 130mm. The RPU-14 is a Soviet 140mm MRL of similar design to the Type 63. The launcher's 12 tubes are arranged in three removable rows of four each, mounted on a single-axle carriage with rubber tires. The Type 63 originally fired an 18.8 kilogram rocket (Type 63-2) with a 1.3 kilogram warhead. Ammunition for the Type 63 was later improved (Type 75 and Type 81 series), although the overall weight of the rocket remained the same. A fixed amount of propellant is contained in the rocket motor. The steel-cased rocket is stabilized with spin imparted by six angled nozzles in its base. Type 63 rockets may be launched without the launcher; improvised firing can employ tubing, rails or even dirt berms. The Type 63 was distributed on the basis of six per infantry regiment, or 18 per infantry division. For airborne and mountain units the lighter Type 63-I was developed. Both the Type 63 and its copies can be mounted on different kinds of armored and unarmored vehicles, for example the MT-LB, the Safir, the Mamba, the RG-32 Scout, the GAZ-66 and the M113.

JRTC VISMOD: R-1685KVE Russian Vehicle-Mounted HF Radio Set

Tiers:

System

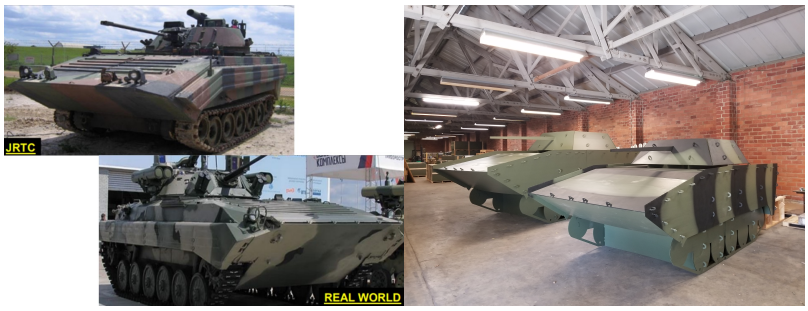
↳*Radio*

Name: R-168-5KVE
Manufacturer: Sarapul Radioplant OJSC
Type: HF
Frequency: MHz1.5-30
Capabilities: Voice Telegraph
Maximum Range: km15-300
Mount Type: Vehicle
In Service: Yes

Notes:

VHF vehicular radio set R-168-5UVE is intended for open and masked radio communication in radio networks of tactical control. There is very little information on the R-168-5UVE

JRTC VISMOD: BMP-2M Berezhok Russian Amphibious Infantry Fighting Vehicle (IFV)



Tiers:

1 **2** 3 4

Parent:

BMP-2 Russian Amphibious Infantry Fighting Vehicle (IFV)

Variants:

- **BMP-2 obr.:** Improved version with "kovriki" armour on turret front
- **BMP-2 obr. 1986:** Late-production model with new BPK-2-42 sight instead of the BPK-1-42.
- **BMP-2D:** Fitted with additional spaced type steel appliqué armour on the hull sides, under the driver's and commander's stations, and 6 mm thick appliqué armour on the turret.
- **BMP-2K:** Command variant fitted with two whip antennas mounted on the rear of the hull, one behind the turret and one on the right-hand side of the rear of the vehicle, one IFF antenna (pin stick) on the left-hand side of the rear of the vehicle and a support for a telescopic mast in the front of the IFF antenna
- **BMP-2M:** This is the general designator for upgraded (modernizirovannyj) versions
- **BMP-2M "Berezhok":** Modernized version from KBP. This version has B05Ya01 Berezhok turret equipped with 2A42 30mm autocannon, PKMT 7.62mm coaxial machine gun, AGS-30 grenade launcher, 2+2 launchers for ATGM 9M133M "Kornet-M" and new day/night sights as found on the BMD-4.
- **BMO-1:** Transport vehicle for a flamethrower squad armed with 30 RPO-A "Shmel" 93 mm napalm rocket launchers.
- **BVP-2V or VR 1p:** Former Czechoslovakia version
- **VPV:** Equipped with a powered crane with 5 tonnes capacity, heavy winch, wider troop compartment etc. Hatches on top of the turret and the troop compartment were removed.
- **BMP-2 "Sarath":** Also known as BMP-II – Indian licence-produced variant of the BMP-2,built by Ordnance Factory Medak. The first vehicle, assembled from components supplied by KBP, was ready in 1987.
- **BMP-2 Light Tank:** India Version, DRDO developed light tank on BMP-2 Chassis DRDO light tank.
- **BMP-2 UGV "Muntra" – unmanned reconnaissance vehicle, "S" version is fitted with equipment used to detect nuclear, biological and:** India Version. unmanned reconnaissance vehicle, "S" version is fitted with equipment used to detect nuclear, biological and chemical contamination while the "M" version is designed to detect mines.
- **BMP-2MD:** Finnish modernisation of the BMP-2, which includes thermal camouflage, thermal sights, anti-aircraft sight and new day/night optics for the gunner and commander, heated cabin and seats, new external storage boxes functioning also as spaced armour and new radio and communications systems

System

↳ ***System***

Name: Shipunov 2A42, 30mm Autocannon

Type: mm30

Max Rate of Fire (Low): rds/min200-300

Max Rate of Fire (High): rds/min550-800

Weight: kg115

Length (Total): m3.027

Barrel Length: mm2,416

Barrels: ea1

Action: Gas-operated

Effective Firing Range: m2,000

Maximum Firing Range: m4,000

Feed System: Twin Feed

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Maximum Elevation: deg+75

Minumum Elevation: deg-5

Firing Modes: Automatic and semi-automatic

Effective Ground Engagement Range: m1,800

↳*Ammunition (Option 1)*

Name: 3UOF8

Type: HEI

Caliber: mm30

Cartidge: mm30 × 165

Muzzle Velocity: m/s960

Basic Load: ea500 total of any combination 30mm projectile

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

↳*Ammunition (Option 2)*

Name: M929

Type: APFSDS-T

Caliber: mm30

Cartridge: mm30 × 165

Muzzle Velocity: m/s1,260

Basic Load: 500 total of any combination 30mm projectile

Note: A sub-caliber fin-stabilized discarding sabot round with tracer from Belgian Mecar, with tungsten alloy penetrator. Penetration: 50 mm RHA steel at 60 degree impact at 1,000 m range

↳*Ammunition (Option 3)*

Name: 3UBR8

Type: APDS

Caliber: mm30

Cartridge: mm30 × 165

Muzzle Velocity: m/s1,120

Basic Load: 500 total of any combination 30mm projectile

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

Note: The 7.62 PKT can be controlled remotely and is slaved to the main gun,

↳*Ammunition*

Name: 57-N-323S

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mm

Muzzle Velocity: m/s855

Basic Load: ea2,000

Accuracy of fire at 300 m: mm90

Anti-Tank Guided Missile (ATGM)

System

Name: 9M133 Kornet
NATO Name: AT-14 Spriggan
Type: Anti-Tank Guided Missile (ATGM)
Manufacfturer: Degtyarev plant
In Service: 1998-present
Proliferation: 35,000 (2009)
Launcher Type: Twin launchers mounted on either side of the turret
Basic Load: ea4
Weight (with Launch Tube): kg29
Weight (with Tripod/Firing Unit): kg63.7
Length: mm1,200
Diameter: mm152
Warhead Weight: kg4.6
Detonation Mechanism: Impact Fuse
Wingspan: mm460
Propellant: Solid-fuel rocket
Operational Range (KORNET): m100-5,000
Operational Range (KORNET-EM): m10,000
Guidance system: SACLOS laser beam riding
Steering system: Two control surfaces
Accuracy: Less than 5 meters
Launch platform: Individual, vehicles, Kornet-T, Kornet-D, Bumerang-BM, Kornet-D1

Fire Control

Name: INA
Computerized FCS: Yes
Commander Periscopes: Two TNPO-170A periscopes, plus a single TKN-3B binocular rear-view prism. Additionally, the Commander has a 1PZ-3 day monocular sight
Thermal Sight Gunner: Sozh panoramic sight
Driver's Central Day Periscope: TNP-350B
Main Gun Stabilization: Yes, digital weapon stabiliser
Effective Ground Engagement Range: m1,800
Searchlight: OU-3GA2 searchlight and the FG-126 searchlight
Digital Battle Management System: Yes
Multi-Channel Optical System: Yes

Advanced Target Detection System: Yes

Laser Range Finder: Yes, PL-1 laser illuminator

Thermal Imaging System: Yes

Ballistic Computer: Yes

Protection

Hull Armor: All-welded steel that is believed to be between 5 and 19 mm thick

Turret Armor: mm23-33

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: KMT-8 mine plow available

Self-Entrenching Blade: INA

NBC Protection: Collective, GO-27 Radioactive and chemical agent detector

Smoke Equipment: 6 smoke grenade launchers, VEESS

Smoke Screen: TDA System using engine

Notes:

The BMP-2M infantry fighting vehicle (IFV) is an upgraded version of the BMP-2 IFV. Designed and developed by Kurganmashzavod JSC, the IFV offers improved mobility and fire power for armed forces. The weapon system for the upgraded vehicle is provided by KBP Instrument Design Bureau. The amphibious vehicle was displayed at an international forum known as Engineering Technologies 2010 held in June 2010 and KADEX-2012, Kazakhstan. The manufacturer also demonstrated the vehicle at Comprehensive Security Exhibition 2015 in Tampere. KBP received an order from Algeria for the modernization of 360 BMP-2 vehicles to BMP-2M standard. A total of 693 BMP-2/2K vehicles of the Indian Army are also being upgraded to BMP-2M standard. The Russian Defense Ministry placed a ten-year contract with KBP for the supply of 540 modernized BMP-2M and BMD-2 airborne vehicles in 2017. The upgraded vehicle is being offered in two different configurations, which include BMP-2M (sb4-2) and BMP-2M (sb4-3). The design of the BMP-2M tracked armored fighting vehicle is based on the BMP-2 IFV, which was commissioned by the Russian Army in 1980. Combat efficiency of the vehicle has been highly improved with advanced armament, while cross-country speed has also been increased. The modernized vehicle can carry three crew members, including a driver, gunner and commander. The troop compartment offers seating for up to seven soldiers. The vehicle retains the design specifications of BMP-2, and measures 6.73m-long, 3.15m-wide and 2.45-high. The combat weight of the vehicle is approximately 16,000kg. The IFV is equipped with a KBM-2 air conditioning system to offer a comfortable environment to the crew when operating in high temperatures. The BMP-2M IFV is equipped with a Berezhok (B05S011) combat module integrating four 9M133 Kornet series anti-tank guided missiles. The missiles are launched from the twin launchers mounted on either side of the turret. The turret is also armed with a 30mm 2A42 automatic gun, a 7.62mm PKT coaxial machine gun and a 30mm AG-17 automatic grenade launcher (AGL). The 30mm cannon has the capability to fire 500 rounds of ammunition a minute, while the 7.62mm gun offers a rate of fire of 2,000 rounds a minute. The AGL can launch 250 grenades a minute for a maximum range of 1,730m. The hull of the IFV is protected by applique armor, which enables the vehicle to withstand 12.7mm B-3232 rounds and high-explosive anti-tank (HEAT) missiles. Observation and fire control The BMP-2M IFV is equipped with a multi-channel optical system for stabilization of view during firing. The vehicle has an advanced target detection system, a laser range-finder and a thermal imaging system to improve the accuracy of target detection and mission efficiency. An armament stabilizer and ballistic computer, as well as a BPK-3-42 gunner’s sight are fitted to the vehicle enable the firing of main armament. The vehicle is also installed with PL-1 laser illuminator. The target detection ranges of the vehicle during the day and night are 5,000m and 3,000m respectively.

