Computerized FCS: Yes, Krupp-Atlas EMES-18 FCS

Main Gun Stabilization: Yes

Direct Fire: Yes

Indirect Fire: Yes

Infrared: Yes, Paint reflects IR

Rangefinder: TEM 2A optical (Leopard 1A2) turret fully stabilized (A3, A4); retrofit of earlier AEG-Telefunken FLER-H modular hybrid computer (1A4 Krupp-Atlas)

Thermal Imaging System: Zeiss thermal-imaging system

Protection

Hull Armor: Glacis 70 mm at 60-deg: Hull Glacis top 25 mm at 83-deg: Hull nose 70 mm at 55-deg: Hull sides 25-35 mm: Hull rear 25 mm at 88 deg: Hull top 10 mm: Hull bottom 15 mm

Turret Armor: Turret mantlet 60 mm; Turret sides 60 mm; Turret rear 60 mm; Turret front 52 mm

Applique Armor: Available, The Leopard tank could also be fitted with bolt-on polycarbonate (Lexan) armour panels, which have increased the effectiveness of the armour.

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: No

NBC Protection: Yes, collective

Smoke Equipment: 2 x 4-barrel 3-in (76-mm) smoke generators, one each side of turret

Notes:

The Leopard (or Leopard 1) is a main battle tank designed and produced by Porsche in West Germany that first entered service in 1965. Developed in an era when HEAT warheads were thought to make conventional heavy armour of limited value, the Leopard focused on firepower in the form of the German-built version of the British L7 105-mm gun, and improved cross-country performance that was unmatched by other designs of the era. The design started as a collaborative project during the 1950s between West Germany and France, and later joined by Italy, but the partnership ended shortly after and the final design was ordered by the Bundeswehr, with full-scale production starting in 1965. In total, 6,485 Leopard tanks have been built, of which 4,744 were battle tanks and 1,741 were utility and anti-aircraft variants, not including 80 prototypes and pre-series vehicles. The Leopard quickly became a standard of European forces, and eventually served as the main battle tank in over a dozen countries worldwide, with West Germany, Italy and the Netherlands being the largest operators until their retirement. Since 1990, the Leopard 1 has gradually been relegated to secondary roles in most armies. In the German Army, the Leopard 1 was completely phased out in 2003 by the Leopard 2, while Leopard 1-based vehicles are still widely used in utility roles. The Leopard 2 has replaced the Leopard 1 in service with many other nations as well, with derived vehicles using the Leopard 1 hull still seeing service. Currently, the largest operators are Greece, with 520 vehicles, Turkey, with 397 vehicles and Brazil with 378 vehicles. Most of these vehicles have been upgraded with various improvements to armor, firepower and sensors to maintain their ability to engage modern threats. Leopard 1A5 In 1980, a research program was undertaken to study further improvements to the Leopard 1, providing it with a completely modern fire control system and fully effective night/bad-weather vision system. The decision was made to base the upgrades on the earlier models, which were no longer competitive. The resulting Leopard 1A5 was based on 1,225 vehicles of the Leopard 1A1A1 model. The turrets were again modified for the 1A5, both in order to store all of the new equipment, as well as to move more of the ammunition into the rear of the turret, as opposed to the left side of the driver where it had previously been stored. The new turret was also able to mount the newer 120 mm gun from the Leopard 2 if desired, although this option has not been used. After trials, the Krupp-Atlas Elektronik EMES 18 fire control system, which was developed from the EMES 15 used on the Leopard 2, was selected in December 1983. The EMES 18 included two new sights on the top of the turret, and no longer required the "bumps" as did the earlier optical systems. A crucial part of the upgrade was the introduction of more effective ammunition, including new APFSDS rounds. The Leopard tank could also be fitted with bolt-on polycarbonate (Lexan) armour panels, which have increased the effectiveness of the armor. The first modified vehicle was delivered in early 1987. Since then, almost all users of the Leopard 1 have also applied similar changes to their own vehicles, and in most ways the 1A5 be considered the "standard" Leopard 1 today. In the Netherlands, an improved version equivalent to the A5 called "Leopard 1 Verbeterd" (improved) was developed, the same version is used by the Chilean Army.

Leopard 1A4 German Main Battle Tank (MBT)

Tiers:

Variants:

- **Leopard 1:** The Leopard project started in November 1956 in order to develop a modern tank, the Standard-Panzer, to replace the Bundeswehr's American-built M47 and M48 Patton tanks, which, though just delivered to West Germany's recently reconstituted army, were rapidly becoming outdated. On 25 July 1957, the detailed specifications were released; the new design needed to weigh no more than 30 tonnes, have a power-to-weight ratio of 30 horsepower per tonne, be able to withstand hits by 20 mm rapid-fire guns on every side as well as to operate in a battlefield contaminated with chemical weapons or radioactive fallout, the then-standard baseline for combat with the Warsaw Pact. In addition, the main armament had to consist of a 105 mm caliber weapon (the new British L7A3 105 mm gun was selected), carrying at least as many rounds as current US tank designs. Mobility had priority, while firepower came second; armour was seen as less essential, as it was believed that no real protection against hollow charge weapons was possible anyway.
- **Leopard 1A1:** After the first batch was delivered, the next three batches were the Leopard 1A1 model, which included a new gun stabilization system from Cadillac Gage that allowed the tank to fire effectively on the move. The 1A1 also added the now-famous "skirts" along the sides to protect the upper tracks, and a new thermal jacket on the gun barrel to control heating. A less important change was to use rectangular rubber blocks fastened to the treads with a single pin instead of the earlier two-pin "shaped" versions. The rubber blocks could be easily replaced with metal X-shaped crampons for movement on ice and snow in the winter.
- **Leopard 1A2:** The first 232 tanks of the fifth production batch were delivered as the Leopard 1A2 between 1972 and 1974. The A2 included a heavier and better armoured turret, and therefore did not receive the B&V armour add-ons as did the earlier machines. However, they did receive the other upgrades; the Leopard 1A2A1 received the PZB 200, the Leopard 1A2A2 received digital radios, and the Leopard 1A2A3 got both.
- **Leopard 1A3:** The next 110 vehicles in the fifth batch were fitted with a new welded turret, which was equipped with a new armor consisting of two spaced steel plates with a plastic filling between them (high-hardness armor, and a wedge-shaped gun mantlet, creating the Leopard 1A3. Although the level of armor area density was equivalent to the A2's new welded version, the internal volume was increased by 1.2 m^3 and the effective protection level was increased by half. The improved TRP 2A independent sight was installed for the commander. Upgrades were identical to the 1A2 models, the Leopard 1A3A1 with the night sights, Leopard 1A3A2 with the new radios, and the Leopard 1A3A3 with both.
- **Leopard 1A4:** The Leopard 1A4 formed the sixth batch of 250 vehicles, delivery starting in 1974. The 1A4 was externally similar to the 1A3, but included a new computerized fire control system and the new EMES 12A1 sighting system to aim it. In addition, the commander was provided with his own independent night sighting system, the PERI R12. The new equipment used up space and the ammunition load was reduced to 55 rounds, of which 42 were stored in the magazine to the left of the driver.
- **Leopard 1A5:** In 1980, a research program was undertaken to study further improvements to the Leopard 1, providing it with a completely modern fire control system and fully effective night/bad-weather vision system. The decision was made to base the upgrades on the earlier models, which were no longer competitive. The resulting Leopard 1A5 was based on 1,225 vehicles of the Leopard 1A1A1 model. The turrets were again modified for the 1A5, both in order to store all of the new equipment, as well as to move more of the ammunition into the rear of the turret, as opposed to the left side of the driver where it had previously been stored. The new turret was also able to mount the newer 120 mm gun from the Leopard 2 if desired, although this option has not been used. After trials, the Krupp-Atlas Elektronik EMES 18 fire control system, which was developed from the EMES 15 used on the Leopard 2, was selected in December 1983. The EMES 18 included two new sights on the top of the turret, and no longer required the "bumps" as did the earlier optical systems. A crucial part of the upgrade was the introduction of more effective ammunition, including new APFSDS rounds. The Leopard tank could also be fitted with bolt-on polycarbonate (Lexan) armour panels, which have increased the effectiveness of the armour. The first modified vehicle was delivered in early 1987. Since then, almost all users of

the Leopard 1 have also applied similar changes to their own vehicles, and in most ways the 1A5 be considered the "standard" Leopard 1 today. In the Netherlands, an improved version equivalent to the A5 called "Leopard 1 Verbeterd" (improved) was developed, the same version is used by the Chilean Army.
- **Leopard 1A6:** The Leopard 1A6 prototype was a single Leopard 1 A1A1 testbed, modified with additional armour on the turret and equipped with a 120 mm L/44 gun. The project was ended in 1987, as the Leopard 2 was in widespread service at this point and the 1A5 offered a more reasonable upgrade path for a fraction of the cost.

System

Alternative Designation: Leopard 1A4

Type: Main Battle Tank

Manufacturer: Krauss-Maffei Wegmann, Munich, Germany Krupp-MaK, Kiel, Germany

Crew: 4 (commander, gunner, loader, driver)

Dimensions

Length, Hull: 7.09 m

Length, Gun Forward: 9.54 m

Width: 3.37 m

Height: INA

Tracks Length, on the Ground: 4.24 m

Tracks Width: 0.55 m

Ground Clearance: 0.44 m

Weight, Unloaded: 40,400 kg

Weight, Combat: 42,400 kg

Ground Pressure: 0.88 kg/cm sq

Automotive

Engine Name: MTU MB 838 Ca M500

Engine Type: 2,282-cu in (37.4-liter) liquid-cooled, 4-stroke, prechamber, inter cooled, turbocharged V-10 multi-fuel

Engine Power: 830 hp at 2,200 rpm

Fuel Capacity: 955 liters

Transmission: ZF 4 HP 250 planetary shifter with hydraulic torque converter; 4 forward/2 reverse gears

Power-to-Weight Ratio: 19.58 hp/metric ton

Suspension: torsion bar, 7 road wheels, rear drive (12- tooth sprocket), front idler, 5 shock absorbs (bump travel 9 in/227 mm, rebound travel 5-6 in/128-156 mm), 4 return rollers

Maximum Speed: 62 km/h

Range, Road: 600 km

Range, Cross-Country: 450 km

Vertical Obstacle: 1.15 m

Trench: 3.00 m

Fording, Unprepared: 1.20 m

Fording, with Preparation: 2.25 m

Fording, with Snorkel: 4.00 m

Gradient: 60 percent

Side Slope: 30 percent

Main Weapon System

↳*System*

Name: 1 x Royal Ordnance L7A3 Rifled Gun

Type: Rifled Gun

Caliber: 105 mm

Length, Barrel: 5.46 m

Muzzle Velocity: INA

Weight: 1,282 kg

Maximum Rate of Fire: 10 rounds per minute (maximum)

Elevation: -9/+20 deg

Traverse: 360 deg

Maximum Firing Range: 4000 m

↳*Ammunition*

Name: L22

Type: Projectile

Caliber: mm105

Basic Load: 60 rounds, 18 ready in turret (Leopard 1A1)

Armor Penetration: INA, Tungsten carbide

Coaxial Weapon System

↳*System*

Name: Heckler & Koch MG5

Type: General Purpose Machine Gun

Caliber: mm7.62

Manufacturer: Heckler & Koch

Length: 1,160 mm

Barrel Length: 550 mm

Height: 239 mm

Width: 120 mm

Weight: 11.20 kg

Action: Gas-operated, rotating bolt

Rate of Fire: 640/720/800 rounds/min

Muzzle Velocity: 840 m/s

Maximum Firing Range: 600–1,000 m

Effective Firing Range: 100–1,000 m

Feed System: Disintegrating DM60/M13 belt in 50-round Gurttrommel or 120-round in separate belt box or from stand-alone ammunition boxes

Sights: Diopter sight or optical sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Basic Load: 1,250 rounds

Armor Penetration: INA

Auxiliary Weapon System

Note: 1 x 7.62-mm air defense machine gun

Fire Control System

Name: FLP-10/EMES 18 integrated fire control

Computerized FCS: Yes, FLP-10/EMES 18 integrated fire control system with Zeiss thermal imaging system retrofitted to approximately 1,300 German Leopard 1A1/1A2s

Main Gun Stabilization: Yes

Direct Fire: Yes

Indirect Fire: Yes

Infrared: Yes, Paint reflects IR

Rangefinder: TEM 2A optical (Leopard 1A2) turret fully stabilized (A3, A4); retrofit of earlier AEG-Telefunken FLER-H modular hybrid computer (1A4 Krupp-Atlas)

Protection

Hull Armor: Glacis 70 mm at 60-deg: Hull Glacis top 25 mm at 83-deg: Hull nose 70 mm at 55-deg: Hull sides 25-35 mm: Hull rear 25 mm at 88 deg: Hull top 10 mm: Hull bottom 15 mm

Turret Armor: Turret mantlet 60 mm; Turret sides 60 mm; Turret rear 60 mm; Turret front 52 mm

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: No

NBC Protection: Yes, collective

Smoke Equipment: 2 x 4-barrel 3-in (76-mm) smoke generators, one each side of turret

Main Weapon System

Note:

↳*System*

Name: 2A46M-5 Smoothbore Gun

Caliber: 125mm

Barrel Length: 6000 mm

Weight: 2400 kg

Elevation: -6 to + 14 degrees

Traverse: 360 degrees

Fume Extractor: Yes

Thermal Sleeve: Yes

Muzzle Reference System: Yes

Muzzle Velocity: APDS: 1715-1800 m/s HEAT: 905-950 m/s HE: 760 m/s

Maximum Effective Range: INA

Effective Firing Range: APDS / HEAT: 3000 m HE: 4000 m ATGM: 5000 m

↳*Ammunition*

Type: Projectile

Caliber: mm125

Shell: INA

Basic Load: 40 Rounds, A total of 22 125-mm ready rounds are carried, with another 18 rounds carried in reserve.

Types of Ammunition: APDS, HEAT, HE:

Anti-Tank Guided Missile

↳*System*

Name: 9M119 Svir/Refleks (AT-11 Sniper)

Type: Anti-Tank Guided Missile
Launch Platform: 125 mm smoothbore guns
Length: INA
Diameter: 125 mm
Weight: 17.2 kg
Warhead: Tandem hollow-charge
Warhead Weight: 4.5 kg
Operational Range: 5,000 m
Maximum Speed: Subsonic
Guidance System: Laser beam riding

Coaxial Weapon System

↳*System*

Name: PKTM 7.62mm Machine Gun
Type: mm7.62
Length: 1,192 mm
Barrel Length: 605 mm
Weight: 7.5 kg (16.53 lb) (gun + integral bipod) + 4.5 kg (9.92 lb) (tripod).
Action: Gas-operated, open bolt
Rate of Fire: 650 rounds/min
Muzzle Velocity: 825 m/s
Maximum Firing Range: 3,800 m
Effective Firing Range: 1,000 m
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×54mmR
Basic Load: 2,800 Rounds

Fire Control

Name: INA
Computerized FCS: The T-90MS is equipped with a computerized fire-control system that can be used to engage static and mobile targets while the tank is in motion with a high first-round hit probability under most weather conditions.
Thermal Sight Tank Commander: separate stabilized panoramic sight,

Thermal Sight Gunner: PNM Sosna-U gunner display

Main Gun Stabilization: Yes

Satellite Navigation System: Yes

Inertial Navigation: Yes

Ballistic Computer: Yes

Meteorological Sensor: Yes

Automatic Target Tracker: Yes

Laser Rangefinder: Yes

Hunter-Killer Engaement: Yes

TV Camera: Yes

Thermal Sight: Yes, with a Laser Rangefinder

Missile Guidance System: Yes, the Reflects Missile Guidance Sighting System

Protection

Hull Armor: The rear of the hull and turret is provided with slat armor to protect against rocket-propelled grenades. Spall liners are fitted in the crew compartment.

Turret Armor: The rear of the hull and turret is provided with slat armor to protect against rocket-propelled grenades. Spall liners are fitted in the crew compartment.

Applique Armor: Available

Explosive Reactive Armor: Yes, Relikt explosive reactive armor (ERA) in place of the previous Kontakt-5.

Active Protection System: Yes, There is an active protection system that includes a number of coarse and fine laser detectors positioned to cover 360 degrees.

Mine Clearing: INA

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: The turret can also be automatically slewed in the direction of the threat to launch 81-mm smoke grenades.

Notes:

The T-90MS is the next step in the development of the Russian-made main battle tank T-90. The new T-90MS was presented for the first time to the public during the defence exhibition Russian Expo arms in September 2011. This new tank is a complete modernization of the T-90 by touching all the characteristics of the basic variant to increase its operational capabilities in combat and against modern threats of the battlefield. The weight of the T-90MS has increased of 1,500 kg, compared to the basic model of the T-90 to reach 48 tons, but it remains significantly lower compared to the German main battle tank Leopard 2A6 and the American M1A2 Abrams. On April 2019, India’s Cabinet Committee on Security (CCS) has approved the INR134.48 billion (USD 1.93 billion) procurement of 464 Russian-made T-90MS main battle tanks (MBTs) for the Indian Army (IA), the New Delhi Times reports. According to a news released on November 8, 2019, to the official website of the "Times of India", the Indian Ministry of defense has signed a contract with with the Heavy Vehicles Factory at Avadi in Chennai to produce 469 Russian T-90 Main Battle Tanks (MBTs), that could be the MS version of the T-90 family.

T-80U Russian Main Battle Tank (MBT)

Tiers:

1 2 3 4

Parent:

T-80B Russian Main Battle Tank (MBT)

Variants:

- **T-80 (1976):** Initial model, with 1,000-hp gas turbine engine, coincidence rangefinder, and no missile capability. This model does not have fittings for explosive reactive armour. The turret is from the T-64A, and thus retains the use of the old coincidence rangefinder. Characteristics of this type are the V shaped water deflector on the front glacis, coincidence rangefinder in front of the commander's cupola, and Luna searchlight mounted in the same position as a T-64. Around 250 were produced, as the tank's armour was essentially obsolete when introduced. Turret vs APFSDS – 380 mm, hull vs APFSDS – 500 mm (without reactive armour). This was, in effect, a pre-production model. It reportedly was fitted with an early version of the Shtora APS.
- **T-80B (1978):** This model had a new turret, laser rangefinder, fire-control, and autoloader allowing the firing of 9M112-1 Kobra antitank guided missile (80% hit probability while stopped and on the move), and improved composite armour. An improved, 1,100-hp, engine was added in 1980, a new gun in 1982, and fittings for reactive armour in 1985. Reactive armour added protection of 400 mm equivalent armour to defend against HEAT warheads. The longest sighting range for T-80B kinetic energy ammunition and for "cumulative" ammunition – 4,000 m, high-explosive fragmentation – 5,000 m (using the "side level" – 10,000 m). A night sight TPNZ-49 in active mode reached 1,300 and a passive – 850 m. "Reflex" guided missile complex with laser beam allowed it to launch missiles at any tank speed
- **T-80BV (1985):** T-80B with explosive reactive armour Kontakt-1
- **T-80UM::** Russian version, with new Buran thermal imaging sight in place of the Luna IR.
- **Object 219A: Early T-80U (Object 219AS) variant:** It has the T-80U's turret, but not the Kontakt-5 ERA. Instead, it uses the old Kontakt-1/3 system; some 219As did not have ERA at all. Often misnamed T-80A. T-80U (1985): Further development with a better turret, Kontakt-5 explosive reactive armour, improved gunsight, and 9M119 Svir missile system. In 1990 a new, 1,250-hp, engine was installed. Overall protection with Kontakt-5 against APFSDS/HEAT is 780/1,320 mm RHAe.9K119M with antitank guided missile 9M119M installed since 1990. Some of the tanks in commander version (T-80UK) equipped with Shtora-1 APS, and thermal imaging night sight TO1-PO2T (detection range / target classification range = 6,400/4,600 meters at night). Basic thermal night sight of the T-80U is within the limits of 1,750/1,500 meters
- **T-80UD Bereza (1987):** Ukrainian diesel version with 1,000-hp 6TD engine and remote-controlled antiaircraft machine gun
- **T-84 (1999):** Further Ukrainian development of T-80UD with 1,200-hp diesel and new welded turret
- **T-80BVD (2002)::** KMDB's upgrade standard for Ukrainian T-80BVs. Changes include the 6TD diesel engine, remote-controlled commander's machine gun, and better optics. None were produced.
- **T-80UM2/Black Eagle (prototype: cancelled)::** Several Russian prototypes were shown at trade shows, with a longer chassis and extra pair of road wheels, and very a large turret with separate ammunition compartment
- **T-80BVM (2017):** up to 3,000 units, installed "Relikt" ERA, PNM Sosna-U gunner sight (as in the T-90, T-72B3), the improved 125mm gun 2A46M-4, the upgraded gas turbine engine and the upgrades of various other systems. More than 120 already in the service.
- **T-80B (1978):** This model had a new turret, laser rangefinder, fire-control, and autoloader allowing the firing of 9M112-1 Kobra antitank guided missile (80% hit probability while stopped and on the move), and improved composite armour. An improved, 1,100-hp, engine was added in 1980, a new gun in 1982, and fittings for reactive armour in 1985. Reactive armour added protection of 400 mm equivalent armour to defend against HEAT warheads. The longest

sighting range for T-80B kinetic energy ammunition and for "cumulative" ammunition – 4,000 m, high-explosive fragmentation – 5,000 m (using the "side level" – 10,000 m). A night sight TPNZ-49 in active mode reached 1,300 and a passive – 850 m. "Reflex" guided missile complex with laser beam allowed it to launch missiles at any tank speed

Dimensions (WHD): mm307 x 335 x 206

Net Weight: kg27.7

Note: Receiver for mobile purposes, 1.5 - 18 MHz in four ranges, AM/CW (BFO), 200 kHz xtal calibrator. Set compartment (CY-615/URR) consists of two chassis: model R-174/GRR-5 receiver and model PP-308/URR power supply plus speaker unit. Tubes only one times listed.

Main Gun

↳*System*

Name: L48 2A46M-1 Smoothbore Cannon

Type: 125 mm smoothbore Gun

Manufacturer: Spetstekhnika Design Bureau

Max Rate of Fire: rds/min6-8

Maximum Range: m4,000

Manually Load Time: rds/min1-2

Maximum Elevation: deg+14

Minimum Elevation: deg-5

Traverse Range: deg360

Autoloader: Yes, Carousel-Type Autoloader

Fire on the Move: Yes, Main Gun

Evacuator Type: Central Bore

Thermal Sleeve: Yes

Barrel effective Full Life Charge: rds800

Breech Mechanism: Semi-automatic horizontal sliding breech block

Mazimum Pressure: bar5,100

Loading System: Korzina electric and hydraulic automatic loading system

Carousel Reloading Time: minutes13-15

Muzzle Bead: Yes

Barrel Type: Quick Change

Note: The L48 2A46M-1 It has been extensively developed into 10 different variations and remains the primary armament of Russian frontline tanks.

↳*Ammunition (Option 1)*

Type: High Explosives (HE)

Caliber: mm125

Muzzle Velocity: m/s850

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Maximum Effective Range: m5,000

Armor Penetration: INA

Max Dispersion: mrad0.23

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 2)*

Name: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Type: Smoothbore 125mm Projectile

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Effective Range: m2,000-3,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Weight: kg11

Projectile Dimesnion: mm900

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Effective Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Name: 9M119 Svir, 9M119M Refleks(NATO designation AT-11 Sniper-B)

Type: Laser Beam Anti-Tank Guided Missiles

Caliber: mm125

Manufacturer: Degtyarev plant

In Service: 1980's to present

Proliferation: Widely Proliferated

Operational Range: m4,000-5,000

Weight: kg17.2

Diameter: mm125

Basic Load: ea6

Warhead Type: Tandem hollow-charge

Warhead Weight: kg4.5

Speed: Subsonic

Guidance System: 9S516 guidance system

Launch Platform: 125 mm smoothbore guns

Armor Penetration: 700mmm of homogeneous armour

Time to meet Maximum Range: sec17.6

Control Unit: 9S517 automatic control unit

Voltage Regulator: 9S831 voltage regulator.

Variants: 9M119M

Coaxial Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: 12.7mm Anti-Aircraft Machine Gun

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Weight (Gun Only): kg25

Muzzle Velocity: m/s845

Max Rate of Fire: rds/min700-800

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Length (Total): mm1,560

Action: Gas Operated

Feed System: 50-Round Belt

Sights: Iron Sights

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: 12.7×108mm

Muzzle Velocity: m/s845

Basic Load: ea500

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Loader's Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)
Type: 7.62mm Machine Gun
Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
Manufacturer: Degtyaryov plant
In Service: 1961-present
Proliferation: 1 Million +
Max Rate of Fire: rds/min650
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length (Total): mm1,203
Length (Barrel): mm605
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×54mmR
Muzzle Velocity: m/s825
Basic Load: ea1,250
Effective Range (Iron Sights): m1,000
Effective Range (With Sight Adjustments): m100-1,500

Fire Control

Name: 1A45 Irtysh, Updated FCS system over the T-80B
Computerized FCS: Yes
Thermal Sight Tank Commander: Yes, day and night, vertical plane PNK-4S (Agat) day/night sight
Commander Day Mode Sight: 10^0 FOV and ×5 magnification
Thermal Sight Gunner: Yes, stabilised T01-K01R Buran-PA night sight.
Main Gun Stabilization: Yes, 2E26M electro-hydraulic dual plane stabilisation system
Main Gun Stabilization Deployment Time: minutes2
Range, Day Sight: m1,000
Range, Thermal Sight: m2,600

IR Searchlight: Yes, L-4A "Luna" IR Searchlight
TNPO-160 Periscopes: ea2
TNPA-65 Periscopes: ea2
Ballistic Computer: 1V528-1 Ballistic Computer
Wind Sensor: DVE-BS wind sensor
Laser Rangefinder: Yes
FCS Fire Gating Capability: YEs
Fire Control Complex: 1A45 fire-control complex,

Protection

Hull Armor: mm440–450
Armor Type: The T-80B is protected by a third iteration Soviet laminate armour that is known as Combination K
Turret Type: Objekt 476
Turret Armor: Renovated ceramic system, Protection equivalent to 550mm
Applique Armor: Yes, Hull side; track skirts
Explosive Reactive Armor: Yes, Kontakt-5 System. Built in ERA system. Upgrade from the T-80B.
Active Protection System: Arena Available
Mine Clearing: Roller-plow available
Self-Entrenching Blade: Yes
NBC Protection: Yes, ZETS-11-2 detection system collective overpressure system
Smoke Equipment: Yes, two banks of four 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade
Smoke Grenade Range: m250-300
Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade.
IR Signature: The exhaust is box-shaped and designed to direct heat away from the tank
Anti-Radiation Material: Installed as a inside protective layer
Personal Breathing Apparatus: Equipment
Automatic Fire Extinguisher System: Yes
Radiation and Chemical Detector: PRKhR, Model GO-27, radiation and chemical agent detector system

Notes:

The T-80U main battle tank is a further development of the original T-80, which was produced only in small numbers. T-80U (1985): Further development with a better turret, Kontakt-5 explosive reactive armour, improved gunsight, and 9M119 Svir missile system. In 1990 a new, 1,250-hp, engine was installed. Overall protection with Kontakt-5 against APFSDS/HEAT is 780/1,320 mm RHAe.[8] 9K119M with antitank guided missile 9M119M installed since 1990. Some of the tanks in commander version (T-80UK) equipped with Shtora-1 APS, and thermal imaging night sight TO1-PO2T (detection range / target classification range = 6,400/4,600 meters at night). Basic thermal night sight of the T-80U is within the limits of 1,750/1,500 meters

Leopard 2 German Main Battle Tank (MBT)

Tiers:

Variants:

- **Leopard 2A1:** Minor modifications and the installation of the gunner's thermal sight[1] were worked into the second batch of 450 vehicles Leopard 2, designated the A1. Krauss-Maffei built 248 (Chassis Nr. 10211 to 10458) and Mak built 202 (Chassis Nr. 20173 to 20347). Deliveries of the 2A1 models started in March 1982 and ended in November 1983. The two most notable changes were the modification of the ammunition racks to be identical to those in the M1A1 Abrams, and redesigned fuel filters that reduced refuelling time. A third batch of 300 Leopard 2, 165 by Krauss-Maffei (Chassis Nr. 10459 to 10623) and 135 by MaK (Chassis Nr. 20375 to 20509.), was built between November 1983 and November 1984. This batch included more minor changes that were later retrofitted to the earlier 2A1s
- **Leopard 2A2:** This designation was given to upgraded vehicles of the first batch of Leopard 2s, brought up to the standard of the second and third batches. This modernisation gradually replaced the original PZB 200 sights in the first batch with thermal sights for the EMES 15 as they became available. Furthermore, the upgrade included the fitting of filler openings and caps to the forward hull fuel tanks to allow separate refuelling, as well as the addition of a deflector plate for the periscope and a large coverplate to protect the existing NBC protection system. Finally, the tank was given new five metre towing cables with a different position. The programme began in 1984 and ended in 1987; the third, fourth and fifth batches, which were produced during this period, had the same features. The modernised first batch can be recognised by the circular plate covering the hole where the cross-wind sensor for the fire-control system was removed
- **Leopard 2A3:** The fourth batch of 300 vehicles, 165 by Krauss-Maffei (Chassis Nr. 10624 to 10788) and 135 by Mak (Chassis Nr. 20510 to 20644), was delivered between December 1984 and December 1985. The main change was the addition of the SEM80/90 digital radio sets (also being fitted to the Leopard 1 at the same time), and the ammunition reloading hatches being welded shut. Even with these minor changes the new batch was known as the 2A3
- **Leopard 2A4:** The most widespread version of the Leopard 2 family, the 2A4 models included more substantial changes, including an automated fire and explosion suppression system, an all-digital fire control system able to handle new ammunition types, and an improved turret with flat titanium/tungsten armour. The Leopard 2s were manufactured in eight batches between 1985 and 1992. All the older models were upgraded to 2A4 standard. Until 1994, Germany operated a total of 2,125 2A4s (695 newly built and the rest modified older versions), while the Netherlands had an additional 445 tanks. The 2A4 was also license manufactured in Switzerland as the Panzer 87 "Leopard" or Pz 87. This version included Swiss-built 7.5 mm MG 87 machine guns and communications equipment, and featured improved NBC protection system. Switzerland operated 380 Pz 87 tanks.
- **Leopard 2 Marksman:** Finland has modernised its Marksman SPAAG vehicles by replacing the original T-55AM chassis with a newer Leopard 2A4 chassis. The upgraded Marksman vehicles were scheduled to enter service with the Finnish Army in 2016. The new Leopard 2 chassis greatly improves mobility compared to the older T-55AM chassis, both on- and off-road. The Leopard 2 chassis is also larger, thus providing a more stable firing platform for the Marksman turret to operate from

- **Leopard 2A5:** "Leopard 2 Improved" was a prototype-series for enhancing the A4, introducing a wedge-shaped, spaced add-on armour to the turret front and the frontal area of the sides. These spaced armour modules defeat a hollow charge prior to reaching the base armour, and causes kinetic-energy penetrators to change direction, eroding them in the process; it does not form a shot-trap, since it does not deflect the penetrators outwards to hit the hull or turret ring. The gun mantlet was redesigned to accept the new armour.
- **Stridsvagn 122:** The Stridsvagn 122 is a Swedish Army tank based on the Leopard 2 Improved, with 120 units built, 91 of which were licence-produced in Sweden. The tank features increased armour on the turret top and front hull, and improved command, control and fire control systems. Externally, it can be distinguished from the Leopard 2A5 by the French GALIX smoke dispensers, different storage bins, and the much thicker crew hatches The Strv 122B, a variant equipped with modular AMAP composite armour from IBD Deisenroth, has increased 360° protection against threats like EFPs, RPGs and IEDs. The width of 4 metres (13 ft) has been kept, while the weight increases by only 350 kilograms (770 lb)
- **Leopard 2-140:** n the early 1990s,[citation needed] Rheinmetall began development of a 140 mm smoothbore cannon for use in future tank designs. The new gun was intended to counter new Soviet tank developments, especially since the next generation of Soviet main battle tanks were rumoured to be armed with a 135 mm or 152 mm cannon. The new 140 mm cannon was part of a modernisation programme for the Leopard 2 known as the KWS III. Test firing of the new 140 mm cannon was conducted. Results showed that the gun had high penetration values, and had a muzzle velocity of around 2000 metres a second, with potential to be increased further. However, the 140 mm rounds were too heavy for the tank crew to handle effectively
- **Leopard 2A6:** The Leopard 2A6 includes the addition of the Rheinmetall 120 mm L/55 smoothbore gun and other changes. All German tank battalions of the "crisis intervention forces" are equipped with the A6. Canada purchased 20 Leopard 2A6s from the Netherlands. These were delivered in 2007. Portugal also purchased 37 Leopard 2A6 from the Dutch in 2007, with delivery in 2008. In January 2014, Finland purchased 100 L2A6s, as well as munitions, simulators, and a ten-year supply of reserve parts from the Netherlands. The tanks are being delivered in batches between 2015-2019.
- **Leopard 2E:** he Leopard 2E is a derivative of the 2A6, with greater armour protection, developed under a programme of co-production between the defence industries of Spain and Germany. The programme was developed within the frame of collaboration decided in 1995 between the Defence Ministries of both countries, in which also was included the cession of use by a period of five years of 108 Leopard 2A4 from the German Army to the Spanish Army. However, this cession was extended up to 2016, and after that those tanks will be the sole property of the Spanish Army, as has been made public on 24 January 2006, then having been paid a total of 15,124,014 euros in ten yearly installments, giving the Spanish co-ownership from 2006.
- **Leopard 2 PSO:** The new Leopard 2 PSO (Peace Support Operations) variant is designed specially for urban warfare, which had been encountered in peacekeeping operations with increasing frequency. Therefore, the Leopard 2 PSO is equipped with more effective all-around protection, a secondary weapons station, improved reconnaissance ability, a bulldozer blade, a shorter gun barrel (for manoeuvring on urban streets at the expense of fire range), non-lethal armament, close-range surveillance ability (through camera systems), a searchlight and further changes to improve its perseverance and mobility in a built-up non-wide open area. These features are similar to the Tank Urban Survival Kit for the American M1A2 Abrams
- **Leopard 2A7:** The Leopard 2A7 is fundamentally different from the KMW variant 2A7+ and is not optimised for combat in urban terrain. A total of 20 vehicles are provided for converting. It involves former Dutch A6NL models returned by Canada to Germany. The original upgrade to A6M has been extended in coordination with Canada and includes a crew-compartment cooling-system from the Leopard 2 A6M-HEL series, a new 20 kW auxiliary power unit based on the Steyr Motors M12 TCA UI engine, the Saab Barracuda Mobile Camouflage System (MCS) with Heat-Transfer Reduction (HTR CoolCam) system, a field trial proven combat management and information system (IFIS: Integriertes Führungs- und Informationssystem), onboard network optimization with ultracapacitors in the chassis and turret, a SOTAS IP digital intercom system, a renewal of the fire suppression system in the crew compartment, and the retrofitting of Attica thermal imaging module in the commander optics. The weapon system is adapted for firing HE ammunition. It is also fitted for, but not with, additional passive side protection armour. The first Leopard 2A7 was handed over to the German Army in Munich on 10 December 2014. A total of 14 vehicles were produced for Tank Battalion 203, plus four more going to the Armoured Corps Training Centre and one vehicle at the Technical School for Land Systems and School for Technology of the Army. The last tank remains as a reference vehicle at KMW
- **Leopard 2A7+:** The Leopard 2A7+ was first shown to the public during the Eurosatory 2010, featuring the label "Developed by KMW – tested and qualified by German MoD". The Leopard 2A7+ has been tested by the Bundeswehr under the name UrbOp (urban operations).The Leopard 2A7+ is designed to operate both in low intensity and high intensity conflicts.

System

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: grenlaunch 8x2 at turret

IR Signature: INA

Fire Suppression System: Yes, Automatic

Notes:

The Leopard 2 is a main battle tank developed by Krauss-Maffei in the 1970s for the West German Army. The tank first entered service in 1979 and succeeded the earlier Leopard 1 as the main battle tank of the German Army. It is armed with a 120 mm smooth bore cannon, and is powered by a V-12 twin-turbo diesel engine. Various versions have served in the armed forces of Germany and 12 other European countries, as well as several non-European nations, including Canada, Chile, Indonesia, Singapore, and Turkey. The Leopard 2 was used in Kosovo with the German Army, and has seen action in Afghanistan with the Dutch, Danish and Canadian contributions to the International Security Assistance Force, as well as seeing action in Syria with the Turkish Armed Forces against ISIS and the YPG. There are two main development batches of the tank: the original models up to Leopard 2A4, which have vertically faced turret Armour, and the improved batch, namely the Leopard 2A5 and newer versions, which have angled arrow-shaped turret applique Armour together with other improvements. All models feature digital fire control systems with laser rangefinders, a fully stabilized main gun and coaxial machine gun, and advanced night vision and sighting equipment (first vehicles used a low-light level TV system or LLLTV; thermal imaging was introduced later on). The tank has the ability to engage moving targets while moving over rough terrain. Even as the Leopard 1 was just entering service, the German military was interested in producing an improved tank in the next decade. This resulted in the start of the MBT-70 development in cooperation with the United States beginning in 1963.[6] However already in 1967 it became questionable whether the MBT-70 would enter service at any time in the foreseeable future. Therefore, the German government issued the order to research future upgrade options of the Leopard 1 to the German company Porsche in 1967. This study was named vergoldeter Leopard (Gilded Leopard) and focused on incorporating advanced technology into the Leopard design. The projected upgrades added an auto loader, a coaxial auto cannon and an independent commander's periscope.[8] The anti-air machine gun could be operated from inside the vehicle and a TV surveillance camera was mounted on an extendable mast. The shape of the turret and hull was optimized using cast steel armor, while the suspension, transmission and the engine exhaust vents were improved. Following the end of the Gilded Leopard study in 1967, the West-German government decided to focus on the Experimental (experimental development) in a feasibility study and to develop new components for upgrading the Leopard 1 and for use on a future main battle tank program. At first 25 million DM were invested, but after the industry came to the conclusion that with such a low budget the development of the two projected test beds was not possible, a total of 30 to 32 million DM was invested. The experimental development was contracted to the company Krauss-Maffei, but with the obligation

to cooperate with Porsche for the development of the chassis and with Wegmann for the development of the turret. Two prototypes with differing components were built with the aim to improve the conception of the Leopard 1 in such a way that it would match the firepower requirements of the MBT-70. A high first-hit probability at ranges of 2,000 metres (6,600 ft) and the ability to accurately engage targets on the move using a computerized fire control system were the main goals of the experimental development. The resulting vehicles were nicknamed Keiler ("tusker"). Two prototypes (ET 01 and ET 02) of the Keiler were built in 1969 and 1970, both of them being powered by the MB 872 engine. The MBT-70 was a revolutionary design, but after large cost overruns and technological problems, Germany withdrew from the project in 1969. After unsuccessful attempts of saving the MBT-70 by conceptual changes in order to eliminate the biggest issue—the driver being seated in the turret—it became clear in late 1969 that Germany would stop the bi-national development. The assistant secretary of the military procurement division of the German Ministry of Defense suggested reusing as much technologies developed for the MBT-70 as possible in a further program, which was nicknamed Eber ("boar") due to his being named Eberhardt. The Eber used a modified MBT-70 turret and hull, with the driver being seated in the hull. Only a wooden mock-up was made. One year later, a choice was made to continue the development based on the earlier Keiler project of the late 1960s, instead of finishing the development of the Eber. In 1971, the name of the design was determined as Leopard 2 with the original Leopard retroactively becoming the Leopard 1, and Paul-Werner Krapke became the project officer of the Leopard 2 program. Originally two versions were projected: the gun-armed Leopard 2K and the Leopard 2FK, which would be armed with the XM150 gun/launcher weapon of the MBT-70. That year 17 prototypes were ordered, but only 16 hulls were built as the production of hull PT12 was cancelled. Ten were ordered initially before another seven were ordered. The 17 turrets were designated T1 to T17, and the hulls were designated PT1 to PT11 and PT13 to PT17. To test a larger number of components and concepts, each prototype was fitted with components not found on the other prototypes. Ten of the turrets were equipped with 105 mm smoothbore guns, and the other seven prototypes were equipped with a 120 mm smoothbore gun. Hulls PT11 and PT17 were fitted with a hydropneumatic suspension based on the MBT-70 design. The running gears of these two hulls had only six road wheels. Different types of APUs were mounted in the prototypes. All turrets were equipped with a machine gun for air defense except the turret mounted on PT11, where a 20 mm remotely operated auto cannon was mounted. With the exception of hulls PT07, PT09, PT15 and PT17, all prototypes used the MB 873 engine. The road wheels were taken from the MBT-70 and the return rollers from the Leopard 1. The prototypes were designed with a projected weight of MLC50, which equals approximately 47.5 tonnes (46.7 long tons; 52.4 short tons). The welded turret utilized spaced armour formed by two steel plates. The prototypes were equipped with an EMES-12 optical rangefinder and fire control system, which later was adopted on the Leopard 1A4. In mid-1973 a new turret was designed by Wegmann saving 1.5 tonnes (1.5 long tons; 1.7 short tons) weight.[15] It was nicknamed the Spitzmaus-Turm (shrew turret) due to the highly sloped front. This design was only possible with the new EMES-13 optical rangefinder, which required a base length of only 350 millimetres (14 in) instead of the previous 1,720 millimetres (68 in). Based on experiences in the Yom Kippur War, a higher level of protection than the prototypes' heavily sloped spaced armour was demanded in late 1973 and the Spitzmaus-Turm was never produced. The weight limit was increased from MLC50 to MLC60, which equals approximately 55 tonnes (54 long tons; 61 short tons). The turret T14 was modified to test a new armor configuration, taking on a blockier-looking appearance as a result of using vertical modules of spaced multilayer armour. It was also used to test the new EMES-13 optical rangefinder. The modified turret T14 was designated T14 mod and was fitted with a fully electric turret drive and stabilization system, which was developed together by the companies General Electric and AEG Telefunken.

T-64 BM Bulat Ukrainian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-64B:** The T-64 MBT was, at the time it entered service, the third generation of tanks to be produced by factories and design bureaus in Ukraine. It was the first Soviet tank to assume the mantel of an MBT, finally expelling the notion of light, medium, and heavy tanks.
- **T-64BK:** Command tank version, with 10-m whip antenna.
- **T-64B1:** Variant has partial era mounted; the few original t-80s retained were upgraded to this standard
- **T-64BV:** Variant has kontakt era mounted. Combat weight (mt): 42.5 for t-64bv with explosive reactive armor (mm): standard on t-64bv
- **T-64U/T-64BM2:** Upgrade series marketed by ukrainian malyshev in 2001. T-64u prototype featured 2nd gen era, composite armor, and fire suppression equipment. Variant added t-80u fire control (1a42 gunner day sight) and thermal night sight-permits it to replace rf-guided at-8/kobra atgm with better refleks series (svir/invar) laser-beam rider atgms. Ukrainian-developed lbr-guided atgm kombat similar to refleks. A later variant changed the fcs to t-80ud/t-90 type, with 1a45 day sight, and agat thermal night sight
- **BM BULAT:** This 45 mt upgrade variant is currently being advertised. It includes an 850-hp engine, fcs with 1g46m lrf-based sight and catherine-based thermal night sight. Remote fired 12.7-mm mg and 5,000 m

System

Alternative Designation: T-64 BM Bulat
Type: Main Battle Tank
Family: T-64 Family
Crew: ea3
Passenger Capacity: INA
Maximum Effective Range (Road): km312
Maximum Effective Range (Main Gun): m5,000
Maximum Operation Duration: hours10
Note: The T-64 became the primary MBT of Soviet forces until it was replaced by the T-80 and T-72.

Dimensions

Length (Gun Forward): m9.23

Length (Hull): m6.54

Width: m3.41

Height: m2.17

Weight, Combat: tons45

Ground Pressure: kg/mINA

Automotive

Engine Name: 5TDFM Diesel

Engine Type: Two-stroke multifuel, 5-cylinder diesel with gas turbine supercharg

Engine Power: hp850

Maximum RPM's: RPM2,800

Power to Weight Ratio: hp/ton18.9

Cruising Range: km312

Speed, Maximum Road: km/h70

Speed, Average Cross: 37

Speed Maximum Swim: km/hNot Amphibious

Gradient: Deg60

Side Slope: Deg40

Vertical Step: m0.8

Trench: m2.72

Fording Depth (Without Preparation): m1.4

Fording Depth (With Preparation): m5

Fuel Tank: liters1,270

Main Gun

↳*System*

Name: KBA-3125 mm smoothbore gun

Type: 125 mm smoothbore

Max Rate of Fire: rds/min8

Length (Barrel): m6

Weight (Barrel): kg2,500

Manual Load Time: rds/min1-2

Autoloader: Yes, Carousel-Type Autoloader

Fire on the Move: Yes, Main Gun

Maximum Penetration: mm750

Rate of Fire: rds/min6-8

Maximum Elevation: Deg+14

Minimum Elevation: Deg-6

Traverse Range: Deg360

Automatic Loader: Yes

Thermal Sleeve: Yes

Guidance System: TAK0-621 Guided Weapon Complex

Evacuator Type: Central bore evacuator

Effective Full Charge (EFC) Life: rds600

Breech Type: semi-automatic horizontal sliding breech block

Loading System: Korzina electric and hydraulic automatic loading system

Carousel: The carousel can accommodate 28 two-piece rounds of ammunition, and rotates automatically after each round is fired

Carousel Load Time: min13-15

Basic Load Time: min27

Muzzle Reference System: Yes

Maximum Effective Range (Day): m2,300-2,500

Maximum Effective Range (Night): m1,500

↳*Ammunition (Option 1)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot ((APFSDS))

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Effective Range: m2,000-3,000

Maximum Range: m4,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Dimension: mm900

Projectile Weight: kg11

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Effective Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Proectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 1)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: 915

Max Dispersion: INA

Maximum Range: m3,00

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Name: Kobra (AT-8 Songster)

Type: SACLOS Anti-Tank Missile System

Caliber: mm125

Manufacturer: KB Tochmash

In Service: 1976-present

Proliferation: Widely Proliferated throughout Armenia, Azerbaijan, Belarus, India Iran, Russia, Ukraine, and Uzbekistan

Basic Load: ea4-6

Weight: kg23.2

Warhead Weight: kg4.5

Guidance System: SACLOS

Effective Firing Range: m100-4,000

Muzzle Velocity: m/s125 m/s, which increases to 800m/s at its peak m/s

Flight Time to a 4,000 Meter Targetsec: 9-10

Armor Penetration: 600mm of RHA

Hit Probability: %80

Maximum Chamber Pressure: kgf/cm36,500

Horizontal and Vertical Dispersion: mils0.2

Kombat Gun-Launched Missile Capable: Yes

Variants: 9M112M, 9M112M2, 9M124

Note: Fired from the T-64 and T-80 Family of Russian Tanks

Coaxial Weapon System

↳*System*

Name: Type 54 DShK Anti-Aircraft Machine Gun

Type: 12.7mm Heavy Machine Gun

Proliferation: over 1 Million

Length (Total): mm1,625

Length (Barrel): mm1,070

Weight (Gun Only): kg34

Weight (on Wheeled Mounting): kg157

Max Rate of Fire: rds/min600

Range Finder Type: Optical

Action: Gas-Operated, Flapper Locking

Sights: Iron/Optical

Feed System: 50 Round Belt

Turret: single seat and placed at the rear of the vehicle roof. It is sharp-pointed at the front.

Variants: DK, DShKM, DSHKS, Type 54 HMG

Fire on the Move: Yes

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: mm12.7x108

Muzzle Velocity: m/s850

Basic Load: ea300

Effective Range: m2,500

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Loader's Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: mm7.62

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea250

Effective Range (Iron Sights): m100- 1,000

Effective Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: 1V528-2 fire-control compute

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, TKN-4S combination day/night binocular periscopic. Additionally, the T-64U is equiped with the PZU-7 Anti-aircraft Sight

Gunner's Aiming System: 1G46M Aiming System

Thermal Sight Gunner: Yes, T01-K01ER Night Sight

1G46 Magnification: 2.7 and ×12 magnification

Rangefinder: IG46 Gunner Sight, Laser

Sighting and Observation System: TKN-4CR, also known as the PNK-4SR

IG46 Rangefinder Maximum Range: m400

IG46 Rangefinder Minumum Range: m5,115

Vision Blocks: 1 x TPNO-16, 2 x TPNA-65 day vision blocks

Fire on the Move: Yes

Main Gun Stabilization: 2-Plane, 2E42M Stabilization System

Rangefinder: two-axis stabilised IG42 laser rangefinder sight

2E42M Stabilization System (Horizontal Error): mrad0.4

2E42M Stabilization System (Vertical Error): mrad.03

Ballistic Computer: 1B528-1 Ballistic Calculator.

PZU-5 Monocular Periscopic Sight: Available

Searchlight: L-4 searchlight.

Wind Sensor: DVE-BS wind sensor

Guidance System: TAK0-621 Guided Weapon Complex

Protection

Hull Armor: Cast and welded steel armour

Turret Armor: Cast armour welded together

Turret Type: ROM-7 commander's cupola

Armor Protection (Front): mm370-440 of RHA against KE rounds and 500 mm to 575 mm of RHA against HEAT rounds

Applique Armor: Available

Self-Entrenching Blade: KMT-4 roller or the KMT-6 track width mine plough,

Explosive Reactive Armor: Nozh ERA system

Explosive Reactive Armor Weight: tons3.5

Explosive Reactive Armor Install Time: hours6

Nozh ERA Strength: 1.5-2.5 times more effective than exiating ERA Designs.

Noza ERA Compatability: interchangeable with the Russian-developed 4C20 and 4C22 ERA systems.

Active Protection System (APS): Zaslon APS

Doppler Radar: Yes

Mine Clearing: Roller-plow available

NBC Protection: Yes

Smoke Equipment: 902A "Tucha-1" smoke grenade launcher in two groups of four, on each side of the gun
IR Signature: INA
Automatic Fire Suppression Systems.: Yes, PPA Fire Suppression System
Zaslon APS: Available
Note: The Explosive Reactive Armor (ERA) protects the T-64 BM Bulat against attacks by 220% and against Kinetic Energy Attacks by 190%

Notes:

The BM “Bulat” started as the Obyekt 447AM-1, this tank presented itself as a modernized version of the T-64BM. After studies of modernization in the early 2000s, work started at the Kharkiv Malyshev Factory design bureau by a first batch of 10 T-64B tanks converted to the BM “Bulat” standard in 2010. These were followed by 19 in 2011 and others in 2012, for a total of 76.

T-72S (Shilden) Iranian Main Battle Tank (MBT)

Tiers:

Parent:

T-72 Russian Main Battle Tank (MBT)

Variants:

- **T-72A:** Second Russian main variant of the T-72.
- **T-72B1:** In 1986, a limited production variant without an ATGM launch capability. Some do not have ERA.
- **T-72BK:** The Commander's variant with additional radios.
- **T-72BM:** Russian T-72B upgrade with 2nd gen ERA. The system is fielded, available for export, and upgraded. Tier 2 and some Tier 3 tanks can challenge US forces under favorable conditions when using modern ammunition and employed by well-trained units with sound tactics. A variety of upgrades are available for the T-72B. They include protection upgrades, such as improved ERA, APS, defensive aids suites with IR jammers, plate armor, welded turret, and grill armor around tracks and grill. Mobility upgrades include a new power train, improved steering, improved mine plows and rollers, and electronic mine spoofing system. Fire control system upgrades include new sights, gun, ammunition, and improved stabilization. With the expanding number of upgrades offered by former Warsaw Pact, Asian, Israeli, and other firms, most T-72-type tanks have some level of upgrade from the basic T-72 MBT. The more affordable upgrade approach for most countries is to execute specific upgrades during maintenance work. But this approach may result in only partially modernized tanks at any one point in the life of the vehicle, and which are not as modern as more recent competitors. An alternative is to produce modernized tanks in small numbers, resulting in high per-unit production costs.
- **T-72BU:** Upgrade variant with the fire control system from the T-80U as well as well as a variety of other changes.
- **T-72BU renamed T-90:** With the limited market for new tanks, the world tank industry has developed upgrades and whole vehicle upgrade packages to tap into the market. Older T-72 tanks can be brought up to the T-72B standard. Some approach the T-90 standard. Most T-72-type tanks fielded reflect some level of upgrade. Upgrade options are expanding from former Warsaw Pact, Asian, Israeli, and other international firms.
- **T-72S / Shilden:** Russian export T-72A upgraded to the T-72B standard. Although visually similar to T-72B, it has slightly less chassis and turret protection. Former Warsaw Pact countries such as Slovakia and Middle Eastern countries like Iran have upgraded their tanks to the T-72S standard.
- **M-84AB1:** Yugoslav upgrade to the M-84, bringing it close to the T-90, and the latest T-72B improved tanks.
- **M-95 Degman:** Croatian M-84 upgrade with box composite armor, ERA, 1200hp and thermal FCS. An export upgrade conversion, AKA M-84D, is offered for Kuwaiti M-84A tanks.
- **PT-91:** Polish upgrade tanks with ERA, Drawa improved FCS, Savan-5 thermal sight, improved gun stabilization, and countermeasures.
- **PT-91M:** Has a 1000hp engine, new guns and FCS, armor changes, and other improvements. PT-91M exported to Singapore. PT-91P is designed for export to Peru.
- **T-72M1:** Demonstrator with 2nd generation ERA and other upgrades were displayed at military shows.
- **T-72M1M:** Includes 3rd generation Relikt ERA and optional Arena Active Protection System (APS). Alternative designations: Rogata and SMT M1988. It is almost the same as the T-72S (Export), except more ERA on the side skirts.
- **AJEYA MK 2:** India is upgrading T-72A tanks close to a Bhishma (T-90S) standard.

System

Alternative Designation: T-72S; Shilden

In Service: 1985-present

Manufacturer: Uralvagonzavod

Type: Main Battle Tank (MBT)

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Note: The 9K120 gun-launched missile complex is a two piece guided missile that is loaded and fired from the main gun in the same way as an ordinary round.

ATGM System Name: 9K120 gun-launched missile complex

Missile Name: 9K119 SVIR / AT-11

Type: Laser Guided Anti-tank guided missile launcher

Manufacturer: KBP Instrument Design Bureau

Caliber: mm125

Round Type: 3UBK20 round

Guidance System: 9M119M Laser Guided Missile

Voltage Converter: 9S831 voltage converter.

Tracking System: IK13 tracker

Basic Load: ea6

Onboard Guidance System: Yes

Sight Assembly: coded laser guidance beam 1K13-49

Gunner's Night Sight: TPN-1-49 secondary night sight.

Fire Control System: 1A40-1

Hit Probability: %80

Penetration: up to 700mm of armor

Warhead Weight (HEAT): kg4.2

Warhead Type: 9N142 shaped charge warhead

Laser Emitter: 1K13 sight's laser

Maximum Effective Range: m4,000

Minimum Effective Range: m100

Elevation Range (Super Elevation): deg-7 to +20

Elevation Range (Standard Elevation): deg-5 to +15

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650-750

Effective Rate of Fire: rds/min250

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length: mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.60

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea2,000

Effective Range (Iron Sights): m1,000

Effective Range (with Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Secondary Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: 12.7 Anti-Aircraft Machine Gun

Proliferation: over 1 Million

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Weight (Gun Only): kg25

Muzzle Velocity: m/s845

Length (Total): mm1,560

Max Rate of Fire: rds/min700-800

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Action: Gas Operated

Maximum Elevation: deg+75

Minimum Elevation: deg-4

Sights: Iron Sights

Feed System: 50-Round Belt

↳***Ammunition***

Type: Rifle

Caliber: mm12.7x108

Muzzle Velocity: m/s845

Basic Load: ea300

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Fire Control

Name: 1A40-1

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, 1K13 sight and aiming complex

Thermal Sight Gunner: Gunner's primary sight is the 1A40-1

Main Gun Stabilization: 2E42-2 (Upgrade)

Range, Day Sight: m5,000

Range, Thermal Sight: m1,000

Infrared: Yes

Gyrocompass: GPK-59 gyrocompass

Searchlight: L-4A "Luna" IR searchlight

Collimator Sight: K10T collimator sight

Periscopes: two TNPO-160 prismatic periscopes

Note: The Gunner, using the 1A40-1 sight can designate and engage targets out to a mazimum distance of 4,000 meters with APFSDS and HEAR rounds.

Protection

Hull Armor: Steel and composite armour with additional plates that provide protection equivalent to 950mm of steel against HEAT projectiles, 440mm resistance to KE rounds, and 500mm against shaped charges. The T-72BM also has a additional twelve separate charges of ERA compared to the T-72B.

Turret Armor: Steel and composite armour with ERA, 950 mm against HEAT weapons. The Turret has additional Ceramic or silica inserts to add to the protection level of the T-72BM. Additionally, the T-72BM has arrow-shaped arrays of ERA added to the turret front

Applique Armor: Available, Turret top and track skirts
Explosive Reactive Armor (ERA): Yes, Kontakt-V (UPGRADE). Additional ERA is added to the Turret, Glacis, and sides of the hull.
ERA Explosive Element: 4S22
ERA 4S22 Elements (Plates): ea240
Armor Cassette Type: 4S22 cassette that is filled with an explosive element and steel armoured plate.
Number of total Armor Cassettes: ea200-300
NBC Protection: Yes, System Sensor Radiation Device and chemical intelligence (PRRM).
Active Protection System: Yes, ZETS11-3 Control System
Self-Entrenching Blade: Yes, built in Dozer Blade
Mine Clearing: Yes, Roller and plow (optional)
Grenade Launcher: Yes, twelve 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.
Grenade Maximum Effective Range: m200-300
Grenade Smoke Screen Size: 30 m wide and 10 m high for 60 seconds per grenade.
Engine Smoke Screen Capable: Yes
Exhaust Smoke-Laying System: Yes
Automatic Fire Extinguishing Equipment.: Yes
IR Signature: INA
Note #3: The additional added armor cassettes reduce penetration by as much as 95%.

Notes:

The T-72S Russian Main Battle Tank is a This is export model of the T-72A, upgraded to the T-72BM standard by Nizhny Tagil in Russia. Known also as the "Shilden," the upgrade package reportedly boosts performance by 1.7 percent. It is modified to accept explosive reactive armor. The tank is fitted with a 125mm D-81 smoothbore gun, a 7.62mm co-axial machine gun and a 12.7mm air defence machine gun mounted on the commander’s cupola. The T-72S carries 45 rounds of 125mm ammunition, 22 rounds of which are carried on an automatic loading carousel.

T-90 Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-90K:** Commander's version of the T-90, with additional communication (station R-163-50K) and navigation equipment (TNA-4-3)
- **T-90A:** Russian army version with welded turret, V-92S2 engine and ESSA thermal viewer. Sometimes called T-90 Vladimir, in honor of its chief designer Vladimir Potkin
- **T-90AK:** Command version of T-90A.
- **T-90AM:** Latest version of the T-90A.[77] The main features include the modernisation of the old turret design, which is equipped with a new advanced fire control system "Kalina" (with integrated combat information and control systems), a new automatic loader and a new upgraded gun 2A46M-5, as well as a remote-controlled anti-aircraft gun "UDP T05BV-1". The new version also includes the Relikt (Реликт (динамическая защита) ERA bricks instead of the Kontakt-5 ERA bricks.
- **T-90M:** New modernized version of T-90A. It's a program of modernization of Vladimir tanks and will include 400 tanks currently in service. Tanks will receive 2A82-1M gun (same as in T-14) and fire control system Kalina. They will be upgraded with Afghanit APS and Relikt ERA. The upgrades are also aimed at improving network-centric warfare capabilities and coordination with Armata project vehicles. The first contract was signed in 2017 and serial production started in 2018.
- **T-90S:** Export version of the T-90, later adopted by the Russian Armed Forces as the T-90A. These tanks were made by Uralvagonzavod and were updated with 1,000 hp (750 kW) engines made by Chelyabinsk Tractor Plant. These tanks carry a leaner version of the Shtora-1 passive/active protection system which lacks the infra-red dazzlers carried on the turret. Sometimes called T-90C (Cyrillic letter es looks like a Latin c). These were initially supplied with cast turrets of the early T-90, and when stocks were depleted, new, welded turrets were fabricated.
- **T-90SK:** Commander's version of the T-90S, with additional communication and navigation equipment. It differs in radio and navigation equipment and Ainet remote-detonation system for HEF rounds.
- **T-90S:** "Bhishma" – modified T-90S in Indian service.
- **T-90MS:** Also known as T-90SM is an updated version of the T-90S. It is equipped with a 1,130 hp engine, a PNM Sosna-U gunner view. a UDP T05BV-1 RWS with a 7.62 mm machine gun, GLONASS, inertial navigation systems, new Relikt explosive reactive armour (ERA) that covers more of the tank, and a steering wheel. A new removable turret bustle is included, which provides storage for eight additional rounds. The T-90MS is ready for serial production.[88] 4 video cameras provide a 360° view of the environment, while the tank is more connected to command. The T-90MS has an upgraded thermal imager that can detect tanks over 3300 meters away.
- **BREM-1M:** Armoured recovery vehicle.
- **IMR-3M:** Combat engineer vehicle.
- **MTU-90:** Bridge layer tank with MLC50 bridge.
- **BMR-3M:** Mine clearing vehicle.
- **MTU-2020:** Bridge layer tank based on the T-90A whose chassis has been extended, along with the addition of a road wheel.

System

Alternative Designation: T-90

Type: Main Battle Tank

Family: T-90 Family of Main Battle Tanks

Manufacturer: Uralvagonzavod

Generation: 3+

Status: In service

Crew: 3 (commander, gunner and driver)

Passenger Capacity: INA

Maximum Effective Range (Land): km500

Maximum Effective Range (ATGM): m5,000

Note: The T-90 is the most modern tank currently in service with the Russian Army, which has a requirement for around 1 500 of these tanks. Also currently it is the only mass-produced MBT in Russia.

Loader Type: Carousel-type autoloader

Minimum Cycle time for the Autoloader: seconds6.5

Thermal Sleeve: Light Allow

Bore Evacuator: Yes

Breech Type: semi-automatic horizontal sliding breech block via an interrupted screw thread

Breech Maximum Chamber Pressure: 6,500 bar over the 5,100 bar

Max Cycle time for a Round 180deg from the Start Position: seconds15

Carousel Reloading Time: min15

↳*Ammunition (Option 1)*

Type: 3BM42M/3BM44M, 125mm Armour-piercing fin-stabilized discarding sabot (APFSDS)

Caliber: mm125

Muzzle Velocity: m/s125

Basic Load: 44 Total rounds of any combination of 125mm Projectiles

Effective Range (Day): m2,000-3,000

Effective Range (Night): m2,000-2,600

Armor Penetration: Yes, 590-630mm at a range of 2000m

Shell Weight: kg20.4

Projectile Weight: kg7.5

Charge Weight: kg5.3

Penetration: mm/deg270/60

↳*Ammunition (Option 2)*

Type: 3BM9/3BM10, 125mm Armour-piercing discarding sabot (APDS)

Caliber: mm125

Muzzle Velocity: m/s1,715-1,800

Effective Firing Range: m3,000

Shell Weight: kg19.6

Projectile Weight: kg5.67

Charge Weight: kg5

Penetration: mm/deg140/60

↳*Ammunition (Option 3)*

Type: 3BK12M, 125mm (HEAT)

Caliber: mm125

Muzzle Velocity: m/s905-950

Effective Firing Range: m4,000

Shell Weight: kg29

Projectile Weight: kg19

Charge Weight: kg5

Penetration: mm/deg220/60

↳***Ammunition (Option 4)***

Type: 3OF19, 125mm (HE)
Caliber: mm125
Muzzle Velocity: m/s760
Effective Firing Range: m4,000
Shell Weight: kg33
Projectile Weight: kg23
Charge Weight: kg5.0
Penetration: mm/degINA

Anti-Tank Guided Missile

↳***System***

Name: 9M119 Svir, 9M119M Refleks(NATO designation AT-11 Sniper-B)
Type: Laser Beam Anti-Tank Guided Missiles
In Service: 1980's to present
Manufacturer: Degtyarev plant
Cost: $37,500
Mass: kg17.2
Diameter: mm125
Basic Load: ea6
Warhead Type: Tandem hollow-charge
Warhead Weight: kg4.5
Max Rate of Fire: INA
Operational Range: m4,000-5,000
Speed: Subsonic
Guidance System: Laser Beam Riding
Launch Platform: 125 mm smoothbore guns
Variants: 9M119M

Tank Commander's Weapon System

↳***System***

Name: 12.7mm Kord Heavy Machine Gun,
Type: 12.7mm Heavy Machine Gun
Manufacturer: V.A. Degtyarev Plant
Cartridge: 12.7×108mm

In Service: 1998-Present

Weight: kg25.5

Length: mm1,980

Max Rate of Fire: rds/min650-750

Sustain Rate of Fire: rds/min550-600

Action: Gas-operated, rotating bolt

Feed System: 50-round linked belt

Sights: Iron Sights

Variants: 6P50-1, 6P50-2, 6P50-3, 6P49

↳***Ammunition***

Cartridge: 12.7×108mm

Caliber: mm12.7mm

Muzzle Velocity: m/s860

Basic Load: ea300

Effective Range: m2,000

Loader's Weapon System

↳***System***

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: 7.62mm Machine Gun

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Sustain Rate of Fire: rds/min500

Range Finder Type: INA

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Total): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳ ***Ammunition***

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mm

Muzzle Velocity: m/s825

Basic Load: ea1,500

Effective Range (Iron Sights): m1,000

Effective Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Tank Commander: No

Thermal Sight Gunner: No

Panoramic Commander's Sight: No

Main Gun Stabilization: Yes, 2E42-4 Zhasmin System

Note: The Fire Control System is outdated and is from the late 1990s.

Protection

Hull Armor: Steel-composite-reactive blend APFSDS: 550 mm + 250–280 mm with Kontakt-5 = 800–830 mm HEAT: 650–850 mm + 500–700 mm with Kontakt-5 = 1,150–1,550 mm

Turret Armor: Steel-composite-reactive blend APFSDS: 550 mm + 250–280 mm with Kontakt-5 = 800–830 mm HEAT: 650–850 mm + 500–700 mm with Kontakt-5 = 1,150–1,550 mm

Applique Armor: Available

Explosive Reactive Armor: Yes, Kontakt-5 explosive reactive armor blocks, equivalent to up to 500mm of steel armor

Active Protection System: Yes, the Shtora-1 countermeasures system

Mine Clearing: INA

Self-Entrenching Blade: Yes

NBC Protection: Yes, GO-27 PRKhR radiation and chemical agent detection system.

Deep Wading Kit: Available

Jammer: Yes, TShU1-7 IR jammers located either side of the main gun

Laser Radiation Sensors: Yes

IR dazzlers: Yes

Nakidka Signal Reduction Kit: Available

Smoke Equipment: Yes, banks of 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.

Grenade Maximum Range: m250-300

Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade.

Fire Suppression System: Yes, the Raduga-2 fire-suppression system

Notes:

The T-90 is a third-generation Russian battle tank that entered service in 1993. The tank is a modern variation of the T-72B and incorporates many features found on the T-80U. Originally called the T-72BU, but later renamed to T-90, it is an advanced tank in service with Russian Ground Forces and the Naval Infantry. The T-90 uses a 125 mm 2A46 smoothbore main gun, the 1A45T fire-control system, an upgraded engine, and gunner's thermal sight. Standard protective measures include a blend of steel and composite armour, smoke grenade dischargers, Kontakt-5 explosive-reactive armour and the Shtora infrared ATGM jamming system. It was designed and built by Uralvagonzavod, in Nizhny Tagil, Russia. Since 2011, the Russian armed forces have ceased any further orders for the T-90, and are instead increasing their numbers of the T-14 Armata that began production in 2016. Variants T-90: Successor to T-72BM, originally called T-72BU, with fire control and armor upgrades similar to those on the T-80U. Despite using the lower cost T-72 chassis, this tank incorporated more recent components than the T-80U and is in some ways superior. The original tank had an II night sight, not the thermal sight upgrade, and the under-powered 840hp engine. Upgrades have been added. T-90A: originally known as T-90SM or T-90M, it is now accepted for Russian service as the standard tank. T-90MS: export variant: improved armor protection and ERA; remote control weapon station on turret rook with 12.7 mm MG; traverse forward 316 degrees; elevate -10 to +45 degree. Improved fire control system for engagement of stationary and moving targets while tank is moving. TC panoramic sight for TC-gunner display linked to laser rangefinder; thermal and 4 television camera-each 95 degree wide/45 degree elev. Improved battle management and land navigation tracking system. External auxiliary diesel power unit for fuel conservation. Some reserve main gun ammo in bustle with blowout panels. Turret and hull rear with bar (lourve) armor; anti-laser warning and protection. 125 mm main gun improved accuracy with 2A46M-5 rather than previous 2A46M in T-90s. T-90S: export variant with option for upgrades. Several subsystem changes, such as upgraded FCS, new engine, removal of SHTORA-1, etc., have been added based on customer preferences, and are included in export versions of the tank. Some early T-90S have been upgraded to this standard. Most of these are being sold to India, with the 1,000hp engine upgrade, and with addition of air conditioning. T-90SK: T-90S command variant Bhishma: Indian variant produced from T-90A knockdown kits. It does not use the SHTORA-1 IRCM system. Engine is T-90A upgrade. The tank is sometimes erroneously called T-90S. Various stages of upgrades will be employed in Indian forces. Russia has provided T-90S tanks with Indian intent to upgrade almost all of its T-90 and T-90S remaining versions in knock-down kits with upgrades to meet the Bhishma standard. An issue remains of no air conditioning system in some export MBT to India cause overHEATing of system components and debilitating environment for tank crew in some environments. Project Rhino: most T-90 and T-90S tanks imported by India to be upgraded as Bhishma under this program and agreement with Russia. Other upgrade versions of the T-72 include features of the T-90A such as the improved gun stabilization, improved fire control system, improved engine, and improved ammunition such as the Ainet and the Invar. Other tanks which provide similar capabilities are the Ukrainian T-72AG and T-72mp. The Czech T-72CZM4 also has a 2nd generation thermal sight. Recent Russian tank upgrade packages for the T-72 are the T-72M1, and the T-72M1M. The above Russian upgrades are for modernizing older tanks, versus T-90/T-90A, which are newly produced tanks. Upgraded T-80U, T80UK, and T-84 tanks also have similar capabilities. Weapons & Ammunition Types And Typical Combat Load 125-mm smoothbore gun (est): 43 APFSDS-T: 14 HEAT-MP/HEAT: 3 Frag-HE: 12 Focused Frag Ainet (available) :8 ATGM: 6 Main Armament Ammunition Caliber, Type, Name: 125-mm APFSDS-T, BM-42M Maximum Aimed Range (m): 3,000-4,000 Max Effective Range (m): Day: 3,000-4000 Night: 2,600 Armor Penetration (mm KE): 590-630 at 2,000 meters 125-mm HEAT-MP, BK-29m Maximum Aimed Range (m): 4,000 Max Effective Range (m): Day: 4,000 Night: 2,600 Armor Penetration (mm CE): 650-750 it has some HE effects similar to Frag-HE rounds against personnel and materiel targets. 125-mm HEAT, BK-27 Maximum Aimed Range (m): 4,000 Max Effective Range (m): Day: 3,000+ Night: 2,600 Armor Penetration (mm CE): 700-800 125-mm HE-shrapnel Focused-Fragmentation, Ainet Maximum Aimed Range (m): 5,200 Max Effective Range (m): Day: 5,000 Night: 2,600 Tactical AA Range: 4,000-5,000 Armor Penetration (mm): can defeat IFV and APC 125-mm Frag-HE-t, of-26 Maximum Aimed Range (m): 5,000 Max Effective Range (m): Day: 5,000 Night: 2,600 Armor Penetration (mm): can defeat IFV and APC. A near miss will seriously damage or destroy most IFVs and APCs. Other Ammunition Types: French Giat 125G1 APFSDS-T, Russian BM-42 and bm-32 APFSDS-T. Note: the Russians may have a version of the BM-42M with a DU penetrator. Russian BM-48 APFSDS-T penetrates 650-700 mm Sokol-1 Guided Antitank Round Antitank guided missiles: AT-11B/INVAR Warhead Type: tandem shaped charge (HEAT) Armor Penetration (mm CE): 900, 850 behind ERA Range (m): Day: 5,000 Night: 2,600 AT-11/Refleks: missile with Frag-HE warhead to 5,000 m Notes T-90AM: the Russian military decided against T90A for its forces. In SEP 2011, they displayed T-90AM as a deep modernization of T-90A. They include a low-profile turret with a bustle autoloader and blow-out panels. The new 2a82 gun fires a longer (700+ mm est) and heavier APFSDS-T round to 3,500+ m. The original version of the tank has an 840-hp diesel engine. The engine in subsequent models is upgraded. Engine options include 950, 1,000 and 1,100 hp. The original tank had an II sight from the T-80 series (Buran-PA, 800-1300 meters range). However, marketing materials feature the Agava-2 thermal sight. Recent Gen3 sights are available. These night sights permit night launch of ATGMs. Relikt 3d gen ERA is offered to replace Kontakt-5 in several upgrade packages, or as a separate upgrade. The ERA adds up to 600 mm CE protection and 300 mm KE to turret base armor protection, or about 150 mm more than Kontakt-5. Active protection systems. Arena APS is available. Defensive aides suite is Shtora-1 (laser warning receiver with gun auto-slew, LWR-directed smoke grenade launchers, and EO-IR jammer), or partial package excluding IR jammers. None is on Bhishma. The Shtora-1 IR ATGM countermeasure illuminators can be detected with night sights. Shtora-1 has no effect against most modern ATGM systems, with encoded tracker beacons. Exclusion of Shtora-1 offers more ERA on the turret front and reduces costs. Protection probably includes radar-absorbent materials and IR-resistant

paint. The T-90 may be fielded with full Shtora-1 package (laser warning receiver with auto-slew gun capability, LWR-directed smoke grenade launchers, and EO-IR jammer), with a partial package, or without Shtora-1. Shtora-1 illuminators can be used for night illumination. An improved gun, 2A46M-4, with improved accuracy and use life is available for fitting to the T-90. The BK-29 round, with a hard penetrator in the nose is designed for use against reactive armor, and as an MP round has fragmentation effects. The BK-27 HEAT round offers a triple-shaped charge warhead and 50mm more penetration. The 12.7-mm MG NSVT has both remote electronically operated sight PZU-5 with vertical stabilization, night acquisition, and a gun-mounted K10-T reflex sight.

M48 Patton American Main Battle Tank (MBT)

Tiers:

Variants:

- **M48:** M48: Differed from the M47 in having yet another new turret design and a redesigned hull, doing away with the bow machine gun position, featuring the M41 90 mm gun. These turrets give the M48 its distinctive non-M26 style look. Originally, the gun featured a Y-shape muzzle brake, but this was changed to the more characteristic T-shape.
- **M48C:** M48C: Over a hundred original production hulls were found to be lacking correct ballistic protection and were relegated to training as the M48C.
- **M48A1:** M48A1: New driver hatch and M1 commander's cupola, allowing the M2HB .50 caliber machine gun to be operated and reloaded from within the vehicle.
- **M48A2:** M48A2: Improved powerpack and transmission, redesigned rear plate, and improved turret control.
- **M48A2C:** M48A2C: M48A2s with an improved rangefinder, M17, new ballistic drive and bore evacuator for the main gun, and the auxiliary tensioning wheels were deleted.
- **M48 AVLB:** M48 AVLB: M48A2 chassis, fitted with a scissors-type bridge. All later upgraded to A3 standard.
- **M48A3:** Refit of M48A1 through M48A2C models to diesel engines and a new fire control system. 1,019 converted.
- **M48A3 Mod. B:** M48A3 Mod. B: Additional armor on the exhausts and tail lights, and a raised commander's cupola.
- **M48A4:** M48A4: upgrade proposed 15 October 1966 by Chrysler Defense, mating the T95E5 turret of the original variant of the M60 series tank to the M48A3 hull. Used by Israel in some Magach 3 variants.
- **M48A5:** M48A5: Up-gunned with the 105 mm M68 gun. 2,069 converted.
- **M48A5E1:** M48A5E1: New laser rangefinder, digital fire-control system, improving night vision system.
- **M48A5PI:** M48A5PI: M1 cupola replaced by the Israeli Urdan model.
- **M67 "Zippo":** M67 "Zippo": M48 armed with a flamethrower inside a dummy model of the main gun with a fake muzzle brake. Named after a popular brand of cigarette lighter.
- **M247 Sergeant York::** M247 Sergeant York: This self-propelled anti-aircraft gun, cancelled in 1985 before it was deployed, used the M48A5 chassis.

Weight: 1,128 kg

Fume Extractor: Yes

Elevation: -9 deg to 19 deg

Traverse: 360 deg

Maximum Firing Range: 4,000 m

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm105

Shell: INA

Shell Weight: INA

Basic Load: 54 Rounds

Coaxial Weapon System

↳*System*

Name: M73 Machine Gun

Type: Medium Machine Gun

Caliber: 7.62mm

Quantity: 1 x 7.62mm M73 machine gun

Manufacturer: United States

Proliferation: The M73 and M219 are 7.62 mm NATO caliber machine guns designed for tank use. NATO no longer uses them, but they were used on the M48 Patton and M60 Patton MBT series (including the M728 Combat Engineer Vehicle), and on the M551 Sheridan Armored Reconnaissance / Airborne Assault Vehicle (AR/AAV).

In Service: 1959-1990s

Length: 1,219.2 mm

Barrel Length: 609.6 mm

Weight: 14.1 kg

Rate of Fire: 500-625 round/min

Action: Recoil-operated/short-recoil operation with gas assist

Muzzle Velocity: 853.44 m/s

Maximum Firing Range: 3,657.6 m

Effective Firing Range: 899.8 m

Feed System: Belt Feed, left or right hand

Sight: INA

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Basic Load: 2,000 Rounds

Auxiliary Weapon System

↳*System*

Name: M60D

Type: 7.62mm

Caliber: General-Purpose Machine Gun

Quantity: 2 x 7.62mm M60D Machine Gun

Manufacturer: Saco Defense U.S. Ordnance

Proliferation: Widely Proliferated

In Service: 1957-Present

Length: 1,105 mm

Barrel Length: 560 mm

Weight: 10.5 kg

Action: Gas-operated, short-stroke gas piston, open bolt

Rate of Fire: 550–650 RPM

Muzzle Velocity: 853 m/s

Effective Firing Range: 1,100 m

Feed System: Disintegrating belt with M13 Links

Sights: Iron sights

Note: The M60D is a mounted variant of the standard M60. It can be mounted on boats, vehicles and as a pintle-mounted door gun in helicopters. When used in aircraft, it differs from the M60C in that it is not controlled by the pilot—rather, it is mounted in a door and operated by a member of the crew. Like the rest of the M60 family, it is an air-cooled, gas-operated, belt-fed weapon. Unlike other models, however, the M60D normally has spade grips and an aircraft ring-type sight or similar, as well as an improved ammunition feed system. A canvas bag is also affixed to the gun to capture ejected casings and links, preventing them from being sucked into the rotor blades or into an engine intake. The M60D was equipped on the UH-1B Huey (using the M23, XM29, M59, and the Sagami mounts), the CH-47 Chinook (using the M24 and M41 mounts) in both door and ramp locations, the ACH-47A "Guns-A-Go-Go" variant of the Chinook (using the XM32 and XM33 mounts), and on the UH-60 Black Hawk (using the M144 mount). The M60D is also used by the British on Royal Air Force Chinooks. In US service, the M60D has been primarily replaced by the M240H. The M60D is still manufactured by U.S. Ordnance and still used on the SH-60 Seahawk.

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Basic Load: 3,000 Rounds Each

Fire Control

Name: INA

Computerized FCS: Yes, The fire control system included a rangefinder, mechanical ballistic computer, ballistic drive, and

gunner's periscope. Collectively, these mechanical devices resembled in miniature the fire control systems used in naval gunnery. Only after the Second World War did such systems become small enough for use in combat vehicles. These mechanical fire control systems permitted tanks to engage effectively at much longer ranges than in World War II, a critical consideration for the Army, expecting to enter the European battlefield outnumbered. Instead of a gunner's sight being slaved to the gun tube, the ballistic computer and drive computed the range and elevated the gun. The gunner's primary responsibility lay in keeping the sight on the target.

Thermal Sight Tank Commander: thermal sights (Taiwanese and Turkish M48s only)

Infrared: driving lights and searchlights

Main Gun Stabilization: INA

Rangefinders: There are two basic types of optical rangefinders, stereoscopic and coincidence. With a stereoscopic model range determination occurred by measuring the distance from the observer to a target using the observer's capability of binocular vision. The coincidence rangefinder uses a single eyepiece. Light from the target enters the rangefinder through two windows located at either end of the instrument. The ARCOVE emphasis upon increased long range accuracy led to the incorporation of a fire control system (FCS) in the M48.

Ballistic Computer: M13 electro-mechanical ballistic computer. The mechanical ballistic computer made a more accurate computation of range possible by mathematically accounting for such factors as vehicle cant and ammunition type. Many developmental range finders based on pulses of IR light, such as the OPTAR rangefinder of the T95 continued into 1957.