JRTC VISMOD: BMP-1 Russian Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **BMP-1P:** The BMP-1P is an upgraded variant of the BMP-1 and weighed 13.4 tonnes. Protection capabilities in the BMP-1P and its sub variant BMP-1PG ('Granatomyot' - grenade launcher) were improved by fitting them with the 81 mm 902V "Tucha" smoke grenade launcher and an AGS-17 "Plamya" AGL respectively.
- **BMP-1 Ambulance (Iraq):** Evacuate wounded
- **BMP-1M:** Kliver turret & drop down gate
- **Type 86/WZ-501 (China):** Chinese BMP-1 IFV
- **BMP-1G ICV:** AT-4/AT-5 ATGM & 30-mm AGS-17 AGL
- **BMP-1 with Soviet modifications in Afghanistan:** Applique armor, AT-4 ATGM mount; some with AGS-17 30-mm AGL
- **BMP-IRM ("Zhuk"-Beetle):** Engineer recon vehicle with front mine claws; 1 MG only
- **BMP-1 with mine plow:** KMT-8 or KMT-10 mine-clearing plows attached
- **MP-31:** Modernized command vehicle
- **BMP-R (BMP M1976):** Recon vehicle with larger rear hatches & 2-man turret
- **BRM-1/BRM-1K Reconnaissance:** BMP-R with a GS-12 Tall Mike radar ILO AT-3 Sagger (see Chapter 1)
- **BREM-2:** Light recovery vehicle w/crane
- **BMP-40:** Larger turret; carries 6 soldiers, prototype model only
- **PRP-3/PRP-4 (Radar):** Artillery recon vehicle with 7.62 MG ILO 73-mm cannon
- **VP-90 (Czech Republic):** Recon with OT-64 turret; 14.5-mm & 7.62-mm MGs
- **SVO Mineclearer (Czech Republic):** Turretless BMP-1 with 24 245-mm explosive rockets
- **BMP-PP0:** Training variant w/o turret
- **Snezka (Czech Republic):** Battlefield surveillance vehicle
- **PRAM-S (Czech Republic):** SP 120-mm mortar carrier
- **BMP-1 Finnish variant:** East German vehicles with autoloaders removed
- **BMP-1 with Poyaud engine (Egypt):** 150 with replaced 10.47-liter Poyaud 6-cylinder engine
- **BMP-1 with applique armor (Iraq):** Armor added to resist 12.7-mm & 14.5-mm armor-piercing shells at 200 m
- **BMP-1A1 Ost:** In 1990, Germany created more space (6 passengers) & removed the automatic loader
- **BMP-1 with CERAWA armor (Poland):** CERAWA ERA on the glacis, hull, & turret front
- **OT-90 (Czech Republic):** OT-64 1-man turret with 14.5-mm & 7.62-mm machine guns
- **BPzV (Czech Republic):** Recon with Tall Mike radar
- **DP-90 (Czech Republic):** Recon with Tall Mike ra0T-90 maintenance variant adar
- **MU-90 (Czech Republic):** Turretless mine-laying OT-90
- **MLI-84 (Romania):** Larger & heavier w/ 12.7-mm machine gun
- **Pansarbandvgn 501 (Pbv 501 (Sweden):** East German vehicles to mechanized Swedish infantry
- **BREM-4 recovery vehicle:** No turret & crane (Czech version is the VPV)
- **BRM-23 (Bulgaria):** Recon with 23-mm cannon
- **82-mm SP Automatic mortar (Hungary):** Vasilyek mortar ILO troop compartment
- **BMP-1K / BMP-1KSh / BMP M1974 Command Vehicle:** This is the company command version of the BMP-1. It has additional communications equipment, an additional radio aerial on the right rear of the hull, a redesigned troop compartment to incorporate tables and a map board. The firing ports were eliminated. The BMP-1K has two roof hatches, each equipped with a roof-mounted TNPO-170A aiming device. The 73-mm gun is provided with 20 rounds of ready use ammunition, which is loaded manually. Two man-portable surface-to-air missiles are carried. The BMP-1K1 and K2 are equipped with two R-123M radios and a semi-telescopic antenna. The K3 features an R123M radio, R130M and a 33-ft (10-m) telescopic antenna. Another variant, the BMP-1KSh (not to be confused with the KShM) was a

regimental and divisional command post vehicle. It was similar to the BMP-1K, except that it was unarmed, has a larger Hawk Eye radio antenna and carries more radio equipment (R-137, R-140M or R-145BM, each with four or five radios). A TNA-3 navigation system is fitted. The crew is provided with a portable 7.62-mm PK machine gun for self-defense. Ref: Military Periscope, April 2016

Notes:

The BMP-1 is a Soviet amphibious tracked infantry fighting vehicle. BMP stands for Boyevaya Mashina Pekhoty 1 (Russian: Боевая Машина Пехоты 1; БМП-1), meaning "infantry fighting vehicle". The BMP-1 was the first mass-produced infantry fighting vehicle (IFV) of the Soviet Union. It was called the M-1967, BMP and BMP-76PB by NATO before its correct designation was known. The Soviet military leadership saw any future wars as being conducted with nuclear, chemical and biological weapons and a new design, like the BMP, combining the properties of an armored personnel carrier (APC) and a light tank would allow infantry to operate from the relative safety of its armored, radiation-shielded interior in contaminated areas and to fight alongside it in uncontaminated areas. It would increase infantry squad mobility, provide fire support to them, and also be able to fight alongside main battle tanks. The BMP-1 was first tested in combat in the 1973 Yom Kippur War, where it was used by Egyptian and Syrian forces. Based on lessons learned from this conflict, and early experiences in the Soviet–Afghan War, a version with improved fighting qualities was developed, called the BMP-2. It was accepted into service in August 1980. In 1987, the BMP-3, a radically redesigned vehicle with a completely new weapon system, entered service in limited numbers with the Soviet Army. The BMP-1 is a fully amphibious tracked vehicle, with a front-engined chassis developed especially for it, a welded steel hull with a sharp, sloping front with a conspicuously ridged surface, a centrally located, flat, truncated cone turret and a troop compartment at the rear.

JRTC VISMOD: ZSU-23-4 Shilka Russian Self-Propelled 23mm Anti-Aircraft Weapon System

Tiers:

Variants:

- **ZSU-23-4V "Shilka"(1964):** Modernized variant with enhanced reliability of some details, ventilation system case located on the hull. Commander vision device was added.
- **ZSU-23-4V1 "Shilka"(1970)::** Modernized variant with enhanced reliability of some details, ventilation system case located on the hull. Commander vision device was added.
- **ZSU-23-4V1 "Shilka" (1970)::** Modernized variant with enhanced reliability of radar system and other details, ventilation system cases located on front bilges of the turret. Guidance-system computer was improved (as well as accuracy and efficiency of anti-aircraft fire on the move at 40 km/h). It is fitted with a slightly improved diesel engine V-6R-1.
- **ZSU-23-4M1 (1973)::** Armed with modernized autocannons 2A7M. The pneumatic loading was replaced with pyrotechnic loading (unreliable compressor was removed), welded tubes of coolant outlet were replaced with flexible pipes which increased autocannon barrel life from 3500 rounds to 4500 rounds.
- **ZSU-23-4M3 "Biryusa" (1977)::** Equipped with identification friend-or-foe system "Luk". All ZSU-23-4M were upgraded to ZSU-23-4M3 level during scheduled repairs. Army unofficially continued to use the name "Shilka" for all variants of ZSU-23-4.
- **ZSU-23-4M2 (1978)::** So-called "Afghan" variant. Re Equipment performed during the Soviet–Afghan War for mountain combat. The radar system was removed and a night-sight was added. Ammunition increased from 2,000 to 4,000 rounds.
- **ZSU-23-4M4 and ZSU-23-4M5 (1999)::** Modernized variants, armed with two additional paired man-portable air-defense systems "Igla" on each side of the turret and equipped with 81mm smoke grenade launchers, laser emission sensors, electro-optical vision devices (including television system for driver) and improved weapon radar system. The mechanical transmission was replaced with hydrostatic transmission, hydraulic boosters were installed. Mobility increased to the level of main battle tanks. This upgrade was first shown during the exhibition MAKS-99 in Zhukovsky and was carried out by the Minotor Service Enterprise and Peleng Joint Stock Company from the Republic of Belarus, and the Ulyanovsk Mechanical Plant of Russia. The Ulyanovsk Mechanical Plant is also offering ZSU-23-4 upgrade packages independently
- **Donets (1999):** This is a Ukrainian modernization developed by Malyshev Tank Factory in Kharkov. It has the modified turret from the ZSU-23-4, armed with two additional paired man-portable air-defense systems "Strela-10" installed on the hull of the T-80UD main battle tank. Ammunition capacity for its 23 mm autocannons is doubled.
- **ZSU-23-4M-A (2017)::** A modernisation package developed by the Arsenal Factory in Kyiv, this system features a new Rokach-AS radar, laser rangefinder, and four automatic Igla missiles.
- **ZSU-23-4MP Biała (2000)::** Polish modernized upgrade with Grom anti-aircraft missiles and fully digital passive aiming devices instead of the radar

Practical Rate of Fire (rd/min): 400, in 10-30 rd bursts

Reload Time (min): 20

Elevation: -4° to +85°

Fire on the Move: Yes

Reaction Time: sec12-18

Maximum Slant Range: km2

Maximum Firing Range: km2.5

Rate of Fire: rds/min850-1,000

Maximum Elevation: deg+85

Minimum Elevation: deg-5

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

Main Armament Ammunition

Description: Can fire the same ammunition as ZU-23. Best mix for modern versions (ZU-23M and ZU-23M1) is 1,200 APDS-T and 1,200 FAPDS. Rounds ballistically matched. No HEI required.

Type: 23x152 HE-I, HEI-T, API-T, TP, APDS-T, FAPDS, TP

Max Effective Range (m): 2,500m, 2,000m against light armored ground targets

Max Effective Altitude (m): 1,500

Projectile Weight (kg): INA

Muzzle Velocity (m/s): 970

Fuze Type: None

Self-Destruct (sec): 11

Penetration (mm KE): 19 @ 1000m API-T

Min Altitude (m): 0

HE-I Projectile Weight (kg): 0.18

HEI-T Projectile Weight (kg): 0.19

API-T Projectile Weight (kg): 0.189

TP Projectile Weight (kg): 0.18

HE-I Fuze Type: Point detonating

HEI-T Fuze Type: Point detonating

API-T Fuze Type: Base igniting

Basic Load: ea2,000

Fire Control

Driver Periscope: BMO-190

Driver IR Periscope: INA

Commander Periscope: TPKU-2

Commander IR Periscope: TKH-ITC

IFF: INA

Radar: DOG EAR (use in OPFOR units)

Name: Sborka (9S80-1 or PPRU-M1)

Function: Target Acquisition

Detection Range (km): 20

Tracking Range (km): 13

Frequency: F/G band

Frequency Band: J

RPK-2: Optical-mechanical computing sight and part of FC subsystem

Armored Command Vehicle:

Chassis: MTLB-U

Range (km): 80 detection, 35 tracking ACV links to supported tactical unit nets.

Other Radars: Using the above ACV, if an Integrated Air Defense System (IADS) is available, ZSU-23-4 links indirectly for early warning and target acquisition data from radars.

Other Fire Control: Guns use air watches and forward observers, and are linked to AD nets

Protection

Hull Armor: Welded steel, up to 15 mm hull

Turret Armor: Welded steel, 9.2 mm (0.36 in) turret

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Shilka ZSU-23-4 is a Self-Propelled Anti-Aircraft Gun (SPAAG) featuring a prominent radar dish that can be folded down mounted on a modified PT-76 chassis. ZSU 23-4 Shilka, is capable of acquiring, tracking and engaging low-flying aircraft (as well as mobile ground targets while either in place or on the move). Employed in pairs 200 meters apart, 400 meters behind battalion leading elements, it is commonly used to suppress ATGM launch sites, such as TOW vehicles. The armament consists of four 23mm cannon with a maximum slant range of 3,000 meters. Ammunition is normally loaded with a ratio of three HE rounds to one AP round. Resupply vehicles carry an estimated additional 3,000 rounds for each of the four ZSUs in a typical battery. Recent (October 1997) information details ZSU-23-4 updates/modernization being offered by the Ukrainians that include: a new radar system replacing the GUN DISH radar, plus a sensor pod believed to include day/night camera, and a laser rangefinder; and mounted above radar/sensor pod is a layer of six fire-and-forget SAMs, believed to be Russian SA-18/GROUSE. The radar-guided ZSU-23-4 "Shilka" SPAAG, with its four 23 mm (0.90") autocannons, was a revolutionary SPAAG, proving to be an extremely effective weapon against enemy attack aircraft and helicopters under every weather and light condition. The ZSU-23-4 has a very high density, rate and accuracy of fire, as well as the capability for each of the four autocannons to fire its own type of projectile from separate belts. While it is technically possible that each cannon shoots different type of ammunition, there were two types commonly used in late 1970s: OFZT incendiary fragmentation and BZT armor-piercing tracer, which were to be loaded in 3:1 ratio—three OFZT, then one BZT, every 10th BZT round equipped with so-called "copper remover" and marked. Operators were strongly discouraged from shooting from a single barrel. The appearance of the "Shilka" caused significant changes in NATO tactics in aircraft use at low altitude over the battlefield. Despite its present obsolescence as a modern short-range anti-aircraft weapon, the ZSU-23-4 is still deadly for enemy light armored vehicles, infantry and firing points as an infantry-support vehicle. With its high rate of accurate fire, the ZSU-23-4 can even neutralize tanks by destroying their gun sights, radio antennas, or other vulnerable parts.[3] ZSU-23-4s, especially late models, have excellent performance and good systems reliability. Based on the GM-575 tracked vehicle chassis, which used components from the PT-76 light amphibious tank, the ZSU-23-4 mounts an armored turret holding four liquid-cooled 23 mm (0.9") 2A7 autocannons linked to an RPK-2 "Tobol" radar (NATO designator: "Gun Dish"). The vehicle weighs 19 tonnes (late modifications up to 21 tonnes), has a movement range of 450 km (280 mi) and a top speed of 50 km/h (31 mph). Additional firepower of late modifications can be supplied by a roof-mounted pod of six short-range SA-18 SAMs, or side mounted SA-16s. The crew numbers four: driver, commander, gunner and radar operator. The driver's compartment is located in the nose part of the vehicle. The fighting compartment is in the center, and the engine compartment is in the rear part of the vehicle. The transmission consists of a

multi-plate metal-contact main clutch, a manual gearbox with five forward gears, two planetary two-step steering gears with locking frictions and two final drive groups. The vehicle chassis has six single rubber tired road wheels, a rear drive sprocket with detachable sprocket rings (lantern-wheel gear) and one idler wheel per side. The first and fifth left, and sixth right road wheels have hydraulic shock absorbers. The track is 11.904 m long, 382 mm (15") wide and has 93 links. Because of a large number of different pipes and tubes to detach during maintenance, the repair procedure for some of the vehicle's mechanisms is hard (for example, replacement or repair of a starter). The electric drive of an air outlet hatch of a gas turbine engine (part of the vehicle's electric power supply system) has an inconvenient location (at the bottom of the hull) which causes overheating and sometimes, jamming of the electric drive. On the other hand, the construction of the electric power supply system is very reliable. Changing the main engine oil and coolant is easy, as is replacement of fuel and oil filters, and sections of the air filter. The ZSU-23-4 can cross vertical obstacles 0.7 m (2.3') high, trenches 2.5 m (8.2') wide, has a 1.0 m (3.3') fording depth and can climb 30° gradients. The ZSU-23-4 has good maneuverability and cross-country ability, but its diesel engine's power is insufficient for a vehicle of its weight. As a result, off-road acceleration capabilities are sub-par, and the vehicle lags behind MBTs and IFVs on up-hill terrain. The ZSU-23-4 is equipped with an NBC system with an air filtration unit, fire-fighting equipment, TNA-2 navigational system, infrared vision device, R-123 radio set, R-124 intercom and electric power supply system consisting of a DGChM-1 single-shaft gas turbine engine (70 hp at 6,000 rpm) and a direct-current generator (which provides 27 V and 54 V direct current or 220 V 400 Hz alternating current).

JRTC VISMOD: Mi-24 (Hind) Attack Helicopter

Tiers:

Variants:

- **V-24:** The first version, twelve prototypes and development aircraft. The first V-24 mockup resembled the Bell UH-1A Huey. Later models resembled the future Hind-A, one of which was modified in 1975 as A-10 for speed record attempts with wings removed and faired over and with inertia-type dampers on the main rotor head. The A-10 reached a speed of 368 km/h. It was armed with GSh-23 and could carry up to six missiles or rockets.
- **Mi-24 (Hind-A):** (Hind-A) Other early versions were the armed assault helicopter, which could carry eight combat troops and three crew members. It could also carry four 57mm rocket pods on four underwing pylons, four MCLOS 9M17 Fleyta (AT-2 Swatter) anti-tank missiles on two underwing rails, free-fall bombs, plus one Afanasev A-12.7 12.7mm machine-gun in the nose. The Mi-24 was the first production model.
- **Mi-24F:** Modified Hind-A with seven reinforcing ribs on the port fuselage aft of the wing and the SRO-2M Khrom ("Odd Rods") IFF antenna relocated from the canopy to the oil cooler. The APU exhaust was also extended and angled downwards. The designation may be unofficial.
- **Mi-24 Hind-B:** The Mi-24A was the second production model. Both the Mi-24 and Mi-24A entered the Soviet Air Forces service in 1972. They Lacked the four-barrel Yak-B 12.7mm machine gun under the nose.
- **Mi-24U (Hind-C):** Training version without nose gun and wingtip stations.
- **Mi-24BMT:** Small number of Mi-24s converted into minesweepers.
- **Mi-24D (Hind-D):** The Mi-24D was a purer gunship than the earlier variants. It entered production in 1973. The Mi-24D has a redesigned forward fuselage, with two separate cockpits for the pilot and gunner. It is armed with a single 12.7mm four-barrel Yak-B machine-gun under the nose. It can carry four 57mm rocket pods, four SACLOS 9M17 Phalanga anti-tank missiles (a significant enhancement compared to the MCLOS system found on the Mi-24A), plus bombs and other weapons. One Mi-24D was sold to Poland in January 1996 and was used by the WTD 61 in Manching during 1994 for tests with the head of a MIM-23 Hawk missile in place of the chin-mounted gun. This version also had an unidentified modification in the rear cabin window on the starboard side.
- **Mi-24PTRK:** This version was the Mi-24D modification was used for testing the Shturm V missile system for the Mi-24V.
- **Mi-24DU:** Small numbers of Mi-24Ds were built as training helicopters with doubled controls.
- **Mi-24V (Hind E):** Later development which entered production in 1976 and was first seen by the west in the early 1980s. It was armed with the more advanced 9M114 Shturm (AT-6 Spiral). Eight of those missile are mounted on four outer wing pylons. It was the most widely produced version with more than 1,500 made. In Polish service this aircraft is designated Mi-24W. One Mi-24V was referred to as Mi-24T for unknown reasons.
- **Arsenal Mi-24V upgrade:** Ukrainian upgrade for Mi-24V.
- **Mi-24P Hind F:** The gunship version, which replaced the 12.7mm machine-gun with a fixed side-mounted 30mm GSh-30-2K twin-barrel auto-cannon.
- **Mi-24TECh-24:** Experimental Mi-24P to test abilities for recovery of downed aircraft.
- **Mi-24VP (Hind-E Mod):** Development of Mi-24V made in 1985 which replaced the machine-gun with twin 23mm auto-cannons in a movable turret. Entered service in 1989, but only 25 were made before production ended the same year.[2] One Mi-24VP flew with the Delta-H tail rotor of the Mil Mi-28.
- **Mi-24RKhR (Hind-G1):** NBC reconnaissance model, which is designed to collect radiation, biological and chemical samples. It was first seen during the 1986 Chernobyl disaster. Also known as the Mi-24R, Mi-24RK and Mi-24RKh (Rch).
- **Mi-24RR:** Radiation reconnaissance model derived from the Mi-24R.
- **Mi-24K (Hind-G2):** Army reconnaissance, artillery observation helicopter.
- **Mi-24VM:** Upgraded Mi-24V with updated avionics to improve night-time operation, new communications gear, shorter and lighter wings, and updated weapon systems to include support for the 9M120 Ataka, Shturm and 9K38 Igla ATGM missiles and a 23mm main gun. Other internal changes have been made to increase the aircraft life-cycle and ease maintenance.