Protection

Hull Armor: hull front: 101/120 mm hull sides: 76 mm hull rear: 44 mm hull top: 57 mm

Turret Armor: turret front: 110 mm turret sides: 76 mm turret rear: 50 mm turret top: 25 mm

Applique Armor: INA

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: limited protection

Smoke Equipment: M339 smoke grenade dischargers; engine smoke-laying system

Notes:

The M48 Patton is an American first generation main battle tank (MBT) introduced in February 1951. It was designed as a replacement for the M26 Pershing, M4 Sherman variants and M46 Pattons used in the Korean War, and as the successor to the M47 Patton. Nearly 12,000 M48s were built, mainly by Chrysler and AlCo, from 1952 to 1961. The M48 underwent many design modifications and improvements during its production life. This led to a wide variety of suspension systems, cupola styles, power packs, fenders and other details among individual tanks. The early designs, up to the M48A2C, were powered by a gasoline engine. The M48A3 and A5 versions used a diesel engine, however gasoline engine versions were still in use in the US Army National Guard through 1968 and through 1975 by many West German Army units. Numerous examples of the M48 saw combat use in various Arab–Israeli conflicts and the Vietnam War. Beginning in 1959, most American M48A1s and A2s were upgraded to the M48A3 model. The M48 Patton-series saw widespread service with the United States and NATO until it was superseded by the M60 tank as well as being widely exported. The tank's hull also developed a wide variety of prototypical, utility and support vehicles such as armored recovery vehicles and bridge layers. Some M48A5 models served into the mid-1980s with US Army National Guard units, and were used as targets for weapons and radar testing into the mid-1990s. Many M48s remain in service in other countries though most of these have been highly modified and had their firepower, mobility and protection upgraded to increase their combat effectiveness on the modern battlefield. The Turkish Army has the largest number of modernized M48 MBTs, with more than 1,400 in its inventory. Of these, around 1,000 have been phased out, placed in storage, or modified as armoured recovery vehicles. Chrysler began building the new Newark Tank Plant in Newark, Delaware in 1951 to produce the M48 while Chrysler Defense Engineering and ARCOVE continued advanced production engineering (APE) to evolve the design using the T48 prototypes at the OTAC Detroit Arsenal. In May 1952 Chrysler came to an agreement to take control on a Government Owned and Contractor Operated (GOCO) basis of the Newark Tank plant production facility with the US Government and to continue production design refinement of the T48 at the OTAC Detroit Arsenal. The first Chrysler production tank was unveiled on 1 July 1952 as the 90mm Gun Tank M48 and christened the M48

Patton by Mrs. Beatrice Ayer Patton, wife of the late General George S Patton.[28] To meet the urgent need for tanks, production contracts were also awarded to General Motors and Ford Motor Company to produce the tank in Michigan starting in 1952. Also in July 1952 the Army awarded American Locomotive Company a $200 million contract to start producing the tank in 1953 at the Schenectady Tank Plant in New York. All four companies were given initial production contracts in that same year for around 400 tanks each. The M48 featured a gasoline-powered engine, different models were used depending on availability and manufacturer. Originally the M48(Mod A) was built at the Chrysler Defense using the Continental AV-1790-5B coupled to a General Motors CD-850-4A or 4B cross-drive transmission as used for the M47. The M48(Mod B) used a Continental AV-1790-5C gasoline engine and either an Allison CD-850-4A or 4B cross-drive transmission. Most of these were built by the American Locomotive Company. Additionally a two-cylinder, gasoline, air-cooled engine (sometimes referred to as the "Little Joe" by tank crews) was provided to power a 28 volt, 300 ampere generator when the main engine was not needed. Fuel capacity was 200 gallons providing a cruising range of about 70 miles (110 km). The suspension consisted of six roadwheel pairs with a torsion bar suspension system and five return rollers. There was a dual compensating idler arm at the front, and dual auxiliary track tension wheels behind the last road wheels, using the T97E2 track assembly as were the previous M46 and M47 tanks. It had hydraulic shock absorbers mount on the first, second and sixth roadwheel pairs (opposite of the M46 and M47). The bow mounted machine gun and its related crew station was eliminated thus providing more ammunition storage for the main gun. The driver's station was moved to the front center of the hull. The steering controls were redesigned. A large aircraft-styled steering wheel (replacing the wobble stick control of the M46 and M47) and placing the transmission range selector on the floor to the driver's right. Mod A hulls had a small oval overhead hatch for the driver. It incorporated a mechanism that dropped his three periscope heads to provide clearance for the hatch door as it swung to the right, and the driver then had to reposition the periscopes by hand once the hatch was closed again. The vehicle did not have an NBC protection system for the crew and a fording depth of approximately 1.2 meters. The M48's turret consisted of a redesigned flat gun shield and standard pop-up hatch for the commander's station. The M48 Mod A turret design had a smaller roof hatches for both the commander and loader. A .50cal M2HB using a M1 remote control mount on a pedestal was available for the commander. When not in use, the machine gun mount could be stowed on a bracket welded to the turret roof in front of the loader. The M48's direct fire control system consisted of an M12/T41 stereoscopic rangefinder with a field of view of 5 degrees and magnification of x7.5, an azimuth indicator, an M20 gunner's periscope and a T13 superelevation actuator. Two main bearings are bolted to the mounting plate on the roof of the tank turret to support the range finder on steel radial ball bearings. A parallel gun linkage between the gun trunnion and the range finder assures that the line of sight of the range finder reproduces the exact motion of the gun in elevation. A .30 caliber M1919E4 machine gun was coaxially mounted to the main gun's right and was operated by the gunner. An M12 full field optical range finder was used, the same as the M47. The tank was not fitted with any night fighting or computerized fire control systems. It featured the 90 mm T139 main gun using a Y-shaped muzzle brake on the barrel and carried 53 rounds. Eight ready rounds were stored in the left side of the turret bustle for the loader, the rest were stored inside safe containers in the hull. Tank crews complained that the Y-shaped fume extractor was found to be prone to snagging brush. It was replaced with a T-shaped model early in production. These early M48 tanks suffered from engine, transmission, track, and suspension problems. The M12 rangefinder was too fragile and often broke. Army Field Forces (AFF) found these tanks to be unsuitable for combat use in Europe and was regulated to limited use by US Army CONUS units until numerous shortcomings were corrected. Furthermore, some 120 hulls were found to have insufficient hull armor. These were denoted as the M48C and relegated to the United States Army Training and Doctrine Command (TRADOC) for non-ballistic training use by the Armor School at Fort Knox to train crewmembers and maintenance personnel.

T-80B Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-80 (1976):** Initial model, with 1,000-hp gas turbine engine, coincidence rangefinder, and no missile capability. This model does not have fittings for explosive reactive armour. The turret is from the T-64A, and thus retains the use of the old coincidence rangefinder. Characteristics of this type are the V shaped water deflector on the front glacis, coincidence rangefinder in front of the commander's cupola, and Luna searchlight mounted in the same position as a T-64. Around 250 were produced, as the tank's armour was essentially obsolete when introduced. Turret vs APFSDS – 380 mm, hull vs APFSDS – 500 mm (without reactive armour). This was, in effect, a pre-production model. It reportedly was fitted with an early version of the Shtora APS.
- **T-80BV (1985):** T-80B with explosive reactive armor Kontakt-1
- **T-80UM::** Russian version, with new Buran thermal imaging sight in place of the Luna IR.
- **Object 219A: Early T-80U (Object 219AS) variant:** It has the T-80U's turret, but not the Kontakt-5 ERA. Instead, it uses the old Kontakt-1/3 system; some 219As did not have ERA at all. Often misnamed T-80A. T-80U (1985): Further development with a better turret, Kontakt-5 explosive reactive armour, improved gunsight, and 9M119 Svir missile system. In 1990 a new, 1,250-hp, engine was installed. Overall protection with Kontakt-5 against APFSDS/HEAT is 780/1,320 mm RHAe.9K119M with antitank guided missile 9M119M installed since 1990. Some of the tanks in commander version (T-80UK) equipped with Shtora-1 APS, and thermal imaging night sight TO1-PO2T (detection range / target classification range = 6,400/4,600 meters at night). Basic thermal night sight of the T-80U is within the limits of 1,750/1,500 meters
- **T-80UD Bereza (1987):** Ukrainian diesel version with 1,000-hp 6TD engine and remote-controlled antiaircraft machine gun
- **T-84 (1999):** Further Ukrainian development of T-80UD with 1,200-hp diesel and new welded turret
- **T-80BVD (2002)::** KMDB's upgrade standard for Ukrainian T-80BVs. Changes include the 6TD diesel engine, remote-controlled commander's machine gun, and better optics. None were produced.
- **T-80UM2/Black Eagle (prototype: cancelled)::** Several Russian prototypes were shown at trade shows, with a longer chassis and extra pair of road wheels, and very a large turret with separate ammunition compartment
- **T-80BVM (2017):** Up to 3,000 units, installed "Relikt" ERA, PNM Sosna-U gunner sight (as in the T-90, T-72B3), the improved 125mm gun 2A46M-4, the upgraded gas turbine engine and the upgrades of various other systems. More than 120 already in the service.

System

Alternative Designation: T-80B

Total Built: The T-80B is the first variant produced in quantity. Russia: 5,391

Type: Main Battle Tank

Family: T-80 Series

Crew: ea3

Maximum Effective Range (Road): km335

Driver's Vision Blocks: ea3

Dimensions

Length (Gun Forward): m9.65

length (Hull): m6.98

Width: m3.58

Height: m2.22

Weight, Combat: tons43.7

Ground Pressure: kg/mINA

Automotive

Engine Name: GTD-1000T

Engine Type: Gas turbine engine

Engine Power: hp1,100

Power to Weight Ratio: hp/ton25.8

Cruising Range: km335

Speed, Maximum Road: km/h70

Speed, Average Cross: 55

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg60

Side Slope: deg40

Vertical Step: m1

Trench: m2.85

Fording Depth (No Preparation): m1.8

Fording Depth (With Preparation): m5

Cold Start Ability: Yes

Deep Water Snorkel: Available

Communications

↳*R-173*

Frequency Range: MHz30.00 - 75.99

HF Output: W30

Modulation: FM

Display: Digitial

Entry of Frequency: Keypad

Present Channels: 10

Digital Transmition: KBaudINA

Sensitivity: uV1.5

Range: km50

Operational Voltage: V27+-2

Weight: kg43

Size: mm428 × 222 × 238

↳*Receiver R-174/GRR-5*

Main Principle: Superhet with RF-stage; ZF/IF 455 kHz; 2 AF stage(s)

Wave Bands: Wave Bands given in the notes.

Loudspeaker: Permanent Magnet Dynamic (PDyn) Loudspeaker (moving coil)

Dimensions (WHD): mm307 x 335 x 206

Net Weight: kg27.7

Note: Receiver for mobile purposes, 1.5 - 18 MHz in four ranges, AM/CW (BFO), 200 kHz xtal calibrator. Set compartment (CY-615/URR) consists of two chassis: model R-174/GRR-5 receiver and model PP-308/URR power supply plus speaker unit. Tubes only one times listed.

Main Gun

↳*System*

Name: L48 2A46M-1 Smoothbore Cannon

Type: 125 mm smoothbore Gun

Manufacturer: Spetstekhnika Design Bureau

Max Rate of Fire: rds/min6-8

Maximum Range: m4,000

Manually Load Time: rds/min1-2

Maximum Elevation: deg+14

Minimum Elevation: deg-5

Traverse Range: deg360

Autoloader: Yes, Carousel-Type Autoloader

Fire on the Move: Yes, Main Gun

Evacuator Type: Central Bore

Thermal Sleeve: Yes

Barrel effective Full Life Charge: rds800

Breech Mechanism: Semi-automatic horizontal sliding breech block

Mazimum Pressure: bar5,100

Loading System: Korzina electric and hydraulic automatic loading system

Carousel Reloading Time: minutes13-15

Note: The L48 2A46M-1 It has been extensively developed into 10 different variations and remains the primary armament of Russian frontline tanks.

↳*Ammunition (Option 1)*

Type: High Explosives (HE)

Caliber: mm125

Muzzle Velocity: m/s850

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Maximum Effective Range: m5,000

Armor Penetration: INA

Max Dispersion: mrad0.23

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 2)*

Name: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Type: Smoothbore 125mm Projectile

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 total rounds of any 125mm Russian Projectiles

Effective Range: m2,000-3,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Weight: kg11

Projectile Dimesnion: mm900

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)
Name: 3VBK27/3BK31 "Start"
Caliber: mm125
Basic Load: 36 total rounds of any 125mm Russian Projectiles
Muzzle Velocity: m/s915
Max Dispersion: INA
Maximum Effective Range: m3,000
Charge: INA
Charge Weight: kg1.62
Projectile Weight: kg18.4
Armor Penetration: Estimated at 800 mm triple charge HEAT
Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Name: Kobra (AT-8 Songster)
Type: SACLOS Anti-Tank Missile System
Caliber: mm125
Manufacturer: KB Tochmash
In Service: 1976-present
Proliferation: Widely Proliferated throughout Armenia, Azerbaijan, Belarus, India Iran, Russia, Ukraine, and Uzbekistan
Weight: kg23.2
Effective Firing Range: m100-4,000
Guidance System: SACLOS Radio
Warhead Weight: kg4.5
Muzzle Velocity: m/s125, which increases to 800m/s at its peak
Flight Time to a 4,000 Meter Targetsec: 9-10
Armor Penetration: 600mm of RHA
Hit Probability: %80
Variants: 9M112M, 9M112M2, 9M124
Note: Fired from the T-64 and T-80 Family of Russian Tanks

Coaxial Weapon System

↳***System***

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)
Type: 12.7mm Anti-Aircraft Machine Gun
Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia
Weight (Gun Only): kg25
Muzzle Velocity: m/s845
Max Rate of Fire: rds/min700-800
Weight (On Tripod): kg41
Weight (50-Round Belt): kg11
Length (Total): mm1,560
Action: Gas Operated
Feed System: 50-Round Belt
Sights: Iron Sights

↳***Ammunition***

Type: Rifle
Caliber: mm12.7
Cartridge: 12.7×108mm
Muzzle Velocity: m/s845
Basic Load: ea500
Effective Firing Range (vs. Air Targets): m1,500
Effective Firing Range (vs. Ground Targets): m2,000

Loader's Weapon System

↳***System***

Name: 7.62mm PK (Kalashnikov's Machine Gun)
Type: 7.62mm Machine Gun
Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
Manufacturer: Degtyaryov plant
In Service: 1961-present
Proliferation: 1 Million +
Max Rate of Fire: rds/min650
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length (Total): mm1,203
Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea1,250

Effective Range (Iron Sights): m1,000

Effective Range (With Sight Adjustments): m100-1,500

Fire Control

Name: 1A33 FCS

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, the T01-KOIR

Commander Day Mode Sight: 10^0 FOV and ×5 magnification

Thermal Sight Gunner: Yes

Main Gun Stabilization: Yes, 2E26M electro-hydraulic dual plane stabilisation system

Main Gun Stabilization Deployment Time: minutes2

Range, Day Sight: m1,000

Range, Thermal Sight: m2,600

IR Searchlight: Yes, L-4A "Luna" IR Searchlight

TNPO-160 Periscopes: ea2

TNPA-65 Periscopes: ea2

Protection

Hull Armor: mm440–450

Armor Type: The T-80B is protected by a third iteration Soviet laminate armour that is known as Combination K

Turret Armor: Protection equivalent to 550mm

Applique Armor: Yes, Hull side; track skirts

Explosive Reactive Armor: Yes, Kontakt-1 System

Active Protection System: Arena Available

Mine Clearing: Roller-plow available

Self-Entrenching Blade: Yes

NBC Protection: Yes, ZETS-11-2 detection system collective overpressure system

Smoke Equipment: Yes, two banks of four 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade

Smoke Grenade Range: m250-300

Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade.

IR Signature: The exhaust is box-shaped and designed to direct heat away from the tank

Anti-Radiation Material: Installed as a inside protective layer

Personal Breathing Apparatus: Equipment

Automatic Fire Extinguisher System: Yes

Notes:

The T-80B is a front-line combat vehicle which combines operational mobility and tactical offensives and defensive capabilities. This variant features the 9K112 Kobra missile system. It also has improvements to the computerized fire-control system, including a laser rangefinder. The T-80B main battle tank is a further development of the original T-80, which was produced only in small numbers. The T-80B is the first variant produced in quantity. Small scale production of this tank commenced in 1978. At least 5,391 T-80B and improved T-80BV tanks were produced. Due to expensive maintenance the Russian Army planned to retire all T-80 series tanks by 2015. However in 2017 upgraded versions of this tank was publicly revealed. Protection of the T-80B was improved comparing with the T-80. The tank is fitted with a composite armor at the front of the hull and turret. Its hull provides protection equivalent to 570-820mm of Rolled Homogeneous Armor (RHA) against armor piercing rounds, depending on the projectile type. Turret provides protection equivalent to 420-760mm or RHA. This tank is fitted with NBC protection and fire suppression systems. The original T-80B tanks lacked explosive reactive armor, which was fitted to improved models and were painted olive drab. Fording depths (m): 12.0 with BROD-M system. The night sight cannot be used to launch the ATGM. The day sight can be used at night for launching ATGMs if the target is illuminated. A variety of thermal sights are available. They include the Russian Agava-2, French Sagem-produced Alis and Namut sight from Peleng. There are thermal sights available for installation, which permit night launch of ATGMs. The 12.7mm MG NSVT has both remote electronically operated sight PZU-5 and gun-mounted K10-t reflex sight. The more recent BK-27 HEAT round offers a triple-shaped charge warhead and increased penetration against conventional armor and ERA. The BK-29 round, with a hard penetrator in the nose is designed for use against reactive armor, and as an MP round, has fragmentation effects. If the BK-29 HEAT-MP is used, it may substitute for FRAG-HE (as with NATO countries) or complement FRAG-HE-he. With three round (APFSDS-T, HEAT-MP, ATGMs) in the auto loader versus four, more antitank rounds would be available for the higher rate of fire. The ATGM may be launched while moving slowly. The AT-8 can be auto-loaded with the two halves mated during ramming; but the stub charge is manually loaded. The GTA-18A auxiliary power unit is used when the engine is off

T-64BV Russian Main Battle Tank (MBT)

Tiers:

1 2 3 4

Variants:

- **T-64A:** Production version of base tank. Tank has a history of reliability problems, and lacks the high armor protection, track skirts, a fcs and atgm launch capability for t-64b.
- **T-64BK:** Command tank version, with 10-m whip antenna.
- **T-64B1:** Variant has partial era mounted; the few original t-80s retained were upgraded to this standard
- **T-64B:** T-64B or 447A (1976) – Fitted with redesigned armour, 1A33 fire control system, 9K112-1 "Kobra" ATGM system (NATO code "AT-8 Songster"), TPN-1-49-23 sight, 2A46-2 gun, 2E26M stabiliser and 6ETs40 loader. Later B/BV models have more modern systems 1A33-1, TPN-3-49, 2E42 and a 2A46M-1 gun. From 1985 the T-64B was fitted with stronger glacis armour; older tanks were upgraded with a 16-mm armour plate. Tanks, equipped with the 1,000 hp 6DT engine are known as T-64BM.
- **T-64U/T-64BM2:** Upgrade series marketed by ukrainian malyshev in 2001. T-64u prototype featured 2nd gen era, composite armor, and fire suppression equipment. Variant added t-80u fire control (1a42 gunner day sight) and thermal night sight-permits it to replace rf-guided at-8/kobra atgm with better refleks series (svir/invar) laser-beam rider atgms. Ukrainian-developed lbr-guided atgm kombat similar to refleks. A later variant changed the fcs to t-80ud/t-90 type, with 1a45 day sight, and agat thermal night sight
- **BM BULAT:** This 45 mt upgrade variant is currently being advertised. It includes an 850-hp engine, fcs with 1g46m lrf-based sight and catherine-based thermal night sight. Remote fired 12.7-mm mg and 5,000 m

System

Alternative Designation: T-64BV
Total Built: +6,000 total
Type: Main Battle Tank
Family: T-64 Family
Crew: ea3
Passenger Capacity: INA, IT"S A TANK
Maximum Effective Range: km600
Note: The T-64 became the primary MBT of Soviet forces until it was replaced by the T-80 and T-72.

Dimensions

Length (Gun Forward): m9.23
Length (Hull): m6.54
Width: m3.41
Height: m2.17

Weight, Combat: tons42

Ground Pressure: kg/mINA

Automotive

Engine Name: 5TDF Diesel

Engine Type: Diesel

Power to Weight Ratio: hp/ton16.6

Engine Power: hp700

Cruising Range: km600

Speed, Maximum Road: km/h60

Speed, Average Cross: 50

Speed Maximum Swim: km/hNot Amphibious

Gradient: Deg60

Side Slope: Deg40

Trench: m2.72

Fording Depth (Without Preparation): m1.4

Fording Depth (With Preparation): m5

Main Gun

↳*System*

Name: D-81T (aka 2A46)125 mm smoothbore gun

Type: 125 mm smoothbore

Max Rate of Fire: rds/min8

Manual Load Time: rds/min1-2

Weight (Barrel): kg1,073

Autoloader: Yes, Carousel-Type Autoloader

Fire on the Move: Yes, Main Gun

Maximum Elevation: Deg+14

Minimum Elevation: Deg-6

Traverse Range: Deg360

Automatic Loader: Yes

Thermal Sleeve: Yes

Evacuator Type: central bore evacuator

Effective Full Charge (EFC) Life: rds600

Breech Type: semi-automatic horizontal sliding breech block

Loading System: Korzina electric and hydraulic automatic loading system

Carousel: The carousel can accommodate 28 two-piece rounds of ammunition, and rotates automatically after each round is fired

Carousel Load Time: min13-15

Basic Load Time: min27

Rate of Fire: rds/min6-8

↳*Ammunition (Option 1)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot ((APFSDS))

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Effective Range: m2,000-3,000

Maximum Range: m4,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Dimension: mm900

Projectile Weight: kg11

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Effective Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Proectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

Ammunition (Option 1)

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 36 Total Rounds any combination of 125mm Projectiles

Muzzle Velocity: 915

Max Dispersion: INA

Maximum Range: m3,00

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Name: Kobra (AT-8 Songster)

Type: SACLOS Anti-Tank Missile System

Caliber: mm125

Manufacturer: KB Tochmash

In Service: 1976-present

Proliferation: Widely Proliferated throughout Armenia, Azerbaijan, Belarus, India Iran, Russia, Ukraine, and Uzbekistan

Basic Load: ea4-6

Weight: kg23.2

Warhead Weight: kg4.5

Guidance System: SACLOS Radio

Effective Firing Range: m100-4,000

Muzzle Velocity: m/s125 m/s, which increases to 800m/s at its peak m/s

Flight Time to a 4,000 Meter Targetsec: 9-10

Armor Penetration: 600mm of RHA

Hit Probability: %80

Variants: 9M112M, 9M112M2, 9M124

Note: Fired from the T-64 and T-80 Family of Russian Tanks

↳

Coaxial Weapon System

↳*System*

Name: Type 54 DShK Anti-Aircraft Machine Gun
Type: 12.7mm Heavy Machine Gun
Proliferation: over 1 Million
Length (Total): mm1,625
Length (Barrel): mm1,070
Weight (Gun Only): kg34
Weight (on Wheeled Mounting): kg157
Max Rate of Fire: rds/min600
Range Finder Type: Optical
Action: Gas-Operated, Flapper Locking
Sights: Iron/Optical
Feed System: 50 Round Belt
Turret: single seat and placed at the rear of the vehicle roof. It is sharp-pointed at the front.
Variants: DK, DShKM, DSHKS, Type 54 HMG
Fire on the Move: Yes

↳*Ammunition*

Type: Rifle
Caliber: mm12.7
Cartridge: mm12.7x108
Muzzle Velocity: m/s850
Basic Load: ea300
Effective Range: m2,500
Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Loader's Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)
Type: mm7.62
Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
In Service: 1961-present
Manufacturer: Degtyaryov plant
Proliferation: 1 Million +

Max Rate of Fire: rds/min650
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length (Overall): mm1,203
Length (Barrel): mm605
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Cartridge: 7.62×54mmR
Muzzle Velocity: m/s825
Basic Load: ea250
Effective Range (Iron Sights): m100- 1,000
Effective Range (With Sight Adjustments): m100-1,500
Maximum Firing Range: m3,800

Fire Control

Name: IG43 fire-control
Computerized FCS: Yes
Thermal Sight Tank Commander: Yes, TKN-3V combination day/night binocular periscopic
Thermal Sight Gunner: Yes, TPN1-49-23 night sigh
Main Gun Stabilization: 2-Plane, 2Eh26M armament stabiliser
Fire on the Move: Yes
Rangefinder: two-axis stabilised IG42 laser rangefinder sight
Ballistic Computer: 1V517 tank ballistic computer
Vision Blocks: 1 x TPNO-16, 2 x TPNA-65 day vision blocks
PZU-5 monocular periscopic sight: Available
Searchlight: L-2AgM infra-red searchlight

Protection

Hull Armor: cast and welded steel armour
Turret Armor: cast armour welded together
Armor Protection (Front): mm370-440 of RHA against KE rounds and 500 mm to 575 mm of RHA against HEAT rounds
Applique Armor: Available

Self-Entrenching Blade: KMT-4 roller or the KMT-6 track width mine plough,
Explosive Reactive Armor: Kontakt-1, also known as 4S20 cassettes
Number of ERA Plates: ea200-300
Active Protection System: Yes
Mine Clearing: Roller-plow available
NBC Protection: Yes
Smoke Equipment: "Tucha" 81-mm smoke grenade launchers on the left of the turret.
IR Signature: INA
Automatic Fire Suppression Systems.: Available, PPO fire detection and suppression system,
ERA Protection (HEAT Warheads): mm450
ERA Protection (Artillery Shells): mm200

Notes:

The T-64BV – Features "Kontakt-1" reactive armour and "Tucha" 81-mm smoke grenade launchers on the left of the turret. The T-64BV can be differentiated from the T-64B by the large quantity of ERA added to the turret and hull. The T-64BV is a modernized version of the T-64B main battle tank with an armour upgrade package. The T-64B version was adopted in service in 1976. The T-64BV featured an enhanced anti-radiation protection and add-on explosive reactive armour. The production of the T-64BV has started in 1985. In 2014, Ukraine sold 50 T-64BV to the Democratic Republic of the Congo (RDC). The T-64BV is currently in service with Russia, Uzbekistan, RDC and Ukraine.

T-72BM Russian Main Battle Tank (MBT)

Tiers:

Parent:

T-72 Russian Main Battle Tank (MBT)

Variants:

- **T-72A:** Second Russian main variant of the T-72.
- **T-72B1:** In 1986, a limited production variant without an ATGM launch capability. Some do not have ERA.
- **T-72BK:** The Commander's variant with additional radios.
- **T-72BM:** Russian T-72B upgrade with 2nd gen ERA. The system is fielded, available for export, and upgraded. Tier 2 and some Tier 3 tanks can challenge US forces under favorable conditions when using modern ammunition and employed by well-trained units with sound tactics. A variety of upgrades are available for the T-72B. They include protection upgrades, such as improved ERA, APS, defensive aids suites with IR jammers, plate armor, welded turret, and grill armor around tracks and grill. Mobility upgrades include a new power train, improved steering, improved mine plows and rollers, and electronic mine spoofing system. Fire control system upgrades include new sights, gun, ammunition, and improved stabilization. With the expanding number of upgrades offered by former Warsaw Pact, Asian, Israeli, and other firms, most T-72-type tanks have some level of upgrade from the basic T-72 MBT. The more affordable upgrade approach for most countries is to execute specific upgrades during maintenance work. But this approach may result in only partially modernized tanks at any one point in the life of the vehicle, and which are not as modern as more recent competitors. An alternative is to produce modernized tanks in small numbers, resulting in high per-unit production costs.
- **T-72BU:** Upgrade variant with the fire control system from the T-80U as well as well as a variety of other changes.
- **T-72BU renamed T-90:** With the limited market for new tanks, the world tank industry has developed upgrades and whole vehicle upgrade packages to tap into the market. Older T-72 tanks can be brought up to the T-72B standard. Some approach the T-90 standard. Most T-72-type tanks fielded reflect some level of upgrade. Upgrade options are expanding from former Warsaw Pact, Asian, Israeli, and other international firms.
- **T-72S / Shilden:** Russian export T-72A upgraded to the T-72B standard. Although visually similar to T-72B, it has slightly less chassis and turret protection. Former Warsaw Pact countries such as Slovakia and Middle Eastern countries like Iran have upgraded their tanks to the T-72S standard.
- **M-84AB1:** Yugoslav upgrade to the M-84, bringing it close to the T-90, and the latest T-72B improved tanks.
- **M-95 Degman:** Croatian M-84 upgrade with box composite armor, ERA, 1200hp and thermal FCS. An export upgrade conversion, AKA M-84D, is offered for Kuwaiti M-84A tanks.
- **PT-91:** Polish upgrade tanks with ERA, Drawa improved FCS, Savan-5 thermal sight, improved gun stabilization, and countermeasures.
- **PT-91M:** Has a 1000hp engine, new guns and FCS, armor changes, and other improvements. PT-91M exported to Singapore. PT-91P is designed for export to Peru.
- **T-72M1:** Demonstrator with 2nd generation ERA and other upgrades were displayed at military shows.
- **T-72M1M:** Includes 3rd generation Relikt ERA and optional Arena Active Protection System (APS). Alternative designations: Rogata and SMT M1988. It is almost the same as the T-72S (Export), except more ERA on the side skirts.
- **AJEYA MK 2:** India is upgrading T-72A tanks close to a Bhishma (T-90S) standard.

System

Alternative Designation: Objekt 184; T-72B obr.1989; T-72B(M)

Manufacturer: Uralvagonzavod

Type: Main Battle Tank (MBT)

Family: INA

Crew: ea3

Passenger Capacity: INA

Maximum Effective Range: m500

Note: The T-72BM can be distinguished from the T-72B and T-72B1 by the shape of the ERA, which is arrow-shaped on the turret front and built from larger ERA cassettes

Dimensions

Length (Gun Forward): m9.53

Length (Hull): m6.95

Width: m3.59

Height: m2.23

Weight, Combat: tons41

Fording (with Preparation): m5

Fording Kit: OPVT deep water fording kit

Transmission: Synchromesh, hydraulically assisted, with 7 forward and 1 reverse gears

Suspension: Torsion bar

Ground Clearance: m0.49

Fuel Capacity: liters1,200

Gyrocompass: GPK-59 gyrocompass

Rechargeable Batteries: four 12ST-85R 34 AMP rechargeable batteries

Starter Generator: SG-10-1S

Communications

Radio #1: R-173 (Standard Radio for Russian Tanks)

R-173 Range: km0-20

Radio #2: R-168-100U (Standard VHF)

Main Gun

Note: Another primary difference between the T-72A and the T-72B is that the T-72B can fire the 125mm 9K120 Svir Missile Complex

↳*System*

Name: 2A46M/2A46M-5

Type: 125mm Smoothbore

Max Rate of Fire: rds/min8

Manually Load Time: rds/min1-2

Barrel Life: rounds600

Sustain Rate of Fire: INA

Thermal Sleeve: Yes, alloy thermal sleeve

Bore Type: Central Bore Evacuator

Breech Type: semi-automatic horizontal sliding breech block via an interrupted screw thread.

Autoloader: Yes, electromechanical carousel autoloader

Time to reload the Autoloader: min4-5

Fire on the Move: Yes, Main Gun

Maximum Elevation: deg-6

Minimum Elevation: deg+14

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

↳*Ammunition (Option 1)*

Name: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS)

Type: Smoothbore 125mm Projectile

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Effective Range: m2,000-3,000

Armor Penetration: mm1,000

Muzzle Energy: MJ15-24

Projectile Dimension: mm900

Projectile Weight: kg11

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

↳*Ammunition (Option 2)*

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s850

Max Dispersion: mrad0.23

Maximum Range: m5,000

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 3)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Basic Load: 45 Total Rounds of any 125mm Russian Projectiles

Muzzle Velocity: m/s915

Max Dispersion: INA

Maximum Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile

↳*System*

Note: The 9K120 gun-launched missile complex is a two piece guided missile that is loaded and fired from the main gun in the same way as an ordinary round.

ATGM System Name: 9K120 gun-launched missile complex

Missile Name: 9K119 SVIR / AT-11

Type: Laser Guided Anti-tank guided missile launcher

Manufacturer: KBP Instrument Design Bureau

Caliber: mm125

Round Type: 3UBK20 round

Guidance System: 9M119M Laser Guided Missile

Voltage Converter: 9S831 voltage converter.

Tracking System: IK13 tracker

Basic Load: ea6

Onboard Guidance System: Yes

Sight Assembly: coded laser guidance beam 1K13-49

Gunner's Night Sight: TPN-1-49 secondary night sight.

Fire Control System: 1A40-1

Hit Probability: %80

Penetration: up to 700mm of armor

Warhead Weight (HEAT): kg4.2

Warhead Type: 9N142 shaped charge warhead

Laser Emitter: 1K13 sight's laser

Maximum Effective Range: m4,000

Minimum Effective Range: m100

Elevation Range (Super Elevation): deg-7 to +20

Elevation Range (Standard Elevation): deg-5 to +15

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650-750

Effective Rate of Fire: rds/min250

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length: mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.60

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: ea2,000

Effective Range (Iron Sights): m1,000

Effective Range (with Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Secondary Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: 12.7 Anti-Aircraft Machine Gun

Proliferation: over 1 Million

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Weight (Gun Only): kg25

Muzzle Velocity: m/s845

Length (Total): mm1,560

Max Rate of Fire: rds/min700-800

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Action: Gas Operated

Maximum Elevation: deg+75

Minimum Elevation: deg-4

Sights: Iron Sights

Feed System: 50-Round Belt

↳***Ammunition***

Type: Rifle

Caliber: mm12.7x108

Muzzle Velocity: m/s845

Basic Load: ea300

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Fire Control

Name: 1A40-1

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes, 1K13 sight and aiming complex

Thermal Sight Gunner: Gunner's primary sight is the 1A40-1

Main Gun Stabilization: 2E42-2 (Upgrade)

Range, Day Sight: m5,000

Range, Thermal Sight: m1,000

Infrared: Yes

Gyrocompass: GPK-59 gyrocompass

Searchlight: L-4A "Luna" IR searchlight

Collimator Sight: K10T collimator sight

Periscopes: two TNPO-160 prismatic periscopes

Note: The Gunner, using the 1A40-1 sight can designate and engage targets out to a mazimum distance of 4,000 meters with APFSDS and HEAR rounds.

Protection

Hull Armor: Steel and composite armour with additional plates that provide protection equivalent to 950mm of steel against HEAT projectiles, 440mm resistance to KE rounds, and 500mm against shaped charges. The T-72BM also has a additional twelve separate charges of ERA compared to the T-72B.

Turret Armor: Steel and composite armour with ERA, 950 mm against HEAT weapons. The Turret has additional Ceramic or silica inserts to add to the protection level of the T-72BM. Additionally, the T-72BM has arrow-shaped arrays of ERA added to the turret front

Applique Armor: Available, Turret top and track skirts

Explosive Reactive Armor (ERA): Yes, Kontakt-V (UPGRADE). Additional ERA is added to the Turret, Glacis, and sides of the hull.

ERA Explosive Element: 4S22

ERA 4S22 Elements (Plates): ea240

Armor Cassette Type: 4S22 cassette that is filled with an explosive element and steel armoured plate.

Number of total Armor Cassettes: ea200-300

NBC Protection: Yes, System Sensor Radiation Device and chemical intelligence (PRRM).

Active Protection System: Yes, ZETS11-3 Control System

Self-Entrenching Blade: Yes, built in Dozer Blade

Mine Clearing: Yes, Roller and plow (optional)

Grenade Launcher: Yes, twelve 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade.

Grenade Maximum Effective Range: m200-300

Grenade Smoke Screen Size: 30 m wide and 10 m high for 60 seconds per grenade.

Engine Smoke Screen Capable: Yes

IR Signature: INA

Automatic Fire Extinguishing Equipment.: Yes

Note #2: The base protection of the T-72BM is the same as the T-72B, however the vehicle is upgraded with considerable amounts of additional composite armor and ERA Plates.

Note #3: The additional added armor cassettes reduce penetration by as much as 95%.

Notes:

The T-72BM is an upgraded version of the T-72, fitted with Kontakt-5 explosive reactive armor. This version appeared in 1989. Russia: Widely Proliferated, the T-72BM has become the most numerous tank in the Russian inventory.

Type 79, Chinese Main Battle Tank

Tiers:

Variants:

- **Type 79 I:** This designation was given to the late production vehicles that were equipped with a more powerful 730 hp diesel engine.
- **Type 79 II:** This is an improved variant that has been reportedly fitted with a new fire-control system, which has the laser rangefinder integrated into the gunner's sight, rather than mounted externally over the 105-mm gun. An export variant with the same designation had an armor array on the turret, 76-mm electrically operated smoke grenade launchers and the sight system of the older Type 69 tank. This type never entered quantity production or service.

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Overpressure system

Smoke Equipment: 4 electronic launchers on each side of the turret

IR Signature: NA

Notes:

The Type 79 is a Chinese main battle tank (MBT) having the same hull and turret as the earlier Type 59 /69 MBT but a different chassis. It is also designated the Type 69 -III. A development of the Type 69-II, the Type 79 is said to have improved firepower, fire control, night-vision and communications equipment. A large rectangular window has been added to the turret, installed forward of the commander's cupola and possibly housing an internal laser rangefinder. Four electrical smoke dischargers are mounted to each side of the turret with a metal stowage box behind them (probably carrying additional grenades). Additional smoke can be generated by injecting diesel fuel into the exhaust outlet on the left side of the hull. A stowage rack runs around the back of the turret, which reportedly provides some protection against high-explosive anti-tank (HEAT) rounds, detonating them before they come in contact with the armor. The main armament is a Type 83-I rifled 105-mm gun, derived from the British L7 design, fitted with a fume extractor and thermal sleeve. It is capable of firing armor-piercing, fin-stabilized, discarding-sabot (APFSDS), HEAT and HEAT fragmentation (HEAT-FRAG) rounds. A 12.7-mm anti-aircraft machine gun is mounted on the loader's cupola. The turret also carries a 7.62-mm coaxial machine gun. While similar to the hull of the Type 69, the rear hull of the Type 79 exhibits slight differences due to a different power pack. In addition, the towing eyes are under the nose and the headlamps are similar to those found on the Type 80. The Type 79 has six road wheels and the upper portion of the suspension is covered by five removable skirts. The tracks on the Type 79 typically come with removable rubber pads. Standard equipment includes a simple fire-control system; night-vision equipment for the commander, gunner and driver; an NBC overpressure system; long-range fuel tanks carried on the rear of the hull; and an unditching beam. Some current Type 79 tanks are fitted with a new sighting system, featuring a laser rangefinder integrated into the gun sight and fitted with new tracks with rubber pads. Later production Type 79s include upgraded fire-control systems, a thermal imager and an electro-hydraulic hybrid 2-axis gun stabilizer. They also feature an expanded bustle rack similar to those equipping the Type 69-II.

ZTZ-99A (Type 99) Chinese Main Battle Tank (MBT)

Tiers:

Variants:

- **Project 9910 prototype:** Also known as the WZ-123. The early pre-production (small batch production) prototype was called Project 9910. Features included composite armor panels and a 1200 hp diesel engine. 1st generation ERA may have been an option.The armor layout of the early pre-production prototype may have been similar to the T-80U and T-80UK.
- **Type 99:** Also known as the Type 99G and Type 99A1. Upgradable from small batch production prototype. The wedged shaped turret and applique armor panels on turret front and sides. Upgraded to third generation ERA and second generation thermal sight. Has a semi-automatic transmission
- **Type 99G:** is a modified version of the basic version of the ZTZ99. A photo from China's Xinhua News Agency in February 2008 revealed this upgraded version. The ZTZ99 G will be equipped with a new observation system and new protection. The vehicle leader's optical system seems wider than the basic version of the ZTZ99, which could indicate the use of a thermal imaging vision system.
- **Type 99Z:** Successor Type 99G and Predecessor Type 99A1
- **Type 99A2:** This latest version has undergone many upgrades and improvements, so we can consider the Type 99A2 version as a new tank. The Type 99A2 is equipped with a new sighting system, an on-board computer giving battlefield information, a new shield design, and a wider turret, The Type 99A2 is also equipped with an active system of turret mounted protection, a new vision system for the vehicle head and a new propulsion unit.
- **Type 99KM:** New version with many upgrades, upgrade the modular system of active protection, upgrade the JD-4 laser defense system, it would be equipped with a 155 mm gun, capable of firing missiles and a new generation of ammunition. Reports state that the Type 99KM version would be 10 years ahead of any existing battle tanks.
- **Type 99A3 / ZTZ-99A:** This is the latest version in operational service. It features a stabilized 125-mm gun and improved armor and targeting systems. The tank reportedly includes an upgraded JD-4 active laser defense system and a 125-mm gun with the ability to launch both missiles and next-generation kinetic rounds. Next-generation explosive reactive armor is fitted on the turret and a new composite armor on the top. The Type 99A3 is also China's first networked tank, with information-sharing, combat coordination and status monitoring capabilities. The tank is slightly taller than the baseline Type 99. An automatic transmission is fitted.

Notes:

Type 99A1 is the latest version of the ZTZ99 in service in the Chinese military, but a Type 99A2 version is undergoing testing and evaluation. The turret of Type 99A1 has been modified, which modifies the physical aspect of the turret, by the disappearance of the bump on the upper part. This modification of the turret has increased its protection and the interior space for the gunner and the head of the vehicle. A shielding kit was mounted on the front and sides of the hull, and the ERA shield was expanded. Type 99A1 has also received new equipment for computers and fire control.

Leopard 2A4 German Main Battle Tank (MBT)

Tiers:

Parent:

Leopard 2 German Main Battle Tank (MBT)

Variants:

- **Leopard 2A1:** Minor modifications and the installation of the gunner's thermal sight[1] were worked into the second batch of 450 vehicles Leopard 2, designated the A1. Krauss-Maffei built 248 (Chassis Nr. 10211 to 10458) and Mak built 202 (Chassis Nr. 20173 to 20347). Deliveries of the 2A1 models started in March 1982 and ended in November 1983. The two most notable changes were the modification of the ammunition racks to be identical to those in the M1A1 Abrams, and redesigned fuel filters that reduced refuelling time. A third batch of 300 Leopard 2, 165 by Krauss-Maffei (Chassis Nr. 10459 to 10623) and 135 by MaK (Chassis Nr. 20375 to 20509.), was built between November 1983 and November 1984. This batch included more minor changes that were later retrofitted to the earlier 2A1s
- **Leopard 2A2:** This designation was given to upgraded vehicles of the first batch of Leopard 2s, brought up to the standard of the second and third batches. This modernisation gradually replaced the original PZB 200 sights in the first batch with thermal sights for the EMES 15 as they became available. Furthermore, the upgrade included the fitting of filler openings and caps to the forward hull fuel tanks to allow separate refuelling, as well as the addition of a deflector plate for the periscope and a large coverplate to protect the existing NBC protection system. Finally, the tank was given new five metre towing cables with a different position. The programme began in 1984 and ended in 1987; the third, fourth and fifth batches, which were produced during this period, had the same features. The modernised first batch can be recognised by the circular plate covering the hole where the cross-wind sensor for the fire-control system was removed
- **Leopard 2A3:** The fourth batch of 300 vehicles, 165 by Krauss-Maffei (Chassis Nr. 10624 to 10788) and 135 by Mak (Chassis Nr. 20510 to 20644), was delivered between December 1984 and December 1985. The main change was the addition of the SEM80/90 digital radio sets (also being fitted to the Leopard 1 at the same time), and the ammunition reloading hatches being welded shut. Even with these minor changes the new batch was known as the 2A3
- **Leopard 2:** The Leopard 2 is a main battle tank developed by Krauss-Maffei in the 1970s for the West German Army. The tank first entered service in 1979 and succeeded the earlier Leopard 1 as the main battle tank of the German Army. It is armed with a 120 mm smoothbore cannon, and is powered by a V-12 twin-turbo diesel engine. Various versions have served in the armed forces of Germany and 12 other European countries, as well as several non-European nations, including Canada, Chile, Indonesia, Singapore, and Turkey. The Leopard 2 was used in Kosovo with the German Army, and has seen action in Afghanistan with the Dutch, Danish and Canadian contributions to the International Security Assistance Force, as well as also seeing action in Syria with the Turkish Armed Forces against ISIS and the YPG.
- **Leopard 2 Marksman:** Finland has modernised its Marksman SPAAG vehicles by replacing the original T-55AM chassis with a newer Leopard 2A4 chassis. The upgraded Marksman vehicles were scheduled to enter service with the Finnish Army in 2016. The new Leopard 2 chassis greatly improves mobility compared to the older T-55AM chassis, both on- and off-road. The Leopard 2 chassis is also larger, thus providing a more stable firing platform for the Marksman turret to operate from
- **Leopard 2A5:** "Leopard 2 Improved" was a prototype-series for enhancing the A4, introducing a wedge-shaped, spaced add-on armour to the turret front and the frontal area of the sides. These spaced armour modules defeat a hollow charge prior to reaching the base armour, and causes kinetic-energy penetrators to change direction, eroding them in the process; it does not form a shot-trap, since it does not deflect the penetrators outwards to hit the hull or turret ring. The gun mantlet was redesigned to accept the new armour.
- **Stridsvagn 122:** The Stridsvagn 122 is a Swedish Army tank based on the Leopard 2 Improved, with 120 units built, 91

of which were licence-produced in Sweden. The tank features increased armour on the turret top and front hull, and improved command, control and fire control systems. Externally, it can be distinguished from the Leopard 2A5 by the French GALIX smoke dispensers, different storage bins, and the much thicker crew hatches The Strv 122B, a variant equipped with modular AMAP composite armour from IBD Deisenroth, has increased 360° protection against threats like EFPs, RPGs and IEDs. The width of 4 metres (13 ft) has been kept, while the weight increases by only 350 kilograms (770 lb)

- **Leopard 2-140:** n the early 1990s,[citation needed] Rheinmetall began development of a 140 mm smoothbore cannon for use in future tank designs. The new gun was intended to counter new Soviet tank developments, especially since the next generation of Soviet main battle tanks were rumoured to be armed with a 135 mm or 152 mm cannon. The new 140 mm cannon was part of a modernisation programme for the Leopard 2 known as the KWS III. Test firing of the new 140 mm cannon was conducted. Results showed that the gun had high penetration values, and had a muzzle velocity of around 2000 metres a second, with potential to be increased further. However, the 140 mm rounds were too heavy for the tank crew to handle effectively
- **Leopard 2A6:** The Leopard 2A6 includes the addition of the Rheinmetall 120 mm L/55 smoothbore gun and other changes. All German tank battalions of the "crisis intervention forces" are equipped with the A6. Canada purchased 20 Leopard 2A6s from the Netherlands. These were delivered in 2007. Portugal also purchased 37 Leopard 2A6 from the Dutch in 2007, with delivery in 2008. In January 2014, Finland purchased 100 L2A6s, as well as munitions, simulators, and a ten-year supply of reserve parts from the Netherlands. The tanks are being delivered in batches between 2015-2019.
- **Leopard 2E:** he Leopard 2E is a derivative of the 2A6, with greater armour protection, developed under a programme of co-production between the defence industries of Spain and Germany. The programme was developed within the frame of collaboration decided in 1995 between the Defence Ministries of both countries, in which also was included the cession of use by a period of five years of 108 Leopard 2A4 from the German Army to the Spanish Army. However, this cession was extended up to 2016, and after that those tanks will be the sole property of the Spanish Army, as has been made public on 24 January 2006, then having been paid a total of 15,124,014 euros in ten yearly installments, giving the Spanish co-ownership from 2006.
- **Leopard 2 PSO:** The new Leopard 2 PSO (Peace Support Operations) variant is designed specially for urban warfare, which had been encountered in peacekeeping operations with increasing frequency. Therefore, the Leopard 2 PSO is equipped with more effective all-around protection, a secondary weapons station, improved reconnaissance ability, a bulldozer blade, a shorter gun barrel (for manoeuvring on urban streets at the expense of fire range), non-lethal armament, close-range surveillance ability (through camera systems), a searchlight and further changes to improve its perseverance and mobility in a built-up non-wide open area. These features are similar to the Tank Urban Survival Kit for the American M1A2 Abrams
- **Leopard 2A7:** The Leopard 2A7 is fundamentally different from the KMW variant 2A7+ and is not optimised for combat in urban terrain. A total of 20 vehicles are provided for converting. It involves former Dutch A6NL models returned by Canada to Germany. The original upgrade to A6M has been extended in coordination with Canada and includes a crew-compartment cooling-system from the Leopard 2 A6M-HEL series, a new 20 kW auxiliary power unit based on the Steyr Motors M12 TCA UI engine, the Saab Barracuda Mobile Camouflage System (MCS) with Heat-Transfer Reduction (HTR CoolCam) system, a field trial proven combat management and information system (IFIS: Integriertes Führungs- und Informationssystem), onboard network optimization with ultracapacitors in the chassis and turret, a SOTAS IP digital intercom system, a renewal of the fire suppression system in the crew compartment, and the retrofitting of Attica thermal imaging module in the commander optics. The weapon system is adapted for firing HE ammunition. It is also fitted for, but not with, additional passive side protection armour. The first Leopard 2A7 was handed over to the German Army in Munich on 10 December 2014. A total of 14 vehicles were produced for Tank Battalion 203, plus four more going to the Armoured Corps Training Centre and one vehicle at the Technical School for Land Systems and School for Technology of the Army. The last tank remains as a reference vehicle at KMW
- **Leopard 2A7+:** The Leopard 2A7+ was first shown to the public during the Eurosatory 2010, featuring the label "Developed by KMW – tested and qualified by German MoD". The Leopard 2A7+ has been tested by the Bundeswehr under the name UrbOp (urban operations).The Leopard 2A7+ is designed to operate both in low intensity and high intensity conflicts.
- **Pz 87:** Pz 87 (standing for Panzer 87, referring to year of service entry) is the designation given to the Leopard 2A4 vehicles built under licence in Switzerland. The vehicles are essentially the same specification as the fifth and sixth production batch 2A4. This version included Swiss built communications equipment and MG 87 MGs, as well as featuring an improved NBC protection system, the installation of a hydraulic track-tensioning system, and the addition of an exhaust silencer. Late model Pz 87 included a field zeroing system, the sealing of the ammunition loading hatch, and from the 120th vehicle, the addition of heavier armoured side skirts.

Fire Suppression System: Yes, Automatic

Grenade Launchers: Eight grenade launchers are mounted on each side of the Turret

Fire Detection and Suppression System: Yes, Kidde-Deugra Brandschutzsysteme System

Emergency Escape Hatch: Yes, below the driver's compartment

Notes:

The most widespread version of the Leopard 2 family, the 2A4 models included more substantial changes, including an automated fire and explosion suppression system, an all-digital fire control system able to handle new ammunition types, and an improved turret with flat titanium/tungsten armour. The Leopard 2s were manufactured in eight batches between 1985 and 1992. All the older models were upgraded to 2A4 standard. Until 1994, Germany operated a total of 2,125 2A4s (695 newly built and the rest modified older versions), while the Netherlands had an additional 445 tanks. The 2A4 was also license manufactured in Switzerland as the Panzer 87 "Leopard" or Pz 87. This version included Swiss-built 7.5 mm MG 87 machine guns and communications equipment, and featured improved NBC protection system. Switzerland operated 380 Pz 87 tanks.After 2000, Germany and the Netherlands found themselves with large stocks of tanks that they had no need for after the Cold War. These tanks were sold to NATO or friendly armies around the world. Among these buyers of the surplus tanks were Turkey (purchasing 354 vehicles), Greece (183), Sweden (160), Chile (140), Finland (139), Poland (128), Austria (114), Spain (108), Canada (107), Singapore (96), Norway (52), Denmark (51), and Portugal (37).

Type 59D Chinese Main Battle Tank (MBT)

Tiers:

Variants:

- **Type 59:** The basic variant, a T-54A clone without IR searchlight. Entered production in 1957.
- **Type 59-I:** Improved variant fitted with a Type 69-II 100 mm rifled gun, as well as a laser rangefinder, hydraulic servo-system, primitive fire-control system, automatic fire suppression system, and rubber track skirt. The Type 59-I includes several versions with different armour and fire control configurations.
- **Type 59-II:** This version was fitted with a two-axis, stabilized, rifled 105-mm gun with a fume extractor and thermal sleeve. The Chinese-made gun is very similar to the British L7/U.S. M68 105-mm tank gun. The Type 59 II also has a 580-hp diesel engine, a light spot fire-control system and an automatic fire extinguisher. New radios and communication systems were installed. It is known to U.S. forces as Model 1984, representing the first year it was identified. Mass increased to 36.5 tonnes.
- **Type 59D1:** The Type 59D1 (also known as WZ-120C) is an upgrade with explosive reactive armour, computerized stabilized fire-control system, the 105 mm. gun of the Type 59-II, and night vision system
- **Type 59G:** An upgrade of the Type 59, featuring a redesigned turret and armor. It uses a turret similar to that of the Type 96A, a 125 mm gun, modern fire control systems, arrow-shaped armor, spaced armor, and possibly third-generation subsystems.
- **Jaguar:** The Jaguar was a prototype vehicle based off the Type 59 chassis that was jointly developed by the United States and China during 1980s, made possible by the US-Chinese détente of the 1970s. Planned to replace China's existing tank fleet, as well as for the export market, the tank featured improvements to the standard Type 59's engine, armament, armour, turret, optics, electronics, fire control and suspension. Following Tiananmen Square massacre, American-Chinese relations soured and the Chinese withdrew from the project. The Americans continued alone and successfully completed the design, however the end of the Cold War saw a glut in the international tank market and thus no orders were ever placed for the vehicle
- **Type 62 Light Tank:** In the late 1950s, the PLA submitted requirements for a light tank more suitable for operations in China's southern region. Development on the new Type 62 tank began in 1958, which was a scaled-down Type 59 MBT with simplified equipment. The Type 62 light tank entered batch production in 1963, and approx. 800 were produced by 1978. The Type 62 light tank weights only 21 tons, and is equipped with a Type 62-85TC 85 mm rifled gun, and 3 machine guns. An improved Type 62-I version was produced with better FCS with laser rangefinder, and turret storage racks for added protection. Other versions based on the Type 62 include the Type 79 recovery vehicle (prototype only) and Type 82 earth-mover. The PLA deployed the Type 62 light tank to Vietnam during the 1979 Sino-Vietnam conflict. They found that the thin armor of the Type 62 tank could be penetrated easily by hand-held anti-tank weapons, such as the 40 mm RPG. The Type 62 tank suffered severe losses during the conflict, which convinced the PLA to develop new second-generation MBTs. The Type 62 tank received a major upgrade in 2000, with new welded turret, vertically stabilized 105 mm rifled gun, fire-control system, night vision device, smoke grenade launchers, and explosive reactive armor (ERA) package
- **Type 69 / 79:** Improved Type 59 MBT built by 617 Factory (Inner Mongolia First Machine Group Co. Ltd). Only saw limited service in the PLA, but was an export success in the 1980s with more than 2,000 sold worldwide.
- **Type 73:** This armored recovery vehicle is a Type 59 with its turret removed. The vehicle is armed with a single 12.7 mm machine gun. This armored recovery vehicle is not believed to have a winch and is limited to towing operations.
- **Type 59 Heavy Infantry Fighting Vehicle:** The modernized HIFV model of Type 59 weighs around 40 tons and can carry up to seven passengers. Modifications include moving the engine to the front of the vehicle chassis, increasing tank armor including explosive reactive armor on all sides, and installing a rear door for dismounting infantry
- **QN-506:** It is a modernized variant of the Type 59 using the tank's chassis similar to its Russian counterpart the BMPT Terminator. The vehicle was first appeared at the Zhuhai Air Show in China in November 2018, and is armed with two QN-502C anti-tank missiles, ten QN-201 multi-purpose mini missiles, four S-507 loitering munitions, an unmanned 30

mm cannon, a 7.62 mm machine gun, six grenade launchers, and a quadcopter surveillance drone
- **Type T-72Z:** Iran version
- **Kok'san:** North Korea version.
- **Al-Zarrar:** Pakistan version. Heavy Industries Taxila of Pakistan has introduced the Al-Zarrar Main Battle Tank. The Al-Zarrar series was designed to improve and rebuild the Pakistani army's Type 59 tanks by way of more modern armament, fire control, defensive equipment, etc. Improvements include: 125 mm smoothbore gun, firing APFSDS, HEAT-FS and HE-FS. Semi-automatic loading and image Stabilized fire control. 730 hp Engine for improved mobility. Improved suspension. Improved defense with explosive reactive armour and anti-mine cover underneath.
- **Type 59G(BD) Durjoy:** Bangladesh version. Bangladesh Army's Type-59 are being upgraded to Type 59(BD)G Durjoy locally with Chinese assistance. 174 are being upgraded in First batch. Upgradation process includes: 125mm main gun with new turret (Type 96 turret) 28 rounds, Type-85 12.7×108mm Commander's machine gun (3,000 rounds), Co-axial 7.62mm gun (600 rounds), 81mm Smoke grenades. Chinese 3rd generation ERA on front, turret and side skirts. Modular Composite armour on turret front. Cage armour on back of turret to protect from RPG hits. NBC protection, Collective Fire suppression system. Laser warning receiver, Laser designator, Fire control system, Combat data link, Thermal imaging system. 730 H.P. Diesel engine Barrel launched ATGM firing capability. Rubber padded tracks. VLC 3000 radio contact system.

System

Alternative Designation: WZ-120D, ZTZ-59D

Type: Main Battle Tank (MBT)

Smoke Equipment: 8 x 81-mm smoke grenade launchers. Vehicle engine exhaust smoke system.

Notes:

Type 59D (also known as WZ-120D) is an upgrade with the Type 59D1. The Type 59D has a longer 105 mm gun, called Type 83A, or Type 94. The gun has a range of 2000 m, and may fire ATGMs out to 5500 m. A thermal sight is available.

Zulfiqar-3 Iranian Main Battle Tank (MBT)

Tiers:

Variants:

- **Zulfiqar-1:** The Zulfiqar-1 is based on the M60 Patton model acquired under the pre-revolution era. The Zulfiqar-1 was first revealed in public in 1994. A total of six prototypes were completed and field tested in 1997. The Zulfiqar-1 is protected by a welded steel hull and the turret is reinforced by a composite armour. The Zulfiqar-1 is armed with a 125mm Smoothbore gun taken from a T-72.
- **Zulfiqar-2:** The Zulfiqar-2 is an interim main battle tank prototype used as a test bed. This variant is fitted with a new and more powerful engine. It has an extended chassis and possibly uses an improved autoloader.

System

Alternative Designation: Zulfiqar-3
Manufacturer: Shahid Kolah Dooz Industrial Complex
In Service: 2012-Present
Type: Main Battle Tank
Family: Zulfiqar Class
Crew: ea3 (commander, gunner and driver)

↳*Ammunition (Option 2)*

Name: 3VOF22

Type: High Explosives (HE)

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Caliber: mm125

Muzzle Velocity: m/s850

Basic Load: 39 Total Rounds of any 125mm Projectiles

Max Dispersion: 0.23 mrad

Maximum Range: m5,000

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Projectile Weight: kg23

Round Weight: kg33

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 3)*

Name: 3VBK27/3BK31 "Start"

Type: High-Explosive Anti-Tank (HEAT)

Caliber: mm125

Muzzle Velocity: m/s915

Basic Load: 39 Total Rounds of any 125mm Russian Projectiles

Max Dispersion: INA

Maximum Range: m3,000

Charge Type: HEAT

Charge Weight: kg1.62

Projectile Weight: kg18.4

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

Anti-Tank Guided Missile (ATGM)

Name: 9M119 Svir, 9M119M Refleks(NATO designation AT-11 Sniper-B)

Type: Laser Beam Anti-Tank Guided Missiles (ATGM)

Caliber: mm125

Manufacturer: Degtyarev plant

In Service: 1980's to present

Proliferation: Widely Proliferated

Operational Range: m4,000-5,000

Weight: kg17.2

Diameter: mm125

Basic Load: ea6

Warhead Type: Tandem hollow-charge

Warhead Weight: kg4.5

Speed: Subsonic

Guidance System: 9S516 guidance system

Launch Platform: 125 mm smoothbore guns

Armor Penetration: 700mmm of homogeneous armour

Time to meet Maximum Range: seconds17.6

Control Unit: 9S517 automatic control unit

Voltage Regulator: 9S831 voltage regulator.

Auxiliary Weapon System #1

Note: The Zulfiqar-3 lacks a coaxial machine gun

↳*System*

Name: Type 54 (DShKM)

Type: 12.7 mm Type 54 Heavy Machine Gun

Proliferation: +1 Million

Length, Total: mm1,625

Barrel length: mm1,070

Weight (Gun Only): kg34

Weight (On Wheeled Mounting): kg157

Rate of Fire: rds/min600

Action: Gas-Operated, Flapper Locking

Feed System: 50 Round Belt

Sights: Iron/Optical

Variants: DK, DShKM, DSHKS, Type 54 HMG

↳*Ammunition*

Type: Heavy machine gun and anti-materiel rifle cartridge

Caliber: mm12.7

Cartridge: 12.7x108 mm

Muzzle Velocity: m/s850

Basic Load: ea1,200

Maximum Effective Range: m2,500

Armor Penetration: API: 21 at 500 m & 13 at 1000 m (RHA)

Auxiliary Weapon System #2

Note: The Rheinmetall MG 3, 7.62mm General Purpose Machine Gun is mounted on the front of the turret and is controlled remotely.

↳*System*

Name: Rheinmetall MG 3

Type: 7.62mm General Purpose Machine Gun

In Service: 1960-Present

Manufacturer: Rheinmetall

Effective Firing Range (With Sight Adjustment): m200-1,200

Maximum Riring Range (Bipod): m600

Maximum Riring Range (Tripod Mounted): m1,200

Maximum Riring Range (Gun Carriage): m3,000

Maximum Riring Range (Terminal): m7,750

Feed System: 50-round non-disintegrating DM1 belt (can be combined in a drum); 100-round disintegrating DM6/M13 belt

Sights: Open tangent iron sights

↳***Ammunition***

Name: INA

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Muzzle Velocity: m/s820

Basic Load: ea2,000

Fire Control

Name: Upgraded Fire Control System compared to the Zulfiqar-1 and Zulfiqar-2. Name: INA

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes

Thermal Sight Gunner: Yes

Thermal Sight Driver: Yes, passive periscope for night driving.

Main Gun Stabilization: Yes

Domestic System: Yes

Laser Rangefinder: Yes

Fire on the Move: Yes

Driver Periscopes: three day periscopes for driving

Protection

Hull Armor: Reinforced composite armor on the front arc.

Turret Armor: Turret mounts a laser-warning pod and the steel is welded providing protection from small arms fire

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes, Six electrically operated smoke-grenade launchers are mounted on each side of the turret.

Note: An armored skirt covers the wheels and the turret is reinforced

Notes:

The Zulfiqar-3 is the most advanced variant of the Zulfiqar family. It features considerable upgrades to the fire control system, chassis, engine and main gun. The new variant is equipped with the 2A46 125 mm smoothbore cannon with an autoloader, a laser rangefinder and a new fire control system. It is also fitted with a reinforced turret and the wheels are covered by an armoured skirt.

T-55 Russian Main Battle Tank (MBT)

Tiers:

Variants:

- **T-55A:** In 1961, development of improved NBC protection systems began. The goal was to protect the crew from fast neutrons; adequate protection against gamma radiation was provided by the thick armour and a PAZ basic NBC protection system.
- **T-54/T-55 upgrades:** n its long service life, the T-55 has been upgraded many times. Early T-55s were fitted with a new TSh-2B-32P sight. In 1959, some tanks received mountings for the PT-55 mine clearing system or the BTU/BTU-55 plough. In 1967, the improved BM8 APDS round, which could penetrate 275 mm thick armour at a range of 2 km, was introduced. In 1970, new and old T-55 tanks had the loader's hatch modified to mount the 12.7 mm DShK machine gun, to deal with the threat of attack helicopters. Starting in 1974, T-55 tanks received the KTD-1 or KTD-2 laser rangefinder in an armoured box over the mantlet of the main gun, as well as the R-123 or R-123M radio set.[10] Simultaneously, efforts were made to modernize and increase the lifespan of the drive train.
- **T-55AM:** upgraded version of the T-55A. It is fitted with add-on composite armor and rubber side skirts. The gun is fitted with a thermal sleeve. It entered service in 1983.
- **T-55AM-1:** upgraded version of the T-55AM, powered by a V-46-5M diesel engine, developing 690 hp.
- **T-55AD:** fitted with Drozd active protection system. It also has add-on armor. It entered service in 1983.
- **T-55AD-1:** fitted wit a V-46-5M diesel engine, developing 690 hp.
- **T-55AMV:** fitted with add-on explosive reactive armor and new fire control system. It is capable of launching anti-tank guided missiles in the same manner as ordinary projectiles. The missile has a range of 4 000 m at daytime and 1 200 m at night. It penetrates 550 mm of rolled homogenous armor. It entered service in 1985.
- **T-55M:** Upgraded version fitted with add-on composite armor and rubber side skirts. The gun is fitted with a thermal sleeve. This tank entered service in 1983.
- **T-55M-1:** it is a further upgrade of the T-55M, powered by a V-46-5M diesel engine, developing 690 hp. This tank is also fitted with ballistic computer.
- **T-55MV:** it has improved protection and firepower. It is fitted with add-on explosive reactive armor and improved fire control system. It is capable of launching anti-tank guided missiles in the same manner as ordinary projectiles. The T-55MV entered service in 1985.
- **T-55MV-1:** fitted with a V-46-5M diesel.
- **T-62A:** an improved T-55 with a stretched chassis, new suspension, new turret. It was armed with a 100 mm gun with improved ballistics. First prototypes were built in 1958 and it was accepted to service in 1962. Only a small number of these tanks were built for experimental service. However it was a forerunner of the T-62 medium tank, that was produced in thousands.
- **TO-55:** flamethrower tank. Coaxial machine gun has been replaced with a flame thrower.
- **BTS-2 and BTS-3:** armored recovery vehicles.
- **MTU-20 and MTU-55:** armored bridgelayers.
- **BTR-T:** is a heavy armored personnel carrier. It was first publicly revealed in 1997. It was converted from obsolete T-55 medium tank. The turret has been removed in order to create a compartment for dismounts. A number of other modifications were made to the vehicle. This armored vehicle has a crew of 2 and accommodates 5 dismounts. The BTR-T received no production orders.
- **Ti-67:** sraeli version, fitted with American M68 105 mm rifled gun. It is also fitted with Israeli fire control system, new engine and transmission and Blazer explosive reactive armor. About 200 T-54/55 tanks, that were captured from Egyptian and Syrian forces, were upgraded to this standard.
- **T-54E Ramzes II:** a proposed upgrade of Egyptian T-54/55 tanks. It is fitted with American M68 105 mm rifled gun, Belgian fire control system, and American Continental AVDS-1790-5A engine.
- **T-55 Enigma:** upgraded Iraqi version, fitted with composite add-on armor. Add-on armor weights a total of 4.6 t, so a

counterweight was mounted at the turret rear. This tank also has improved night vision devices.
- **TR-580:** a Romanian version of the T-55 with a longer hull. An extra road wheel on each side has been added. It is fitted with a different engine. This tank is fitted with metal side skirts.

System

Alternative Designation: T-55

Estimated Out of Service Date: Phased out of service with Russia in the early 1990s. Likely to remain in service with current users until the capital can be raised to replace the vehicles according to defence priorities

Total Built: 86,000–100,000+ est. The T-55 has been used worldwide by as many as 50 countries and quasi-armies. They have been subject to numerous improvements throughout their production history and afterwards and many are still in service today.

Manufacturer: KhPZ, UVZ (Soviet Union) Bumar-Łabędy (Poland) ZTS Martin (Czechoslovakia)

Type: Main Battle Tank

Crew: ea4

Modifications: Modifications to the T-54/55 series over the years have changed almost every aspect of the vehicle. Initially, Soviet modifications included a better turret shape, improved NBC protection and an improved powerplant. Later, improved fire-control equipment and night-vision equipment was added. Foreign improvements, both in Warsaw Pact nations and elsewhere, have further improved protection, powerplant, and firepower. T-54/55s have been re-armed with improved tank guns, AA machine guns, advanced armour arrays, and technologies, such as laser range finders and computerized fire control systems, that did not exist when the tank was first being built in the early days of the Cold War.

Dimensions

Length: 9.00 m (with gun forward)

Width: 3.37 m

Height: 2.40 m

Weight, Combat: 36 tons

Automotive

Engine Name: Model V-55

Engine Type: V-12 water-cooled. 38.88-l diesel

Engine Power: hp500

Power-to-Weight Ratio: 14.6 hp (10.4 kW) / tonne

Transmision: Mechanical [synchromesh], 5 forward, 1 reverse gears

Fuel Capacity: 580 l internal, 320 l external (less on early T54), 400 l jettisonable rear drums

Cruising Range: INA

Speed, Maximum Road: km/h48

Speed, Average Cross: km/h25

Protection

Hull Armor: 120 mm hull front at 60° (100 mm after 1949) 79 mm hull upper sides 20 mm hull lower sides 60 mm at 0° hull rear 20 mm hull bottom 33-16 mm hull roof

Turret Armor: 205 mm turret front 130 mm turret sides 60 mm turret rear 30 mm turret roof

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: Roller-plow available, In 1959, some tanks received mountings for the PT-55 mine clearing system or the BTU/BTU-55 plough.

Self-Entrenching Blade: No

NBC Protection: Yes, PAZ (Protivoatomnaya Zashchita) NBC protection system

Smoke Equipment: grenlaunch/eng smk sys

Note: The T-55 focuses most of its armour around the front 60 deg arc.

Notes:

The T-54 and T-55 tanks are a series of Soviet main battle tanks introduced in the years following the Second World War. The first T-54 prototype was completed at Nizhny Tagil by the end of 1945. Initial production ramp up settled for 1947 at Nizhny Tagil, and 1948 for Kharkiv were halted and curtailed as many problems were uncovered; the T-34-85 still accounted for 88 percent of production through the 1950s. The T-54 eventually became the main tank for armoured units of the Soviet Army, armies of the Warsaw Pact countries, and many others. T-54s and T-55s have been involved in many of the world's armed conflicts since the later part of the 20th century. The T-54/55 series eventually became the most-produced tank in military history. Estimated production numbers for the series range from 86,000 to 100,000. They were replaced by the T-62, T-64, T-72, T-80 and T-90 tanks in the Soviet and Russian armies, but remain in use by up to 50 other armies worldwide, some having received sophisticated retrofitting. During the Cold War, Soviet tanks never directly faced their NATO adversaries in combat in Europe. However, the T-54/55's first appearance in the West around the period of the 1950s (then the beginning of the Cold War) spurred the United Kingdom to develop a new tank gun, the Royal Ordnance L7, and the United States to develop the M60 Patton. Trials with nuclear weapons showed that a T-54 could survive a 2–15 kt nuclear charge at a range of more than 300 metres (980 ft) from the epicentre, but the crew only had a chance of surviving at 700 metres (2,300 ft). It was decided to create an NBC (nuclear, biological, and chemical) protection system which would start working 0.3 seconds after detecting gamma radiation. The task of creating a basic PAZ (Protivoatomnaya Zashchita) NBC protection system offering protection against the blast of a nuclear explosion and (radioactive) particulate filtration, but not against external gamma radiation or gas, was given to the KB-60 design bureau in Kharkiv and was completed in 1956. The documentation was sent to Uralvagonzavod. It was decided to increase the tank's battle capabilities by changing the tank's construction and introducing new production technologies. Many of those changes were initially tested on the T-54M (Ob'yekt 139). The tank was fitted with the new V-55 12-cylinder 4-stroke one-chamber 38.88 litre water-cooled diesel engine developing 581 hp (433 kW). Greater engine power was accomplished by increasing the pressure of the fuel delivery and charging degree. The designers planned to introduce a heating system for the engine compartment and MC-1 diesel fuel filter. The engine was to be started pneumatically with the

use of an AK-150S charger and an electric starter. This eliminated the need for the tank to carry a tank filled with air. To allow easier access during maintenance and repairs, it was decided to change hatches over the engine compartment. To increase the operational range, 300 litres (66 imp gal; 79 US gal) fuel tanks were added to the front of the hull, increasing the overall fuel capacity to 680 litres (150 imp gal; 180 US gal). The ammunition load for the main gun was increased from 34 to 45, with 18 shells stored in so called "wet containers" located in hull fuel tanks (the concept for which came from Kartsev's cancelled Ob'yekt 140). The ammunition load included high explosive-fragmentation and anti-tank rounds and designers also planned to introduce the BK5M HEAT rounds which penetrated 390 millimetres (15 in) thick armour. The TPKU commander's vision device was replaced by either the TPKUB or TPKU-2B. The gunner received a TNP-165 vision device. The loader's hatch-mounted 12.7 mm DShK anti-aircraft heavy machine gun was dropped, because it was deemed worthless against high-performance jets. The tank was supposed to be equipped with the "Rosa" fire protection system. The tank had a thicker turret casting and the improved two-plane gun stabilization system from the T-54B, as well as night vision fighting equipment. To balance the weight of the new equipment, the armour on the back of the hull was thinned slightly. The T-55 was superior to the IS-2/IS-3/T-10 heavy tanks in many respects, including the rate of fire of the gun (at least four compared to fewer than three rounds per minute). Despite somewhat thinner frontal turret armour (200 millimetres (7.9 in) instead of 250 millimetres (9.8 in)) it compared favourably with the IS-3, thanks to its improved antitank gun and better mobility. Heavy tanks soon fell from favour, with only 350 IS-3s produced. The old model of highly mobile medium tanks and heavily armoured heavy tanks was replaced by a new paradigm: the "main battle tank". Parallel developments in the West would produce similar results. Kartsev combined all the ongoing improvements being offered, or planned, on the T-54 into one design. This became the Ob'yekt 155, and entered production at Uralvagonzavod 1 January 1958 as the T-55. It was accepted for service with the Red Army on 8 May. It suffered a significant lapse in one area: there was no antiaircraft machine gun, which had been present on the T-54. After 1959, it served as a basis for the T-55K command tank which was equipped with an additional R-112 radio set, an AB-1-P/30 fuel powered accumulator charging unit, and TPN-1-22-11 night vision sight. All this additional equipment made it necessary to decrease the ammunition load for the main gun to 37 rounds and eliminate the bow machine gun. In the beginning of the 1960s, a T-55K was experimentally fitted with a Uran TV relay apparatus for battlefield surveillance. The tank was fitted with an external camera, the picture from which was relayed to a receiver in a BTR-50PU command vehicle. There was an observation camera mounted on a folding mast which was in turn mounted on a UAZ 69 car. The range within which the picture could be relayed varied between 10 and 30 kilometres (6.2 and 18.6 mi). In 1961, a T-55 tank was used to test the "Almaz" TV complex, which was supposed to replace the standard observation devices right after a nuclear explosion or while fording a body of water. There was a camera mounted on the hull for the driver and two cameras mounted on the turret, one for aiming and one for observation, and the picture from the cameras was relayed to two control screens. The tank had the front hull fuel tanks and bow machine gun removed. The commander was seated in the driver's usual position while the driver sat next to him. The cameras allowed battlefield observation and firing during daytime at ranges between 1.5 and 2 kilometres (0.93 and 1.24 mi). Because of the low quality of the equipment, the trials gave negative results. In the beginning of the 1960s, the OKB-29 design bureau in Omsk was working on adapting the tank to use a GTD-3T gas turbine engine developing 700 hp (522 kW). One T-55 tank fitted with this gas turbine engine passed trials but was deemed unsatisfactory and the design did not go into production. The Omsk OKB-29 group tested three experimental T-55 tanks (designated Ob'yekt 612) between 1962 and 1965 that were fitted with an automatic gearbox controlled by electro-hydraulic systems. The trials found that such gearboxes were prone to frequent breakdowns in tanks. At the same time the Ob'yekt 155ML, a T-55 fitted with a launcher for three 9M14 "Malyutka" (NATO code: AT-3 Sagger) ATGMs mounted on the rear of the turret, was tested. Along with standard tanks a flamethrower-armed version was designed (designated TO-55 (Ob'yekt 482)), which was produced until 1962. It was fitted with 460 litre tanks filled with flammable liquid instead of the frontal hull fuel tanks. The flamethrower replaced the coaxial machine gun. This was a much better way to mount a flamethrower than in the experimental Ob'yekt 483, based on the T-54 tank, where the flamethrower replaced the main gun. TO-55 flamethrower tanks were withdrawn from service in 1993.

ZTZ-96A (Type 96) Chinese Main Battle Tank (MBT)

Tiers:

Parent:

Type 96 (ZTZ96) Chinese Main Battle Tank (MBT)

Variants:

- **Type 96:** Domestic version of Type 85-IIM. Also sometimes mistakenly referred to as the Type 88C.[8] Renamed Type 96 when put into PLA service.[1] In comparison to the Type 85 and Type 88, the Type 96 features a more powerful engine, improved electronics and a western-style turret. Type 96 was accepted by the PLA in 1996.
- **Type 96B:** Variant first seen in July 2016 loaded on a Russia-bound train to participate in the 2016 Tank biathlon. It is equipped with an improved engine, improved high-performance gun with an upgraded fire-control system, new transmission, chassis, ventilation, communications and computer systems, exhaust and suspension. Additionally it features an independent commander sight and lighter, more reliable running wheels. The specifications of the upgraded engine are unknown but is speculated to produce between 1,000 and 1,200 horsepower
- **VT-2:** Export variant of Type-96A. Debuted at the 2012 Defence Services Asia Exhibition. Can be equipped with Remote Weapons Station and has a maximum speed of 70 km/h (on road). Capable of turning on its own axis.

System

Alternative Designation: Type 96A, ZTZ-96Gai; Type 96G

Manufacturer: First Inner Mongolia Machinery Factory

Type: Main Battle Tank

Family: Type 96 Main Battle Tank Family

Crew: ea3

Note: The Type 96A looks different from the Type 96 because of the additional arrow shaped armor on the turret front and the extra ERA plates

Control: Self-Adaptive Control (Including Automatic Antenna Tuner)

Frequency Agile: Yes

Wireless Network Capabilities: Yes

Note:: Very similar in capabilities to the US SINCGARS ASIP

Main Gun

↳*System*

Name: 125 mm L50 ZPT-98

Type: 125mm Smoothbore Gun

Max Rate of Fire (Automatic Loading): rds/min8

Max Rate of Fire (Manual Loading): rds/min1-4

Length (Barrel): mm6,000

Barrel Type: 1 with a sliding gun barrel and a smoke evacuator in the middle

Loader Type: Autoloader

Thermal Sleeve: Yes, Light Alloy

Bore Evacuator: Yes

Barrel Life: rounds800

Loader Type: Carousel auto-loader and Manual Loading capable

Launch Mode: Single Shot

After: Wedge Cross

Recoil: Hydraulic and pneumatic

Note: The L50 ZPT-98 can replce the barrel without removing the turret

↳*Ammunition (Option 1)*

Type: High Explosives (HE)

Caliber: mm125

Purpose: High explosive fragmentation fin stabilised. General purpose rounds, for use against infantry, bunkers and light vehicles and other "soft" targets.

Muzzle Velocity: m/s850

Basic Load: 42 total rounds of any 125mm Projectiles

Maximum Effective Range: m4,000

Minimum Effective Range: mINA

Max Dispersion: mrad0.23

Tungsten Rods: ea450

Charge: A-IX-2 (73% RDX, 23% aluminium powder, phlegmatized with 4% wax) 3.0 kg

Round Weight: kg33

Projectile Weight: kg23

Fragments: ea2,500

Armor Penetration: Yes

Variants: 3VOF22/3OF19, 3VOF36/3OF26, 3VOF128/3OF82

↳*Ammunition (Option 2)*

Type: High-Explosive Anti-Tank (HEAT)

Name: 3VBK27/3BK31 "Start"

Caliber: mm125

Muzzle Velocity: m/s915

Basic Load: 42 total rounds of any 125mm Projectiles

Max Dispersion: INA

Maximum Effective Range: m3,000

Charge: INA

Charge Weight: kg1.62

Projectile Weight: kg18.4

Fragments: INA

Armor Penetration: Estimated at 800 mm triple charge HEAT

Variants: 3VBK7/3BK12, 3VBK10/3BK14, 3BK12M, 3BK14M, 3VBK16/3BK18, 3BK18M, 3VBK17/3BK21, 3BK21B, 3VBK21/3BK25, 3VBK25/3BK29 "Breyk", 3VBK25M/3BK29M

↳*Ammunition (Option 3)*

Type: Armour-Piercing Fin-Stabilized Discarding Sabot (APFSDS) Rounds.

Name: 3VBM?/3BM69 "Vacuum-1"

Caliber: mm125

Muzzle Velocity: m/s2,050

Basic Load: 42 total rounds of any 125mm Projectiles

Maximum Effective Range: m3,000

Projectile Dimension: mm900

Round Weight: INA

Projectile Weight (Estimated): kg11

Armor Penetration: mm1,000

Note: Entered service in 2005[5] Utilising a new sabot. Reported to be uranium alloy. For 2A82/2A82-1M cannon on T-80UM-2/T-14s.

Variants: 1.1 3VBM3/3BM9/10 1.2 3VBM6/3BM12/13 1.3 3VBM7/3BM15/16 1.4 3VBM8/3BM17/18 1.5 3VBM9/3BM22/23 1.6 3VBM10/3BM29/30 1.7 3VBM11/3BM26/27 1.8 3VBM13/3BM32/33 1.9 3VBM17/3BM42 (3BM44 "Mango") 1.10 3VBM19/3BM42M (3BM44M "Lekalo") 1.11 3VBM20/3BM46 (3BM48 "Svinets") 1.12 3VBM22/3BM59 (3BM59 "Svinets-1") 1.13 3VBM23/3BM60 (3BM60 "Svinets-2") 1.14 3VBM?/3BM69 "Vacuum-1" 1.15 3VBM?/3BM70 "Vacuum-2"

Tank Commander's Weapon System

↳*System*

Name: Type 80 Chinese Heavy Machine Gun

Type: 7.72mm Heavy Machine Gun

Manufacturer: Norinco

Date of Introduction: 1985

Max Rate of Fire: rds/min700-800

Length (Total): mm1,192

Length (Barrel): mm658

Diameter: mmINA

Weight (Gun Only): kg12.6

Weight (With Tripod): kg17.5

Action: Gas-operated, open bolt

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

Variant 1: Type 80 - The copy of the PKM GPMG, chambered in 7.62×54mmR

Variant 2: Type 86 - A machine gun only used for tanks as a secondary weapon.

Variant 3: CF06 - An export-only version of the Type 80, which is chambered for 7.62 NATO ammunition.

Variant 4 (Foreign): BD-14 - A variant of the Type 80 made by Bangladesh Ordnance Factories under license which uses 7.62×51mm NATO instead of 7.62×54mmR

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Muzzle Velocity: m/s840

Basic Load: ea2,250

Effective Range (With Sight Adjustments): m100-1,500

Armor Penetration: Available

Loader's Weapon System

↳*System*

Name: QJG89

Type: 12.7mm Heavy Machine Gun

Manufacturer: INA

Max Rate of Fire: rds/min400-600

Length (Total): mm2,119

Weight (Gun Only): kg18.5

Weight (Tripod): kg17.5

Action: Gas Operated

Feed System: Belt

Sights: Iron/Optical

↳*Ammunition*

Type: Rifle

Caliber: mm12.7x108

Muzzle Velocity: m/s825

Basic Load: ea500

Effective Range (vs. Air): m1,500

Effective Range (vs. Ground): m2,000

Feed System: Belt fed, 50 rounds

Action: Hybrid direct impingement and short recoil

Fire Control

Name: New Updated FCS, ISFCS-213

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes

Thermal Sight Gunner: Yes

Maximum Night Vision Distance: m1,500

Main Gun Stabilization: Dual axis gun stabilisation

Periscopes: ea3

Rangefinder: Laser

Sights, Maximum Distance (Day): m5,000

Ballistic Computer: Yes

Sights, Maximum Distance (Night): m1,200

Step Motor Driver: Yes

Crosswind Velocity Sensor: Yes

Note: The Type 96 is unable to perform hunter-killer engagements

:

Protection

Hull Armor: Type 96: Composite armor, FY Series ERA Added

Turret Armor: Type 96: Composite armor, FY Series ERA Added.

Turret Protection: 670mm of RHAe

Applique Armor: Available, Track Skirts

Explosive Reactive Armor: FY Series ERA

Active Protection System: INA

Mine Clearing: Roller-plow available

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Grenlaunch 12x; VESS

IR Signature: INA

Grenades: Six 76mm grenades are equipped on each side of the turret

Automatic Fire Suppression System: Yes

Jammer: JD-3 IR Jammer

Note: The RY Series ERA is capable of protecting the Type 96A against single or multiple HEAR projectiles and the manufacturer claims the ERA can withstand SABOT Rounds.