- **Mi-24VN (Hind-E variant):** A night-attack version based on an Mi-24V in Mi-24VM Stage 1 configuration.
- **Mi-24PM:** Upgraded Mi-24P using same technologies as in Mi-24VM.
- **Mi-24PN:** PN version has a TV and a FLIR camera located in a dome on the front of the aircraft, and is armed with GSh-23L. The Russian Air Force received 14 Mi-24PNs in 2004
- **Mi-24PS:** Civil police or paramilitary version, equipped with a FLIR, searchlight, loudspeaker PA system and attachments for rappelling ropes.
- **Mi-24V Ecological Survey Version:** Environmental research modification developed by the Polyot Industrial Research Organisation.
- **Mi-24 SuperHind Mk.II:** Modern western avionics upgrade produced by South African company Advanced Technologies and Engineering (ATE)
- **Mi-24 SuperHind Mk.III:** Extensive operational upgrade of the original Mi-24 including weapons, avionics and counter measures.
- **Mi-PSV:** Experimental high-speed helicopter based on the Mi-24. PSV stands for Perspektivny skorostnoi vertolet (Перспективный скоростной вертолёт) – Prospective high speed helicopter). Single-seat streamlined cockpit, unarmed, fitted with experimental main rotors for research into high-speed flight, with a target of increasing the speed of the Mi-28N by 10% and the Mi-35M by 13%

EW Counter Measures/CCM: No

Counter Measures (Chaff/Flares): ASO-2V flare dispensers

Notes:

Mil Mi-24 is a twin-engine combat helicopter intended for close support of ground forces, destruction of armored targets and transportation of persons or cargo. The Mi-24 is not a direct counterpart to the American AH-64 Apache, since unlike this and other Western attack helicopters it is also capable of transporting up to eight troops. As a combination gunship and troop transport, the Hind combat helicopter has no direct NATO counterpart. The combat helicopter is a flying infantry fighting vehicle, which blends features of both transport and attack helicopters. Soviet pilots called the aircraft 'letayushiy tank' or flying tank. Another common nickname is 'Krokodil' (Crocodile) - due to the helicopter's camouflage and fuselage shape and "Drinking Glass", (Stakan) because of the flat glass plates that surround the Mi-24's cockpit. The core of the aircraft was derived from the Mil Mi-8 (NATO reporting name "Hip") with two top-mounted turbo-shaft engines driving a mid-mounted 17.3 m five-blade main rotor and a three-blade tail rotor. The engine configuration gave the aircraft its distinctive double air intake. Original versions have an angular greenhouse-style cockpit; Model D and later have a characteristic tandem cockpit with a "double bubble" canopy. Other airframe components came from the Mi-14 "Haze". Two mid-mounted stub wings provide weapon hardpoints, each offering three stations, in addition to providing lift. The loadout mix is mission dependent; Mi-24s can be tasked with close air support, anti-tank operations, or aerial combat. The Mi-24 fuselage is armored and can resist impacts from 12.7 mm (0.50 in) rounds from all angles. The titanium rotor blades are resistant to 12.7 mm rounds. The cockpit is protected by ballistic-resistant windscreens and a titanium-armored tub. The cockpit and crew compartment are over pressurized to protect the crew in NBC conditions. Considerable attention was given to making the Mi-24 fast. The airframe was streamlined, and fitted with retractable tricycle undercarriage landing gear to reduce drag. At high speed, the wings provide considerable lift (up to a quarter of total lift). The main rotor was tilted 2.5° to the right from the fuselage to compensate for translating tendency at a hover. The landing gear was also tilted to the left so that the rotor would still be level when the

aircraft was on the ground, making the rest of the airframe tilt to the left. The tail was also asymmetrical to give a side force at speed, thus unloading the tail rotor. Comparison to Western helicopters As a combination of armored gunship and troop transport, the Mi-24 has no direct NATO counterpart. While the UH-1 ("Huey") helicopters were used in the Vietnam War either to ferry troops, or as gunships, they were not able to do both at the same time. Converting a UH-1 into a gunship meant stripping the entire passenger area to accommodate extra fuel and ammunition, and removing its troop transport capability. The Mi-24 was designed to do both, and this was greatly exploited by airborne units of the Soviet Army during the 1980–89 Soviet–Afghan War. The closest Western equivalent was the Sikorsky S-67 Blackhawk, which used many of the same design principles and was also built as a high-speed, high-agility attack helicopter with limited troop transport capability using many components from the existing Sikorsky S-61. The S-67, however, was never adopted for service. Other Western equivalents are the Romanian Army's IAR 330, which is a licence-built armed version of the Aérospatiale SA 330 Puma, and the MH-60 Direct Action Penetrator, a special purpose armed variant of the Sikorsky UH-60 Black Hawk. The Hind has been called the world's only "assault helicopter" due to its combination of firepower and troop-carrying capability A modified Mi-24B, named A-10, was used in several speed and time-to-climb world record attempts. The helicopter had been modified to reduce weight as much as possible—one measure was the removal of the stub wings. The previous official speed record was set on 13 August 1975 over a closed 1000 km course of 332.65 km/h (206.7 mph); many of the female-specific records were set by the all-female crew of Galina Rastorguyeva and Lyudmila Polyanskaya. On 21 September 1978, the A-10 set the absolute speed record for helicopters with 368.4 km/h (228.9 mph) over a 15/25 km course. The record stood until 1986, when it was broken by the current official record holder, a modified British Westland Lynx.

JRTC VISMOD: Skylark II Israeli Unmanned Aerial Vehicle (UAV)

Tiers:

1 **2** 3 4

Variants:

- **Skylark II LE:**

System

Alternative Designation : None
Ground Crew: 2

Description: HD Color CCD 10x zoom lens

Type: Optical Camera

↳*Payload 2*

Description: Night FLIR thermal imaging

Type: IR Camera

↳*Payload 3*

Description: Marker

Type: Laser

Notes:

The Skylark II was unveiled in 2006. It has a range of 60 km and is designed to be operated by a two-person crew and to be deployed using HMMWV class field vehicles. In December 2007, South Korea decided to purchase the Skylark II system. Israel planned to bring the Skylark II into service by mid-2013. Skylark II is designed to support brigades and divisions. The guidance system is a Starlink air terminal with secure digital data links, redundant avionics, and autonomous flight modes. They are interoperable with other Skylarks with real-time video transfer rate of 1.5 mb per second, encrypted UHF uplink, D/E band downlink. Uses a triple sensor payload that provides high definition optical, thermal imager, and laser capabilities.

JRTC VISMOD: BMD-3 Russian Airborne Amphibious Infantry Fighting Vehicle (IFV)

Tiers:

Variants:

- **BMD-3K:** The commander variant of the BMD-3 adopted by the Russian Army in 1996. Mass production of this vehicle was never initiated.
- **2S25 Sprut-SD (Object 952):** A self-propelled anti-tank gun that entered service in 2005. This vehicle has the chassis of the BMD-3 and is operated by a crew of three. The main armament is the 125 mm 2A75 smoothbore gun which is a variant of the 2A46 smoothbore gun series used by Soviet main battle tanks since the T-64. It can fire the ammunition of the 2A46 including the 9M119 Svir. The chassis has seven road wheels on each side instead of five and the engine is now the 2V-06-2S with a power of 510 hp.
- **BTR-MD “Rakushka” (Object 955):** A multi-role transport vehicle with bigger hull and no turret. This type can be used to transport troops, fuel, ammunition and wounded personnel. It also serves as the basis for a new range of specialised vehicles for the Russian airborne forces, including a mortar platform and an ambulance.
- **BTR-MDM:** A modernized version with the same improvements as the BMD-4M.
- **RKhM-5 (Object 958):** A chemical reconnaissance vehicle introduced in 2011 and is fitted with the same specialized equipment as the BTR-80 version known as the RKhM-4. The turret has been removed; the RKhM-5 has a fixed superstructure with a machine gun turret. The hull is larger allowing it to transport troops, fuel, ammunition and wounded personnel
- **BMD-4 (Object 960):** Originally designated as the BMD-3M, this vehicle has a modified chassis with new turret known as the "Bakhcha-U". The weaponry bears greater similarity to the BMP-3. This new armament consists of: a 100 mm 2A70 rifled main gun, a 30mm 2A72 autocannon, a 7.62 mm coaxial machine gun, and new "Ramka" fire control system. The bow-mounted AGS-17 has been removed and is replaced with an AGS-30. BMD-4s are newly built or upgraded BMD-3s. The BMD-4 is no longer being purchased for the Russian troops, in favor of the BMD-4M.
- **BMD-4M:** The upgraded variant with a new chassis and the 500 hp UTD-29 engine of the BMP-3. This version will be produced by Kurganmashzavod (KTZ) instead of VgTZ. The vehicle was presented to the VDV in March 2008. According to KTZ, series production could have started in 2009. The BMD-4M was evaluated by the VDV
- **BMM-D:** A command post vehicle and a recovery vehicle. Some variants will have a longer chassis with seven road wheels and probably the same 510 hp engine as the 2S25.

System

Secondary Radio: Digital R-168

Main Gun

↳*System*

Name: Shipunov 2A42, 30mm Autocannon

Type: 30mm

Manufacturer: Tulamashzavod

Max Rate of Fire (Low): rds/min200-300

Max Rate of Fire (High): rds/min550-800

Weight: kg115

Length (Total): m3.02

Barrel Length: m2.4

Barrels: ea1

Action: Gas-operated

Effective Firing Range: m2,000

Maximum Firing Range: m4,000

Feed System: Twin Feed

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Maximum Elevation: deg+75

Minumum Elevation: deg-5

↳*Ammunition (Option 1)*

Name: 3UOF8

Type: HEI

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s960

Basic Load:

Projectile Weight: g389

Bursting Charge: g49

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

↳*Ammunition (Option 2)*

Name: M929

Type: APFSDS-T

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,260

Basic Load: ea

Projectile Weight: g235

Bursting Charge: None

Note: A sub-caliber fin-stabilized discarding sabot round with tracer from Belgian Mecar, with tungsten alloy penetrator. Penetration: 50 mm RHA steel at 60 degree impact at 1,000 m range

↳*Ammunition (Option 3)*

Name: 3UBR8

Type: APDS

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,120

Projectile Weight: g304

Bursting Charge: None

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

Grenade Launcher

↳*System*

Name: AGS-17 Plamya, 30mm Automatic Grenade Launcher

Type: Automatic Grenade Launcher

Manufacturer: Molot plant

In Service: 1970-Present

Proliferation: Widely Proliferated

Weight: kg31

Length: mm840

Rate of Fire: rds/min400

Effective Firing Range: m8,00 - 1,700

Maximum Effective Range: m1,700

Action: Blowback

Feed system: 29 grenades belt

Sights: Adjustable iron sights, optional mount required for optical sights

Variants: AG-17A helicopter-mounted version

↳*Ammunition (Option 1)*

Name: VOG-17M

Type: 30mm Grenade

Cartridge: 30×29mm grenade

Muzzle velocity: m/s185

Warhead: High explosive fragmentation warhead.

Effective Firing Range: 8,00 - 1,700

Basic Load: ea40

↳*Ammunition (Option 2)*

Name: VOG-30

Type: 30mm Grenade

Cartidge: 30×29mm grenade

Muzzle velocity: m/s185

Effective Firing Range: 8,00 - 1,700

Basic Load: ea40

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: 7.62mm

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

Note: The 7.62 PKT can be controlled remotely and is slaved to the main gun,

↳*Ammunition (Option 1)*

Name: 57-N-323S

Type: Rifle

Caliber: mm7.62

Cartridge: km7.62×54mm

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

↳*Ammunition (Option 2)*

Name: 7N13 (AP)

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

↳***Ammunition (Option 3)***

Name: 7BZ3 (API)

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mm

Muzzle Velocity: m/s834

Basic Load: ea2,500

Accuracy of fire at 300 m: mm150

Tank Commander's Weapon System

↳***System***

Name: RPK-74 (AK-47) 5.45mm Machine Gun

Type: mm5.45

Manufacturer: Vyatskiye Polyany Machine-Building Plant

In Service: 1974-Present

Proliferation=: Widely Proliferated

Max Rate of Fire: rds/min600

Weight (RPK): kg4.7

Weight (RPKS): kg5.1

Length: mm1,060

Barrel Length: mm590

Action: Gas operated, rotating bolt; closed bolt

Effective Firing Range (with sight adjustments): m100-1,000

Maximum Firing Range: m3,150

Feed system: 30-, 45-round box magazine, 100-round plastic drum magazine, belt ammunition (with side mounted belt feed device)

Sights: Iron sights: semi-shrouded front post and rear sliding tangent with an adjustable notch Sight radius: 555 mm (21.9 in)

↳***Ammunition***

Type: Rifle

Caliber: mm5.45

Cartridge: 5.45×39mm M74

Muzzle Velocity: m/s960

Basic Load: ea2,500

Anti-Tank Guided Weapon (ATGW)

Name: 9M113 Konkurs (AT-5 Spandrel)

Type: Soviet SACLOS wire-guided anti-tank missile.

Manufacturer: Tula Machinery Design Bureau (Tula KBP) – Tulsky Oruzheiny Zavod

In Service: 1974-Present

Proliferation: Algeria– used by mechanized infantry units Armenia Azerbaijan Egypt – mounted on Fahd armoured personnel carriers purchased in 1990s Belarus The launcher is been locally produced and upgraded. Bulgaria Croatia Cuba – not confirmed Czech Republic Eritrea[Finland – known as PstOhj 82M, fired from 9P135M-1 launchers (withdrawn from service) Georgia Guinea Hungary Indonesia – mounted on BVP-2 infantry fighting vehicles operated by the marine corps India – 15,000 Konkurs-M, ordered in 2008 for Rs 1,380-crore. Another 10,000 Konkurs-M ordered for US$250 million in 2012. A new contract was signed in 2019 for USD 110 mln. Iran– produced domestically as Tosan-1 Iraq Ivory Coast (reported) Kazakhstan Kyrgyzstan Morocco[Mongolia Moldova– used on BRDM-2 North Korea – produced domestically Pakistan – Used on Viper infantry fighting vehicle Peru Romania Russia – about 300 Konkurs-M complexes delivered annually in the last years (2014) Slovakia Turkmenistan Turkey Syria Ukraine Houthis – Tosan version

Varaints: 9M113M,Towsan-1, Tosan, Towsan, or M113, 9N131M1, 9N131M2-1

Weight (Missile): kg14.6

Weight (9P135 Launching Post): kg22.5

Length: mm1,150

Diameter: mm135

Warhead Weight: kg2.7

Detonation Mechanism: Contact

Engine: Solid-fuel rocket

Wingspan: mm468

Maximum Operational Range: km4

Minimum Operational Range: m70

Speed: m/s208

Guidance system: Wire-guided SACLOS

Steering system: Two control surfaces

Launch platform: Individual, vehicle

Penetration: 600mm of RHA

Basic Load: INA

Fire Control

Name: INA

Computerized FCS: INA

Thermal Sight Vehicle Commander: Yes, 1PZ-3 with a TNP-165A designator

Thermal Sight Gunner: Yes, BPK-1-42 with a TNPT-1 designator and a TKN-3B binocular sight

Main Gun Stabilization: Yes, 2E36-5

Periscopes: TNPO-170A periscopes and the TNPO-350B night vision periscope.

Protection

Hull Armor: Protection to stop up to 12.7mm rounds fired at the hull and 7.72mm rounds fired at the sides

Turret Armor: INA

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes, three 81 mm electrically-operated smoke grenade dischargers firing forwards,

IR Signature: INA

Fire Suppression System: Yes

Notes:

The BMD-3 (Boyevaya Mashina Desanta, Russian "Боевая Машина Десанта", literally "Combat Vehicle of the Airborne") is an infantry fighting vehicle (IFV) originating from the former Soviet Union. This armored fighting vehicle is one of the lightest in its class and is intended to be a fire support platform for use by airborne and air assault units. The primary armament is a 30 mm 2A42 autocannon capable of firing different types of ammunition which include high-explosive and armor-piecing. The BMD-3 possesses multiple secondary weapons such as the 9M113 Konkurs missile and the AGS-17 grenade launcher to defeat a wide range of targets from enemy infantry to other armored fighting vehicles. The development of this 3rd generation airborne combat vehicle was initiated during the same time frame of the development of the BMP-3. However, the results of the development showed that the mass of the BMP-3 with landing facilities will significantly exceed 20 tonnes limiting an Il-76 to transporting one vehicle. In the early 1980s, the creation of an airborne combat vehicle was initiated. During the design, two options were considered for the BMD-3. The first one included a chassis weighing over 18 tonnes with a 100 mm 2A70 rifled gun and a coaxial 30 mm 2A72 autocannon. The second option was to use the combat module with a 30 mm 2A42 autocannon. Thus, an IL-76 could be loaded either with two airborne combat vehicles weighing 18 tonnes, or three airborne combat vehicles weighing 12.5 tonnes. Research showed that the latter version of the new BMD-3 ran much more efficiently. On the basis of the experience gained and the results of the research, the Council of Ministers of the USSR and the CPSU number 451-159 officially opened the ROC under the code "Bakhcha" on 20 May 1983. Work included the development of an airborne combat vehicle weighing 12.5 tonnes with the Volgograd tractor factory appointed as the head developer. One month later, an agreement was made for the tactical and technical requirements for the new BMD as well as a complete technical design stage. When developing the new BMD, the experience gained in the course of work on the BMD-1 and "Object 934" light tank was used. By 1985, the acceptance testing of three new BMD prototypes was completed. The test results revealed that all the samples exceeded the permissible mass by 190–290 kg and that the running vehicle gave numerous failures. The design bureau VgTZ fixed most of the shortcomings and were eliminated. By May 1986, the refined BMD prototypes completed preliminary tests with three more prototypes developed by the Volgograd tractor factory. These were sent to the state test for another evaluation. New samples exceeded the permissible mass by 400 kg, as they were made subject to measures of improving the reliability of the running transmission gears. The BMD state tests took place between 27 October 1986 and 27 October 1987. According to test results, two to three vehicles were completed and sent to the control tests in different climatic zones conducted from 10 July to 19 November 1988. The conclusion for the "Bakhcha" was assessed as positive with the vehicle fulfilling the tactical and technical requirements set by the airborne troops. On 10 February 1990, the USSR adopted the "Object 950" IFV into service under the designation BMD-3. The serial production of the BMD-3 was then initiated and continued until 1997. Excluding six prototypes produced before 1990, 137 BMD-3s were produced from the year of its adoption to the end of its serial production.

JRTC VISMOD: M98 American Fast Attack Vehicle / Desert Patrol Vehicle

Tiers:

1 **2** 3 4

System

Alternative Designations: Desert Patrol Vehicle, Light Strike Vehicle

Description: 4 X 4 dune buggy type vehicle with rollover frame can hold up to 4 passengers in addition to the crew.

Manufacturer: Chenowth Racing Products, Inc

Crew: 4; 1 driver, 1 gunner, and 2 passengers

Dimensions

Length: m4.08

Width: m2.11

Height: m2.01

Curb Weight: kg960

Payload Capacity: kg

Automotive

Engine Name: INA

Engine Type: Diesel

Engine Power: INA

Operational Range: km500

Speed (Max Road): km/h130

Speed (Max Off Road): km/h110

Main Weapon System

Note: 1X 12.7 mm M2 .50 caliber HMG; 1 x 5.56 mm M249 SAW LMG; 1 x 7.62 mm M60 or M240 series GPMG; or Russian / Chinese equivalent

Protection

Armor (turret front): None, relies on speed

Survivability Equipment: Off-road mobility, speed, 360°crew fire, & quick dismount for protection

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Self-entrenching Blade: No

NBC Protection System: No

Smoke Equipment: INA

Notes:

The Desert Patrol Vehicle (DPV), formerly called the Fast Attack Vehicle (FAV), is a high-speed, lightly armored sandrail-like vehicle first used in combat during the Gulf War in 1991. Due to their dash speed and off-road mobility, the DPVs were used extensively during Operation Desert Storm. The first U.S. forces to enter Kuwait City were United States Navy SEALs in DPVs The DPV was built by Chenowth Racing Products, Inc. The German Volkswagen Kübelwagen was the first military Light Utility Vehicle based on the Volkswagen Beetle which uses rear-wheel rather than four-wheel drive. Volkswagen components were also the basis for the postwar dune buggy, and its layout is used in the DPV with rear-mounted air-cooled 200 hp (150 kW) Volkswagen engine. This makes the lightweight vehicle capable of accelerating from 0 to 30 mph (0–50 km/h) in only four seconds and able to travel at speeds of up to 80 mph (130 km/h). With its standard 21 gallon (79.5 litre) fuel tank, the DPV has a range of about 210 miles (338 km). An optional fuel bladder can extend the range to over 1,000 miles (1,610 km). Payload capacity is 1500 lb (680 kg). Note: The Light Strike Vehicle (LSV) is an improved version of the Desert Patrol Vehicle (DPV) it replaced. Although the conventional US military replaced its DPVs with Humvees, special operation groups adopted the LSV for its small size and high mobility. It is part of the family of Internally Transportable Light Strike Vehicles (ITV-LSV). It is used for fast hit-and-run style raids (as its name suggests), scouting missions, special forces support, and low intensity guerrilla warfare.

JRTC VISMOD: UH-72 Lakota American Light Utility Helicopter

Tiers:

Variants:

- **Armed Scout 645:** Designed to meet the U.S. Army's armed scout helicopter requirements.
- **Armed Aerial Scout 72X/72X+:** Based on the UH-72A and optimized for scout and light attack missions. The latest version, the AAS-72X+, incorporates more powerful Turbomeca Arriel 2E engines with dual-channel full authority digital engine control (FADEC), a Fenestron tail rotor for improved anti-torque, an upgraded transmission, the Helionix glass cockpit and avionics suite and a four-axis autopilot system. The improvements provide greater power, range, endurance and payload capacity when operating in 6,000 ft (1,800 m) altitude and 95 degrees F (35 degrees C) environments. The AAS-72X+ could be in service with the U.S. Army by 2016, said an EADS press release dated Oct. 29, 2012.
- **Security and Support Mission Package:** This U.S. Army variant features an MX-15 turreted electro-optical/infrared sensor and laser pointer; EuroAvionics EuroNav moving map system and two SkyQuest touch-screen displays; a video management system, SkyQuest digital video recorder plus additional avionics; and Sierra Nevada Tactilink Eagle data downlink system. A searchlight, slaved to the MX-15 turret, is mounted on the aft starboard step. It also has the same rescue hoist that equips the UH-72 medical evacuation mission package. The Army has ordered about 100 Lakotas in this configuration.