Notes:

The ZTZ-96A (Type 96) that entered service in 2006, it reflects the developments made in Chinese tank design such as the arrow shaped add on turret armour also found on the Type 99. The vehicle described below is offered for export in the format described below with the designation of VT2.A total of 42 rounds are carried. Additional "arrow shaped" modular armor similar to the Type 99 is installed on the turret front. The back of the hull is now completely flat compared to the Type 96. The Type 96A was first revealed in 2006, but in-service tanks were first seen in a military parade in 2009. The ZTZ-96A (Type 96) is a third-generation upgrade of the Type 96. Its internal electronics may have been upgraded to Type 99 standards. The visual profile of the ZTZ-96A (Type 96) is similar to the Type 99. However, the Type 96A can be distinguished from the Type 99 by the driver's position of the left side of the hull. FY-4 ERA was added on front upper glacis.The vehicle is equipped with a thermal imager. Features an upgraded 800 hp engine. A laser defense system similar to the Shtora has been installed as well.[Electro-optical jammers which are able to jam enemy guided missiles, rangefinders, and designators are found on the tank.

T-14 Armata Russian Main Battle Tank

Tiers:

Variants:

- **T-16 Armata BREM:** Armored recovery version with the T-14 chassis. The standard turret of the T-14 is removed and replaced by a small, remotely operated, weapon station armed with a Kord 12.7mm caliber heavy machine gun. A crane is mounted on the right side on the top of the hull which is protected at the front with slat armor.

System

Alternative Designation: T-14 Armata
Crew: ea3
Passenger Capacity: NA
Maximum Effective Range: m8,000
Meteorological Mast: Yes
Satellite Communications: Yes
Global Navigation Satellite System (GLONASS): Yes

Dimensions

Length: m8.7
Width: m3.5
Height: m3.3
Weight, Combat: 55 tons (sources range from 48 tons to 65 tons)

Cartridge: 12.7×108mm

Muzzle Velocity: m/s860

Basic Load: ea300

Effective Range: m2,000

Maximum Effective Range vs Aircraft: m1,000

Maximum Effective Range vs Armor: m800

Maximum Effective Range vs Ground Targets: m2,000

Maximum Range: m7,850

Auxiliary Weapon System #2

Note #1: The T-14 is equipped with a Remotely-Controled Weapon Station (RCWS)

↳*System*

Name: 7.62mm PK (Kalashnikov's) Machine

Type: 7.62mm Machine Gun

Caliber: mm7.62

In Service: 1961-Present

Length: mm1,203

Barrel length: mm605

Weight: kg9

Max Rate of Fire: rds/min800

Sustain Rate of Fire: rds/min250

Action: Gas-operated, open bolt

Maximum Firing Range: m3,000

Effective Firing Range: m1,000

Feed System: Non-disintegrating metal 50 round belts in 100, 200, and 250 round boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Ball

Caliber: mm7.62

Cartridge: 7.62×54mmR

Muzzle Velocity: m/s825

Basic Load: rds/min1,000

Effective Range: m1,500

Armor Penetration: INA

Maximum Firing Range: m4,000

Fire Control

Name: Kalina System

Computerized FCS: Yes

Thermal Sight Tank Commander: Yes

Thermal Sight Gunner: Yes

Main Gun Stabilization: Yes

Battle Field Management System: Yes

Laser Rangefinder: Yes

Cameras: Several cameras provide for a 360 degree visual coverage

Automatic Target Tracker: Yes

Protection

Hull Armor: 44S-sv-Sh: effective to 900mm vs Sabot and 1400mm vs HEAT.

Turret Armor: Lightly armored; relies on APS.

Applique Armor: Capable

Explosive Reactive Armor: Malachit dual ERA (4th Gen) can reduce penetration of APFSDS and HEAT rounds by 50%.

Active Protection System: Yes, Afghanit (similar to Israeli "Trophy"); NII Stali Upper Hemisphere Protection Complex; AESA radar slaved to the AA machine gun.

Mine Clearing: Yes, the T-14 has a active mine countermeasure system.

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: Yes

IR Signature: Can warn of electro-optical and infrared interrogation.

Note: There are reports that the T-14 will be equipped with STANAG 4569 Level 5 protection.

Notes:

The T-14 MBT can be a significant capability to Russia’s tank fleet once a substantial number of T-14s appear in operational units. Although varied ways exist to classify tanks by characteristics of weight, roles, or main armament, current tank design descriptions sometimes blur terms, such as main battle tank versus medium tank. Overall size of a tank appears less important than developments to optimize technological advantages in automotive performance, weapon system lethality, and vehicle and crew survivability within a general category of main battle tank.The Armata chassis now presents the ability to apply major improvements to Russia’s tank fleet that were previously constrained by the chassis and turret dimensions of the basic T-72 MBT design and those of its predecessors. Some of the most significant changes in the T-14 design, besides its visual dimensions, are— • Unmanned turret with a 125mm main gun and autoloader of main gun ammunition from a cassette within the turret base, and a remotely-controlled weapon station (RCWS) on top of the turret that mounts one medium 7.62mm machine gun (there is no machine gun mounted coaxially to the main gun); • Crew compartment capsule separated and protected from the turret and main gun ammunition to enhance crew survivability if turret area stored ammunition experiences a catastrophic explosion; • Vehicle survivability armor appliques and active protection systems that improve the probability to defeat main gun, missile, large rocket-propelled grenade, and mine threats; and • Improved automotive engineering, crew situational awareness systems, weapon system effectiveness, and digital command and fire control systems. The larger dimensions of the T-14 allow for future design modifications as Russian requirements evolve and technology advances. Although some designers suggest a fully-robotic Armata vehicle could be considered in the future, or that a larger cannon or gun could be mounted to the Armata MBT, neither robotics nor a larger main weapon appear to be in the current program. Other capability claims have yet to be fully substantiated, such as radically-reduced emission signatures to diminish or negate infrared or thermal detection. T-14 Main Battle Tank System Description Although several specific capabilities of the T-14 remain to be proven in public forum, Russian defense industry and government sources state several aspects of this advanced weapon system are quite impressive. Examples from open source material, as well as some speculation of capabilities in the T-14, are as follows: Crew Compartment The tank crew is three individuals: tank commander, gunner, and driver. When viewing the MBT from in front of the tank, the commander is on the left side, the driver is on the right side, and the gunner is positioned in the middle of the crew compartment. Interior views of the crew capsule from Russian promotional videotapes show much more crew space than in previous Russian tank hull or turret compartments. Design aspects of ergonomics and crew efficiencies greatly improve conditions from the cramped crew space of earlier Russian tank designs. Digital displays span the entire width of the crew capsule compartment and illustrate the computerized nature of the T-14 command and fire control systems. Automotive Performance Some reports estimate a turbocharged diesel engine capable of producing up to 1500 horsepower (hp) that functions with an automatic transmission.11 However, other comments indicate that an engine is being tested that operates more typically in the 1200–1350 hp range. The gross vehicle weight estimate is approximately 57 metric tons.This weight is realistic versus early open source speculation that the T-14 would remain in the relative weight category of 46 to 48 metric tons of the T-90 MBT series. Some reports suggest that an improved basic armor composite might reduce overall weight of the tank by hundreds of kilograms.Nonetheless, length, height, and width comparisons of the T-14 with a T-90 series MBT suggest that the T-14 is heavier than the T-90 MBT. Cruising range in favorable terrain is approximately 500 kilometers, and the maximum speed in field conditions may exceed 80 kilometers/hour. An adjustable suspension system assists in greater mobility and improved target engagement in rugged or sloped terrain. Improved engine and transmission

capabilities enhance more effective driver operations and maneuverability. The larger chassis has seven road wheels rather than the six of most former tank designs. Armament The main armament is a 125mm 2A82-1M smoothbore gun. The main gun tube has a thermal sleeve and a muzzle reference system. However, the main gun barrel does not have a bore evacuator on the gun barrel, which is very visible in many other tank models. This is different from most tanks, since the unmanned turret of the T-14 does not have the requirement of previous tank models to evacuate fumes for the crew in the turret after firing the main gun. The T-14 has an integrated fume extractor. The main gun fires three types of conventional ammunition and an antitank guided missile. The armor-piercing fin-stabilized discarding sabot round has a heavy-metal alloy tungsten-based penetrator. A high-explosive fragmentation (HE-FRAG or HEF) round has the capability to be detonated over a target, as well as to engage a target using direct line-of-sight. With an Ainet system, targets can be engaged by HEF rounds with a special electronic detonator at extended distances and within the acquisition of the laser rangefinder. This capability allows engagements several kilometers beyond the typical range of main gun direct fire. A tank gunner must lase to a target before this HEF round is loaded into the gun breech. With the registered laser targeting data, the system automatically sets the fuse to detonate at the designated distance. This type of fragmentation round can be particularly effective on infantry, light armor or vehicles in entrenched positions, or hovering helicopters. The other typical main gun round is high explosive antitank (HEAT)—a shaped charge—that can defeat various types of armor or materiel targets. Special main gun rounds such as antipersonnel canister are available, when required, in a tank's ammunition combat load for particular mission conditions, but are not promoted in the typical ammunition on-board load. The T-14 carries up to 45 main-gun rounds. An autoloader system in the hull stores up to 32 rounds of ammunition for immediate use. The mix of stowed 125mm rounds can be adjusted depending on how many antitank guided missiles are configured for a tank's combat load of ammunition. One auxiliary weapon is a 7.62mm machine gun or a 12.7mm Kord Machine Gun turret mounted in a remote-controlled weapon station atop the turret, with a full 360-degree traverse capability. The ability to engage ground and aerial targets spans a depression of -5 degrees to an elevation of +75 degrees. The RCWS carries up to 500 rounds of machinegun ammunition for immediate use. Additional ammunition is stowed to manually replenish the weapon station. Antitank Guided Missile Launcher The main gun can fire an antitank guided missile (ATGM), Sprinter, with a tandem HEAT warhead. The tandem warhead reduces the protection provided by modern types of armor, to include variants in the appliques of explosive reactive armor (ERA). The missile tracks with semiautomatic laser beam-riding guidance controlled by the tank gunner and has a maximum range of 5,000 meters.Earlier versions of ATGM Refleks (AT-11), or Sniper as its NATO designation, can also range five kilometers. Although a tank-to-target track could be feasible at this missile maximum distance, tactical conditions can typically limit effective long-range ATGM engagements. Fire Control The tank houses an advanced fire control system and battlefield management system. The commander has an independent sighting system from the gunner's sight to assist in targeting and tactical situational awareness. A panoramic sight mounted on top of the turret complements optics with improved day and night acquisition, and complements thermal imaging and integrate laser range-finding for acquisition and tracking of targets. This provides a tank commander-to-gunner hunter/killer capability to identify multiple targets and pass engaging a target to the gunner while the tank commander acquires and tracks additional targets. Several cameras mounted on the T-14 provide for 360-degree visual coverage and situational awareness of the tank's immediate surrounding area. Fire control system components of the Kalina system in the T-14, including the automatic target tracker and fire control computer, are also being planned for use in the modernization upgrade to selected T-72 and T-90 MBTs. The T-72B3 and T-90 MBTs selected for upgrading are already fitted with an earlier version of the Kalina computerized fire control system (FCS). The most current FCS version is installed in the T-14 MBT. This modularity concept and example of modernization of other tanks in Russia's tank fleet will significantly improve the capabilities of acquisition, tracking, and engagement of targets for probability of a first-round target hit or kill. Protection Additional armor protection applique, a norm among modern MBTs, is visible on the T-14 turret, front glacis, and along each side of the tank from the front glacis to about three-quarters the length of the tank. The remaining one-quarter side-to-rear area of the T-14 mounts bar/slat armor. Other applique armor provides a degree of protection to other areas of the tank. The T-14 has a new advanced ERA suite according to Russian production sources. An ERA called Malachit may provide a significant increase in tank hull and turret protection from kinetic penetrator and shaped charge main gun rounds, guided missiles, or large rocket-propelled grenades.30 Russian sources state, "specifications exceed those of Kontakt-1, Kontakt-5, and Relict 9 [ERA systems]." Metal-ceramic plates comprise the vehicle main armor of this new tank, and Russian sources claim the new metal-ceramic armor applied to the T-14 MBT has "one-and-a-half times more resistance than fully metal systems." The T-14 has active protection systems (APSs). The Afghanit system comprises five launch "hard-kill" tubes recessed under the left and right side of the turret base. Detection by radar of an incoming threat by the APS causes a launcher to automatically slew toward the incoming projectile, intercept it with a counter-projectile, and defeat its trajectory to the tank. Four "soft-kill" countermeasure launchers complement overall protection of the tank. Two launchers on rotating pedestals carry twelve small charges in each pedestal to counter attacks from the flanks. Two other launchers orient upward to counter incoming engagements from above the tank. The launch of these projectiles are soft-kill in that they create a thick, multi-spectral smoke screen that obscures to defeat the tracking lock by guided missiles, laser, or similar targeting systems and weapons. The manufacturer describes its operation to disrupt the guidance system of precision-guided munitions as a "powerful electromagnetic pulse or the creation of securable multispectral aerosol cloud." The T-14 may also have a vehicle engine exhaust smoke system capability. This provides the ability to produce a smoke screen, as in previous Russian tank models, by injecting diesel fuel into the exhaust channel outlet, which creates a thick cloud of obscurant. An active mine countermeasure system, mounted on the lower front edge of the tank hull, can detect and disable some types of mines in front of the tank. Mounting a retractable blade under the front slope of the tank, as in some previous tank designs, allows for limited self-entrenchment and protection to create an expedient fighting position with multiple scrapes by the blade. Other protection means counter aspects of chemical, biological, radiological, and nuclear weapons. Source: The information provided above is from the January 2017 article titled "T-14 Gun-Missile Tank for the Russian Federation," by Jon H. Moilanen published in the

Automatic Fire Suppression: Yes

Notes:

The Engesa EE-T1 Osório was a Brazilian main battle tank prototype. It was developed as a privately funded venture by Engesa, with little government support. It was intended to be sold first to Arab and other Third World countries, jump-starting production — and enabling the Brazilian Army to later place its own orders without having to fund development costs. However macro-political events including the Gulf War and American political pressure led to the tank's demise, and the tank was never acquired by the Brazilian Army.

Leopard 1A3 German Main Battle Tank (MBT)

Tiers:

Variants:

- **Leopard 1:** The Leopard project started in November 1956 in order to develop a modern tank, the Standard-Panzer, to replace the Bundeswehr's American-built M47 and M48 Patton tanks, which, though just delivered to West Germany's recently reconstituted army, were rapidly becoming outdated. On 25 July 1957, the detailed specifications were released; the new design needed to weigh no more than 30 tonnes, have a power-to-weight ratio of 30 horsepower per tonne, be able to withstand hits by 20 mm rapid-fire guns on every side as well as to operate in a battlefield contaminated with chemical weapons or radioactive fallout, the then-standard baseline for combat with the Warsaw Pact. In addition, the main armament had to consist of a 105 mm caliber weapon (the new British L7A3 105 mm gun was selected), carrying at least as many rounds as current US tank designs. Mobility had priority, while firepower came second; armour was seen as less essential, as it was believed that no real protection against hollow charge weapons was possible anyway.
- **Leopard 1A1:** After the first batch was delivered, the next three batches were the Leopard 1A1 model, which included a new gun stabilization system from Cadillac Gage that allowed the tank to fire effectively on the move. The 1A1 also added the now-famous "skirts" along the sides to protect the upper tracks, and a new thermal jacket on the gun barrel to control heating. A less important change was to use rectangular rubber blocks fastened to the treads with a single pin instead of the earlier two-pin "shaped" versions. The rubber blocks could be easily replaced with metal X-shaped crampons for movement on ice and snow in the winter.
- **Leopard 1A2:** The first 232 tanks of the fifth production batch were delivered as the Leopard 1A2 between 1972 and 1974. The A2 included a heavier and better armoured turret, and therefore did not receive the B&V armour add-ons as did the earlier machines. However, they did receive the other upgrades; the Leopard 1A2A1 received the PZB 200, the Leopard 1A2A2 received digital radios, and the Leopard 1A2A3 got both.
- **Leopard 1A3:** The next 110 vehicles in the fifth batch were fitted with a new welded turret, which was equipped with a new armor consisting of two spaced steel plates with a plastic filling between them (high-hardness armor, and a wedge-shaped gun mantlet, creating the Leopard 1A3. Although the level of armor area density was equivalent to the A2's new welded version, the internal volume was increased by 1.2 m^3 and the effective protection level was increased by half. The improved TRP 2A independent sight was installed for the commander. Upgrades were identical to the 1A2 models, the Leopard 1A3A1 with the night sights, Leopard 1A3A2 with the new radios, and the Leopard 1A3A3 with both.
- **Leopard 1A4:** The Leopard 1A4 formed the sixth batch of 250 vehicles, delivery starting in 1974. The 1A4 was externally similar to the 1A3, but included a new computerized fire control system and the new EMES 12A1 sighting system to aim it. In addition, the commander was provided with his own independent night sighting system, the PERI R12. The new equipment used up space and the ammunition load was reduced to 55 rounds, of which 42 were stored in the magazine to the left of the driver.
- **Leopard 1A5:** In 1980, a research program was undertaken to study further improvements to the Leopard 1, providing it with a completely modern fire control system and fully effective night/bad-weather vision system. The decision was made to base the upgrades on the earlier models, which were no longer competitive. The resulting Leopard 1A5 was based on 1,225 vehicles of the Leopard 1A1A1 model. The turrets were again modified for the 1A5, both in order to store all of the new equipment, as well as to move more of the ammunition into the rear of the turret, as opposed to the left side of the driver where it had previously been stored. The new turret was also able to mount the newer 120 mm gun from the Leopard 2 if desired, although this option has not been used. After trials, the Krupp-Atlas Elektronik EMES 18 fire control system, which was developed from the EMES 15 used on the Leopard 2, was selected in December 1983. The EMES 18 included two new sights on the top of the turret, and no longer required the "bumps" as did the earlier optical systems. A crucial part of the upgrade was the introduction of more effective ammunition, including new APFSDS rounds. The Leopard tank could also be fitted with bolt-on polycarbonate (Lexan) armour panels, which have increased the effectiveness of the armour. The first modified vehicle was delivered in early 1987. Since then, almost all users of

the Leopard 1 have also applied similar changes to their own vehicles, and in most ways the 1A5 be considered the "standard" Leopard 1 today. In the Netherlands, an improved version equivalent to the A5 called "Leopard 1 Verbeterd" (improved) was developed, the same version is used by the Chilean Army.

- **Leopard 1A6:** The Leopard 1A6 prototype was a single Leopard 1 A1A1 testbed, modified with additional armour on the turret and equipped with a 120 mm L/44 gun. The project was ended in 1987, as the Leopard 2 was in widespread service at this point and the 1A5 offered a more reasonable upgrade path for a fraction of the cost.

System

Alternative Designation: Leopard 1A3

Type: Main Battle Tank

Manufacturer: Krauss-Maffei Wegmann, Munich, Germany Krupp-MaK, Kiel, Germany

Crew: 4 (commander, gunner, loader, driver)

Note: Leopard 1A3: The next 110 vehicles in the fifth batch were fitted with a new welded turret, which was equipped with a new armour consisting of two spaced steel plates with a plastic filling between them (high-hardness armor, and a wedge-shaped gun mantlet, creating the Leopard 1A3. Although the level of armor area density was equivalent to the A2's new welded version, the internal volume was increased by 1.2 m^3 and the effective protection level was increased by half. The improved TRP 2A independent sight was installed for the commander. Upgrades were identical to the 1A2 models, the Leopard 1A3A1 with the night sights, Leopard 1A3A2 with the new radios, and the Leopard 1A3A3 with both.

Side Slope: 30 percent

Main Weapon System

↳*System*

Name: 1 x Royal Ordnance L7A3 Rifled Gun

Type: Rifled Gun

Caliber: 105 mm

Length, Barrel: 5.46 m

Muzzle Velocity: INA

Weight: 1,282 kg

Maximum Rate of Fire: 10 rounds per minute (maximum)

Elevation: -9/+20 deg

Traverse: 360 deg

Maximum Firing Range: 4000 m

↳*Ammunition*

Name: L22

Type: Projectile

Caliber: mm105

Basic Load: 60 rounds, 18 ready in turret (Leopard 1A1)

Armor Penetration: INA, Tungsten carbide

Coaxial Weapon System

↳*System*

Name: Heckler & Koch MG5

Type: General Purpose Machine Gun

Caliber: mm7.62

Manufacturer: Heckler & Koch

Length: 1,160 mm

Barrel Length: 550 mm

Height: 239 mm

Width: 120 mm

Weight: 11.20 kg

Action: Gas-operated, rotating bolt

Rate of Fire: 640/720/800 rounds/min

Muzzle Velocity: 840 m/s

Maximum Firing Range: 600–1,000 m

Effective Firing Range: 100–1,000 m

Feed System: Disintegrating DM60/M13 belt in 50-round Gurttrommel or 120-round in separate belt box or from stand-alone ammunition boxes

Sights: Diopter sight or optical sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Basic Load: 1,250 rounds

Armor Penetration: INA

Auxiliary Weapon System

Note: 1 x 7.62-mm air defense machine gun

Fire Control System

Name: FLP-10/EMES 18 integrated fire control

Computerized FCS: Yes, FLP-10/EMES 18 integrated fire control system with Zeiss thermal imaging system retrofitted to approximately 1,300 German Leopard 1A1/1A2s

Main Gun Stabilization: Yes

Direct Fire: Yes

Indirect Fire: Yes

Infrared: Yes, Paint reflects IR

Rangefinder: TEM 2A optical (Leopard 1A2) turret fully stabilized (A3, A4); retrofit of earlier AEG-Telefunken FLER-H modular hybrid computer (1A4 Krupp-Atlas)

Protection

Hull Armor: Glacis 70 mm at 60-deg: Hull Glacis top 25 mm at 83-deg: Hull nose 70 mm at 55-deg: Hull sides 25-35 mm: Hull rear 25 mm at 88 deg: Hull top 10 mm: Hull bottom 15 mm

Turret Armor: Turret mantlet 60 mm; Turret sides 60 mm; Turret rear 60 mm; Turret front 52 mm

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: No

NBC Protection: Yes, collective

Smoke Equipment: 2 x 4-barrel 3-in (76-mm) smoke generators, one each side of turret

Notes:

The Leopard (or Leopard 1) is a main battle tank designed and produced by Porsche in West Germany that first entered service in 1965. Developed in an era when HEAT warheads were thought to make conventional heavy armour of limited value, the Leopard focused on firepower in the form of the German-built version of the British L7 105-mm gun, and improved cross-country performance that was unmatched by other designs of the era. The design started as a collaborative project during the 1950s between West Germany and France, and later joined by Italy, but the partnership ended shortly after and the final design was ordered by the Bundeswehr, with full-scale production starting in 1965. In total, 6,485 Leopard tanks have been built, of which 4,744 were battle tanks and 1,741 were utility and anti-aircraft variants, not including 80 prototypes and pre-series vehicles. The Leopard quickly became a standard of European forces, and eventually served as the main battle tank in over a dozen countries worldwide, with West Germany, Italy and the Netherlands being the largest operators until their retirement. Since 1990, the Leopard 1 has gradually been relegated to secondary roles in most armies. In the German Army, the Leopard 1 was completely phased out in 2003 by the Leopard 2, while Leopard 1-based vehicles are still widely used in utility roles. The Leopard 2 has replaced the Leopard 1 in service with many other nations as well, with derived vehicles using the Leopard 1 hull still seeing service. Currently, the largest operators are Greece, with 520 vehicles, Turkey, with 397 vehicles and Brazil with 378 vehicles. Most of these vehicles have been upgraded with various improvements to armor, firepower and sensors to maintain their ability to engage modern threats. Leopard 1A3 The next 110 vehicles in the fifth batch were fitted with a new welded turret, which was equipped with a new armor consisting of two spaced steel plates with a plastic filling between them (high-hardness armor, and a wedge-shaped gun mantlet, creating the Leopard 1A3. Although the level of armor area density was equivalent to the A2's new welded version, the internal volume was increased by 1.2 m^3 and the effective protection level was increased by half. The improved TRP 2A independent sight was installed for the commander. Upgrades were identical to the 1A2 models, the Leopard 1A3A1 with the night sights, Leopard 1A3A2 with the new radios, and the Leopard 1A3A3 with both.

Hull Armor: 16mm on sides

Turret Armor: 32mm to 50mm

Roof and Belly Armor: 13mm

Glacis: 25mm

Lower Glacis: 20mm

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: No

Smoke Equipment: Carries two smoke pots

Notes:

The Type 62 light tank appears to be a scaled-down Type 59 main battle tank (MBT) that is used in the reconnaissance role or as an MBT in rugged terrain. The tank was originally designed for use in China's southern river network areas and hilly terrain where heavier vehicles are difficult to deploy. Crew location is identical to the Type 59. The driver sits at the left front of the hull, with the commander and gunner to the left of the turret and the loader to its right. The driver is provided with a single-piece hatch cover that lifts and swings to the left and two standard periscopes for observation over the frontal arc. To the right of the driver are stowed ammunition and a diesel fuel tank. The engine and transmission are at the rear of the hull. The torsion

bar suspension on either side consists of five road wheels with a distinct gap between the first and second wheels. The drive sprocket is at the rear and the idler at the front. The initial road wheel was of a stamped design, similar to that of the Russian PT-76, but has been replaced b y a new design similar to that on the larger T-54A/Type 59 tank. The Type 62 is armed with an 85mm main gun, likely the same as that used on the Type 63 light amphibious tank. It fires fixed ammunition, including armor-piercing discarding-sabot (APDS), high-explosive anti-tank (HEAT) and high-explosive rounds. The turret observation and weapon sighting equipment are the same as that used on the Type 59 tank. It includes a TSh-1A hinged telescopic sight with a magnification of x3.5 and x7 for aiming the main gun and a TPK-1 observation device in the commander's cupola. There are also two roof-mounted MK-4 day periscopes, one for the gunner and one for the loader. A 7.62-mm machine gun is mounted coaxial to the right of the main gun and a 12.7-mm Type 54 heavy machine gun is mounted at the loader's position for anti-aircraft purposes. The Type 62 cannot lay its own smoke screen by injecting diesel fuel into the exhaust. It does carry two smoke pots that can be activated by remote control from the crew compartment. Similar to the Type 59, the Type 62 can be recognized by its squat, dome-shaped cast turret and large space between the first and second road wheels on each side. The Type 62-I version was developed after China's border war with Vietnam in 1979. The modernization included a laser rangefinder for better firing accuracy and a machine gunner protection shield on the turret. Some later variants were also fitted with turret storage racks and hull skirts for additional prot ection against HEAT projectiles.

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: AZ collective nuclear warning and protection system blower/dust separator removes fallout no chemical or biological agent filters

Smoke Equipment: Generated from the engine exhaust

Notes:

The T-62 is a Soviet main battle tank that was first introduced in 1961. As a further development of the T-55 series, the T-62 retained many similar design elements of its predecessor including low profile and thick turret armor. In contrast with previous tanks, which were armed with rifled tank guns, the T-62 was the first tank armed with a smoothbore tank gun that could fire APFSDS rounds at higher velocities. While the T-62 became the standard tank in the Soviet arsenal, it did not fully replace the T-55 in export markets due to its higher manufacturing costs and maintenance requirements compared to its predecessor. Although the T-62 was replaced in Russia and the successor states of the Soviet Union, it is still used in some countries and its design features became standardized in subsequent Soviet and Russian mass-produced tanks. The T-62 has a typical tank layout: driver's compartment at the front, fighting compartment in the center and engine compartment in the rear. The four-

man crew consists of the commander, driver, gunner and loader. Although the T-62 is very similar to the T-55 and makes use of many of the same parts, there are some differences. These include the hull, which is a few centimeters longer and wider, the different road wheels, and differences in characteristic uneven gaps between road wheels. Unlike the T-54 and T-55 main battle tanks, the gaps between the last three pairs of road wheels are larger than the rest. The armament consists of the 115 mm U-5TS "Molot" (2A20) Rapira smoothbore tank gun with a two-axis "Meteor" stabilizer and 7.62 mm PKT coaxial general-purpose machine gun mounted on the right of the main gun. The 12.7 mm DShK 1938/46 antiaircraft heavy machine gun is mounted on the loader's hatch. It was optional until 1972 when all newly built tanks were fitted with the AA heavy machine gun. The tank carries 40 rounds for the main gun (although only 4 are placed in the turret, the rest are stored in the back of the fighting compartment and in the front of the hull, to the right of the driver) and 2500 rounds for the coaxial machine gun. All of the vehicle's armament is mounted in or on the round cast egg-shaped turret from the Ob'yekt 140 prototype main battle tank, mounted over the third pair of road wheels. The T-62 was armed with the world's first smoothbore tank gun, giving it considerably greater muzzle velocity than the Western 90 mm and 105 mm tank guns of its time. It can fire BM-3 APFSDS-T, BK-4, BK-4M HEAT and OF-18 Frag-HE rounds. The 115 mm gun introduced the first successful APFSDS ammunition, albeit with a steel penetrator. A smoothbore gun allowed a significantly better performance (from 10% to 20%) from HEAT ammunition, which was considered the main ammunition type for fighting enemy armour at medium and long ranges. The gun can be elevated or depressed between −6° and +16°. It is reloaded manually and gets automatically reset to +3.5° of elevation after it is fired if the stabilizer is enabled. Empty cartridges are automatically ejected outside the vehicle through a small hatch in the rear of the turret. The gun has a range of effective fire of about 4 km during day conditions and 800 m (with the use of night vision equipment) at night. This tank was fitted with a Meteor two-axis stabilizer, it allows the T-62 to aim and fire while moving, according to tests conducted by the US army the Meteor gave the T-62 a first hit probability of 70% for a moving target at 1000 meters with the tank moving up to 20 km/per hour. This gave the tank a good advantage in dynamic battlefields and breakthrough operations, especially in Central Europe where most of tank battles would take place under the 1500 meters range. The T-62 uses torsion bar suspension. It has five pairs of rubber-tired road wheels, a drive sprocket at the rear and idler at the front on each side, with no return rollers. The first and last road wheels each have a hydraulic shock absorber. The tank is powered by the V-55 12-cylinder 4-stroke one-chamber 38.88 litre water-cooled diesel engine developing 581 hp (433 kW) at 2,000 rpm. This is the same engine as the one used in the T-55. Because the T-62 weighs more than the T-55, it is less maneuverable. Like the T-55, the T-62 has three external diesel fuel tanks on the right fender and a single auxiliary oil tank on the left fender. The tank carries 960 litres of fuel in its internal and external fuel tanks. Two optional 200-litre drum-type fuel tanks can be fitted on the rear of the vehicle for an increased operational range

T-34-85 Russian Medium Tank

Tiers:

Variants:

- **Model 1943:** Short production run of January–March 1944 with D-5T 85 mm gun.
- **Model 1944:** Produced from March 1944 through to the end of that year, with simpler ZiS-S-53 85 mm gun, radio moved from the hull into a turret with improved layout and new gunner's sight.
- **Model 1945:** Produced from 1944 to 1945, with an electrically powered turret traverse motor, an enlarged commander's cupola with a one-piece hatch, and the TDP smoke system with electrically detonated MDSh canisters.
- **Model 1946:** Production model with the improved V-2-34M engine, new wheels, and other minor details.
- **Model 1960:** A refurbishing program introduced a new V-2-3411 engine and other modernizations.
- **Model 1969:** (also called T-34-85M): Another refurbishing program introducing night driving equipment, additional fuel, and other modernizations.

Notes:

The T-34, a Soviet medium tank, had a profound and lasting effect on the field of tank design. At its introduction in 1940, the T-34 possessed an unprecedented combination of firepower, mobility, protection and ruggedness. Its 76.2 mm (3 in) high-velocity tank gun provided a substantial increase in firepower over any of its contemporaries while its well-sloped armour was difficult to penetrate by most contemporary anti-tank weapons. The 60 degree sloped armor and Christie suspension were inherited from the design of American Walter Christie's M1928 tank, versions of which were sold turret-less to the Red Army and documented as "farm tractors", after being rejected by the U.S. Army. When it was first encountered in 1941, German general Paul Ludwig Ewald von Kleist called it "the finest tank in the world" and Heinz Guderian affirmed the T-34's "vast superiority" over existing German armour of the period. "As early as July 1941 OKW chief Alfred Jodl noted in his war diary the surprise at this new and thus unknown wunder-armament being unleashed against the German assault divisions." Although its armour and armament were surpassed later in the war, it has been often credited to have been the most influential tank design of the Second World War. The T-34 was the mainstay of Soviet armoured forces throughout the Second World War. Its general specifications remained nearly unchanged until late 1944, when it received a major upgrade to firepower and ergonomics with the introduction of the greatly improved T-34/85 variant. Despite this, its production method had been continuously refined to meet the constantly increasing needs of the Eastern Front, making the T-34 quicker and cheaper to produce. Soviet industry would eventually produce over 80,000 T-34s of all variants, allowing steadily greater numbers to be fielded while the war progressed despite the loss of tens of thousands of them in combat against the German Wehrmacht. Replacing many light and medium tanks in Red Army service, it was the most-produced tank of the war, as well as the second most produced tank of all time (after its successor, the T-54/55 series). At 44,900 losses during the war, it also suffered the most tank losses of all time. Its development led directly to the T-54 and T-55 series of tanks, which in turn evolved into the later T-62, T-72, and T-90 that form the armoured core of many modern armies. T-34 variants were widely exported after World War II, and even as recently as 2010, the tank has seen limited front-line service with several developing countries. The T-34 had well-sloped armour, a relatively powerful engine and wide tracks. The initial T-34 version had a powerful 76.2 mm gun, and is often called the T-34/76 (originally a World War II German designation, never used by the Red Army). In 1944, a second major version began production, the T-34-85, with a larger 85 mm gun intended to deal with newer German tanks. Comparisons can be drawn between the T-34 and the U.S. M4 Sherman tank. Both tanks were the backbone of the armoured units in their respective armies, both nations distributed these tanks to their allies, who also used them as the mainstay of their own armoured formations, and both were upgraded extensively and fitted with more powerful guns. Both were designed for mobility and ease of manufacture and maintenance, sacrificing some performance for these goals. Both chassis were used as the foundation for a variety of support vehicles, such as armour recovery vehicles, tank destroyers, and self-propelled artillery. Both were an approximately even match for the standard German medium tank, the Panzer IV, though each of these three tanks had particular advantages and weaknesses compared with the other two. Neither the T-34 nor the M4 was a match for Germany's heavier tanks, the Panther (technically a medium tank) or the Tiger I; the Soviets used the IS-2 heavy tank and the U.S. used the M26 Pershing as the heavy tanks of their forces instead. After improved German Panzer IVs with the high-velocity 75 mm (2.95 in) gun were encountered in combat in 1942, a project to design an entirely new Soviet tank was begun, with the goals of increasing armour protection while adding modern features like a torsion-bar suspension and a three-man turret. This new tank, the T-43, was intended to be a universal tank to replace both the T-34 and the KV-1 heavy tank. However, the T-43 prototype's armour, though heavier, was still not proof against German 88 mm guns, while its mobility was found to be inferior to the T-34. Finally, although the T-43 shared over 70% of its components with the T-34, manufacturing it would still have required a significant slow-down in production. Consequently, the T-43 was cancelled. Not only were the weapons of German tanks improving, so was their armour. Soviet firing tests against a captured Tiger I heavy tank in April 1943 showed that the T-34's 76 mm gun could not penetrate the front of the Tiger I at all, and the side only at the very close range. A Soviet 85 mm anti-aircraft gun, the 52-K, was found capable of doing the job, and so derivatives of it were developed for tanks. The resulting tank gun could penetrate the side armour of the Tiger I from a distance of 800 meters and the turret side from a distance of 600 meters. It was still not enough to match the Tiger, as a Tiger could destroy the T-34 from a distance of 1,500 to 2,000 meters, but it was a noticeable improvement. With the T-43 canceled, the Soviet command made the decision to retool the factories to produce an improved version of the T-34. Its turret ring was enlarged from 1,425 mm (56 in) to 1,600 mm (63 in), allowing a larger turret to be fitted and thus the larger 85 mm gun. The prototype T-43's turret design was hurriedly adopted by Vyacheslav Kerichev at the Krasnoye Sormovo Factory to fit the T-34.[102] This was a larger three-man turret, with radio (previously in the hull) and observation cupola in the roof. Now the tank commander needed only to command (aided by cupola and radio systems), leaving the operation of the gun to the gunner and the loader. The turret armour was much thicker, 90 mm, even if bigger and less sloped than the original T-34 turret. This made the turret, overall, a bigger target (due to the three-man crew and bigger gun), but more resistant to enemy fire. The ammunition load shrank from around 90-100 to 55-60 shells,

but the projectiles were 50% heavier (9 kg) and were much better in the anti-armour role, and reasonable in a general purpose role. The resulting new tank, the T-34-85, was seen as a compromise between advocates for the T-43 and others who wanted to continue to build as many 76 mm-armed T-34s as possible without interruption. Production of the T-34-85 began in January 1944 at Factory No. 112, first using the D-5T 85 mm gun. Parallel to the production of the T-34-85 with the D-5T gun, production of the T-34-85 using the S-53 gun (later to be modified and redesignated as the ZIS-S-53 gun) began in February 1944 at Factory No. 112. The improved T-34-85 became the standard Soviet medium tank, with an uninterrupted production run until the end of the war. A T-34-85 initially cost about 30 percent more to produce than a Model 1943, at 164,000 rubles; by 1945 this had been reduced to 142,000 rubles.[105] During the course of the World War II, the cost of a T-34 tank was reduced by almost half, from 270,000 rubles in 1941, while in the meantime its top speed remained about the same, and its main gun's armour penetration and turret frontal armour thickness both nearly doubled. The T-34-85 gave the Red Army a tank with better armour and mobility than the German Panzer IV tank and StuG III assault gun. While it could not match the armour or weapons of the heavier Panther and Tiger tanks, its improved firepower made it much more effective than earlier models, and overall it was more cost-effective than the heaviest German tanks. In comparison with the T-34-85 program, the Germans instead chose an upgrade path based on the introduction of completely new, expensive, heavier, and more complex tanks, greatly slowing the growth of their tank production and aiding the Soviets in maintaining a substantial numerical superiority in tanks. By May 1944, T-34-85 production had reached 1,200 tanks per month. In the entire war, production figures for all Panther types reached no more than 6,557, and for all Tiger types (including the Tiger I and Tiger II) 2,027. Production figures for the T-34-85 alone reached 22,559.

T-54 Russian Medium Tank

Tiers:

Variants:

- **T-55A:** In 1961, development of improved NBC protection systems began. The goal was to protect the crew from fast neutrons; adequate protection against gamma radiation was provided by the thick armour and a PAZ basic NBC protection system.
- **T-54/T-55 upgrades:** n its long service life, the T-55 has been upgraded many times. Early T-55s were fitted with a new TSh-2B-32P sight. In 1959, some tanks received mountings for the PT-55 mine clearing system or the BTU/BTU-55 plough. In 1967, the improved BM8 APDS round, which could penetrate 275 mm thick armour at a range of 2 km, was introduced. In 1970, new and old T-55 tanks had the loader's hatch modified to mount the 12.7 mm DShK machine gun, to deal with the threat of attack helicopters. Starting in 1974, T-55 tanks received the KTD-1 or KTD-2 laser rangefinder in an armoured box over the mantlet of the main gun, as well as the R-123 or R-123M radio set.[10] Simultaneously, efforts were made to modernize and increase the lifespan of the drive train.
- **T-55AM:** upgraded version of the T-55A. It is fitted with add-on composite armor and rubber side skirts. The gun is fitted with a thermal sleeve. It entered service in 1983.
- **T-55AM-1:** upgraded version of the T-55AM, powered by a V-46-5M diesel engine, developing 690 hp.
- **T-55AD:** fitted with Drozd active protection system. It also has add-on armor. It entered service in 1983.
- **T-55AD-1:** fitted wit a V-46-5M diesel engine, developing 690 hp.
- **T-55AMV:** fitted with add-on explosive reactive armor and new fire control system. It is capable of launching anti-tank guided missiles in the same manner as ordinary projectiles. The missile has a range of 4 000 m at daytime and 1 200 m at night. It penetrates 550 mm of rolled homogenous armor. It entered service in 1985.
- **T-55M:** Upgraded version fitted with add-on composite armor and rubber side skirts. The gun is fitted with a thermal sleeve. This tank entered service in 1983.
- **T-55M-1:** it is a further upgrade of the T-55M, powered by a V-46-5M diesel engine, developing 690 hp. This tank is also fitted with ballistic computer.
- **T-55MV:** it has improved protection and firepower. It is fitted with add-on explosive reactive armor and improved fire control system. It is capable of launching anti-tank guided missiles in the same manner as ordinary projectiles. The T-55MV entered service in 1985.
- **T-55MV-1:** fitted with a V-46-5M diesel.
- **T-62A:** an improved T-55 with a stretched chassis, new suspension, new turret. It was armed with a 100 mm gun with improved ballistics. First prototypes were built in 1958 and it was accepted to service in 1962. Only a small number of these tanks were built for experimental service. However it was a forerunner of the T-62 medium tank, that was produced in thousands.
- **TO-55:** flamethrower tank. Coaxial machine gun has been replaced with a flame thrower.
- **BTS-2 and BTS-3:** armored recovery vehicles.
- **MTU-20 and MTU-55:** armored bridgelayers.
- **BTR-T:** is a heavy armored personnel carrier. It was first publicly revealed in 1997. It was converted from obsolete T-55 medium tank. The turret has been removed in order to create a compartment for dismounts. A number of other modifications were made to the vehicle. This armored vehicle has a crew of 2 and accommodates 5 dismounts. The BTR-T received no production orders.
- **Ti-67:** sraeli version, fitted with American M68 105 mm rifled gun. It is also fitted with Israeli fire control system, new engine and transmission and Blazer explosive reactive armor. About 200 T-54/55 tanks, that were captured from Egyptian and Syrian forces, were upgraded to this standard.
- **T-54E Ramzes II:** a proposed upgrade of Egyptian T-54/55 tanks. It is fitted with American M68 105 mm rifled gun, Belgian fire control system, and American Continental AVDS-1790-5A engine.
- **T-55 Enigma,:** upgraded Iraqi version, fitted with composite add-on armor. Add-on armor weights a total of 4.6 t, so a

counterweight was mounted at the turret rear. This tank also has improved night vision devices.
- **TR-580:** a Romanian version of the T-55 with a longer hull. An extra road wheel on each side has been added. It is fitted with a different engine. This tank is fitted with metal side skirts.

System

Alternative Designation: T-54

Estimated Out of Service Date: Phased out of service with Russia in the early 1990s. Likely to remain in service with current users until the capital can be raised to replace the vehicles according to defence priorities

Manufacturer: KhPZ, UVZ (Soviet Union) Bumar-Łabędy (Poland) ZTS Martin (Czechoslovakia)

Type: Main Battle Tank

Crew: ea4

Modifications: Modifications to the T-54/55 series over the years have changed almost every aspect of the vehicle. Initially, Soviet modifications included a better turret shape, improved NBC protection and an improved powerplant. Later, improved fire-control equipment and night-vision equipment was added. Foreign improvements, both in Warsaw Pact nations and elsewhere, have further improved protection, powerplant, and firepower. T-54/55s have been re-armed with improved tank guns, AA machine guns, advanced armour arrays, and technologies, such as laser range finders and computerized fire control systems, that did not exist when the tank was first being built in the early days of the Cold War.

Dimensions

Length: 9.00 m (with gun forward)

Width: m3.37 m

Protection

Hull Armor: 120 mm hull front at 60° (100 mm after 1949) 79 mm hull upper sides 20 mm hull lower sides 60 mm at 0° hull rear 20 mm hull bottom 33-16 mm hull roof

Turret Armor: 205 mm turret front 130 mm turret sides 60 mm turret rear 30 mm turret roof

Applique Armor: Available

Explosive Reactive Armor: Available

Active Protection System: INA

Mine Clearing: Roller-plow available, In 1959, some tanks received mountings for the PT-55 mine clearing system or the BTU/BTU-55 plough.

Self-Entrenching Blade: No

NBC Protection: Yes, PAZ (Protivoatomnaya Zashchita) NBC protection system

Smoke Equipment: grenlaunch/eng smk sys

Note: The T-55 focuses most of its armour around the front 60 deg arc.

Notes:

The T-54 and T-55 tanks are a series of Soviet main battle tanks introduced in the years following the Second World War. The first T-54 prototype was completed at Nizhny Tagil by the end of 1945. Initial production ramp up settled for 1947 at Nizhny Tagil, and 1948 for Kharkiv were halted and curtailed as many problems were uncovered; the T-34-85 still accounted for 88 percent of production through the 1950s. The T-54 eventually became the main tank for armoured units of the Soviet Army, armies of the Warsaw Pact countries, and many others. T-54s and T-55s have been involved in many of the world's armed conflicts since the later part of the 20th century. The T-54/55 series eventually became the most-produced tank in military history. Estimated production numbers for the series range from 86,000 to 100,000. They were replaced by the T-62, T-64, T-72, T-80 and T-90 tanks in the Soviet and Russian armies, but remain in use by up to 50 other armies worldwide, some having received sophisticated retrofitting. During the Cold War, Soviet tanks never directly faced their NATO adversaries in combat in Europe. However, the T-54/55's first appearance in the West around the period of the 1950s (then the beginning of the Cold War) spurred the United Kingdom to develop a new tank gun, the Royal Ordnance L7, and the United States to develop the M60 Patton. Production of the initial series of T-54s began slowly as 1,490 modifications were made. The Red Army received a tank that was superior to World War II designs and theoretically better than the newest tanks of potential opponents. The 100 mm gun fired BR-412 series full-calibre APHE ammunition, which had superior penetration capability when compared to the T-34 that it replaced. The serial production version, designated T-54-1, differed from the second T-54 prototype. It had thicker hull

armour (80 mm on the sides, 30 mm on the roof and 20 mm on the bottom). As production ramped up, quality problems emerged. Production was stopped and an improved T-54-2 (Ob'yekt 137R) version was designed. Several changes were made and a new turret was fitted. The new dome-shaped turret with flat sides was inspired by the turret from the IS-3 heavy tank; it is similar to the later T-54 turret but with a distinctive overhang at the rear. It also had a shorter bustle. The fender machine guns were removed in favour of a single bow-mounted machine gun. The transmission was modernized and the track was widened to 580 mm. The T-54-2 entered production in 1949, at Stalin Ural Tank Factory No. 183 (Uralvagonzavod). In 1951, a second modernization was made, designated T-54-3 (Ob'yekt 137Sh), which had a new turret without side undercuts, as well as the new TSh-2-22 telescopic gunner's sight instead of the TSh-20. The tank featured the TDA smoke generating system. A command version was built, the T-54K (komandirskiy), with a second R-113 radio.

→Amphibious Tanks

ZTD-05 (ZBD-2000) Chinese Amphibious Light Tank

Tiers:

Variants:

- **PLZ-07B:** The PLZ-07B is an SPH designed for the Chinese Marine Corps. It is based on the Type 05 hull and uses the weapon system from the PLZ-07, which is based on a different hull. The vehicle is designed to have the same mobility and protection as the ZBD-05, however, it is equipped with a large-calibre howitzer and attendant FCS so that it can provide organic indirect fire support for ZBD-05 formations.
- **Type 001:** The Type 001 is an APC based on the Type 05 hull. It is believed that the Type 001 is more likely to be found in service with the amphibious elements of the PLA rather than the Marine Corps, as it has been shown on exercises with the 74th Army Group. It is designed to perform as an APC and is capable of carrying a section of equipped infantry into combat alongside other Type 005 variants.

Self-Sealing Fuel Tank: Yes, capable of stopping a 25 mm APFSDS round at 2,000 m.

Automatic Fire Suppression Device.: Yes

Notes:

The ZBD-2000 is a family of Chinese tracked amphibious assault vehicles. They are designed for beach assault missions and to accompany infantry as ground forces move inland. The vehicle resembles the (now cancelled) U.S. Expeditionary Fighting Vehicle (EFV). The vehicle has a boat-shaped hull with six road wheels and lead return rollers. A welded turret is mounted over the middle of the hull. The commander and gunner sit inside the turret, with the driver at the front, to the left of the engine. The driver has a single-piece hatch cover that opens to the rear. It can be locked in the vertical position with at least three day periscopes providing observation to the frontal arc. The middle periscope can be replaced by a passive periscope for driving at night. The troop compartment is provided with two oblong roof hatches that open outwards and can be locked in the vertical position. The troops enter and leave through a door in the hull rear that opens to the right. The ZBD-2000 is propelled in the water by a pair of waterjets. Speeds of up to 28 mph (45 kph) can be achieved. The vehicle utilizes hydraulically actuated bow and transom flaps, which are designed to aid the vehicle's hull skimming. The vehicle is able to travel more than 6 mi (10 km) over the water. The vehicle has all-welded armor over the hull and turret, providing protection against 25-mm armor-piercing rounds over the frontal arc and all-round protection against 7.62-mm armor-piercing rounds. This version is equipped with a three-man turret armed with a 105-mm gun, 7.62-mm coaxial machine gun and roof-mounted 12.7-mm machine gun. The manually loaded gun can fire a variety of munitions, including gun-launched anti-tank guided missiles. The ZTD-05 has a crew of four (commander, driver, gunner, loader), and can carry up to four personnel. The commander and gunner sit in tandem to the left of the main gun. The loader is to the right and is also responsible for manning the 12.7-mm machine gun. The rear part of the turret has a storage rack for additional protection against high-explosive anti-tank (HEAT) rounds. The ZTD-05 is equipped with a computerized fire-control system that includes a fire-control computer, light spot commander sight with laser rangefinder, and light spot gunner sight with passive night vision. It is also fitted with a GPS navigation system and image-intensifier night-vision or thermal-imaging system. The PLA and marine corps have about 200 and 140 of these vehicles, respectively.

Notes:

The M1985 is a North Korean light tank that is based on the designs of the Russian PT-76 and the Chinese Type 63 amphibious light tanks. The M1985 hull is similar in size and appearance to the Type 63 , but has a turret resembling the PT-76. The hull is probably based on the same chassis as the VTT-323 armored personnel carrier (see separate record). The North Korean turret does differ in several aspects. On the forward edge of the turret, in line with the main gun, is an anti-tank guided missile rail. The commander's hatch has a semi-circle shape, unlike the Soviet-era oval hatch, and is located on the top left side of the turret. The hatch op ens to the front, rather than to the rear as in the PT-76. The hull is all-welded steel. The driver sits to the front left. Ammunition is stored to his right. The engine and transmission are in the rear. The M1985 probably does not have any horizontal or vertical gun stabilizers; that, however, is unconfirmed. It may come equipped with a night-vision system and nuclear, biological and chemical (NBC) warfare protection.

ZTS-63 Chinese Amphibious Light Tank

Tiers:

Variants:

- **Type 63A1:** The Type 63AI is a slightly modified version of the Type 63A, which is designed to increase the protection of the vehicle against cumulative projectiles.

Sustain Rate of Fire: INA

Time the Max Rate of Fire can be Sustained: INA

Range Finder Type: Laser

Stabilized: No

Muzzle Velocity: m/s200

Operational Range: m3,000-4,000

Guidance System: SACLOS Wire Guidance

Armor Penetration: Yes

Fuel Capacity: liters4501

Gears: 5 Forward and 1 Reverse

Feed System: Belt

Sights: Iron/Optical

Type Round: Type 54 Round

Operation: Gas Operated, Open Belt

Traverse: deg360

Elevation Angle: deg90

↳***Ammunition***

Type: Anti-Aircraft Machine Gun

Muzzle Velocity: m/s850

Basic Load: belt-fed by boxes of 250 rounds.

Maximum Effective Range: m1,200-1,800

Armor Penetration: Yes

Coaxial Weapon System

↳***System***

Name: Type 80 Chinese Heavy Machine Gun

Type: 7.62mm Coaxial Machine Gun

Manufacturer: NORINCO

Date of Introduction: 1985

Length, Total: mm1,192

Length, Barrel: mm658

Diameter: INA

Range Finder Type: Optical/Night Vision

Weight (Gun Only): kg12.6

Weight (With Tripod): kg17.5

Action: Gas Operated

Rate of Fire: rds/min700-800

Feed System: Belts in 100/200/250 round boxes

Sights: Open sights. Optical/Night vision scope can be outfitted.

Variant 1: Type 80 - The copy of the PKM GPMG, chambered in 7.62×54mmR

Variant 2: Type 86 - A machine gun only used for tanks as a secondary weapon.

Variant 3: CF06 - An export-only version of the Type 80, which is chambered for 7.62 NATO ammunition.

Variant 4: BD-14 - A variant of the Type 80 made by Bangladesh Ordnance Factories under license which uses 7.62×51mm NATO instead of 7.62×54mmR

Ammunition

Type: Rifle
Caliber: 7.62×54mmR
Muzzle Velocity: m/s840
Basic Load: INA, Belts in 100/200/250 round boxes
Effective Range: 100-1,500m (With Sight Adjustments) m
Armor Penetration: Available

Anti-Tank Guided Missile

↳*System*

Name: HJ-8
Type: Anti-Tank Guided Missiles
Function: Wire-Guided Anti-Tank Missile System
Maximum Range of Fire: m4,000-5,000
Hit Probability (Static Targets: %90
Time the Max Rate of Fire can be Sustained: INA
Range Finder Type: Laser Guidance System
Caliber/Length: mm1,566
Diameter: mm120

Fire Control

Name: INA
Computerized FCS: Yes, believed to be the same FCS that is installed on Type 80 tanks
Thermal Sight Tank Commander: Yes
Thermal Sight Gunner: Yes
Main Gun Stabilization: Yes, stabilised in both axes to improve accuracy
Direct Fire Support: Yes
Indirect Fire Support: Yes
Laser Rangefinder: Yes

Protection

Armor Type: All-welded steel
Hull Armor: Steel armour, 25mm thick
Turret Armor: Steel armour, 25mm thick
Applique Armor: Available
↳ **Explosive Reactive Armor:** Yes

Active Protection System: Yes

Mine Clearing: Yes, Type 762 light mine clearance device

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes, Four smoke-grenade launchers are mounted on each side of the turret

IR Signature: INA

Note #1: It is likely that the vehicle's mine or blast resistance is low and that the protection is sufficient only for large-calibre small arms fire such as 12.7 or 14.5 mm rounds at typical combat ranges.

Note #2: Storage racks provide additional protection against HEAT rounds

Notes:

North Korea imports a large amount of their military equipment from China and Russia. The Type 63A amphibious light tank is a radically improved variant of the Type 63. The Type 63A entered service with Chinese Army in 1997. Over 300 of these light tanks were built for the Chinese Army. Some sources report that this light tank has been exported to Venezuela. Currently very few countries develop amphibious tanks and China is one of them. Its predecessor, the Type 63, was originally designed for river-crossing operations at inland rivers and lakes, however it was unsuitable for high-speed, long-distance maritime operations. The new Type 63A has specially modified features to improve its amphibious performance at sea. It can be launched from amphibious ships 10 km or more offshore. Before the mid-1990s, Chinese ground forces relied on the Type 63 amphibious light tank developed in the early 1960s. The low swimming-speed and weak firepower of the Type 63 was insufficient to the needs of modern maritime amphibious assault operations that PLA would conduct. The PLA demanded a replacement for the Type 63 in the early 1990s, which led to the development of the Type 63A in 1997. Reports indicate that over 300 examples has been delivered to the PLA by the end of 2000. The tank is also used by the Tanzanian armed forces. The Type 63A is a lightly armoured amphibious light tank with a flat, boat-like hull. Suspension is made up of 6 road wheels and lead or return rollers. A redesigned welded turret from the original Type 63 is mounted center of the hull, with the powerpack positioned in the rear. The Type 63A has 2 additional floating tanks to increase the stability of the vehicle in the water. There are 3 water inlets on both sides of the hull. In the rear of the hull there are to allow 2 large water jets for travelling in water. Type 63A introduces an enlarged welded turret replacing the original Type 63 turret, the modernised Type 63A utilises a dual-way stabilised 105 mm rifled gun replacing the 85 mm gun. The 105 mm rifled gun fires armour piercing fin stabilised discarding sabot (APFSDS), high explosive (HE), and high-explosive anti-tank (HEAT) ammunitions, with 45 rounds carried inside the vehicle. APFSDS round penetrates 400 mm steel armour or destroy a reinforced concrete bunker a distance of 2,000 m. To overcome the inaccuracy of firing when swimming, the Type 63A uses laser-beam guidance ATGM which is not affected by wave motion while swimming. The missile has a maximum firing range of 4–5 km with a first hit probability of +90% against stationary targets. Its secondary functions can engage low-flying helicopters. The Type 63A enhance capability allows the vehicle to conduct amphibious operations from its host amphibious warfare ships at distances from 5–7 km to shore at a speed of 28 km/h. Compared to the Type 63, the Type 63A featured five major improvements: The modernised Type 63 to Type 63A has given enhanced sea travelling performance, increased swimming speed, improved fire-control system, ATGM capability, and larger 105 mm rifled gun with dual stabilizers. The FCS includes digital fire-control computer, integrated commander sight with laser rangefinder input, and white-light spotter or image-stabilised gunner's sight w/ passive night vision. The Type 63A night vision is an image intensifier system. Alternatively the gunner sight can be fitted with a thermal imager night vision. It is also equipped with the satellite positioning (GPS/GLONASS) system to allow accurate landing position in harsh weather conditions and night operations. It's also equipped with computerised fire-control to enable accurate firing both on land and at sea.

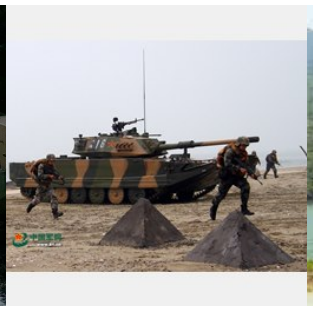
Notes:

The Model 1981 "Shin'heung" (Rise) is a North Korean amphibious light tank. Its common western designation is PT-85. It is built for the needs of their army, with around 500 examples operated. The Model 1981 "Shin'heung is based on the lengthened VTT-323 APC chassis, and although the turret appears similar to PT-76, the PT-85 has a higher horseshoe-shaped turret, with an 85 mm gun and hatches similar to those of a T-54. Early examples of the Model 1981 "Shin'heung" tank have shown a 9M14 Malyutka (AT-3 "Sagger") anti-tank guided missile installed on top of the turret directly above the main gun, and with two lights on the front of either side of the hull. In recent parades, the Model 1981 "Shin'heung" has been observed with a large IR projector (possibly a reverse engineered copy of a L-2 Luna IR spotlight on the turret, linked to the gun with a brace for elevation, as on the Russian T-55/62 tanks. The arrangement of the lights on the hull has also changed: there are three lights on the right side of the front glacis (two black ones and one white), plus one on the left side plate; sometimes some of these lights are omitted. The AT-3 "Sagger" missile is also now absent on the PT-85; it's unclear if these new or upgraded variants can be armed with that missile, and if so where the launcher would be installed. In 2015, Model 1981 "Shin'heung" tanks in parades have also been observed with a Manpad SAM installed on the rear of the turret, as well as three smoke mortars on each side of the turret.

Type 63A (ZTS-63A) Chinese Amphibious Light Tank



Tiers:

1 2 3 4

Variants:

- **Type 63A1:** The Type 63AI is a slightly modified version of the Type 63A, which is designed to increase the protection of the vehicle against cumulative projectiles.

System

Alternative Designation: Type 63A; ZTZ-63A; WZ 213
Type: Amphibious Tanks
Family: IIght Armoured Amphibious Tanks
Crew: ea4, 4 (Driver, Loader, Commander, Gunner)
Status: In service, but no further production.
Purpose: designed to transport a force from ship-to-shore during a contested landing and provide direct, as well as indirect, fire support to those forces once deployed.
Passenger Capacity: INA
Maximum Effective Range (Land): km400
Maximum Effective Range (Sea): km+120
Amphibious: Yes
Propellers: 2, at the rear of the tank
Note: The Type 63A has weak protection compared to other tanks

Protection

Armor Type: All-welded steel

Hull Armor: Steel armour, 25mm thick

Turret Armor: Steel armour, 25mm thick

Applique Armor: Available

Explosive Reactive Armor: Yes

Active Protection System: Yes

Mine Clearing: Yes, Type 762 light mine clearance device

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes, Four smoke-grenade launchers are mounted on each side of the turret

IR Signature: INA

Note #1: It is likely that the vehicle's mine or blast resistance is low and that the protection is sufficient only for large-calibre small arms fire such as 12.7 or 14.5 mm rounds at typical combat ranges.

Note #2: Storage racks provide additional protection against HEAT rounds

Notes:

The Type 63A amphibious light tank is a radically improved variant of the Type 63. The Type 63A entered service with Chinese Army in 1997. Over 300 of these light tanks were built for the Chinese Army. Some sources report that this light tank has been exported to Venezuela. Currently very few countries develop amphibious tanks and China is one of them. Its predecessor, the Type 63, was originally designed for river-crossing operations at inland rivers and lakes, however it was unsuitable for high-speed, long-distance maritime operations. The new Type 63A has specially modified features to improve its amphibious performance at sea. It can be launched from amphibious ships 10 km or more offshore. Before the mid-1990s, Chinese ground forces relied on the Type 63 amphibious light tank developed in the early 1960s. The low swimming-speed and weak firepower of the Type 63 was insufficient to the needs of modern maritime amphibious assault operations that PLA would conduct. The PLA demanded a replacement for the Type 63 in the early 1990s, which led to the development of the Type 63A in 1997. Reports indicate that over 300 examples has been delivered to the PLA by the end of 2000. The tank is also used by the Tanzanian armed forces. The Type 63A is a lightly armoured amphibious light tank with a flat, boat-like hull. Suspension is made up of 6 road wheels and lead or return rollers. A redesigned welded turret from the original Type 63 is mounted center of the hull, with the powerpack positioned in the rear. The Type 63A has 2 additional floating tanks to increase the stability of the vehicle in the water. There are 3 water inlets on both sides of the hull. In the rear of the hull there are to allow 2 large water jets for travelling in water. Type 63A introduces an enlarged welded turret replacing the original Type 63 turret, the modernised Type 63A utilises a dual-way stabilised 105 mm rifled gun replacing the 85 mm gun. The 105 mm rifled gun fires armour piercing fin stabilised discarding sabot (APFSDS), high explosive (HE), and high-explosive anti-tank (HEAT) ammunitions, with 45 rounds carried inside the vehicle. APFSDS round penetrates 400 mm steel armour or destroy a reinforced concrete bunker a distance of 2,000 m. To overcome the inaccuracy of firing when swimming, the Type 63A uses laser-beam guidance ATGM which is not affected by wave motion while swimming. The missile has a maximum firing range of 4–5 km with a first hit probability of +90% against stationary targets. Its secondary functions can engage low-flying helicopters. The Type 63A enhance capability allows the vehicle to conduct amphibious operations from its host amphibious warfare ships at distances from 5–7 km to shore at a speed of 28 km/h. Compared to the Type 63, the Type 63A featured five major improvements: The modernised Type 63 to Type 63A has given enhanced sea travelling performance, increased swimming speed, improved fire-control system, ATGM capability, and larger 105 mm rifled gun with dual stabilizers. The FCS includes digital fire-control computer, integrated commander sight with laser rangefinder input, and white-light spotter or image-stabilised gunner's sight w/ passive night vision. The Type 63A night vision is an image intensifier system. Alternatively the gunner sight can be fitted with a thermal imager night vision. It is also equipped with the satellite positioning (GPS/GLONASS) system to allow accurate landing position in harsh weather conditions and night operations. It's also equipped with computerised fire-control to enable accurate firing both on land and at sea.

Protection

Hull Armor: The hull of the 2S25 self-propelled anti-tank gun is composed of welded aluminum armor with a composite skin to maintain a light weight. Through the frontal arc, 40° left and right of the frontal armor provides protection against attack from 23 mm weapons at 500 m (550 yd) and against small arms fire and shell splinters through the remainder of the vehicle.

Turret Armor: Turret – Welded steel

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Two banks of three smoke-grenade dischargers are mounted towards the rear on each side of the turret as countermeasures to infrared weapons.

Automatic Fire Suppression System: Yes

Notes:

The 2S25 Sprut-SD (Russian: 2С25 «Спрут-СД»; 2S25 "Kraken-SD") is a self-propelled tank destroyer or light tank developed and manufactured by the Russian defence company, Volgograd Tractor Plant joint stock company, to meet the requirements of the VDV. In mid-2001, the Volgograd tractor plant revealed that the development of the 2S25 had lasted several years. The

Sprut-SD is designed to defeat tanks, hard-skinned material and enemy manpower by airborne and amphibious landing forces, as well as by specially designated units of ground forces. Its main armament, the 2A75, is capable of firing APFSDS, HE-Frag, HEAT and ATGM ammunition. This allows the 2S25 to be as powerful as a main battle tank and as maneuverable and amphibious as airborne infantry combat vehicles. The 2S25 can be used by units of ground forces and naval infantry as a light amphibious tank. Currently, the only operators of the 2S25 are the Russian airborne troops with 24 of these vehicles in service. The Republic of Korea and the Indian military have expressed interest in acquiring the 2S25 Sprut-SD. The 2S25 is based on the chassis of the BMD-3 Infantry fighting vehicle, which is also produced by the Volgograd tractor factory and is in service with the Russian airborne troops. Notable distinctions from the BMD-3 are the armament, the fire control system and the addition of two wheels to each side of the vehicle; which increases the number to seven on each side. The crew is located at the front of the chassis. The turret and ammunition occupies the middle of the vehicle, while the engine-transmission compartment is towards the rear. The driver has a hatch on the front deck; the commander and gunner have hatches on the turret deck. In the stowed position, the commander sits to the right of the driver, while the gunner sits to the left. Each crew member has available built-in roof observant instruments with the day and night channels. Standard equipment includes an electronic NBC protection system to ensure survivability of the crew in case of nuclear fallout. The 2S25 Sprut-SD is equipped with a two-man turret armed with a 125 mm anti-tank gun. The gun is fitted with an autoloader, which ensures the high rate of fire of 6−8 rounds per minute with both conventional projectiles and rounds with guided missiles. It is completely stabilized in the vertical and horizontal planes and conducts fire with the same 125 mm separate case ammunition loadings that are used for the 2A46 smoothbore tank gun. With the fire control system featuring this stabilization of the elevation and azimuth, it also includes a laser rangefinder and a ballistic computer that provides ever-changing data about the target. The two-plane stabilization of the commander's sight is aligned with the laser sight for aiming the 125 mm shells onto the laser rangefinder. The main armament of the 2S25 is a 125 mm smoothbore 2A75 tank gun, which is a derivative of the 125 mm 2A46 tank gun installed on Russian main battle tanks. The angles of elevation and depression for the anti-tank gun are +15° and −5° respectively. When aimed towards the stern of the vehicle, the elevation and depression of the gun changes to +17° and −3° respectively. Given the need to install a gun to a substantially lighter chassis, designers created a new recoil device with a new ejector and thermal insulation jacket; it lacks a muzzle brake. The 2A75's ammunition includes laser guided missiles like the 9M119 Svir, which have a maximum range of 4 km, for defeating armored targets. Reloading the main gun is completed by means of a horizontal autoloader mounted behind the turret. It can carry 40 rounds for the main armament, with 22 ready to use in the autoloader. In case the autoloader is no longer intact, manual loading is possible at the cost of a substantially longer reload time. A coaxial 7.62 mm PKT machine gun mounted to the left side of the main armament serves as the secondary armament of the 2S25; equipped with one tape of 2000 rounds.

PT-76 Russian Light Amphibious Tank

Tiers:

Variants:

- **PT-76A:** This variant is equipped with a D-56T gun with a multi-slotted muzzle brake
- **PT-76B:** This version features the D-56TS gun with a double-baffle muzzle brake, fume extractor and two-axis stabilizer system. Two auxiliary fuel tanks, each with 25 gal (95 liters), were also fitted, increasing overall weight by 440 lb (200 kg). Speed is increased to 37 mph (60 kmh). The hull was raised by 5 in (130 mm), the bow lengthened and the stern given a slightly steeper reverse angle to enhance buoyancy.
- **PT-76C:** This variant is fitted with a 12.7-mm air defense machine gun.
- **PT-76(M):** NIMDA, an Israeli company, designed an upgrade package for the PT-76. This included a new Detroit Diesel 6V-92T engine developing 300 hp at 2,100 rpm coupled to the original transmission and a new clutch; a Cockerill Mk 3M-A2 90-mm main gun; and a new fire-control system with a laser rangefinder. The 90-mm barrel measures 10 ft 8 in (3.25 m). The upgrade kit also includes a new alternator; new cooling and electrical system; and fuel, exhaust, air inlet, hull and top deck modifications.
- **PT-76 with AU-220M 57-mm turret:** First shown in 2005 as an export-oriented upgrade, the AU-220M replaces the existing PT-76 two-man turret with the AU-220M two-man turret equipped with a 57-mm automatic gun and a 7.62-mm machine gun. The fully stabilized main gun, equipped with a muzzle brake, fires a 57 x 347 SR round. Its ammunition-handling system manages the 20 ready rounds stored in the turret and replaces them with 70 more in the vehicle.
- **Chinese Type 63:** he Chinese Type 63 is a modification of the PT-76 design.

System

Alternative Designation: PT-76
Type: Light Amphibious Tank
Manufacturer: VTZ, Kirov Factory
In Service: 1951-Present
Crew: ea3 (commander, gunner, driver)

Dimensions

Length, Hull: m6.91

Length, with Gun Forward: m7.63

Width: m3.14

Height: m2.26

Weight, Combat: kg14,000

Ground Pressure: 0.48 kg/sq cm

Track Length on the Ground: m4.08

Track Width: m0.36

Ground Clearance: m0.37

Automotive

Engine Name: 1 x Model V-6B

Engine Type: water-cooled, in-line six-cyl diesel

Engine Power: 240 hp at 1,800 rpm

Main Fuel Capacity: 380 liters

Auxiliary Fuel Capacity: 190 liters

Speed, Road: 44 kph

Speed, Water: 10 kph

Maximum Road Range: 370 km

Maximum Road Range with Aux Fuel Tanks: 480 km

Maximum Water Range: 120 km

Gradient: %70

Vertical Obstacle: 1.10 m

Trench: 2.80 m

Fording: Amphibious w/hydrojet

Suspension: torsion bar, 6 road wheels, rear drive, front idler, no return rollers

Main Gun

↳*System*

Name: D-56T

Type: Rifled Anti-Tank Fun

Caliber: mm76.2

Length: 42 calibers (3.2 metres)

Carriage: Vehicle Mount

Rate of Fire: 6-8 rounds per minute

Maximum Firing Range: 1,500 metres

Maximum Elevation: deg+30

Minimum Elevation: deg-4

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

↳*Ammunition*

Name: BM-354P

Type: High Velocity Armor Piercing (HVAP)

Caliber: mm76.2

Cartridge: INA

Basic Load: 40

Maximum Effective Range: 650 meters by day and 600 meters at night.

Other Types of Ammunition: BM-354P High Velocity Armor Piercing (HVAP); BK-350M High Explosive Anti Tank or HEAT; OF-350 Frag-HE

Coaxial Weapon System

Note: The PT-76 has been seen with the following types of secondary weapons: * 1 x 7.62 mm SGMT, * 1 x PKT machine gun, * 1 x 12.7mm DSHKM Machine Gun

↳*System*

Name: Goryunov SG-43

Type: 7.62mm Heavy Machine Gun

Caliber: mm7.62

Length: mm1,150

Barrel Length: mm720

Weight, Unloaded: kg120.81

Action: Gas-Operated

Muzzle Velocity: m/s800

Rate of Fire: 600 Rounds per Minute

Effective Range: m1,097

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: INA

Basic Load: 1,000

Armor Penetration: INA

Fire Control

Name: INA

Computerized FCS: INA

Night Vision: only the driver had a night vision device

Main Gun Stabilization: stabilized in both planes

Protection

Turret Armor: front 17 mm at 35 deg sides 16 mm at 35 deg rear 11 mm at 35 deg top 8 mm mantlet 11 mm at 33 deg

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Only with the PT-76B and later

Smoke Equipment: Diesel fuel injected into exhaust system

Notes:

The PT-76 is a Soviet amphibious light tank that was introduced in the early 1950s and soon became the standard reconnaissance tank of the Soviet Army and the other Warsaw Pact armed forces. It was widely exported to other friendly states, like India, Iraq, Syria, North Korea and North Vietnam. Overall, some 25 countries used the PT-76. The tank's full name is Floating Tank–76 (плавающий танк, plavayushchiy tank, or ПТ-76). 76 stands for the caliber of the main armament: the 76.2 mm D-56T series rifled tank gun. The PT-76 is used in the reconnaissance and fire-support roles. Its chassis served as the basis for a number of other vehicle designs, many of them amphibious, including the BTR-50 armored personnel carrier, the ZSU-23-4 self-propelled antiaircraft gun, the ASU-85 airborne self-propelled gun and the 2K12 Kub anti-aircraft missile launch vehicle. The PT-76 has a typical tank layout: the steering compartment at the front, the combat compartment in the center and the engine compartment at the back. The tank has a three-man crew, with the commander also acting as the radio operator and gunner. This reduces his effectiveness as an observer. The commander and loader stations are located inside the turret, the commander sits on the left side of the main gun and the loader sits on the right. They have a large oval shaped double hatch, which opens forwards on top of the turret. The driver sits in the center of the front of the hull and has a one piece hatch that opens to the right, with three vision blocks and periscopes located beneath the main gun at the top of the sloping glacis plate. Under the driver's seat, there is an emergency hatch that can be used by all crew members. At night, the center periscope is swapped for a TVN-2B night vision device which gives the driver clear vision up to 60 meters. Its main armament consists of a 76.2 mm D-56T series rifled tank gun, which has an effective range of approximately 1,500 meters and a rate of fire of six to eight rounds per minute. This gun is 42 calibers long. The PT-76 carries 40 rounds for its gun. A typical ammunition load consists of 24 x OF-350 Frag-HE, 4 x AP-T, 4 x API-T and 8 x BK-350M HEAT rounds (with AP-T rounds substituted for HVAP when available). The gun is mounted in an oval dish-type circular truncated cone turret with flat, sloping sides which is mounted over the second, third, and fourth pair of road wheels. All PT-76s have a fume extractor for the main gun at the rear of the turret. The 7.62 mm SGMT coaxial medium machine gun comes with 1,000 rounds. This weapon has a maximum effective range of 1,000 meters in daylight while the vehicle is stationary, 400 to 500 meters in daylight while the vehicle is on the move and 600 meters at night. Maximum range is 1,500 meters. It can be fired in 2 to 10 round bursts and has a practical rate of fire of 250 rounds per minute and a cyclic rate of fire of 650 rounds per minute. From 1967, the machine gun was replaced with PKT of the same caliber. The main gun, considered light for a modern tank, can fire BM-354P HVAP, API-T, AP-T, BR-350 API-T and OF-350 Frag-HE rounds (as can the 76.2 mm M1942 (ZiS-3) divisional gun) and is capable of penetrating the armour of APCs and other lightly armored vehicles. The commander/gunner has a cupola on the left side of the double hatch. The cupola has the TPKU-2B observation device and two TNP day periscopes and can be rotated 360 degrees by hand. The commander also has a 4X optical sight mounted to the left of the main armament and a TShK-66 sight/rangefinder. The loader has the MK-4 observation device mounted on the turret's roof in front of the hatch.

Notes:

The M1985 152mm Towed Howitzer is a Romanian version of the Russian M1955 (D-20) 152mm Towed Howitzer. The 152 mm gun-howitzer M1955, also known as the D-20, (Russian: 152-мм пушка-гаубица Д-20 обр. 1955 г.) is a manually loaded, towed 152 mm artillery piece, manufactured in the Soviet Union during the 1950s. It was first observed by the west in 1955, at which time it was designated the M1955. Its GRAU index is 52-P-546. The D-20 has a 34 calibre (5.195 m) barrel, with a double baffle muzzle brake and a semi-automatic vertical sliding-block breech, with a tied jaw and the block moving down to open. The barrel is mounted in a long ring cradle with the trunnions just forward of the breech. The recoil system (buffer and recuperator) is mounted on the cradle above the barrel. Compression balancing gear is attached behind the saddle support, passing through the complex shaped saddle to connect to the cradle just forward of the trunnions. This can be manually re-pressured by a pump below the breech. The breech has a projectile retaining catch to prevent the shell sliding out at higher elevations before it is rammed with a manual rammer. Top traverse totals 58° and the vertical elevation range is −5° to 45°. Box girder section split trail legs are hinged to the cradle support, with bolts to lock them into either the open or closed position. The cradle support also has a bolt for locking the barrel in the centre for traverse before towing the gun. Large spades are permanently fixed close to the end of each trail; these are hinged and it appears that the gun can be fired with them up or down depending on the terrain, but they are always up when the gun is towed. To assist with all-round carriage traverse, there is a pivot jack mounted at the front of the cradle support. The pivot jack is not a sole plate and the gun fires with its foam filled rubber tyred wheels supporting the gun on the ground. When the gun is brought into action, the pivot jack is folded down and adjusted to be on the ground. If a large traverse is required, small jacks on each trail leg are rotated downwards, and the trails jacked up until the main wheels are lifted clear of the ground and the bogey wheels mounted on each trail leg swung downwards and the trail

jacks raised, the carriage is then traversed, and the trail jacks re-used to lift the bogey wheels and then place the piece back on its main wheels. The pivot jack is also used to secure the barrel against vertical movement when the gun is being towed. The barrel is locked in the centre for traverse with a bolt on the cradle support. The jack is folded upwards, lugs on the ring cradle engage the jack base and two tensioners fixed to the saddle support are hooked to the cradle, these are tightened to lock the cradle onto the jack base. As was normal for the period, the gun has a shield, including a folding piece below the cradle support. The centre section of the upper shield slides both up and down and folds to accommodate the barrel at higher elevation angles of fire. The shield may offer some protection against muzzle blast to the sights and layer, although it is usually shown being fired with a long lanyard, but is probably mostly for defence against machine gun fire. The non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope (OP4M), a panoramic periscopic indirect-fire sight, a dial sight, (PG1M) in a mounting, an angle of sight scale, and a range drum for each charge engraved with the range (distance) scale, coupled to an elevation leveling bubble mounted on dial sight mount. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. Like most Soviet artillery, the gun fires separate ammunition using metal cartridge cases that also provide obturation. The ammunition is interchangeable with that used with other 152 mm guns, although the more modern ones also have a third, much larger cartridge. The D-20 uses two types of cartridge; one has a base charge and up to five increments, the other is a single 'super' charge cartridge. The standard shell weight is 44 kg with a muzzle velocity of 655 m/s, but some projectiles are more or less than this. The basic shell is HE-Fragmentation, other projectiles include smoke, illuminating, chemical and probably incendiary. Later projectiles include bomblet, anti-personnel mine, flechette, Krasnopol precision munition, communications jammer, and extended range HE using rocket assistance (RAP). The normally maximum range is 17.4 km, RAP being greater. Two direct-fire anti-tank projectiles have been used, HEAT and APHE, the latter being 5.2 kg heavier and with a lower muzzle velocity. The maximum rate of fire is usually stated as five rounds/minute, and 65 rounds/hour sustained. In Soviet service, the unit of fire was 60 rounds. The detachment was either 8 or 10 men, probably differing between armies and the time period. In Soviet service, the 5,700 kg gun was usually towed by a URAL-375 6×6 truck or, in some regions, an AT-S or AT-L medium tractor.

Notes:

Iran imports a large amount of their military equipment and weapons from Russia, China, and America. The D-20 was the first 152-mm cannon system to incorporate a semiautomatic vertical-sliding-wedge breech block. Although the ammunition for the system was not changed, this modification allowed a slightly higher rate of fire to be achieved (6 rounds per minute rather than 4), although the sustained Rate of fire was unchanged. Because the carriage is based on that of the 122-mm gun D-74, the D-20 cannot be elevated above 45°. Variants M1974: North Korean self-propelled howitzer with a vVTT-323 APC chassis and a D-20 mounted in the side-armored rear bay Type 66: Chinese copy of D-30 Type 83: Self-propelled howitzer based on the Type 66, and an armored tracked chassis Other ammunition types: DPICM, DPICM-BB, incendiary, expendable jammer, chemical, flechette, semi-active laser-guided Krasnopol-m frag-HE. The cannon is ballistically matched to the 2S3M self-propelled howitzer. Thus it can generally fire the same ammunition to the same range. Selection of rounds available may differ based on tier of the system.

M114A1 American 155mm Towed Howitzer

Tiers:

Variants:

- **M114A2:** This is the standard M114 fitted with the longer barrel of the newer M198.
- **M114/39:** This was an upgrade developed by RDM (De Rotterdamsche Droogdok Maatschappij BV) Defense Engineering in Rotterdam, Netherlands. Longer barrel (39 calibers vs. 23) with increased rifling twist from 1 in 25 calibers to 1 in 20, a three-port muzzle brake, larger-capacity equilibrators, revised recoil system inclu ding new metering and recoil rods, maximum elevation increase to 70-deg (1,245 mils) and a greater barrel-chamber volume. The gun carriage was modified to handle the increased forces. Firing weight is 16,755 lb (7,600 kg); traveling length is 32 ft 10 in (10.0 m).
- **Modified M114 (Israel):** his version was developed as a private venture by Soltam of Israel.
- **155-mm M65 Howitzer:** This is a South Korean conversion of the M114A1 (see separate database entry).
- **M114 (Iran):** The variant is an Iranian upgraded M114 with an M114/39 barrel designated the HM41.

Notes:

Iran imports many of their military equipment and weapons from China, Russia, and the United States. The M114 155mm howitzer, which was replaced by the M198, is a towed weapon first produced in 1942 as medium artillery. The weapon uses NATO standard 155mm ammunition, with a range of about 14,000m, and was used during World War II in Korea, and in Viet Nam. Until recently they were in service with the National Guard. It was the U.S. Army and Marine Corps' principal 155-mm howitzer until the introduction o f the M198 in the early 1980s. It was exported to many other countries as well.

ZPU-2 Russian 14.5mm Towed Anti-Aircraft Gun

Tiers:

1 2 3 **4**

Variants:

- **Type 58:** Type 58: Chinese version of ZPU-2
- **PKM-2:** PKM-2 – Polish-built version.

System

Alternative Designation: ZPU-2
Type: 14.5mm Towed Anti-Aircraft Gun
Crew: 5
Carriage: INA
Displacement Time: minutes5
Emplacement Time: minutes5

Dimensions

Length, Traveling: m3.54
Barrel Length: m1.36
Width: m1.92
Height: m1.83
Weight, Traveling: kg649
Weight, Firing: kg621
Ground Clearance: m0.27

Cannon

↳*System*

Name: ZPU-2
Type: two Model KPV machine guns mounted on a two-wheel carriage.
Barrels: 2

Bore: 14.5-mm; fitted w/flash hiders

Muzzle Velocity: m/s1,000

Maximum Vertical Range: m5,000

Maximum Horizontal Range: m8,000

Effective Vertical Range: m1,400

Max Elevation: deg+85

Min Elevation: deg-15

Traverse Range: deg360

Traverse Right: deg180

Traverse Left: deg180

Cyclic Rate of Fire: 600 rds/min

Practical Rate of Fire: 150 rds/min

↳*Ammunition (Option 1)*

Name: BS.41

Type: API

Caliber: mm14.5

Basic Load: INA

Core: Tungsten carbide core

Projectile Weight: 64.4 g

Muzzle Velocity: m/s1,000

Armor Penetration: Armor-penetration at 500 m (550 yd) is 32 mm (1.3 in) of RHA at 90 degrees.

↳*Ammunition (Option 2)*

Name: BZT

Type: API-T

Caliber: 14.5

Basic Load: INA

Core: Steel Core

Projectile Weight: 59.56 g

Muzzle Velocity: m/s1,005

Tracer Burns: Tracer burns to at least 2,000 m (2,200 yd).

↳*Ammunition (Option 3)*

Name: ZP

Type: I-T (Instantaneous Incendiary)

Caliber: mm14.5

Basic Load: INA

Core: INA

Projectile Weight: 60.0 g

Note: I-T (ZP) – "Instantaneous Incendiary" bullet with internal fuze, incendiary in tip, tracer container in base.

Fire Control

Name: INA

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: Yes

Notes:

The ZPU-2 consists of two Model KPV machine guns mounted on a two-wheel carriage. The ZPU-2 was introduced in 1949 and is a twin version of the ZPU-1 basic Soviet 14.5MM machine gun. The ZPU-2 was used in Korea and considered a dangerous opposition in Vietnam. The Type 58 is the Chinese version, while the individual KPV machine guns as the Type 56. The twin ZPU-2 has appeared on two different two-wheeled carriages. The earlier model has larger fenders and a double tubular tow bar. In firing position the crew removes the wheels, and the weapon rests on a three-point platform. The later model, which is lighter in weight, has smaller fenders, a tighter single tow bar, and a tower silhouette. When in firing position the wheels are raised, but not removed. A very similar carriage is used for the twin 23mm automatic antiaircraft gun ZU-23, although the ammunition boxes, barrels and flash hiders are distinctly different. The ZPU-2 was used in the 1970s by some Warsaw Pact armies and by security elements such as the East German Workers' militia. All weapons in this series fire the API (BS 41) projectiles weighing 64.4 grams having a muzzle velocity of 1000 meters per second which will penetrate 32 mm of armour.

Type 54 Chinese 122mm Towed Howitzer

Tiers:

Variants:

- **M-30S:** Slightly modified variant; was used as the main armament of the SU-122 assault gun.
- **U-11:** A gun with identical ballistics, but equipped with a more compact recoil mechanism for easier mounting in vehicles. It was tried on the experimental SU-122M and rejected due to insufficient reliability. A variant of the same gun was also mounted on the experimental Obiekt 234 tank, also known as Iosif Stalin no. 2 (not to be confused with the IS-2).
- **D-6:** Another vehicle mounted gun with identical ballistics. It was used on the experimental SU-122-III and, like the U-11, proved unreliable.
- **Type 54:** China Licence version.
- **Type 54-1:** Slightly improved version.
- **Wz.1938/1985:** Existing Wz.1938 that was fitted with a castor wheel, PGO-9H sight and a second firing mechanism for direct fire.
- **M-30M:** In the 1980s Romanian Army M-30s were upgraded with new, larger pneumatic wheels, new brakes, a new optical sight for direct fire and a second height sighting mechanism for anti-tank combat. These upgraded howitzers were designated M-30M.

System

Alternative Designation: Type 54
Country of Origin: China
Type: Towed 122mm Howitzer
In Service: 1939-Present
Crew: 8
Carriage: Split trail
Displacement Time: less than 2 minutes
Emplacement Time: less than 2 minutes

Dimensions

Length: 5.9 m (19 ft 4 in) (with limber)
Barrel Length: bore: 2.67 m (8 ft 9 in) L/21.9 overall: 2.8 m (9 ft 2 in) L/23 (without breech block)
Width: 1.98 m (6 ft 6 in)
Height: 1.82 m (6 ft)
Weight: combat: 2,450 kg (5,401 lbs) travel: 3,100 kg (6,834 lbs)

Howitzer

↳*System*

Name: Type 54
Type: Towed 12mm Howitzer
Caliber: mm122
Breech: Interrupted screw
Recoil: Hydro-pneumatic
Carriage: Split trail
Elevation: -3° to 63.5°
Traverse: 49°
Rate of FIre: 5-6 rounds per minute
Maximum Firing Range: 11.8 km (7.33 mi)

↳*Ammunition (Option 1)*

Name: BP-460A
Type: HEAT
Caliber: mm122
Shell: 122 x 284mm .R loading charge and projectile.
Shell Weight: INA
Maximum Range: 2,000 m

↳*Ammunition (Option 2)*

Name: OF-462
Type: HE-Frag, steel (1,000 fragments to hit personnel in radius of 30 meters)
Caliber: mm122
Shell: 122 x 284mm .R loading charge and projectile.
Shell Weight: 21.76 kg
Maximum Range: 11,720

↳*Ammunition (Option 3)*

Name: H-462
Type: Chemical
Caliber: mm122
Shell: 122 x 284mm .R loading charge and projectile.
Shell Weight: 21.8 kg
Maximum Range: 11,800 m

Fire Control

Name: INA

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: Yes

Collimator: INA

Notes:

The Type 54 Chinese 122mm Towed Howitzer is a licensed version of the M-30 Russian 122mm Towed Howitzer. The 122 mm howitzer M1938 (M-30) was a Soviet 121.92 mm (4.8 inch) howitzer. The weapon was developed by the design bureau of Motovilikha Plants, headed by F. F. Petrov, in the late 1930s, and was in production from 1939 to 1955. The M-30 saw action in World War II, mainly as a divisional artillery piece of the Red Army (RKKA). Captured guns were also employed later in the conflict by the German Wehrmacht and the Finnish Army. Post World War II the M-30 saw combat in numerous conflicts of the mid- to late twentieth century in service of other countries' armies, notably in the Middle East. The barrel of the M-30 was of built-up construction and consisted of a liner, jacket and breech. The breechblock was of interrupted screw type, with forced cartridge case extraction. The gun was equipped with a hydraulic recoil buffer and hydropneumatic recuperator. A panoramic sight was used for both indirect and direct fire. The M-30 had a modern split trail carriage with leaf spring suspension and steel wheels with rubber tires. It was usually towed by vehicle without a limber. The carriage allowed for a towing speed of up to 50 km/h on paved road and up to 35 km/h on gravel or dirt roads, although the gun could also be moved by a team of six horses, in which case a limber was used. When the trails were swung open the suspension locked automatically . In an emergency it was possible to shoot in a "single trail" mode, at the price of a drastically reduced traverse (1°30'). The time required to set the gun up for combat was about 1–1.5 minutes. The carriage of the M-30 was later used for the D-1 152 mm howitzer. In the M-30, RKKA units finally received a modern divisional howitzer which successfully combined increased firepower and better mobility with reliability and ease of use. A summary of its employment by the Red Army was provided by Marshal G. F. Odintsov, who said "Nothing can be better". The long post-war employment of the howitzer is additional testimony to its combat and operational utility and effectiveness. It is hard to compare the M-30 directly with contemporary foreign guns since the artillery of France, Germany and United States employed in similar roles was either the much smaller 105 mm (Great Britain used the even smaller—87.6 mm—25 pounder gun-howitzer) or much larger 150 to 155 mm caliber guns. Howitzers of similar calibers existed but most of those were World War I era pieces, such as the Vickers 114 mm howitzer used by the Finnish Army. Naturally, 150 mm howitzers were more powerful, but much heavier than the M-30; while 105 mm pieces were lighter but their smaller shells contained less explosive. The most direct German equivalent was the 10.5 cm leFH 18 light howitzer. Weighing 1985 kg, it had a maximum elevation of 42°, muzzle velocity of 470 m/s and maximum range of 10,675 m. In the upgraded leFH 18/40 version, muzzle velocity was improved to 540 m/c, elevation to 45° and range to 12,325 m. About equal in range, the German howitzer had a less powerful HE shell and its smaller maximum elevation made it less effective against dug-in troops, although it also weighed some 400 kg less than M-30. Both guns were well suited for mass production with 16.887 M-30s and 15.388 leFH 18 built in 1941–45.

G-5 South African 155mm Towed Gun Howitzer

Note: DPICM, DPICM-BB, Incendiary, Expendable Jammer, Chemical, Flechette, Semi-Active Laser Guided Krasnopol-M Frag-HE.

Notes:

The APU, combined with the tandem walking-beam suspension, gives the G5 excellent self-propelled mobility over short distances. The four wheels are all powered and give the gun excellent traction over most terrain. But, the APU serves purposes other than mobility. It provides power to open and close the trails, raise and lower the trail wheels, and raise and lower the firing platform. However, there is no power traverse or elevation. Although designed for an eight-man section, the South African defense force normally operates the G5 with a five-man section. However, the G5 can operate with minimum of two people when all of the powered systems are working. The G-5 MKIII includes 35 reliability modifications and performance improvements. The improvements include the addition of the AS2000 gun monitor, an improved braking system, bigger diameter and wider trail wheels (specifically designed for sand), and incorporation of the Reutech ACV 58 communication system. The cannon is ballistically matched to the 2S3M self-propelled howitzer thus, it can generally fire the same ammunition to the same range.

PL-96 (Type 96) Chinese 122mm Towed Howitzer

Tiers:

Variants:

- **Type 89:** Type 89 is a tracked 122 mm artillery system with the 122 mm ordnance. Actually it uses ordnance of the older Type 86 howitzer. Since the late 1970s a number of 122 mm self-propelled howitzers were developed in China to meet Chinese Army requirements. The PLA required mobile artillery system to provide medium- to long-range indirect fire support for motorized infantry and armored troops and capable of keeping pace with them. However none of them could meet these requirements. The Type 89, also known as the PLZ89, was developed in late 1980s. It was Chinese attempt to develop indigenous self-propelled howitzer with similar capabilities to the Soviet 2S1 Gvosdika. The Type 89 is currently in service with Chinese Army and Marines. Several hundred of these artillery systems were built. Currently these are being replaced by the PLZ-07 and PLZ-07B self-propelled howitzers.
- **SH-3:** SH-3 is a tracked artillery system. It is an improved version of the Type 89, developed mainly for export. It can be seen as a China's newly-built equivalent to the Soviet 2S1 Gvosdika. It offers greater mobility, improved fire control system and delivers greater firepower than the 2S1 or the Type 89 self-propelled howitzers.
- **PLZ-07:** PLZ-07 is a version of the SH-3, adopted by the Chinese army. It is a successor to the Type 89 self-propelled howitzer. It was adopted in the late 2000s and first publicly revealed in 2009. The PLZ-07 is being fielded by the Chinese army in large numbers. This artillery system is not amphibious, though it seems that it might be fitted with floatation kit in order to ford inland rivers and lakes.
- **PLZ-07B:** PLZ-07B is an amphibious self-propelled howitzer, used by China's marine corps. This artillery system is fully amphibious. It has a boat-like hull for improved floatation and is fitted with a trim vane and two waterjets. Though it uses a similar turret as the SH-3 and PLZ-07. The PLZ-07B can be launched at sea from amphibious assault ships and swim over short distances to shore.
- **SH-2:** SH-2 is another truck-mounted howitzer. It is based on a 6x6 light utility truck chassis and uses ordnance of the PL-96. This artillery system was first publicly revealed in 2007. It was aimed mainly at export customers. However it received no production orders.
- **PCL-09:** PCL-09 is a truck-mounted howitzer. It is based on a Shaanxi 6x6 military truck and uses ordnance of the PL-96. This artillery system was adopted in around 2009 and is widely used by Chinese army.
- **PLL-09:** PLL-09 is a self-propelled artillery system, which is based on a ZBL-09 Snow Leopard armored personnel carrier chassis with 8x8 configuration. This self-propelled howitzer is widely used by the China's army. A number of these systems are used by China's marines. It provides indirect fire support for rapid deployment brigades. The PLL-09 has good cross-country mobility and is capable of keeping pace with main battle tanks.
- **CS/SH-1:** CS/SH-1 airportable truck-mounted howitzer, intended for airborne forces. It also utilizes modified ordnance of the PL-96, mounted on an open-top 4x4 truck. This artillery system can be airdropped. It was first publicly revealed in 2014.
- **SH-4:** SH-4 is a recent truck-mounted artillery system, which utilizes modified ordnance of the PL-96 122 mm howitzer, based on a 4x4 military truck chassis with an armored cab.

System

Alternative Designation: PL-96 (Type 96) Chinese 122mm Towed Howitzer
Type: Towed 122mm Howitzer
Crew: 5 men
Towing vehicles: This field howitzer is towed by a 6x6 truck. It is typically seen towed by Dongfeng EQ2102 or Shaanxi

SX2150 trucks, that also carry crew and ammunition.

Displacement Time: minutes1.5 - 2.5

Emplacement Time: minutes1.5 - 2.5

Maximum Range of Fire: 18 - 27 km

Maximum Rate of Fire: 6 - 8 rpm

Sustained Rate of Fire: 1 - 2 rpm

Elevation Range: - 7 to + 70 degrees

Traverse Range: 360 degrees

Ammunition

Name: INA

Type: Projectile

Caliber: 122mm

Basic Load: INA

Types of Projectiles: A whole family of 122 mm ammunition is produced in China for its artillery system. This howitzer fires High Explosive (HE), High Explosive Fragmentation (HE-FRAG), cargo, incendiary, smoke, illumination, and possibly other types of shells.

Compatibility: The PCL-09 is compatible with all standard 122 mm ammunition of Russian D-30 howitzer.

HE-FRAG Projectile Maximum Range of Fire: 18 km

Extended-Range Projectile Maximum Range of Fire: 21 km

Rocket Assisted Projectile Maximum Range of Fire: 27 km

Laser-Guided Projectile Capable: Yes

HE Projectile Penetration: 180 mm of steel armor

HEAT Projectile Penetration: Around 450-500 mm of steel armor

Fire Control

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: Yes

Notes:

The PL-96 is a Chinese copy of the Soviet D-30 howitzer. It is also referred as the Type 96. It is a slightly improved version of the Type 86 howitzer.

M115 American 203mm Towed Howitzer

Tiers:

Variants:

- **M43 self-propelled howitzer:** This version was developed during World War II. It entered service in 1946 in small numbers; all have been retired.
- **M55 self-propelled howitzer:** This was based on the M48 tank chassis. It serves in Turkey. This has the same elevation and traverse ranges as M115. It was superseded in U.S. service by the M110.
- **M110 self-propelled howitzer:** This gun has a lighter chassis for air-portability. See separate database entry

System

Alternative Designation: M115
Type: 203mm Towed Howitzer
In Service: 1939-Present
Manufacturer: Hughes Tool, Houston, Texas (now part of Baker Hughes)
Family: M115
Crew: ea14
Carriage: M35 Prime Mover gun tractor or a Mack 7⅓ ton 6×6 truck
Displacement Time: INA
Emplacement Time: INA
Note: It is capable of firing U.S. 203-mm nuclear and chemical munitions, but the United States does not export those.

Dimensions

Length, Traveling: m10.97
Barrel Length: m5.14
Width, Firing: m6.86
Width, Traveling: m2.84

Protection

Notes:

The M115 8-in (203-mm) towed howitzer is the largest towed artillery weapon ever developed in the United States. It is no longer in service with the U.S. Army, but is remains the arsenals of several other countries. The M115 8 in (203 mm) howitzer, which was replaced by the M110 self-propelled howitzer, is a towed weapon developed prior to World War II as a heavy artillery weapon. The weapon uses NATO standard 203mm ammunition, and was used during World War II, in Korea, and in Viet Nam. In NATO service their prime mission was to fire nuclear rounds which have since been phased out of service. Tests of the prototype T3 howitzer began at Aberdeen Proving Ground in 1939 and the howitzer entered service as the 8 in Howitzer M1. After the Second World War the complete weapon was redesignated the Howitzer, Heavy, Towed: 8 in: M115. Variants of the M110 with a longer barrel includes the M110A1 (no muzzle brake) and the M110A2 (fitted with muzzle brake). In most countries the M115 and the M110 have been phased out of service due to short range. The carriage of the 8 in howitzer is also used to mount the 155 mm Gun M1 (Long Tom), which is still in use with some armies.

Direct Fire: OP 5M
Collimator: K-1
Fire Control Computer: None
Gun Display Unit: None

Notes:

The towed, nuclear-capable 152-mm field gun M1976, along with its self- propelled counterpart 2S5, replaced the 130-mm field gun M-46 in gun battalions organic to artillery regiments and brigades at front and army level. This gun has a distinctive four-wheeled carriage, and has an armored shield that slopes to the rear and extends over the wheels. It has been fielded since 1978 and deployed in Soviet forces in Eastern Europe. This deployment indicated the importance Soviet doctrine placed on the capability to deliver low-yield nuclear strikes relatively close to Soviet forces.

Notes:

The most distinguishing feature of the 2A36 is its lower carriage. The large system weight required the use of tandem “walking-beam” axles and four wheels to provide mobility. A hydraulically powered firing pedestal is mounted on the front of the lower carriage and serves as part of the travel lock (similar to the D-20). Although the trails do not have the folding summer spades of the D-20, they do have two large spades similar to those found on the M-46/M-47. The weight of the 2A36 normally requires it to be towed by a heavy truck (like the KRAZ-255B). The KRAZ-255B is equipped with a special winch used to lift the trails in order to attach the gun’s lunette to the towing pintle.

GHN-45 Iranian 155mm Towed Gun Howitzer

Tiers:

Variants:

- **GHN-45:** Licensed Austrian copy, made by Noricum. These were the first mass-produced GC-45s.
- **GHN-45 with Auxiliary Power Unit (APU):** Independence from a separate prime mover is achieved with a 110-hp Porsche APU that can be mounted on the front of the carriage in about two days. The APU is equipped with headlights, a right-side driver's seat and two 7.9-US gal (30-liter) gasoline tanks.
- **155-mm Type WA 021 (PLL01):** This is a Chinese variant based on GHN-45 technology obtained from Austria.

Notes:

Iran imports many of their military weapons and equipment from Russia, Canada, America, and China. The GC-45 (Gun, Canada, 45-calibre) is a 155 mm howitzer designed by Gerald Bull's Space Research Corporation (SRC) in the 1970s. Versions were produced by a number of companies during the 1980s, notably in Austria and South Africa. The most publicized use of the design was in Iraq, where the GHN-45 variant used by some Iraqi artillery units had a longer range than any coalition cannon systems. This initially caused considerable worry on the part of the allied forces in the Persian Gulf War.

Notes:

The Type 66 152mm Towed Howitzer is a Chinese version of the Russian D-20 152mm Towed Howitzer. The 152 mm gun-howitzer M1955, also known as the D-20, (Russian: 152-мм пушка-гаубица Д-20 обр. 1955 г.) is a manually loaded, towed 152 mm artillery piece, manufactured in the Soviet Union during the 1950s. It was first observed by the west in 1955, at which time it was designated the M1955. Its GRAU index is 52-P-546. The D-20 has a 34 caliber (5.195 m) barrel, with a double baffle muzzle brake and a semi-automatic vertical sliding-block breech, with a tied jaw and the block moving down to open. The barrel is mounted in a long ring cradle with the trunnions just forward of the breech. The recoil system (buffer and recuperator) is mounted on the cradle above the barrel. Compression balancing gear is attached behind the saddle support, passing through the complex shaped saddle to connect to the cradle just forward of the trunnions. This can be manually re-pressured by a pump below the breech. The breech has a projectile retaining catch to prevent the shell sliding out at higher elevations before it is rammed with a manual rammer. Top traverse totals 58° and the vertical elevation range is −5° to 45°. Box girder section split trail legs are hinged to the cradle support, with bolts to lock them into either the open or closed position. The cradle support also has a bolt for locking the barrel in the center for traverse before towing the gun. Large spades are permanently fixed close to the end of each trail; these are hinged and it appears that the gun can be fired with them up or down depending on the terrain, but they are always up when the gun is towed. To assist with all-round carriage traverse, there is a pivot jack mounted at the front of the cradle support. The pivot jack is not a sole plate and the gun fires with its foam filled rubber tired wheels supporting the gun on the ground. When the gun is brought into action, the pivot jack is folded down and adjusted to be on the ground. If a large traverse is required, small jacks on each trail leg are rotated downwards, and the trails jacked up until the main wheels are lifted clear of the ground and the bogey wheels mounted on each trail leg swung downwards and the trail jacks raised, the carriage is then traversed, and the trail jacks re-used to lift the bogey wheels and then place the piece back on its main wheels. The pivot jack is also used to secure the barrel against vertical movement when the gun is being towed. The barrel is locked in the center for traverse with a bolt on the cradle support. The jack is folded upwards, lugs on the ring cradle engage the jack base and two tensioners fixed to the saddle support are hooked to the cradle, these are tightened to lock the cradle onto the jack base. As was normal for the period, the gun has a shield, including a folding piece below the cradle support. The center section of the upper shield slides both up and down and folds to accommodate the barrel at higher elevation angles of fire. The shield may offer some protection against muzzle blast to the sights and layer, although it is usually shown being fired with a long lanyard, but is probably mostly for defense against machine gun fire. The non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope (OP4M), a panoramic periscopic indirect-fire sight, a dial sight, (PG1M) in a mounting, an angle of sight scale, and a range drum for each

charge engraved with the range (distance) scale, coupled to an elevation leveling bubble mounted on dial sight mount. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. Like most Soviet artillery, the gun fires separate ammunition using metal cartridge cases that also provide obscuration. The ammunition is interchangeable with that used with other 152 mm guns, although the more modern ones also have a third, much larger cartridge. The D-20 uses two types of cartridge; one has a base charge and up to five increments, the other is a single 'super' charge cartridge. The standard shell weight is 44 kg with a muzzle velocity of 655 m/s, but some projectiles are more or less than this. The basic shell is HE-Fragmentation, other projectiles include smoke, illuminating, chemical and probably incendiary. Later projectiles include bomblet, anti-personnel mine, flechette, Krasnopol precision munition, communications jammer, and extended range HE using rocket assistance (RAP). The normally maximum range is 17.4 km, RAP being greater. Two direct-fire anti-tank projectiles have been used, HEAT and APHE, the latter being 5.2 kg heavier and with a lower muzzle velocity. The maximum rate of fire is usually stated as five rounds/minute, and 65 rounds/hour sustained. In Soviet service, the unit of fire was 60 rounds. The detachment was either 8 or 10 men, probably differing between armies and the time period. In Soviet service, the 5,700 kg gun was usually towed by a URAL-375 6×6 truck or, in some regions, an AT-S or AT-L medium tractor.

2S19M2 (Msta-SM2) Russian 152mm Self-Propelled Howitzer (SPH)

Tiers:

Parent:

2S19 Msta Russian Self-Propelled Howitzer (SPH)

Variants:

- **152 mm howitzer 2A65:** a towed version of the same gun.
- **1K17 Szhatie -:** a "laser tank" armed with a battery of lasers meant to disable optoelectronic systems; uses Msta-S chassis and turret.
- **2S33 "Msta-SM":** Improved version. Prototype.
- **2S19M1 (2000):** Improved version with automatic laying system and Glonass.
- **2S19M2 "Msta-SM2" (2013):** mproved version currently in production equipped with a new automatic fire control system which increases the rate of fire. Digital electronic maps are now available which significantly speeds up the terrain orientation in difficult geographical conditions and allows performing faster and more efficiently firing missions.
- **2S19M1-155 (2006):** 155mm export version of the 2S19M1, fitted with an L/52 gun with a range of 40+ km.
- **2S27 "Msta-K":** Wheeled variant (K = kolyosnij), based on a 8x8 truck chassis. There were several different prototypes, including one based on a KrAZ-ChR-3130 and two based on the Ural-5323 (with and without turret).
- **2S30 "Iset":** Improved version, prototype only.
- **2S35 "Koalitsiya-SV" -:** Project for a new artillery system for the Russian land forces (SV = sukhoputniye voyska). Early prototypes consisted of a 2S19 chassis with modified turret, fitted with an over-and-under dual autoloaded 152mm howitzer. Development of this variant was abandoned in favour of an entirely new artillery system using the same designation

System

Alternative Designation: 2S19M2
Estimated out of service date: 2058
Manufacturer: Uraltransmash
Type: Self-propelled howitzer
Family: Msta-S 2S19 family
Crew: ea5
Chassis: Modified T-72
Displacement Time: min1.5
Emplacement Time: min1.5
Navigation System: Yes, GNSS
Air Conditioning Unit: Yes, the AP18DM system

Note: The 2S19M2 can be distinguished from other variants by the presence of two external stowage containers on the right side of the turret.

Notes:

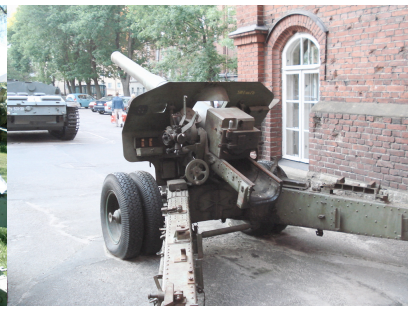
The 122mm D-74 towed gun is a Soviet-built gun. Developed in the late 1950s it provided direct and indirect fire for the Soviet Army. Today it is in reserve units with the Russian Army. It is in active service with the Egyptian Army and the Pakistani Army. The 122 mm (originally 48 lines) caliber has been in Russian service since the early 20th century. After World War II the Soviet Union developed two new long range guns to replace existing 122 mm and 152 mm guns such as 122 mm gun M1931 (A-19), 122 mm gun M1931/37 (A-19), 152 mm gun M1910/30 and 152 mm gun M1935 (Br-2). The two new guns were the 122 mm D-74 and the 130 mm M-46. The D-74 design was probably initiated in the late 1940s and it was first seen in public in 1955. It was designed by the well established design bureau at Artillery Plant No. 9 in Sverdlovsk (now Motovilikha Plants in Yekaterinburg), led by the eminent artillery designer Fëdor Fëdorovich Petrov who was also responsible for several World War II and later artillery designs. The design team also developed the 152 mm gun howitzer D-20 at much the same time, and both D-74 and D-20 use the same carriage. Both the 122 mm D-74 and 130 mm M-46 entered Soviet service, but the heavier shell and greater range of the M-46 meant that it outlasted the D-74. The D-74 has a 52 caliber barrel, with a double baffle muzzle brake and a semi-automatic vertical sliding-block breach, with a tied jaw and the block moving down to open. The barrel is mounted in a long ring cradle with the trunnions just forward of the breach. The recoil system (buffer and recuperator) is mounted on the cradle above the barrel. Compression balancing gear is attached behind the saddle support, passing through the complex shaped saddle to connect to the cradle just forward of the trunnions. This can be manually re-pressured by a pump below the breach. The breach has a projectile retaining catch to prevent the shell sliding out at higher elevations before it is rammed with a manual rammer. The Type 60 122mm towed gun is the Soviet D-74 122mm gun produced by the Chinese under licence. Developed in the late 1950s, it provided direct/indirect fire for the PLA. It remains in service with reserve units in gun battalions attached to motorized infantry and armored divisions. It is in active service with the Sri Lankan Army, introduced in the early 1990s to replace the Ordnance QF 25 pounder field gun. It has seen action in the Sri Lankan civil war. Top traverse totals 60° and the vertical elevation range in -5° to 50°. Box girder section split trail legs are hinged to the cradle support, with bolts to lock them into either the open or closed position. The cradle support also has a bolt for locking the barrel in center for traverse before towing the gun. There are small spades at the end of each trail leg, and fittings for large spades that are carried on the side of each trail leg. The large spades are used on soft ground and are fitted to the trail ends via have a pintle in the same way as the similar spades on M-46. These spades are the main difference from the D-20 carriage. To assist with all-round carriage traverse, there is a pivot jack mounted at the front of the cradle support. The pivot jack is not a sole plate and the gun fires with its foam filled rubber tyred wheels supporting the gun on the ground. When the gun is brought into action the pivot jack is folded down and adjusted to be on the ground. If the requires large traverse, small jacks on each trail leg are rotated downwards, and the trails jacked up until the main wheels are lifted clear of the ground and the bogey wheels mounted on each trail leg swung downwards and the trail jacks raised, the carriage is then traversed, and the trail jacks re-used to lift the bogey wheels and then place the piece back on its main wheels. The pivot jack is also used to secure the barrel against vertical movement when the gun is being towed. The barrel is locked in center for traverse with a bolt on the cradle support. The jack is

folded upwards, lugs on the ring cradle engage the jack base and two tensioners fixed to the saddle support are hooked to the cradle, these are tightened to lock the cradle onto the jack base. As was normal for the period the gun has a shield, including a folding piece below the cradle support. The center section of the upper shield both slides up and down and folds to accommodate the barrel at higher elevation angles of fire. The shield may offer some protection against muzzle blast to the sights and layer, although it is usually shown being fired with a long lanyard, but is probably mostly for defense against machine gun fire. The non-reciprocating sights are designed for one-person laying. Included are a direct fire anti-tank telescope (OP4M), a panoramic periscopic indirect-fire sight, a dial sight, (PG1M), an angle of sight scale, and a range drum for the single charge engraved with the range (distance) scale, coupled to an elevation levelling bubble mounted on dial sight mount. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. The gun fires separate ammunition using a metal cartridge case that also provides obscuration. The ammunition is different to that used with 122 mm howitzers. There is a single charge without increments. The shell weight is 25 kg with a muzzle velocity of 900 m/s although the slightly lighter APHE shell has a higher muzzle velocity. Maximum rate of fire is usually stated as six rounds per minute. The detachment was either eight or nine men, probably differing between armies and period. In Soviet service the 5,600 kg gun was usually towed by a URAL-375 6×6 truck, AT-S or AT-L medium tractor in some regions.

M1938 (M-10) Russian 152mm Towed Howitzer



Tiers:

Variants:

- **M1938 (M-10T):** In addition to the towed howitzer, a vehicle-mounted variant was developed for use in KV-2 heavy tanks. This variant—152 mm tank howitzer M1938 (M-10T)—had a shorter barrel. A single prototype with powder bag loading was built in 1939.

System

Alternative Designation: M1938 (M-10)
Type: 152mm Towed Howitzer
Caliber: 152mm
Crew: 10
Carriage: Split trail
Breech: Interrupted screw
Recoil: Hydro-pneumatic
Elevation: −1° to 65°
Traverse: 50°
Rate of Fire: 3–4 rounds per minute
Muzzle Velocity: 432–508 m/s
Maximum Firing Range: 12.4 km
Sights: panoramic
Displacement Time: Under 5 Minutes
Emplacement Time: Under 5 Minutes

Dimensions

Length: 3.7 m
Width: INA
Height: INA
Weight, Combat: 4,150 kg

Weight, Traveling: 4,550 kg

Ammunition

Note: The M-10 used separate-loading ammunition, with eight different charges. The charges ranges from the "full charge" Zh-536 and smaller charges ranging from the "first" to "sixth", which was the smallest. A "special charge" was used with the BP-540 HEAT projectile. Propellant charges were produced in "full" and "third" variants in munitions factories. All other charges were derived from removing small gunpowder bags from the charge cartridge. For flash suppression there was a special chemical mixture which was inserted into cartridges before night firing.152 mm projectiles for the M-10 weighed about 40 kg, making a difficult job for loaders, who had to carry the projectiles alone. When set to fragmentation mode, the OF-530 projectile produced fragments which covered an area 70 meters wide and 30 meters deep. When set to high-explosive (HE) action, the exploding shell produced a crater about 3.5 meters in diameter and about 1.2 meters deep. The OF-530 is still fired from modern 152 mm ordnance pieces of the Russian Army. The G-530 HEAC anti-concrete shell had a muzzle velocity of 457 m/s when fired with the "first" charge. At a range of one kilometer it had 358 m/s terminal velocity and was able to punch through up to 80 centimeters of reinforced concrete before detonating a TNT charge which increased the total penetration to 114 centimeters. The G-530 could not be fired with a "full" charge without putting the crew at risk of having the shell explode in the barrel. A special version of the shell, the G-530Sh, was developed to allow use with the full charge. The BP-540 HEAT projectile was not used during World War II. It had an armour penetration of 250 millimeters at an incident angle of 90°, 220 millimeters at 60°, 120 millimeters at 30°.

↳*Ammunition (Option 1)*

Name: BP-540

Type: HEAT

Caliber: 152mm

Projectile Weight: 51.07 kg

Muzzle Velocity: INA

Maximum Range: INA

Maximum Range: INA

Fire Control

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: Yes

Collimator: INA

Notes:

152-mm howitzer M1938 (M-10) (Russian: 152-мм гаубица обр. 1938 г. (М-10)) was a Soviet 152.4 mm (6 inch) howitzer of World War II era. It was developed in 1937–1938 at the Motovilikha Mechanical Plant by a team headed by F. F. Petrov. Although production of the gun was stopped in 1941, it saw combat with the Red Army until the end of World War II and remained in service until the 1950s. Captured pieces were used by Wehrmacht and the Finnish Army. The latter kept the M-10 in service until 2000. The M-10 was much more advanced design compared to older Soviet 152 mm howitzers. It had a modern split trail carriage which allowed for a much larger traverse. The trails were of riveted construction. The carriage was equipped with suspension and wheels from the ZiS-5 truck, increasing towing speed. The barrel, much longer than that of older designs, was fitted with an interrupted screw breechblock with recoil devices consisting of a hydraulic recoil buffer and hydro-pneumatic recuperator. The recoil travel was variable. A gun shield provided some protection from bullets and shell fragments. Unlike its eventual successor, the D-1, the M-10 was not equipped with a muzzle brake. While softening recoil and thus allowing for a lighter carriage, a muzzle brake has the disadvantage of redirecting some of the gases that escape the barrel toward the ground where they raise dust, revealing the gun position. The gun could be towed by an artillery tractor or a team of horses. In the latter case, a 400-kg limber was used. In a tank-mounted variant, M-10T, the gun was mounted on the KV-2 heavy tank. By the early 1930s the Red Army (RKKA) started to look for a replacement for the 152-mm howitzer M1909 and the 152-mm howitzer M1910. Those pieces, developed before World War I, had unsprung fixed trail carriages and short barrels, which meant poor mobility, insufficient elevation and traverse angles and short range. Although both pieces were eventually modernized, resulting in the 152-mm howitzer M1909/30 and the 152-mm howitzer M1910/37 respectively, these were relatively minor upgrades which brought only limited improvement in some areas and didn't address others. It was clear that a completely new design was needed. However, at that time, the Soviets had little experience in developing modern artillery pieces. An initial attempt was made to overcome that issue through a collaboration with Germany. Constrained by the limitations of the Treaty of Versailles, Germany was looking for ways to proceed with weapons development and joint projects gave them such an opportunity. Among other weapons supplied by Germans was a heavy howitzer, designated 152-mm howitzer M1931 (NG) in the USSR. Soon the Motovilikha Mechanical Plant (MMZ) was tasked with the production of this gun. However, only eight pieces were completed in 1932–1934 until production was stopped. The design proved to be too complicated for the Soviet industry of the early 1930s, similar to other designs like 122-mm howitzer M1934 or 20-mm and 37-mm autocannons. Also it was considered somewhat heavy at 5,445 kg in travelling configuration. But these early failures gave Soviet developers some valuable experience. In 1937, F. F. Petrov and his design team at the Motovilikha Ordnance Plant started work on a new design, the M-10. Technical papers were submitted to the Artillery Directorate on 1 August 1937 and on 2 November the first prototype was completed. Ground trials (19–25 October 1938) featured two pieces: No. 302 (L/25 barrel with constant rifling) and No. 303 (L/20 barrel with progressive rifling). The No. 303 was found to be superior. The trials also revealed numerous defects in the gun construction: the howitzer suffered from insufficient upper carriage strength, leaks in the recoil buffer, unreliable suspension etc. For army tests early in 1939, an improved design with a longer barrel was presented. Another series of army tests followed from 22 December 1939 to 10 January 1940, but even before it started—on 29 September 1939—the gun was adopted as 152 mm divisional howitzer model 1938. Later, the word divisional was removed from the designation.

Uragan-1M Russian 220mm/300mm Multiple Launch Rocket System (MRL)

Tiers:

1 2 3 4

Parent:

BM-27 Uragan Russian 220mm Multiple Launch Rocket System

Variants:

- **9P140 Uragan:** Standard variant on ZIL-135 truck
- **Uragan-1M:** Variant presented to the public in 2007; all processes are automated. Can also fire the 300 mm rockets of the BM-30 Smerch system. Reloading is simplified by substituting barrels; can be fitted with two banks of 6 300 mm launch tubes or 15 220 mm launch tubes. Deliveries to the Russian Army started as of September 2016
- **9A53 Uragan-U:** Successor with 2 × 15 launch tubes; presented in 2009 on 8×8 MZKT-7930. Thanks to its modular assembly the BM-30 Smerch and BM-21 Grad rockets can also be fired.
- **Bastion-03:** Prototype by Ukrainian company AvtoKrAZ, presented in 2010. Installed on a 6×6 truck type KrAZ-63221RA.

System

Alternative Designation: Uragan-1M (Hurricane-1M)'

Type: 220mm/300mm Multiple Launch Rocket System

Chassis/Carriage: MZKT-7930

Manufacturer: Splav State Research and Production Enterprise

In Service: 2007-Present

Crew: ea3

Displacement Time: min3

Emplacement Time: min3

Note: Brief redeployment time allows to avoid counter-battery fire. Rockets are launched directly form the cab, or remotely form the vehicle.

220mm Main Gun Weapon System (Option 1)

↳*Launch System*

Name: 9K57 System

Type: Multiple Launch Rocket System

Caliber: mm220

Chassis: 9P140 Vehicle

Number of Tubes: ea30

Effective Firing Range: km34

Full Salvo Duration: 9-20 seconds

Reloading Time: min15-20

Maximum Elevation: deg+55

Minimum Elevation: deg0

Traverse Range: deg60

Traverse Left: deg30

Traverse Right: deg30

Main Gun Stabilizer: Yes

Launch Mode: Single Fire or Salvo Fire

Single Launch Mode Time to Fire: seconds8.8

Salvo Launch Mode Time to Fire (16 Rockets): seconds20

Note: The Uragan-1M launcher is escorted by an associated reloading vehicle, which is referred as 9T249.

↳*Ammunition (Option 1)*

Name: 9M27F

Type: HE FRAG

Caliber: mm220

Rocket Weight: kg100

Explosive Weight: kg51.9

Maximum Effective Range: km10

Minimum Effective Range: km3.5

Penetration: 8 meters wide and 3 meters deep

↳*Ammunition (Option 2)*

Name: 9M27K

Type: Cluster warhead

Caliber: mm220

Maximum Effective Range: km10

Minimum Effective Range: km3.5

Note: The 9M27K contains 30 9N210 dual-purpose fragmentation bomblets. Each submunition generates 370 to 400 2-g preformed fragments.

↳*Ammunition (Option 3)*

Name: 9M27K2

Type: Anti-tank mines

Caliber: mm220

Maximum Effective Range: km10

Minimum Effective Range: km3.5

Warhead Type: 9N218K2

Note: 9N218K2 warhead, which contains 24 PTM-1 or PTM-1G scatterable anti-tank mines. Designed to break tracks.

300mm Main Gun Weapon System (Option 2)

↳*System*

Name: 9A52, 300mm Launcher

Type: mm300

Number of Tubes: 12 (3 rows of 4 tubes)

Launch Rate: INA

Full Salvo Time: 12 rounds in 38 seconds

Single Rocket Interval: 3 Seconds per Rocket

Loader Type: Manual

Reload Time: 36 minutes

Launcher Drive: Electric

Armor: Unarmoured

Land Navigation: No

Smoke Equipment: No

NBC Protection: No

Notes:

Presented to the public in 2007, all processes of the Uragan are automated. The Uragan can fire the 300mm rockets of the BM-30 Smerch system. Reloading is simplified by substituting launch tubes; can be fitted with two banks of six 300mm launch tubes or fifteen 220mm launch tubes. Deliveries to the Russian army started as of September 2016. The Uragan-1M is based on a 8x8 military truck chassis, MZKT-7930, developed in Belarus early 1990s. The forward control cab of the MZKT-7930 accommodates the driver and two passengers. The Uragan-1M is fitted with two launcher pods, each containing two layers of three rockets ready to fire, giving a total of 12 launch tubes. The rocket launcher station is mounted on a turntable at the rear of the truck chassis with powered elevation and traverse.

M101 American 105mm Towed Howitzer

Tiers:

Variants:

- **M101:** The original production model had the M2A1 carriage and the M2A1 model gun, which had a straight barrel.
- **M101A1:** This is covered in the main entry. It has a M2A2 carriage (which differs from the M2A1 chiefly in the amount of shielding) and the M2A2 gun, which has a thickened muzzle.
- **German M101 modification:** It features a longer barrel with single-baffle muzzle brake, new breech ring and new sights. Maximum range is 15,420 yds (14,100 m).
- **M101/33 Upgrade:** This was proposed by RDM (De Rotterdamsche Droogdok Maatschappij BV) Defence Engineering of Rotterdam, Netherlands. It features a longer barrel of 33 calibers; progressive twist rifling increasing from 1 in 35 to 1 in 18 over the first 9 ft 2 in (2.974 m) and holding 1 in 18 over last 12 in (306 mm); and a slotted muzzle brake. The loaded weight increases to 5,247 lb (2,380 kg). In March 1994, RDM was awarded a US$13.75 million contract by the Canadian army to upgrade 96 M101 howitzers to the M101/33 standard. The contract included two options, one for an additional 29 howitzers, and another for an additional 60. The first upgraded howitzers were shipped back to Canada in late 1995 with the entire batch of 96 to be completed in 1998. It was also trialed in Indonesia and Malaysia. In 1994, a single model of a Brazilian M101 was upgraded by RDM with a 37-caliber barrel from the Royal Ordnance L118 Light Gun. At the time, Brazil had a requirement for up to 80 upgraded M101s.
- **M101/LG1 Upgrade:** Giat Industries has developed an upgrade for the M101 that replaces the 23-caliber barrel of the M101 with the 30-caliber barrel used by Giat's LG1 Mk II 105-mm Light Gun. The upgrade allows the M101 to fire new Giat HE extended-range base-bleed ammunition out to 17,500 m (10.9 miles). Giat was awarded a contract by the Philippines in July 1996 to modify 12 M101A1s with the newer barrel. An order for the rest of the Philippines inventory of M101s was seen as possible. Thailand reportedly ordered 300 upgraded kits for its stock of M101s.

System

Alternative Designation: M101
Type: 105mm Towed Howitzer

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: Yes

Collimator: INA

Notes:

The 105 mm M101A1 howitzer (previously designated M2A1) is an artillery piece developed and used by the United States. It was the standard U.S. light field howitzer in World War II and saw action in both the European and Pacific theaters. Entering production in 1941, it quickly gained a reputation for accuracy and a powerful punch. The M101A1 fires 105 mm high explosive (HE) semi-fixed ammunition and has a range of 12,330 yards (11,270 m), making it suitable for supporting infantry. All of these qualities of the weapon, along with its widespread production, led to its adoption by many countries after the war. Its ammunition type also became the standard for many foreign countries' later models. During the Second World War, U.S. artillery regiments consisted of an HQ detachment, one 155 mm artillery battalion, and three 105 mm artillery battalions. Both the 155 mm and 105 mm battalions had twelve guns each, divided into three batteries of four guns. That gave each regiment a total of twelve 155 mm howitzers, and thirty-six 105 mm howitzers. The U.S. military artillery designation system was changed in 1962, redesignating the 105 mm M2A1 howitzer the M101A1. The gun continued to see service in the Korean and Vietnam Wars. Though a similar model, the M102 howitzer, shared the same roles in battle, it never fully replaced the M101A1. Today, the M101A1 has been retired by the U.S. military, though it continues to see service with many other countries. By the end of the Second World War, 8,536 105 mm towed howitzers had been built and post-war production continued at Rock Island Arsenal until 1953, by which time 10,202 had been built. The Canadian Army continued to use the M2A1 as the C2 Howitzer until 1997 when a modification was made to extend its service life; it is now designated the C3. The changes include a longer barrel, a muzzle brake, reinforced trails and the removal of shield flaps. It remains the standard light howitzer of Canadian Forces Reserve units. The C3 is used by Reserve units in Glacier National Park in British Columbia as a means of avalanche control. In addition, the M101 has found a second use in the U.S. as an avalanche control gun, supervised by the US Forest Service and the US Army TACOM's cooperative effort in the Avalanche Artillery Users of North America Committee (AAUNAC). The M101 is used by a number of ski areas and state departments of transportation for long-range control work. Under the designation of M2A2, the 2nd Battalion, 2nd Field Artillery Regiment, 428th Field Artillery Brigade performs salutes with 7 guns with World War Two Medal of Honor recipient names on their barrels. France and the State of Vietnam used M2A1 howitzers during the First Indochina War, as did the Viet Minh guerilla forces they fought against, who were supplied with at least 24 by the People's Republic of China, along with other captured American artillery pieces and mortars formerly operated by both Nationalist Chinese forces (the Kuomintang military) and US troops fighting in Korea.[citation needed] Today upgraded M2A1 howitzers (some of which have been mounted on trucks and employed as self-propelled artillery) are still being used by the People's Army of Vietnam (the VPA). The French Army used the M2 howitzer, designated HM2, in the Algerian War and during the Opération Tacaud in Chad.[5] France later supplied a battery of HM2 to the Rwandan Armed Forces during the Rwandan Civil War that led into the Rwandan genocide. A number of M2/M101 howitzers were used by the Socialist Federal Republic of Yugoslavia and approximately 50 were inherited by Croatia, of which four are still in use for training with the Croatian Army. M2 Howitzers are still in limited service in the Australian Army Reserve, but are being replaced with 81-millimetre (3.2 in) mortars with an emphasis on the retention of indirect fire support skills. In regular service they were replaced by the 105 mm L119

Hamel gun and the 155-millimetre (6.1 in) M198 howitzers. Two M2 howitzers (1942) are still employed in providing the gun salute at Kristiansten Fortress, in Trondheim, Norway. M101/M2 is one of three approved salute guns in the Norwegian armed forces, and have been reduced to a caliber of 75 millimetres (3.0 in) for this purpose. They are used for gun salute also at Rena and Setermoen. Five M101A1 howitzers are owned by the Virginia Military Institute and are used for parades, evening retreat and other ceremonies.

PL-66 (Type 66) Chinese 152mm Towed Gun-Howitzer

Tiers:

1 2 3 4

Variants:

- **Type 83:** Type 83 self-propelled howitzer with a modified ordnance of the PL-66 with an added semi-automatic loader and fume extractor. It was modeled after a Soviet 2S3 Akatsiya self-propelled howitzer, which utilized a modified ordnance of D-20. This Chinese artillery system uses an armored tracked chassis.
- **APU-66-152:** APU-66-152 is a recent version of the PL-66, fitted with auxiliary power unit. This allows to self-deploy over short distances. Also auxiliary power unit aids in emplacement and displacement. This artillery system was first publicly revealed in 2018.
- **PL-66 Truck Mounted:** It uses the same light armored chassis with 6x6 configuration as the SH-2 and SH-5 artillery systems. This truck-mounted howitzer was first publicly revealed in 2018, alongside the APU-66-152.

System

Alternate Designation: PL-66
Manufacturer: INA
In Service: 1966 to present
Barrel Length: 26 calibers
Maximum Rate of Fire: 5 - 6 rpm
Maximum Range of Fire: 17.4 - 22 km
Gun Bore: 152mm
Elevation Range: - 5 to + 45 degrees
Traverse Range: 58 degrees

Dimensions

Weight: 5.56 t
Length (in traveling order): 8.69m

Length (in combat order): INA

:

Ammunition

Type:

Caliber: 26

Projectile Weight: 43.56 kg

Note #1:: This artillery piece is towed by a 6x6 military truck, which carries the whole gun crew, as well as ammunition. A Chinese Shaanxi SX2150 6x6 army truck is typically used for this role.

Note #2:: The PL-66 artillery systems are deployed in batteries of 6 artillery pieces.

Notes:

The PL-66, also known as Type 66, is a Chinese 152 mm field howitzer. It is a license-produced version of the Soviet D-20 howitzer, that was created during the early 1950s and is one of the most prolific artillery systems ever. It is unknown if this howitzer is still in production. Though this artillery system is still widely used in China and was exported to some countries, including Iraq and Sri Lanka.

AH-1/AH-1A Chinese 155mm Towed Artillery

Tiers:

Variants:

- **AH-1:** AH-1 is an improved version of the PLL-01, manufactured in China by NORINCO. It has a more powerful auxiliary power unit, consisting of an air-cooled diesel engine, developing 110 hp. This howitzer has a maximum auto-propulsion speed of 20 km/h. Reportedly, the AH1 is in service with Ethiopia.
- **AH-2:** AH2 is a 52-caliber version of the AH1 towed howitzer. It has a longer range.
- **GM-45:** Same cannon fit onto a lighter carriage. This allows the system to be easier to maneuver but provides less stability to the system.

System

Alternative Designation: AH-1/AH-1A
Crew: ea6
Displacement Time: min1.5
Emplacement Time: min1.5
Range with standard ammunition: km24
Range with ERFB: km30
Range with ERFB-BB: km39
Minimum Range: m5,400

Dimensions

Notes:

The AH-1/AH-1A Chinese 155mm Towed Artillery is a variant of the PLL-01 Chinese 155mm Towed Artillery that is equipped with a APU. The APU provides limited self-propulsion to move into or out of the firing position and enables powered deployment in the firing position. The difference between the AH1 and the AH1A is a conventional screw breechblock on the AH1 and a laterally sliding wedge breech block on the AH1A.

M777A2 AUS Australian 155mm Towed Howitzer

Tiers:

Variants:

- **M777:** gun with optical fire control
- **M777A1:** digitization upgrades with the addition of an on-board power source, satellite global positioning, inertial navigation, radio, Gun Display Unit (GDU) and Section Chief Assembly (SCA).
- **M777A2:** Block 1A software upgrade. Addition of an Enhanced Portable Inductive Artillery Fuze Setter (EPIAFS) to enable Excalibur and precision munition compatibility.
- **M777ER:** Experimental upgrade created by the Extended Range Cannon Artillery (ERCA) project modified with a 52-caliber barrel, adding 1.8 m (5.9 ft) to the cannon and less than 450 kilograms (990 lb) to the overall system, extending range from 30 to 70 km (19 to 43 mi); concept only

System

Alternative Designation: M777A2 AUS
Type: Towed Howitzer
Crew: 7+1
Carriage: Split trail
Displacement Time: INA
Emplacement Time: INA

Dimensions

Length: Combat: 10.7 m (35 ft 1 in) Travel: 9.5 m (31 ft 2 in)
Barrel Length: 5.08 m
Weight: 4,200 kg

Main Weapon System

↳*System*

Name: M777A2 AUS
Type: Towed Howitzer
Caliber: mm155
Carriage: Split trail

Elevation: 0° to +71.7°

Traverse: INA

Rate of Fire: Normal: 2 rpm Maximum: 5 rpm

Muzzle Velocity: Charge 8S: 827 m/s (2713.25 ft/s)

Effective Firing Range: 24-40 km

↳*Ammunition (Option 1)*

Name: M107

Type: Projectile

Caliber: mm155

Length: 605.3 mm

Diameter: 154.71 mm

Weight as Fired: 43.2 kilograms

Fuzes: PD M51A5, M728 family, M557, M572, M739, M564, M577, M582, M732

Explosive Content: NT 6.86 kilograms

Effective Firing Range: 24 km

Note: The M107 155mm projectile was the standard 155mm high explosive (HE) projectile for howitzers of the US Army and US Marine Corps. A bursting round with fragmentation and blast effects, the M107 is being superseded in the US military by the M795.

↳*Ammunition (Option 2)*

Name: M795

Type: Projectile

Caliber: mm155

Length: 605.3 mm

Diameter: 154.89 mm

Weight as Fired: 46.7 kg

Fuzes: INA

Explosive Content: TNT: 10.8 kg with a charge liner OR IMX-101(IMX was adopted by the Army; Marines still use TNT)

Effective Firing Range: 22.5 km

Note: The M795 155mm projectile is the US Army and US Marine Corps' standard 155mm high explosive (HE) projectile for howitzers. It is a bursting round with fragmentation and blast effects. The M795 is designed to be a more lethal, longer range version of the M107. A welded band replaces the swaged rotating band of the M107, allowing the M795 to be fired with M119 or M203 propelling charges, increasing range by 6,000 meters. The explosive payload was also improved, as was the fragmentation pattern, giving 30% higher lethality.

↳*Ammunition (Option 3)*

Name: M982 Excalibur

Type: Projectile

Caliber: mm155

Length: 996 mm

Diameter: 155 mm

Weight: 48 kg

Warhead: PBXN-9

Guidance System: GPS, inertial navigation

Accuracy: 5-20 m

Effective Firing Range: 40 km

Fire Control

Name: INA

Computerized FCS: The M777A2 uses a digital fire-control system similar to that found on self-propelled howitzers such as the M109A6 Palladin to provide navigation, pointing and self-location, allowing it to be put into action quickly.

Direct Fire: No

Indirect Fire: Yes

Collimator: INA

Notes:

In 2008, the Australian Defence Force made a US Foreign Military Sales request for 57 M777A2s worth an estimated US$248m. Subsequently, 35 guns were purchased for the Australian Army to re-equip the 1st Regiment, Royal Australian Artillery, the 4th Regiment, Royal Australian Artillery and the 8th/12th Regiment, Royal Australian Artillery to replace 155 mm M198s and 105 mm L119 Hamels. The first deliveries of M777A2 began in late 2010. An additional 19 guns will be bought directly from American production lines to enable a total of six batteries. Concurrently, the Australian Army has acquired guided 155 mm munitions in the form of the M982 Excalibur and XM1156 Precision Guidance Kit. M777A2 – Block 1A software upgrade. Addition of an Enhanced Portable Inductive Artillery Fuze Setter (EPIAFS) to enable Excalibur and precision munition compatibility. The M777 howitzer is a towed 155 mm artillery piece. It succeeded the M198 howitzer in the United States Marine Corps and United States Army in 2005. The M777 is also used by the ground forces of Australia, Canada, India and Saudi Arabia. It made its combat debut in the War in Afghanistan. The M777 is manufactured by BAE Systems' Global Combat Systems division. Prime contract management is based in Barrow-in-Furness in the United Kingdom as well as manufacture and assembly of the titanium structures and associated recoil components. Final integration and testing of the weapon is undertaken at BAE's facility in Hattiesburg, Mississippi. The M777 began as the Ultralight Field Howitzer (UFH), developed by Vickers Shipbuilding and Engineering's (VSEL) Armaments Division in Barrow-in-Furness, United Kingdom. VSEL was bought by BAE Systems after the UFH prototypes had been manufactured and demonstrated, consequently BAE became responsible for future design refinements and re-named the gun 'M777'. Upon taking-over responsibility for the weapon BAE to a large degree 'americanised' the construction and assembly through its US-based BAE Systems Land and Armaments group. The M777 now uses about 70% US-built parts including the gun barrel manufactured at the Watervliet Arsenal. With a weight of 4,200 kg (9,300 lb), the M777 is 41% lighter than the 7,154 kg (15,772 lb) M198 howitzer it replaces. Much of the weight reduction is due to the extensive use of titanium. The M777 can be transported by helicopter sling-load, transporter aircraft such as the C-130, or towed by air-braked vehicles weighing over 2.5 tonnes (2.8 short tons), such as the FMTV and MTVR. The minimal gun crew required is five, compared to a previous nine. The M777 uses a digital fire-control system similar to that found on self-propelled howitzers such as the M109A6 Palladin to provide navigation, pointing and self-location, allowing it to be put into action quickly. The Canadian M777 in conjunction with the traditional "glass and iron sights/mounts" also uses a digital fire control system called the Digital Gun Management System (DGMS) produced by Leonardo MW with components of the Indirect Fire Control Software Suite (IFCSS) built by the Firepower team in the Canadian Army Land Software Engineering Centre. The Leonardo MW portion of the system, known as LINAPS, had been proven previously through earlier fielding on the British Army Royal Artillery's L118 Light Gun The Digital Fire Control System will be powered by a unique new design of rotary hybrid-electric engine designed and manufactured by Liquid Piston. The M777 may be combined with the M982 Excalibur GPS-guided munition, which allows accurate fire at a range of up to 40 km (25 mi). This almost doubles the area covered by a single battery to about 1,250 km2 (480 sq mi). Testing at the Yuma Proving Ground by the US Army placed 13 of 14 Excalibur rounds, fired from up to 24 kilometres (15 mi), within 10 m (33 ft) of their target, suggesting a circular error probable of 5 m (16 ft). In June 2012, Golf Battery, 2nd Battalion, 11th Marines, out of Camp Pendleton, California, dropped the M982 Excalibur round on insurgents at a range of 36 km (22 mi) in Helmand Province, Afghanistan. This marked the longest operational shot in the history of the M777 howitzer, and the longest operational tube artillery shot in history for the Marine Corps. In 2014 the US military began fielding

several upgrades to its M777 howitzers including new liquid crystal display units, software updates, improved power systems, and muzzle sensors for onboard ballistic computing. Future upgrades include a touchscreen Chief Section Display, a new Mission System Computer, and a digital radio. In May 2017, the US Army revealed it was buying the Swedish BONUS round as an interim system as a result of the required phasing out of cluster munitions from artillery shells, complying with policy to achieve less than 1% unexploded ordnance from non-unitary explosives; the BONUS has two sensor-fused munitions deployed by a 155 mm carrier projectile that scan the ground for targets and fire explosively formed penetrators down from the air. The system has been tested from the M777 howitzer.

M1 (M59) American 155mm Towed Gun

Tiers:

Variants:

- **Gun Variants:** *M1920 – prototype. *T4 – prototype. *M1 (1938) – first production variant, 20 built. *M1A1 (1941) – modified breech ring. *M1A1E1 – prototype with chromium-plated bore. *M1A1E3 – prototype with liquid cooling. *M2 Standard (1945) – with modified breech ring.
- **Carriage Variants:** *T2 – prototype. *M1 (1938). *M1A1 – refurbished T2 carriages. *M2 Standard
- **Limber Variants:** *M1 Standard (1938) *M5 Heavy (1945) The gun was also mounted on a modified M4 medium tank chassis, in mount M13. The resulting vehicle was initially designated 155 mm Gun Motor Carriage T83 and eventually standardized as 155 mm Gun Motor Carriage M40.[15] 155 mm Gun Motor Carriage T79, based on T23 Medium Tank chassis, never advanced past proposal stage. A portable "Panama mount" M1 was also provided.

System

Alternative Designation: M1; M59

Type: Towed Gun

Crew: 14

Carriage: M1 Carriage The gun carriage provides a stable, yet mobile, base for the gun. The new split-trail carriage featured an eight-wheel integral two-axle bogie and a two-wheel limber that supported the trails for transport. The carriage was a two-piece design. The upper carriage included the side frames with trunnion bearings that supported the recoil mechanism that carried the gun cradle, slide and gun tube. The upper carriage also incorporated the elevating and azimuth gearing. The upper carriage pivoted in azimuth on the lower carriage. The lower carriage included the transport suspension and the split-trail that stabilized and absorbed recoil when the gun was fired. After the gun was placed in a firing position with the gun pointing in the desired direction, the trails were lowered to the ground and the limber was removed. The carriage wheels would then be raised using built-in ratcheting screw-jacks, lowering the gun carriage to the ground. Once on the ground, the limber-end of the trail legs were separated to form a wide "vee" with its apex at the center of the carriage pivot point. A recoil spade at the limber-end of each trail leg required a correctly positioned hole to be dug for the spade, which was attached to the trail end, to transmit the recoil from gun carriage through the trails and into the earth. This made the gun very stable and assisted its accuracy. The removable spades were transported in brackets on the trail legs. The carriage M1 and M2 were shared with the 8 inch Howitzer M1, differing only in the gun tube, sleigh, cradle, recoil and equilibrators, weight due to the heavier barrel.

Notes:

The 155 mm gun M1 was a 155 millimeter caliber field gun developed and used by the United States military. Nicknamed "Long Tom" (an appellation with a long and storied history in U.S. field and naval artillery), it was produced in M1 and M2 variants, later known as the M59. Developed to replace the Canon de 155mm GPF, the gun was deployed as a heavy field weapon during World War II and the Korean War, and also classed as secondary armament for seacoast defense. The gun could fire a 100 lb (45 kg) shell to a maximum range of 14 mi (23 km), with an estimated accuracy life of 1,500 rounds. The Long Tom was also adopted by a number of other nations, including the United Kingdom, Austria, Israel, and the Netherlands. The new gun design used a barrel similar to the earlier 155 mm GPF, but with an Asbury mechanism that incorporated a vertically-hinged breech plug support. This type of breech used an interrupted-thread breech plug with a lock that opened and closed the breech by moving a single lever.[4] The ammunition for the 155 mm gun was "separate-loading", that is with the shell and the powder

charge packaged, shipped and stored separately. The shell is lifted into position behind the breech and then rammed into the chamber to engage the shell's rotating band into the barrel rifling. Ramming the shell home is followed by loading a number of powder bags, as required for the desired range.The powder charge could be loaded in up to seven charge settings. Once the powder is loaded, the breech plug is closed and locked, and a primer is placed in the breech plug's firing mechanism. After setting the elevation and azimuth, the gun is ready to fire. The firing mechanism is a device for initiating the ammunition primer. The primer then sets off the igniter which ignites the propelling charge of the ammunition. A continuous-pull lanyard first cocks the firing pin, then fires the primer when pulled. The gun was developed into M1A1 and M2 variants. After World War II, the United States Army re-organized, and the gun was re-designated as the M59.

Type 83 Chinese 122mm Towed Gun Howitzer

Tiers:

Variants:

- **2A18M or D-30M:** new double baffle muzzle brake, square central base plate, towing lunette assembly.
- **2A18M-1 or D-30M-1:** with semi-automatic loader. Prototype.
- **D-30A:** modified recoil system, new muzzle brake
- **2S1 Gvozdika s:** self-propelled version.
- **Type 85 or D-30-2:** Chinese self-propelled version of the D-30.
- **D-30-3:** Chinese upgrade of the Type 56 85 mm field gun with 122 mm weapon.
- **Type 86, variously, Type 83, Type 96:** Chinese licence-production or derivative of the D-30.
- **D30 RH M-94:** Croatian built version, new muzzle brake, redesigned trail, improved hydraulic brake.
- **D 30-M:** Egyptian licence version of the D-30.
- **SPH 122:** Self-propelled version, mounted on a modified M-109 chassis.
- **T-122:** Self-propelled version, mounted on a modified T-34 chassis.
- **HM 40:** Iranian version.
- **Shafie D-30I or HM-40:** Iranian version.
- **D-30J:** Yugoslav version of the D-30 - heavily modified version based on license designed by Military Technical Institute Belgrade
- **Saddam:** Iraqi designation of Yugoslavia D-30J produced on license bought from Yugoslavia.
- **D-30JA1:** Improved Serbian version - further development of D-30J.
- **Sora 122mm:** Self-propelled version of D-30J
- **M-91 "Mona":** Yugoslav variant with the 100 mm ordnance of the MT-12. Prototype only.
- **Khalifa-1:** Sudanese licensed version of the D-30.

Notes:

The Type 83 122mm Towed Gun Howitzer is a Chinese version of the D-30 Russian 122mm Towed Gun Howitzer. The D-30, also known as the M1963, replaced the older 122mm howitzer M-30 (M1938). The original D-30 was fielded in 1963 and the midlife product improvements occurred in the mid to late 1970's. The original D-30 is in use with at least 50 different countries. The 2A18M, D-30A and D-30M are midlife product improvements of the D-30 that are currently in production. The D-30 features a unique three-trail carriage, a conspicuous boxy shield for the recuperator above the tube, and a small protective shield between the wheels. The gun has a semiautomatic, vertically sliding, wedge-type breechblock. It is towed muzzle-first by a truck or armored tractor, at speeds up to 80 kilometers per hour, with its trails folded under the barrel. Distinctive features of the D-30 include its low mobile mounting and above-barrel recoil system. The three-legged mobile mount is unusual for field artillery, with stabilizers that are clamped together for towing and deployed when in action. A large tow linkage is fixed to the muzzle; in transport the barrel serves as a trail. Similar mounts were a feature of several 76-mm pre-war (1931–1935) universal

(both field and anti-aircraft) guns designed by Leningrad's Kirov Plant (L-1, L-2 and L-3). Other examples were the 1939 French 47SA39 APX, and 1943 German 105-mm light field howitzers designs by Skoda and Krupp; neither entered service. The Bofors 105 mm L28 Light Field Howitzer 4140 was similarly arranged with four legs and did enter Swedish service. The 1930s-designed British 2-pdr. anti-tank gun was another piece featuring a three-legged mounting. Compared to the M-30, the new howitzer had a significantly longer 35 calibre gun barrel, just short of being a gun-howitzer by Soviet definition. Like other guns of the period, it had a high efficiency muzzle brake; this improved muzzle velocity by 175 m/s to a total of 650 m/s for HE, and raised maximum range by 3,500 m beyond the similar M-30. Maximum range was 2 km better than the 76 mm M1942 at 15.3 km. Weight increased by 650 kg over the M-30, to 3,150 kg; the D-30 is over twice the weight of the 76mm M1942. Accuracy improved, with mean error at about 10 km dropping from 35 m with the M-30 to just 21 m. Effective stabilisation length is a fundamental aspect of a gun mount, and legs 120° apart need to be longer than those with a smaller angle. The D-30's design minimises this problem in several ways. Trunnions are close to the ground, as a result of placing the recoil system and cradle above the barrel. The trunnions are also at the very rear of the breech; this maximises the recoil space when firing at higher elevation angles. Their rearward position also pushes the recoiling element forward on the mount, maximizing relative rearward span of the stabilizers and so stability during recoil. Additionally there is a very efficient muzzle brake, which absorbs about half the recoil. There is no mechanism to reduce recoil length as the angle of elevation increases. Some of the design decisions have a price. The muzzle brake produces about twice the overpressure in the area around the gun that is acceptable to Western armies, and is the reason it is often seen being fired with a long lanyard, which reduces rate of fire. Furthermore, the maximum elevation angle is restricted to 18° (early versions) or 22° (later versions) when the breech is over a trail leg. This is enforced by a mechanical cam that prevents the piece firing for about 60% of the total top traverse, and limits range to about 12 km, with full maximum range only possible in the central arc of about 48° between each pair of legs. The extreme rearward location of the trunnions means the elevating mass is unbalanced, requiring a strong balancing mechanism to enable manual elevation. To do this, the D-30 uses compression balancing gears. A central jack is powered by hand-operated hydraulics. This jack is lowered while the wheels are raised to permit two of the stabiliser legs to be swung 120° rearwards. The mounting is then lowered and the ends of the legs spiked to the ground. This mounting provides for quick traversing to fire in any direction. The pair of large tires are suspended on a single trailing arm; maximum towing speed is 60 km/h on the road. As was normal in Soviet designs, the tyres were filled with foam. Initially, the D-30 had no brakes and no seat for the layer—non-essential luxuries. A sliding block breech was adopted instead of the M-30's pre-1914 screw pattern, giving a slight increase in the rate of fire. It is a semi-automatic vertical sliding block breech, with a tied jaw; the block moves down to open and opens automatically ejecting the empty cartridge case as the recuperator forces the gun tube back into battery after a round is fired. The design is closely related to those of breeches on other Soviet post–World War II guns and howitzers. The non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope, a panoramic periscopic indirect-fire sight (dial sight) in a reciprocating mounting, an angle of sight scale, and a range drum for each charge engraved with the range (distance) scale. The elevation leveling bubble is mounted on the dial sight mount. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. Soviet 122 mm howitzers used different ammunition to 122 mm guns, although there was some compatibility. In the case of ammunition for the D-30, the standard 122 mm howitzer shell weight of 21.8 kg was retained, with a metal cartridge case holding variable propelling charges. Cartridge and shell are loaded separately; this means that the shells have to be hand-rammed by a man to the right of the breech with a ramming rod. The D-30 could fire the older M-30 ammunition; however, new shells were also introduced, eventually including a rocket assisted projectile with a range of 21.9 km. The M-30's range of propelling charges, comprising base and eight increments, was replaced by a new set comprising base and four increments; single base propellant was retained. A more effective High Explosive (HE) shell was developed, as well as smoke, illumination and chemical filled projectiles. In keeping with Soviet doctrine, the anti-tank role is important; there is a HEAT shell capable of penetrating 460 mm of steel armour plate. The maximum rate of fire of the D-30 is 6–8 rounds per minute, and about 75 rounds per hour. There is disagreement as to whether this maximum rate of fire is achievable for indirect fire. Based on reloading speeds of similar guns using separate charges, solo re-laying, and given a stable emplacement, semi-automatic breech and no long lanyard, (examples are the 25-pdr. and 105mm L118), and assuming concurrent lay adjustment during reloads, then it probably is when in the hands of a competent detachment. However, 5-6 rounds per minute may be more realistic with a poorly trained gun crew. The D-30 is noted for simplicity of maintenance by its users; reputedly there are no special tools, all jobs can be done with a wrench and large hammer. However, like any other gun, routine maintenance is essential, and western troops in Afghanistan have reported Afghan manned D-30s having problems with shells sticking in the barrel due to lack of cleaning. A location chosen for emplacement of the D-30 should be as level as reasonably possible. Firstly, the carriage is raised via an internal hydraulic jack located under the cradle of the gun. Once the gun is at the required height, the wheels are raised via the wheel lifting lever; this allows the two split stabilizer legs to be separated from the mono stabiliser leg and brought rearward into firing configuration. The legs are then locked in place with locking pins. The carriage is lowered via the hydraulic jack so that the legs touch the ground; integral stakes are then hammered into the ground. At this point, the gun is ready for direct fire using the OP4 direct fire sight, or can be orientated and have its position fixed via the aiming circles for subsequent indirect fire using the Pantel sight.

M-46 (M1954) Russian 130mm Towed Gun

Tiers:

Variants:

- **M-47:** This is a 152 mm field gun (Russian: 152-мм пушка М-47 обр. 1953 г.) that was developed alongside the M-46. The M-47 had a range of 20,470 m and was far less successful than its 130 mm counterpart. Only a small number was built between 1954 and 1957.
- **Type 59:** This is a licensed version of the M-46.
- **Type 59-1:** This is a combination of the 130 mm ordnance of the Type 59 with the carriage of the Type 60 (D-74 copy). The result is a gun with the same range as the M-46, but with a much lower weight of 6.3 t.
- **Type GM-45:** For the export market, NORINCO (China North Industries Corporation) developed this upgrade package where the original barrel of the Type 59 is replaced by the 155/45 mm ordnance of the WA 021.
- **SP-130 "Catapult":** Indian-designed self-propelled version, mounted on the hull of the Vijayanta tank.
- **M-46S:** This is an upgrade of an existing M-46 or Type 59, carried out by Soltam Systems Ltd. The original barrel is replaced by a new model of 155/45mm (western ammunition) for a range of 25.8 (HE) to 39 km (ERFB-BB). A 39-calibre barrel is optional. In March 2000, Soltam won a contract worth $47,524,137 for upgrading 180 M-46s to M-46S standard (Indian designator: 155/45mm (E1) Soltam).
- **M46/84:** This is a conversion that involved replacing the original 130 mm barrel with a new 155/45 mm barrel or 152 mm barrel. With ERFB-BB ammunition, this version has a range of 38,600 m and with M05 152 mm range exceeds 40 km
- **A412:** License-built Chinese Type 59-1 with D-20 carriage.

Notes:

The 130mm towed field gun M-46 (Russian: (130мм пушка М-46) is a manually loaded, towed 130mm artillery piece, manufactured in the Soviet Union in the 1950s. It was first observed by the west in 1954. There is also a Chinese copy, called the Type 59. For many years, the M-46 was one of the longest range artillery systems around, with a range of more than 27 km. The M-46 was developed from the M-36 130 mm naval gun used on ships and for coast defence. It is a true gun, being unable to fire much above 45° and having a long barrel and a single propelling charge. In contrast, most Western field guns of this period had a dual high and low angle fire capability, a gun-howitzer. It has a 39 calibre barrel with a tied jaw horizontal sliding-block breach and 'pepperpot' muzzle brake. The latter is not notably efficient, but subjective reports suggest that it is quite effective in reducing muzzle flash. The hydro-pneumatic recoil system comprises a buffer below the barrel and a recuperator above the barrel. The long barrel enables a substantial propelling charge by providing more length in which to achieve 'all-burnt' and hence projectile acceleration space and thus achieve its 930 m/s muzzle velocity. The barrel is mounted on a split-trail carriage, with deep box section trails and foam filled road wheels on the ground when firing and 50° of top traverse. The small shield protects little more than the sights, possible including from the effects of muzzle blast, and some protection from machine gun fire in anti-tank engagements. The gun has long and robust trails to provide stability when firing, a large detachable spade is fitted to the end of each when the gun is brought into action. Non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope, a panoramic periscopic indirect-fire sight (a dial sight) in a reciprocating mounting, an angle of sight scale, and a range drum engraved with the range (distance) scale, coupled to a mounted elevation levelling bubble. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. An APN-3 was later provided for direct fire at night in place of the day telescope. For travel, the gun is towed via a two-wheeled limber fitted to the end of the closed trails, with the spades removed and carried on each trail. Simple jacks on the trails just behind the main wheels are used to lift and support the closed trails so that the limber can be connected. The barrel and recuperator are pulled back between the closed trails and locked in a travelling position. There is a large bicycle chain arrangement on the right trail for this, and a compressed air cylinder, charged by the gun firing, is used to bring the barrel forward when the gun is brought back into action. It takes about four minutes to bring the gun into action, the normal detachment is eight strong. Propelling charges are in metal cartridge cases and loaded separately from the projectile. Projectiles originally included HE fragmentation, Armour Piercing solid shot, smoke, illuminating and chemical. HE shells weigh some 33 kg. Illuminating shells have a substantially lower muzzle velocity. APHE and extended range shells were introduced later. Maximum rate of fire is probably 6-7 rounds/minute, and about 70 rounds/hour. The standard Soviet unit of fire was 80 rounds.

D-1 (M1943) Russian 152mm Towed Howitzer

Tiers:

1 2 3 4

Variants:

- **Variants:** In addition to the towed howitzer, Petrov's team developed a vehicle-mounted variant of the D-1. Red Army offensive operations in the summer and fall of 1943 reawakened interest in the idea of a heavy "artillery" tank similar to the KV-2, that could provide close fire support to rifle and tank units and would be capable of demolishing heavy fortifications. Probable causes for the development of such a vehicle were the cessation of mass production of the SU-122 medium assault gun and diversion of SU-152 heavy assault guns for anti-tank actions. The tank variant of the D-1 was originally intended for mounting in a variant of the KV-1s heavy tank. It utilized the mount of the 85 mm D-5, leading to the unofficial name D-1-5 and eventually to the official designation of D-15. Only one example was built. There is no information about the gun being mounted in the KV tank. By October 1943 Soviet authorities were anticipating the start of mass production of the powerful IS-2 heavy tank; as a result the idea of a specialized artillery tank based on the obsolete KV chassis was dropped. Another project combining the T-34 tank chassis with the D-15 gun was also considered. Designated SU-D15, the medium assault gun was intended as a replacement for the SU-122. Although the project received a lot of support from the authorities it never entered production, both because of its shortcomings (the heavy gun put too much strain on the suspension and ammunition stowage was too limited) and because it was made redundant by the ISU-152. However lessons learned mounting a powerful gun in the T-34 allowed for rapid development of the SU-100 tank destroyer.
- **Type 54:** This is a Chinese-produced copy of the D-1. Firing weight is 5,512 lb (2,500 kg); projectile weight, 48 lb (21.76 kg); and maximum range, 12,904 yd (11,800 m). It is in service in China. Ref: Military Periscope, May 2015

↳*Ammunition (Option 2)*

Name: OF-530A

Type: HE-Fragmentation, steely iron

Caliber: 152.4 mm

Shell: Separate loading charge and projectile

Maximum Range: m12,400

Basic Load: INA

Note: The D-1 had a large variety of ammunition, including high-explosive, armor-piercing, HEAT, shrapnel, illumination, and chemical. The D-1 used separate loading ammunition, with eight different charges. The charges included the "full charge" Zh-536 and smaller charges ranging from the "first" to "sixth", which was the smallest. A "special charge" was used with the BP-540 HEAT projectile. Propellant charges were produced in "full" and "third" variants in munitions factories. All other charges were derived from them by removing small gunpowder bags from the charge cartridge. For

flash suppression there was a special chemical mixture which was to be inserted into a cartridge before night firing. 152 mm projectiles for the D-1 weighed about 40 kg; a difficult job for the loaders, who had to carry the projectiles alone. When set to fragmentation mode, the OF-530 projectile produced fragments which covered an area 70 meters wide and 30 meters deep. When set to high-explosive (HE) action, the exploding shell produced a crater about 3.5 meters in diameter and about 1.2 meters deep. Despite the D-1's withdrawal from service in the mid- 1970s, the OF-530 is still fired from modern 152 mm ordnance pieces of the Russian Army. The G-530 HEAC anti-concrete shell had a muzzle velocity of 457 m/s when fired with the "first" charge. At a range of one kilometer it had a 358 m/s terminal velocity and was able to punch through up to 80 centimeters of reinforced concrete before detonating a TNT charge which increased the total penetration to 114 centimeters. The G-530 could not be fired with a "full" charge without putting the crew at risk of having the shell explode in the barrel. A special version of the shell, the G-530Sh, was developed to allow use with the full charge. The BP-540 HEAT projectile was not used during World War II. It had an armour penetration of 250 millimeters at an incident angle of 90°, 220 millimeters at 60°, 120 millimeters at 30°. In the late 1950s old ammunition stocks for the D-1 were removed from the Soviet inventory. The only shells retained were the OF-530, O-530, G-530/G-530Sh, and possibly chemical shells. The Soviet Army also possessed a 152 mm nuclear shell, but it is not clear whether that shell could be used with the D-1

Notes:

The D-1 howitzer M1943 (Russian: 152-mm gaubitsa obr. 1943 g. (D-1)) is a Soviet World War II-era 152.4 mm howitzer. The gun was developed by the design bureau headed by F. F. Petrov in 1942 and 1943, based on the carriage of the 122 mm howitzer M1938 (M-30) and using the barrel of the 152 mm howitzer M1938 (M-10). The powerful and mobile D-1, with its wide range of ammunition, significantly increased the firepower and breakthrough abilities of Red Army tank and motor rifle formations. Several hundred D-1s were manufactured before the end of World War II. Post World War II, the D-1 saw combat in numerous conflicts during the mid- to late 20th century. The long operational history of D-1 howitzers in national armies of numerous countries is a testimony to its qualities; the gun still remains in service in a number of post-Soviet states and some other countries. The D-1 is widely considered a valuable element of Soviet artillery. The D-1 howitzer was essentially a combination of the barrel of the 152-mm howitzer model 1938 (M-10) on the carriage of the 122-mm howitzer M1938 (M-30). Since the new carriage was lighter than that of the M-10, the barrel was fitted with a massive double-baffle muzzle brake DT-3 to soften the shock of recoil. The breech block was of interrupted screw type, the recoil system consisted of a hydraulic buffer and a hydro-pneumatic recuperator. The separately loaded ammunition included a variety of shells and eight different propellant charges in cartridges. The carriage was nearly identical to the carriage of the M-30. It had suspension and steel wheels with pneumatic rubber tires. The trails were initially of riveted construction, but were eventually replaced in production by welded ones. Late production pieces were equipped with caster wheels to ease manhandling. Time to set up for combat was about two minutes. In an emergency it was possible to fire without splitting trails; however this was at the price of a drastically reduced traverse (1°30'). Since the gun was not equipped with a limber, it could be towed only by vehicle. The maximum towing speed was 40 km/h on paved roads, 30 km/h on cobbled roads and 10 km/h off-road. To give the crew some protection from bullets and shell fragments, the gun was fitted with a shield.

SM-4-1 Russian 130mm Towed Coastal Defense Gun

Computerized FCS: INA

Direct Fire: Yes

Indirect Fire: Yes

Collimator: INA

Radar System

Radar: ZALP-B Top Bow

Notes:

The 130-mm SM-4-1 is a mobile coastal defense gun that is in limited use. It is thought to have been derived from a naval gun of a similar caliber and is carried in a very large four-wheeled carriage; each wheel is dual-tired. In the firing position, the axles are removed and four stabilizers -- two to each side -- are staked down. The SM-4-1 was designated the K54 when in Finnish service. The gun fires high-explosive (HE) and armor-piercing HE (APHE) projectiles.

PKM-2 Polish 14.5mm Towed Anti-Aircraft Gun

Cyclic Rate of Fire: 600 rds/min

Practical Rate of Fire: 150 rds/min

↳*Ammunition (Option 1)*

Name: BS.41

Type: API

Caliber: mm14.5

Basic Load: INA

Core: Tungsten carbide core

Projectile Weight: 64.4 g

Muzzle Velocity: m/s1,000

Armor Penetration: Armor-penetration at 500 m (550 yd) is 32 mm (1.3 in) of RHA at 90 degrees.

↳*Ammunition (Option 2)*

Name: BZT

Type: API-T

Caliber: 14.5

Basic Load: INA

Core: Steel Core

Projectile Weight: 59.56 g

Muzzle Velocity: m/s1,005

Tracer Burns: Tracer burns to at least 2,000 m (2,200 yd).

↳*Ammunition (Option 3)*

Name: ZP

Type: I-T (Instantaneous Incendiary)

Caliber: mm14.5

Basic Load: INA

Core: INA

Projectile Weight: 60.0 g

Note: I-T (ZP) – "Instantaneous Incendiary" bullet with internal fuze, incendiary in tip, tracer container in base.

Fire Control

Name: INA

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: Yes

Notes:

The PKM-2 is a Polish version of the Russian ZPU-2. The ZPU-2 consists of two Model KPV machine guns mounted on a two-wheel carriage. The ZPU-2 was introduced in 1949 and is a twin version of the ZPU-1 basic Soviet 14.5MM machine gun. The ZPU-2 was used in Korea and considered a dangerous opposition in Vietnam. The Type 58 is the Chinese version, while the individual KPV machine guns as the Type 56. The twin ZPU-2 has appeared on two different two-wheeled carriages. The earlier model has larger fenders and a double tubular tow bar. In firing position the crew removes the wheels, and the weapon rests on a three-point platform. The later model, which is lighter in weight, has smaller fenders, a tighter single tow bar, and a tower silhouette. When in firing position the wheels are raised, but not removed. A very similar carriage is used for the twin 23mm automatic antiaircraft gun ZU-23, although the ammunition boxes, barrels and flash hiders are distinctly different. The ZPU-2 was used in the 1970s by some Warsaw Pact armies and by security elements such as the East German Workers' militia. All weapons in this series fire the API (BS 41) projectiles weighing 64.4 grams having a muzzle velocity of 1000 meters per second which will penetrate 32 mm of armour.