System

Alternative Designation: UH-145, UH-72A
Primary Function: Utility Helicopter
Crew: ea2
Blades, Main Rotor: ea4
Blades, Tail Rotor: ea2
Number of Engines: ea2
Day/Night Capable: Yes
All Weather Capable: Yes
Takeoff or Landing Limitations: INA

Engine Type: Turboshaft

Engine Power: 738 shp each

Cruising Range: km685

Speed, Maximum: km/h269

Speed, Average: km/h

Hover Ceiling (In Ground Effect): m3,400

Hover Ceiling (Out of Ground Effect): m2,700

Notes:

The UH-72A Lakota is the U.S. Army's new light utility helicopter. Based on the commercial EC145, it is designed for homeland security, medical evacuation, passenger/logistics transportation and drug interdiction missions within the U.S. Many of the helicopters are being assigned to the National Guard, replacing older air-frames and freeing up larger helicopters for other duties, which has included deployment to Iraq and Afghanistan. Modular kits, such as MEDEVAC and external hoists, enable the Lakota helicopter to make a quick transition to different missions. The UH-72 is easily configurable for a variety of missions. The large main cabin is equipped with a sliding side door and rear clam-shell door to maximize access and space. It can carry up to eight passengers. Two stretchers can be carried for medical evacuation missions. The Lakota is equipped with twin engines turning a hinge-less rotor system with advanced composite rotor blades, which limit vibration and noise. The main and tail rotors are set high to enable loading through side and rear doors even when the blades are turning. For safety, the hydraulic and electrical systems are redundant. The helicopter is equipped with night-vision-goggle-compatible cockpit systems, and a vehicle and engine management display (VEMD) helps crew-members integrate and synthesize flight and vehicle information, reducing pilot workload. The Lakota also has a built-in air-to-ground communications system so pilots may talk directly to first responders, including police, firefighters and ambulance crews during rescue and disaster-relief operations. The Army also considered an armed version of the helicopter for reconnaissance, although that mission was for a while expected to go to the ARH-70A armed reconnaissance helicopter. However, in October 2008, the U.S. Army terminated the ARH program. Military Periscope, May 2013

JRTC VISMOD: BAT-M Russian Tracked Route-Clearing Vehicle

Tiers:

1 2 3 4

Variants:

- **BAT, BAT-2:** Based on MT-T artillery tractor

System

Alternative Designations: Dozer

↳*Description*

Max Swim: INA

Fording Depths: m0.7

↳***Features***

Radios, Frequency, and Range: INA
Vertical Step: m1
Trench Crossing: m1.57
Time from Travel to Operating Position: min5 to 7

Notes:

In the late 40’s the Soviet troops required a heavy artillery tractor to tow their super heavy guns and the upcoming nuclear missiles. One of them was the legendary AT-T based on the very early chassis and lower hull of the T-44 and later T-54 tank with 500mm wide tracks and a 13 teeth sprocket wheel. On the basis of this very strong artillery tractor several other heavy engineer vehicles were also derived. One of them, the BAT-M (also known as a “Way Builder”), featured a huge blade that was pivoted back when marching or being transported and a 2-ton crane installed at the rear part of the vehicle. My model represents an NVA version used by the former Eastern German Army until its end in 1990, at which time they still had 158 BAT / BAT-M in service. This vehicle had a V12 Diesel Engine with a cylinder capacity of 38.800 cm3, was water cooled, with a 415 hp rating.

Protection

NBC Protection: INA

Smoke Screening System: No

Notes:

The UMZ has been disclosed as the likely replacement for the GMZ-series. The UMZ consists of three launchers mounted on each side of the vehicle for a total of six mine launchers per vehicle. each full turn launcher is hexagonally shaped and contains 30 launch tubes totaling 180. It can fire the mines to one or both sides, or to the rear. Both AP and AT mines are launched from the 140-mm launch tubes. The UMZ uses the same mine canisters as the PKM system. Depending on the position of the launch tubes, one-, two-, or three-lane mine fields can be laid. Minefield (m): length: 1,000 to 1,200. Depth (m): 30 to 120. Max length of minefield with one basic load (m): AP, PFM-1s: 3,200. AP, POM-2: 5,000. AT, PTM-3: 600. Mine capacity: from 180 to 11,520 depending on the type of mine number of mines in one basic load: AP PFM-1s: 11,520. AP POM-2: 720. AT PTM-3: 180. Variants: although primarily mounted on the ZIL-131B, the UMZ minelaying system has been observed mounted on several different carriers such as a modified MT-Blue chassis or on a PT-S tracked amphibious personnel carrier and most recently on the KamAZ-63501 in the UMZ-K Variant.

Armor Penetration: INA

Weight of Round: kg3.14

Note:: Can fire all ammunition designed for earlier model 82mm Soviet / Russian mortars

Fire Control

Computerized FCS: No

Direct Fire: INA

Indirect Fire: Yes

Collimator: Yes

Notes:

The 2B14 Podnos is a Russian 82 mm mortar. The 2B14 was designed in early 1980s as a light, indirect fire weapon for the use of airborne and other light infantry forces. It was developed to replace the older M47 and is lighter and has better range than its predecessor. Despite the intent to field the 2B14 with light infantry units, the 2B14 appears to have been fielded with regular motor rifle units as well at a scale of six per battalion.

Warhead Weight: kg9

Fuze Type: Proximity

Self Destruct: INA

System Reaction Time: sec6-12

Fire on the Move: No (must be at a halt to fire the missile)

Fire Control

FCS Name: INA

Computerized FCS: Yes

IFF: Yes, IFF system (1RL138), operating in C-and D-band

Direct-view Optics (DVO): Yes

Rangefinder: Laser

Radar System, 1RL144M

Note: The HOT SHOT radar system, which consists of a surveillance radar with a maximum range of 18 km, and a tracking radar with a maximum range of 13 km

↳*Radar 1 (Detection)*

Name: 1RL144 Radar

Type: Detection Radar

Function: This radar provides primary search capability in addition to measurement of range and bearing

Frequency/Band: E-band

Maximum Range: km18

Antenna Location: Antenna is mounted at the rear of the turret and is folded down when not in use

Antenna Rotation: The antenna rotates at approximately 1 r/s, which gives a rapid update of the airspace around the 2S6M

Fan Beam: The TAR emits a fan beam covering 4.50 in azimuth and 150 in elevation. The beam is pointed at a constant elevation of 7.50 to permit detection of low-altitude targets.

↳*Radar 2 (Tracking)*

Name: 1RL144M

Type: Target Tracking Radar (TTR)

Function: The tracking radar constantly relays target range, elevation and bearing to the fire-control computer, and on the basis if these data the computer generated the laying commands for the weapon system.

Frequency/Band: J-band

Maximum Range: km16

Antenna Location: Antenna is mounted at the front section of the turret and has two fundamental functions that depend on whether the guns or missiles are selected.

Optical Sight: A stabilized optical sight is used as a back up tracking channel, allowing target data to be relayed to the fire-control computer. This sight is also used to calculate the deviation of a missile's flight path from the line-of-sight, these data being automatically relayed to the fire control computer and used to generate correction signals.

Gun Engagement: During a gun engagement, the TTR functions as an automatic target tracker, feeding target position data to the fire-control computer.

Missile Engagement: During missile engagement, the tracking radar locks onto the target and then lays the optical sight on the target. Subsequently the gunner assumes the target-tracking function with the electro-optic sight, and the radar is used for relaying guidance commands to the SA-19 missile.

Protection

Hull Armor: Welded steel

Turret Armor: Welded steel

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The 2S6 Tunguska 2K22 (NATO code SA-19 Grison) is a Russian-made self-propelled air defense system which combines gun and missile armament. The development of the 2S6 Tunguska began in 1970 after a request by the Russian army for a new self-propelled anti-aircraft weapon system to replace the old ZSU-23-4 self-propelled anti-aircraft gun. The first version entered service in 1986 and had four missiles, two either side, in the ready to launch position. The second version to enter service with the Russian army, and the current production model vehicle, is designated the 2S6M or 2K22M, has eight missiles, four to each side of the turret. The Tunguska vehicle uses a tracked chassis GM-352M which is also used for the ground-to-air missile system Buk-M1 SA-11 Gadfly. A typical 2K22/2K22M battery would consist of six 2S6/2S6M self-propelled air defense vehicles, six

reload vehicles and associated support and maintenance vehicles. The 2S6 Tunguska is intended to protect tank and motorized units from low-flying aircraft and helicopters, some types of cruise-missile, as well as to engage light armor ground targets and manpower of the enemy.

JRTC VISMOD: M-37 (82-BM-37) Russian 82mm Mortar

Tiers:

Variants:

- **Type 53:** Chinese production M37
- **82 Krh/37:** Finnish designation for M37
- **M41:** The M41 is a modified version of the M37 mortar. The bipod has been replaced by a T-shaped bipod with each bipod leg acting as an axle to which road wheels can be attached. The idea was to improve the mobility of the M37, but the bipod proved to be unstable.
- **M43:** The M43 is another attempt to increase the mobility of the M37. It differs from the M41 in that the bipod has dedicated feet and the wheel are permanently fixed above those feet. Just as with the M41 the M43 was discontinued in favor of the improved M37 mortar.

↳***Ammunition***

Name: INA

Types: HE, Smoke, Flare

Caliber: 82mm

Shell: 3.05 kg

Muzzle Velocity: fps690

Notes:

The M-37 or 82-BM-37 (батальонный миномёт) is a Soviet 82 millimeter calibre mortar designed by B.I. Szayrin and accepted into service in 1937. The design of the M-37 is based on the earlier French Brandt mle 27/31 mortar with Russian modifications. The main difference between the 82-PM-37 and the earlier 82-PM-36 was the adoption of a round base-plate, revised traverse/elevation controls, simplified sights and spring-loaded shock absorbers on the bi-pod to reduce the amount of relaying needed between shots. The German designation for captured M-37 mortars was 8.2 cm GrW 274/2(r). The M-37M is an improved version with lighter base plate and a device to prevent double loading. It was produced in China by Norinco as the Type 53, in Egypt by the Helwan Machine Tools Company as the Model 69 and in Bulgaria by Arsenal as the M-82 Mod 1937.

Notes:

The GAZ-66 is a Soviet and later Russian 4x4 all-road (off-road) military truck produced by GAZ. It was one of the main cargo vehicles for motorized infantry of the Soviet Army and is still employed in former Soviet Union countries. It is nicknamed shishiga (шишига) shehsherik (шешерик) trueman (in Siberia). Almost one million vehicles of this type were built for both military and civil use. The GAZ-66 has gained legendary status in many countries around the world due to its reliability, simplicity and off-road capability. Thanks to standard features, such as a front-mounted winch, Central Tire Inflation System (CTIS) and self-locking differentials, the GAZ-66 is extremely popular worldwide with armed forces and off-road enthusiasts. Production ceased in 1999, with the GAZ-3308 being produced instead. Besides functioning as a general cargo carrier, the GAZ-66 is used as a prime mover for 120mm mortars. The DDA-66 variant is an NBC decontamination truck.

JRTC VISMOD: MDK-3 Russian Tracked Ditching Vehicle

Counter Measures (Chaff/Flares): Yes, ASO-3 and ASO-2 chaff/flare countermeasures system
Jammer: Hot Brick IR

Notes:

The military variant Mi-17 (NATO reporting name: Hip) is a Soviet/Russian helicopter in production at two factories in Kazan and Ulan-Ude. It is known as the Mi-8M series in Russian service. It is a medium twin-turbine transport helicopter. There are also armed gunship versions. The improved version of the Mi-8 is the Mi-17 Hip multipurpose helicopter, also known as the Mi-8TMB. It is specifically designed for improved capabilities at high altitudes and in hot weather conditions. The Mi-17 is identifiable from the Mi-8 by the additional air filters on the turbine air intakes, as well as left hand side mounted tail rotor, required by the more powerful TB-3-117A turbo-shaft engines it is fitted with. The Mi-17 can climb at the rate of 8m/s. The maximum and cruise speed of the helicopter are 250km/h and 225 km/h respectively. The range of the helicopter is 465 km and the service ceiling is 6,000m. The aircraft weighs around 7,489 kg and its maximum take-off weight is 13,000kg. The Mi-8/17 have given rise to a bewildering range of versions that fulfill a wide variety of specialized roles. Dedicated combat support variants include airborne reserve command post, electronic counter measures (with onboard jammers), Communications intelligence and command relay. Other versions carry out delivery of fuel to front-line units, photo-reconnaissance, artillery fire-correction, reconnaissance, VIP transport, mine laying and mine clearing.

JRTC VISMOD: OZM-3 Russian Anti-Personnel Mine

Tiers:

System

Emplacement Method: Manual
Diameter: 75
Height: mm120
Weight: kg3.2
Armor Penetration / Kill Mechanism: Bounding fragmentation
Effective Range: mMax: 25 Lethal: 10 Min: 0 Bound height 1.5 to 2.4 m
Detectability/ Composition: Easy/metal
Anti-Handling: Possible / no 2nd fuze well
Fuze Type/Self Neutralize: Tripwire (2 to 5 kg) or cmd detonated (electrical) or pressure / Self-neutralize: no
Explosive Type & Weight/Total Weight (kg): kgTNT: .075 Total: 3
Comment: Not waterproof

Notes:

The OZM-3, OZM-4 and OZM-72 are Soviet manufactured bounding type anti-personnel mines. (fragmentation-barrier mine, in the Russian and other post-Soviet armies as informally called "frog mine" or "witch") They are normally painted olive green, and issued with a spool of tripwires and two green painted wooden or metal stakes for affixing the tripwires. Both OZM-3 and OZM-4 have cast iron fragmenting bodies while the OZM-72 also contains preformed steel fragments, and all three are issued with empty fuze wells, so a variety of fuzing options are possible. The mines can be activated by a variety of fuzes, including electronic fuzes or command initiation, although they are most commonly fitted with an MUV booby trap switch which is activated by a tripwire. On firing, a metal base plate remains in the ground, while the mine body is thrown up by a small lifting charge, but remains attached to a strong wire tether. When the end of the tether is reached at a height of approximately 0.5 m, the main charge explodes and scatters fragments of the casing across a wide area. OZM mine may sometimes be laid directly on top of an MS-3 mine. The MS-3 is an anti-handling device which closely resembles a PMN mine, except that it has a "blister" on top and operates purely as a pressure-release boobytrap. Lifting an OZM mine (without rendering safe the MS-3 placed underneath) will trigger detonation.

JRTC VISMOD: 9A51 Prima Russian 122mm Multiple Rocket Launcher System

Tiers:

Fire Control Systems

Collimator: K-1

Indirect Fire: PG-1M Panoramic Telescope (PANTEL)

Protection

NBC Protection: No

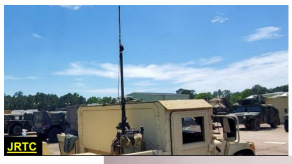
Self-Entrenching Blade: No

Smoke Equipment: No

Notes:

The Prima multiple launch rocket system is an improvement of the BM-21 Grad. It was adopted by the Soviet Army in 1988, however due to budget cuts, only a small number of these artillery systems were ever produced. Some sources claim that it is also in service with Kazakhstan. The Prima MLRS is also referred to as the 9K59, the launching vehicle is 9A51. It has 50 tubes for 122mm rockets. The older Grad has 40 tubes. It can fire all of the rockets developed for the BM-21 Grad, including cluster rockets with anti-tank or anti-personnel sub-munitions. Furthermore, new and more effective rockets have been developed for this system. The new 9M53F rocket with a separable HE-FRAG warhead is standard for this artillery system. The maximum range of fire is 21km. This and other new rockets can also be fired from improved Grad launchers. Rockets can be launched directly from the driver's cab or remotely from the vehicle. A full salvo of the Prima has 7-8 times better coverage and it spends 4-5 times less time in its firing position compared to the Grad.

JRTC VISMOD: DFINT-3T2 Turkish Transportable Direction Finding (DF) System



Tiers:

System

Alternate Designation: DFINT-3T2 communications DF system
Type: Transportable Direction Finding (DF) System
Organization: ASELSAN A.S., Radar, Electronic Warfare and Intelligence Systems Division
In Service: 2000-present
Demodulation: AM, FM (SSB optional)
Frequency Range: MHz20-1,200
DF Accuracy: <1.5 deg RMS
LOB Resolution: deg0.1
Frequency (FFT) Resolution: 500 Hz-160 kHz selectable
Hopper Performance: better than 1,000 hops/s
Scan speed (with DF): better than 1,000 MHz/s
Power Generator Weight: kg8.8
Antenna Weight: kg10.5
Antenna Mast Weight: kg12
System Weight (Total): kg29.6
Dimensions: m6.25
GPS Receiver: External or built in
Power Generator: 220 V AC
Environment: MIL-STD-810E
Operating Temperature Range: -20 to +50°C
Storage Temperature Range: -40 to +70°C
Power Supply: 24 V DC or 110/220 V AC or Both
Monitor: 640mm x 480mm (8 colors)

Notes:

The tri-service DFINT-3T2 system is a transportable direction finding (DF) equipment that can intercept, take a bearing on, and analyse V/UHF band communications traffic. Emitter location is achieved via collaboration with other DFINT systems (with intercommunication being by radio or landline) and, according to the contractor, the equipment can handle state-of-the-art emitter types including frequency hoppers and burst transmitters. The system can be deployed with a standard lightweight, high-gain antenna, sub-band arrays and/or a range of application specific antennas that include disguised low-profile, airborne and heliborne types. In rough terrain land-based applications, the environmentally ruggedised DFINT-3T2 equipment can be deployed by a two-man team and the system presents data in either graphical or list formats.

JRTC VISMOD: BMP-3 Infantry Fighting Vehicle

Tiers:

Variants:

- **BMP-3M:** KBP and Kurganmashzavod have upgraded the vehicle with a new engines and turret with a new ATGM system 9K116-3 Basnya. The upgraded vehicle is called the BMP-3M and the new Bakhcha-U turret which includes a new automatic fire control system with ballistic computer, new SOZH gunner's sight with laser rangefinder and an ATGM guidance channel, thermal imager, TKN-AI commander's vision device with laser illuminator and new ammunition loading system for ATGM.
- **BMP-3M Ataka:** BMP-3M version with a two men turret armed with 30 mm 2A72 autocannon, and 9M120-1 Ataka ATGM
- **BMMP:** Version for naval infantry, fitted with the turret of the BMP-2.
- **BMP-3K:** Tactical command variant, includes additional radio R-173, an intercom for seven users, an AB-R28 independent portable power unit, a navigation device TNA-4-6 and the "Ainet" air burst round detonation system. The BMP-3K lacks the bow machine guns and has its whip antennas mounted on the rear hull. Crew: 3+3
- **BMP-3F:** Armed with the standard 2K23 turret. Specially designed for operations at sea, with improved seaworthiness and buoyancy, capability to move afloat at sea state 3 and fire with the required accuracy at sea state 2. Compared to the basic model, the vehicle design features changes increasing floatability and vehicle stability: the self-entrenching equipment is omitted, a lightweight anti-surge vane and an air intake tube are introduced; the BMP-3F turret is also protected by anti-surge vanes. Water jet propellers develop a speed of 10 km/h when afloat. The BMP-3F design allows the vehicle to come ashore under rough sea conditions and to tow the same-type vehicle. A new main sight, the SOZH, which has an integrated laser range finder and an ATGM guidance channel, is installed. This version can endure continuous amphibious operation for seven hours with the running engine
- **BMP-3F:** Amphibious version based on BMP-3F with the original turret replaced by a smaller remote weapon station with either 7.62, 12.7 or 14.5mm machine gun. It can accommodate a crew commander, driver, gunner, and 14 troops, and can use optional ERA armor.
- **BRM-3K "Rys" (Ob.501):** Surveillance and reconnaissance variant with 1PN71 thermal sight (3.7x/11x, 3 km range), 1PN61 active-pulse night vision device (3 km range), 1RL-133-1 ("TALL MIKE") I-band surveillance radar (3 km man, 12 km vehicle), 1V520 computer and a TNA-4-6 navigation system. The armament consists of the stabilized 30 mm autocannon 2A72 (600 rounds) and a coaxial 7.62 mm machine gun (2,000 rounds) or AU-220M Baikal remote weapon station with 57 mm BM-57 autocannon and 7.62mm PKMT machine gun.
- **BMP-3 Dragoon:** New IFV version with an unmanned turret which can be armed with a variety of combat modules, including standard BMP-3's Bakhcha-U turret with a 2A70 100 mm cannon, a 2A72 30 mm autocannon and a PKTM 7.62 mm machine gun, the AU-220M Baikal remote weapon station module with a 57 mm BM-57 gun and a module with a 125 mm 2A82-1M tank gun, the new 816 h.p.
- **BREM-L "Beglianka" (Ob.691):** Armoured recovery vehicle with five-tonne crane and 20/40 metric tonne capacity winch.
- **BMP-3 Anti-Tank:** A prototype of this BMP-3 variant was completed in 1995. This turretless variant has two launchers for the AT-14 Kornet laser-beam-riding ATGM system, and is capable of feeding six missiles equipped with tandem high-explosive anti-tank (HEAT) warheads to each launcher. A related version is the Kornet self-propelled anti-tank missile complex. This variant provides a ready-round capacity of 16 missiles in two ready-launch drums. It is estimated that the vehicle has capacity for 16 reload missiles. The Kornet ATGM is designed by the KBP Instrument Design Bureau. Integration on the BMP-3 is performed by the Volsk Mechanical Plant in Saratov. Self-propelled anti-tank version with 9M123 Khrizantema (AT-15) ATGM system with radar and laser guidance. The 9P157-2 carries two 9M123 missiles on launch rails, which are extended from a stowed position; the radar is also stowed during transit. The missiles are re-loaded automatically from an internal magazine with 15 rounds (missiles are stored and transported in sealed canisters) and can also accept munitions manually loaded from outside the vehicle. Ref: Military Periscope, April 2016