Type 59-1 Chinese 130mm Towed Artillery

Tiers:

Variants:

- **GM-45:** This was developed by NORINCO to field a Chinese-built version of the Austrian GHN-45 gun on the many 130-mm M-46/Type 59 and 152-mm Type 66 carriages remaining in service. The M46 carriage was adapted to ensure its recoil resistance was able to withstand the more powerful gun by: Raising maximum elevation to +55 deg (978 mils); Limiting maximum recoil distance to 49.2 in (1,250 mm); modifying the GHN-45's recuperator (minimum distance is 30.5 in/775 mm); Adopting a pneumatic rammer; Modifying the panoramic sight and sight mount; Changing the M-46/Type 59's breech ring and breech block to the semi-automatic screw type of the GHN-45; Adding compressed-air supply; and Incorporating hydraulically actuated trail-wheel raising. Weight is 18,739 lb (8,500 kg) firing, 19,401 lb (8,800 kg) traveling; rate of elevation is 11.8 mils/revolution; rate of traverse, 11.25 mils/revolution. Ammunition is extended-range full-bore high-explosive (ERFB), ERFB/smoke (ERFB/WP), ERFB/base-bleed (ERFB/BB) and ERFB/BB illuminating (ERFB/BB IL) projectiles. Range with ERFB is 32,808 yds (30,000 m), ERFB/BB 42,651 yds (39,000 m). ERFB/WP is 28,433 yds (26,000 m) and ERFB/BB IL is 26,247 yds (2 4,000 m). The system is available for export; no buyers have been publicly announced. Ref: Military Periscope, May 2015

Collimator: K-1

Gun Display Unit: None

Fire Control Computer: None

Night Vision: Available for Direct Fire

Notes:

The Type 59 Field Gun is a licensed copy of the Soviet, Cold War era M-46 Field Gun. Normally had two road wheels however, two additional road wheels have been seen on some variants. The Type 59-1 is the result to improve on some of the design flaws of the Type 59. These improvements include: a new carriage which is based upon the Type 66. The improvement has allowed am improvement in the emplacement and displacement times. The addition of a base plate gives the gun more stability while firing and, along with the wheels at the end of the split trails, allows the gun to be rotated thus, giving it 360 traverse ability.

2S1 (Gvozdika) Russian 122mm Self-Propelled Howitzer (SPH)

Tiers:

Variants:

- **2S34 Hosta:** Modernisation of the 2S1 with the 122 mm 2A31 gun replaced by the 120 mm 2A80-1 gun-mortar. Further improvements include a new Malakhit fire control system, a battlefield observation system and the ability to fire the Kitolov-2M guided ammunition. One unit, the 21st Mechanized Brigade in Totskoye is currently being equipped with the system.
- **2S15 "Norov":** A prototype tank destroyer equipped with a radar-based fire control system and a 100 mm gun
- **Kevlar-E:** Infantry fighting vehicle based on the 2S1 platform, equipped with Shturm remote weapon station and room for 6 passengers in addition to the 3 crew. The original 300 horsepower V8 diesel engine has been replaced with 420 horsepower diesel engine, produced by Caterpillar, Cummins or Deutz, increasing the maximum road speed to 70 km/h. Additionally, the vehicle is amphibious, includes air conditioning, a fire detection and suppression system, an NBC system, navigation system and night-vision equipment. The variant was first introduced in April 2018.
- **2S1M Goździk:** Version with special amphibious kit that increases the vehicle's amphibious capabilities.
- **2S1T Goździk:** Version with a TOPAZ digital fire control system from WB electronics. The system consists of a FONET-IP digital intercom system, new digital radio, military GPS receiver, military computer and dedicated software. The same system is used on other Polish Armed Forces artillery systems like the AHS Krab, Dana-T and WR-40 Langusta.
- **Model 89:** Romanian variant that uses a modified version of the hull of the MLI-84.
- **Raad-1 ('thunder'):** Iranian variant that is based on the hull of the Boragh APC.

Name: 2A18 122 mm (4.8 in) howitzer

Type: mm122

Breech Type: Horizontal sliding-wedge, semi-automatic

Length, Barrel: mmINA

Loader Type: Semi-automatic

Max Rate of Fire: rds/min4-5

Sustained Rate of Fire: rds/min1-2

Muzzle Brake Type: Double Baffle

Max Elevation: Deg+70

Min Elevation: Deg-3

Traverse Range: Deg360

Collimator Type: K-1

↳*Ammunition (Option 1)*

Type: HEAT-FS
Caliber: mm122
Muzzle Velocity: m/s680
Fuse Type: GPV-2 PIBD
Basic Load: 40 Total, any combination of 122mm Projectiles
Maximum Effective Range (Conventional): m1,000
Shell: separate loading, cased charge
Armor Penetration: 460mm at 0 degree obliquity any range
Projectile Weight: kg21.58

↳*Ammunition (Option 2)*

Type: OF-81, FRAG-HE
Caliber: mm122
Muzzle Velocity: m/s680
Minumum Range: m1,000
Maximum Range: m15,300
Projectile Weight: kg21.76
Fuze Type: RGM-2 PD
Basic Load: 40 Total, any combination of 122mm Projectiles

↳*Ammunition (Option 3)*

Type: Rocket Assisted FRAG-HE
Caliber: 122mm
Muzzle Velocity: m/sINA
Minimum Range: mINA
Maximum Range: m21,900
Projectile Weight: kg21.76
Basic Load: 40 Total, any combination of 122mm Projectiles

Coaxial Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)
Type: 7.62 mm
Manufacturer: Degtyaryov plant
Function: in use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Max Rate of Fire: rds/min650

Proliferation: 1 Million +

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Muzzle Velocity: m/s825

Basic Load: ea250

Effective Range (Iron Sights): m100-1,000

Effective Range (With Sight Adjustments): m100,1,500

Smoke Equipment: No

IR Signature: INA

Notes:

The 2S1 Gvozdika is a tracked 122mm self-propelled howitzer of Russian origin. It was developed in the late 1960's and entered large scale production in 1971. 2S1 was the GRAU designation for the new weapon system. In service the name Gvozdika, carnation in English, is most common. In the West it was known as the M1974, based on the year it was first observed by the West.

HM 40 (Shafie D-301) Iranian 122mm Towed Gun Howitzer

Tiers:

Variants:

- **2A18M or D-30M:** new double baffle muzzle brake, square central base plate, towing lunette assembly.
- **2A18M-1 or D-30M-1:** with semi-automatic loader. Prototype.
- **D-30A:** modified recoil system, new muzzle brake
- **2S1 Gvozdika s:** self-propelled version.
- **Type 85 or D-30-2:** Chinese self-propelled version of the D-30.
- **D-30-3:** Chinese upgrade of the Type 56 85 mm field gun with 122 mm weapon.
- **Type 86, variously, Type 83, Type 96:** Chinese licence-production or derivative of the D-30.
- **D30 RH M-94:** Croatian built version, new muzzle brake, redesigned trail, improved hydraulic brake.
- **D 30-M:** Egyptian licence version of the D-30.
- **SPH 122:** Self-propelled version, mounted on a modified M-109 chassis.
- **T-122:** Self-propelled version, mounted on a modified T-34 chassis.
- **HM 40:** Iranian version.
- **Shafie D-30I or HM-40:** Iranian version.
- **D-30J:** Yugoslav version of the D-30 - heavily modified version based on license designed by Military Technical Institute Belgrade
- **Saddam:** Iraqi designation of Yugoslavia D-30J produced on license bought from Yugoslavia.
- **D-30JA1:** Improved Serbian version - further development of D-30J.
- **Sora 122mm:** Self-propelled version of D-30J
- **M-91 "Mona":** Yugoslav variant with the 100 mm ordnance of the MT-12. Prototype only.
- **Khalifa-1:** Sudanese licensed version of the D-30.

Notes:

The HM 40 (Shafie D-301) 122mm Towed Gun Howitzer is a Iranian version of the Russian 2A18 D-30 122mm Towed Gun Howitzer. The D-30, also known as the M1963, replaced the older 122-mm howitzer M-30 (M1938). The original D-30 was fielded in 1963 and the midlife product improvements occurred in the mid to late 1970's. The original D-30 is in use with at least 50 different countries. The 2A18M D-30A and D-30M are midlife product improvements of the D-30 that are currently in production by the Gosudarstvennoe Unitarnoe Predpriatie Zavod 9 [Vysokodispersnye Metallicheskiye Poroshki AO]. The D-30 features a unique three-trail carriage, a conspicuous boxy shield for the recuperator above the tube, and a small protective shield between the wheels. The gun has a semiautomatic, vertically sliding, wedge-type breechblock. It is towed muzzle-first by a truck or armored tractor, at speeds up to 80 kilometers per hour, with its trails folded under the barrel. The D-30 can be recognized by its unique three-trail carriage, the conspicuous box-like shield for the recoil-recuperator mechanism mounted above the tube, the multi-baffle muzzle brake, and the small protective shield fitted between the wheels. Early models of the D-30 had a multi-baffle muzzle brake while the D-30M has a double-baffle muzzle brake. The gun has a semiautomatic, vertically-sliding, wedge-type breechblock. It can be towed by a truck (Ural-375 or ZIL-131) or armored tractor at speeds up to 80 krn/hr. It is towed muzzle-first by a large lunette just under the muzzle brake with its trails folded under the barrel. Distinctive features of the D-30 include its low mobile mounting and above-barrel recoil system. The three-legged mobile mount is unusual for field artillery, with stabilizers that are clamped together for towing and deployed when in action. A large tow linkage is fixed to the muzzle; in transport the barrel serves as a trail. Similar mounts were a feature of several 76-mm pre-war (1931–1935) universal (both field and anti-aircraft) guns designed by Leningrad's Kirov Plant (L-1, L-2 and L-3). Other examples were the 1939 French 47SA39 APX, and 1943 German 105-mm light field howitzers designs by Skoda and Krupp; neither entered service. The Bofors 105 mm L28 Light Field Howitzer 4140 was similarly arranged with four legs and did enter Swedish service. The 1930s-designed British 2-pdr. anti-tank gun was another piece featuring a three-legged mounting.

Compared to the M-30, the new howitzer had a significantly longer 35 calibre gun barrel, just short of being a gun-howitzer by Soviet definition. Like other guns of the period, it had a high efficiency muzzle brake; this improved muzzle velocity by 175 m/s to a total of 650 m/s for HE, and raised maximum range by 3,500 m beyond the similar M-30. Maximum range was 2 km better than the 76 mm M1942 at 15.3 km. Weight increased by 650 kg over the M-30, to 3,150 kg; the D-30 is over twice the weight of the 76mm M1942. Accuracy improved, with mean error at about 10 km dropping from 35 m with the M-30 to just 21 m. Effective stabilisation length is a fundamental aspect of a gun mount, and legs 120° apart need to be longer than those with a smaller angle. The D-30's design minimises this problem in several ways. Trunnions are close to the ground, as a result of placing the recoil system and cradle above the barrel. The trunnions are also at the very rear of the breech; this maximises the recoil space when firing at higher elevation angles. Their rearward position also pushes the recoiling element forward on the mount, maximizing relative rearward span of the stabilizers and so stability during recoil. Additionally there is a very efficient muzzle brake, which absorbs about half the recoil. There is no mechanism to reduce recoil length as the angle of elevation increases. Some of the design decisions have a price. The muzzle brake produces about twice the overpressure in the area around the gun that is acceptable to Western armies, and is the reason it is often seen being fired with a long lanyard, which reduces rate of fire. Furthermore, the maximum elevation angle is restricted to 18° (early versions) or 22° (later versions) when the breech is over a trail leg. This is enforced by a mechanical cam that prevents the piece firing for about 60% of the total top traverse, and limits range to about 12 km, with full maximum range only possible in the central arc of about 48° between each pair of legs. The extreme rearward location of the trunnions means the elevating mass is unbalanced, requiring a strong balancing mechanism to enable manual elevation. To do this, the D-30 uses compression balancing gears. A central jack is powered by hand-operated hydraulics. This jack is lowered while the wheels are raised to permit two of the stabiliser legs to be swung 120° rearwards. The mounting is then lowered and the ends of the legs spiked to the ground. This mounting provides for quick traversing to fire in any direction. The pair of large tires are suspended on a single trailing arm; maximum towing speed is 60 km/h on the road. As was normal in Soviet designs, the tyres were filled with foam. Initially, the D-30 had no brakes and no seat for the layer—non-essential luxuries. A sliding block breech was adopted instead of the M-30's pre-1914 screw pattern, giving a slight increase in the rate of fire. It is a semi-automatic vertical sliding block breech, with a tied jaw; the block moves down to open and opens automatically ejecting the empty cartridge case as the recuperator forces the gun tube back into battery after a round is fired. The design is closely related to those of breeches on other Soviet post–World War II guns and howitzers. The non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope, a panoramic periscopic indirect-fire sight (dial sight) in a reciprocating mounting, an angle of sight scale, and a range drum for each charge engraved with the range (distance) scale. The elevation leveling bubble is mounted on the dial sight mount. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. Soviet 122 mm howitzers used different ammunition to 122 mm guns, although there was some compatibility. In the case of ammunition for the D-30, the standard 122 mm howitzer shell weight of 21.8 kg was retained, with a metal cartridge case holding variable propelling charges. Cartridge and shell are loaded separately; this means that the shells have to be hand-rammed by a man to the right of the breech with a ramming rod. The D-30 could fire the older M-30 ammunition; however, new shells were also introduced, eventually including a rocket assisted projectile with a range of 21.9 km. The M-30's range of propelling charges, comprising base and eight increments, was replaced by a new set comprising base and four increments; single base propellant was retained. A more effective High Explosive (HE) shell was developed, as well as smoke, illumination and chemical filled projectiles. In keeping with Soviet doctrine, the anti-tank role is important; there is a HEAT shell capable of penetrating 460 mm of steel armour plate. The maximum rate of fire of the D-30 is 6–8 rounds per minute, and about 75 rounds per hour. There is disagreement as to whether this maximum rate of fire is achievable for indirect fire. Based on reloading speeds of similar guns using separate charges, solo re-laying, and given a stable emplacement, semi-automatic breech and no long lanyard, (examples are the 25-pdr. and 105mm L118), and assuming concurrent lay adjustment during reloads, then it probably is when in the hands of a competent detachment. However, 5-6 rounds per minute may be more realistic with a poorly trained gun crew. The D-30 is noted for simplicity of maintenance by its users; reputedly there are no special tools, all jobs can be done with a wrench and large hammer. However, like any other gun, routine maintenance is essential, and western troops in Afghanistan have reported Afghan manned D-30s having problems with shells sticking in the barrel due to lack of cleaning. A location chosen for emplacement of the D-30 should be as level as reasonably possible. Firstly, the carriage is raised via an internal hydraulic jack located under the cradle of the gun. Once the gun is at the required height, the wheels are raised via the wheel lifting lever; this allows the two split stabilizer legs to be separated from the mono stabiliser leg and brought rearward into firing configuration. The legs are then locked in place with locking pins. The carriage is lowered via the hydraulic jack so that the legs touch the ground; integral stakes are then hammered into the ground. At this point, the gun is ready for direct fire using the OP4 direct fire sight, or can be orientated and have its position fixed via the aiming circles for subsequent indirect fire using the Pantel sight.

2B16 Nona-K is a 120mm towed gun based on the 120mm Nona gun which also served as the basis for the 2S9 Nona-S and 2S23 Nona-SVK self-propelled guns. Nona-K combines the capabilities of a gun, a mortar, and a howitzer into a single weapon system that can effectively engage troops, fortifications, and armored vehicles. To do so, this artillery system is capable of firing HE-fragmentation, shaped-charge Rocket Assisted Projectiles (RAPs), 120mm HE-fragmentation, illuminating, smoke and incendiary mortar rounds including those designed for NATO's 120mm mortars. The Russian Army has deployed Nona-K gun

systems within motorized infantry battalions. Its effectiveness as been deemed similar to standard 152/155mm HE-fragmentation howitzer ammunition. The Nona-M1 is a special version designed for use by Russian airborne troops. It was introduced in late 2011 and is capable of hitting targets at ranges between 200 and 12,000 meters.

M1977 (A407) Romanian 100mm Towed Anti-Tank Gun

Tiers:

Variants:

- **M1975:** used the horizontal sliding wedge breech lock.
- **M1977:** used the vertical sliding wedge breech lock.
- **M2002:** modernized version of M1977 with a FCS TAT-100. Adaptations:
- **A 308:** tank gun used for TR-77 and TR-85 main battle tanks.
- **A 430:** 100 mm gun used for ship turrets.

System

Alternative Designation: M1977; A407
Type: 100mm Towed Anti-Tank Gun
Crew: 8
Carriage: INA
Elevation: −5°/+37°
Traverse: 27°30' left and right
Rate of Fire: 7 to 15 rounds per minute
Muzzle Velocity: 900 m/s for HE 1400 m/s for APFSDS-T
Maximum Firing Range: 20.600 m (HE) 4.000 m (AP) 3.000 m (HEAT)
Effective Firing Range: 1.040 m for AP 1.728 m for APFSDS-T
Sights: mechanical sight, panoramic sight, optical sight, collimator
Emplacement Time: INA
Displacement Time: INA
Note: The gun can be towed with the DAC 665T truck and has a maximum road speed of 60 km/h on road and 30 km/h off-road.

Dimensions

Length: 9.250 m
Barrel Length: 4.630 m

Collimator: INA

Notes:

The A407 100mm anti-tank gun M1977 is a Romanian rifled 100-mm anti-tank gun which serves as the main towed anti-tank gun of the Romanian Land Forces from 1975 until present. Versions of the M1977 gun were installed on main battle tanks (TR-77 and TR-85) and ship turrets on river monitors. The A407 100mm anti-tank gun was the first artillery piece designed in Romania after World War II. The first variant of the gun, the M1975 (M stands for Model) had a semi-automatic horizontal sliding wedge type breech lock. The second variant, M1977, had a more practical vertical sliding wedge breech block. The M1977 can be also used as a field gun at brigade level, as it has a maximum range of 20.6 kilometers. After 1992, the M1977 anti-tank guns were modernized with improved optical sights. The gun can be towed with the DAC 665T truck and has a maximum road speed of 60 km/h on road and 30 km/h off-road

M101A1 American 105mm Towed Howitzer

Tiers:

Variants:

- **M101:** The original production model had the M2A1 carriage and the M2A1 model gun, which had a straight barrel.
- **M101A1:** This is covered in the main entry. It has a M2A2 carriage (which differs from the M2A1 chiefly in the amount of shielding) and the M2A2 gun, which has a thickened muzzle.
- **German M101 modification:** It features a longer barrel with single-baffle muzzle brake, new breech ring and new sights. Maximum range is 15,420 yds (14,100 m).
- **M101/33 Upgrade:** This was proposed by RDM (De Rotterdamsche Droogdok Maatschappij BV) Defence Engineering of Rotterdam, Netherlands. It features a longer barrel of 33 calibers; progressive twist rifling increasing from 1 in 35 to 1 in 18 over the first 9 ft 2 in (2.974 m) and holding 1 in 18 over last 12 in (306 mm); and a slotted muzzle brake. The loaded weight increases to 5,247 lb (2,380 kg). In March 1994, RDM was awarded a US$13.75 million contract by the Canadian army to upgrade 96 M101 howitzers to the M101/33 standard. The contract included two options, one for an additional 29 howitzers, and another for an additional 60. The first upgraded howitzers were shipped back to Canada in late 1995 with the entire batch of 96 to be completed in 1998. It was also trialed in Indonesia and Malaysia. In 1994, a single model of a Brazilian M101 was upgraded by RDM with a 37-caliber barrel from the Royal Ordnance L118 Light Gun. At the time, Brazil had a requirement for up to 80 upgraded M101s.
- **M101/LG1 Upgrade:** Giat Industries has developed an upgrade for the M101 that replaces the 23-caliber barrel of the M101 with the 30-caliber barrel used by Giat's LG1 Mk II 105-mm Light Gun. The upgrade allows the M101 to fire new Giat HE extended-range base-bleed ammunition out to 17,500 m (10.9 miles). Giat was awarded a contract by the Philippines in July 1996 to modify 12 M101A1s with the newer barrel. An order for the rest of the Philippines inventory of M101s was seen as possible. Thailand reportedly ordered 300 upgraded kits for its stock of M101s.

System

Alternative Designation: M101A1
Type: 105mm Towed Howitzer
In Service: 1964-Present
Crew: 8
Carriage: split trail, post-war designation of M2A1 on carriage M2A2
Displacement Time: Less than 2 Minutes
Emplacement Time: Less than 2 Minutes

Dimensions

Length, Overall: 5.99 m
Barrel Length: 2.57 m
Rifling Length: 1.98 m

Width, Firing: 3.66 m

Width, Traveling: 2.16 m

Height: 1.57 m

Ground Clearance: 356 mm

Weight: 2,258 kg

Howitzer

↳*System*

Name: M101A1

Type: Towed Howitzer

Caliber: 105mm

Carriage: split trail, split trail, post-war designation of M2A1 on carriage M2A2

Bore: 105-mm/23-cal M2A1 or M2A2, rifled (barrel has a life of 20,000 rounds)

Rifling: 1 in 20 constant twist, 36 grooves

Elevation: -5 deg to 66 deg (-89 mils to 1,156 mils)

Traverse: 23 deg (409 mils) to each side

Breech Type: horizontal sliding wedge

Recoil System: hydropneumatic

Rate of Fire, Sustained: 3 rds/min

Rate of Fire, Maximum: 10 rds/min

↳*Ammunition (Option 1)*

Name: M548

Type: HERA

Caliber: mm105mm

Length: 830mm

Weight: 17.46 kg

Muzzle Velocity: 548 mps

Maximum Range: 14,600 m

↳*Ammunition (Option 2)*

Name: M546

Type: APERS-T

Caliber: 105mm

Length: 867mm

Weight: 17.35kg

Muzzle Velocity: 549 mps

Maximum Range: 11,600 m

↳*Ammunition (Option 3)*

Name: INA

Type: HE, GB, HD, WP, HC, ILLUM

Caliber: 105mm

Length: Varies

Weight: Varies

Muzzle Velocity: 472.4 mps

Maximum Range: 11,270 m

Fire Control

Name: INA

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: Yes

Collimator: INA

Notes:

M101A1 – upgraded version, introduced in 1964. It has a modified carriage with a different shield. The M101A1 105mm Light Howitzer, Towed is a general purpose, light field artillery weapon consisting of a cannon, 105mm howitzer (M2A2); recoil mechanism, M2 series; and carriage, 105mm Howitzer, M2A2. It can be used for direct or indirect fire. The cannon consists of a tube assembly, breech ring, and locking ring. The cannon is mounted on the recoil sleigh assembly. The firing mechanism is a continuous pull (self cocking) type activated by pulling a lanyard. The cannon is single-loaded, air-cooled and uses semi-fixed ammunition. The carriage is of the single axle and split trail type. The trails are divided at emplacement, but are drawn together and locked during travel. A drawbar is provided for securing to a prime mover. The carriage consists of an equilibrator, shield, elevating mechanism, cradle, gear, elevating arcs, traversing mechanism, top carriage, wheels, and trails. The recoil mechanism is a constant hydropneumatic type shock absorber that decreases the energy of the recoil gradually and so avoids violent movement of the cannon or carriage. It is installed in the cradle of the carriage.

M-56A1 Serbian 105mm Towed Howitzer

Tiers:

Variants:

- **M-56:** The M-56 Howitzer is a 105mm artillery gun from Serbia. It is comparable to the German 10.5 cm leFH 18 and the American M101 howitzer.

System

Alternative Designation: M-56A1
Type: 105mm Howitzer
Crew: 7
Carriage: Split Tail
Displacement Time: Less than 2 Minutes
Emplacement Time: Less than 2 Minutes

Shell: separate loading, cased charge

Fire Control

Name: INA

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: Yes

Collimator: INA

Notes:

MTI developed the M56A1 version, with a longer 33 caliber barrel designed to last for at least 18,000 shots, with a stronger breechblock, with recoil systems that allow it to fire modern rounds up to 18 km and a hydro-pneumatic balancer. The M-56A1 and M09 Soko Self-propelled artillery are offered by Yugoimport and the M-56 by BNT TMiH in Bosnia. The M-56 Howitzer is a 105mm artillery gun from Serbia. It is comparable to the German 10.5 cm leFH 18 and the American M101 howitzer. The gun's design is based on the M101 and leFH 18. The gun's initial model was the SH-1, designed by the Military Technical Institute Belgrade, Yugoslavia, in 1951. It was produced by Crvena Zastava in Kragujevac, now Zastava Arms. Second prototype, also developed by Military Technical Institute Belgrade, in 1955 designated as SH-2 was basis for serial M-56. Serial production started in 1956 Bratstvo Novi Travnik because prior to that in 1945 decision was made by communist government of Socialist Federal Republic of Yugoslavia to move factories from Serbia to other parts of newly formed Yugoslavia in order to develop their industries. Because of that decision in 1951 Zastava Arms factory, then called Crvena Zastava, was partially dissembled (including complete Crvena Zastava factory artillery program with calibers over 20 mm) and together with 250 experts was transferred to Bosnia into new Bratstvo Novi Travnik factory from then Socialist Republic of Serbia to Socialist Republic of Bosnia and Herzegovina to help in Bosnia development at cost of Serbia who in that time was heavy industrialized and had educated technical staff. The original production version was 28 caliber with a maximum range of 13 km.

Direct Fire: OP 4M

Collimator: K-1

Notes:

The 152 mm gun-howitzer M1955, also known as the D-20, (Russian: 152-мм пушка-гаубица Д-20 обр. 1955 г.) is a manually loaded, towed 152 mm artillery piece, manufactured in the Soviet Union during the 1950s. It was first observed by the west in 1955, at which time it was designated the M1955. Its GRAU index is 52-P-546. The D-20 has a 34 calibre (5.195 m) barrel, with a double baffle muzzle brake and a semi-automatic vertical sliding-block breech, with a tied jaw and the block moving down to open. The barrel is mounted in a long ring cradle with the trunnions just forward of the breech. The recoil system (buffer and recuperator) is mounted on the cradle above the barrel. Compression balancing gear is attached behind the saddle support, passing through the complex shaped saddle to connect to the cradle just forward of the trunnions. This can be manually re-pressured by a pump below the breech. The breech has a projectile retaining catch to prevent the shell sliding out at higher elevations before it is rammed with a manual rammer. Top traverse totals 58° and the vertical elevation range is −5° to 45°. Box girder section split trail legs are hinged to the cradle support, with bolts to lock them into either the open or closed position. The cradle support also has a bolt for locking the barrel in the centre for traverse before towing the gun. Large spades are permanently fixed close to the end of each trail; these are hinged and it appears that the gun can be fired with them up or down depending on the terrain, but they are always up when the gun is towed. To assist with all-round carriage traverse, there is a pivot jack mounted at the front of the cradle support. The pivot jack is not a sole plate and the gun fires with its foam filled rubber tyred wheels supporting the gun on the ground. When the gun is brought into action, the pivot jack is folded down and adjusted to be on the ground. If a large traverse is required, small jacks on each trail leg are rotated downwards, and the trails jacked up until the main wheels are lifted clear of the ground and the bogey wheels mounted on each trail leg swung downwards and the trail jacks raised, the carriage is then traversed, and the trail jacks re-used to lift the bogey wheels and then place the piece back on its main wheels. The pivot jack is also used to secure the barrel against vertical movement when the gun is being towed. The barrel is locked in the centre for traverse with a bolt on the cradle support. The jack is folded upwards, lugs on the ring cradle engage the jack base and two tensioners fixed to the saddle support are hooked to the cradle, these are tightened to lock the cradle onto the jack base. As was normal for the period, the gun has a shield, including a folding piece below the cradle support. The centre section of the upper shield slides both up and down and folds to accommodate the barrel at higher elevation angles of fire. The shield may offer some protection against muzzle blast to the sights and layer, although it is usually shown being fired with a long lanyard, but is probably mostly for defence against machine gun fire. The non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope (OP4M), a panoramic periscopic indirect-fire sight, a dial sight, (PG1M) in a mounting, an angle of sight scale, and a range drum for each charge engraved with the range (distance) scale, coupled to an elevation leveling bubble mounted on dial sight mount.

The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. Like most Soviet artillery, the gun fires separate ammunition using metal cartridge cases that also provide obturation. The ammunition is interchangeable with that used with other 152 mm guns, although the more modern ones also have a third, much larger cartridge. The D-20 uses two types of cartridge; one has a base charge and up to five increments, the other is a single 'super' charge cartridge. The standard shell weight is 44 kg with a muzzle velocity of 655 m/s, but some projectiles are more or less than this. The basic shell is HE-Fragmentation, other projectiles include smoke, illuminating, chemical and probably incendiary. Later projectiles include bomblet, anti-personnel mine, flechette, Krasnopol precision munition, communications jammer, and extended range HE using rocket assistance (RAP). The normally maximum range is 17.4 km, RAP being greater. Two direct-fire anti-tank projectiles have been used, HEAT and APHE, the latter being 5.2 kg heavier and with a lower muzzle velocity. The maximum rate of fire is usually stated as five rounds/minute, and 65 rounds/hour sustained. In Soviet service, the unit of fire was 60 rounds. The detachment was either 8 or 10 men, probably differing between armies and the time period. In Soviet service, the 5,700 kg gun was usually towed by a URAL-375 6×6 truck or, in some regions, an AT-S or AT-L medium tractor.

In Soviet service, the 5,700 kg gun was usually towed by a URAL-375 6×6 truck or, in some regions, an AT-S or AT-L medium tractor.

M777 British 155mm Towed Howitzer

Tiers:

Variants:

- **M777:** gun with optical fire control
- **M777A1:** digitization upgrades with the addition of an on-board power source, satellite global positioning, inertial navigation, radio, Gun Display Unit (GDU) and Section Chief Assembly (SCA).
- **M777A2:** Block 1A software upgrade. Addition of an Enhanced Portable Inductive Artillery Fuze Setter (EPIAFS) to enable Excalibur and precision munition compatibility.
- **M777ER:** Experimental upgrade created by the Extended Range Cannon Artillery (ERCA) project modified with a 52-caliber barrel, adding 1.8 m (5.9 ft) to the cannon and less than 450 kilograms (990 lb) to the overall system, extending range from 30 to 70 km (19 to 43 mi); concept only

System

Alternative Designation: M777
Type: Towed Howitzer
Crew: 7+1
Carriage: Split trail
Displacement Time: INA
Emplacement Time: INA

Dimensions

Length: Combat: 10.7 m (35 ft 1 in) Travel: 9.5 m (31 ft 2 in)
Barrel Length: 5.08 m
Weight: 4,200 kg

Main Gun

↳*System*

Name: M777
Type: Towed Howitzer
Caliber: mm155
Carriage: Split trail
Elevation: 0° to +71.7°
Traverse: INA
Rate of Fire: Normal: 2 rpm Maximum: 5 rpm
Muzzle Velocity: Charge 8S: 827 m/s (2713.25 ft/s)
Effective Firing Range: 24-40 km

↳*Ammunition (Option 1)*

Name: M107
Type: Projectile
Caliber: mm155
Length: 605.3 mm
Diameter: 154.71 mm
Weight as Fired: 43.2 kilograms
Fuzes: PD M51A5, M728 family, M557, M572, M739, M564, M577, M582, M732
Explosive Content: NT 6.86 kilograms
Effective Firing Range: 24 km
Note: The M107 155mm projectile was the standard 155mm high explosive (HE) projectile for howitzers of the US Army and US Marine Corps. A bursting round with fragmentation and blast effects, the M107 is being superseded in the US military by the M795.

↳*Ammunition (Option 2)*

Name: M795
Type: Projectile
Caliber: mm155
Length: 605.3 mm
Diameter: 154.89 mm
Weight as Fired: 46.7 kg
Fuzes: INA
Explosive Content: TNT: 10.8 kg with a charge liner OR IMX-101(IMX was adopted by the Army; Marines still use TNT)
Effective Firing Range: 22.5 km
Note: The M795 155mm projectile is the US Army and US Marine Corps' standard 155mm high explosive (HE) projectile for howitzers. It is a bursting round with fragmentation and blast effects. The M795 is designed to be a more lethal,

longer range version of the M107. A welded band replaces the swaged rotating band of the M107, allowing the M795 to be fired with M119 or M203 propelling charges, increasing range by 6,000 meters. The explosive payload was also improved, as was the fragmentation pattern, giving 30% higher lethality.

Fire Control

Name: INA

Computerized FCS: The M777 uses a digital fire-control system similar to that found on self-propelled howitzers such as the M109A6 Palladin to provide navigation, pointing and self-location, allowing it to be put into action quickly.

Direct Fire: No

Indirect Fire: Yes

Collimator: INA

Notes:

The M777 howitzer is a towed 155 mm artillery piece. It succeeded the M198 howitzer in the United States Marine Corps and United States Army in 2005. The M777 is also used by the ground forces of Australia, Canada, India and Saudi Arabia. It made its combat debut in the War in Afghanistan. The M777 is manufactured by BAE Systems' Global Combat Systems division. Prime contract management is based in Barrow-in-Furness in the United Kingdom as well as manufacture and assembly of the titanium structures and associated recoil components. Final integration and testing of the weapon is undertaken at BAE's facility in Hattiesburg, Mississippi. The M777 began as the Ultralight Field Howitzer (UFH), developed by Vickers Shipbuilding and Engineering's (VSEL) Armaments Division in Barrow-in-Furness, United Kingdom. VSEL was bought by BAE Systems after the UFH prototypes had been manufactured and demonstrated, consequently BAE became responsible for future design refinements and re-named the gun 'M777'. Upon taking-over responsibility for the weapon BAE to a large degree 'americanised' the construction and assembly through its US-based BAE Systems Land and Armaments group. The M777 now uses about 70% US-built parts including the gun barrel manufactured at the Watervliet Arsenal. With a weight of 4,200 kg (9,300 lb), the M777 is 41% lighter than the 7,154 kg (15,772 lb) M198 howitzer it replaces. Much of the weight reduction is due to the extensive use of titanium. The M777 can be transported by helicopter sling-load, transporter aircraft such as the C-130, or towed by air-braked vehicles weighing over 2.5 tonnes (2.8 short tons), such as the FMTV and MTVR. The minimal gun crew required is five, compared to a previous nine. The M777 uses a digital fire-control system similar to that found on self-propelled howitzers such as the M109A6 Palladin to provide navigation, pointing and self-location, allowing it to be put into action quickly. The Canadian M777 in conjunction with the traditional "glass and iron sights/mounts" also uses a digital fire control system called the Digital Gun Management System (DGMS) produced by Leonardo MW with components of the Indirect Fire Control Software Suite (IFCSS) built by the Firepower team in the Canadian Army Land Software Engineering Centre. The Leonardo MW portion of the system, known as LINAPS, had been proven previously through earlier fielding on the British Army Royal Artillery's L118 Light Gun The Digital Fire Control System will be powered by a unique new design of rotary hybrid-electric engine designed and manufactured by Liquid Piston. The M777 may be combined with the M982 Excalibur GPS-guided munition, which allows accurate fire at a range of up to 40 km (25 mi). This almost doubles the area covered by a single battery to about 1,250 km2 (480 sq mi). Testing at the Yuma Proving Ground by the US Army placed 13 of 14 Excalibur rounds, fired from up to 24 kilometres (15 mi), within 10 m (33 ft) of their target, suggesting a circular error probable of 5 m (16 ft). In June 2012, Golf Battery, 2nd Battalion, 11th Marines, out of Camp Pendleton, California, dropped the M982 Excalibur round on insurgents at a range of 36 km (22 mi) in Helmand Province, Afghanistan. This marked the longest operational shot in the history of the M777 howitzer, and the longest operational tube artillery shot in history for the Marine Corps. In 2014 the US military began fielding several upgrades to its M777 howitzers including new liquid crystal display units, software updates, improved power systems, and muzzle sensors for onboard ballistic computing. Future upgrades include a touchscreen Chief Section Display, a new Mission System Computer, and a digital radio. In May 2017, the US Army revealed it was buying the Swedish BONUS round as an interim system as a result of the required phasing out of cluster munitions from artillery shells, complying with policy to achieve less than 1% unexploded ordnance from non-unitary explosives; the BONUS has two sensor-fused munitions deployed by a 155 mm carrier projectile that scan the ground for targets and fire explosively formed penetrators down from the air. The system has been tested from the M777 howitzer.

M1937 (ML-20) Russian 152mm Towed Howitzer-Gun

Tiers:

1 2 3 4

Variants:

- **ML-20 with bag loading:** ML-20 with bag loading – In 1937 the Main Artillery Department decided, for economic reasons, to modify medium caliber guns to use bag loading instead of cased loading. An experimental ML-20 piece was built in 1939; the trials were unsuccessful.
- **ML-20SM:** ML-20SM – Modified ML-20S with identical ballistics. muzzle brake was removed. The gun was mounted in the experimental ISU-152 model 1945, of which only one unit was built.
- **BL-20:** BL-20 – ML-20 with cast breech and wedge breechblock. Was developed by OKB-172 (sharashka of the NKVD) in 1946.
- **ML-20 with M-46-type carriage:** ML-20 with M-46-type carriage – ML-20 with a modified carriage, resembling in construction a carriage of the M-46 130 mm gun. In 1950 an experimental piece was built and tested.
- **52 H 88-37 –:** 152 H 88-37 – A Finnish modernization program
- **152 mm haubico-armata wz. 37/85:** 152 mm haubico-armata wz. 37/85 – A Polish modernization, tires from KrAZ-255B truck, new compressed air cylinder and automotive lighting increased the road speed of the towed gun from 20 to 50 km/h and allowed the gun to be towed on public roads.

Notes:

The 152 mm howitzer-gun M1937 (ML-20) (Russian: 152-мм гаубица-пушка обр. 1937 г. (МЛ-20)), is a Soviet heavy gun-howitzer. The gun was developed by the design bureau of the plant no 172, headed by F. F. Petrov, as a deep upgrade of the 152-mm gun M1910/34, in turn based on the 152-mm siege gun M1910, a pre-World War I design by Schneider. It was in production from 1937 to 1946. The ML-20 saw action in World War II, mainly as a corps / army level artillery piece of the Soviet Army. Captured guns were employed by Wehrmacht and the Finnish Army. Post World War II, the ML-20 saw combat in numerous conflicts during the mid to late twentieth century. The ML-20 was officially classified as howitzer-gun, i.e. an artillery system which combines characteristics of a howitzer and (to lesser extent) of a gun and therefore can be used in both roles. This universality was achieved by wide range of elevation angles and by using separate loading with 13 different propellant loads. The gun was fitted with both telescopic sight for direct fire and panoramic sight for an indirect one. For ballistic calculations and meteorological corrections a special mechanical device was developed. The device, called meteoballistic summator, consisted of a specialized slide rule and a pre-calculated table. After World War II similar devices were introduced for other types of guns. The barrel was either monobloc or built-up. Some sources indicate that a third type—with loose liner—also existed. To soften recoil, a large slotted muzzle brake was fitted. The breechblock was of interrupted screw type, with forced extraction of cartridge during opening. A safety lock prevented opening of the breechblock before the shot; if there was a need to remove a shell, the lock had to be disabled. To assist loading when the barrel was set to high elevation angle, the breach was equipped with cartridge holding mechanism. The gun was fired by pulling a trigger cord. The recoil system consisted of a hydraulic buffer and hydro-pneumatic recuperator. Each held 22 litres of liquid. Pressure in the recuperator reached 45 Bar. The carriage was of split trail type, with shield and balancing mechanism, leaf spring suspension and steel wheels with rubber tires (some early production pieces received spoked wheels with solid tires from M1910/34). During transportation the barrel was usually retracted. The gun could also be towed with the barrel in its normal position, but in this case the transportation speed was limited, about 4–5 km/h (compared to 20 km/h with barrel pulled back). The gun could be set up for combat in 8–10 minutes. The carriage, designated 52-L-504A, was also used in the 122-mm gun model 1931/37 (A-19). This gun was also mounted in some Tank-Destroyers employed during WWII like the ISU-152 and SU-152. The ML-20 was one of the most successful Soviet artillery pieces of World War II. Its characteristics positioned it between classical short-range howitzers and special long-range guns. Compared to the former, the ML-20 has better range (e.g. the German 15 cm sFH 18 had range of 13.3 km), which often allowed it to shell positions of enemy artillery while remaining immune to enemy fire. Its advantage over the latter was in weight and cost, and therefore in mobility and production rate. For example, the German 15 cm K 39 with range of 24.7 km weighed 12.2 tons and only 61 pieces were built; of the excellent 17 cm K 18 (23.4 t, 29.6 km) 338 pieces were manufactured; lighter 10.5 cm sK 18 (5.6 t, 19.1 km) was more common (2,135 pieces) but its 15 kg shell was much less powerful than a 44 kg shell of ML-20. German attempts to produce an analogue to the ML-20 were unsuccessful. The 15 cm sFH 40 was never produced due to construction defects; the 15 cm sFH 42 had insufficient range and only 46 pieces were built. In 1943 and 1944 Wehrmacht announced requirements for a 15 cm howitzer with a range of 18 km, but none reached production. Of other guns with more or less similar characteristics, there were French 155 mm guns model 1917 and 1918 with longer range, but some 3.5 tons heavier (as was the US 155 mm Long Tom). The Czechoslovakian howitzer K4 (used by Germans as 15 cm sFH 37(t)) was about 2 tons lighter, but with range more than 2 km shorter and only 178 pieces were built. The British BL 5.5 inch (140 mm) Medium Gun probably had the closest characteristics; weight slightly over six tons and range of 18,100 yd (16,600 m) with an 82 lb (37 kg) shell. The main shortcomings of the ML-20 were its weight and limited mobility. As the experience of the ML-15 project suggests, the gun could be made somewhat lighter and more suitable for high-speed transportation. The use of a muzzle brake can be seen as a minor flaw: while softening the recoil and thus allowing the use of a lighter carriage, a muzzle brake has the disadvantage of redirecting some of the gases that escape the barrel toward the ground, where they can raise dust, potentially revealing the gun position. But when the ML-20 was developed, muzzle brakes were already a common design element in artillery pieces of that class.

M114 American 155mm Towed Howitzer

Tiers:

1 2 3 4

Variants:

- **M114A2:** This is the standard M114 fitted with the longer barrel of the newer M198.
- **M114/39:** This was an upgrade developed by RDM (De Rotterdamsche Droogdok Maatschappij BV) Defense Engineering in Rotterdam, Netherlands. Longer barrel (39 calibers vs. 23) with increased rifling twist from 1 in 25 calibers to 1 in 20, a three-port muzzle brake, larger-capacity equilibrators, revised recoil system inclu ding new metering and recoil rods, maximum elevation increase to 70-deg (1,245 mils) and a greater barrel-chamber volume. The gun carriage was modified to handle the increased forces. Firing weight is 16,755 lb (7,600 kg); traveling length is 32 ft 10 in (10.0 m).
- **Modified M114 (Israel):** This version was developed as a private venture by Soltam of Israel.
- **155-mm M65 Howitzer:** This is a South Korean conversion of the M114A1 (see separate database entry).
- **M114 (Iran):** The variant is an Iranian upgraded M114 with an M114/39 barrel designated the HM41.

Note: This system provides no protection for the crew

Notes:

The M114 155mm howitzer, which was replaced by the M198, is a towed weapon first produced in 1942 as medium artillery. The weapon uses NATO standard 155mm ammunition, with a range of about 14,000m, and was used during World War II, in Korea, and in Viet Nam. Until recently they were in service with the National Guard. It was the U.S. Army and Marine Corps' principal 155mm howitzer until the introduction of the M198 in the early 1980s. It was exported to many other countries as well.

M1931 (A-19) Russian 122mm Towed Gun

Tiers:

1 2 3 4

Variants:

- **A-19S:** Slightly modified variant of A-19 for use in ISU-122 self-propelled gun.
- **D-25:** In 1943 a tank gun based on the A-19 was developed for the new Iosif Stalin tank, in particular because the existing 85 mm tank gun utilized in the early prototypes was deemed insufficient; the resulting prototype was the IS-122. There were, however, safety concerns as the muzzle brake on the gun exploded, nearly killing the attending Marshal Kliment Voroshilov. The fact caused some initial resistance to the adoption of the gun, but Stalin supported the decision to arm the tank named after him with a 122 mm gun. The gun was redesigned to address the safety issue and the resulting weapon was named D-25, analogous to the earlier D-5T 85mm gun.
- **D-25T:** tank gun variant (T stands for tankovaya, 'tank' adj.) . In the last days of November 1943, Fyodor Petrov's artillery design team tried the D-25 122 mm corps gun on a mounting used for the D-5T 85 mm tank gun against a captured German Panther tank. Tests took place in the Kubinka proving grounds (about 60 km west of Moscow). Firing from a distance of 1200 m, the round pierced the front glacis, made its way through the engine block and penetrated the rear plate too. After the overwhelming success of this trial, necessary adaptations were made during the following weeks, and the model was accepted as the D-25T on 31 December 1943. Production started immediately, to equip the IS-2 tank.
- **D-25S:** variant for use in late production ISU-122 self-propelled gun (S for samokhodnaya, 'self-propelled'). The variant of ISU-122 armed with this gun was designated ISU-122S.
- **152 H 88-31:** A Finnish modernization, involving the upgrading of the caliber to 152 mm.
- **122 mm armata wz. 1931/37/85:** A Polish modernization.

Notes:

122 mm corps gun M1931/37 (A-19) (Russian: 122-мм корпусная пушка обр. 1931/1937 гг. (А-19)) was a Soviet field gun developed in late 1930s by combining the barrel of the 122 mm gun M1931 (A-19) and the carriage of the 152 mm howitzer-gun M1937 (ML-20). The gun was in production from 1939 until 1946. It saw action in World War II (primarily with corps and RVGK artillery of the Red Army) and remained in service for a long time after the end of the war. Vehicle-mounted variants of the gun were fitted to the IS-2 and IS-3 tanks of the Iosif Stalin series of tanks and the ISU-122 self-propelled gun. In 1936 the Red Army adopted the 122 mm gun M1931, also known as A-19. Unlike earlier ordnance pieces used by the Red Army, it had split trail carriage with suspension, and consequently improved mobility and traverse. The carriage of M1931 had a number of shortcomings though. The elevation mechanism was slow and unreliable; solid-tired wheels hindered mobility to some extent; there were technological problems in carriage production. Soon after the M1931, the Red Army received another artillery piece in form of the 152 mm howitzer-gun M1937 (ML-20), developed at the No. 172 Plant, under F. F. Petrov. This led to an upgrade of the M1931, handled also by Petrov's design bureau. The barrel of the M1931 was placed on the carriage of a ML-20. The improved gun successfully underwent trials in September–October 1938 and on 29 April 1939 was adopted as 122 mm corps gun M1931/37. Unusually, the new variant, like the old one, was referred to as A-19. The M1931/37 was manufactured by the Barrikady Plant in Stalingrad (1939–41), No. 172 Plant (1941–46). The number of M1931/37s manufactured can be estimated at about 2,450, not including those mounted on vehicles. Like barrel of late production M1931, the barrel of the M1931/37 was of loose liner construction, and consisted of liner, jacket and screwed-upon breech. The breechblock was of interrupted screw type, similar in construction to that of the 152 mm howitzer M1910/37. Recoil system consisted of hydraulic recoil buffer and hydro-pneumatic recuperator, both located inside the cradle under the barrel. The gun had split trail carriage adapted from the 152 mm howitzer-gun M1937 (ML-20). The carriage was fitted with leaf spring suspension and metal wheels with pneumatic tires. The carriage also featured an equilibrator. The shield gave the crew some protection from small arms and shell fragments. The M1931/37 was transported as a single piece, with barrel pulled back. It was permitted to tow the gun with barrel in its normal position, but for short distances only and with speed of no more than 4–5 km/h. Several types of artillery tractors were used: S-2 Stalinets-2, Komintern and, from 1943, Ya-12.

D-30 Russian 122mm Towed Gun Howitzer

Tiers:

Variants:

- **2A18M or D-30M:** new double baffle muzzle brake, square central base plate, towing lunette assembly.
- **2A18M-1 or D-30M-1:** with semi-automatic loader. Prototype.
- **D-30A:** modified recoil system, new muzzle brake
- **2S1 Gvozdika s:** self-propelled version.
- **Type 85 or D-30-2:** Chinese self-propelled version of the D-30.
- **D-30-3:** Chinese upgrade of the Type 56 85 mm field gun with 122 mm weapon.
- **Type 86, variously, Type 83, Type 96:** Chinese licence-production or derivative of the D-30.
- **D30 RH M-94:** Croatian built version, new muzzle brake, redesigned trail, improved hydraulic brake.
- **D 30-M:** Egyptian licence version of the D-30.
- **SPH 122:** Self-propelled version, mounted on a modified M-109 chassis.
- **T-122:** Self-propelled version, mounted on a modified T-34 chassis.
- **HM 40:** Iranian version.
- **Shafie D-30I or HM-40:** Iranian version.
- **D-30J:** Yugoslav version of the D-30 - heavily modified version based on license designed by Military Technical Institute Belgrade
- **Saddam:** Iraqi designation of Yugoslavia D-30J produced on license bought from Yugoslavia.
- **D-30JA1:** Improved Serbian version - further development of D-30J.
- **Sora 122mm:** Self-propelled version of D-30J
- **M-91 "Mona":** Yugoslav variant with the 100 mm ordnance of the MT-12. Prototype only.
- **Khalifa-1:** Sudanese licensed version of the D-30.

Notes:

The D-30, also known as the M1963, replaced the older 122mm howitzer M-30 (M1938). The original D-30 was fielded in 1963 and the midlife product improvements occurred in the mid to late 1970's. The original D-30 is in use with at least 50 different countries. The 2A18M, D-30A and D-30M are midlife product improvements of the D-30 that are currently in production. The D-30 features a unique three-trail carriage, a conspicuous boxy shield for the recuperator above the tube, and a small protective shield between the wheels. The gun has a semiautomatic, vertically sliding, wedge-type breech-block. It is towed muzzle-first by a truck or armored tractor, at speeds up to 80 kilometers per hour, with its trails folded under the barrel. Distinctive features of the D-30 include its low mobile mounting and above-barrel recoil system. The three-legged mobile mount is unusual for field artillery, with stabilizers that are clamped together for towing and deployed when in action. A large tow linkage is fixed to the muzzle; in transport the barrel serves as a trail. Similar mounts were a feature of several 76-mm pre-war (1931–1935) universal (both field and anti-aircraft) guns designed by Leningrad's Kirov Plant (L-1, L-2 and L-3). Other examples were the 1939 French 47SA39 APX, and 1943 German 105-mm light field howitzers designs by Skoda and Krupp; neither entered service. The Bofors 105 mm L28 Light Field Howitzer 4140 was similarly arranged with four legs and did enter Swedish service. The 1930s-designed British 2-pdr. anti-tank gun was another piece featuring a three-legged mounting. Compared to the M-30, the new howitzer had a significantly longer 35 caliber gun barrel, just short of being a gun-howitzer by Soviet definition. Like other guns of the period, it had a high efficiency muzzle brake; this improved muzzle velocity by 175 m/s to a total of 650 m/s for HE, and raised maximum range by 3,500 m beyond the similar M-30. Maximum range was 2 km better than the 76 mm M1942 at 15.3 km. Weight increased by 650 kg over the M-30, to 3,150 kg; the D-30 is over twice the weight of the 76mm M1942. Accuracy improved, with mean error at about 10 km dropping from 35 m with the M-30 to just 21 m. Effective stabilization length is a fundamental aspect of a gun mount, and legs 120° apart need to be longer than those with a smaller angle. The D-30's design minimizes this problem in several ways. Trunnions are close to the ground, as a result of placing the recoil system and cradle above the barrel. The trunnions are also at the very rear of the breech; this maximizes the recoil space when firing at higher elevation angles. Their rearward position also pushes the recoiling element forward on the mount, maximizing relative rearward span of the stabilizers and so stability during recoil. Additionally there is a very efficient

muzzle brake, which absorbs about half the recoil. There is no mechanism to reduce recoil length as the angle of elevation increases. Some of the design decisions have a price. The muzzle brake produces about twice the overpressure in the area around the gun that is acceptable to Western armies, and is the reason it is often seen being fired with a long lanyard, which reduces rate of fire. Furthermore, the maximum elevation angle is restricted to 18° (early versions) or 22° (later versions) when the breech is over a trail leg. This is enforced by a mechanical cam that prevents the piece firing for about 60% of the total top traverse, and limits range to about 12 km, with full maximum range only possible in the central arc of about 48° between each pair of legs. The extreme rearward location of the trunnions means the elevating mass is unbalanced, requiring a strong balancing mechanism to enable manual elevation. To do this, the D-30 uses compression balancing gears. A central jack is powered by hand-operated hydraulics. This jack is lowered while the wheels are raised to permit two of the stabilizer legs to be swung 120° rearwards. The mounting is then lowered and the ends of the legs spiked to the ground. This mounting provides for quick traversing to fire in any direction. The pair of large tires are suspended on a single trailing arm; maximum towing speed is 60 km/h on the road. As was normal in Soviet designs, the tires were filled with foam. Initially, the D-30 had no brakes and no seat for the layer—non-essential luxuries. A sliding block breech was adopted instead of the M-30's pre-1914 screw pattern, giving a slight increase in the rate of fire. It is a semi-automatic vertical sliding block breech, with a tied jaw; the block moves down to open and opens automatically ejecting the empty cartridge case as the recuperator forces the gun tube back into battery after a round is fired. The design is closely related to those of breeches on other Soviet post–World War II guns and howitzers. The non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope, a panoramic periscopic indirect-fire sight (dial sight) in a reciprocating mounting, an angle of sight scale, and a range drum for each charge engraved with the range (distance) scale. The elevation leveling bubble is mounted on the dial sight mount. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. Soviet 122 mm howitzers used different ammunition to 122 mm guns, although there was some compatibility. In the case of ammunition for the D-30, the standard 122 mm howitzer shell weight of 21.8 kg was retained, with a metal cartridge case holding variable propelling charges. Cartridge and shell are loaded separately; this means that the shells have to be hand-rammed by a man to the right of the breech with a ramming rod. The D-30 could fire the older M-30 ammunition; however, new shells were also introduced, eventually including a rocket assisted projectile with a range of 21.9 km. The M-30's range of propelling charges, comprising base and eight increments, was replaced by a new set comprising base and four increments; single base propellant was retained. A more effective High Explosive (HE) shell was developed, as well as smoke, illumination and chemical filled projectiles. In keeping with Soviet doctrine, the anti-tank role is important; there is a HEAT shell capable of penetrating 460 mm of steel armor plate. The maximum rate of fire of the D-30 is 6–8 rounds per minute, and about 75 rounds per hour. There is disagreement as to whether this maximum rate of fire is achievable for indirect fire. Based on reloading speeds of similar guns using separate charges, solo re-laying, and given a stable emplacement, semi-automatic breech and no long lanyard, (examples are the 25-pdr. and 105mm L118), and assuming concurrent lay adjustment during reloads, then it probably is when in the hands of a competent detachment. However, 5-6 rounds per minute may be more realistic with a poorly trained gun crew. The D-30 is noted for simplicity of maintenance by its users; reputedly there are no special tools, all jobs can be done with a wrench and large hammer. However, like any other gun, routine maintenance is essential, and western troops in Afghanistan have reported Afghan manned D-30s having problems with shells sticking in the barrel due to lack of cleaning. A location chosen for emplacement of the D-30 should be as level as reasonably possible. Firstly, the carriage is raised via an internal hydraulic jack located under the cradle of the gun. Once the gun is at the required height, the wheels are raised via the wheel lifting lever; this allows the two split stabilizer legs to be separated from the mono stabilizer leg and brought rearward into firing configuration. The legs are then locked in place with locking pins. The carriage is lowered via the hydraulic jack so that the legs touch the ground; integral stakes are then hammered into the ground. At this point, the gun is ready for direct fire using the OP4 direct fire sight, or can be orientated and have its position fixed via the aiming circles for subsequent indirect fire using the Pantel sight.

M-56 Serbian 105mm Towed Howitzer

Tiers:

Variants:

- **M56A1:** MTI developed the M56A1 version, with a longer 33 caliber barrel designed to last for at least 18,000 shots, with a stronger breechblock, with recoil systems that allow it to fire modern rounds up to 18 km and a hydro-pneumatic balancer. The M-56A1 and M09 Soko Self-propelled artillery are offered by Yugoimport and the M-56 by BNT TMiH in Bosnia.

Notes:

The M-56 Howitzer is a 105mm artillery gun from Serbia. It is comparable to the German 10.5 cm leFH 18 and the American M101 howitzer. The gun's design is based on the M101 and leFH 18. The gun's initial model was the SH-1, designed by the Military Technical Institute Belgrade, Yugoslavia, in 1951. It was produced by Crvena Zastava in Kragujevac, now Zastava Arms. Second prototype, also developed by Military Technical Institute Belgrade, in 1955 designated as SH-2 was basis for serial M-56. Serial production started in 1956 Bratstvo Novi Travnik because prior to that in 1945 decision was made by communist government of Socialist Federal Republic of Yugoslavia to move factories from Serbia to other parts of newly formed Yugoslavia in order to develop their industries. Because of that decision in 1951 Zastava Arms factory, then called Crvena Zastava, was partially dissembled (including complete Crvena Zastava factory artillery program with calibers over 20 mm) and together with 250 experts was transferred to Bosnia into new Bratstvo Novi Travnik factory from then Socialist Republic of Serbia to Socialist Republic of Bosnia and Herzegovina to help in Bosnia development at cost of Serbia who in that time was heavy industrialized and had educated technical staff. The original production version was 28 caliber with a maximum range of 13 km.

↳

M-46 (Type 59) Russian 130mm Towed Gun

Tiers:

Variants:

- **M-47:** This is a 152 mm field gun (Russian: 152-мм пушка М-47 обр. 1953 г.) that was developed alongside the M-46. The M-47 had a range of 20,470 m and was far less successful than its 130 mm counterpart. Only a small number was built between 1954 and 1957. Externally, the M-46 and M-47 are virtually identical, except for the calibre.
- **Type 59:** This is a licensed version of the M-46.
- **Type 59-1:** This is a combination of the 130 mm ordnance of the Type 59 with the carriage of the Type 60 (D-74 copy). The result is a gun with the same range as the M-46, but with a much lower weight of 6.3 t. The M59-1M is the Egyptian licence version. For the export market, a version with APU and redesigned carriage was developed. Also for the export market, a self-propelled variant, based on the Type 83 SPH was designed.
- **Type GM-45:** For the export market, NORINCO (China North Industries Corporation) developed this upgrade package where the original barrel of the Type 59 is replaced by the 155/45 mm ordnance of the WA 021. The Type GM-45 has a maximum range of 39 km when ERFB-BB ammunition is used.
- **SP-130 "Catapult":** Indian-designed self-propelled version, mounted on the hull of the Vijayanta tank.
- **Metamorphosis IOB M46 FG:** Another 155 mm upgrade (45 Calibre) of the 300 M-46, this one designed by Ordnance Factory Board (OFB). The upgraded M-46 has a range of 39 km. India's Ministry of Defence (MoD) has awarded an INR2 billion (US$27.2 million) contract on 25 October 2018 to the state-owned Ordnance Factory Board (OFB) to upgrade 300 of the Indian Army's (IA's) Soviet-era 130 mm/52 calibre M-46 field guns to 155 mm/45 calibre in a bid to augment its firepower.
- **M-46S:** This is an upgrade of an existing M-46 or Type 59, carried out by Soltam Systems Ltd. The original barrel is replaced by a new model of 155/45mm (western ammunition) for a range of 25.8 (HE) to 39 km (ERFB-BB). A 39-calibre barrel is optional. In March 2000, Soltam won a contract worth $47,524,137 for upgrading 180 M-46s to M-46S standard (Indian designator: 155/45mm (E1) Soltam). A follow-on deal for 250 retrofit kits was optioned for. In 2005, after only 40 howitzers were modified, the M-46S programme was terminated due to a fatal barrel explosion.
- **M46/84:** This is a conversion that involved replacing the original 130 mm barrel with a new 155/45 mm barrel or 152 mm barrel. With ERFB-BB ammunition, this version has a range of 38,600 m and with M05 152 mm range exceeds 40 km.
- **A412:**
- **:** License-built Chinese Type 59-1 with D-20 carriage. In Romanian Army service, the A412 is known as the 130 mm towed gun M1982 (Romanian: Tun calibrul 130-mm tractat M1982). The A412 was also exported.

Notes:

The 130 mm towed field gun M-46 (Russian: 130-мм пушка М-46) is a manually loaded, towed 130 mm artillery piece, manufactured in the Soviet Union in the 1950s. It was first observed by the west in 1954. There is also a Chinese copy, called the Type 59.When first seen by the West, it was given the provisional designation "M1954", for the year it was first identified by NATO. For many years, the M-46 was one of the longest range artillery systems around, with a range of more than 27 km. (16.7 mi)

Notes:

The AH-4 is a Chinese clone of the US, M777, lightweight towed howitzer. It is intended mainly for export. The AH-4, was revealed in 2014. Soon after its introduction this howitzer reportedly received its first export order from Middle-East. Can fire all of the western made 155mm/39 caliber rounds. The towed AH4 howitzer is a Chinese artillery system manufactured by Norinco. Its main characteristic is that it has been designed to be lightweight, which allows greater tactical mobility. The weight of 4,500 kg, compared to a traditional system that can weigh 18,000 kg, allows the system to be airlifted via heavy-lift helicopters like the CH-47 or Mi-26, or transport aircraft like a C-130 or Y-8. Also, as a modern howitzer system, it possesses a range of engagement of up to 40 km using rocket-assisted projectiles. Because of its weight, the AH4 can be used in mountain warfare, which traditionally had to use pack howitzers like the OTO Melara Mod 56.

Notes:

The GHN-45 is an improved version of the GC 45 155-mm howitzer that was developed by South Africa. This version was developed by Austria, and about 600 have been made. It is an example of a towed howitzer that can be fitted with an auxiliary power unit (APU) that offers some limited ability to self-propel the gun and to enable automated reloading. Its longer barrel also provides it a greater maximum range than that of the M777, but it is also a significantly heavier weapon at 27,300 pounds. The Auxiliary Power Unit (APU), combined with the tandem walking-beam suspension, gives the GHN-45 excellent self-propelled mobility over short distances. The four wheels are all powered and give the gun excellent traction over most terrain. But, the APU serves purposes other than mobility. It provides power to open and close the trails, raise and lower the trail wheels, and raise and lower the firing platform. However, there is no power traverse or elevation. The GHN-45 also includes an optional chain system (reducing the ground pressure) to improve cross-country mobility in deep, muddy, or sandy terrain. The GHN-45 A1 includes reliability modifications and performance improvements. The GHN-45 is fully compatible with NATO standard 155-mm ammunition.

Notes:

The Type 54 76mm Towed Field Gun is a Chinese version of the Russian ZiS-3 (M1942) 76mm Towed Field Gun. The 76-mm divisional gun ZiS-3 (M1942) (Russian: 76-мм дивизионная пушка обр. 1942 г. (ЗиС-3)) was a Soviet 76.2 mm divisional field gun used during World War II. ZiS was a factory designation and stood for Zavod imeni Stalina ("factory named after Stalin"), the honorific title of Artillery Factory No. 92, which first constructed this gun. Artillery Factory No. 92 began designing the ZiS-3 at the end of 1940. The ZiS-3 combined the light carriage from the 57 mm ZiS-2 anti-tank gun and the powerful 76.2 mm barrel from the F-22USV, the previous divisional field gun. The addition of a muzzle brake reduced recoil and prevented damage to the light carriage upon firing. Producing a ZiS-3 cost only a third of the time and two-thirds of the money of a F-22USV by making greater use of casting, stamping and welding. V. G. Grabin, the chief designer of Soviet medium caliber guns, initiated the gun's development without state approval, and the prototype was hidden from the state. Marshal Grigory Kulik, commander of Soviet artillery, had ordered a halt to the production of light 45 mm anti-tank guns and 76.2 mm divisional field guns in the belief that they were inadequate; the Soviets overestimated the armour protection of the latest German heavy tanks from propaganda about the Neubaufahrzeug multi-turreted prototype tank. The beginning of the Great Patriotic War revealed that the pre-war 76 mm guns overmatched German armour; in some cases even 12.7 mm DShK machine guns were adequate. Most of the 76 mm guns were lost early in the war; some captured examples armed German Panzerjäger self-propelled guns. Marshal Kulik ordered the F-22USV back into production. At Artillery Factory No. 92, Grabin put the ZiS-3 into mass production in December 1941. The factory's ZiS-3 stockpile grew and went unused as the Red Army refused to accept the guns without the usual acceptance trials. Grabin convinced the army to issue the guns for impromptu testing at the front, where it proved superior to existing divisional ield guns. A subsequent demonstration impressed Joseph Stalin, who praised the weapon as "a masterpiece of artillery systems design." The ZiS-3 underwent an official five-day acceptance trial in February 1942, and was then accepted into service as divisional field gun model 1942 (full official name). Grabin worked to increase production at Artillery Factory No. 92. Conveyor assembly lines admitted the use of low-skilled labour without significant quality loss. Experienced laborers and engineers worked on complicated equipment and served as brigade leaders; they were replaced on the production line by young factory workers who were exempt from conscription, producing a new generation of skilled labourers and engineers. More than 103,000 ZiS-3s were produced by the end of the war, making it the most numerous Soviet field gun during the war. Mass production of the ZiS-3 ceased after the war. It was replaced by the 85 mm D-44 divisional field gun. The D-44 had better anti-armour capabilities, but inferior mobility due to its increased weight. The Finns captured 12 units, and designated them 76 K 42. At least one ZiS-3 was produced at the Reșița Works in Reșița, Romania, during 1943. This Romanian-produced copy was tested against several Romanian-designed prototypes as well as some foreign models, until eventually one of the Romanian prototypes was selected for production as the Tunul antitanc DT-UDR 26, cal. 75 mm, md. 1943, commonly shortened to 75 mm Reşiţa Model 1943. This gun had the muzzle brake, split-trail carriage and recoil/firing mechanisms of the ZiS-3. At least 375 DT-UDR guns were produced by Romania, including three prototypes.

Indirect Fire: Yes

Collimator: INA

Notes:

The M102 is a light, towable 105 mm howitzer used by the United States Army in the Vietnam War, the First Gulf War, and the Iraq War. The 105 mm howitzer M102 is a lightweight towed weapon, which has a very low silhouette when in the firing position. The M102 howitzer fires a 33 lb (15 kg) projectile of semi fixed ammunition and at charge 7 will fire 11,500 meters. It has a muzzle velocity of 494 metres per second (1,620 ft/s). The maximum rate of fire is 10 rounds per minute for the first 3 minutes, with a sustained rate of 3 rounds per minute. A roller tire attached to the trail assembly of the M102 permits the weapon to be rotated 6,400 mils (360 degrees) around a firing platform, which provides the pivot for the weapon. It can be elevated from −89 mils (−5 degrees) to a maximum of 1,333 mils (75 degrees). The panoramic telescope has a four power, fixed focus optical system, with 178 mils field of view. It contains dry nitrogen gas to retard fogging and condensation. The parallax shield used during boresighting protects the lens. The trails are made of aluminum alloy. They are a single box trail in wishbone shape, and serve three purposes: mobility; stability; and stowage of section equipment. The lunette is the towing pintle that allows the weapon to be connected to the vehicle. When towing, vehicle has a fixed or seized tow pintle; remove the lock plate located under the lunette. The drawbar has two positions: lowered for travel and raised for firing. There are two lifting brackets to connect slings to when the howitzer is being lifted by helicopter. A third bracket is located on front yoke. The carriage handles are used by crew members to lifting and shifting the howitzer during loading, unloading, and emplacing the howitzer. The firing platform attaches to the howitzer lower carriage by using a socket and a locking handle. The eight holes are for the stakes needed to stake the howitzer in position. Platform stakes are issued in three sizes. There are four 15 in (38 cm) stakes issued for use in frozen or rocky terrain, and are normally issued only where needed, such as extremely cold areas. There are eight 24 in (61 cm) stakes issued, and are used for hard packed ground. Four 38 in (0.97 m) stakes are issued for use in soft ground. The first production versions were displayed with a muzzle brake, most likely to allow long range 105 mm rounds to be fired, but was discontinued before shipment to Vietnam.

PLL-01 (WAC-21) Chinese 155mm Towed Artillery

Tiers:

Variants:

- **AH-1:** AH-1 is an improved version of the PLL-01, manufactured in China by NORINCO. It has a more powerful auxiliary power unit, consisting of an air-cooled diesel engine, developing 110 hp. This howitzer has a maximum auto-propulsion speed of 20 km/h. Reportedly, the AH1 is in service with Ethiopia.
- **AH-2:** AH2 is a 52-caliber version of the AH1 towed howitzer. It has a longer range.
- **GM-45:** Same cannon fit onto a lighter carriage. This allows the system to be easier to maneuver but provides less stability to the system.

Notes:

The PLL-01 howitzer is fitted with auxiliary power unit which is a small air-cooled 77 hp diesel engine. It is installed in a fairing carried atop the front of the carriage. The power unit is used for self-movement once the howitzer is in position. It also assists emplacement and displacement of the howitzer. This feature significantly reduced the stress on the crew. A single crew member can jack the gun in 90 seconds. Also it takes slightly less time to emplace and displace, compared to conventional towed artillery pieces. The PLL-01 uses Extended Range, Full Bore (ERFB) ammunition, which has a much longer range than typical howitzer ammunition thanks to improved aerodynamics. The PLL-01 can also fire all standard NATO 155 mm ammunition.

Type 54-1 Chinese 122mm Towed Howitzer

Tiers:

Variants:

- **Type 70 self-propelled howitzer:** Tracked vehicle equipped with the Type 54-1 gun.

System

Alternative Designation: Type 54-1
Country of Origin: China
Type: Towed 122mm Howitzer
Crew: 8
Carriage: Split trail
Displacement Time: less than 2 minutes
Emplacement Time: less than 2 minutes

Dimensions

Length, Traveling: 19 ft 4 in (5.9 m)
Barrel Length: 9 ft 2 in (2.8 m) overall
Width, Traveling: 6 ft 7 in (2.0 m)
Height, Traveling: 5 ft 11 in (1.8 m)
Height, to axis of Bore: 3 ft 11 in (1.2 m)
Weight: 5,500 lb (2,500 kg)

Howitzer

↳*System*

Name: Type 54-1
Type: Towed 12mm Howitzer
Caliber: mm122
Breech: Interrupted screw

Recoil: Hydro-pneumatic

Carriage: Split trail

Elevation: 61 deg/-3 deg

Traverse: 49°

Rate of FIre: 5-6 rounds per minute

Maximum Firing Range: 11,800 m

Minimum Firing Range: 5,350 m

↳*Ammunition (Option 1)*

Name: BP-460A

Type: HEAT

Caliber: mm122

Shell: 122 x 284mm .R loading charge and projectile.

Shell Weight: INA

Maximum Range: 2,000 m

↳*Ammunition (Option 2)*

Name: OF-462

Type: HE-Frag, steel (1,000 fragments to hit personnel in radius of 30 meters)

Caliber: mm122

Shell: 122 x 284mm .R loading charge and projectile.

Shell Weight: 21.76 kg

Maximum Range: 11,720

↳*Ammunition (Option 3)*

Name: H-462

Type: Chemical

Indirect Fire: Yes

Collimator: INA

Notes:

The Type 54-1 is the Chinese version of the Russian 122-mm M-30 (M1938) towed howitzer. It is virtually identical to the original, apart from its short gun tube with no muzzle brake. It is thought to be the first large-caliber artillery weapon manufactured in China. The gun has a hydraulic buffer and hydropneumatic recuperator recoil system. It has a split rail carriage and hinged screw breech mechanism. A gun shield is provided. The Type 54-1 is typically towed by a 6 x 6 vehicle. The weapon is fitted with a Type 58 panoramic sight, weighing 2.7 lb (1.2 kg) with a magnification of 3.7x and a 10-deg field of view; it also has a Type 58 collimator sight with a 10-deg field of view. The system uses a variable nine-charge propellant system and can fire at least four types of projectiles: high-explosive, smoke, illumination and incendiary. A leaflet shell containing 24 lb (11 kg) of leaflets can also be used. China has also developed a prototype 122-mm cargo round with six layers of high-explosive anti-tank bomblets.

ZiS-2 (M1943) Russian 57mm Towed Anti-Tank Gun

Tiers:

1 2 3 4

System

Alternative Designation: ZiS-2; M1943

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: No

Notes:

The ZiS-2 (Russian: ЗиС-2) was a Soviet 57-mm anti-tank gun used during World War II. The ZiS-4 was a version of the gun meant to be installed in tanks. ZiS stands for Zavod imeni Stalina (Russian Завод имени Сталина, "Factory named after Stalin"), the official title of Artillery Factory No. 92, which produced the gun first. In the beginning of 1940 the design office of V. G. Grabin received a task from the Artillery Department to develop a powerful anti-tank gun. The head of this department Marshal Kulik and its subordinates estimated that the use of heavily armoured tanks by the USSR in the Winter War would not have gone unnoticed in Nazi Germany and would lead to the development of similar fighting machines there. There is also a chance that the department was influenced by the German propaganda about the experimental multi-turreted "supertank" NbFz, ie. heavier armour was attributed to this vehicle than it actually carried. Therefore, Grabin and his office were guided by the characteristics of their own domestic heavy tank KV-1 with 40–75 mm armour. In the opinion of the designers the optimal calibre in this case was 57 mm. The velocity and mass of the armour-piercing 57 mm projectile allowed it to attain sufficient kinetic energy to penetrate up to 90 mm of armour RHA while keeping the gun sufficiently light, mobile and easy to conceal. However, the decision also had a downside: this calibre was a new one to the Red Army so the manufacturing of the projectile had to be started from scratch. Development started in May 1940 and in the beginning of 1941 the gun was adopted as 57-mm anti-tank gun model 1941 (ZiS-2) (Russian: 57-мм противотанковая пушка образца 1941 года (ЗиС-2)). Production began on 1 June 1941, but on 1 December 1941 it was stopped by Marshals N. N. Voronov and G. L. Govorov, their explanation being that ZiS-2 shells penetrated straight through weakly-armoured German tanks from one side to the other without doing much damage internally. Other possible reasons for the decision were the high cost of the gun and problems with shell production. By that time 371 pieces had been built. The production lines were switched to manufacturing of the ZiS-3 76.2 mm divisional gun while Soviet anti-tank artillery received cheaper 45 mm guns. Some anti-tank regiments also received the ZiS-3 which was able to defeat any German vehicle until late 1942. Appearance of the heavy Tiger I and then the Panther changed the balance in favour of the Germans. 45 mm guns model 1942 could only pierce the side armour of the Panther while the ZiS-3 managed to penetrate the sides from a greater distance. Against the Tiger the ZiS-3 was effective only from the side at close range (up to 300 m) and 45 mm pieces were nearly helpless. A more powerful gun was needed and on 15 June 1943 the ZiS-2 once again entered service as 57-mm anti-tank gun model 1943. Until 1945 9,645 units were produced. It is a automated-action gun with vertical block breech. When firing the block opens and closes automatically, the loader only has to put a round into the

receiver. Due to this feature the rate of fire can reach 25 rounds per minute. The Split-trail carriage with gunshield was shared with the ZiS-3 divisional gun. The carriage has coil spring suspension, which allows towing with a speed of up to 50 km/h (31 mph) on highways, 30 km/h (19 mph) on unpaved roads and 10 km/h (6.2 mph) off-road. The gun can also be attached to a limber and towed by a team of six horses. ZiS-2s are equipped with PP1–2 panoramic sight.

AH-2 Chinese 155mm Towed Artillery

Tiers:

Variants:

- **AH-1:** AH-1 is an improved version of the PLL-01, manufactured in China by NORINCO. It has a more powerful auxiliary power unit, consisting of an air-cooled diesel engine, developing 110 hp. This howitzer has a maximum auto-propulsion speed of 20 km/h. Reportedly, the AH1 is in service with Ethiopia.
- **AH-2:** AH2 is a 52-caliber version of the AH1 towed howitzer. It has a longer range.
- **GM-45:** Same cannon fit onto a lighter carriage. This allows the system to be easier to maneuver but provides less stability to the system.

M777A2 British 155mm Towed Howitzer

Tiers:

1 2 3 4

Variants:

- **M777:** gun with optical fire control
- **M777A1:** digitization upgrades with the addition of an on-board power source, satellite global positioning, inertial navigation, radio, Gun Display Unit (GDU) and Section Chief Assembly (SCA).
- **M777A2:** Block 1A software upgrade. Addition of an Enhanced Portable Inductive Artillery Fuze Setter (EPIAFS) to enable Excalibur and precision munition compatibility.
- **M777ER:** Experimental upgrade created by the Extended Range Cannon Artillery (ERCA) project modified with a 52-caliber barrel, adding 1.8 m (5.9 ft) to the cannon and less than 450 kilograms (990 lb) to the overall system, extending range from 30 to 70 km (19 to 43 mi); concept only

System

Alternative Designation: M777A2
Type: Towed Howitzer
Crew: 7+1
Carriage: Split trail
Displacement Time: INA
Emplacement Time: INA

Dimensions

Length: Combat: 10.7 m (35 ft 1 in) Travel: 9.5 m (31 ft 2 in)
Barrel Length: 5.08 m
Weight: 4,200 kg

Main Weapon System

↳*System*

Name: M777A2

Type: Towed Howitzer

Caliber: mm155

Carriage: Split trail

Elevation: 0° to +71.7°

Traverse: INA

Rate of Fire: Normal: 2 rpm Maximum: 5 rpm

Muzzle Velocity: Charge 8S: 827 m/s (2713.25 ft/s)

Effective Firing Range: 24-40 km

↳*Ammunition (Option 1)*

Name: M107

Type: Projectile

Caliber: mm155

Length: 605.3 mm

Diameter: 154.71 mm

Weight as Fired: 43.2 kilograms

Fuzes: PD M51A5, M728 family, M557, M572, M739, M564, M577, M582, M732

Explosive Content: NT 6.86 kilograms

Effective Firing Range: 24 km

Note: The M107 155mm projectile was the standard 155mm high explosive (HE) projectile for howitzers of the US Army and US Marine Corps. A bursting round with fragmentation and blast effects, the M107 is being superseded in the US military by the M795.

↳*Ammunition (Option 2)*

Name: M795

Type: Projectile

Caliber: mm155

Length: 605.3 mm

Diameter: 154.89 mm

Weight as Fired: 46.7 kg

Fuzes: INA

Explosive Content: TNT: 10.8 kg with a charge liner OR IMX-101(IMX was adopted by the Army; Marines still use TNT)

Effective Firing Range: 22.5 km

Note: The M795 155mm projectile is the US Army and US Marine Corps' standard 155mm high explosive (HE) projectile for howitzers. It is a bursting round with fragmentation and blast effects. The M795 is designed to be a more lethal,

longer range version of the M107. A welded band replaces the swaged rotating band of the M107, allowing the M795 to be fired with M119 or M203 propelling charges, increasing range by 6,000 meters. The explosive payload was also improved, as was the fragmentation pattern, giving 30% higher lethality.

↳*Ammunition (Option 3)*

Name: M982 Excalibur
Type: Projectile
Caliber: mm155
Length: 996 mm
Diameter: 155 mm
Weight: 48 kg
Warhead: PBXN-9
Guidance System: GPS, inertial navigation
Accuracy: 5-20 m
Effective Firing Range: 40 km

Fire Control

Name: INA
Computerized FCS: The M777A2 uses a digital fire-control system similar to that found on self-propelled howitzers such as the M109A6 Palladin to provide navigation, pointing and self-location, allowing it to be put into action quickly.
Direct Fire: No
Indirect Fire: Yes
Collimator: INA

Notes:

M777A2 – Block 1A software upgrade. Addition of an Enhanced Portable Inductive Artillery Fuze Setter (EPIAFS) to enable Excalibur and precision munition compatibility. The M777 howitzer is a towed 155 mm artillery piece. It succeeded the M198 howitzer in the United States Marine Corps and United States Army in 2005. The M777 is also used by the ground forces of Australia, Canada, India and Saudi Arabia. It made its combat debut in the War in Afghanistan. The M777 is manufactured by BAE Systems' Global Combat Systems division. Prime contract management is based in Barrow-in-Furness in the United Kingdom as well as manufacture and assembly of the titanium structures and associated recoil components. Final integration and testing of the weapon is undertaken at BAE's facility in Hattiesburg, Mississippi. The M777 began as the Ultralight Field Howitzer (UFH), developed by Vickers Shipbuilding and Engineering's (VSEL) Armaments Division in Barrow-in-Furness, United Kingdom. VSEL was bought by BAE Systems after the UFH prototypes had been manufactured and demonstrated, consequently BAE became responsible for future design refinements and re-named the gun 'M777'. Upon taking-over responsibility for the weapon BAE to a large degree 'americanised' the construction and assembly through its US-based BAE Systems Land and Armaments group. The M777 now uses about 70% US-built parts including the gun barrel manufactured at the Watervliet Arsenal. With a weight of 4,200 kg (9,300 lb), the M777 is 41% lighter than the 7,154 kg (15,772 lb) M198 howitzer it replaces. Much of the weight reduction is due to the extensive use of titanium. The M777 can be transported by helicopter sling-load, transporter aircraft such as the C-130, or towed by air-braked vehicles weighing over 2.5 tonnes (2.8 short tons), such as the FMTV and MTVR. The minimal gun crew required is five, compared to a previous nine. The M777 uses a digital fire-control system similar to that found on self-propelled howitzers such as the M109A6 Palladin to provide navigation, pointing and self-location, allowing it to be put into action quickly. The Canadian M777 in conjunction with the traditional "glass and iron sights/mounts" also uses a digital fire control system called the Digital Gun Management System (DGMS) produced by Leonardo MW with components of the Indirect Fire Control Software Suite (IFCSS) built by the Firepower team in the Canadian Army Land Software Engineering Centre. The Leonardo MW portion of the system, known as LINAPS, had been proven previously through earlier fielding on the British Army Royal Artillery's L118 Light Gun The Digital Fire Control System will be powered by a unique new design of rotary hybrid-electric engine designed and manufactured by Liquid Piston. The M777 may be combined with the M982 Excalibur GPS-guided munition, which allows accurate fire at a range of up to 40 km (25 mi). This almost doubles the

area covered by a single battery to about 1,250 km2 (480 sq mi). Testing at the Yuma Proving Ground by the US Army placed 13 of 14 Excalibur rounds, fired from up to 24 kilometres (15 mi), within 10 m (33 ft) of their target, suggesting a circular error probable of 5 m (16 ft). In June 2012, Golf Battery, 2nd Battalion, 11th Marines, out of Camp Pendleton, California, dropped the M982 Excalibur round on insurgents at a range of 36 km (22 mi) in Helmand Province, Afghanistan. This marked the longest operational shot in the history of the M777 howitzer, and the longest operational tube artillery shot in history for the Marine Corps. In 2014 the US military began fielding several upgrades to its M777 howitzers including new liquid crystal display units, software updates, improved power systems, and muzzle sensors for onboard ballistic computing. Future upgrades include a touchscreen Chief Section Display, a new Mission System Computer, and a digital radio. In May 2017, the US Army revealed it was buying the Swedish BONUS round as an interim system as a result of the required phasing out of cluster munitions from artillery shells, complying with policy to achieve less than 1% unexploded ordnance from non-unitary explosives; the BONUS has two sensor-fused munitions deployed by a 155 mm carrier projectile that scan the ground for targets and fire explosively formed penetrators down from the air. The system has been tested from the M777 howitzer.