- **9P163M-1 "Kornet-T":** Anti-tank version with Kornet (AT-14) missile system. Some sources call it the 9P162. The Kornet is similar in function to the Khrizantema missile system. The 9P163M-1 carries two 9M133 missiles on launch rails, which are extended from a stowed position during transit. Missiles are re-loaded automatically by the tank destroyer from an internal magazine with 16 rounds (missiles are stored and transported in sealed canisters).
- **2S18 "Pat-S" (Ob.697):** Self-propelled version of the 152 mm howitzer 2A61 "Pat-B". This was only a prototype, further development led to the 2S31 Vena.
- **DZM "Vostorg-2":** Combat engineer vehicle with a dozer blade and excavating bucket. Prototype.
- **UR-07:** Mine clearing system. The UR-07 might replace the UR-77 "Meteorit". It has the same chassis as the BMP-3 but a bigger steel hull with two launch ramps in the rear. The ramps are used to fire rockets towing hose-type mine-clearing line charges to clear mine fields.
- **UNSh (Ob.699):** Basic chassis for specialised variants.
- **Hermes or TKB-841:** Air-defence vehicle with high-velocity missiles and radar system. Prototype.[68] 2S31 Vena – Self-propelled mortar carrier equipped with a 120 mm mortar based on BMP-3 chassis. It entered production in 1996 and service in 2010.
- **2S38 ZAK-57 Derivatsiya-PVO:** Self-propelled air defense vehicle based on BMP-3 chassis fitted with a 57 mm autocannon and passive reconnaissance and target tracking equipment.[72] It is designed to shoot down unmanned aerial vehicles (UAVs), cruise missiles, air-to-surface missiles, aircraft, helicopters, and MLRS rockets.
- **UDAR UGV:** Unmanned ground vehicle based on the tracked chassis of the BMP-3 with the center hull raised to fit the DUBM-30 Epoch armed with 2A42 autocannon, 7.62mm PKMT machine gun, and Kornet-M ATGM.
- **Prokhod-1:** Unmanned mine-clearing vehicle based on the BMP-3 chassis. It is equipped with the anti-mine TMT-C trawl, and a remote weapon station turret with a 12.7mm machine gun.
- **BMP-3 with Athos Sight:** This variant is fitted with the French SAT Athos thermal imaging system. Known as the Namut, the two-axis stabilized thermal sight is mounted on the left rear of the BMP-3 turret, identical to the sight that is employed on the French Leclerc tank and which was supplied to the United Arab Emirates. The horizontal and vertical sight has magnification of 3x and 10x, with 9x6, 3x2 and 1.5x1 fields of view increasing the vehicle's three turret-mounted weapon ranges. The Namut operates in the 8 to 12 micron wavelength and operates on a 28 V power supply. The U.A.E. fields several BMP-3s with the Athos sight. Ref: Military Periscope, April 2016
- **BMP-3 multiple role chassis:** The Kurgan Machine Construction Plant offers the BMP-3 chassis minus the turret and top and front decking to serve a variety of roles, including air defense, engineering vehicles, artillery, mortar platforms and as command-and-control vehicles. Ref: Military Periscope, April 2016
- **BMP-3 with Wildcat turret:** GLS, a subsidiary of Krauss-Maffei of Germany, designed a prototype BMP-3 chassis fitted with a Wildcat turret. The modular nature of the turret allowed it to be armed with a variety of weapon systems including a 30-mm cannon and a pod of two SA-16/SA-18 missiles. An optical tracking system incorporating a FLIR, laser rangefinder and a Siemens 2D radar has also been tested. The Swedish Ericsson HARD 3-D radar system could also be incorporated onto the turret. The turret was unveiled in 2001. Ref: Military Periscope, April 2016
- **BMP-3 with Mistral SAM:** The SANTAL turret manufactured by Matra Defense of France has been offered for installation onto the BMP-3 chassis. The SANTAL turret comprises six Mistral SAMs in the ready position. Ref: Military Periscope, April 2016

System

Alternative Designation: BMP-3

Manufacturer: Kurganmashzavod

Type: Amphibious Infantry Fighting Vehicle (IFV)

Family: BMP-3

Crew: ea3

Passenger Capacity: ea7

Fighting Module: 2K23 Fighting Module

Dimensions

Length (Hull): m7.14

Width: m3.2

Height: m2.45

Weight, Combat: tons20.6

Ground Pressure: 0.63 kg/cm2

Automotive

Engine Name: UTD-29

Engine Type: 10 cylinder, 4 stroke, v-shaped, water colled diesel

Engine Power: hp500

Cruising Range: km600

Speed, Maximum Road: km/h70

Speed, Average Cross: 45

Speed Maximum Swim: km/h10

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.8

Trench: m2.5

Fording Depth: mAmphibious

Communications

Primary Radio: R-173

Secondary Radio: R-173P

Main Gun

Note: The complete weapon system of the BMP-3 infantry combat vehicle is known as the 2K23 and consists of the 100 mm gun 2A70 with a 30 mm 2A72 automatic cannon (see later in this section) mounted coaxially to the right and a 7.62 mm PKT coaxial machine gun.

↳*System*

Name: 2A70 (100mm) Rifle Gun

Type: mm100

Max Rate of Fire: rds/min8-10

Loader Type: Automatic loader, manual for gun and ATGMs

Maximum Elevation: deg+60

Minimum Elevation: deg-5

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Fire on the Move: Yes

Maximum Aimed Range: INA

Maximum Effective Range (Day): m5,200

Maximum Effective Range (Night): INA

Tactical AA Range: m4,000

Armor Penetration: 25mm of RHA

↳***Ammunition***

Name: 9M117M1 Arkan

Type: Laser beam riding missile

Caliber: mm100

Muzzle Velocity: m/s330

Basic Load: ea40 Total Rounds of any 100mm Russian Projectile

Warhead Type: HEAT

Cartridge: 3UBK23-3 cartridge

Soft Launch: Yes

Motor Type: Rocket

Penetration: 650 mm of rolled homogenous armour (RHA) behind ERA or 750 mm of RHA without ERA and it has a maximum range of 4,000 m

Anti-Tank Guided Missile (ATGM)

↳***System***

Name: 9M117 Bastion (AT-10)

Type: Anti-Tank Guided Missile

Caliber: mm100

Charge Type: Reduced Explosive Charge

Muzzle Velocity: m/s400-500

Length: mm1,048

Weight: kg27

Basic Load: ea8

Rocket Motor: Ignites 1.6 seconds after firing the missile and it burns for 6 seconds

Guidance System: Beam-riding laser guidance.

Steering System: Laser sensor to detect the modulation of the light.

Flight Time (4,000 meters): seconds12

Self Destruct Time: seconds26-41

Telescopic Sight: 1K13 day/night telescopic sight (with integral 1K13BZ laser emitter)

Stabilising Fins: ea4

Searchlight: L4 IR searchlight

Effective Firing Range: m100-4,000

Warhead Type: HEAT

Penetration: mm650-750

Note: The 9M117 Bastion (AT-10) is prone to radio or optical jamming

Coaxial Weapon System

↳*System*

Name: 2A72, 30mm Automatic Cannon

Type: mm30

Max Rate of Fire: rds/min330

Maximum Effective Firing Range (Air Targets): km4

Maximum Effective Firing Range (Ground Targets): km2

Maximum Effective Firing Range (Light Armor Vehicles): km1.5

Loader Type: Dual-belt feed

Maximum Elevation: deg-5

Minimum Elevation: deg+60

Fire on the Move: Yes

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

Firing Modes: Single shot, 10-round burst, or automatic mode.

↳*Ammunition (Option 1)*

Name: 3UBR8

Type: 195 AP rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s1,120

Basic Load: INA

Penetrator Type: Tungsten alloy sub-calibre penetrator

Penetration: Can defeat 28 mm of RHA set at a 60° angle from a range of 1,000 m

Note: A sub-caliber discarding sabot. No tracer. Penetration: 25mm RHA at flat angle of impact, 1500 m range 25mm thick plate at 60 degree impact, 1500 m

↳*Ammunition (Option 2)*

Name: 3UOF8

Type: 305 HE rounds

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s960

Basic Load: eaINA

Lethal Radius: m25.95

Charge Type: A-IX-2

Note: A high-explosive incendiary round with A-670M nose fuze.The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

Commander and Driver's Weapons System

Note: The BMP-3 is equipped with a total of two 7.62mm PKT (Kalashnikov's Machine Gun)

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Caliber: mm7.62

Cartridge: mm7.62×54

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

Manufacturer: Degtyaryov plant

Rate of Fire: rds/min650

Effective Rate of Fire: rds/min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Action: Gas-operated, open bolt

Length (Overall): mm1,203

Length (Barrel): mm605

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m4,000

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

Fire Control

Name: 1K13-2

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Optical sight 1PZ-10, a day/night vision device TKN-3MB

Thermal Sight Gunner: 1K13-2 II night channel, 5.5x

Gunner Day Sights: 1K13-2, 8x ; 1P3-10 antiaircraft, 2.6x; PPD-1 stand-by

Main Gun Stabilization: Yes, 2E52 electro-mechanical stabiliser

Stabilizer Modes: The stabiliser has three modes: automatic; semi-automatic; and guidance.

Ballistic Computer: Yes, V539 ballistic computer

Rangfinder: Laser

Infrared Searchlight: Yes, IR searchlight OU-3GA2

Cross-Wind Sensor: Yes

Minutes Of Angle (MOAs): 1.69

Protection

Armor Type: Welded of aluminum alloy armor

Hull Armor (Front): Protection against 30 mm armor-piercing rounds.

Hull Armor (Sides and Back): Protection is against 14.5 mm armor-piercing rounds.

Turret Armor: mm30-35

Applique Armor: On Turret

Explosive Reactive Armor: Available

Active Protection System: Yes, Arena active protection system

Mine Clearing: Yes, KMT-8 mine plow available

Self-Entrenching Blade: Yes

NBC Protection: Yes, Collective

Smoke Equipment: 6 VEESS

Countermeasures System: Shtora countermeasures systems

Automatic Fire Suppression System: Yes

Notes:

The BMP-3 is one of the most heavily armed infantry combat vehicles in service, fitted with several different weapon systems capable of ranging out to 5.2km. It carries a 3 man crew plus 7 infantrymen, and is capable of firing all weapons on the move with no loss of effectiveness. This makes it crucial asset for the threat. While most variants will have a 30mm auto cannon, reports indicate that a variant with a 100mm rifled gun may be in production. Although Explosive Reactive Armor is available for the BMP-3, the threat will likely not use it in environments / situations where there will be extensive use of dismounted infantry in the area in order to prevent injuring soldiers in the vicinity of the vehicle. The BMP-3 [BMP = Boyevaya Mashina Pyekhota - Infantry Fighting Vehicle], which represents a totally different design concept from BMP-1/2, is a light tank that can hold a squad of infantry. It has a 100mm main gun that fires HE to destroy buildings, can fire long-range ATGMs, a 30mm auto-cannon and a medium machine gun as a single unit in the turret. The innovative BMP-3 armament suite has been subjected to criticism in the Russian military. The performance obtained from the 500 horsepower engine powering this 20.6 ton vehicle compares favorably to the American Bradley, which has an engine of similar power. The BMP-3, first seen in public during a parade in Moscow in 1990, was built by Kurganmashzavod, developer and manufacturer of the BMP-2 infantry combat vehicle.