ZiS-3 (M1942) Russian 76mm Towed Field Gun

Tiers:

1 2 3 4

Variants:

- **Type 54:** Chinese Version

Indirect Fire: Yes

Notes:

The 76-mm divisional gun M1942 (ZiS-3) (Russian: 76-мм дивизионная пушка обр. 1942 г. (ЗиС-3)) was a Soviet 76.2 mm divisional field gun used during World War II. ZiS was a factory designation and stood for Zavod imeni Stalina ("factory named after Stalin"), the honorific title of Artillery Factory No. 92, which first constructed this gun. Artillery Factory No. 92 began designing the ZiS-3 at the end of 1940. The ZiS-3 combined the light carriage from the 57 mm ZiS-2 anti-tank gun and the powerful 76.2 mm barrel from the F-22USV, the previous divisional field gun. The addition of a muzzle brake reduced recoil and prevented damage to the light carriage upon firing. Producing a ZiS-3 cost only a third of the time and two-thirds of the money of a F-22USV by making greater use of casting, stamping and welding. V. G. Grabin, the chief designer of Soviet medium caliber guns, initiated the gun's development without state approval, and the prototype was hidden from the state. Marshal Grigory Kulik, commander of Soviet artillery, had ordered a halt to the production of light 45 mm anti-tank guns and 76.2 mm divisional field guns in the belief that they were inadequate; the Soviets overestimated the armour protection of the latest German heavy tanks from propaganda about the Neubaufahrzeug multi-turreted prototype tank. The beginning of the Great Patriotic War revealed that the pre-war 76 mm guns overmatched German armour; in some cases even 12.7 mm DShK machine guns were adequate. Most of the 76 mm guns were lost early in the war; some captured examples armed German Panzerjäger self-propelled guns. Marshal Kulik ordered the F-22USV back into production. At Artillery Factory No. 92, Grabin put the ZiS-3 into mass production in December 1941. The factory's ZiS-3 stockpile grew and went unused as the Red Army refused to accept the guns without the usual acceptance trials. Grabin convinced the army to issue the guns for impromptu testing at the front, where it proved superior to existing divisional ield guns. A subsequent demonstration impressed Joseph Stalin, who praised the weapon as "a masterpiece of artillery systems design." The ZiS-3 underwent an official five-day acceptance trial in February 1942, and was then accepted into service as divisional field gun model 1942 (full official name). Grabin worked to increase production at Artillery Factory No. 92. Conveyor assembly lines admitted the use of low-skilled labour without significant quality loss. Experienced laborers and engineers worked on complicated equipment and served as brigade leaders; they were replaced on the production line by young factory workers who were exempt from conscription, producing a new generation of skilled labourers and engineers. More than 103,000 ZiS-3s were produced by the end of the war, making it the most numerous Soviet field gun during the war. Mass production of the ZiS-3 ceased after the war. It was replaced by the 85 mm D-44 divisional field gun. The D-44 had better anti-armour capabilities, but inferior mobility due to its increased weight. The Finns captured 12 units, and designated them 76 K 42. At least one ZiS-3 was produced at the Reșița Works in Reșița, Romania, during 1943. This Romanian-produced copy was tested against several Romanian-designed prototypes as well as some foreign models, until eventually one of the Romanian prototypes was selected for production as the Tunul antitanc DT-UDR 26, cal. 75 mm, md. 1943, commonly shortened to 75 mm Reşiţa Model 1943. This gun had the muzzle brake, split-trail carriage and recoil/firing mechanisms of the ZiS-3. At least 375 DT-UDR guns were produced by Romania, including three prototypes.

Fire Control

Name: INA
Computerized FCS: No
Direct Fire: Yes
Indirect Fire: Yes

Notes:

The Type 58 Chinese 14.5mm Towed Anti-Aircraft Gun is a Chinese version of the Russian ZPU-2 The ZPU-2 consists of two Model KPV machine guns mounted on a two-wheel carriage. The ZPU-2 was introduced in 1949 and is a twin version of the ZPU-1 basic Soviet 14.5MM machine gun. The ZPU-2 was used in Korea and considered a dangerous opposition in Vietnam. The Type 58 is the Chinese version, while the individual KPV machine guns as the Type 56. The twin ZPU-2 has appeared on two different two-wheeled carriages. The earlier model has larger fenders and a double tubular tow bar. In firing position the crew removes the wheels, and the weapon rests on a three-point platform. The later model, which is lighter in weight, has smaller fenders, a tighter single tow bar, and a tower silhouette. When in firing position the wheels are raised, but not removed. A very similar carriage is used for the twin 23mm automatic antiaircraft gun ZU-23, although the ammunition boxes, barrels and flash hiders are distinctly different. The ZPU-2 was used in the 1970s by some Warsaw Pact armies and by security elements such as the East German Workers' militia. All weapons in this series fire the API (BS 41) projectiles weighing 64.4 grams having a muzzle velocity of 1000 meters per second which will penetrate 32 mm of armour. This is a Chinese-produced version of the later production Soviet model. It no longer serves in China, but is in service in third world nations. The Type 58 differs from the ZPU-2 in several aspects: weight, 1,234 lb (560 kg); elevation/depression, -15 deg to 90 deg; effective anti-aircraft range, 6,561 ft (2,000 m); and effective ground range, 1,093 yd (1,000 m). The Type 58 has a muzzle velocity of 3,264 fps (995 mps) and a combined cyclic rate of fire of 1,100 rounds/min.

Notes:

The 85-mm divisional gun D-44 (Russian: 85-мм дивизионная пушка Д-44) was a Soviet divisional 85-mm calibre field artillery gun used in the last action of World War II. It was designed as the replacement for the 76 mm divisional gun M1942 (ZiS-3). The gun is no longer in front-line service with the Russian Ground Forces, although some 200 of the Chinese Type 56 variant are still in service with the Pakistan Army. Wartime service included use by communist forces during the Vietnam War and by Arab forces during their conflicts with Israel. The design of the D-44 started in 1943 at the design bureau of No.9 factory "Uralmash" and production began in 1944. Its GRAU code was 52-P-367. The SD-44 was a 1950s variant with an auxiliary propulsion unit and ammunition box for 10 rounds, with 697 issued to the airborne forces (VDV) from 1954. The D-44N was a 1960s variant with an APN 3-7 infra-red illumination device for night combat. China received D-44s during the Korean War and began manufacturing a copy, the Type 56, in the early 1960s. Finally, the Polish Army has equipped some of their D-44 guns with electrical subsystems in the early 1980s and designated them D-44M and D-44MN. The barrel was developed from that of the T-34-85 tank and was capable of firing 20–25 high-explosive (HE), armor-piercing, and high-explosive antitank (HEAT) projectiles per minute. Subcaliber BR-365P HVAP-T (high velocity armor-piercing-tracer) projectiles were capable of penetrating 100 mm of armor at 1000 meters at a ninety-degree obliquity, and the BR-367P HVAP-T projectile penetrates 180 mm of armor under the same conditions. The post-war round O-365K HE weighed 9.5 kg and packed 741 grams of TNT as its bursting charge,

while the BK-2M HEAT-FS (fin-stabilized) projectile can penetrate 300 mm of armor. The HEAT round for the Type 56 has a maximum range of 970 meters and will penetrate 100 mm of armor at an angle of 65 degrees.

Notes:

The 122mm D-74 towed gun is a Soviet-built gun. Developed in the late 1950s it provided direct and indirect fire for the Soviet Army. Today it is in reserve units with the Russian Army. It is in active service with the Egyptian Army and the Pakistani Army. The 122 mm (originally 48 lines) calibre has been in Russian service since the early 20th century. After World War II the Soviet Union developed two new long range guns to replace existing 122 mm and 152 mm guns such as 122 mm gun M1931 (A-19), 122 mm gun M1931/37 (A-19), 152 mm gun M1910/30 and 152 mm gun M1935 (Br-2). The two new guns were the 122 mm D-74 and the 130 mm M-46. The D-74 design was probably initiated in the late 1940s and it was first seen in public in 1955. It was designed by the well established design bureau at Artillery Plant No. 9 in Sverdlovsk (now Motovilikha Plants in Yekaterinburg), led by the eminent artillery designer Fëdor Fëdorovich Petrov who was also responsible for several World War II and later artillery designs. The design team also developed the 152 mm gun howitzer D-20 at much the same time, and both D-74 and D-20 use the same carriage. Both the 122 mm D-74 and 130 mm M-46 entered Soviet service, but the heavier shell and greater range of the M-46 meant that it outlasted the D-74. The D-74 has a 52 calibre barrel, with a double baffle muzzle brake and a semi-automatic vertical sliding-block breach, with a tied jaw and the block moving down to open. The barrel is mounted in a long ring cradle with the trunnions just forward of the breach. The recoil system (buffer and recuperator) is mounted on the cradle above the barrel. Compression balancing gear is attached behind the saddle support, passing through the complex shaped saddle to connect to the cradle just forward of the trunnions. This can be manually re-pressured by a pump below the breach. The breach has a projectile retaining catch to prevent the shell sliding out at higher elevations before it is rammed with a manual rammer. Top traverse totals 60° and the vertical elevation range in -5° to 50°. Box girder section split trail legs are hinged to the cradle support, with bolts to lock them into either the open or closed position. The cradle support also has a bolt for locking the barrel in centre for traverse before towing the gun. There are small spades at the end of each trail leg, and fittings for large spades that are carried on the side of each trail leg. The large spades are used on soft ground and are fitted to the trail ends via have a pintle in the same way as the similar spades on M-46. These spades are the main difference from the D-20 carriage. To assist with all-round carriage traverse, there is a pivot jack mounted at the front of the cradle support. The pivot jack is not a sole plate and the gun fires with its foam filled rubber tyred wheels supporting the gun on

the ground. When the gun is brought into action the pivot jack is folded down and adjusted to be on the ground. If the requires large traverse, small jacks on each trail leg are rotated downwards, and the trails jacked up until the main wheels are lifted clear of the ground and the bogey wheels mounted on each trail leg swung downwards and the trail jacks raised, the carriage is then traversed, and the trail jacks re-used to lift the bogey wheels and then place the piece back on its main wheels. The pivot jack is also used to secure the barrel against vertical movement when the gun is being towed. The barrel is locked in centre for traverse with a bolt on the cradle support. The jack is folded upwards, lugs on the ring cradle engage the jack base and two tensioners fixed to the saddle support are hooked to the cradle, these are tightened to lock the cradle onto the jack base. As was normal for the period the gun has a shield, including a folding piece below the cradle support. The centre section of the upper shield both slides up and down and folds to accommodate the barrel at higher elevation angles of fire. The shield may offer some protection against muzzle blast to the sights and layer, although it is usually shown being fired with a long lanyard, but is probably mostly for defence against machine gun fire. The non-reciprocating sights are designed for one-person laying. Included are a direct fire anti-tank telescope (OP4M), a panoramic periscopic indirect-fire sight, a dial sight, (PG1M), an angle of sight scale, and a range drum for the single charge engraved with the range (distance) scale, coupled to an elevation levelling bubble mounted on dial sight mount. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. The gun fires separate ammunition using a metal cartridge case that also provides obturation. The ammunition is different to that used with 122 mm howitzers. There is a single charge without increments. The shell weight is 25 kg with a muzzle velocity of 900 m/s although the slightly lighter APHE shell has a higher muzzle velocity. Maximum rate of fire is usually stated as six rounds per minute. The detachment was either eight or nine men, probably differing between armies and period. In Soviet service the 5,600 kg gun was usually towed by a URAL-375 6×6 truck, AT-S or AT-L medium tractor in some regions.

The HEAT round for the Type 56 has a maximum range of 970 meters and will penetrate 100 mm of armor at an angle of 65 degrees.

Type 96 Chinese 122mm Towed Gun / Howitzer

Tiers:

Variants:

- **6x6 Wheeled SP Variant:** China's Poly Technologies firm has developed a self-propelled version of the Type 96. In the new configuration, the upper part of the howitzer is removed from the standard two-wheel carriage and installed on the rear of a 6 x 6 cross-country truck chassis. The vehicle can carry a crew of five in the four-door cab. Up to 40 rounds of separate-loading 122-mm ammunition are stored in lockers at each side of the cab's rear. The upper part of the weapon fires to the rear and stabilizers are deployed on each side of the vehicle before firing. The system takes about 90 seconds to activate and can be rapidly deployed to a new position to avoid counter-battery fire. The complete system has a combat weight of 36,400 lb (16,500 kg), with a maximum road speed of 53 mph (85 kph) and a range of 370 mi (600 km). Ref: Military Periscope, April 2015

Notes:

The Chinese 122mm Type 96 towed howitzer is based on the Russian D-30 (See D-30 WEG page for more detail) weapon system. It is almost identical to the Russian model, but with minor changes likely to meet local manufacturing requirements. The howitzer is equipped with a Type PG-1M panoramic sight with a magnification of 4x and a 10-degree field of view; Type OP4M telescopic sight with a magnification of 5.5x and 11-degree field of view; and a Type K-1 indicator with a 10-degree field of view. The gun has a multi-baffle muzzle brake. The Type 96 can fire standard 122mm high-explosive (HE) rounds, as well as a Chinese-developed long-range HE projectile that uses a special charge. This round has a range of 59,100 ft (18,000 m). The long-range round is longer and has a more aerodynamic body. It can also fire two NORINCO-developed cargo rounds. In Chinese service, the Type 96 is generally towed by a 6 x 6 cross-country truck that also carries the howitzer crew and ready-use ammunition. Ref: Military Periscope, April 2015

Type 59 Chinese 130mm Towed Gun

Tiers:

Variants:

- **M-47:** This is a 152 mm field gun (Russian: 152-мм пушка М-47 обр. 1953 г.) that was developed alongside the M-46. The M-47 had a range of 20,470 m and was far less successful than its 130 mm counterpart. Only a small number was built between 1954 and 1957.
- **Type 59-1:** This is a combination of the 130 mm ordnance of the Type 59 with the carriage of the Type 60 (D-74 copy). The result is a gun with the same range as the M-46, but with a much lower weight of 6.3 t.
- **Type GM-45:** For the export market, NORINCO (China North Industries Corporation) developed this upgrade package where the original barrel of the Type 59 is replaced by the 155/45 mm ordnance of the WA 021.
- **SP-130 "Catapult":** Indian-designed self-propelled version, mounted on the hull of the Vijayanta tank.
- **M-46S:** This is an upgrade of an existing M-46 or Type 59, carried out by Soltam Systems Ltd. The original barrel is replaced by a new model of 155/45mm (western ammunition) for a range of 25.8 (HE) to 39 km (ERFB-BB). A 39-calibre barrel is optional. In March 2000, Soltam won a contract worth $47,524,137 for upgrading 180 M-46s to M-46S standard (Indian designator: 155/45mm (E1) Soltam).
- **M46/84:** This is a conversion that involved replacing the original 130 mm barrel with a new 155/45 mm barrel or 152 mm barrel. With ERFB-BB ammunition, this version has a range of 38,600 m and with M05 152 mm range exceeds 40 km
- **A412:** License-built Chinese Type 59-1 with D-20 carriage.

Notes:

The Type 59 130mm Towed Gun is a Chinese version of the Russian M-46 (M1954) 130mm Towed Gun The 130mm towed field gun M-46 (Russian: (130мм пушка М-46) is a manually loaded, towed 130mm artillery piece, manufactured in the Soviet Union in the 1950s. It was first observed by the west in 1954. There is also a Chinese copy, called the Type 59. For many years, the

M-46 was one of the longest range artillery systems around, with a range of more than 27 km. The M-46 was developed from the M-36 130 mm naval gun used on ships and for coast defense. It is a true gun, being unable to fire much above 45° and having a long barrel and a single propelling charge. In contrast, most Western field guns of this period had a dual high and low angle fire capability, a gun-howitzer. It has a 39 caliber barrel with a tied jaw horizontal sliding-block breach and 'pepperpot' muzzle brake. The latter is not notably efficient, but subjective reports suggest that it is quite effective in reducing muzzle flash. The hydro-pneumatic recoil system comprises a buffer below the barrel and a recuperator above the barrel. The long barrel enables a substantial propelling charge by providing more length in which to achieve 'all-burnt' and hence projectile acceleration space and thus achieve its 930 m/s muzzle velocity. The barrel is mounted on a split-trail carriage, with deep box section trails and foam filled road wheels on the ground when firing and 50° of top traverse. The small shield protects little more than the sights, possible including from the effects of muzzle blast, and some protection from machine gun fire in anti-tank engagements. The gun has long and robust trails to provide stability when firing, a large detachable spade is fitted to the end of each when the gun is brought into action. Non-reciprocating sights are standard Soviet pattern, designed for one-man laying. Included are a direct fire anti-tank telescope, a panoramic periscopic indirect-fire sight (a dial sight) in a reciprocating mounting, an angle of sight scale, and a range drum engraved with the range (distance) scale, coupled to a mounted elevation leveling bubble. The range drum enables the standard Soviet technique of semi-direct fire when the piece is laid visually on the target and the range set on the range drum. An APN-3 was later provided for direct fire at night in place of the day telescope. For travel, the gun is towed via a two-wheeled limber fitted to the end of the closed trails, with the spades removed and carried on each trail. Simple jacks on the trails just behind the main wheels are used to lift and support the closed trails so that the limber can be connected. The barrel and recuperator are pulled back between the closed trails and locked in a travelling position. There is a large bicycle chain arrangement on the right trail for this, and a compressed air cylinder, charged by the gun firing, is used to bring the barrel forward when the gun is brought back into action. It takes about four minutes to bring the gun into action, the normal detachment is eight strong. Propelling charges are in metal cartridge cases and loaded separately from the projectile. Projectiles originally included HE fragmentation, Armour Piercing solid shot, smoke, illuminating and chemical. HE shells weigh some 33 kg. Illuminating shells have a substantially lower muzzle velocity. APHE and extended range shells were introduced later. Maximum rate of fire is probably 6-7 rounds/minute, and about 70 rounds/hour. The standard Soviet unit of fire was 80 rounds.

M-30 (M1938) Russian 122mm Towed Howitzer

Tiers:

Variants:

- **M-30S:** Slightly modified variant; was used as the main armament of the SU-122 assault gun.
- **U-11:** A gun with identical ballistics, but equipped with a more compact recoil mechanism for easier mounting in vehicles. It was tried on the experimental SU-122M and rejected due to insufficient reliability. A variant of the same gun was also mounted on the experimental Obiekt 234 tank, also known as Iosif Stalin no. 2 (not to be confused with the IS-2).
- **D-6:** Another vehicle mounted gun with identical ballistics. It was used on the experimental SU-122-III and, like the U-11, proved unreliable.
- **Type 54:** China Licence version.
- **Type 54-1:** Slightly improved version.
- **Wz.1938/1985:** Existing Wz.1938 that was fitted with a castor wheel, PGO-9H sight and a second firing mechanism for direct fire.
- **M-30M:** In the 1980s Romanian Army M-30s were upgraded with new, larger pneumatic wheels, new brakes, a new optical sight for direct fire and a second height sighting mechanism for anti-tank combat. These upgraded howitzers were designated M-30M.

Name: INA
Computerized FCS: No
Direct Fire: Yes
Indirect Fire: Yes
Collimator: INA

Notes:

The 122 mm howitzer M1938 (M-30) was a Soviet 121.92 mm (4.8 inch) howitzer. The weapon was developed by the design bureau of Motovilikha Plants, headed by F. F. Petrov, in the late 1930s, and was in production from 1939 to 1955. The M-30 saw action in World War II, mainly as a divisional artillery piece of the Red Army (RKKA). Captured guns were also employed later in the conflict by the German Wehrmacht and the Finnish Army. Post World War II the M-30 saw combat in numerous conflicts of the mid- to late twentieth century in service of other countries' armies, notably in the Middle East. The barrel of the M-30 was of built-up construction and consisted of a liner, jacket and breech. The breechblock was of interrupted screw type, with forced cartridge case extraction. The gun was equipped with a hydraulic recoil buffer and hydropneumatic recuperator. A panoramic sight was used for both indirect and direct fire. The M-30 had a modern split trail carriage with leaf spring suspension and steel wheels with rubber tires. It was usually towed by vehicle without a limber. The carriage allowed for a towing speed of up to 50 km/h on paved road and up to 35 km/h on gravel or dirt roads, although the gun could also be moved by a team of six horses, in which case a limber was used. When the trails were swung open the suspension locked automatically . In an emergency it was possible to shoot in a "single trail" mode, at the price of a drastically reduced traverse (1°30'). The time required to set the gun up for combat was about 1–1.5 minutes. The carriage of the M-30 was later used for the D-1 152 mm howitzer. In the M-30, RKKA units finally received a modern divisional howitzer which successfully combined increased firepower and better mobility with reliability and ease of use. A summary of its employment by the Red Army was provided by Marshal G. F. Odintsov, who said "Nothing can be better". The long post-war employment of the howitzer is additional testimony to its combat and operational utility and effectiveness. It is hard to compare the M-30 directly with contemporary foreign guns since the artillery of France, Germany and United States employed in similar roles was either the much smaller 105 mm (Great Britain used the even smaller—87.6 mm—25 pounder gun-howitzer) or much larger 150 to 155 mm caliber guns. Howitzers of similar calibers existed but most of those were World War I era pieces, such as the Vickers 114 mm howitzer used by the Finnish Army. Naturally, 150 mm howitzers were more powerful, but much heavier than the M-30; while 105 mm pieces were lighter but their smaller shells contained less explosive. The most direct German equivalent was the 10.5 cm leFH 18 light howitzer. Weighing 1985 kg, it had a maximum elevation of 42°, muzzle velocity of 470 m/s and maximum range of 10,675 m. In the upgraded leFH 18/40 version, muzzle velocity was improved to 540 m/c, elevation to 45° and range to 12,325 m. About equal in range, the German howitzer had a less powerful HE shell and its smaller maximum elevation made it less effective against dug-in troops, although it also weighed some 400 kg less than M-30. Both guns were well suited for mass production with 16.887 M-30s and 15.388 leFH 18 built in 1941–45.

Type 05 (PLZ-05) Chinese 155mm Self-Propelled Howitzer (SPH)

Tiers:

Variants:

- **PLZ-52:** The PLZ-52 is a 155mm / 52 caliber tracked self-propelled howitzer similar in appearance to the PLZ-45, but based on a slightly different hull. Having a gross vehicle weight of 43 tonnes, the PLZ-52 features a new power pack, which consists of a diesel engine developing 1,000 hp at 2,300 rpm coupled to a fully automatic transmission. This gives a maximum road speed of up to 65 km/h and an operational range up to 450 km.[6] The PLZ-52 howitzer has a maximum firing range of 53 km (with ERFB-BB-RA projectiles), maximum firing rate of eight rounds per minute, a burst firing rate of three rounds per fifteen seconds, and a multiple-round simultaneous impact capability of four rounds.
- **PLZ-04:** Self-propelled howitzer with a 54 caliber barrel and apparently offered for export.
- **Command post vehicle:** This appears to be based on a different six-wheeled hull with a raised crew compartment to the rear of the drivers and commanders position at the front left side of the hull.

Remote Fire Capable: Yes

Direct Fire: Yes

Indirect Fire: Yes

Laser/fibre optic Enabled: Yes

Land Navigation: Yes

Protection

Hull Armor: Rolled homogeneous plate armor (RHA), Protection against small arms and shell splinters.

Turret Armor: Rolled homogeneous plate armor (RHA), Protection against small arms and shell splinters.

Applique Armor: Available

Explosive Reactive Armor: No

Active Fire Suppression System: Yes

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: two banks of four electrically fired smoke dischargers on each side.

Grenade Launchers: 2 sets of 4-barrel grenade launchers

Note: The PLZ-05 is a rear-line artillery support vehicle that is not meant to be on the front lines of the battlefield.

Notes:

The PLZ-05 was designed and manufactured by the China North Industries Group Corporation (CNGC), better known as Norinco. According to most reports, its development started in the mid-1990s, as a further development of the PLZ-45, an export version which already saw combat. The first prototype was completed in 2003 and it seems to have been accepted into service in 2005, at least according to its official denomination. It was also revealed during the 2005 Beijing International Aviation Exhibition. However, this model only entered service with the PLA around 2007.

M109A6 Paladin American 155mm Self-Propelled Howitzer

Tiers:

1 **2** 3 4

Parent:

M109 American 155mm Self-Propelled Howitzer

Variants:

- **M109:** First produced in 1963. It had a 23 caliber 155 mm M126 gun in an M127 Howitzer Mount, and carried 28 rounds of 155 mm ammunition. It was also armed with a .50cal M2HB machine gun with 500 rounds of ammunition. Easily identified by its short barrel and a double baffle muzzle brake with a large fume extractor just behind it. Maximum range of 14,600 meters.
- **M109A1:** Replaced the M126 gun with a longer barreled, 39 caliber M185 gun, increasing maximum range to 18,100 meters.
- **M109A2:** Incorporated 27 Reliability, Availability, and Maintainability (RAM) mid-life improvements. Most notably, the long barreled 155 mm M185 cannon in the new M178 gun mount, ballistic protection for the panoramic telescope, counterbalanced travel lock, and the ability to mount the M140 alignment device. Stowage of 155mm rounds increased from 28 to 36 rounds; .50cal ammunition remained at 500 rounds. During M109A2 production, a slightly simplified version was also produced for export. This had minor internal changes and deleted the hull flotation feature. These were designated M109A1B.
- **M109A3 and M109A3B:** M109A1s and M109A1Bs rebuilt to M109A2 standard respectively. Some A3s feature three contact arm assemblies, while all A2s have five.
- **M109A4:** M109A2s and M109A3s improved with Nuclear, Biological, and Chemical / Reliability, Availability, and Maintainability (NBC/RAM) improvements, including air purifiers, heaters, and Mission Oriented Protective Posture (MOPP) gear. The traversing mechanism's clutch is hydraulic, as compared to the electric mechanism on previous M109s, and features a manual override in the event of an electrical failure. The A4 also adds an additional hydraulic filter, for a total of two. Also included is an improvement to the engine starting equipment, greatly improving the ability to start in an emergency. Ammunition amounts remain the same as two previous models.
- **M109A5:** Replaces the 155 mm M185 cannon in an M178 mount with a 39-caliber 155 mm M284 cannon in an M182 mount, giving the A5 a maximum range of 22,000 meters with unassisted projectiles and 30,000 meters with Rocket Assisted Projectiles (RAP Rounds). The vehicle can carry 36 complete rounds of ammunition and has a 440 hp engine instead of the standard 405 hp engine.
- **M109A5+:** Various manufacturers have upgraded the fire control and other components of the M109A5. BAE Systems in York PA recently delivered 12 M109A5+ vehicles to Chile and 32 for Brazil.
- **M109A6 "Paladin":** Overall product improvement in the areas of survivability, RAM, and armament. This includes increased armor, a redesigned internal arrangement for safer ammunition and equipment storage, engine and suspension upgrades, and product improvement of the M284 cannon and M182A1 mount. The greatest difference is the

integration of an inertial navigation system, sensors detecting the weapons' lay, automation, and an encrypted digital communication system, which utilizes computer controlled frequency hopping to avoid enemy electronic warfare and allow the howitzer to send grid location and altitude to the battery fire direction center (FDC). The battery FDCs in turn coordinate fires through a battalion or higher FDC. This allows the Palladin to halt from the move and fire within 30 seconds with an accuracy equivalent to the previous models when properly emplaced, laid, and safed—a process that required several minutes under the best of circumstances. Tactically, this improves the system's survivability by allowing the battery to operate dispersed by pairs across the countryside and allowing the howitzer to quickly displace between salvos, or if attacked by indirect fire, aircraft, or ground forces. Ammunition storage is increased from 36 to 39 155 mm rounds.

- **M109 "KAWEST":** This Swiss improved version produced by Ruag incorporates a new Swiss-designed L47 155 mm gun with an increased firing range of up to 36 km. It features inertial navigation system coupled with a new gun-laying system and more ammunition storage(40 rounds, 64 charges). The KAWEST (lit. Kampfwertsteigerung = upgrade of combat capabilities) requires only 6 crew members instead of 8, and is able to fire 3-round bursts within 15 seconds or maintain a constant firing rate of over one round per minute.[9][10] Upgraded Swiss PzHb (Panzerhaubitze) 79 and 88 (M109A1) are known as respectively PzHb 79/95 and PzHb 88/95
- **M109L52:** Jointly developed by the Dutch firm RDM and the German firm Rheinmetall, the M109L52 was first revealed in 2002. The main improvement was replacing the M126 series gun with the longer 52-caliber cannon from the PzH 2000, thus the MTLS ammunition of the PzH 2000 can be used. In addition, improvements to the loading system were made. This resulted in an increase of the rate of fire to 9–10 rds/min from the original 3 rds/min, and this high rate of fire can be sustained for up to 2 minutes. A total of 35 rounds can be carried.
- **M109A3GNM:** The current version in service with the Norwegian Army's Artilleribataljonen. 126 M109Gs were acquired from West Germany between 1969–1971. They were then upgraded to the M109A3GN configuration during the latter half of the 1980s. In 2006, there were still 56 M109A3GNs in the Army's inventory, meaning that at least 70 SPGs had been scrapped after the end of the Cold War. 14 of the M109A3GNs received additional upgrades in 2007, and were designated M109A3GNM. The upgrade includes, among other things, new intercom and new navigation and positioning systems. The M109A3GNMs are currently the only SPGs that remain in active service with the remainder of the M109s having been put in storage.
- **K55/K55A1:** K55/K55A1 are South Korean variants of the M109A2 , originally named KM109A2 with additional domestic augmentations, license-produced by Samsung Techwin. They are fitted with M178 155 mm 39 caliber gun, NBC protection, automatic fire extinguishing system, and a modified ammunition reception module for K56 automatic ammunition resupply vehicle. The Performance Improvement Program variant, K55A1, is a complete domestic overhaul of the K55 which is further augmented by Samsung Thales with modern digital ballistic computers, multifunctional data display and controllers, GPS navigation and target acquisition system, wireless datalink equipment, and upgraded fire control storage battery and power supply unit, to closely match the US military's modernization of the Paladin into next-generation standard. Many improved technologies of the South Korean K9 Thunder were retrofitted on the K55A1. 1,040 howitzers of these variants were produced.
- **M109A7:** The newest M109 version for U.S. service is the M109A7, formerly known as the M109A6 Paladin Integrated Management (PIM). The M109A7 shares common components with the Bradley Fighting Vehicle such as the engine, transmission, and tracks. This creates commonality with other systems and maximizes cost-savings in production, parts inventory, and maintenance personnel. The M109A7's on-board power systems harness technologies originally developed for the Non-Line-of-Sight Cannon; the electric drive is faster than the previous hydraulic system, and the automatic rammer more consistently rams the round into the gun for consistent velocities and better accuracy. It features a 600-volt on-board power system to accommodate additional armor and future networking technologies as they become ready. The M109A7 can sustain a one-round per-minute rate of fire and a maximum rate of fire of four rounds per-minute.

System

Alternative Designation: M109A6 Paladin

In Service: 1997-Present

Type: Self-Propelled Howitzer

Crew: ea4

Chassis: The M108 and M109 shared a common chassis (along with the M113 APC), but the M109 was heavier and had a larger gun. The M108 proved unsuccessful, mainly due to its overly light gun.

Displacement Time: INA

Emplacement Time: According to United Defense, the Paladin can move from road march to firing status in one minute. Response time while in firing position is less than 30 seconds. These reaction times give Paladin a true "shoot-and-scoot" capability. The Paladin's travel lock, a front-mounted bracket that steadies the long barrel during vehicle movement, has

been modified to enable remote operation.

Note #1: The Paladin consists of 1,900 parts. Major components include a low-heat rejection engine from Detroit Diesel; Honeywell navigation/positioning system; and an Alliant Techsystems automatic fire-control system (AFCS).

Dimensions

Length, with Rear Box: 6.81 m

Length, Gun Forward: 9.68 m

Width, with ADMG: 3.24 m

Width, over Side Boxes: 3.92 m

Height, Overall: 3.62 m

Height, Top of MG Mount: 3.27 m

Weight: 63,600 lb (28,848 kg)

Ground Pressure: 13.53 lb/sq in (0.95 kg/cm sq)

Track, Length on Ground: 3.96 m

Automotive

Engine Name: 1 x DDC 8V-71T 568-cu in (9.3-liter) liquid-cooled, turbo-charged two-stroke V-8 diesel/JP8

Engine Type: V-8 diesel

Engine Power: hp440 hp

Power-to-Weight Ratio: 15.25 hp/metric ton

Transmission: Allison ATD-XTG 411-2A (A3) or 411-4 with quick disconnect powershift crossdrive, 4 forward and 2 reverse gears

Range: km344

Speed, Maximum Road: km/h64

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Side Slope: %30

Gradient: %60

Vertical Step: m0.53

Trench: m1.83

Fording Depth: m1.07

Fuel Capacity: 133 gal (503 liters)

Suspension: torsion bar, 7 road wheels, front drive, rear idler, no return rollers (all models except PIM). An upgraded suspension has longer torsion bars and hydro pneumatic bump stops to handle the greater vehicle weight.

Note: The M109A5 offers upgraded components providing greater durability. It has a higher horsepower low heat rejection (LHR) engine and an improved transmission for increased performance.

Main Gun

Note: The elevation/equilibrium cylinder and turret traverse clutch assembly are redesigned to prevent failures.

↳*System*

Name: M284 39 cal/155mm Rifled Howitzer fitted with Muzzle Brake and Fume Extractor
Type: Howitzer
Caliber: 155mm
Length: INA
Barrel Length: INA
Weight: INA
Cannon Groves: 48
Rifling: right-hand rifling with constant, 8.93-deg twist
Breech Type: Welin-step thread
Recoil System: hydropneumatic
Elevation: -3/+75 deg (-53/+1,333 mils)
Traverse: 360 deg (6,400 mils)
Maximum Firing Range: 14.6 km
Maximum Rate of Fire: 1 rd/min first hour, 4 rd in first 3 min max
Sustained Rate of Fire: 2 rpm
Note #1: This self-propelled artillery system is supported by an associated M992 armored ammunition supply vehicle. It is based on the same tracked chassis as the M109.
Note #2: The cab has a rear bustle rack which provides an increased ammunition stowage capacity.
Note #3: The M109A5 share commonality with all of the other M109 family members and fires all NATO-standard 155-mm ammunition.

↳*Ammunition (Option 1)*

Name: M549A1
Type: HERA
Caliber: mm155mm
Length: 33.7 in (858 mm)
Weight: 95.9 lb (43.54 kg)
Basic Load: 39 rounds including 2 Copperhead
Maximum Range: 30,000 m
Response Time: 60 seconds

↳*Ammunition (Option 2)*

Name: M712
Type: Copperhead
Caliber: mm155
Length: 54.0 in (1,372 mm)
Weight: 140.0 lb (63.50 kg)

Basic Load: 39 rounds including 2 Copperhead

Maximum Range: 14,000 m

Response Time: 60 seconds

↳*Ammunition (Option 3)*

Name: M864

Type: DPICM

Caliber: 155mm

Length: 35.3 in (898 mm)

Weight: 103.2 lb (43.80 kg)

Basic Load: 39 rounds including 2 Copperhead

Maximum Range: 22,100 m

Response Time: 60 seconds

Auxiliary Weapon System

↳*System*

Name: M2 Browning

Type: Heavy Machine Gun

Caliber: 12.7mm

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 500

Fire Control

Name: Alliant Techsystems automatic fire-control system (AFCS).

Computerized FCS: Yes, The AFCS has a ballistic computer/weapon controller, power conditioner and an inertial reference navigation systems/dynamic reference unit based on the modular azimuth positioning system (MAPS) using ring laser gyro on-board land navigation. The AFCS permits 0.6 mi. (1 km) separation between vehicles, improving gun battery survivability.

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: Yes

Night Vision Devices: Yes

Note: It has an all weather ballistic shield mounted over the panoramic telescope; counterbalanced travel lock and provisions for mounting the M140 alignment device.

Protection

Hull Armor: 5083 aluminum with composite spall liners and supplemental armor.

Turret Armor: INA, The turret takes up the rear. On top of the turret, there is a small cupola, from which the commander operates. This cupola is also fitted with a 12.7 mm (.50) M2HB heavy machine gun.

Applique Armor: DuPont Kevlar armor has been added to the Paladin, forming an inner lining of the cab, roof and crew compartment sides. Rolled homogeneous steel armor is fitted over the driver's compartment and on the rear of the bustle.

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: MCS system

Smoke Equipment: No

Fire Suppression: Automatic. Improved protection also includes the segmentation of hydraulic lines and the use of a Halon fire-suppression system. The hydraulic system, which is distributed in the A3, has been centralized in the Paladin. The Halon system is intended to snuff out internal fires in less than 0.25 sec. In addition, a microclimate cooling system has been added to improve the working environment and protect against the effects of nuclear, biological and chemical (NBC) warfare. Projectile stowage has been placed lower in the hull to reduce threat of secondary explosions from counter-battery fires.

Notes:

The M109A6 Paladin is a further upgrade of the M109 self-propelled howitzer, which was introduced in early 1960s. This M109A6 Paladin self-propelled howitzer entered service with the US Army in 1991. Production ceased in 1999. A total of 950 artillery systems were built for the US Army. Export operators are Israel and Taiwan. With the cancellation of Crusader and NLOS-C programmes the US Army will continue to rely on the M109A6 Paladin artillery system, until it will be upgraded to the M109A7 standard. The M109A6 has a larger turret than its predecessor. It is armed with the M284 155 mm/L39 howitzer, fitted with a semi-automatic loading system. Maximum range of fire is 24 km with standard projectiles and 30 km with rocket-assisted projectiles. Maximum rate of fire is 4 rounds per minute. Sustained rate is one round every three minutes. Some of the US Army M109A6 Paladins were fitted with modification kits to fire M982 Excalibur extended-range precision guided projectiles. The Excalibur is GPS-guided and has a maximum range of 40 km. The Paladin can stop and fire the first round in under 60 seconds. Brief redeployment time allows to avoid counter-battery fire and gives shoot-and-scoot capability. Secondary armament consists of a roof-mounted 12.7 mm heavy machine gun. Some vehicles were fitted with 40 mm automatic grenade launcher in place of machine gun. The M109A6 is fitted with an automatic fire control system with an integrated navigation and inertial positioning system. It is also fitted with a muzzle reference system. Armor of the M109A6 Paladin provides protection against small arms fire and artillery shell splinters. Vehicle is fitted with NBC protection system. Turret is fitted with Kevlar anti-spall lining.

PLL-09 (Type 09) Chinese 122mm Self-Propelled Howitzer (SPH)

Tiers:

Variants:

- **ZBL-09:** ZBL-09 or Type 07P is a wheeled infantry armoured fighting vehicle designed and manufactured by the Chinese Defense Company NORINCO China North Industries Corp. The ZBD-09 was presented for the first during the military parade in Beijing for the 60th anniversary of the Chinese army (PLA), the 01 October 2009. The ZBD-09 was based to the chassis of the VN1 8x8 wheeled chassis.

Protection

Front Arc Armor: Welded steel hull, Front arc can withstand 12.7mm armor piercing rounds.

All Around Armor: Welded steel hull, Protection from 7.62mm armor-piercing rounds.

Automatic Fire Suppression Systems: Yes

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: Yes

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes, 12 Smoke Grenades on Turret

IR Signature: INA

Notes:

The PLL-09 is a Chinese 122 mm self-propelled howitzer. Currently this howitzer is widely used by the China's army. This artillery system is also used by China's marines. The PLL-09 provides indirect fire support for rapid deployment brigades. These Chinese brigades are similar in concept to the US Stryker brigades. These military units are equipped with lightly armored, but highly mobile 8x8 armored personnel carriers of all variants. Each rapid reaction brigade has numerous armored vehicles of all variants, including armored personnel carriers, reconnaissance vehicles, 105 mm fire support vehicles, command vehicles, engineer vehicles, and some other specialized vehicles. These brigades can be briefly redeployed over significant distances. Also the PLL-09 SPH has good cross-country mobility and is capable of keeping pace with main battle tanks.

Caesar French 155mm Self-Propelled Howitzer (SPH)

Turret Armor: INA
Applique Armor: mmAvailable
Explosive Reactive Armor: No
Active Protection System: INA
Mine Clearing: No
Self-Entrenching Blade: No
NBC Protection: No
Smoke Equipment: INA
IR Signature: INA

Notes:

The CAESAR 8x8 self-propelled howitzer was developed by Nexter. Sometimes this artillery system is referred as CAESAR 2.

The acronym CAESAR stands for CAmion Equipe d'un Systeme d'ARtillerie, or truck equipped with an artillery system. It is based on the original CAESAR, which first appeared back in 1994 and was the first mass produced truck-mounted howitzer. Prototype of the CAESAR with 8x8 configuration was revealed in 2015. The new artillery system, which emerged more than 20 years after its predecessor, is based on an 8x8 chassis. Gun of the new artillery system remains without significant changes, however weapon control systems have been updated. So the CAESAR 8x8 can shoot faster and is more accurate than its predecessor. In 2017 Denmark selected this artillery system to replace their old M109 howitzers that are in service since 1965.

Boxer RCH 155 German Self-Propelled Howitzer

Tiers:

System

Alternative Designation: Boxer RCH 155 German Self-Propelled Howitzer

Effective Firing Range: INA

Sights: INA

Note #1: A total of 30 rounds of ammunition are carried for the main gun. A lifting system is installed at the front of the turret. It allows the crew to reload magazine from outside of the vehicle. This artillery system can be adapted for a lighter gun, such as a shorter 155 mm/L39 or even 105 mm gun.

↳*Ammunition (Option #1)*

Name: INA

Type: Standard NATO projectiles

Caliber: mm155

Shell: INA

Basic Load: 30 rounds

Armor Penetration: INA

Note #1: Maximum range of fire is 30 km

↳*Ammunition (Option #2)*

Name: INA

Type: Bleed projectile

Caliber: mm155

Shell: INA

Basic Load: 30 rounds

Armor Penetration: INA

Note #1: Maximum range of fire is 40 km

↳***Ammunition (Option #3)***

Name: South African VLAP

Type: Rock-assisted projectile

Caliber: mm155

Shell: INA

Basic Load: 30

Armor Penetration: INA

Note #1: Maximum range of fire is 50 km

Fire Control System

Name: INA

Computerized FCS: Yes. It receives target data via radio or datalink. The gun is automatically laid using the fire control data. This howitzer is aimed and fired by the crew remotely from the cab. Though in case of emergency or failure this artillery system can be loaded and fired manually. It takes approximately 30 seconds to open fire. Out of action time is also as short as 30 seconds. After firing the last round vehicle can leave its position in order to avoid counter-battery fire.

Main Gun Stabilization: INA

Direct Fire: Yes

Indirect Fire: Yes

:

:

Protection

Hull Armor: Vehicle hull has a modular hull armor with special ceramic mix. The triple hull floor is shaped for maximum protection against anti-tank mines and improvised explosive devices

Turret Armor: The turret is made of lightweight aluminum armor and provides protection only against small arms fire and artillery shell splinters.

Applique Armor: INA

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Vehicle is fitted with NBC protection system for the crew

Smoke Equipment: INA

Note #1:: This artillery system has low radar and acoustic signatures, making it harder to detect.

Note #2:: The front arc can withstand hits from 30 mm projectiles.All-round protection is against 12.7 mm rounds. Damaged armor slabs can be easily replaced in field condition.

Notes:

In April 2014, Krauss-Maffei Wegmann decided to integrate the artillery gun module (AGM) onto the Boxer armored vehicle, with the system making an appearance at Eurosatory in June 2014. The Boxer has to prove it can deal with recoil forces without stabilization, but stabilization concepts can be added if needed to retain shoot and scoot and 360 degree firing capability. The Boxer-AGM system could be used as an upgrade option for countries with existing boxer fleets. Test firings were completed in 2014. Firing trials with the turret traversed front and to its sides were carried out at WTD 41 proving ground and were successful without the use of stabilizers. The trials also demonstrated the ability to fire an 8-round burst and redeploy under 90 seconds, and carry out multi-round simultaneous impact missions. The combination of the Boxer vehicle with AGM became known as Remote Controlled Howitzer 155 (RCH 155) due to the turret module being remote controlled. Additionally, a remote weapons station with a .50 caliber machine gun has been fitted on the roof.

M110A2 American 203mm Self-Propelled Howitzer (SPH)

Tiers:

Parent:

M110 American 203mm Self-Propelled Howitzer (SPH)

Variants:

- **M110A1:** M110A1, improved variant of the M110, fitted with a longer M201 203 mm/L37 howitzer. It entered service in 1971. Maximum range of fire was increased to 27 km. This self-propelled howitzer fires newly developed rocket-assisted, cluster projectiles, nuclear and chemical projectiles.

System

Alternative Designation: M110A2
Type: Self Propelled Howitzer
Manufacturer: General Motors Corp.
In Service: 1980-Present
Family: M110 Series
Crew: ea5 (commander, driver, 3 gunners)
Resupply Vehicle: + 8 in the associated M548 ammunition resupply vehicle.
Chassis: chassis identical to the M110's
Displacement Time: min1
Emplacement Time: min1
Note: Support crew of 8 men are carried by an escorting armored personnel carrier, which also transports ammunition for this SPH.

Dimensions

Length, with Gun Forward: m10.72
Length, Hull: m5.72
Barrel Length: m8.36
Width: m3.15
Height (To the Top of the Barrel): m3.15

NBC Protection: Yes

Smoke Equipment: INA

IR Signature: INA

Note: This artillery system carries no defensive armament, except individual weapons carried by the crew.

Notes:

The M110A2 is the largest available self-propelled howitzer in the Army's inventory. It is deployed in division artillery of general support battalions and in separate corps- and Army-level battalions. Missions include general support, counter battery fire, and suppression of enemy air defense systems. The M110A2 is a self-propelled heavy artillery cannon with a crew of 12. Designed to be part of a common family of weapons utilising the same chassis components, the M107 and M110 were essentially the same vehicle mounting different barrels. This full-tracked, self-propelled artillery weapon that fires a 200-pound, eight-inch diameter projectile. The shell leaves the muzzle at a velocity of 2,300 feet per second and can travel more than 18 miles.

G6 Rhino South African 155mm Self-Propelled Howitzer (SPH)

Tiers:

Variants:

- **G6 M1A3:** exported UAE version
- **G6-52:** (23 litre chamber)
- **G6-52 extended range:** (25 litre chamber)
- **Al-Majnoon::** licensed Iraqi version Reduced crew to 3–5; can fire projectile up to 67 km at a rate of fire of eight rounds/minute; increased off-road speeds to nearly 70 km/h; implemented multiple rounds simultaneous impact (MRSI) technology and can land six (G6-52L variant) or five (G6-52) rounds simultaneously at targets up to 25 km away; and is currently undergoing extensive trials.
- **G6 Marksman:** British SPAAG version, combining the G6's base vehicle with the Marksman turret.[

Smoke Equipment: Yes, 81 mm electrically operated grenade launchers which fire smoke grenades.

IR Signature: INA

Double Armored Floor: Yes

Bullet Proof Windows: Yes

Firing Ports: Yes, each side

Thermal Warning Device (TWD): Yes

Notes:

The G6, sometimes denoted as the G6 Rhino, is a South African mine-protected self-propelled howitzer. It was developed as a turreted, self-propelled variant of the G5 howitzer series, mating the gun to a six-wheeled armored chassis. Design work on the G6 began in the late 1970s to replace the obsolescent Sexton being retired from service with the artillery regiments of the South African Army. Serial production commenced between 1988 and 1999. At the time of its introduction, the G6 was considered one of the most mobile self-propelled howitzers in service. Its chassis was engineered to be mine-resistant and blast proof, allowing it to survive multiple TM-46 detonations during trials. The G6 was conceived as a wheeled rather than a tracked vehicle for this purpose, as well as to allow it to deploy long distances by road without consuming excessive quantities of fuel or requiring a tank transporter.

2S19M1 (Msta-SM1) Russian 152mm Self-Propelled Howitzer (SPH)

Tiers:

Parent:

2S19 Msta Russian Self-Propelled Howitzer (SPH)

Variants:

- **152 mm howitzer 2A65:** a towed version of the same gun.
- **1K17 Szhatie -:** a "laser tank" armed with a battery of lasers meant to disable optoelectronic systems; uses Msta-S chassis and turret.
- **2S33 "Msta-SM":** Improved version. Prototype.
- **2S19M1 (2000):** Improved version with automatic laying system and Glonass.
- **2S19M2 "Msta-SM2" (2013):** mproved version currently in production equipped with a new automatic fire control system which increases the rate of fire. Digital electronic maps are now available which significantly speeds up the terrain orientation in difficult geographical conditions and allows performing faster and more efficiently firing missions.
- **2S19M1-155 (2006):** 155mm export version of the 2S19M1, fitted with an L/52 gun with a range of 40+ km.
- **2S27 "Msta-K":** Wheeled variant (K = kolyosnij), based on a 8x8 truck chassis. There were several different prototypes, including one based on a KrAZ-ChR-3130 and two based on the Ural-5323 (with and without turret).
- **2S30 "Iset":** Improved version, prototype only.
- **2S35 "Koalitsiya-SV" -:** Project for a new artillery system for the Russian land forces (SV = sukhoputniye voyska). Early prototypes consisted of a 2S19 chassis with modified turret, fitted with an over-and-under dual autoloaded 152mm howitzer. Development of this variant was abandoned in favour of an entirely new artillery system using the same designation

System

Alternative Designation: 2S19M1 (Msta-SM1)
Estimated out of service date: 2038
Manufacturer: Uraltransmash
Type: Self-propelled howitzer
Family: Msta-S 2S19 family
Crew: ea5
Chassis: Modified T-72
Displacement Time: min1.5
Emplacement Time: min1.5
Navigation System: Yes, GNSS

Dimensions

Length: m7.15

Width: m3.38

Height: m2.99

Weight, Combat: tons42

Ground Pressure: kg/mINA

Automotive

Engine Name: V84-A

Engine Type: Diesel

Engine Power: hp840

Cruising Range: km500

Speed, Maximum Road: km/h60

Speed, Average Cross: km/h25

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.85

Trench: m2.8

Fording Depth (Without Preparation): m1.2

Fording Depth (With Preparation): m5

Suspension: torsion bar

Auxiliary Power: AP-18D system

Communications

Primary: R-173M

Secondary: R-168-25UE-2 Radio

Intercom: 1V116 intercom

Main Gun

↳*System*

Name: 152 mm 2A64 Long Barrel Gun

Type: mm152

Breech Type: Vertical sliding wedge

Manufacturer: Motovilikha Plants

Length, Barrel: 7,200m L/47

Weight: kg6,800

Loader Type: Automated

Max Rate of Fire: rds/min8

Sustain Rate of Fire: rds/min3-4

Muzzle Brake Type: Double baffle

Max Elevation: deg+68

Min Elevation: deg-3

Traverse Range: deg360

Range Finder Type: INA

Central Bore Evacuator: Yes

Travel Lock: Yes

TZM-K 2F66-1 Capable: Yes

Note # 1: Engage a target within 30 seconds of receiving target coordinates,

Note # 2: the 2S19 to fire all 152 mm howitzer ammunition in the Russian inventory, including those rounds designed for very old Soviet weapons such as the D-20.

↳*Ammunition (Option 1)*

Type: 152-mm Frag-HE, OF-72

Caliber: mm152

Muzzle Velocity: m/s864

Fuse Type: RGM-2 PD

Basic Load: 50 Total Rounds of any 152mm combination projectile

Maximum Effective Range: m24,700

Complete Projectile Weight (OF-45): kg43.56

↳*Ammunition (Option 2)*

Type: 152-mm Frag-HEAT, BP-540

Caliber: mm152

Muzzle Velocity: m/s655

Fuse Type: GPV-3 PD

Basic Load: 50 Total Rounds of any 152mm combination projectile

Maximum Effective Range: m27,000

Complete Projectile Weight: kg27

↳*Ammunition (Option 3)*

Type: 152-mm Frag-HE BB, OF-91

Caliber: 152

Muzzle Velocity: m/s828

Fuse Type: KZ-88 PD

Basic Load: 50 Total Rounds of any 152mm combination projectile

Maximum Effective Range: m29,000

Complete Projectile Weight (OF-61): kg42.86

Note: The 2S19 can fire the additional 152mm projectiles: 9K25 Krasnopol guided projectile and the 3-RB-30 radio jamming round

Coaxial Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: mm12.7mm Anti-Aircraft Machine Gun

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Max Rate of Fire: rds/min700-800

Weight (Gun Only): kg25

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Length (Total): mm1,560

Action: Gas Operated

Feed System: 50-Round Belt

Sights: Iron Sights

↳*Ammunition*

Type: Rifle

Caliber: mm12.7 mm

Cartridge: 12.7×108mm

Muzzle Velocity: m/s845

Basic Load: ea500

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Fire Control

Name: Kapustnik-B 1V126 fire control system,

Computerized FCS: Yes

Modernised Gun Control Equipment: 2E46M.

Automated Fire Control System: 1V168 ASUNO-S (Success)

Grot-B GLONASS Receiver: Yes

Thermal Sight Vehicle Commander: Yes, PZU-5 or PZU-7 sight

Thermal Sight Gunner: Yes, Panoramic 1P22 sight and 1P23 direct fire set

Main Gun Stabilization: Yes, self-orientating gyro stabilisation system

Indirect Fire: 1P22 Panoramic Telescope (PANTEL)

Direct Fire: 1P23

Collimator: K-1

Ballistic Computer: Yes

Traverse: Semi-Automatic

Artillery Command and Control System: 1V12M Falstet artillery command and control system

Note # 1: Returns the barrel to its firing line automatically after every shot

Note # 2: conduct fire missions at the maximum rate of fire by day or night and in all weather conditions whether the target can be seen or not.

Protection

Hull Armor: mmClassified

Turret Armor: mmClassified

Armor Material: Rolled homogeneous armour that is further protected by Combination-K armour.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Built-in bulldozer blade: Yes

NBC Protection: Yes, System Sensor Radiation Device and chemical intelligence (PRRM)

Smoke Equipment: Yes, via the exhaust manifold

Grenade Launcher: Yes, six 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade

Grenade Range: m200-300

Grenade Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade

Automatic fire suppression systems.: Yes

Camouflage system: Yes, Накидка or cape camouflage system

Camouflage IR Reduction: %30

Notes:

2S19M1 (2000) - Improved version with automatic laying system and Glonass. Upgrade to the 2S19 Msta-s. The 2S19 "Msta-S" (Russian: Мста, after the Msta River) is a 152.4 mm self-propelled howitzer designed by Russia/Soviet Union, which entered service in 1989 as the successor to the 2S3 Akatsiya. The vehicle is based on the T-80 tank hull, but is powered by the T-72's diesel engine.

PCL-09 Chinese 122mm Self-Propelled Howitzer

Tiers:

Variants:

- **CS/SH1:** Export version of the PCL-09
- **PLL-09:** Self-propelled howitzer, based on ZBL-09 8x8 armored personnel carrier chassis. It was adopted alongside the PCL-09. The PLL-09 is more mobile due to its chassis. It is capable of keeping pace with main battle tanks. Also this artillery system is fully amphibious and can ford water obstacles afloat.

System

Alternative Designation: PCL-09 Chinese 122mm Self-Propelled Howitzer
Type: Howitzer
Caliber: mm122
Chassis: Shaanxi 6x6 Military Truck
Crew: ea5
Emplacement Time: 1.5 - 2.5 minutes
Displacement Time: 1.5 - 2.5 minutes
Note #1: A complete PCL-09 battery comprises of around 6 truck-mounted howitzers, and a battery command post vehicle. The regiment of the PCL-09 consists of a couple of batteries, and also includes one battalion command post vehicle, one meteorological radar, one artillery locating radar and some reconnaissance vehicles.

Dimensions

Length: m8
Barrel Length: 38 calibers
Width: m3
Height: 2.1 m without turret
Weight, Combat: t16.5

Automotive

↳*Ammunition (Option #1)*

Name: INA

Type: HE-FRAG

Caliber: mm122

Shell: INA

Basic Load: 40 rounds

Armor Penetration: INA

Maximum firing range: 18 km

Note #1: This system is separate-loaded ammunition with projectiles and their charges

↳*Ammunition (Option #2)*

Name: INA
Type: Extended-range projectile
Caliber: 122 mm
Shell: INA
Basic Load: 40 rounds
Armor Penetration: INA
Maximum firing range: 22 Km

↳*Ammunition (Option #3)*

Name: INA
Type: Rocket assisted projectile
Caliber: 122 mm
Shell: INA
Basic Load: 40 rounds
Armor Penetration: INA
Maximum firing range: 27 km
Note #1: The PCL-09 is also capable of firing 122 mm laser-guided projectiles. These are based on Russian Kitolov projectile technology.

Fire Control System

Name: INA
Computerized FCS: Yes, the PCL-09 is fitted with a computerized fire control system, navigation, positioning and targeting systems. It receives target information from artillery command post vehicle.
Main Gun Stabilization: Large spades and stabilizing jacks are lowered to the ground prior to firing. These provide a more stable firing platform.
Direct Fire: INA
Indirect Fire: Yes
Digital Battlefield Management System: Yes
:

Hull Armor: It seems that this artillery system carries no defensive armament
Turret Armor: INA
Applique Armor: INA
Explosive Reactive Armor: INA
Active Protection System: INA
Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Chinese Army has followed the global shift and embraced the concept of a lighter, more mobile ground force. This is showcased by the adoption of such battlefield elements as the PCL-09, a 6x6 wheeled, self-propelled, artillery-carrying vehicle capable of delivering various warhead types at range. The system is believed to have appeared in or around 2009 and was publicly showcased in 2010 military exercises. The Chinese Army fields about six PCL-09 trucks per battery with these being assigned several accompanying support vehicles (radar director, Command Post, etc.). Like other weapons of this kind, the PCL-09 is used as a ranged solution capable of supplying ground forces with fire support. The mobile nature of the vehicle allows the weapon to be relocated, fired, and relocated once again in short order. Prior to firing, support legs at the center of the chassis are lowered into the earth to help absorb the inherently violent recoil of such a weapon.

2S35-1 Koalitsiya-SV-KSh Russian 152mm Self Propelled Howitzer (SPH)

Tiers:

1 2 3 4

Parent:

2S35 Koalitsiya-SV Russian Self Propelled Howitzer (SPH)

System

Alternative Designation: 2S35-1 Koalitsiya-SV KSh

Manufacturer: Burevestnik Central Scientific Research Institute

Type: Self Propelled Howitzer (SPH)

Family: 2S35

Crew: ea3

Chassis: The KamAZ-6560 is a heavy-duty military truck.

Chassis Configuration: 8x8

Estimated Service Life: years30

Emplacement Time: min1.5

Displacement Time: minless than 1

Note: This artillery system can be seen as a less expensive and more mobile alternative to the tracked version.

Muzzle Velocity: m/s828

Fuze Type: KZ-88 PD

Basic Load: 65 Total Rounds of any 152mm combination projectile

Maximum Effective Range: km29

Complete Projectile Weight (OF-61): kg42.86

Note: The 2S19 can fire the additional 152mm projectiles: 9K25 Krasnopol guided projectile and the 3-RB-30 radio jamming round

Coaxial Weapon System

↳*System*

Name: 12.7×108mm ZiD Kord Remote weapon station
Type: mm12.7
Manufacturer: V.A. Degtyarev Plant
In Service: 1998-Present
Length: mm1,980
Max Rate of Fire: rds/min650-600
Sustain Rate of Fire: rds/min550-600
Action: Gas-operated, rotating bolt
Feed System: 50-round linked belt
Sights: Iron Sights with two sighting options, known as CAM and CAM1
CAM 1 Capability: TV/IR camera and a laser rangefinder
CAM 2 Capability: TV camera, Thermal Camera and laser rangefinder
Variants: 6P50-1, 6P50-2, 6P50-3, 6P49
Note: Remote weapon cocking capability

↳*Ammunition*

Type: Rifle
Caliber: mm12.7
Cartridge: mm12.7×108
Muzzle Velocity: m/s860
Basic Load: ea2,500
Effective Range: m2,000

Fire Control

Name: INA
Computerized FCS: Yes, with Automatic targeting and charge selection system.
Thermal Sight Vehicle Commander: Yes, CAM 1 (TV/IR camera, Thermal Camera and a laser rangefinder)
Thermal Sight Gunner: Yes, CAM 2 (TV/IR camera, Thermal Camera and a laser rangefinder)
Main Gun Stabilization: INA
Multiple Round, Simultaneous Impact (MRSI) Capable: Yes
Direct Fire: Yes
Indirect Fire: Yes
Radars: ea2
Radar Type: Doppler

Protection

Hull Armor: mmcomposite laminate design up to 200 mm thick
Turret Armor: mmcomposite laminate design up to 200 mm thick. The Turret is not heavily Armored
Applique Armor: Available
Explosive Reactive Armor: Available, the Kontakt-V Explosive Reactive Armour.
Active Protection System: INA
Mine Clearing: No
Self-Entrenching Blade: Yes, can dig 12 m × 5.5 m × 1.5 m entrenchment in sandy soil within 12 to 15 minutes.
NBC Protection: Reported to be the GO-27 PRKhR (NBC) System
Fire Suppression System: Reported to be the Raduga-2 Fire Suppression System
Smoke Equipment: Yes, 2 bundles of 902B Tucha smoke grenade launchers
Smoke Grenade Range: m250-300
Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade
IR Signature: INA

Notes:

The 2S35-1 Koalitsiya-SV KSh is a new Russian 152mm Self-Propelled Howitzer. Developed by JSC Central Research Institute Burevestnik, the 2S35-1 Koalitsiya-SV KSh is mounted on an 8x8 KAMAZ-6560 truck chassis and has the same turret and fires the same ordinance as its predecessor the 2S35-1 Koalitsiya-SV. With a maximum range of up to 70 kilometers using precision-guided projectiles, and 40 kilometers using standard projectiles, the 2S35-1 Koalitsiya-SV KSh is an extremely mobile self-propelled howitzer system. The 2S35-1 Koalitsiya-SV KSh can fire a variety of 152mm projectiles ranging from: Anti-Tank projectiles; Jammer carrying projectiles, Cluster projectiles, Rocket-Assisted projectiles; standard projectiles, and HE-FRAG projectiles.

SH-2 Chinese 122mm Self Propelled Howitzer (SPH)

Tiers:

Variants:

- **SH1:** The SH-1 self-propelled howitzer was developed by NORINCO for the export market. Development of this artillery system commenced in 2002. It was modeled after a French CASEAR. This Chinese artillery system was first revealed in 2007. Details of this artillery system were released at the same time as were details of the smaller SH-2 122 mm truck-mounted howitzer. Pakistan acquired a total of 90 SH-1 truck-mounted howitzers. Deliveries were completed between 2012 and 2013. This artillery system is also in service with Myanmar. The SH-1 was aimed mainly at export as Chinese army does not use this system.
- **SH3:** The WMZ322 is a 122mm tracked self-propelled howitzer designed and manufactured by the Chinese Defense Company NORINCOP (North Industries Corporation). First information about this artillery systems was released in 2005, but NORINCO has never published technical details about the product. According some Chinese military sources, the WMZ322 is proposed for the export under the name of SH-3.

System

Alternative Designation: SH2

Manufacturer: NORINCO

Type: 122mm Self Propelled Howitzer (SPH)

Family: INA

Crew: ea5

Chassis: Truck Mounted, 6 × 6 cross-country chassis

Displacement Time: min50

Emplacement Time: min2

Maximum Effective Range (Road): km600

Maximum Effective Range (Howitzer): m27,000

Add on Parts: different communications equipment, tactical direction and fire distribution, positioning, orientation and navigation systems, and an automatic gun-laying ability.

Dimensions

Length: m8.5

Width: m2.5

Height: m2.9

Weight, Combat: tons11.5

Ground Pressure: kg/mINA

Automotive

NBC Protection: Yes

Smoke Equipment: Available

Bullet-Proof Windows: Front and Sides

Notes:

The SH2 is a wheeled self-propelled howitzer designed and manufactured by the Chinese Defence Company Norinco. The SH2 artillery system was first unveiled at the Abu Dhabi International Defence Exhibition in 2007 (IDEX 2007) held between 18 and 22 February, and is being actively prompted to the export market. The lightweight and high-mobility features of this artillery system may be of special appeal to the PLA airborne force and marine corps. The SH2 has demonstrated superior performance under all weather conditions and a wide range of altitude, and it can be equipped with special gear as per mission requirement.

M1977 North Korean 122mm Self-Propelled Howitzer

Tiers:

1 2 **3** 4

System

Alternative Designation: M1977
Type: 122mm Self-Propelled Howitzer
Chassis: The M1977 self-propelled howitzer is based on an M1973 armored personnel carrier chassis, which is sometimes referred as VT-323.
Crew: 8-9
Emplacement Time: Under 3 minutes
Dsiplacement Time: Under 3 minutes

Dimensions

Length: 5.5 m
Width: 2.9 m
Height: 2.7 m
Weight, Combat: 16 tons

Automotive

Engine Name: Deutz BF8L413F
Engine Type: Diesel
Engine Power: hp320
Cruising Range: km400
Speed, Maximum Road: km/h60
Speed, Average Cross: INA
Speed Maximum Swim: km/h5
Gradient: %60
Side Slope: %30
Vertical Step: 0.6 m

Trench: 2 m

Fording Depth: Amphibious

Note: The M1977 self-propelled howitzer is fully amphibious. Even though rear-mounted waterjets of the M1973 armored personnel carrier were removed, this vehicle is propelled on water by its tracks. It can ford inland waterways such as lakes and rivers.

Main Weapon System

↳*System*

Name: The Soviet D-30 122 mm/L38 Howitzer

Type: Howitzer

Caliber: 122mm

Length, Barrel: 38 calibers

Maximum Firing Range: 21,9 km

Maximum Rate of Fire: 6-8 rpm

Elevation: 0-70 deg

Traverse: INA

↳*Ammunition*

Name: INA

Type: Projectile

Caliber: mm122

Projectile Weight: 14.08 - 21.76 kg

Basic Load: INA

Armor Penetration: A High-Explosive (HE) projectile penetrates a 180 mm steel armor plate.

Note #1: This North Korean artillery system uses an ordnance of the Soviet D-30 towed howitzer.

Note #2: The Soviet D-30 122 mm/L38 towed howitzer was created in the late 1950s and eventually proved to be a successful weapon. It was exported to numerous countries, including the North Korea. Maximum range of fire is 15.3 km with a standard High-Explosive Fragmentation (HE-FRAG) projectile and 21.9 km with rocket-assisted projectile.

Auxiliary Weapon System

Note: There is no information available about the type of auxiliary Weapon Systems are mounted on the M1977.

Fire Control

Name: INA

Computerized FCS: INA

Main Gun Stabilization: Yes, two large stabilizing spades are lowered to the ground at the rear.

Direct Fire: Yes

Indirect Fire: Yes

Protection

Hull Armor: The tracked chassis is lightly armored and has enclosed sides, but open top. It provides some degree of protection from small arms fire and artillery shell splinters. In traveling order the open top can be covered with bows and canvas cover.

Turret Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No, This artillery system has no defensive armament, except firearms of its crew members.

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1977 is a North Korean 122 mm self-propelled howitzer. Its actual designation is unknown. The M1977 designation was allocated by a US Department of Defense. Number in the designation denotes the year when this system was observed by US intelligence. This North Korean artillery system was adopted in the mid 1970s and is widely used to this day. As far as it is known the M1974 was not exported outside North Korea.

Type 83 Chinese 152mm Self-Propelled Howitzer (SPH)

Tiers:

1 2 3 4

Variants:

- **Type 89 Multiple Launch Rocket System:** Type 89 multiple launch rocket system. It is based on the same tracked armored chassis. This artillery rocket system was revealed in 1999. It is speculated that this system entered service in the late 1990s and was not offered for export. It replaced in service the ageing Type 70 130 mm artillery rocket systems.
- **425-mm mine-clearing system:** This is a basic vehicle with a limited-traverse launcher that has two cradles, each holding a large rocket with a range of 875-1,090 yds (800-1,000 m). When the rocket lands, it explodes -- clearing an area 140 yds (130 m) long by 13-24 yds (12-22 m) wide. The mine-clearance vehicle's combat weight is 59,525 lb (27,000 kg); it is is 23 ft 6 in (7.16 m) long and 10 ft 6 in (3.20 m) tall. Its launcher elevation range is -5 degrees to 45 degrees; traverse is 90 degrees to each side. The vehicle has a crew of five. The mine-clearing rocket weighs 1,675 lb (760 kg) and the warhead -- which is 15 ft 5 in (4.70 m) long -- accounts for 1,320 lb (600 kg) of that total weight.
- **Type 89 Tank Destroyer:** The Type 89 is a tank destroyer based on the hull of the Type 83. It features a 120-mm smoothbore anti-tank gun in a new turret.
- **Trench Digger:** A trench digger has been developed based on the hull of the Type 83 self-propelled howitzer. The vehicle, fitted with a front-mounted dozer blade, can dig between 8,830 cubic ft (250 cubic m) to 10,590 cubic ft (300 cubic m) of earth per hour using a digging machine carried over the rear of the hull. A crew of three operates the digger from a raised cab at the front of the vehicle. The trench digger has a combat weight of 66,140 lb (30,000 kg). The vehicle is no longer offered for export by NORINCO.

System

Alternative Designation: None
Date of Introduction: 1984
Manufacturer: NORINCO
Proliferation: China: 78
Type: 152mm Gun-Howitzer
Family: INA
Crew: 5 (commander, driver, gunner, 2 loaders)
Chassis: Type 83
Displacement Time: min1
Emplacement Time: min1
Maximum Effective Range: km17.2 - 28
Note: The Type 83 has been supplemented by the newer and more capable PLZ05 and will eventually be replaced.

Dimensions

Length (Hull): m6.41

Length (Gun Foward): m7.01

Width: m3.24

Height (Turret Top): m2.68

Height (Overall): m3.50

Weight, Combat: mt30

Ground Pressure: kg/m0.68

Automotive

Engine Name: Deutz Type 12150L

Engine Type: liquid cooled diesel

Engine Power: hp520

Fuel: liters885

Cruising Range: km450

Speed, Maximum Road: km/h55

Speed, Average Cross: km/h35

Towed Speed: km/h60

Speed Maximum Swim: Not Amphibious

Fording Depth: m1.3

Wheel Base: Tracked chassis, 6 roadwheels, drive sprocket front, idler rear, 4.61 m length, 0.48 m width, 2.62 m track

Carriage: Split Trail

Trench Digger Capable: Yes, capable of digging 250m to 300m

Fording without Preparation: m1.3

Gradient: %60

Side Slope: %40

Vertical Obstacle (Forward): m0.7

Trench: m2.5

Communications

Self-Entrenching Blade: No

NBC Protection: No

Smoke Equipment: No

IR Signature: INA

Notes:

The Type 83 152mm SP howitzer is capable of firing all standard types of 152mm rounds. The main armament cannon is based on the Chinese 152mm towed Type 66 mounted on a vehicle hull similar to the Russian 152mm SP gun-howitzer 2S3. The crew communicates with each other using the Type 803 intercom system. There are reports of the Type 83 being equipped with an anti-tank rocket launcher referred to as the Type 40. However, it is suspected that the rocket launcher is really the 40mm anti-tank rocket launcher Type 69-1 (an upgraded variant of the Russian RPG-7). Variants of this system are based on the Type 66, Chinese copy of the D-20 howitzer 425mm mine-clearing rocket launcher Type 462: 2-round rocket launcher for use in clearing minefields. 120mm SP anti-tank gun: the AT gun is fitted with a 120mm smoothbore, mounted inside a turret on a Type 83 gun-howitzer chassis Other ammunition types: HE-I, illumination, smoke

2S3M1 Russian 152mm Self-Propelled Howitzer (SPH)

Tiers:

Parent:

2S3 Akatsiya (M1973) Russian 152mm Self-Propelled Howitzer (SPH)

Variants:

- **2S3 (SO-152):** Basic variant, developed in 1968. Produced in 1970–1975. Two modifications used D-11 and D-11M howitzers.
- **2S3M (SO-152M):** Equipped with a mechanized drum-type stowage for 12 rounds, the amount of hatches in rear armored plates of the hull and the turret was reduced, the configuration of those hatches was changed, antenna of R-123 radio set was transferred on a turret top. Ammunition was increased from 40 to 46 rounds (usually consists of 42 OF-540 and OF-25 HE-Frag projectiles, and of 4 BP-540 HEAT-FS projectiles). Much more powerful OF-29 HE-Frag projectiles and OF-38 Krasnopol laser-guided rocket-assisted projectiles were developed for SO-152M. The modernized howitzer has a designator 2A33. Produced in 1975–1987.
- **2S3M1 (SO-152M1):** Equipped with a command data acquisition and display equipment, and with a new SP-538 sight. OF-38 Krasnopol laser-guided rocket-assisted projectiles were added to standard ammunition. Produced in 1987–1993. All 2S3s and 2S3Ms were modernized to 2S3M1 level.
- **2S3M2 (SO-152M2):** Modernized variant equipped with an automatic fire control system, a satellite navigational system, and smoke grenade launchers. Developed in 2000.
- **2S3M2-155:** An export-oriented variant of 2S3M2 equipped with a new 155 mm M-385 howitzer. Developed in 2000.
- **2S3M3:** An experimental variant of 2S3M2 equipped with a further improved fire control system and a modernized howitzer 2A33M that can fire ordnance of a more powerful 2A65 howitzer that equips the 2S19.

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: INA

IR Signature: INA

Note: This artillery system carries no defensive armament, except individual weapons carried by the crew.

Notes:

The M110A1 American 203mm Self-Propelled Howitzer (SPH), is a variant of the M110 American 203mm Self-Propelled Howitzer. Versions of the M110 with the longer barrel are the M110A1 (no muzzle brake) and the M110A2 (fitted with muzzle brake). In 1977, the first M110A1s entered service; these were armed with the longer 8" howitzer M201. The M201 allowed greater range over the shorter M2A2 howitzer. The M110A1s had been limited to zone 8 of the M188A1 propelling charge, but the muzzle brake alleviated excessive recoil forces and allowed the howitzer to fire zone 9, which permitted greater range. The M110A1 replaced both the M110 and M107, which were phased out of service with the US Army in Europe by 1980. It then cost less than USD100,000 to convert the M107/M110 to the M110A1/M110A2 standard.

M-1978 Koksan North Korea 170mm Self-Propelled Gun (SPG)

Tiers:

Variants:

- **M-1989:** he M1989 self-propelled gun was developed as a successor to the previous M1978 Koksan. Designation of this vehicle has been allocated by the US Department of Defense. Number in the designation indicates the year it was first observed by the US intelligence. A key requirement for this artillery system was the capability of reaching Seoul from the north of the demilitarized zone. North Korea placed a great emphasis on artillery firepower, because of its air force limited ground attack capability.

System

Alternative Designation: M1978 Koksan, M1978 SPG Koksan
In Service: 1978-Present
Manufacturer: Second Machine Industry Bureau, North Korea
Type: 170mm Self-Propelled Gun (SPG)
Family: Koksan, “Juche-Po” self-propelled guns family
Crew: ea4 (Driver, commander, gunner, loader)
Chassis: modified Chinese Type 59 medium tank chassis (copy of the Soviet T-54A)
Displacement Time: minless than 10
Emplacement Time: minless than 20
Note #1: Ammunition resupply vehicles are required to be assigned in the location of the M1978

IR Signature: INA

Notes:

The M-1978 Koksan is a 170mm self-propelled gun of North Korean design and manufacture. Very little information is available due to the secretive nature of the North Korean government. The designations M-1978 and Koksan were given to the type by American military analysts, as they first became aware of it in that year in Koksan, North Korea. What is known is that it is a 170mm (~6.69") self-propelled gun of the open turret type. It was first seen publicly during a military parade in 1985. At least one example has been acquired by the United States.

Type 89 (PLZ-89) Chinese 122mm Self-Propelled Howitzer

Tiers:

Variants:

- **SH3:** Is an improved version of the Type 89, developed for export. It can be seen as a China's newly-built equivalent to the Soviet 2S1 Gvosdika. It offers greater mobility, improved fire control system and delivers greater firepower than the 2S1 or the Type 89 self-propelled howitzers. The SH3 has been exported to Rwanda.
- **PLZ-07:** Is a successor of the Type 89. This artillery system is widely used by the China's army. It utilizes a similar 122 mm howitzer, but has a new tracked chassis. It has greater mobility, improved fire control system and delivers greater firepower than its predecessor. This artillery system was adopted by the Chinese army in the late 2000s and is fielded in large numbers.
- **PLZ-07B:** Is a version of the PLZ-07, developed for China's marine corps. This artillery system is fully-amphibious and can be launched at sea from amphibious assault ships and swim over short distances to shore.

System

Alternative Designation: Type 89; PLZ-89
Type: 122mm Self-Propelled Howitzer
Crew: ea5
Chassis: The Type 89 uses a tracked chassis
Displacement Time: INA
Emplacement Time: INA

Dimensions

Length: 6.5 m
Width: 3.4 m
Height: 2 m
Weight, Combat: 20 t

Automotive

Engine Name: 12V150L12

Engine Type: Diesel

Engine Power: hp450

Cruising Range: km500

Speed, Maximum Road: km/h60

Speed, Average Cross: INA

Speed Maximum Swim: The Type 89 can be fitted with floatation kit for amphibious operation. Once the kit is fitted it can ford water obstacles such as lakes and rivers.

Computerized FCS: INA

Thermal Sight Vehicle Commander: INA

Main Gun Stabilization: Yes

Protection

Hull Armor: Armor of the Type 89 provides protection against small arms fire and artillery shell splinters.

Turret Armor: Armor of the Type 89 provides protection against small arms fire and artillery shell splinters.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Type 89/PLZ-89 is a 122 mm self-propelled howitzer used by the People's Liberation Army of China to replace Type 85 and Type 70 122 mm self-propelled howitzer. PLZ-89 was first unveiled to the public during 1999 National Day military parade. Since the late 1970s a number of 122 mm self-propelled howitzers were developed in China to meet Chinese Army requirements. The PLA required mobile artillery system to provide medium- to long-range indirect fire support for motorized infantry and armored troops and capable of keeping pace with them. However none of them could meet these requirements. The Type 89, also known as the PLZ89, self-propelled howitzer was developed in late 1980s. It was Chinese attempt to develop indigenous SPH with similar capabilities to the Soviet 2S1 Gvosdika. The Type 89 is currently in service with Chinese Army and Marines. Several hundred of these artillery systems were built. The Type 89 SPH is armed with a 122 mm / L32 howitzer. It is a variant of the towed Type 86 (W-86), which in turn is a copy of the Soviet D-30 towed howitzer. The Type 89 is fitted with a semi-automatic loader. This artillery system is compatible with Chinese and Russian 122 mm ammunition. Maximum range of fire is 18 km using standard HE projectile and 21 km with extended-range projectiles. Vehicle is fitted with a computerized fire control system. Secondary armament consists of a roof-mounted 12.7-mm machine gun. Armor of the Type 89 provides protection against small arms fire and artillery shell splinters. Vehicle is fitted with an NBC protection and automatic fire suppression systems. The Type 89 uses a tracked chassis, developed from the Type 77 amphibious armored personnel carrier. Vehicle is powered by the 12V150L12 diesel engine, developing 450 hp. The Type 89 can be fitted with flotation kit for amphibious operation. Gun for PLZ-89 is mounted on a tracked chassis which developed from Type 77 amphibious armored personnel carrier and the main armament is derived from the Type 86 (W-86) 122 mm / 32 caliber towed howitzer, which itself is a Chinese copy of the Russian D-30 122 mm howitzer. PLZ-89 carries 40 rounds inside the turret and it can fire all types of Chinese and Russian 122 mm rounds. The gun is equipped with semi-automatic loader with maximum rate of fire of 6~8 rounds/min and fire accuracy is achieved by a digital fire-control system and a roof-mounted electro-optical sighting for day/night operations. The five crew members are protected by collective anti-NBC systems and automatic fire suppression. The howitzer can swim with the assistance of certain floating devices.

M1974 North Korea 152mm Self-Propelled Gun-Howitzer System

Tiers:

1 2 3 4

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The M1974 is a North Korean 152 mm self-propelled gun-howitzer. Its actual designation is unknown. The M1974 designation was allocated by a US Department of Defense. Number in the designation denotes the year when this system was observed by US intelligence. This North Korean artillery system was adopted in the 1970s and is widely used to this day. As far as it is known the M1974 was not exported outside North Korea. This artillery system combines a modified version of the Soviet D-20 towed gun-howitzer, mounted on a lightly armored tracked chassis. North Korea manufactured these Soviet howitzers under license. The M1974 can be seen as a North Korean attempt to create a self-propelled artillery system, somewhat equivalent to the Soviet 2S3 Akatsiya. Though the North Korean artillery system was inferior in many respects. North Korea produced many examples of self-propelled artillery systems by mating existing towed artillery pieces with various chassis. In many cases these North Korean artillery systems resemble various equivalent Soviet or Chinese systems. The D-20 152 mm/L26 gun-howitzer was created during the early 1950s and was one of the most prolific artillery pieces ever. Today it is no longer a modern weapon. It can not match performance of modern 155 mm howitzers used by NATO countries and non-NATO allies, such as Japan and South Korea. Still though the D-20 made its name as a solid, reliable and devastating weapon. It is still used by a number of countries. For some reason the North Korean license-produced version of the D-20, as well as ordnance of the M1974 has a different muzzle brake than that of the D-20 towed gun-howitzer. The M1974 is compatible with all standard 152 mm ammunition of the D-20 gun-howitzer. It fires fragmentation, High-Explosive Fragmentation (HE-FRAG), High Explosive (HE), concrete-busting, and illumination rounds. It is also capable of launching Krasnopol laser-guided projectiles, as well as nuclear rounds. Though it is unknown if North Korea obtained any of these rounds from its allies. Maximum range of fire with HE-FRAG round is 17.4 km. The HE round penetrates 250 mm steel plate at a range of 3 km. This artillery system has a semi-automatic semi-automatic sliding wedge breech, which improves rate. Maximum rate of fire is around 4 to 6 rounds per minute. This artillery system is operated by a crew of 8 or 9 soldiers. The crew prepares the M1974 for firing within around 3 minutes from traveling. Two large stabilizing spades are lowered to the ground at the rear before firing. This self-propelled artillery system is based on a lightly armored tracked chassis. Most likely that it is a heavily modified Soviet ATS-59G artillery tractor. The ATS-59G is powered by a 39-liter A-650 diesel engine, developing 300 hp. Actually it is a standard engine of a T-55 medium tank, developing 520 hp. However the ATS-59G has a rate reduced, which reduced the power to 300 hp in order to extend service life of the engine. The M1974 artillery system has a maximum road range of around 350 km on internal fuel and around 500 km with auxiliary fuel tanks. The same lightly armored tracked chassis is used by other North Korean artillery systems, including an M1975 130 mm self-propelled gun, M1981 122 mm self-propelled gun and unidentified 100 mm anti-tank gun. Armor of the M1974 provides some degree of protection for its crew against small arms fire and artillery shell splinters. The gun-howitzer retains its original splinter shield. Though top of the superstructure is opened. In traveling order it can be covered with bows and canvas cover. This artillery system has no defensive armament, except firearms of its crew members.

AUF1 155mm French Self-Propelled Gun (SPG)

Tiers:

1 2 **3** 4

Variants:

- **AUF1T:** Fitted with the "Sagem Cita 20" inertial navigation system as well as a 20-24 HP gas turbine auxiliary power unit (APU)
- **AUF2:** Created in the 90s, based on the AMX-30B2 chassis, 70 of which were bought by the French Army.

Notes:

The AUF1 is a French self-propelled gun vehicle currently in use by the armies of France, Saudi Arabia, Iraq, and Kuwait. It replaced the Mk F3 155mm in French army service. The AUF1 primary advancement is that it incorporates and provides full armor and nuclear-biological-chemical (NBC) protection for its crew of four, while the Mk F3 155mm offered no protection and could carry only two of its four crew members. The AUF1 saw combat with the Iraqi Army in the Iran–Iraq War. A four-man gun crew can reload the AUF1 in 15 minutes. A two-man gun crew can reload the AUF1 in 20 minutes. The AUF1T is fitted with the "Sagem Cita 20" inertial navigation system as well as a 20-24 HP gas turbine auxiliary power unit (APU). The production ended in 1995, and the 155 GCT (standing for “Grande Cadence de Tir”, which can be translated to High Rate of Fire), like its predecessor, was largely exported to Iraq, Kuwait and Saudi Arabia, with 427 built in total. The 155 GCT saw service during the Iran-Iraq war, the invasion of Kuwait, both Gulf wars and in Yugoslavia.

PLZ-45 (Type 88) Chinese 155mm Self-Propelled Howitzer (SPH)

Tiers:

System

Alternative Designation: PLZ-45, Type 88

Manufacturer: NORINCO

Type: 155mm Self-Propelled Howitzer (SPH)

Active Fire Suppression System: Yes

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

IR Signature: INA

Grenade Launchers: Yes, 2 sets of 4-barrel grenade launchers

Notes:

The PLZ-45 or Type 88 is a 155mm self-propelled howitzer developed by Norinco in the 1990s for the export market. It is based on Norinco's Type 89 (PLL01) 155mm/45-calibre towed gun-howitzer. The PLZ-45 self-propelled howitzer is used by the People's Liberation Army of China, People's National Army (Algeria), Kuwaiti Army and Saudi Arabian Army. Operated by a crew of five (commander, gunner, two loaders and a driver), the PLZ-45 is armed with a 155mm, 45-calibre main gun, with a semi-automatic loader and an electrically controlled and hydraulically operated ram that enables projectile loading to take place at any angle of elevation with the charge being loaded manually. The turret has an elevation of +72 to -3 degrees with 360 degree traverse. Secondary weapons include a roof-mounted W-85 heavy machine gun and two sets of four-barrel smoke grenade launchers on the turret's side. Ammunition is stored at the rear of the turret. A total of 30 rounds for the gun-howitzer and 480 rounds for the machine gun are carried on board. 24 howitzer rounds are carried in the loader and 6 rounds on the right side below the loader. The fire-control system of the PLZ-45 includes an automatic laying system, optical sighting system, gun orientation and navigation system, and a GPS receiver.

SH-1 Chinese 155mm Self Propelled Howitzer (SPH)

Tiers:

Variants:

- **SH2:** The SH2 is a wheeled self-propelled howitzer designed and manufactured by the Chinese Defence Company Norinco. The SH2 artillery system was first unveiled at the Abu Dhabi International Defence Exhibition in 2007 (IDEX 2007) held between 18 and 22 February, and is being actively prompted to the export market. The lightweight and high-mobility features of this artillery system may be of special appeal to the PLA airborne force and marine corps. The SH2 has demonstrated superior performance under all weather conditions and a wide range of altitude, and it can be equipped with special gear as per mission requirement. It is equipped with a digitised information system, which includes a gunner's terminal and digitised tactical radio so the system can be seamlessly integrated into a C4ISR system. It also has an autonomous navigation and orientation system, digital command-and-control, and FCS. There are a number of other recent Chinese SP artillery systems, tracked and wheeled, that have the same SH designator: SH2 - 122 mm (6 × 6) SP artillery system. SH3 - 122 mm full tracked SP artillery system. The PLA have introduced the 122 mm full tracked SP howitzer called the PLZ-07.This is very similar to the first system but had a different hull and suspension. SH5 - 105 mm (6 × 6) SP artillery system.
- **SH3:** 122 mm full tracked SP artillery system. The PLA have introduced the 122 mm full tracked SP howitzer called the PLZ-07.This is very similar to the first system but had a different hull and suspension.
- **SH5:** 05 mm (6 × 6) SP artillery system.

NBC Protection: Yes

Smoke Equipment: Available

Notes:

The SH1 is a wheeled, self-propelled, 155mm howitzer designed and manufactured by the Chinese Defense Company, Norinco. Compared with other similar artillery systems, the SH1 has advantages such as a high mobility, greater fire-power, fast hit capability, modular design, and cost-effectiveness. The SH1 was presented for the first time to the public at the Defense Exhibition in Dubai, IDEX 2010.

Raad-2M Iranian 155mm Self-Propelled Howitzer (SPH)

Tiers:

Parent:

Raad-2 (Thunder 2) Iranian 155mm Self-Propelled Artillery

System

Alternative Designation: Raad-2M

In Service: 1997-Present

Manufacturer: Defense Industries Organization

Type: Self-Propelled Howitzer

Family: Raad Series

Crew: 5 (commander, gunner, driver, 2 loaders)

Chassis: chassis is based on the Chinese WZ-501/503 series, itself a copy of the Russian BMP-1 series.

Displacement Time: INA

Emplacement Time: Less than 1 min

Dimensions

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Automatic Firefighting System: Yes

Air-Conditioner: Yes

Notes:

In early September 1997 it was reported that Iran had successfully tested a locally built rapid fire mobile field gun known as Raad-2 (Thunder-2). It uses a turret that has a similar layout to the M109A1, 155mm/39-cal self-propelled howitzer. The Iranian Defense Industries Organization claimed that the 155 mm HM44 howitzer manufactured by the Hadid facility of the Iranian Defense Industries Organization had a high firing rate and accuracy. It was described as being able to fire five rounds per minute. The gun's range was reported as 30km (19mi), and it also includes features such as a laser range-finder and a semi-automatic loading system. The gun looks exactly like 155mm/39-cal M185 gun from M109A1 and is fitted with a double baffle muzzle brake, fume extractor, screw breech mechanism, hydro-pneumatic recuperator and a hydraulic recoil brake. It uses the Iranian-made Boragh APC chassis, a conversion of the either the Russian BMP-1 or Chinese Type 86 (WZ-501) IFV. It was described as being able to move with a speed of 70km/h (43mph) on the battlefield.

Type 70-I Chinese 122mm Self Propelled Artillery

Tiers:

Variants:

- **Type 85:** The Type 85 self-propelled 122mm howitzer has a turretless design, based on the YW531H APC chassis. It has the Soviet D-30 howitzer. The maximum range of fire is 21 km. The Type 85 is a significant improvement to its predecessor, however it still lacks gun enclosure.

System

Alternative Designation: NA
Type: Self Propelled Howitzer
Chassis: Based on the Type 63-I (YW531 / Type B531) APC
Crew: ea6-7
Emplacement Time: INA
Displacement Time: INA

Dimensions

Length: m5.6
Width: m3.07
Height: m2.69
Weight, Combat: tons15.3

Automotive

Engine Name: 6150L
Engine Type: Diesel

Engine Power: hp260

Cruising Range: km450

Traverse Left: INA

Traverse Right: INA

Maximum Firing Range: km11.8

Sights: Basic

Direct Fire Capable: Yes

Basic Load: rounds40

↳*Ammunition*

Note: Compatible with 122mm projectiles of the M-30. The Type 70-I is also capable of direct firing.

Auxiliary Weapon System

↳*System*

Type: 7.62mm Machine Gun

Fire Control System

Note: There is no fire control system. Basic sights are used for aiming the cannon.

Protection

Hull Armor: INA
Turret Armor: INA
Applique Armor: INA
Explosive Reactive Armor: INA
Active Protection System: INA
Mine Clearing: INA
Self-Entrenching Blade: INA
NBC Protection: INA
Smoke Equipment: INA

Notes:

It is estimated that no more than 200 Type 70-Is were ever manufactured. It was build to fill a gap in self propelled artillery in the Chinese army. It is believed that the Soviet Union assisted in the development and manufacture of the Type 70-I because of the use of the Type 54 cannon which is similar to the M1938 / M-30. The vehicle has no roof and thus no overhead protection for the crew of 6-7 soldiers.

M109A3 American 155mm Self-Propelled Howitzer

Tiers:

Parent:

M109 American 155mm Self-Propelled Howitzer

Variants:

- **M109:** First produced in 1963. It had a 23 caliber 155 mm M126 gun in an M127 Howitzer Mount, and carried 28 rounds of 155 mm ammunition. It was also armed with a .50cal M2HB machine gun with 500 rounds of ammunition. Easily identified by its short barrel and a double baffle muzzle brake with a large fume extractor just behind it. Maximum range of 14,600 meters.
- **M109A1:** Replaced the M126 gun with a longer barreled, 39 caliber M185 gun, increasing maximum range to 18,100 meters.
- **M109A2:** Incorporated 27 Reliability, Availability, and Maintainability (RAM) mid-life improvements. Most notably, the long barreled 155 mm M185 cannon in the new M178 gun mount, ballistic protection for the panoramic telescope, counterbalanced travel lock, and the ability to mount the M140 alignment device. Stowage of 155mm rounds increased from 28 to 36 rounds; .50cal ammunition remained at 500 rounds. During M109A2 production, a slightly simplified version was also produced for export. This had minor internal changes and deleted the hull flotation feature. These were designated M109A1B.
- **M109A3 and M109A3B:** M109A1s and M109A1Bs rebuilt to M109A2 standard respectively. Some A3s feature three contact arm assemblies, while all A2s have five.
- **M109A4:** M109A2s and M109A3s improved with Nuclear, Biological, and Chemical / Reliability, Availability, and Maintainability (NBC/RAM) improvements, including air purifiers, heaters, and Mission Oriented Protective Posture (MOPP) gear. The traversing mechanism's clutch is hydraulic, as compared to the electric mechanism on previous M109s, and features a manual override in the event of an electrical failure. The A4 also adds an additional hydraulic filter, for a total of two. Also included is an improvement to the engine starting equipment, greatly improving the ability to start in an emergency. Ammunition amounts remain the same as two previous models.
- **M109A5:** Replaces the 155 mm M185 cannon in an M178 mount with a 39-caliber 155 mm M284 cannon in an M182 mount, giving the A5 a maximum range of 22,000 meters with unassisted projectiles and 30,000 meters with Rocket Assisted Projectiles (RAP Rounds). The vehicle can carry 36 complete rounds of ammunition and has a 440 hp engine instead of the standard 405 hp engine.
- **M109A5+:** Various manufacturers have upgraded the fire control and other components of the M109A5. BAE Systems in York PA recently delivered 12 M109A5+ vehicles to Chile and 32 for Brazil.
- **M109A6 "Paladin":** Overall product improvement in the areas of survivability, RAM, and armament. This includes increased armor, a redesigned internal arrangement for safer ammunition and equipment storage, engine and suspension upgrades, and product improvement of the M284 cannon and M182A1 mount. The greatest difference is the

integration of an inertial navigation system, sensors detecting the weapons' lay, automation, and an encrypted digital communication system, which utilizes computer controlled frequency hopping to avoid enemy electronic warfare and allow the howitzer to send grid location and altitude to the battery fire direction center (FDC). The battery FDCs in turn coordinate fires through a battalion or higher FDC. This allows the Palladin to halt from the move and fire within 30 seconds with an accuracy equivalent to the previous models when properly emplaced, laid, and safed—a process that required several minutes under the best of circumstances. Tactically, this improves the system's survivability by allowing the battery to operate dispersed by pairs across the countryside and allowing the howitzer to quickly displace between salvos, or if attacked by indirect fire, aircraft, or ground forces. Ammunition storage is increased from 36 to 39 155 mm rounds.

- **M109 "KAWEST":** This Swiss improved version produced by Ruag incorporates a new Swiss-designed L47 155 mm gun with an increased firing range of up to 36 km. It features inertial navigation system coupled with a new gun-laying system and more ammunition storage(40 rounds, 64 charges). The KAWEST (lit. Kampfwertsteigerung = upgrade of combat capabilities) requires only 6 crew members instead of 8, and is able to fire 3-round bursts within 15 seconds or maintain a constant firing rate of over one round per minute.[9][10] Upgraded Swiss PzHb (Panzerhaubitze) 79 and 88 (M109A1) are known as respectively PzHb 79/95 and PzHb 88/95
- **M109L52:** Jointly developed by the Dutch firm RDM and the German firm Rheinmetall, the M109L52 was first revealed in 2002. The main improvement was replacing the M126 series gun with the longer 52-caliber cannon from the PzH 2000, thus the MTLS ammunition of the PzH 2000 can be used. In addition, improvements to the loading system were made. This resulted in an increase of the rate of fire to 9–10 rds/min from the original 3 rds/min, and this high rate of fire can be sustained for up to 2 minutes. A total of 35 rounds can be carried.
- **M109A3GNM:** The current version in service with the Norwegian Army's Artilleribataljonen. 126 M109Gs were acquired from West Germany between 1969–1971. They were then upgraded to the M109A3GN configuration during the latter half of the 1980s. In 2006, there were still 56 M109A3GNs in the Army's inventory, meaning that at least 70 SPGs had been scrapped after the end of the Cold War. 14 of the M109A3GNs received additional upgrades in 2007, and were designated M109A3GNM. The upgrade includes, among other things, new intercom and new navigation and positioning systems. The M109A3GNMs are currently the only SPGs that remain in active service with the remainder of the M109s having been put in storage.
- **K55/K55A1:** K55/K55A1 are South Korean variants of the M109A2 , originally named KM109A2 with additional domestic augmentations, license-produced by Samsung Techwin. They are fitted with M178 155 mm 39 caliber gun, NBC protection, automatic fire extinguishing system, and a modified ammunition reception module for K56 automatic ammunition resupply vehicle. The Performance Improvement Program variant, K55A1, is a complete domestic overhaul of the K55 which is further augmented by Samsung Thales with modern digital ballistic computers, multifunctional data display and controllers, GPS navigation and target acquisition system, wireless datalink equipment, and upgraded fire control storage battery and power supply unit, to closely match the US military's modernization of the Paladin into next-generation standard. Many improved technologies of the South Korean K9 Thunder were retrofitted on the K55A1. 1,040 howitzers of these variants were produced.
- **M109A7:** The newest M109 version for U.S. service is the M109A7, formerly known as the M109A6 Paladin Integrated Management (PIM). The M109A7 shares common components with the Bradley Fighting Vehicle such as the engine, transmission, and tracks. This creates commonality with other systems and maximizes cost-savings in production, parts inventory, and maintenance personnel. The M109A7's on-board power systems harness technologies originally developed for the Non-Line-of-Sight Cannon; the electric drive is faster than the previous hydraulic system, and the automatic rammer more consistently rams the round into the gun for consistent velocities and better accuracy. It features a 600-volt on-board power system to accommodate additional armor and future networking technologies as they become ready. The M109A7 can sustain a one-round per-minute rate of fire and a maximum rate of fire of four rounds per-minute.

System

Alternative Designation: M109A3

In Service: 1980-Present

Type: Self-Propelled Howitzer

Crew: ea6 (commander, gunner, 3 loaders, driver)

Chassis: The M108 and M109 shared a common chassis (along with the M113 APC), but the M109 was heavier and had a larger gun. The M108 proved unsuccessful, mainly due to its overly light gun.

Displacement Time: INA

Emplacement Time: INA

Note: This variant has an improved M178 mounting, boresight alignment driver and selected RAM and safety kits, which included a fuel system air purge; driver's instrument panel; bustle/rack; propellant stowage; torsion bar; counter-recoil

buffer; and upper recoil cylinder. The designation also applies to retrofitted models.

Dimensions

Length, Hull: 6.19 m
Length, Gun Forward: 9.12 m
Width: 3.28 m
Height: 3.28 m
Weight: 24,948 kg
Ground Pressure: 0.83 kg/cm sq

Automotive

Engine Name: 1 x General Motors 8V-71T 569-cu in (9.32-liter) liquid-cooled, turbo-charged 2-stroke V-8 diesel
Engine Type: V-8 diesel
Engine Power: hp405 hp at 2,300 rpm
Power-to-Weight Ratio: 16.23 hp/ton
Transmission: Allison ATD-XTG 411-2A (A3) or 411-4 with quick disconnect powershift crossdrive, 4 forward and 2 reverse gears
Range: km354
Speed, Maximum Road: km/h56
Speed, Average Cross: INA
Speed Maximum Swim: Not Amphibious
Side Slope: %30
Gradient: %60
Vertical Step: m0.53
Trench: m1.83
Fording Depth: m1.07
Fuel Capacity: 135 gal (511 liters)
Suspension: torsion bar, 7 road wheels, front drive, rear idler, no return rollers (all models except PIM)

Main Gun

↳*System*

Name: M185 155 mm/L39 howitzer
Type: Howitzer
Caliber: 155mm
Length: INA
Barrel Length: INA
Weight: INA
Cannon Groves: 48

Rifling: right-hand rifling with constant, 8.93-deg twist

Breech Type: Welin-step thread

Recoil System: hydropneumatic

Elevation: -3/+75 deg (-53/+1,333 mils)

Traverse: 360 deg (6,400 mils)

Maximum Firing Range: 14.6 km

Maximum Rate of Fire: 1 rd/min first hour; 4 rd in first 3 min max

Sustained Rate of Fire: 2 rpm

Note #1: This self-propelled artillery system is supported by an associated M992 armored ammunition supply vehicle. It is based on the same tracked chassis as the M109.

Note #4: The cab has a rear bustle rack which provides an increased ammunition stowage capacity.

↳*Ammunition (Option 1)*

Name: M864

Type: DPICM

Caliber: mm155mm

Length: 35.3 in (898 mm)

Weight: 103.2 lb (43.80 kg)

Basic Load: 36 Rounds Total of any Combination Projectiles

Maximum Range: 22,000 m

Response Time: 11 min

↳*Ammunition (Option 2)*

Name: M483A1

Type: HE

Caliber: mm155

Length: 35.4 in (899 mm)

Weight: 102.5 lb (46.49 kg)

Basic Load: 36 Rounds Total of any Combination Projectiles

Maximum Range: 17,740 m

Response Time: 11 min

↳*Ammunition (Option 3)*

Name: M718

Type: RAAMS Long

Caliber: 155mm

Length: 30.7 in (781 mm)

Weight: 103.0 lb (46.71 kg)

Basic Load: 36 Rounds Total of any Combination Projectiles

Maximum Range: 17,740 m

Response Time: 11 min

Auxiliary Weapon System

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 500

Fire Control

Name: INA

Computerized FCS: Fire-control equipment includes an elbow telescope M118C for direct fire with a magnification of 4x and 10-degree field of view; panoramic telescope M117 for indirect fire and gunner's quadrant M1A1.

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: Yes

Night Vision Devices: Yes

Note: It has an all weather ballistic shield mounted over the panoramic telescope; counterbalanced travel lock and provisions for mounting the M140 alignment device.

Protection

Hull Armor: light alloy aluminum to protect against small-arms fire and shell splinters
Turret Armor: INA, the turret takes up the rear. On top of the turret, there is a small cupola, from which the commander operates. This cupola is also fitted with a 12.7 mm (.50) M2HB heavy machine gun.
Applique Armor: INA
Explosive Reactive Armor: INA
Active Protection System: INA
Mine Clearing: INA
Self-Entrenching Blade: INA
NBC Protection: none fitted
Smoke Equipment: INA
Fire Suppression: INA

Notes:

M109A3 (1980) The M109A3 is a depot converted M109A1 incorporating the 27 mid-life improvements. The operational characteristics of the M109A3 are virtually identical to the M109A2. Some M109A3s have three contact arm assemblies: all M109A2 have five contact arm assemblies. This variant has an improved M178 mounting, boresight alignment driver and selected RAM and safety kits, which included a fuel system air purge; driver's instrument panel; bustle/rack; propellant stowage; torsion bar; counter-recoil buffer; and upper recoil cylinder. The designation also applies to retrofitted models.

Type 07 (PLZ-07) Chinese 122mm Self Propelled Howitzer (SPH)

Tiers:

1 **2** 3 4

Variants:

- **SH3:** Is a forerunner of the PLZ-07. It is a similar 122 mm self-propelled howitzer, which was developed mainly for export. It emerged a couple of years before the PLZ-07. Known operators of the SH3 include Rwanda.
- **PLZ-07B:** Is an amphibious self-propelled howitzer, used by China's marine corps. This artillery system is fully amphibious. It has a boat-like hull for improved floatation and is fitted with a trim vane. Though it uses the same turret as the PLZ-07. On water this artillery system is propelled by two waterjets. The PLZ-07B can be launched at sea from amphibious assault ships and swim over short distances to shore.

System

Alternative Designation: INA
Type: Self-propelled howitzer
Family: PLZ-07 Family
Crew: ea5
Chassis: Modified Chassis of the Type 97 Infantry Fighting Vehicle
Displacement Time: INA
Emplacement Time: INA
Maximum Effective Range: km500
Amphibouis: No
Note: The PLZ-07 was developed to replace the older 122mm self-propelled howitzer in service with the PLA, which inlcude the Type 89, Type 85, and Type 70/70-1 Systems.

Range, Thermal Sight: kmINA

Protection

Hull Armor: High hardness armor steel, which protections the vehicle from small arms firing and shell splinters.

Turret Armor: High hardness armor steel, which protections the vehicle from small arms firing and shell splinters.

Applique Armor: Yes

Explosive Reactive Armor: INA

Active Protection System: Yes, Automatic Fire Suppression System

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes, two lines of four smoke grenade launchers are mounted to each side of the turret.

IR Signature: INA

Day/Night Driving Vision: Yes

Notes:

The Type 07 / PLZ-07 is a Chinese tracked self-propelled howitzer armored vehicle designed and manufactured by the China North Industries Group Corporation (NORINCO). The PLZ-07 self-propelled howitzer was presented for the first time to the public during the military parade in Beijing for the 60th anniversary of the Chinese army (PLA), 01 October 2009. The PLZ-07 has been in service with PLA (People's Liberation Army), Chinese Army. The PLZ-07 was developed to replace the older 122 mm self-propelled howitzers in service with the People's Liberation Army, which include the Type 89, Type 85 and Type 70/70-1 systems.

2S7 Pion Russian 203mm Self-Propelled Gun (SPG)

Tiers:

1 2 3 4

Variants:

- **2S7M Malka:** An improved variant, which entered service in 1983, that improved the gun's fire control systems, increased the rate of fire from 1.5 to 2.5 rds/min to 2.5 rounds per minute, and increased the ammunition load to eight projectiles
- **BTM-4 Trench Digger:** INA

System

Alternative Designation: 2S7 Pion; M-1975 (NATO designation)
Type: 203mm Self-Propelled Gun (SPG)
Manufacturer: INA
Family: S27
In Service: 1976-Present
Crew: ea7
Chassis: Obiekt 216
Displacement Time: min3-5
Emplacement Time: min5-6

Dimensions

Length (Gun Forward): m13.1
Length (Hull Forward): m10.5
Width: m3.38
Height: m3
Weight, Combat: tonsmt46
Ground Pressure: INA

Automotive

Engine Name: V-46-1 Diesel
Engine Type: Diesel

Engine Power: hp750

Cruising Range: km500

Speed, Maximum Road: km/h51

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: deg40

Side Slope: deg20

Vertical Step: m0.7

Trench: m2.5

Fording Depth: m1.2

Transmission: Manual

Communications

Primary: R-123M radio system

Secondary: R-173 radio system

Crew Communcation System: 1V116 crew communication system

Main Gun

↳*System*

Name: 2A44, 203mm Cannon

Type: 203mm Self-Propelled Gun (SPG)

Length, Barrel: 56.2 Caliber

Weight, Barrel: kg7,800

Barrel Life: rounds450

Max Rate of Fire: rds/min1.5

Effective Firing Range: km37.5-55

Travel Lock: Manually operated travel lock

Max Elevation: deg+60

Min Elevation: deg-0

Traverse Range: deg30

Traverse Left: deg15

Traverse Right: deg15

Loader Type: Load Assisting System

Muzzle Brake: No

Fume Extractor: No

Breech Mechansim: Two-cycle screw type

Recoil Braking: Hydraulic

Recuperation: Pneumatic

Note #1: The 2S7 can fire ordinary and rocket-assisted HE-FRAG projectiles, chemical and nuclear projectiles. A standard HE-FRAG projectile,

Note #2: Regular Rates of Fire: eight rounds in five minutes; 15 rounds in 10 minutes; 24 rounds in 20 minutes; 30 rounds in 30 minutes; 40 rounds in 60 minutes.

↳*Ammunition (Option 1)*

Type: HE FRAG

Caliber: mm203

Muzzle Velocity: m/s960

Basic Load: ea8

Projectile Weight: kg110

Filler Weight: kg17.8

Charge Weight: kg44

Maximum Range: km37.5

↳*Ammunition (Option 2)*

Type: RAP

Caliber: mm203

Muzzle Velocity: INA

Basic Load: ea8

Projectile Weight: kg103

Filler Weight: kg13.8

Charge Weight: kg44

Maximum Range: km47.5

Fire Control

Name: INA

Computerized FCS: INA

Thermal Sight Vehicle Commander: No

Thermal Sight Gunner: Yes

Main Gun Stabilization: Yes, a large recoil spade lowered to the ground, provides stability at all angles and charges.

Collimator: K-1

Telescope: PG-1M panoramic day telescope

Indirect Fire: Yes

Direct Fire: Yes, using the OP4M-87 telescope.

Protection

Hull Armor: All-welded steel armor (10mm thickness), which provides protection against small arms fire and shell splinters.
Turret Armor: INA
Applique Armor: No
Explosive Reactive Armor: No
Active Protection System: No
Mine Clearing: No
Self-Entrenching Blade (Dozer blade): Yes
NBC Protection: INA
Smoke Equipment: INA
Note: Additionally, the 2S7 can carry a Russian Strela-2 man-portable SAM system

Notes:

The 2S7 Pion ("peony") or Malka is a Soviet self-propelled 203mm heavy artillery. "2S7" is its GRAU designation. It was identified for the first time in 1975 in the Soviet Army and so was called M-1975 by NATO (the 2S4 Tyulpan also received the M-1975 designation), whereas its official designation is SO-203 (2S7). Its design is based on a T-80 chassis carrying an externally mounted 2A44 203 mm gun on the hull rear.

Archer (FH77BW L52) Swedish 155mm Self-Propelled Gun

Tiers:

System

Alternative Designation: The Archer Artillery System, or Archer - FH77BW L52, or Artillerisystem 08
Type: 155mm Self-Propelled Gun
Crew: 4; In case of emergency this artillery system can be operated by a crew of only 2 men (driver and one operator). The Archer artillery system is operated remotely from the cab.
Chassis: The Archer artillery system is mounted on a commercially available Volvo A30D 6x6 articulated hauler chassis.
Displacement Time: less than 30 seconds
Emplacement Time: less than 30 seconds

Dimensions

Length: m14.1
Width: m3.0
Height: m3.9
Weight, Combat: 30 tons
Ground Pressure: INA

Automotive

Engine Name: INA
Engine Type: Diesel
Engine Power: hp340
Cruising Range: km500

Speed, Maximum Road: km/h65

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %30

Vertical Step: m0.5

Trench: m0.9

Fording: m1.2

Main Gun

↳*System*

Name: 1× FH 77 derived 155-mm/52-calibre howitzer

Type: Howitzer

Caliber: 155mm

Barrel Length: 8.06

Barrel Weight: 11,500 kg

Maximum Firing Range: 30 - 60 km

Maximum Rate of Fire: 8 - 9 rpm

Elevation: INA

Traverse: 360 degrees

↳*Ammunition*

Type: Projectile

Caliber: mm155

Shell: 155 mm NATO

Basic Load: INA

Note: The vehicle carries 21 155mm projectiles in the fully automatic magazine. Reloading the magazine from the accompanying munitions carrier takes about 10 minutes using the purpose-built lifting device. The howitzer can use NATO modular charges or Bofors Uniflex 2 modular charges. The Uniflex 2IM modular charge system consists of two sizes of combustible charge cases; one full-size and one half-size case, both filled with the same type of insensitive guanylurea dinitramide [fr] (GuDN) propellant. The modular charge system allows several increments of charge to be available and increases the gun system's multiple rounds simultaneous impact (MRSI) capability and good range overlap between the increments. With BAE Bofors/Nexter Bonus rounds the range is 35 km. The range of the gun is extended to 60 km with the precision-guided Raytheon/Bofors XM982 Excalibur round. The Excalibur shell is corrected in flight towards a pre-programmed trajectory by a GPS guidance system. For armoured vehicles, the Bofors 155 Bonus is used.

Auxiliary Weapon System

Note: There is also a LEMUR remotely-controlled weapon station, armed with a 12.7 mm heavy machine gun for self-defense and smoke grenade dischargers.

Fire Control

Name: INA

Computerized FCS: INA

Main Gun Stabilization: Yes

Protection

Hull Armor: Cab and ordnance of the Archer is protected against 7.62 mm armor-piercing rounds and artillery shell fragments. It also withstands mine blasts equivalent to 6 kg of TNT.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Automatic Fire Suppression System: Yes

Notes:

The Archer Artillery System, or Archer - FH77BW L52, or Artillerisystem 08 is an international project aimed at developing a next-generation self-propelled gun system for Sweden and Norway. The heart of the system is a fully automated 155 mm/L52 gun howitzer and a M151 Protector remote controlled weapon station mounted on a modified 6×6 chassis of the Volvo A30D, all-terrain articulated hauler. The crew and engine compartment is armoured and the cab is fitted with bullet and fragmentation- resistant windows. Aside from this, the system consists of an ammunition resupply vehicle, a support vehicle, BONUS and the M982 Excalibur guided projectile. The project began its life in 1995 as earlier studies for a self-propelled system based on the FH 77. Further test systems received the designation FH 77BD and FH 77BW. By 2004, two prototypes had been ordered based on a lengthened version of the FH 77B mounted on a modified Volvo Construction Equipment A30D articulated haul truck (6x6). In 2008, Sweden ordered a first batch of seven units, while Norway ordered one. In August 2009, Norway and Sweden ordered 24 Archers each, in a cooperative deal. The Howitzer was developed for the Swedish armed forces following a contract awarded to Bofors (now BAE Systems Bofors) in 2003 by Försvarets Materielverk (FMV), the Swedish defence acquisition agency to build two demonstrator howitzers. The prototype FH77 BW L52 self-propelled howitzers entered firing trials in Sweden in 2005 and 2006. In September 2006, the FMV placed a contract for detailed design work on Archer and, in January 2007, a contract for the next development phase. The Swedish Army has a requirement for 24 systems (two battalions). Following In September 2008, the Swedish government approved the final development and procurement of the Archer artillery system. In November 2008, Sweden and Norway signed a co-operative agreement for the development of the Archer system and, in January 2009, awarded BAE Systems a contract to complete development of the artillery system with the exception of the remote weapon system which is made by Kongsberg Defence & Aerospace. A final prototype is scheduled for completion by September 2009, which is expected to be followed by a contract for 48 systems – 24 for Sweden and 24 for Norway. Archer was planned to enter service in 2011 but was delayed until October 2013. This because of unforeseen technical problems. The Swedish Army received its first four pre-serial production FH-77 BW L52 Archer systems on 23 September 2013, and the first guns finally entered service on 1 February 2016. The Norwegian government withdrew from the project in December 2013. The vehicle platform is a modification of the Volvo A30D 6×6 articulated all-terrain hauler vehicle. The vehicle cabin and engine compartment are fully armoured and the cab is fitted with bullet and fragmentation-proof windows. The cabin seats up to four personnel. The howitzer is operated by three or four crew. The system also includes a munition carrier consisting of a removable, modified standard container mounted on a ballistic-proofed all-terrain lorry. The unit cost is approximately $4,500,000.

M109A1 American 155mm Self-Propelled Howitzer

Tiers:

Variants:

- **M109:** First produced in 1963. It had a 23 caliber 155 mm M126 gun in an M127 Howitzer Mount, and carried 28 rounds of 155 mm ammunition. It was also armed with a .50cal M2HB machine gun with 500 rounds of ammunition. Easily identified by its short barrel and a double baffle muzzle brake with a large fume extractor just behind it. Maximum range of 14,600 meters.
- **M109A1:** Replaced the M126 gun with a longer barreled, 39 caliber M185 gun, increasing maximum range to 18,100 meters.
- **M109A2:** Incorporated 27 Reliability, Availability, and Maintainability (RAM) mid-life improvements. Most notably, the long barreled 155 mm M185 cannon in the new M178 gun mount, ballistic protection for the panoramic telescope, counterbalanced travel lock, and the ability to mount the M140 alignment device. Stowage of 155mm rounds increased from 28 to 36 rounds; .50cal ammunition remained at 500 rounds. During M109A2 production, a slightly simplified version was also produced for export. This had minor internal changes and deleted the hull flotation feature. These were designated M109A1B.
- **M109A3 and M109A3B:** M109A1s and M109A1Bs rebuilt to M109A2 standard respectively. Some A3s feature three contact arm assemblies, while all A2s have five.
- **M109A4:** M109A2s and M109A3s improved with Nuclear, Biological, and Chemical / Reliability, Availability, and Maintainability (NBC/RAM) improvements, including air purifiers, heaters, and Mission Oriented Protective Posture (MOPP) gear. The traversing mechanism's clutch is hydraulic, as compared to the electric mechanism on previous M109s, and features a manual override in the event of an electrical failure. The A4 also adds an additional hydraulic filter, for a total of two. Also included is an improvement to the engine starting equipment, greatly improving the ability to start in an emergency. Ammunition amounts remain the same as two previous models.
- **M109A5:** Replaces the 155 mm M185 cannon in an M178 mount with a 39-caliber 155 mm M284 cannon in an M182 mount, giving the A5 a maximum range of 22,000 meters with unassisted projectiles and 30,000 meters with Rocket Assisted Projectiles (RAP Rounds). The vehicle can carry 36 complete rounds of ammunition and has a 440 hp engine instead of the standard 405 hp engine.
- **M109A5+:** Various manufacturers have upgraded the fire control and other components of the M109A5. BAE Systems in York PA recently delivered 12 M109A5+ vehicles to Chile and 32 for Brazil.
- **M109A6 "Paladin":** Overall product improvement in the areas of survivability, RAM, and armament. This includes increased armor, a redesigned internal arrangement for safer ammunition and equipment storage, engine and suspension upgrades, and product improvement of the M284 cannon and M182A1 mount. The greatest difference is the integration of an inertial navigation system, sensors detecting the weapons' lay, automation, and an encrypted digital communication system, which utilizes computer controlled frequency hopping to avoid enemy electronic warfare and allow the howitzer to send grid location and altitude to the battery fire direction center (FDC). The battery FDCs in turn coordinate fires through a battalion or higher FDC. This allows the Palladin to halt from the move and fire within 30

seconds with an accuracy equivalent to the previous models when properly emplaced, laid, and safed—a process that required several minutes under the best of circumstances. Tactically, this improves the system's survivability by allowing the battery to operate dispersed by pairs across the countryside and allowing the howitzer to quickly displace between salvos, or if attacked by indirect fire, aircraft, or ground forces. Ammunition storage is increased from 36 to 39 155 mm rounds.

- **M109 "KAWEST":** This Swiss improved version produced by Ruag incorporates a new Swiss-designed L47 155 mm gun with an increased firing range of up to 36 km. It features inertial navigation system coupled with a new gun-laying system and more ammunition storage(40 rounds, 64 charges). The KAWEST (lit. Kampfwertsteigerung = upgrade of combat capabilities) requires only 6 crew members instead of 8, and is able to fire 3-round bursts within 15 seconds or maintain a constant firing rate of over one round per minute.[9][10] Upgraded Swiss PzHb (Panzerhaubitze) 79 and 88 (M109A1) are known as respectively PzHb 79/95 and PzHb 88/95
- **M109L52:** Jointly developed by the Dutch firm RDM and the German firm Rheinmetall, the M109L52 was first revealed in 2002. The main improvement was replacing the M126 series gun with the longer 52-caliber cannon from the PzH 2000, thus the MTLS ammunition of the PzH 2000 can be used. In addition, improvements to the loading system were made. This resulted in an increase of the rate of fire to 9–10 rds/min from the original 3 rds/min, and this high rate of fire can be sustained for up to 2 minutes. A total of 35 rounds can be carried.
- **M109A3GNM:** The current version in service with the Norwegian Army's Artilleribataljonen. 126 M109Gs were acquired from West Germany between 1969–1971. They were then upgraded to the M109A3GN configuration during the latter half of the 1980s. In 2006, there were still 56 M109A3GNs in the Army's inventory, meaning that at least 70 SPGs had been scrapped after the end of the Cold War. 14 of the M109A3GNs received additional upgrades in 2007, and were designated M109A3GNM. The upgrade includes, among other things, new intercom and new navigation and positioning systems. The M109A3GNMs are currently the only SPGs that remain in active service with the remainder of the M109s having been put in storage.
- **K55/K55A1:** K55/K55A1 are South Korean variants of the M109A2 , originally named KM109A2 with additional domestic augmentations, license-produced by Samsung Techwin. They are fitted with M178 155 mm 39 caliber gun, NBC protection, automatic fire extinguishing system, and a modified ammunition reception module for K56 automatic ammunition resupply vehicle. The Performance Improvement Program variant, K55A1, is a complete domestic overhaul of the K55 which is further augmented by Samsung Thales with modern digital ballistic computers, multifunctional data display and controllers, GPS navigation and target acquisition system, wireless datalink equipment, and upgraded fire control storage battery and power supply unit, to closely match the US military's modernization of the Paladin into next-generation standard. Many improved technologies of the South Korean K9 Thunder were retrofitted on the K55A1. 1,040 howitzers of these variants were produced.
- **M109A7:** The newest M109 version for U.S. service is the M109A7, formerly known as the M109A6 Paladin Integrated Management (PIM). The M109A7 shares common components with the Bradley Fighting Vehicle such as the engine, transmission, and tracks. This creates commonality with other systems and maximizes cost-savings in production, parts inventory, and maintenance personnel. The M109A7's on-board power systems harness technologies originally developed for the Non-Line-of-Sight Cannon; the electric drive is faster than the previous hydraulic system, and the automatic rammer more consistently rams the round into the gun for consistent velocities and better accuracy. It features a 600-volt on-board power system to accommodate additional armor and future networking technologies as they become ready. The M109A7 can sustain a one-round per-minute rate of fire and a maximum rate of fire of four rounds per-minute.

System

Alternative Designation: M109A1

In Service: 1970-Present

Type: Self-Propelled Howitzer

Crew: ea6

Chassis: The M108 and M109 shared a common chassis (along with the M113 APC), but the M109 was heavier and had a larger gun. The M108 proved unsuccessful, mainly due to its overly light gun.

Displacement Time: INA

Emplacement Time: INA

Note: The first M109A1 conversion kits became available in early 1972 and the first examples, converted from standard models, became operational in 1973.

Dimensions

Length, Hull: 6.19 m

Length, Gun Forward: 9.04-m

Width: 3.15 m

Height: 3.28 m

Weight: 24,070 kg

Automotive

Engine Name: Detroit Diesel 8V71T Diesel

Engine Type: Diesel

Engine Power: hp450

Range: km390

Speed, Maximum Road: km/h65

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %30

Vertical Step: m0.53

Trench: m1.83

Fording Depth: m1.07

Fuel Capacity: 135 gal (511 liters)

Main Gun

↳*System*

Name: M185 155 mm/L39 howitzer

Type: Howitzer

Caliber: 155mm

Length: INA

Barrel Length: INA

Weight: INA

Cannon Groves: 48

Rifling: right-hand rifling with constant, 8.93-deg twist

Breech Type: Welin-step thread

Recoil System: hydropneumatic

Elevation: -3/+75 deg (-53/+1,333 mils)

Traverse: 360 deg (6,400 mils)

Maximum Firing Range: 14.6 km

Maximum Rate of Fire: 4 rpm

Sustained Rate of Fire: 2 rpm

Note #1: This self-propelled artillery system is supported by an associated M992 armored ammunition supply vehicle. It is based on the same tracked chassis as the M109.

Note #2: This version mounts the longer M185 155-mm gun and incorporated elevation, traversing and suspension improvements.

Note #3: Other improvements include a more efficient muzzle brake, improved load assisting system and improved suspension. Maximum range of fire is 18.1 km with standard HE-FRAG projectile and 24 km with rocket-assisted projectile. IT is also capable of launching M712 Copperhead laser-guided rounds. These rounds are intended to engage high-value hostile targets, such as tanks, armored vehicles, artillery systems, radars, observation posts and so on. Most original M109 artillery systems were upgraded to this standard.

↳*Ammunition (Option 1)*

Name: M712

Type: Copperhead

Caliber: mm155

Length: 54.0 in (1,372 mm)

Weight: 140.0 lb (63.50 kg)

Basic Load: 28 Rounds Total of any Combination Projectiles

↳*Ammunition (Option 2)*

Name: M864

Type: DPICM

Caliber: 155mm

Length: 35.3 in (898 mm)

Weight: 103.2 lb (43.80 kg)

Basic Load: 28 Rounds Total of any Combination Projectiles

↳*Ammunition (Option 3)*

Name: M718

Type: RAAMS Long

Caliber: 155mm

Length: 30.7 in (781 mm)

Weight: 103.0 lb (46.71 kg)

Basic Load: 28 Rounds Total of any Combination Projectiles

Auxiliary Weapon System

↳*System*

Name: M2 Browning

Type: Heavy Machine Gun

Caliber: 12.7mm

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 500

Computerized FCS: INA

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: Yes

Night Vision Devices: Yes

Protection

Hull Armor: The M109’s protection consists of up to 32 millimeters of armor, which is only effective against small arms and grenade/artillery fragments.

Turret Armor: INA, the turret takes up the rear. On top of the turret, there is a small cupola, from which the commander operates. This cupola is also fitted with a 12.7 mm (.50) M2HB heavy machine gun.

Applique Armor: INA

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: none fitted

Smoke Equipment: INA

Fire Suppression: INA

Notes:

M109A1 M109A1: variant with an improved gun—the M185 155 mm/L39 howitzer. This artillery system was introduced in 1970 and deliveries commenced in 1973. Other improvements include a more efficient muzzle brake, improved load assisting system and improved suspension. Maximum range of fire is 18.1 km with standard HE-FRAG projectile and 24 km with rocket-assisted projectile. IT is also capable of launching M712 Copperhead laser-guided rounds. These rounds are intended to engage high-value hostile targets, such as tanks, armored vehicles, artillery systems, radars, observation posts and so on. Most original M109 artillery systems were upgraded to this standard The M109 is an American 155 mm turreted self-propelled howitzer, first introduced in the early 1960s to replace the M44. It has been upgraded a number of times, most recently to the M109A7. The M109 family is the most common Western indirect-fire support weapon of maneuver brigades of armored and mechanized infantry divisions. The M109 has a crew of four: the section chief/commander, the driver, the gunner, and the ammunition handler/loader. The chief or gunner aims the cannon left or right (deflection) and up and down (quadrant). The British Army replaced its M109s with the AS-90. Several European armed forces have or are currently replacing older M109s with the German PzH 2000. Upgrades to the M109 were introduced by the U.S. (see variants below) and by Switzerland (KAWEST). With the cancellation of the U.S. Crusader and Non-Line-of-Sight Cannon, the M109A6 ("Paladin") will remain the principal self-propelled howitzer for the U.S. for the foreseeable future until the new M1299 will enter service. First produced in 1963. It had a 23 caliber 155 mm M126 gun in an M127 Howitzer Mount, and carried 28 rounds of 155 mm ammunition. It was also armed with a .50cal M2HB machine gun with 500 rounds of ammunition. Easily identified by its short barrel and a double baffle muzzle brake with a large fume extractor just behind it. Maximum range of 14,600 meters. The widely used M109 carries a 155-mm howitzer and is the principal self-propelled artillery support for U.S. Army divisions. It is a large tracked vehicle with a fully traversable turret and prominent bustle. Early variants had a short, 23-caliber barrel. Later versions, including the M109A6 Paladin, have a 39-caliber barrel. The M109 has a crew of six: commander, gunner, driver and three ammunition members. The hull is made of all-welded aluminum armor, which protects against small-arms fire and shell splinters. The driver is seated at the front left of the hull, with the powerpack to the right and the turret at the rear. The driver is provided with a single-piece hatch cover that opens to the left, with three M45 day periscopes in front. These can be covered with small metal flaps to prevent damage. One of the day periscopes can be replaced by a passive night-vision periscope. The Detroit Diesel Model 8V-71T engine is coupled to an Allison Transmission XTG-411-4A cross-drive transmission. The all-welded aluminum armor turret at the rear of the hull has a square hatch in each side that opens to the rear and twin doors in the turret rear. The commander is seated on the right side of the turret and has a cupola that can be traversed through 360 deg, a single-piece hatch cover that opens to the rear and an M27 day periscope. A .50-cal M2 heavy-barrel machine gun is pintle-mounted on the front of the cupola. The gunner is seated on the left side of the turret and has a square single-piece hatch cover that opens to the right. The twin doors at the rear of the turret are provided for ammunition resupply. Mounted at the rear of the hull on each side of the hull door is a large spade that is manually lowered to the ground before firing. They are normally deployed only when firing top charges. The torsion bar suspension on either side consists of seven dual rubber-tired road wheels with the drive sprocket at the front and the idler at the rear. There are no track-return rollers. The tracks are of a single-pin, center-guide type with replaceable rubber pads. The M109 is fitted with night-vision equipment, but does not have nuclear, biological and chemical (NBC) warfare protection. The vehicle can be fitted with an amphibious kit consisting of nine air bags, four on each side of the hull and one at the front. The bags are inflated from the vehicle, which can then propel itself across rivers on its tracks at a maximum speed of 4 mph (6 kmh). The main armament is a 155-mm M126 howitzer in an M127 mount with a fume extractor and large muzzle brake. The recoil system is hydropneumatic and the breech block is of the Welin-step thread type. Gun elevation and depression and turret traverse are hydraulic with manual controls for emergency use. Fire-control equipment includes an elbow telescope M118C for direct fire with a magnification of 4x and 10-deg field of view; panoramic telescope M117 for indirect fire and gunner's quadrant M1A1 . The M109 Paladin self-propelled Howitzer, first produced in 1963 and improved upon numerous times over the past 40 years, is currently slated for a comprehensive overhaul. The M109 PIM upgrade shares many common components of the Bradley Fighting Vehicle, allowing for more commonality with other Army vehicle systems and maximizing production savings, parts inventory and maintenance personnel while avoiding component obsolescence. The PIM modernization effort is a significant upgrade of the M109A6 Paladin which includes buying back Space, Weight, and Power - Cooling. While the self-propelled howitzer's cannon will remain unchanged, the PIM will sport a brand new chassis, engine, transmission, suspension, steering system, to go along with an upgraded electric ramming system.

2S3 Akatsiya (M1973) Russian 152mm Self-Propelled Howitzer (SPH)

Tiers:

Variants:

- **2S3 (SO-152):** Basic variant, developed in 1968. Produced in 1970–1975. Two modifications used D-11 and D-11M howitzers.
- **2S3M (SO-152M):** Equipped with a mechanized drum-type stowage for 12 rounds, the amount of hatches in rear armored plates of the hull and the turret was reduced, the configuration of those hatches was changed, antenna of R-123 radio set was transferred on a turret top. Ammunition was increased from 40 to 46 rounds (usually consists of 42 OF-540 and OF-25 HE-Frag projectiles, and of 4 BP-540 HEAT-FS projectiles). Much more powerful OF-29 HE-Frag projectiles and OF-38 Krasnopol laser-guided rocket-assisted projectiles were developed for SO-152M. The modernized howitzer has a designator 2A33. Produced in 1975–1987.
- **2S3M1 (SO-152M1):** Equipped with a command data acquisition and display equipment, and with a new SP-538 sight. OF-38 Krasnopol laser-guided rocket-assisted projectiles were added to standard ammunition. Produced in 1987–1993. All 2S3s and 2S3Ms were modernized to 2S3M1 level.
- **2S3M2 (SO-152M2):** Modernized variant equipped with an automatic fire control system, a satellite navigational system, and smoke grenade launchers. Developed in 2000.
- **2S3M2-155:** An export-oriented variant of 2S3M2 equipped with a new 155 mm M-385 howitzer. Developed in 2000.
- **2S3M3:** An experimental variant of 2S3M2 equipped with a further improved fire control system and a modernized howitzer 2A33M that can fire ordnance of a more powerful 2A65 howitzer that equips the 2S19.

System

Alternative Designation: 2S3 Akatsiya, SO-152 (CO-152), Designated M1973 by the U.S. Army

Manufacturer: Uraltransmash

Type: Self-propelled gun

Crew: ea4-6

Chassis: Object 123 tracked chassis

Family: 2S3 Family

Displacement Time: min3

Emplacement Time: min3

Note: The 2S3 is a Tier 2 weapon because it has been identified as one of the top 52 pieces of Russian Military Equipment.

Dimensions

Length (Overall): m8.4

Length (Hull): m7.765

Width: m3.25

Height: m3.05

Weight, Combat: kg27,500

Max Elevation: deg+60

Min Elevation: deg-4

Traverse Range: deg360

Projectile Carousel: Automatically revolves 30 deg

Bore Evacuator: Yes, behind the muzzle brake

Fume Extractor: Yes

Traveling Lock: Gun barrel traveling lock

↳*Ammunition (Option 1)*

Type: OF-540 HE-Frag

Caliber: mm152

Muzzle Velocity: m/s655

Fuse Type: RGM-2 fuze

Basic Load: 46 Total, any combination of Russian 152mm Projectiles

Maximum Effective Range: km17.4

Projectile Weight: kg43.56

Warhead Weight: kg7.76

Maximum Range: km18.5

↳*Ammunition (Option 2)*

Type: OF-25 HE-Frag

Caliber: mm152

Maximum Range: km18.5

Basic Load: 46 Total, any combination of Russian 152mm Projectiles

Projectile Weight: kg43.56

Note: The 2S3 Akatsiya can fire the following 152mm Projectiles: BP-540 HEAT-FS (sight distance is 3 km, 250 mm armor penetration), Br-540B and Br-540 AP-T (115–120 mm armor penetration at a 1000 m), OF-38 Krasnopol laser-guided rocket-assisted projectiles, S1 illuminating, ZH3 smoke, nuclear projectiles (with explosive capacity of 2 kt). Secondary armament consists of a remotely controlled 7.62 mm PKT tank machine gun on commander's cupola for anti-aircraft defence and self-defence at close range.

Coaxial Weapon System

↳*System*

Name: 7.62mm PK (Kalashnikov's Machine Gun)

Type: mm7.62

Max Rate of Fire: rds/min650

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳***Ammunition***

Type: Rifle

Caliber: mm7.62

Muzzle Velocity: m/s825

Basic Load: ea1,000

Effective Range (Iron Sights): m100-1,000

Effective Range (With Sight Adjustments): m100-1,500

Maximum Firing Range: m3,800

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Yes, PG-4 sight

Thermal Sight Gunner: Yes, OP5-38 gunner's telescope

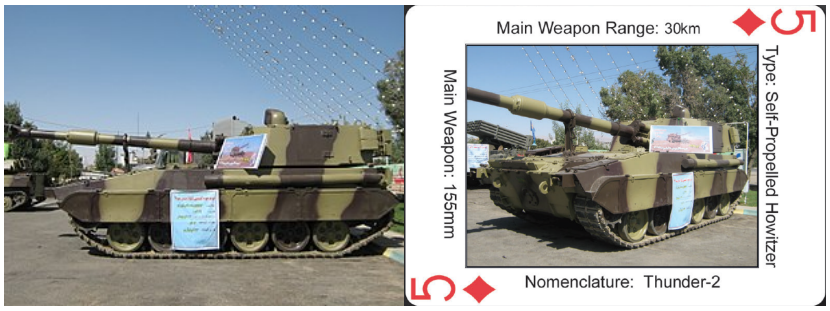
Self-Entrenching Blade: Yes
NBC Protection: Yes, Automatic CBRN defense system with filtration unit
Smoke Equipment: No
Fire Suppression System: Yes

Notes:

2S3 Akatsiya SO-152 (CO-152) is a Soviet 152.4 mm self-propelled gun developed in 1968. It was a response to the American 155 mm M109. The development started in 1967 according to the Resolution of the Council of Ministers of the Soviet Union from July 4, 1967. In 1968 the SO-152 was completed and in 1971 entered service. Its GRAU designation is 2S3 (2C3). The fighting vehicle also received the additional designation Akatsiya (Акация), which is Russian for acacia.The Akatsiya is armed with a 152.4 mm howitzer based on the Soviet 152.4 mm D-20 howitzer and is sometimes confused with the M109 self-propelled artillery. The artillery system was developed at the design bureau No. 9 of Sverdlovsk. The factory designation of the howitzer is D-22 and the GRAU designation, 2A33. The chassis was developed by Uraltransmash. The driver's and engine-transmission compartments are located in the front part of a hull, the fighting compartment with rotatory turret in middle and rear parts of the hull. The armor is welded rolled steel. The SPG is equipped with an R-123 radio set, an R-124 intercom, an automatic CBRN defense system with filtration unit and fire-fighting equipment. The V-59 12-cylinder four-stroke water-cooled diesel engine connects to a mechanical two-gear transmission. The gear box is combined into one block with a planetary steering gear. The 2S3 has self-entrenching equipment which allows it to prepare a trench within 20–40 min. The crew consists of 4–6 men: a driver, a gunner, a loader, a commander, and two ammunition bearers, which are positioned to the rear of the vehicle feeding rounds through two hatches in the hull rear when in masked firing position.

Raad-2 (Thunder-2) Iranian 155mm Self-Propelled Howitzer (SPH)



Tiers:

1 **2** 3 4

Variants:

- **Raad-2M:** Raad-2 upgraded with a Ukrainian-made 5TDF engine instead of a V-8 Diesel engine.

System

Alternative Designation: Raad-2, Thunder 2
In Service: 1997-Present
Manufacturer: Defense Industries Organization
Type: Self-Propelled Howitzer
Family: Raad Series
Crew: 5 (commander, gunner, driver, 2 loaders)
Chassis: chassis is based on the Chinese WZ-501/503 series, itself a copy of the Russian BMP-1 series.
Displacement Time: INA
Emplacement Time: Less than 1 min

Dimensions

Length: m9.14
Width: m3.38
Height to Turret Roof: m2.60
Height to Top of Roof-Mounted Weapon: m3.47
Height, Axis of Fire: m2.24
Weight, Combat: kg36,000
Ground Pressure: 0.67 kg/sq cm

Automotive

Engine Name: V-84MS V12 diesel
Engine Type: Diesel
Engine Power: hp840

Power-to-Weight Radio: 23 hp/ton

Cruising Range: km450

Length: mm1,654

Barrel Length: mm1,143

↳**Action:** Short recoil-operated

Rate of Fire: rds/min450-600

Effective Firing Range: m1,800

Maximum Effective Firing Range: m7,400

Feed System: Belt-fed (M2 or M9 links)

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: .50 BMG (12.7×99mm NATO)

Muzzle Velocity: m/s890

Basic Load: ea2,000

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: Yes

Thermal Sight Gunner: Passive night-driving periscope

Main Gun Stabilization: Yes, When deployed in the firing position two spades are lowered either side of the hull rear of Thunder-2 to provide a more stable firing platform.

Indirect Fire: Indirect fire sight is fitted in the turret roof

Direct Fire: The direct-fire sight is parallel to the main 155-mm cannon

GPS: Yes

Navigation: Yes

Gunner's Control Panel and Display: Yes

Commander's Control Panel and Display: Yes

Automatic Gunlaying System: Yes

Protection

Hull Armor: mm20

Turret Armor: All-welded steel armor, providing protection from small-arms fire and shell splinters

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Automatic Firefighting System: Yes

Air-Conditioner: Yes

Notes:

The 155mm Raad-2 (Thunder 2) is a domestically developed self-propelled howitzer system in Iranian army service. The system uses components from other domestic armored vehicle programs to simplify logistics and training. The Raad-2 resembles the U.S. M109A2 self-propelled howitzer in appearance. A large number of these vehicles were supplied to Iran prior to the revolution in 1979. It has a crew of five: commander, driver, gunner and two ammunition loaders. In early September 1997 it was reported that Iran had successfully tested a locally built rapid fire mobile field gun known as Raad-2 (Thunder-2). It uses a turret that has a similar layout to the M109A1 155mm/39-cal self-propelled howitzer. The Iranian Defense Industries Organization claimed that the 155 mm HM44 howitzer manufactured by the Hadid facility of the Iranian Defense Industries Organization had a high firing rate and accuracy. It was described as being able to fire five rounds per minute. The gun's range was reported as 30 km (19 mi), and it also includes features such as a laser range-finder and a semi-automatic loading system. The gun looks exactly like 155mm/39-cal M185 gun from M109A1 and is fitted with a double baffle muzzle brake, fume extractor, screw breech mechanism, hydro-pneumatic recuperator and a hydraulic recoil brake. It uses the Iranian-made Boragh APC chassis, a conversion of the either the Russian BMP-1 or Chinese Type 86 (WZ-501) IFV. It was described as being able to move with a speed of 70 km/h (43 mph) on the battlefield.

M110 Iranian 203mm Self-Propelled Howitzer (SPH)

Tiers:

1 2 3 4

Variants:

- **M110A1:** Improved variant of the M110, fitted with a longer M201 203 mm/L37 howitzer. It entered service in 1971. Maximum range of fire was increased to 27 km. This self-propelled howitzer fires newly developed rocket-assisted, cluster projectiles, nuclear and chemical projectiles.
- **M110A2:** Improved variant of the M110A1. It entered service in 1978 and was fitted with double muzzle brake. Maximum range of fire was increased to 29 km.

System

Alternative Designation: M110

Manufacturer: General Motors Corp.

In Service: 1961-Present

Family: M110 Series

Crew: 5 (commander, driver, 3 gunners)

Resupply Vehicle: Required as M110 can only carry 2 rounds on board. M548 ammunition resupply vehicle is the primary option.

Chassis: Same universal tracked chassis as the M107 175 mm self-propelled gun.

Displacement Time: min1

Emplacement Time: min1

Note: Support crew of 8 men are carried by an escorting armored personnel carrier, which also transports ammunition for this SPH.

Dimensions

Length, with Gun Forward: m10.72

Length, Hull: m5.72

Barrel Length: m8.24

Width: m3.15

Height (To the Top of the Barrel): m3.15

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: INA

IR Signature: INA

Note: This artillery system carries no defensive armament, except individual weapons carried by the crew.

Notes:

The self-propelled M-110 8-inch [203 mm] howitzer first entered service with the US Army in 1963. Many of these units have been exported to other countries, such as Iran. The vehicle itself transports only two projectiles and five men, while the remainder of the ammunition and the crew is on board a tracked M548. The M-110 Howitzer fires a 200-pound projectile out to almost 17 kilometers (16,800-meters). Designed to be part of a common family of weapons utilising the same chassis components, the M107 and M110 were essentially the same vehicle mounting different barrels. The hull of the M110 is identical to that of the M107 and is made of all-welded armour and high-tensile alloy steel with the driver at the front of the hull on the left, the engine to his right and the main armament at the rear. The M107 self-propelled 175-mm. gun and the M110 8-inch howitzer had identical carriages but different tubes. The 175-mm. gun fired a 174-pound projectile almost 33 kilometers. This impressive range made it a valuable weapon for providing an umbrella of protection over large areas. The 8-inch howitzer fired a 200-pound projectile almost 17 kilometers, plus being the most accurate weapon in the field artillery. The 8-inch howitzer was found with most division artilleries, and both the 8-inch howitzer and 175-mm. gun were with field force artillery. At field force the proportion of 8-inch and 175-mm. weapons varied. Since the weapons had identical carriages, the common practice was to install those tubes that best met the current tactical needs. One day a battery might be 175mm.; a few days later it might be half 175-mm. and half 8-inch.

2S35 Koalitsiya-SV Russian 152mm Self Propelled Howitzer (SPH)

Tiers:

1 2 3 4

Variants:

- **S35-1 Koalitsiya-SV-KSh:** The Koalitsiya-SV KSh is a new Russian self-propelled howitzer. It uses the ordnance of the 2S35 Koalitsiya-SV, but is based on 8x8 military truck chassis. A prototype of this artillery system was ready by 2013. Public pictures of this artillery system first appeared in 2017. The Koalitsiya-SV KSh is a very capable artillery system. Since the early 1980s Soviets developed a 152 mm howitzer, based on an 8x8 wheeled chassis. It was known as the 2S21 Msta-K. A couple of prototypes were built, however this artillery system never reached production and the program was cancelled in 1987. It was a failure mainly because at that time Soviets had no suitable trucks to carry this howitzer, that would have sufficient payload capacity, be powerful enough and could withstand the violent recoil. The new 2S35-1 Koalitsiya-SV KSh can be seen as an evolution of the 2S21 Msta-K. The 2S35-1 Koalitsiya-SV KSh utilizes the unmanned turret with 152 mm ordnance of the 2S35 Koalisiya-SV self-propelled howitzer. It is based on a modified KamAZ-6560 military truck with 8x8 configuration. This artillery system can be seen as a less expensive and more mobile alternative to the tracked version. Though it looses to tracked version in terms of off-road mobility and armor protection. It is planned that this truck-mounted howitzer will be mainly used by units, that are equipped with wheeled combat vehicles, while the tracked version will be used by units equipped with tracked combat vehicles.

System

Alternative Designation: 2S35 Koalitsiya-SV

Manufacturer: Burevestnik Central Scientific Research Institute

Type: Self Propelled Howitzer (SPH)

Family: 2S35

Crew: ea3

Chassis: Modified T-90

Estimated Service Life: years30

Note: The S35 Koalitsiya-SV is a a next-generation system capable of providing overmatch in a modern battle space

Dimensions

Length: m9.63

Width: m3.78

Height: m2.2

Weight, Combat: tons48-55

Ground Pressure: kg/mINA

Note: The 2S35 chassis is based off of the T-90 MBT

Automotive

Engine Name: V92-S2

Engine Type: Diesel

Engine Power: hp1,000

Cruising Range: km800

Speed, Maximum Road: km/h65

Speed, Maximum Off-Road: INA

Speed Maximum Swim: Not Amphibious

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.8

Trench: m2.8

Fording Depth: m2.1

Type: 152-mm Frag-HE BB, OF-91

Caliber: mm152

Muzzle Velocity: m/s828

Fuze Type: KZ-88 PD

Basic Load: 65 Total Rounds of any 152mm combination projectile

Maximum Effective Range: km29

Complete Projectile Weight (OF-61): kg42.86

Note: The 2S19 can fire the additional 152mm projectiles: 9K25 Krasnopol guided projectile and the 3-RB-30 radio jamming round

Coaxial Weapon System

↳*System*

Name: 12.7×108mm ZiD Kord Remote weapon station

Type: mm12.7

Manufacturer: V.A. Degtyarev Plant

In Service: 1998-Present

Length: mm1,980

Max Rate of Fire: rds/min650-600

Sustain Rate of Fire: rds/min550-600

Action: Gas-operated, rotating bolt

Feed System: 50-round linked belt

Sights: Iron Sights with two sighting options, known as CAM and CAM1

CAM 1 Capability: TV/IR camera and a laser rangefinder

CAM 2 Capability: TV camera, Thermal Camera and laser rangefinder

Variants: 6P50-1, 6P50-2, 6P50-3, 6P49

Note: Remote weapon cocking capability

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: mm12.7×108

Muzzle Velocity: m/s860

Basic Load: ea2,500

Effective Range: m2,000

Fire Control

Name: INA

Computerized FCS: INA

Thermal Sight Vehicle Commander: Yes, CAM 1 (TV/IR camera, Thermal Camera and a laser rangefinder)

Thermal Sight Gunner: Yes, CAM 2 (TV/IR camera, Thermal Camera and a laser rangefinder)

Main Gun Stabilization: INA

Multiple Round, Simultaneous Impact (MRSI) Capable: Yes

Direct Fire: Yes

Indirect Fire: Yes

Radars: ea2

Radar Type: Doppler

Protection

Hull Armor: Composite laminate design up to 200mm thick

Turret Armor: Composite laminate design up to 200mm thick. The Turret is not heavily Armored

Applique Armor: Available

Explosive Reactive Armor: Available, the Kontakt-V Explosive Reactive Armour.

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: Yes, can dig 12m × 5.5m × 1.5m entrenchment in sandy soil within 12 to 15 minutes.

NBC Protection: Reported to be the GO-27 PRKhR (NBC) System

Fire Suppression System: Reported to be the Raduga-2 Fire Suppression System

Smoke Equipment: Yes, 2 bundles of 902B Tucha smoke grenade launchers

Smoke Grenade Range: m250-300

Smoke Screen: 30m wide and 10m high for 60 seconds per grenade

IR Signature: INA

Notes:

The 2S35 Koalitsiya is a self-propelled howitzer designed and manufactured in Russia by Ural Vagon Zavod (UVZ) to provide the Russian Ground Troops with its next generation of field artillery systems. It is a successor to the 2S19 Msta-S. It is also intended to replace ageing Russian 152 mm artillery systems. Currently it is one of the most capable howitzers in the world. The first demonstration was conducted in 2006. It used a number of components from the previous 2S19 Msta-S.

Panzerhaubitze 2000 (PzH 2000) German 155mm Self-Propelled Howitzer

Tiers:

System

Alternative Designation: Panzerhaubitze 2000; PzH 2000

Type: 155mm Self-Propelled Howitzer

Manufacturer: Germany; Company: INA

Crew: ea5 (commander, driver, gunner, and two loaders)

Chassis: Wegmann supplied both the chassis, sharing some components with the Leopard 2, and the turret for the gun. The system has superb cross-country performance because of its use of continuous tracks and considerable protection in the case of counter-fire.

Displacement Time: INA

Emplacement Time: INA

Dimensions

Length, Overall: 11.67 m

Length, Hull: 7.30 m

Length, Barrel Overhang: 3.30 m

Height: 3.06 m

Width, Including Skirts: 3.58 m

Width, Over Track: 3.37 m

Track Width: 0.55 m

Track Length on Ground: 4.81 m

Ground Clearance: 0.44 m

Weight, Combat: 55,000 kg

Ground Pressure: 0.98 kg/sq cm

Load Class: MLC 60

Automotive

Engine Name: 1 x MTU MT881 Ka-500 8-cylinder direct-injection supercharged diesel

Engine Type: Diesel

Engine Power: hp1,000

Power-to-Weight Ratio: 18 hp/ton

Power Pack: 736 kW

Transmission: Renke HSWL 284 C; 4 forward and 2 reverse gears; integrated steering and clutch

Suspension: torsion bar; seven double-tire road wheels; front drive sprocket, rear idler, track return rollers

Road Speed: 60 km/h

Cross-Country Speed: 45 km/h

Range: 420 km

Gradient: %50

Side Slope: %25

Vertical Obstacle: 1.00 m

Trench: 3.00 m

Fording: 1.50 m

Main Weapon System

↳*System*

Name: 1 x Rheinmetall Industrie AG 155-mm L52 howitzer

Type: Self-Propelled Howitzer

Caliber: 155mm

Barrel Length: INA

Weight: INA

Elevation: -2.5/65 deg (-44/+1,156 mils)

Traverse: 360 deg (6,400 mils)

Range: 30 km with standard NATO projectiles, 40 km) with assisted projectiles

Rate of Fire: 3 rounds in 9.2 sec, 8 rounds in 42.9 sec, 10 rounds in 59.6 sec, 20 rounds in 2 min 10 sec

Resupply Rate: 60 complete rounds and 288 charges by 2 crew members in 10 min 50 sec

↳*Ammunition*

Type: 288 MTLS charges or equivalent bagcharges

Caliber: mm155

Shell: INA

Basic Load: 60 rounds, 288 MTLS charges or equivalent bagcharges

Coaxial Weapon System

System

Name: MG3

Type: General-Purpose Machine Gun

Caliber: 7.62mm

Date of Introduction: 1959

Manufacturer: Rheinmetall License-built by: Beretta, MKEK, Ellinika Amyntika Systimata, Defense Industries Organization, Military Industry Corporation, Pakistan Ordnance Factories, General Dynamics Santa Bárbara Sistemas

In Service: 1959-Present

Proliferation: over 1 Million

Length: 1,225 mm (48.2 in) 1,097 mm (43.2 in) (without stock)

Barrel Length: 565 mm

Weight: 11.5 kg (25.35 lb) 27.5 kg (61 lb) (mounted on tripod)

Action: Recoil-operated, roller locked

Rate of Fire: 1,000–1,300 rpm

Muzzle Velocity: 820 m/s

Maximum Firing Range: 600 m (1,969 ft) (bipod) 1,200 m (3,937 ft) (tripod mounted) 3,000 m (9,843 ft) (gun carriage) 3,750 m (12,303 ft) (terminal

Effective Firing Range: 200–1,200 m sight adjustments

Feed System: 50-round non-disintegrating DM1 belt (can be combined in a drum); 100-round disintegrating DM6/M13 belt

Sights: Open tangent iron sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO

Basic Load: 1,000 rounds

Fire Control

Name: INA

Computerized FCS: Yes

Main Gun Stabilization: Yes

Range Finder: GUI terminal controlled, laser backup

Navigation: autonomous navigation and fire control

Protection

Hull Armor: steel; crew and ammunition protection from 14.5-mm AP, artillery fragments and bomblets

↳**Turret Armor:** INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

NBC Protection: Yes

Smoke Equipment: 4 x 76-mm smoke grenade dischargers on each side of hull

Notes:

The Panzerhaubitze 2000 ("armoured howitzer 2000"), abbreviated PzH 2000, is a German 155 mm self-propelled howitzer developed by Krauss-Maffei Wegmann (KMW) and Rheinmetall for the German Army. The PzH 2000 is one of the most powerful conventional artillery systems deployed in the 2010s. It is capable of a very high rate of fire; in burst mode it can fire three rounds in nine seconds, ten rounds in 56 seconds, and can—depending on barrel heating—fire between 10 and 13 rounds per minute continuously. The PzH 2000 has automatic support for up to 5 rounds of Multiple Rounds Simultaneous Impact (MRSI). The replenishment of shells is automated. Two operators can load 60 shells and propelling charges in less than 12 minutes. PzH 2000 has also been selected by the armies of Italy, Netherlands, Greece, Lithuania and Croatia, and more orders are probable[citation needed] as many NATO forces replace their M109 howitzers. In 1986 Italy, the United Kingdom and Germany agreed to terminate their existing development of the PzH 155-1 (SP70) programme, which had run into reliability problems and had design defects, notably being mounted on a modified tank chassis. A new Joint Ballistics Memorandum of Understanding (JBMOU) for a 52 calibre barrel (based on a UK proposal) to replace 39 calibre was nearing agreement. German industry was asked for proposals to build a new design with gun conforming to the JBMOU. Of the proposed designs, Wegmann's was selected. Wegman eventually won a contract in 1996 for 185 to be delivered to Germany's rapid reaction force, followed by another 410 for the main force. Wegmann and Krauss-Maffei, the two main German military tracked vehicle designers, merged in 1998 to form KMW. Rheinmetall designed the 155 mm 52-calibre JBMOU compliant gun, which is chromium-lined for its entire 8 metre length and includes a muzzle brake on the end. The gun uses a new modular charge system with six charges (five identical), which can be combined to provide the optimal total charge for the range to the target, as well as the conventional bagged charge systems. Primer is loaded separately via a conveyor belt, and the entire loading, laying and clearing is completely automated. The maximum range of the gun is 30–36 km with the standard DM121 Boattail round, about 40–47 km with base bleed rounds, and 67 km with M2005 V-LAP assisted projectiles. In April 2006 a PzH 2000 shot assisted shells (Denel V-Lap) over a distance of 56 km with a probable maximum range of over 60 km. The gun can also fire the SMArt 155 artillery round, which is used by Germany and Greece. Wegmann supplied both the chassis, sharing some components with the Leopard 2, and the turret for the gun. The system has superb cross-country performance because of its use of continuous tracks and considerable protection in the case of counter-fire. The turret includes a phased array radar on the front glacis for measuring the muzzle velocity of each round fired. Laying data can be automatically provided via encrypted radio from the battery fire direction centre. A lighter, more air-portable version, using the gun in a module fitted to a lighter chassis, has been developed by KMW. It is called the Artillery Gun Module. In December 2013, Raytheon and the German Army completed compatibility testing for the M982 Excalibur extended range guided artillery shell with the PzH 2000. Ten Excaliburs were fired at ranges from 9 to 48 kilometers. Shells hit within three meters of their targets, with an average miss distance of one meter at 48 km. The Excalibur may be accepted by the German Army in 2014. A PzH 2000 L52 gun fired a shell to a range of 67 km at the Alkantpan test range in South Africa on 6 November 2019.

M1992 North Korean 30mm Self-Propelled Anti-Aircraft Gun

Tiers:

1 2 3 4

System

Alternative Designation: M1992

Type: 30mm Self-Propelled Anti-Aircraft Gun

Chassis: This self-propelled anti-aircraft gun is based on the ZSU-23-4 Shilka chassis.

Crew: ea4

Displacement Time: INA

Emplacement Time: INA

Dimensions

Length, Fun Forward: INA

Length, Hull: 6.5 m

Width: 3.1 m

Height: 3.6 m

Protection

Hull Armor: Thin armor of the ZSU-23-4 provides only limited protection against small arms fire and artillery shell splinters. It has been reported that sides of this vehicle can be penetrated by standard Soviet 7.62x39 mm rounds fired from assault rifle. Though front arc withstands this ammunition.

Turret Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

This self-propelled anti-aircraft gun is based on the ZSU-23-4 Shilka chassis. This vehicle was first observed in 1992. It was developed as a replacement for the older twin 37 mm SPAAG. It is worth mentioning that in the 1980s North Korea produced a significant amount of self-propelled artillery, mating towed artillery tubes with chassis already in service. Unlike most North Korean adaptations, the M1992 may have improved performance over the original type. This anti-aircraft artillery system was produced in quantity, however it is unknown how many of them were built.

2S5 Giatsint-S Russian 152mm Self-Propelled Gun (SPG)

Tiers:

Variants:

- **2A36 Giatsint-B:** The 2A36 Giatsint-B is a towed artillery piece that utilises the ordnance from the 2S5 Giatsint-S. It is designed to be used to provide brigades with fire support as part of an artillery formation. The distinctive system has four wheels: two on each side of the gun carriage.

System

Alternative Designation: 2S5 Giatsint-S
Type: Self-Propelled Howitzer (SPH)
Family: 2S5
Crew: ea5-6
Displacement Time: minLess than 2
Emplacement Time: minLess than 2
Transportation (Rail): Spora-80 or larger
Transportation (Air): An-124 aircraft or similar class plane
Note: The 2S5 Giatsint-S is rated a Tier 2 because it has been identified as one of the top 52 pieces of Russian Equipment.

Thermal Sight Gunner: Yes, D726-45 and PG-1M sights

Main Gun Stabilization: Yes, pneumatic rod type with an extra spring mechanism

Collimator: K-1

Spotlight: Luch-S71M spotlight

Protection

Hull Armor: mm13

Turret Armor: mm12

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: Yes

Note: A shoulder-launched surface-to-air missile is carried inside the vehicle for protection against helicopters and low-flying aircraft.

Notes:

Development of the 2S5 Giatsint, 152mm self-propelled gun began in 1968 alongside with the 2A36 Giatsint-B towed gun of the same caliber. Both guns have similar ballistics and use the same ammunition. The 2S5 entered service with the Soviet Army in 1976. Production commenced the same year and ceased in the early 1990s. Currently it is in service with Russia, Belarus and Ukraine. The 2S5 Giatsint was only exported to Finland, locally designated as the 152 TELAK 91. The 2S5 Giatsint is fitted with a turretless 152 mm/L54 gun. This gun is completed with load assisting system. Maximum rate of fire is 5 - 6 rounds per minute. The Giatsint fires ordinary and rocket-assisted HE-FRAG projectiles, HEAT, cluster and smoke projectiles. Maximum range of fire with ordinary HE-FRAG projectile is 28.4 km, and up to 33 km with rocket assisted projectile. Some sources claim that the 2S5 is capable of firing 0.1-2 kT nuclear projectiles. Full ammunition load consists of 60 rounds, however only 30 of them are carried by the Giatsint. Other rounds are carried by the re-supply vehicle. It takes 3 minutes to prepare this artillery system for firing.

SH-3 (WMZ322) Chinese 122mm Self-Propelled Howitzer

Tiers:

Variants:

- **Type 89:** The Type 89/PLZ-89 is a 122 mm self-propelled howitzer used by the People's Liberation Army of China to replace Type 85 and Type 70 122 mm self-propelled howitzer. PLZ-89 was first unveiled to the public during 1999 National Day military parade.
- **PLZ-07:** is a successor of the Type 89. This artillery system is widely used by the China's army. It utilizes a similar 122 mm howitzer, but has a new tracked chassis. It has greater mobility, improved fire control system and delivers greater firepower than its predecessor. This artillery system was adopted by the Chinese army in the late 2000s and is fielded in large numbers.
- **PLZ-07B i:** is a version of the PLZ-07, developed for China's marine corps. This artillery system is fully-amphibious and can be launched at sea from amphibious assault ships and swim over short distances to shore.

System

Alternative Designation: SH-3
Type: 122mm Self-Propelled Howitzer
Crew: ea5
Chassis: The SH-3 uses a new chassis, which is based on the Type 89 chassis, but has numerous improvements.
Displacement Time: INA
Emplacement Time: INA

Dimensions

Length: 6.6 m
Width: 3.28 m
Height: 2.5 m
Weight, Combat: 24.5 t

Automotive

Engine Name: BF8M1015CP

Engine Type: Diesel

Engine Power: hp590

Cruising Range: km500

Speed, Maximum Road: km/h65

Speed, Average Cross: INA

Speed Maximum Swim: The SH-3 can be fitted with floatation kit for amphibious operation. Once the kit is fitted it can ford water obstacles such as lakes and rivers.

Gradient: %60

Side Slope: %30

Protection

Hull Armor: Armor of the SH-3 provides protection against small arms fire and artillery shell splinters.
Turret Armor: Armor of the SH-3 provides protection against small arms fire and artillery shell splinters.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The SH-3 (WMZ322) is a 122-mm tracked self-propelled howitzer designed and manufactured by the Chinese defense company NORINCO (North Industries Corporation). The first information about these artillery system was published in 2005, but NORINCO never officially provided technical information about this product. According to some Chinese military sources, WMZ322 is offered for export under the name SH3. WMZ322 has high mobility and firepower, which is provided by a computerized fire control system. WMZ322 is in the service of the Chinese army. In November 2017, the office of the President of Rwanda, Paul Kagame, published a photo on his Flickr account, which showed SH-3, which participated in military exercises in Rwanda, code-named "Hard Punch II". Layout and protection The layout of the WMZ322/SH3 is very similar to the PLZ-89, especially in terms of the turret design, most of the differences in the suspension. Another feature of WMZ322 is that the driver is in the front left part of the hull, but the PLZ-89 has two hatches, the driver is in the same place, and the commander's seat is behind him. The WMS322 has a crew of five peoples. The turret is installed in the rear part of the hull, it has one door, rear located. The hull and the turret provide protection from small arms firing and fragments of artillery shells. Mobility The WMZ322/SH3 is powered by a Deutz BF8M 1015CP water cooled diesel engine with a power of 450 hp. It provides a maximum speed of 60 km/h and a maximum range of up to 500 km. On the sides there are six paired rubberised road wheels, having a torsion suspension, sprocket wheels in front, guide wheels at the rear and three supporting rollers. Armament WMZ322/SH3 is equipped with a turret very similar to PLZ-89, an older version of the 122-mm Chinese-made tracked self-propelled howitzer. It uses the same type of main armament that consists of one Type 89 122/32-mm cal howitzer borrowed from a Type 85 towed howitzer that has a box screen for a recoil mounted above the barrel and a muzzle brake. The gun is equipped with a semi-automatic loading system that provides a rate of fire from 6 to 8 rounds per minute. The maximum range of standard ammunition is 18 km, for EFRB (Extend Range Full Bore) - up to 22 km and 27 km - for projectiles with Rocket Assisted Projectiles (RAP). The vehicle has ammunition total of 40 rounds. The 12.7-mm machine gun is mounted on the roof of the turret, near the commander's hatch. On the sides of the turret there are also four smoke grenade launchers. Equipment Standard equipment WMZ322/SH3 includes a infrared night vision device, a meteorological sensor, a NBC protection, an automatic fire-extinguishing system and a GPS navigation system. WMZ322 is also equipped with an automatic fire control system that includes a digital ballistic computer, an optical sight for day and night vision and a laser range finder installed at the top of the turret.

M1981 North Korean 122mm Self-Propelled Gun

Tiers:

1 2 **3** 4

System

Alternative Designation: M-1981
Type: 122mm Self-Propelled Gun
Chassis: This self-propelled artillery gun is based on a lightly armored tracked chassis. The same chassis was used for the North Korean M1974 self-propelled gun-howitzer. Most likely that it is a heavily modified Soviet ATS-59G artillery tractor.
Crew: ea8-9
Emplacement Time: under 3 minutes
Displacement Time: under 3 minutes
Note: he M1981 can be seen as a North Korean attempt to create a self-propelled artillery system, somewhat equivalent to the Soviet 2S1 Gvosdika and to improve mobility and protection of their D-74 towed guns.

Dimensions

Length, Hull: 6.3 m
Length, Gun Forward: 8 m
Width: 2.6 m
Height: 2.6 m
Weight, Combat: 25 tons

Automotive

Engine Name: A-650

Direct Fire: Yes

Indirect Fire: Yes

Protection

Hull Armor: mmArmor of the M1981 provides some degree of protection for its crew against small arms fire and artillery shell splinters. The gun retains its original splinter shield. Though top of the superstructure is opened and completely unprotected. In traveling order it can be covered with bows and canvas cover. This artillery system has no defensive armament, except firearms of its crew members.

Turret Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1981 is a North Korean 122 mm self-propelled gun. Its actual designation is unknown. The M1981 is provisional designation, allocated by a US Department of Defense. Number in the designation denotes the year when this system was first observed by US intelligence. This North Korean artillery system was adopted in the late 1970s or early 1980s and is used to this day. As far as it is known the M1981 was not exported outside the North Korea.

M109 American 155mm Self-Propelled Howitzer

Tiers:

Variants:

- **M109:** First produced in 1963. It had a 23 caliber 155 mm M126 gun in an M127 Howitzer Mount, and carried 28 rounds of 155 mm ammunition. It was also armed with a .50cal M2HB machine gun with 500 rounds of ammunition. Easily identified by its short barrel and a double baffle muzzle brake with a large fume extractor just behind it. Maximum range of 14,600 meters.
- **M109A1:** Replaced the M126 gun with a longer barreled, 39 caliber M185 gun, increasing maximum range to 18,100 meters.
- **M109A2:** Incorporated 27 Reliability, Availability, and Maintainability (RAM) mid-life improvements. Most notably, the long barreled 155 mm M185 cannon in the new M178 gun mount, ballistic protection for the panoramic telescope, counterbalanced travel lock, and the ability to mount the M140 alignment device. Stowage of 155mm rounds increased from 28 to 36 rounds; .50cal ammunition remained at 500 rounds. During M109A2 production, a slightly simplified version was also produced for export. This had minor internal changes and deleted the hull flotation feature. These were designated M109A1B.
- **M109A3 and M109A3B:** M109A1s and M109A1Bs rebuilt to M109A2 standard respectively. Some A3s feature three contact arm assemblies, while all A2s have five.
- **M109A4:** M109A2s and M109A3s improved with Nuclear, Biological, and Chemical / Reliability, Availability, and Maintainability (NBC/RAM) improvements, including air purifiers, heaters, and Mission Oriented Protective Posture (MOPP) gear. The traversing mechanism's clutch is hydraulic, as compared to the electric mechanism on previous M109s, and features a manual override in the event of an electrical failure. The A4 also adds an additional hydraulic filter, for a total of two. Also included is an improvement to the engine starting equipment, greatly improving the ability to start in an emergency. Ammunition amounts remain the same as two previous models.
- **M109A5:** Replaces the 155 mm M185 cannon in an M178 mount with a 39-caliber 155 mm M284 cannon in an M182 mount, giving the A5 a maximum range of 22,000 meters with unassisted projectiles and 30,000 meters with Rocket Assisted Projectiles (RAP Rounds). The vehicle can carry 36 complete rounds of ammunition and has a 440 hp engine instead of the standard 405 hp engine.
- **M109A5+:** Various manufacturers have upgraded the fire control and other components of the M109A5. BAE Systems in York PA recently delivered 12 M109A5+ vehicles to Chile and 32 for Brazil.
- **M109A6 "Paladin":** Overall product improvement in the areas of survivability, RAM, and armament. This includes increased armor, a redesigned internal arrangement for safer ammunition and equipment storage, engine and suspension upgrades, and product improvement of the M284 cannon and M182A1 mount. The greatest difference is the integration of an inertial navigation system, sensors detecting the weapons' lay, automation, and an encrypted digital communication system, which utilizes computer controlled frequency hopping to avoid enemy electronic warfare and allow the howitzer to send grid location and altitude to the battery fire direction center (FDC). The battery FDCs in turn coordinate fires through a battalion or higher FDC. This allows the Palladin to halt from the move and fire within 30 seconds with an accuracy equivalent to the previous models when properly emplaced, laid, and safed—a process that required several minutes under the best of circumstances. Tactically, this improves the system's survivability by allowing the battery to operate dispersed by pairs across the countryside and allowing the howitzer to quickly displace between salvos, or if attacked by indirect fire, aircraft, or ground forces. Ammunition storage is increased from 36 to 39 155 mm rounds.
- **M109 "KAWEST":** This Swiss improved version produced by Ruag incorporates a new Swiss-designed L47 155 mm gun with an increased firing range of up to 36 km. It features inertial navigation system coupled with a new gun-laying system and more ammunition storage(40 rounds, 64 charges). The KAWEST (lit. Kampfwertsteigerung = upgrade of combat capabilities) requires only 6 crew members instead of 8, and is able to fire 3-round bursts within 15 seconds or maintain a constant firing rate of over one round per minute.[9][10] Upgraded Swiss PzHb (Panzerhaubitze) 79 and 88

(M109A1) are known as respectively PzHb 79/95 and PzHb 88/95

- **M109L52:** Jointly developed by the Dutch firm RDM and the German firm Rheinmetall, the M109L52 was first revealed in 2002. The main improvement was replacing the M126 series gun with the longer 52-caliber cannon from the PzH 2000, thus the MTLS ammunition of the PzH 2000 can be used. In addition, improvements to the loading system were made. This resulted in an increase of the rate of fire to 9–10 rds/min from the original 3 rds/min, and this high rate of fire can be sustained for up to 2 minutes. A total of 35 rounds can be carried.
- **M109A3GNM:** The current version in service with the Norwegian Army's Artilleribataljonen. 126 M109Gs were acquired from West Germany between 1969–1971. They were then upgraded to the M109A3GN configuration during the latter half of the 1980s. In 2006, there were still 56 M109A3GNs in the Army's inventory, meaning that at least 70 SPGs had been scrapped after the end of the Cold War. 14 of the M109A3GNs received additional upgrades in 2007, and were designated M109A3GNM. The upgrade includes, among other things, new intercom and new navigation and positioning systems. The M109A3GNMs are currently the only SPGs that remain in active service with the remainder of the M109s having been put in storage.
- **K55/K55A1:** K55/K55A1 are South Korean variants of the M109A2 , originally named KM109A2 with additional domestic augmentations, license-produced by Samsung Techwin. They are fitted with M178 155 mm 39 caliber gun, NBC protection, automatic fire extinguishing system, and a modified ammunition reception module for K56 automatic ammunition resupply vehicle. The Performance Improvement Program variant, K55A1, is a complete domestic overhaul of the K55 which is further augmented by Samsung Thales with modern digital ballistic computers, multifunctional data display and controllers, GPS navigation and target acquisition system, wireless datalink equipment, and upgraded fire control storage battery and power supply unit, to closely match the US military's modernization of the Paladin into next-generation standard. Many improved technologies of the South Korean K9 Thunder were retrofitted on the K55A1. 1,040 howitzers of these variants were produced.
- **M109A7:** The newest M109 version for U.S. service is the M109A7, formerly known as the M109A6 Paladin Integrated Management (PIM). The M109A7 shares common components with the Bradley Fighting Vehicle such as the engine, transmission, and tracks. This creates commonality with other systems and maximizes cost-savings in production, parts inventory, and maintenance personnel. The M109A7's on-board power systems harness technologies originally developed for the Non-Line-of-Sight Cannon; the electric drive is faster than the previous hydraulic system, and the automatic rammer more consistently rams the round into the gun for consistent velocities and better accuracy. It features a 600-volt on-board power system to accommodate additional armor and future networking technologies as they become ready. The M109A7 can sustain a one-round per-minute rate of fire and a maximum rate of fire of four rounds per-minute.

System

Alternative Designation: M109

In Service: 1963-Present

Type: Self-Propelled Howitzer

Crew: ea6

Chassis: The M108 and M109 shared a common chassis (along with the M113 APC), but the M109 was heavier and had a larger gun. The M108 proved unsuccessful, mainly due to its overly light gun.

Protection

Hull Armor: The M109’s protection consists of up to 32 millimeters of armor, which is only effective against small arms and grenade/artillery fragments.

Turret Armor: INA, the turret takes up the rear. On top of the turret, there is a small cupola, from which the commander operates. This cupola is also fitted with a 12.7 mm (.50) M2HB heavy machine gun.

Applique Armor: INA

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: none fitted

Smoke Equipment: INA

Fire Suppression: INA

Notes:

The M109 is an American 155 mm turreted self-propelled howitzer, first introduced in the early 1960s to replace the M44. It has been upgraded a number of times, most recently to the M109A7. The M109 family is the most common Western indirect-fire support weapon of maneuver brigades of armored and mechanized infantry divisions. The M109 has a crew of four: the section chief/commander, the driver, the gunner, and the ammunition handler/loader. The chief or gunner aims the cannon left or right (deflection) and up and down (quadrant). The British Army replaced its M109s with the AS-90. Several European armed forces have or are currently replacing older M109s with the German PzH 2000. Upgrades to the M109 were introduced by the U.S. (see variants below) and by Switzerland (KAWEST). With the cancellation of the U.S. Crusader and Non-Line-of-Sight Cannon, the M109A6 ("Paladin") will remain the principal self-propelled howitzer for the U.S. for the foreseeable future until the new M1299 will enter service. First produced in 1963. It had a 23 caliber 155 mm M126 gun in an M127 Howitzer Mount, and carried 28 rounds of 155 mm ammunition. It was also armed with a .50cal M2HB machine gun with 500 rounds of ammunition. Easily identified by its short barrel and a double baffle muzzle brake with a large fume extractor just behind it. Maximum range of 14,600 meters. The widely used M109 carries a 155-mm howitzer and is the principal self-propelled artillery support for U.S. Army divisions. It is a large tracked vehicle with a fully traversable turret and prominent bustle. Early variants had a short, 23-caliber barrel. Later versions, including the M109A6 Paladin, have a 39-caliber barrel. The M109 has a crew of six: commander, gunner, driver and three ammunition members. The hull is made of all-welded aluminum armor, which protects against small-arms fire and shell splinters. The driver is seated at the front left of the hull, with the powerpack to the right and the turret at

the rear. The driver is provided with a single-piece hatch cover that opens to the left, with three M45 day periscopes in front. These can be covered with small metal flaps to prevent damage. One of the day periscopes can be replaced by a passive night-vision periscope. The Detroit Diesel Model 8V-71T engine is coupled to an Allison Transmission XTG-411-4A cross-drive transmission. The all-welded aluminum armor turret at the rear of the hull has a square hatch in each side that opens to the rear and twin doors in the turret rear. The commander is seated on the right side of the turret and has a cupola that can be traversed through 360 deg, a single-piece hatch cover that opens to the rear and an M27 day periscope. A .50-cal M2 heavy-barrel machine gun is pintle-mounted on the front of the cupola. The gunner is seated on the left side of the turret and has a square single-piece hatch cover that opens to the right. The twin doors at the rear of the turret are provided for ammunition resupply. Mounted at the rear of the hull on each side of the hull door is a large spade that is manually lowered to the ground before firing. They are normally deployed only when firing top charges. The torsion bar suspension on either side consists of seven dual rubber-tired road wheels with the drive sprocket at the front and the idler at the rear. There are no track-return rollers. The tracks are of a single-pin, center-guide type with replaceable rubber pads. The M109 is fitted with night-vision equipment, but does not have nuclear, biological and chemical (NBC) warfare protection. The vehicle can be fitted with an amphibious kit consisting of nine air bags, four on each side of the hull and one at the front. The bags are inflated from the vehicle, which can then propel itself across rivers on its tracks at a maximum speed of 4 mph (6 kmh). The main armament is a 155-mm M126 howitzer in an M127 mount with a fume extractor and large muzzle brake. The recoil system is hydropneumatic and the breech block is of the Welin-step thread type. Gun elevation and depression and turret traverse are hydraulic with manual controls for emergency use. Fire-control equipment includes an elbow telescope M118C for direct fire with a magnification of 4x and 10-deg field of view; panoramic telescope M117 for indirect fire and gunner's quadrant M1A1 . The M109 Paladin self-propelled Howitzer, first produced in 1963 and improved upon numerous times over the past 40 years, is currently slated for a comprehensive overhaul. The M109 PIM upgrade shares many common components of the Bradley Fighting Vehicle, allowing for more commonality with other Army vehicle systems and maximizing production savings, parts inventory and maintenance personnel while avoiding component obsolescence. The PIM modernization effort is a significant upgrade of the M109A6 Paladin which includes buying back Space, Weight, and Power - Cooling. While the self-propelled howitzer's cannon will remain unchanged, the PIM will sport a brand new chassis, engine, transmission, suspension, steering system, to go along with an upgraded electric ramming system.

Type 07B (PLZ 07B) Chinese Amphibious Self Propelled Artillery

Tiers:

System

Battle Management System: Yes

Navigation System: BeiDou satellite navigation system,

Protection

Hull Armor Type: Hull is of aluminium base armour protected by composite appliqué armour.

Hull Armor: mm30

Sides and Rear Armor: mm14.5

Turret Armor: INA

Applique Armor: Yes

Explosive Reactive Armor: INA

Active Protection System: Yes

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: Yes, 8 Total, 4 on each side 76mm

Bow Blade: Yes

Belly Plate: Yes

Self-Sealing Fuel Tank: Yes, capable of stopping a 25 mm APFSDS round at 2,000 m.

Automatic Fire Suppression Device.: Yes

Notes:

This version of the ZBD-2000 family is fitted with a rear-mounted turret with a 122mm cannon. The Type 07B combines the cannon and fire-control system from the Type 07B howitzer with the ZBD-2000 hull. The weapon enables longer range fire support farther inshore with heavier ammunition, including laser-guided rounds. The ZBD-2000 is a family of Chinese tracked amphibious assault vehicles. They are designed for beach assault missions and to accompany infantry as ground forces move inland. The vehicle resembles the (now cancelled) U.S. Expeditionary Fighting Vehicle (EFV). The vehicle has a boat-shaped hull with six road wheels and lead return rollers. A welded turret is mounted over the middle of the hull. The commander and gunner sit inside the turret, with the driver at the front, to the left of the engine. The driver has a single-piece hatch cover that opens to the rear. It can be locked in the vertical position with at least three day periscopes providing observation to the frontal arc. The middle periscope can be replaced by a passive periscope for driving at night. The ZBD-2000 is propelled in the water by a pair of waterjets. Speeds of up to 28 mph (45 kph) can be achieved. The vehicle utilizes hydraulically actuated bow and transom flaps, which are designed to aid the vehicle's hull skimming. The vehicle is able to travel more than 6 mi (10 km) over the water. The vehicle has all-welded armor over the hull and turret, providing protection against 25-mm armor-piercing rounds over the frontal arc and all-round protection against 7.62-mm armor-piercing rounds.

Notes:

The PLZ-52 is a Chinese self-propelled howitzer. It is similar in appearance to the PLZ-45, however it packs a heavier punch. It was first unveiled in 2014. Currently it is among the most capable artillery systems in the world. However the PLZ-52 is aimed mainly at export customers, rather than Chinese army. The PLZ-52 is capable of firing Chinese precision guided projectiles. In the 1990s China obtained a Russian Krasnopol laser-guided projectile technology and production license. Later it successfully developed its own precision guided munitions.

M109A5 American 155mm Self-Propelled Howitzer

Tiers:

Parent:

M109 American 155mm Self-Propelled Howitzer

Variants:

- **M109:** First produced in 1963. It had a 23 caliber 155 mm M126 gun in an M127 Howitzer Mount, and carried 28 rounds of 155 mm ammunition. It was also armed with a .50cal M2HB machine gun with 500 rounds of ammunition. Easily identified by its short barrel and a double baffle muzzle brake with a large fume extractor just behind it. Maximum range of 14,600 meters.
- **M109A1:** Replaced the M126 gun with a longer barreled, 39 caliber M185 gun, increasing maximum range to 18,100 meters.
- **M109A2:** Incorporated 27 Reliability, Availability, and Maintainability (RAM) mid-life improvements. Most notably, the long barreled 155 mm M185 cannon in the new M178 gun mount, ballistic protection for the panoramic telescope, counterbalanced travel lock, and the ability to mount the M140 alignment device. Stowage of 155mm rounds increased from 28 to 36 rounds; .50cal ammunition remained at 500 rounds. During M109A2 production, a slightly simplified version was also produced for export. This had minor internal changes and deleted the hull flotation feature. These were designated M109A1B.
- **M109A3 and M109A3B:** M109A1s and M109A1Bs rebuilt to M109A2 standard respectively. Some A3s feature three contact arm assemblies, while all A2s have five.
- **M109A4:** M109A2s and M109A3s improved with Nuclear, Biological, and Chemical / Reliability, Availability, and Maintainability (NBC/RAM) improvements, including air purifiers, heaters, and Mission Oriented Protective Posture (MOPP) gear. The traversing mechanism's clutch is hydraulic, as compared to the electric mechanism on previous M109s, and features a manual override in the event of an electrical failure. The A4 also adds an additional hydraulic filter, for a total of two. Also included is an improvement to the engine starting equipment, greatly improving the ability to start in an emergency. Ammunition amounts remain the same as two previous models.
- **M109A5:** Replaces the 155 mm M185 cannon in an M178 mount with a 39-caliber 155 mm M284 cannon in an M182 mount, giving the A5 a maximum range of 22,000 meters with unassisted projectiles and 30,000 meters with Rocket Assisted Projectiles (RAP Rounds). The vehicle can carry 36 complete rounds of ammunition and has a 440 hp engine instead of the standard 405 hp engine.
- **M109A5+:** Various manufacturers have upgraded the fire control and other components of the M109A5. BAE Systems in York PA recently delivered 12 M109A5+ vehicles to Chile and 32 for Brazil.
- **M109A6 "Paladin":** Overall product improvement in the areas of survivability, RAM, and armament. This includes increased armor, a redesigned internal arrangement for safer ammunition and equipment storage, engine and suspension upgrades, and product improvement of the M284 cannon and M182A1 mount. The greatest difference is the

integration of an inertial navigation system, sensors detecting the weapons' lay, automation, and an encrypted digital communication system, which utilizes computer controlled frequency hopping to avoid enemy electronic warfare and allow the howitzer to send grid location and altitude to the battery fire direction center (FDC). The battery FDCs in turn coordinate fires through a battalion or higher FDC. This allows the Palladin to halt from the move and fire within 30 seconds with an accuracy equivalent to the previous models when properly emplaced, laid, and safed—a process that required several minutes under the best of circumstances. Tactically, this improves the system's survivability by allowing the battery to operate dispersed by pairs across the countryside and allowing the howitzer to quickly displace between salvos, or if attacked by indirect fire, aircraft, or ground forces. Ammunition storage is increased from 36 to 39 155 mm rounds.

- **M109 "KAWEST":** This Swiss improved version produced by Ruag incorporates a new Swiss-designed L47 155 mm gun with an increased firing range of up to 36 km. It features inertial navigation system coupled with a new gun-laying system and more ammunition storage(40 rounds, 64 charges). The KAWEST (lit. Kampfwertsteigerung = upgrade of combat capabilities) requires only 6 crew members instead of 8, and is able to fire 3-round bursts within 15 seconds or maintain a constant firing rate of over one round per minute.[9][10] Upgraded Swiss PzHb (Panzerhaubitze) 79 and 88 (M109A1) are known as respectively PzHb 79/95 and PzHb 88/95
- **M109L52:** Jointly developed by the Dutch firm RDM and the German firm Rheinmetall, the M109L52 was first revealed in 2002. The main improvement was replacing the M126 series gun with the longer 52-caliber cannon from the PzH 2000, thus the MTLS ammunition of the PzH 2000 can be used. In addition, improvements to the loading system were made. This resulted in an increase of the rate of fire to 9–10 rds/min from the original 3 rds/min, and this high rate of fire can be sustained for up to 2 minutes. A total of 35 rounds can be carried.
- **M109A3GNM:** The current version in service with the Norwegian Army's Artilleribataljonen. 126 M109Gs were acquired from West Germany between 1969–1971. They were then upgraded to the M109A3GN configuration during the latter half of the 1980s. In 2006, there were still 56 M109A3GNs in the Army's inventory, meaning that at least 70 SPGs had been scrapped after the end of the Cold War. 14 of the M109A3GNs received additional upgrades in 2007, and were designated M109A3GNM. The upgrade includes, among other things, new intercom and new navigation and positioning systems. The M109A3GNMs are currently the only SPGs that remain in active service with the remainder of the M109s having been put in storage.
- **K55/K55A1:** K55/K55A1 are South Korean variants of the M109A2 , originally named KM109A2 with additional domestic augmentations, license-produced by Samsung Techwin. They are fitted with M178 155 mm 39 caliber gun, NBC protection, automatic fire extinguishing system, and a modified ammunition reception module for K56 automatic ammunition resupply vehicle. The Performance Improvement Program variant, K55A1, is a complete domestic overhaul of the K55 which is further augmented by Samsung Thales with modern digital ballistic computers, multifunctional data display and controllers, GPS navigation and target acquisition system, wireless datalink equipment, and upgraded fire control storage battery and power supply unit, to closely match the US military's modernization of the Paladin into next-generation standard. Many improved technologies of the South Korean K9 Thunder were retrofitted on the K55A1. 1,040 howitzers of these variants were produced.
- **M109A7:** The newest M109 version for U.S. service is the M109A7, formerly known as the M109A6 Paladin Integrated Management (PIM). The M109A7 shares common components with the Bradley Fighting Vehicle such as the engine, transmission, and tracks. This creates commonality with other systems and maximizes cost-savings in production, parts inventory, and maintenance personnel. The M109A7's on-board power systems harness technologies originally developed for the Non-Line-of-Sight Cannon; the electric drive is faster than the previous hydraulic system, and the automatic rammer more consistently rams the round into the gun for consistent velocities and better accuracy. It features a 600-volt on-board power system to accommodate additional armor and future networking technologies as they become ready. The M109A7 can sustain a one-round per-minute rate of fire and a maximum rate of fire of four rounds per-minute.

System

Alternative Designation: M109A5
In Service: 1993-Present
Type: Self-Propelled Howitzer
Crew: ea5 (chief of section, gunner, assistant gunner, No. 1 cannoneer and driver)
Chassis: The M108 and M109 shared a common chassis (along with the M113 APC), but the M109 was heavier and had a larger gun. The M108 proved unsuccessful, mainly due to its overly light gun.
Displacement Time: INA
Emplacement Time: INA
Note: This variant has an improved M178 mounting, boresight alignment driver and selected RAM and safety kits, which included a fuel system air purge; driver's instrument panel; bustle/rack; propellant stowage; torsion bar; counter-recoil

buffer; and upper recoil cylinder. The designation also applies to retrofitted models.

Dimensions

Length, Hull: 6.19 m

Length, Gun Forward: 9.12 m

Width: 3.28 m

Height: 3.28 m

Weight: 55,000 lb (24,948 kg)

Ground Pressure: INA

Automotive

Engine Name: 1 x General Motors 8V-71T LHR, 9310cc, 2-cycle diesel

Engine Type: V-8 diesel

Engine Power: hp440 hp

Power-to-Weight Ratio: 17.96 hp/ton

Transmission: Allison ATD-XTG 411-4A, 4 forward and 2 reverse gears

Range: km354

Speed, Maximum Road: km/h56

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Side Slope: %30

Gradient: %60

Vertical Step: m0.53

Trench: m1.83

Fording Depth: m1.07

Fuel Capacity: 135 gal (511 liters)

Suspension: torsion bar, 7 road wheels, front drive, rear idler, no return rollers (all models except PIM). The suspension system has been strengthened and an external NATO power receptacle allows the M109A5 to be electrically powered by the M992 field artillery ammunition support vehicle (FAASV).

Note: The M109A5 offers upgraded components providing greater durability. It has a higher horsepower low heat rejection (LHR) engine and an improved transmission for increased performance.

Main Gun

Note: The elevation/equilibrium cylinder and turret traverse clutch assembly are redesigned to prevent failures.

↳*System*

Name: M284 39 cal/155mm Rifled Howitzer fitted with Muzzle Brake and Fume Extractor

Type: Howitzer

Caliber: 155mm

Length: INA

Barrel Length: INA

Weight: INA

Cannon Groves: 48

Rifling: right-hand rifling with constant, 8.93-deg twist

Breech Type: Welin-step thread

Recoil System: hydropneumatic

Elevation: -3/+75 deg (-53/+1,333 mils)

Traverse: 360 deg (6,400 mils)

Maximum Firing Range: 14.6 km

Maximum Rate of Fire: 1 rd/min first hour, 4 rd in first 3 min max

Sustained Rate of Fire: 2 rpm

Note #1: This self-propelled artillery system is supported by an associated M992 armored ammunition supply vehicle. It is based on the same tracked chassis as the M109.

Note #2: The cab has a rear bustle rack which provides an increased ammunition stowage capacity.

Note #3: The M109A5 share commonality with all of the other M109 family members and fires all NATO-standard 155-mm ammunition.

↳*Ammunition (Option 1)*

Name: M864

Type: DPICM

Caliber: mm155mm

Length: 35.3 in (898 mm)

Weight: 103.2 lb (43.80 kg)

Basic Load: 34 Rounds Total of any Combination Projectiles

Maximum Range: 22,000 m

Response Time: 11 min

↳*Ammunition (Option 2)*

Name: M483A1

Type: HE

Caliber: mm155

Length: 35.4 in (899 mm)

Weight: 102.5 lb (46.49 kg)

Basic Load: 34 Rounds Total of any Combination Projectiles

Maximum Range: 17,740 m

Response Time: 11 min

↳*Ammunition (Option 3)*

Name: M718
Type: RAAMS Long
Caliber: 155mm
Length: 30.7 in (781 mm)
Weight: 103.0 lb (46.71 kg)
Basic Load: 34 Rounds Total of any Combination Projectiles
Maximum Range: 17,740 m
Response Time: 11 min

Auxiliary Weapon System

↳*System*

Name: M2 Browning
Type: Heavy Machine Gun
Caliber: 12.7mm
Length: 1,654 mm
Barrel Length: 1,143 mm
Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)
Action: Short recoil-operated
Rate of Fire: 450–600 rounds/min
Muzzle Velocity: 890 m/s
Maximum Firing Range: 7,400 m
Effective Firing Range: 1,800 m
Feed System: Belt-fed (M2 or M9 links)
Sights: INA

↳*Ammunition*

Type: Rifle
Caliber: mm12.7
Cartridge: .50 BMG (12.7×99mm NATO)
Basic Load: 500

Fire Control

Name: INA
Computerized FCS: Fire-control equipment includes an elbow telescope M118C for direct fire with a magnification of 4x and 10-degree field of view; panoramic telescope M117 for indirect fire and gunner's quadrant M1A1.

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: Yes

Night Vision Devices: Yes

Note: It has an all weather ballistic shield mounted over the panoramic telescope; counterbalanced travel lock and provisions for mounting the M140 alignment device.

Protection

Hull Armor: maximum 20-mm light alloy aluminum, small-arms and artillery fragment protection

Turret Armor: INA, The turret takes up the rear. On top of the turret, there is a small cupola, from which the commander operates. This cupola is also fitted with a 12.7 mm (.50) M2HB heavy machine gun.

Applique Armor: INA

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: ventilated face Piece System (VFPS)

Smoke Equipment: INA

Fire Suppression: CO2 fire extinguisher system in crew and engine compartments

Notes:

M109A5 (1993) The M109A5 is a modified M109A4 it consists of two major improvements: a new M284 cannon and a new M182 gun mount. These improvements provide the M109A5 with greater range and allow for sustained fire for prolonged periods of time. Over 950 existing M109s have been rebuilt as the M109A6 Paladin. The Paladin configuration is achieved through extensive modifications to existing M109A2/A3 vehicle hulls and the subsequent introduction of an entirely new turret structure. The remaining M109 howitzer fleet has received the M109A5 upgrade, which included some of the same automotive and crew NBC protection improvements as well as the Paladin's M284 cannon and M182 gun mount. A requirements survey was forwarded to authorized security assistance customer countries on 10 February 2003 , advising of the availability of Long Supply M109A5 self-propelled (SP) 155mm howitzers at a reduced price. The howitzers are available for immediate sale to countries addressed in the survey. These countries were determined by Defense Security Cooperation Agency, Commerce and State Department review. Upon receiving acknowledgement of interest from a foreign customer addressed in the message, allocations will be made, as received, on a "case by case basis." Allocations may be constrained by the number of available assets remaining and it is possible that all howitzers may be committed. The M109A5, 155mm SP medium howitzer is a vehicle that provides armored combat support, is air transportable, internally loaded, and has excellent ground mobility. The M109A5's main armament is the 39-caliber, M284 cannon, which has a maximum range of 23,500 meters with unassisted projectiles and 30,000 meters with Rocket Assisted Projectiles (RAP Rounds). The cab of the M109A5 rotates in a full 360-degree circle, allowing operation of both its primary (the 155mm cannon assembly) and secondary (the M2 heavy barrel caliber 50 machine gun or MK19 40mm Grenade Launcher) armament in any direction. The system is capable of both direct (line of sight) and indirect (out of the line of sight) firing. The vehicles have a cruising range of 220 miles at speeds up to 35 miles per hour. The M109A5 howitzer gives the customer the maximum flexibility to tailor modifications to meet desired missions requirements. It can accommodate future technology and is economical to purchase, operate, and maintain. The M109 family of howitzers continues to be improved to generate additional operational capabilities and cost savings for the customer. It continues to be backed by the extensive life-cycle sustainment support of the weapon's proponent. The M109A5 howitzers can be brought to a Fully Mission Capable (FMC) Standard prior to delivery for an additional cost. This option can be achieved at the current storage facility prior to shipment. This Program ensures that all of the howitzer's systems and subsystems are fully operational and standards are met in accordance to the Operational Preventative Maintenance Checks and Services (PMCS) of 10/20 Manuals. Oil samples will be taken and analyzed from the engines, transmissions, and hydraulic systems to ensure that these systems are in good shape and do not have any detectable problems. The traversing, elevation, fire control, rammer, personnel heater, gun mount, and cannon systems will be checked for proper operation and repaired as needed. All of the replenishers, recuperators, and fire control nitrogen charges will be checked and re-charged as needed. The fire extinguishers will be checked for proper load to ensure that they are fully charged and ready for operation. If the customer plans to use the vehicle

with the VIC-1 intercom system, it will be checked to ensure proper operation. The outside of the vehicle will be repainted according to the customer's color requirements, and the inside of the crew compartment will be painted as needed. The fuel system will be flushed and any contaminants will be removed from it. New batteries will be installed in all of the vehicles, and all track pads with less than 50 percent of life remaining will be replaced. Finally, the vehicles will be driven two miles as a road test to ensure that they have no mobility problems and each vehicle will have a minimum of 50 gallons of fuel in their tanks for ease of loading and off-loading them during shipping. This proposed repair program is designed to ensure that the customer receives a good-looking, fully operational howitzer for as little cost as possible. If the customer desires additional upgrade component replacement (new 8V71T-91 Series Engines; overhauled/modified XTG-411-4 Transmissions; new T154 track, etc.), their requirements can be easily added to the Scope of Work (SOW) for the repair program and the customer would have to pay for these additional requirements. Further, thirty percent of the M109A5 Howitzers have a restriction on either the Breech Block or Breech Ring; however, these items can be replaced at an additional cost. If the customer selects one of these vehicles during the JVI, the Rough Order of Magnitude (ROM) for these items will be provided at that time.

Sholef Israeli 155mm Self-Propelled Howitzer

Tiers:

1 2 **3** 4

System

Alternative Designation: Self-Propelled Howitzer
Type: Self-Propelled
Crew: ea4
Chassis: Merkava Mk.1
Displacement Time: INA
Emplacement Time: INA

Dimensions

Hull Length: m3.49
Width: m3.72
Length (gun forward): m13.5
Height: m3.49
Weight, Combat: ton45

Automotive

Engine Name: Continental AVDS 9AR 1790
Engine Type: Diesel
Engine Power: hp1 200 hp
Cruising Range: km500

Fording: m1.38
Gradient: 60%

Main Gun

↳*System*

Name: Sholef
Type: 155mm Self Propelled Howitzer
Breech Type: semi-automatic wedge
Length, Barrel: 52 Calibers
Loader Type: Automatic computerised loading system,
Max Rate of Fire: rds/min9
Muzzle Brake Type: Double-baffle
Max Elevation: deg70
Min Elevation: deg-5
Traverse Range: deg360
Traverse Left: deg180
Traverse Right: deg180

↳*Ammunition*

Type: Separate loading propellant / projectile
Caliber: mm155 mm
Muzzle Velocity: Varies by propellant
Basic Load: 75 Projectiles/60 Complete Rounds
Effective Range: km45
Note: Projectile Standard 155mm NATO

Coaxial Weapon System

Note: 1 ring mount 7.62mm or 12.7mm for Anti-Aircraft/Anti-Infantry

Fire Control

Name: INA
Computerized FCS: yes
Direct Fire While Moving: the weapon is stabilized and can actually be used for direct-fire while the vehicle is moving

Protection

Hull Armor: The hull has the same ballistic protection as the Merkava Mk.1
Turret Armor: The armor on the turret is sufficient to defeat small arms fire, shell splinters, blast overpressure, and most heavy machine gun rounds
NBC Protection: Over Pressure
Note: The armor is augmented by spall liners, and the same overpressure NBC system as the Merkava Mk.1 is fitted

Notes:

The Slammer (Sholef) is a 155mm self-propelled howitzer variant of the Merkava with automatic loading system. The gun has a

range of 40+ km with ERFB-BB. Two prototypes appeared in 1984 and 1986 but didn't entered production. The Slammer is a heavily armored artillery gun mounted on a modified Merkava Mk 1 chassis. Many of these vehicles are Merkava Mk 1 that were retired after the Merkava Mk 2 and Merkava Mk 3 came into service. The Slammer has a long 52-caliber gun barrel that allows +10% range. Reload speed may be decreased to 1 for one minute every 10 minutes through use of an automatic loader. Ammunition racks are large. The Slammer is ready for autonomous operation (without an FDC) if the target's location is known within 15 seconds of a halt, using GPS, inertial navigation, and an internal fire control computer. The Slammer is also capable of direct fire on the move.

M1992 North Korean 130mm Self-Propelled Gun System

Tiers:

System

Alternative Designation: M1992

Type: 130mm Self-Propelled Gun System

Muzzle Velocity: INA

Basic Load: 12 total of 170mm Projectiles

Maximum Effective Range: km60

Fire Control

Name: INA

Computerized FCS: Yes, There is a upgraded FCS compared to the M-1978, but there is very little information on North Korea Equipment

Thermal Sight Vehicle Commander: Yes, infra-red night vision equipment

Thermal Sight Gunner: Yes, infra-red night vision equipment

Main Gun Stabilization: Yes, Two large spades that are lowered to the ground manually before firing

Indirect Fire: Range drum

Direct Fire: INA

Collimator: K-1

Fire Control Computer: No

Fun Display Unit: No

Protection

Hull Armor: Open-mounted, providing no armored protection for its assumed 4-6 crew members.

Turret Armor: Open-mounted, providing no armored protection for its assumed 4-6 crew members.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: Yes, smoke screen by injecting diesel fuel into the exhaust outlet

IR Signature: INA

Notes:

The M-1978 (KOKSAN) 170mm self propelled (SP) gun, of North Korean design and manufacture, is probably mounted on a T-54 chasis, a Chinese Type 59 hull or a T62 Chassis [most sources tend towards the Type 59 tank chassis, the CHICOM derivative of the T-54]. The 170mm gun has no superstructure, and it has 2 large spades at the rear. The 170mm (~6.69") gun itself is a previously unknown type, possibly Russian coastal-defence or ex-naval weapon. The M-1978 Koksan gun was first noted publicly in a parade in 1985. The Koksan is named after the city in North Korea where it was first seen by the West in 1978. The M-1978 version carried no on-board ammunition supply

M109A2 American 155mm Self-Propelled Howitzer

Tiers:

Variants:

- **M109:** First produced in 1963. It had a 23 caliber 155 mm M126 gun in an M127 Howitzer Mount, and carried 28 rounds of 155 mm ammunition. It was also armed with a .50cal M2HB machine gun with 500 rounds of ammunition. Easily identified by its short barrel and a double baffle muzzle brake with a large fume extractor just behind it. Maximum range of 14,600 meters.
- **M109A1:** Replaced the M126 gun with a longer barreled, 39 caliber M185 gun, increasing maximum range to 18,100 meters.
- **M109A2:** Incorporated 27 Reliability, Availability, and Maintainability (RAM) mid-life improvements. Most notably, the long barreled 155 mm M185 cannon in the new M178 gun mount, ballistic protection for the panoramic telescope, counterbalanced travel lock, and the ability to mount the M140 alignment device. Stowage of 155mm rounds increased from 28 to 36 rounds; .50cal ammunition remained at 500 rounds. During M109A2 production, a slightly simplified version was also produced for export. This had minor internal changes and deleted the hull flotation feature. These were designated M109A1B.
- **M109A3 and M109A3B:** M109A1s and M109A1Bs rebuilt to M109A2 standard respectively. Some A3s feature three contact arm assemblies, while all A2s have five.
- **M109A4:** M109A2s and M109A3s improved with Nuclear, Biological, and Chemical / Reliability, Availability, and Maintainability (NBC/RAM) improvements, including air purifiers, heaters, and Mission Oriented Protective Posture (MOPP) gear. The traversing mechanism's clutch is hydraulic, as compared to the electric mechanism on previous M109s, and features a manual override in the event of an electrical failure. The A4 also adds an additional hydraulic filter, for a total of two. Also included is an improvement to the engine starting equipment, greatly improving the ability to start in an emergency. Ammunition amounts remain the same as two previous models.
- **M109A5:** Replaces the 155 mm M185 cannon in an M178 mount with a 39-caliber 155 mm M284 cannon in an M182 mount, giving the A5 a maximum range of 22,000 meters with unassisted projectiles and 30,000 meters with Rocket Assisted Projectiles (RAP Rounds). The vehicle can carry 36 complete rounds of ammunition and has a 440 hp engine instead of the standard 405 hp engine.
- **M109A5+:** Various manufacturers have upgraded the fire control and other components of the M109A5. BAE Systems in York PA recently delivered 12 M109A5+ vehicles to Chile and 32 for Brazil.
- **M109A6 "Paladin":** Overall product improvement in the areas of survivability, RAM, and armament. This includes increased armor, a redesigned internal arrangement for safer ammunition and equipment storage, engine and suspension upgrades, and product improvement of the M284 cannon and M182A1 mount. The greatest difference is the integration of an inertial navigation system, sensors detecting the weapons' lay, automation, and an encrypted digital communication system, which utilizes computer controlled frequency hopping to avoid enemy electronic warfare and allow the howitzer to send grid location and altitude to the battery fire direction center (FDC). The battery FDCs in turn coordinate fires through a battalion or higher FDC. This allows the Palladin to halt from the move and fire within 30 seconds with an accuracy equivalent to the previous models when properly emplaced, laid, and safed—a process that required several minutes under the best of circumstances. Tactically, this improves the system's survivability by allowing the battery to operate dispersed by pairs across the countryside and allowing the howitzer to quickly displace between salvos, or if attacked by indirect fire, aircraft, or ground forces. Ammunition storage is increased from 36 to 39 155 mm rounds.
- **M109 "KAWEST":** This Swiss improved version produced by Ruag incorporates a new Swiss-designed L47 155 mm gun with an increased firing range of up to 36 km. It features inertial navigation system coupled with a new gun-laying system and more ammunition storage(40 rounds, 64 charges). The KAWEST (lit. Kampfwertsteigerung = upgrade of combat capabilities) requires only 6 crew members instead of 8, and is able to fire 3-round bursts within 15 seconds or maintain a constant firing rate of over one round per minute.[9][10] Upgraded Swiss PzHb (Panzerhaubitze) 79 and 88

(M109A1) are known as respectively PzHb 79/95 and PzHb 88/95

- **M109L52:** Jointly developed by the Dutch firm RDM and the German firm Rheinmetall, the M109L52 was first revealed in 2002. The main improvement was replacing the M126 series gun with the longer 52-caliber cannon from the PzH 2000, thus the MTLS ammunition of the PzH 2000 can be used. In addition, improvements to the loading system were made. This resulted in an increase of the rate of fire to 9–10 rds/min from the original 3 rds/min, and this high rate of fire can be sustained for up to 2 minutes. A total of 35 rounds can be carried.
- **M109A3GNM:** The current version in service with the Norwegian Army's Artilleribataljonen. 126 M109Gs were acquired from West Germany between 1969–1971. They were then upgraded to the M109A3GN configuration during the latter half of the 1980s. In 2006, there were still 56 M109A3GNs in the Army's inventory, meaning that at least 70 SPGs had been scrapped after the end of the Cold War. 14 of the M109A3GNs received additional upgrades in 2007, and were designated M109A3GNM. The upgrade includes, among other things, new intercom and new navigation and positioning systems. The M109A3GNMs are currently the only SPGs that remain in active service with the remainder of the M109s having been put in storage.
- **K55/K55A1:** K55/K55A1 are South Korean variants of the M109A2 , originally named KM109A2 with additional domestic augmentations, license-produced by Samsung Techwin. They are fitted with M178 155 mm 39 caliber gun, NBC protection, automatic fire extinguishing system, and a modified ammunition reception module for K56 automatic ammunition resupply vehicle. The Performance Improvement Program variant, K55A1, is a complete domestic overhaul of the K55 which is further augmented by Samsung Thales with modern digital ballistic computers, multifunctional data display and controllers, GPS navigation and target acquisition system, wireless datalink equipment, and upgraded fire control storage battery and power supply unit, to closely match the US military's modernization of the Paladin into next-generation standard. Many improved technologies of the South Korean K9 Thunder were retrofitted on the K55A1. 1,040 howitzers of these variants were produced.
- **M109A7:** The newest M109 version for U.S. service is the M109A7, formerly known as the M109A6 Paladin Integrated Management (PIM). The M109A7 shares common components with the Bradley Fighting Vehicle such as the engine, transmission, and tracks. This creates commonality with other systems and maximizes cost-savings in production, parts inventory, and maintenance personnel. The M109A7's on-board power systems harness technologies originally developed for the Non-Line-of-Sight Cannon; the electric drive is faster than the previous hydraulic system, and the automatic rammer more consistently rams the round into the gun for consistent velocities and better accuracy. It features a 600-volt on-board power system to accommodate additional armor and future networking technologies as they become ready. The M109A7 can sustain a one-round per-minute rate of fire and a maximum rate of fire of four rounds per-minute.

System

Alternative Designation: M109A2

Date of Introduction: 1978

Proliferation: M109A2: About 836 were produced for the U.S. Army and Army National Guard. Austria [152] (M109A2/A3/A5Oe) Bahrain [20] (M109A5) Brazil [73] (37 M109A3, 36 M109A5+) Chile [36] (24 M109A3, 12 M109A5) Djibouti [10] (M109L) Denmark [24] (M109) Egypt [368] (164 M109A2, 204 M109A5) Germany [288] (M109A3G) Greece [195] (M109A1/A2/A3GEA1/A5) Iran [180] (M109) Iraq [2] (M109A1/A2) Israel [350] (M109A1/A2) Italy [124] (M109L) Jordan [253] (M109A1/A2) Kuwait [23] (M109A3) Latvia [47] (M109A5Oe) Libya [14] (M109) Morocco [127] (84 M109A1/A1B, 43 M109A2) Norway [54] (M109A3GN) Pakistan [430] (200 M109A2, 230 M109A5) Peru [12] (M109A2) Portugal [20] (6 M109A2, 14 M109A5) Saudi Arabia [110] (M109A1B/A2) South Korea [1,040] (M109A2 [K55/K55A1]) Spain [96] (M109A1/A5) Switzerland [200] (PzHb-66/74/79/88 [M109U]) Taiwan [225] (M109A2/A5) Thailand [20] (M109A2) United Arab Emirates [125] (M109A3) USA [1,594] (M109A1/A2/A6/A7)

In Service: 1978-Present

Type: Self-Propelled Howitzer

Crew: 6 (commander, gunner, 3 loaders, driver)

Chassis: The M108 and M109 shared a common chassis (along with the M113 APC), but the M109 was heavier and had a larger gun. The M108 proved unsuccessful, mainly due to its overly light gun.

Displacement Time: INA

Emplacement Time: INA

Note: Major changes from the M109A1 include a redesigned rammer and improved recoil mechanism, engine operation warning devices, a redesigned hatch and door latches, an improved hydraulic system and a bustle designed to carry an additional 22 rounds of ammunition.

Dimensions

Length, Hull: 6.19 m
Length, Gun Forward: 9.12 m
Width: 3.28 m
Height: 3.28 m
Weight: 24,948 kg
Ground Pressure: 0.83 kg/cm sq

Automotive

Engine Name: 1 x General Motors 8V-71T 569-cu in (9.32-liter) liquid-cooled, turbo-charged 2-stroke V-8 diesel
Engine Type: V-8 diesel
Engine Power: 405 hp at 2,300 rpm
Power-to-Weight Ratio: 16.23 hp/ton
Transmission: Allison ATD-XTG 411-2A (A3) or 411-4 with quick disconnect powershift crossdrive, 4 forward and 2 reverse gears
Range: km354
Speed, Maximum Road: km/h56
Speed, Average Cross: INA
Speed Maximum Swim: Not Amphibious
Side Slope: %30
Gradient: %60
Vertical Step: m0.53
Trench: m1.83
Fording Depth: m1.07
Fuel Capacity: 135 gal (511 liters)
Suspension: torsion bar, 7 road wheels, front drive, rear idler, no return rollers (all models except PIM)

Main Gun

↳*System*

Name: M185 155 mm/L39 howitzer
Type: Howitzer
Caliber: 155mm
Length: INA
Barrel Length: INA
Weight: INA
Cannon Groves: 48
Rifling: right-hand rifling with constant, 8.93-deg twist

Breech Type: Welin-step thread

Recoil System: hydropneumatic

Elevation: -3/+75 deg (-53/+1,333 mils)

Traverse: 360 deg (6,400 mils)

Maximum Firing Range: 14.6 km

Maximum Rate of Fire: 1 rd/min first hour; 4 rd in first 3 min max

Sustained Rate of Fire: 2 rpm

Note #1: This self-propelled artillery system is supported by an associated M992 armored ammunition supply vehicle. It is based on the same tracked chassis as the M109.

Note #2: This version mounts the longer M185 155-mm gun and incorporated elevation, traversing and suspension improvements.

Note #3: Other improvements include a more efficient muzzle brake, improved load assisting system and improved suspension. Maximum range of fire is 18.1 km with standard HE-FRAG projectile and 24 km with rocket-assisted projectile. IT is also capable of launching M712 Copperhead laser-guided rounds. These rounds are intended to engage high-value hostile targets, such as tanks, armored vehicles, artillery systems, radars, observation posts and so on. Most original M109 artillery systems were upgraded to this standard.

Note #4: The cab has a rear bustle rack which provides an increased ammunition stowage capacity.

↳*Ammunition (Option 1)*

Name: M864

Type: DPICM

Caliber: 155mm

Length: 35.3 in (898 mm)

Weight: 103.2 lb (43.80 kg)

Basic Load: 36 Rounds Total of any Combination Projectiles

Maximum Range: 22,000 m

Response Time: 11 min

↳*Ammunition (Option 2)*

Name: M483A1

Type: HE

Caliber: mm155

Length: 35.4 in (899 mm)

Weight: 102.5 lb (46.49 kg)

Basic Load: 36 Rounds Total of any Combination Projectiles

Maximum Range: 17,740 m

Response Time: 11 min

↳*Ammunition (Option 3)*

Name: M718

Type: RAAMS Long

Caliber: 155mm

Length: 30.7 in (781 mm)

Weight: 103.0 lb (46.71 kg)

Basic Load: 36 Rounds Total of any Combination Projectiles

Maximum Range: 17,740 m

Response Time: 11 min

Auxiliary Weapon System

↳*System*

Name: M2 Browning

Type: Heavy Machine Gun

Caliber: 12.7mm

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm12.7

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 500

Fire Control

Name: INA

Computerized FCS: Fire-control equipment includes an elbow telescope M118C for direct fire with a magnification of 4x and 10-degree field of view; panoramic telescope M117 for indirect fire and gunner's quadrant M1A1.

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: Yes

Night Vision Devices: Yes

Note: It has an all weather ballistic shield mounted over the panoramic telescope; counterbalanced travel lock and provisions for mounting the M140 alignment device.

Protection

Hull Armor: light alloy aluminum to protect against small-arms fire and shell splinters

Turret Armor: INA, the turret takes up the rear. On top of the turret, there is a small cupola, from which the commander operates. This cupola is also fitted with a 12.7 mm (.50) M2HB heavy machine gun.

Applique Armor: INA

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: none fitted

Smoke Equipment: INA

Fire Suppression: INA

Notes:

The M109A2 is a new production weapon which incorporated 27 mid-life improvements to the M109A1. The improvements provide for increased Reliability, Availability, and Maintainability (RAM) and safety characteristics as well as enhanced operational capabilities. Major changes from the M109A1 include a redesigned rammer and improved recoil mechanism, engine operation warning devices, a redesigned hatch and door latches, an improved hydraulic system and a bustle designed to carry an additional 22 rounds of ammunition. The M109A2 has the long tube M185 cannon installed in the M178 gun mount. The cab has a rear bustle rack which provides an increased ammunition stowage capacity. It has an all weather ballistic shield mounted over the panoramic telescope; counterbalanced travel lock and provisions for mounting the M140 alignment device. The M109A2 entered production at BMY Combat Systems in 1978, with first deliveries made early in 1979. The first production quantity of 103 vehicles was with FY77 funding. M109A2 pro 36 M109A2s were produced for the National Guard using FY82 funds.

M107 American 175mm Self-Propelled Gun (SPG)

Tiers:

Variants:

- **M110:** this is basically the same chassis, mounting a 203 mm howitzer instead of a 175 mm gun. Because both the M107 and M110 are fully-modular and thier weapons are easily interchangeable, M107s frequently became M110s - and vice-versa - in armies that operated both weapons.

System

Alternative Designation: M107

Type: Self-Propelled Gun (SPG)

Manufacturer: FMC Corp., Bowen-McLaughlin-York, General Motors Corp.

In Service: 1962-1984 (United States) The M107 is still in service in some armies.

Family: M107

Crew: 5 + 8 men

Chassis: M107/M110 chassis

Displacement Time: INA

Emplacement Time: min3

Resupply Truck: The remainder of the crew (8 x Soldiers) rode in accompanying M548 tracked cargo carriers or M992 FAASVs, some of which carried additional ammunition and supplies.

Dimensions

Length, Gun Forward: m11.25

Length, Hull: m3.45

Width: m3.15

Height: m3.47

Weight, Combat: tons28.2

Ground Pressure: 0.82kg/cm²

Automotive

Engine Name: General Motors 8V71T

Engine Type: Diesel

Engine Power: hp345

Gradient: deg60

Side Slope: deg30

Vertical Step: m1

Trench: m2.36

Fording Depth: m1

Fuel Capacity: liters1,100

Communications

Primary: INA

Main Gun

Note: The dominant recognition feature of the M107 is its 175 mm gun, which is thin, extremely long, and has a bull barrel. The gun sits atop a carriage in a slot that allows the tube to recoil rearward. This carriage is attached to a rotating mount at rear of the chassis, while the front of the carriage is attached to a pair of tall, narrow gun carriage cheeks by a pair of long pneumatic struts.

↳*System*

Name: M113 or M113A1 Gun

Type: mm175

Weapon Mount: M158 mount

Breech Type: Welin-step thread

Length, Barrel: 60 calibers

Loader Type: Manual

Maximum Rate of Fire: 2 rds/min

Normal Rate of Fire: 1 rd/2 min

Maximum Firing Range: km40

Muzzle Brake Type: No Muzzle Brake

Max Elevation: deg+65

Min Elevation: deg-2

Traverse Range: deg60

Traverse Left: deg30

Traverse Right: deg30

Recoil System: Hydropneumatic

Recoil Length: 711-1,778 mm

Fume Extractor: No

↳*Ammunition (Option 1)*

Name: M437A1

Type: HE

Caliber: mm175

Projectile Length: mm867

Projectile Weight: kg66.78

Muzzle Velocity: m/s914

Fuse Type: INA

Basic Load: 2 projectiles stored on the vehicle, with a Ammo resupply truck and 8 Soldiers positioned nearby.

↳*Ammunition (Option 2)*

Name: M437A2

Type: HE

Caliber: mm175

Projectile Length: mm867

Projectile Weight: kg66.87

Muzzle Velocity: m/s913

Fuse Type: INA

Basic Load: 2 projectiles stored on the vehicle, with a Ammo resupply truck and 8 Soldiers positioned nearby.

Fire Control

Name: INA

Computerized FCS: No

Thermal Sight Vehicle Commander: Infrared night vision devices

Thermal Sight Gunner: Infrared night vision devices

Main Gun Stabilization: Yes, hydraulically deployable spade.

Sights: M115 panoramic sight

Protection

Hull Armor: 20-mm (estimated) for the driver only

Turret Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: Yes, the hydraulically deployable spade can be used as a dozer blade.

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The M107 175mm self-propelled gun was used by the U.S. Army from the early 1960s through to the late 1970s. It was part of a family of self-propelled artillery that also included the M110. It was intended to provide long-range fire support in an air-transportable system. It was exported to several other countries including Germany, South Korea, Spain, Greece, Iran, Israel, Italy, the Netherlands, the United Kingdom, and Turkey. The M107's combat history in U.S. service was limited to the Vietnam War; it also saw extensive combat use in Israeli service. The M107 shared many components with, and in many cases was replaced by, later versions of the M110 8-inch howitzer. Although withdrawn from U.S. service in the late 1970s, it continues in service with some armies as of 2019. Video: https://www.youtube.com/watch?v=r8InZPRmQMU

2S19 Msta Russian 152mm Self-Propelled Howitzer (SPH)

Tiers:

Variants:

- **152 mm howitzer 2A65:** A towed version of the same gun.
- **1K17 Szhatie -:** A "laser tank" armed with a battery of lasers meant to disable optoelectronic systems; uses Msta-S chassis and turret.
- **2S33 "Msta-SM":** Improved version. Prototype.
- **2S19M1 (2000):** Improved version with automatic laying system and Glonass.
- **2S19M2 "Msta-SM2" (2013):** Improved version currently in production equipped with a new automatic fire control system which increases the rate of fire. Digital electronic maps are now available which significantly speeds up the terrain orientation in difficult geographical conditions and allows performing faster and more efficiently firing missions.
- **2S19M1-155 (2006):** 155mm export version of the 2S19M1, fitted with an L/52 gun with a range of 40+ km.
- **2S27 "Msta-K":** Wheeled variant (K = kolyosnij), based on a 8x8 truck chassis. There were several different prototypes, including one based on a KrAZ-ChR-3130 and two based on the Ural-5323 (with and without turret).
- **2S30 "Iset":** Improved version, prototype only.
- **2S35 "Koalitsiya-SV" -:** Project for a new artillery system for the Russian land forces (SV = sukhoputniye voyska). Early prototypes consisted of a 2S19 chassis with modified turret, fitted with an over-and-under dual autoloaded 152mm howitzer. Development of this variant was abandoned in favour of an entirely new artillery system using the same designation

System

Alternative Designation: 2S19M1 Msta-S

Estimated out of service date: 2038

Manufacturer: Uraltransmash

Type: Self-propelled howitzer

Family: Msta-S 2S19 family

Crew: ea5

Chassis: Modified T-72

Displacement Time: min1.5

Emplacement Time: min1.5

Navigation System: Yes, GNSS

Note: The 2S19 is rated a Tier 2 because it has been identified as one of the top 52 pieces of Russian Equipment.

↳*System*

Name: 152 mm 2A64 Long Barrel Gun

Type: mm152

Breech Type: Vertical sliding wedge

Manufacturer: Motovilikha Plants

Length, Barrel: 7,200m L/47

Weight: kg6,800

Loader Type: Automated

Max Rate of Fire: rds/min8

Sustain Rate of Fire: rds/min3-4

Muzzle Brake Type: Double baffle

Max Elevation: deg+68

Min Elevation: deg-3

Traverse Range: deg360

Range Finder Type: INA

Central Bore Evacuator: Yes

Travel Lock: Yes

TZM-K 2F66-1 Capable: Yes

Note # 1: Engage a target within 30 seconds of receiving target coordinates,

Note # 2: the 2S19 to fire all 152 mm howitzer ammunition in the Russian inventory, including those rounds designed for very old Soviet weapons such as the D-20.

↳*Ammunition (Option 1)*

Type: 152-mm Frag-HE, OF-72

Caliber: mm152

Muzzle Velocity: m/s864

Fuse Type: RGM-2 PD

Basic Load: 50 Total Rounds of any 152mm combination projectile

Maximum Effective Range: m24,700

Complete Projectile Weight (OF-45): kg43.56

↳*Ammunition (Option 2)*

Type: 152-mm Frag-HEAT, BP-540

Caliber: mm152

Muzzle Velocity: m/s655

Fuse Type: GPV-3 PD

Basic Load: 50 Total Rounds of any 152mm combination projectile

Maximum Effective Range: m27,000

Complete Projectile Weight: kg27

↳*Ammunition (Option 3)*

Type: 152-mm Frag-HE BB, OF-91

Caliber: 152

Muzzle Velocity: m/s828

Fuse Type: KZ-88 PD

Basic Load: 50 Total Rounds of any 152mm combination projectile

Maximum Effective Range: m29,000

Complete Projectile Weight (OF-61): kg42.86

Note: The 2S19 can fire the additional 152mm projectiles: 9K25 Krasnopol guided projectile and the 3-RB-30 radio jamming round

Coaxial Weapon System

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Weight (Gun Only): kg25
Weight (On Tripod): kg41
Weight (50-Round Belt): kg11
Length (Total): mm1,560
Action: Gas Operated
Feed System: 50-Round Belt
Sights: Iron Sights

↳*Ammunition*

Type: Rifle
Caliber: mm12.7 mm
Cartridge: 12.7×108mm
Muzzle Velocity: m/s845
Basic Load: ea500
Effective Firing Range (vs. Air Targets): m1,500
Effective Firing Range (vs. Ground Targets): m2,000

Fire Control

Name: Eectric and mechanical control system designated 2Eh46
Computerized FCS: Yes
Thermal Sight Vehicle Commander: Yes, PZU-5 or PZU-7 sight
Thermal Sight Gunner: Yes, Panoramic 1P22 sight and 1P23 direct fire set
Main Gun Stabilization: Yes, via the 2Eh46
Indirect Fire: 1P22 Panoramic Telescope (PANTEL)
Direct Fire: 1P23
Collimator: K-1
Ballistic Computer: Yes
Traverse: Semi-Automatic

Artillery Command and Control System: 1V12M Falstet artillery command and control system

Note: Returns the barrel to its firing line automatically after every shot

Protection

Hull Armor: INA

Turret Armor: INA

Armor Material: Rolled homogeneous armour that is further protected by Combination-K armour.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Built-in bulldozer blade: Yes

NBC Protection: Yes, System Sensor Radiation Device and chemical intelligence (PRRM)

Smoke Equipment: Yes, via the exhaust manifold

Grenade Launcher: Yes, six 81 mm Toucha 902B grenade launchers that fire the ZD-6 smoke grenade

Grenade Range: m200-300

Grenade Smoke Screen: 30 m wide and 10 m high for 60 seconds per grenade

Automatic fire suppression systems.: Yes

Camouflage system: Yes, Накидка or cape camouflage system

Camouflage IR Reduction: %30

Notes:

The 2S19 "Msta-S" (Russian: Мста, after the Msta River) is a 152.4 mm self-propelled howitzer designed by Soviet Union, which entered service in 1989 as the successor to the 2S3 Akatsiya. The vehicle is based on the T-80 tank hull, but is powered by the T-72's diesel engine. The Msta is a modern howitzer designed for deployment either as an unarmored towed gun, or to be fitted in armored self-propelled artillery mountings. Current production of the towed model is designated Msta-B, while the self-propelled model is the Msta-S (also known by the GRAU index 2S19). Development of the 2S19 started in 1980 under the project name Ferma. The prototype was known as Ob'yekt 316. The 2S19's standard equipment consists of a semi-automatic laying system 1P22, an automatic loader, an NBC protection system, passive night vision device for the driver, a wading kit, a dozer blade, a smoke generator and 81mm smoke launchers, 1V116 intercom system and a 16 kW generator AP-18D. In 2008 the Russian armed forces ordered an improved model with an automated fire control system. The 2A64 ordnance of the 2S19 can fire the following types of ammunition, among others: HE (24.7 km), HEAT-FS, HE-BB (28.9 km), HERA (36 km), smoke, chemical, tactical nuclear, illumination and cargo (ICM).The laser-guided round “Krasnopol” (of the 9K25 system) can also be launched, as well as the shorter "Krasnopol-M” which fits into the automatic loader. Msta-S howitzers were used by Russian Army to deliver artillery strikes against Chechen separatists during the Second Chechen War. Msta-S howitzers have also been used in the War in Donbass by the Ukrainian Army as well as pro-Russian separatists who captured one machine during the conflict.

M110 American 203mm Self-Propelled Howitzer (SPH)

Tiers:

Variants:

- **M110A1:** improved variant of the M110, fitted with a longer M201 203 mm/L37 howitzer. It entered service in 1971. Maximum range of fire was increased to 27 km. This self-propelled howitzer fires newly developed rocket-assisted, cluster projectiles, nuclear and chemical projectiles.
- **M110A2:** improved variant of the M110A1. It entered service in 1978 and was fitted with double muzzle brake. Maximum range of fire was increased to 29 km.

System

Alternative Designation: M110
Type: Main Battle Tank
Manufacturer: General Motors Corp.
In Service: 1961-Present
Family: M110 Series
Crew: 5 (commander, driver, 3 gunners)
Resupply Vehicle: + 8 in the associated M548 ammunition resupply vehicle.
Chassis: same universal tracked chassis as the M107 175 mm self-propelled gun.
Displacement Time: min1
Emplacement Time: min1
Note: Support crew of 8 men are carried by an escorting armored personnel carrier, which also transports ammunition for this SPH.

Dimensions

Note: This artillery system carries no defensive armament, except individual weapons carried by the crew.

Notes:

The self-propelled M-110 8-inch [203 mm] howitzer first entered service with the US Army in 1963. The vehicle itself transports only two projectiles and five men, while the remainder of the ammunition and the crew is on board a tracked M548. The M-110 Howitzer fired a 200-pound projectile out to almost 17 kilometers (16,800-meters). Designed to be part of a common family of weapons utilising the same chassis components, the M107 and M110 were essentially the same vehicle mounting different barrels. The hull of the M110 is identical to that of the M107 and is made of all-welded armour and high-tensile alloy steel with the driver at the front of the hull on the left, the engine to his right and the main armament at the rear. The M107 self-propelled 175-mm. gun and the M110 8-inch howitzer had identical carriages but different tubes. The 175-mm. gun fired a 174-pound projectile almost 33 kilometers. This impressive range made it a valuable weapon for providing an umbrella of protection over large areas. The 8-inch howitzer fired a 200-pound projectile almost 17 kilometers, plus being the most accurate weapon in the field artillery. The 8-inch howitzer was found with most division artilleries, and both the 8-inch howitzer and 175-mm. gun were with field force artillery. At field force the proportion of 8-inch and 175-mm. weapons varied. Since the weapons had identical carriages, the common practice was to install those tubes that best met the current tactical needs. One day a battery might be 175mm.; a few days later it might be half 175-mm. and half 8-inch.

M1975 North Korean 130mm Self-Propelled Gun

Tiers:

1 2 **3** 4

System

Alternative Designation: M1975
Type: Self-Propelled Gun
Chassis: This artillery system combines a modified version of a Soviet SM-4-1 130 mm towed coastal defense gun, mounted on a lightly armored tracked chassis.

Notes:

The M1975 is a North Korean 130 mm self-propelled gun. Its actual designation is unknown. The M1975 designation was allocated by a US Department of Defense. Number in the designation denotes the year when this system was first observed by US intelligence. This North Korean artillery system was adopted in the 1970s and is widely used to this day. As far as it is known the M1975 was not exported outside North Korea.

M-1985 North Korean 240mm Multiple Rocket Launcher

Tiers:

Variants:

- **Fadjr 3:** Fadjr 3 is an Iranian artillery rocket system, similar to the M1985. Iran have taken delivery of 9 M1985 artillery rocket systems from North Korea, based on the Isuzu 6x6 truck. It is understood that production technology has also been transferred to Iran. Iranian-built vehicles were based on a commercially available Mercedes-Benz truck chassis with 6x6 configuration. Production reportedly commenced in the 1990s.
- **M1991:** a more powerful North Korean artillery rocket system, fitted with 22 tubes for 240 mm rockets.

System

Alternative Designation: M-1985; M1985
Type: Multiple Rocket Launcher
Crew: ea5
Chassis: The M1985 MLRS is based on a Japanese Isuzu 6x6 truck. The same chassis is used for the North Korean 122 mm MLRS. This launcher pack can be also adapted to any suitable cross-country truck.
Displacement Time: 2
Emplacement Time: 2
Note: The M1985 is supported by a reloading vehicle, which carries one complete reload and is fitted with a crane. Reloading would normally be carried out well away from the firing position, to avoid counter-battery fire. A typical battery of the M1985 consists of five launching vehicles.

Notes:

The M1985 is a multiple launch rocket system, developed in the North Korea. It was first observed by US intelligence in 1985. Number in the designation indicates the year it was first observed. This artillery system was produced in quantity. According to some reports, North Korea has about 200 of these launchers in service. Large numbers of these systems are located north of the demilitarized zone and are targeted towards South Korea. The DPRK has about 500 various long-range artillery systems within range of Seoul. This artillery system has been exported to Iran. Despite simplistic appearance the M1985 is a very capable system. At the time of its introduction it was one of the most capable artillery rocket systems in the world. In some cases it even outperformed a contemporary Soviet Uragan and a US M270 MLRS. This artillery rocket system is intended to engage important enemy targets, such as concentrations of troops and armored vehicles, command posts, artillery batteries, radar sites, airfields, as well as other important targets. Range of this system allows to strike targets behind enemy lines. This rocket system can also engage hostile warships. The M1985 has 12 launching tubes for 240 mm unguided spin-stabilized rockets. The type is easily identified by its two rows of 6 tubes. A standard HE-FRAG warhead weights 90 kg and contains 45 kg of high explosives. Other types of warheads exist, including incendiary, smoke and chemical. It is claimed that maximum range of fire is 43 km. Operator can launch all rockets in full salvo, or just individual rocket manually. This artillery system can launch one rocket every 4 or 8 seconds. So it takes 48 to 96 seconds to launch all 12 rockets. Four manually-operated stabilizing jacks have to be lowered, prior to the rockets being launched. Elevation and traverse controls are also manually-operated. Vehicle can leaves firing position within 2 minutes. The M1985 MLRS is based on a Japanese Isuzu 6x6 truck. The same chassis is used for the North Korean 122 mm MLRS. This launcher pack can be also adapted to any suitable cross-country truck. Behind the vehicle cabin there is another cabin for the crew. This artillery rocket system is operated by a crew of around 5 men. The forward control cab accommodates 3 crew members, while the rest are seated in the rear cab. The M1985 is supported by a reloading vehicle, which carries one complete reload and is fitted with a crane. Reloading would normally be carried out well away from the firing position, to avoid counter-battery fire. A typical battery of the M1985 consists of five launching vehicles.

9A53-G Tornado Russian 122mm Multiple Rocket Launcher

Tiers:

Variants:

- **BM-21-1:** Launch vehicles are mounted on a family of Ural-4320 truck chassis
- **2B17 or also BM-21-1:** This upgrade was presented for the first time in 2003 and was developed by Motovilikha Plants from Perm. The system is fitted with a satellite navigation system NAP SNS, automated fire control system ASUNO, APP laying system and can fire a new generation of rockets with a range of 40 km (25 mi). The truck is the Ural-43201.
- **9P138 "Grad-1"::** lighter 36-round version, mounted on a six-by-six ZIL-131 chassis. The vehicle with supporting equipment (rockets, transporter 9T450 and re-supply truck 9F380) is referred to as complex 9K55. The 9P138 can only use "short-range" rockets with a range of 15 km (9.3 mi). It used to be known in the West as BM-21b or M1976.
- **BM-21V "Grad-V":** (NATO designation M1975): Developed for Soviet airborne troops in 1969. A GAZ-66B four-by-four truck chassis is fitted with a 12-round 122 mm rocket launcher. The vehicle is sturdy enough to be air-dropped. Parts of the vehicle such as the canvas cab roof can be taken off or folded down to reduce its size during transit. Like the BM-21, the BM-21V has stabilizing jacks on the rear of the vehicle for support when firing. The launch vehicle has the industrial index of 9P125.
- **9A51 "Prima":** 50-round launcher on a Ural-4320 5t chassis. The vehicle together with fire control equipment, the ammunition transporter TZM 9T232M and the new rocket 9M53F is referred to as complex
- **"Grad-P Light portable rocket system":** he complete system comprises a 9P132 [vi] single-round man-portable launcher (it can be reloaded and used again), a 9M22M 122 mm high-explosive fragmentation rocket and a fire control panel. The system was developed in the middle of the 1960s for Soviet special units and was used by Vietnamese forces at war with the US, under the designation DKZ-B. It was not accepted for regular service with the Russian Army, but it was and is still popular with paramilitary and guerrilla forces.
- **BM-21PD "Damba":** 40-round launcher mounted on Ural-375D or 43201 truck chassis. Developed for protection of naval bases against underwater infiltrations, uses special ammunition PRS-60 (Protivodiversionnyi Reaktivnyi Snaryad). The vehicle together with ammunition transporter is referred to as complex DP-62 "Damba".
- **A-215 "Grad-M":** 22-round naval version, entered service in 1978.
- **9K51M "Tornado-G":** an advanced version of the original BM-21 vehicle with sophisticated fire control system, satellite navigation, and automatic target aiming.
- **BM-21A "BelGrad":** This is a modernized version, based on a MAZ-631705 6×6 truck with 425 hp diesel engine TMZ-8424. Between the cab and the launcher there is another pack of 40 rockets. The system was evaluated from 1997 and entered service in 2001.

Notes:

The Tornado-G multiple launch rocket system (MLRS) is designed and manufactured by SPLAV Scientific Production Enterprise, a company based in Russia. It is an upgraded variant of the BM-21 Grad MLRS. The new rocket system is intended for use by the armed forces of Russia and foreign countries. Meant to replace the age-old BM-21 Grad launch system, the new MLRS will provide improved tactical capabilities over its predecessor. The Tornado-G rocket system is designed to destroy enemy fortifications and artillery systems with a high degree of precision. Equipped with automated targeting and navigation systems, the MLRS offers superior target engagement capabilities. The Tornado-G was demonstrated during the ARMY 2018 international defence exhibitions held in August 2018 in Kubinka, Russia. It also took part in the Victory Day Parade 2018 held in Saint Petersburg, Russia, in May 2018. SPLAV rolled out an upgraded version of rockets with enhanced warhead capabilities to be used on Tornado-G MLRS in August 2018.

Notes:

The SR5 is a Guided Multiple Launch Rocket System (GMLRS) designed and manufactured in China by the Company NORINCO (China North Industries Corporation). It is a universal launching platform adopting such technologies as canister launching, automatic loading and common-frame rocket launching. Featuring intensive and accurate firepower, high level of automation, rapid reaction and excellent maneuverability, the weapon can realize common-frame launching of 122mm and 220mm guided/unguided rockets to achieve a highly efficient combination of surface suppression and precision strikes. The SR-5 GMLRS was unveiled for the first time to the public with a scale model showed at Eurosatory defense exhibition in June 2012. The vehicle is now in service in the Chinese army since 2013. The Venezuela has ordered a total of 18 SR5 in 2012 and 6

vehicles were delivered in 2014 to Venezuelan Armed Forces.

Notes:

The BM-24 is a multiple rocket launcher designed in the Soviet Union. It is capable of launching 240mm rockets from 12 launch tubes. Versions of the BM-24 have been mounted on the ZIL-151 6x6 Truck chassis and the AT-S tracked artillery tractor, forming the BM-24T from the latter. Production began out of Automotive Factory no. 2 in 1947 Moscow. Israel operated one battalion, consisting of vehicles captured from Egypt in the Six-Day War. The battalion took part in the Yom Kippur War and the 1982 Lebanon War. The Soviet Army was equipped with BM-24 after WWII. The BM-24 multiple launch rocket system fired the powerful M-24F 240mm rockets, each carrying 27,4 kg of the explosive. In addition to the M-24F, the system could also fire the M-24FUD, having the lighter 18,4 kg shell, but with a longer 10600m range. The MS-24 and MS-24D, loaded with P-35 poison-gas, were also available. The system had 12 launch tubes located on a rotary frame, disposed on a stub pole at the vehicle rear. The lining and turning mechanisms were hand driven. The cabin and fuel tanks were protected from rocket's exhaust by steel skin plates. Two jacks were set against the soil before shooting to discharge the back axles springs and to stabilize the platform. The 95 hp engine permitted the BM-24 to reach a speed 55km/h on the highway and to have a range of up to 600 km.

Kung Feng VI Taiwanese 117mm Multiple Launch Rocket System

Tiers:

Variants:

- **Kung Feng I:** Prototype only. Never entered service.
- **Kung Feng II:** Prototype only. Never entered service.
- **Kung Feng III:** 126mm x 40 round launcher mounted on trailer.
- **Kung Feng IV Army:** 126mm x 40 (2x20 round) launcher mounted on CM-21 APC used by the ROC Army.
- **Kung Feng IV Marines:** 126mm x 40 (2x20 round) launcher mounted on LVTP-5 used by the ROC Marines.[
- **Kung Feng V:** Experimental version that did not enter service.
- **Kung Feng VI:** 117mm x 45 round launcher mounted on M52A1 truck. 2 types of rockets, A version carries either HE warhead or WP. B version came with air burst fuse and 6,400 6.4mm size steel balls, covering 30,000 sq meters.
- **Kung Feng Sea:** Naval version, mounted on destroyers to launch ECM chaff.

Notes:

The Kung Feng (Chinese: □□; pinyin: Gōngfēng; literally: 'worker bee') MLR series is a family of multiple rocket launcher systems used by the Republic of China (Taiwan). Of these weapon systems, the latest variant is the Kung Feng VI, which commenced development in 1975, and was formally revealed to the public during the Taiwan National Day Parade in 1981. The Kung Feng IV features two compartments of 20 launchers, adding to a total of 40 launchers altogether, and is able to fire all rockets within 16 seconds. Its 126mm rockets weigh 24.4 kilograms, are 0.91 metres long, and have a range of 10,500 metres. The Kung Feng VI resembles the Soviet BM-21 Grad, albeit with a smaller diameter size and greater number of launcher tubes. Each of the 45 117mm launcher tubes houses an A-type rocket, and the tubes are capable of firing all rockets within 22.5 seconds, with a destructive area of 800 by 600 metres. The A-type rockets are 2.166 metres long, weigh 42.64 kilograms, have a maximum range of 15,000 metres, and can be fitted with either high explosive or white phosphorus payloads. The Kung Feng IV began development in 1960 and was completed in 1975, and were placed atop M113 armored vehicles. Towed and self-propelled variants of the Kung Feng IV entered service in 1972 and 1976 respectively; the towed variants were initially attached to the chemical weapons artillery division. Because the Kung Feng IV launchers were comparatively small, they were modified to be placed atop various different vehicles, such as the M151 jeep and LVTP5-RL. By the year 2000, only the LVTP5-RL variants of the marine corps were in service. During the 1970s, the earlier developmental models of the Kung Feng VI rocket launchers only had a range of 10 kilometres, which made them less effective than the older Kung Feng IV launchers. Unsatisfied with the range of the launchers being inferior to that of those from other countries, chief of staff of the artillery forces Hau Pei-tsun requested that the Academia Sinica research and development division increase the range of the rockets to 22 kilometres, and develop designs that allow for the implementation of cluster bombs and airburst fuses. This development led to the B-type rockets which were completed but never entered service. As other countries further continued to improve their rocket systems, with post-Cold War 122mm rocket models pushing beyond ranges of 20 kilometres, the weapons development of the ROC armed forces gradually fell behind. Within the development process, the Kung Feng VI was initially planned to be placed on top of an M42 Duster chassis, however due to difficulties in procurement the M113 chassis was used instead, which was unable to properly bear the weight of the rocket system. Henceforth, the ROC army gave up on the prospects of implementing the Kung Feng VI on caterpillar tracks, and began working on placing them on M809 five tonne wheeled trucks, in addition to implementing the FAC-202R fire control apparatus in order to improve precision. The ROC armed forces quickly retired its Kung Feng IV launchers and replaced them with the newer VI model as it entered service, however at the same time the launchers were incapable of fast reloading and had no dedicated transport trailer. Upon firing, it took soldiers 15 minutes to manually load the next rockets before the Kung Feng VI could fire again. Because the Kung Feng VI had logistical requirements greater than that of non-traditional artillery units, not many units were manufactured. As of present the Kung Feng VI is still in service, however there are plans for the units to be mass-replaced by the Thunderbolt-2000 systems.

M1985 North Korean 122mm Multiple Rocket Launcher (MRL)

Tiers:

1 2 3 4

Variants:

- **BM-21-1:** Launch vehicles are mounted on a family of Ural-4320 truck chassis
- **2B17 or also BM-21-1:** This upgrade was presented for the first time in 2003 and was developed by Motovilikha Plants from Perm. The system is fitted with a satellite navigation system NAP SNS, automated fire control system ASUNO, APP laying system and can fire a new generation of rockets with a range of 40 km (25 mi). The truck is the Ural-43201.
- **9P138 "Grad-1"::** lighter 36-round version, mounted on a six-by-six ZIL-131 chassis. The vehicle with supporting equipment (rockets, transporter 9T450 and re-supply truck 9F380) is referred to as complex 9K55. The 9P138 can only use "short-range" rockets with a range of 15 km (9.3 mi). It used to be known in the West as BM-21b or M1976.
- **BM-21V "Grad-V":** (NATO designation M1975): Developed for Soviet airborne troops in 1969. A GAZ-66B four-by-four truck chassis is fitted with a 12-round 122 mm rocket launcher. The vehicle is sturdy enough to be air-dropped. Parts of the vehicle such as the canvas cab roof can be taken off or folded down to reduce its size during transit. Like the BM-21, the BM-21V has stabilizing jacks on the rear of the vehicle for support when firing. The launch vehicle has the industrial index of 9P125.
- **9A51 "Prima":** 50-round launcher on a Ural-4320 5t chassis. The vehicle together with fire control equipment, the ammunition transporter TZM 9T232M and the new rocket 9M53F is referred to as complex
- **"Grad-P Light portable rocket system":** he complete system comprises a 9P132 [vi] single-round man-portable launcher (it can be reloaded and used again), a 9M22M 122 mm high-explosive fragmentation rocket and a fire control panel. The system was developed in the middle of the 1960s for Soviet special units and was used by Vietnamese forces at war with the US, under the designation DKZ-B. It was not accepted for regular service with the Russian Army, but it was and is still popular with paramilitary and guerrilla forces.
- **BM-21PD "Damba":** 40-round launcher mounted on Ural-375D or 43201 truck chassis. Developed for protection of naval bases against underwater infiltrations, uses special ammunition PRS-60 (Protivodiversionnyi Reaktivnyi Snaryad). The vehicle together with ammunition transporter is referred to as complex DP-62 "Damba".
- **A-215 "Grad-M":** 22-round naval version, entered service in 1978.
- **9K51M "Tornado-G":** an advanced version of the original BM-21 vehicle with sophisticated fire control system, satellite navigation, and automatic target aiming.
- **BM-21A "BelGrad":** This is a modernized version, based on a MAZ-631705 6×6 truck with 425 hp diesel engine TMZ-8424. Between the cab and the launcher there is another pack of 40 rockets. The system was evaluated from 1997 and entered service in 2001.

Notes:

The M1985 122mm Multiple Rocket Launcher (MRL) is a North Korean version of the Russian BM-21 122mm Multiple Rocket Launcher (MRL). MRL 122 mm M1985: This is a more modern version, based on an Isuzu 6×6 truck and probably with a 40-round reload-pack mounted between the cab and the launcher The BM-21 "Grad" (Russian: БМ-21 "Град", lit. 'hail') is a Soviet truck-mounted 122 mm multiple rocket launcher. The weapons system and the M-21OF rocket which it fires evolved in the early 1960s and saw their first combat use in March 1969 during the Sino-Soviet border conflict. BM stands for boyevaya mashina (Russian: боевая машина – combat vehicle), and the nickname grad means "hail". The complete system with the BM-21 launch vehicle and the M-21OF rocket is designated as the M-21 field-rocket system. The complete system is more commonly known as a Grad multiple rocket launcher system. In NATO countries the system (either the complete system or the launch vehicle only) was initially known as M1964. Several other countries have copied the Grad or have developed similar systems. The M-21 field rocket system with a BM-21 launch vehicle (122 mm multiple rocket launcher (MRL) system) entered service with the Soviet Army in 1963 to replace the aging 140 mm BM-14 system. The launch vehicle consists of a Ural-375D six-by-six truck chassis fitted with a bank of 40 launch tubes arranged in a rectangular shape that can be turned away from the unprotected cab. The vehicle is powered by a water-cooled V-8 180 hp gasoline engine, has a maximum road speed of 75 km/h (47 mph), road range of up to 750 kilometers (470 mi), and can cross fords up to 1.5 m (4 ft 11 in) deep. The original vehicle together with supporting equipment (including the re-supply truck 9T254 with 60 rockets) is referred to by the GRAU index

"9K51"; the launcher itself has the industrial index of "2B5". In 1976, the BM-21 was mounted on the newer Ural-4320 six-by-six army truck. The three-member crew can emplace the system and have it ready to fire in three minutes. The crew can fire the rockets from the cab or from a trigger at the end of a 64-meter (210 ft) cable. All 40 rockets can be away in as little as 20 seconds, but can also be fired individually or in small groups in several-second intervals. A PG-1M panoramic telescope with K-1 collimator can be used for sighting. The BM-21 can be packed up and ready to move in two minutes, which can be necessary when engaged by counter-battery fire. Reloading is done manually and takes about 10 minutes. Each 2.87-meter (9 ft 5 in) rocket is slowly spun by rifling in its tube as it exits, which along with its primary fin stabilization keeps it on course. Rockets armed with high explosive-fragmentation, incendiary, or chemical warheads can be fired 20 kilometers (12 mi). Newer high explosive and cargo (used to deliver anti-personnel or antitank mines) rockets have a range of 30 kilometers (19 mi) and more. Warheads weigh around 20 kilograms (44 lb), depending on the type. The number of rockets that each vehicle is able to quickly bring to bear on an enemy target makes it effective, especially at shorter ranges. One battalion of eighteen launchers is able to deliver 720 rockets in a single volley. The system has lower precision than typical artillery and cannot be used in situations that call for pinpoint accuracy. It relies on a large number of shells dissipating over an area for a certain hit rate on specific targets. Nonetheless, because of the short warning time for the impact of the whole volley, the BM-21 is still considered an effective weapon.

Indirect Fire: PG-1M Panoramic Telescope (PANTEL)

Protection

NBC Protection: No

Self-Entrenching Blade: No

Smoke Equipment: No

Notes:

The Prima multiple launch rocket system is an improvement of the BM-21 Grad. It was adopted by the Soviet Army in 1988, however due to budget cuts, only a small number of these artillery systems were ever produced. Some sources claim that it is also in service with Kazakhstan. The Prima MLRS is also referred to as the 9K59, the launching vehicle is 9A51. It has 50 tubes for 122mm rockets. The older Grad has 40 tubes. It can fire all of the rockets developed for the BM-21 Grad, including cluster rockets with anti-tank or anti-personnel sub-munitions. Furthermore, new and more effective rockets have been developed for this system. The new 9M53F rocket with a separable HE-FRAG warhead is standard for this artillery system. The maximum range of fire is 21km. This and other new rockets can also be fired from improved Grad launchers. Rockets can be launched directly from the driver's cab or remotely from the vehicle. A full salvo of the Prima has 7-8 times better coverage and it spends 4-5 times less time in its firing position compared to the Grad.

Type 90 Chinese 122mm Multiple Launch Rocket System

Tiers:

Variants:

- **Type 90A:** This is an improved version. The major upgrades include the ability to launch all types of 122-mm unguided rockets to a maximum range of 25 mi (40 km), including high-explosive and high-explosive incendiary weapons, and the installation of a new computerized fire-control system with a GPS and north -finding device for greater accuracy. The panoramic sight on the left side of the launcher is retained for manual laying. A third improvement is a high level of automation for the operator. The command post vehicle can control a number of Type 90A systems by remote control.
- **Type 90B:** This is the latest variant of the system. The Type 90B system features a reconnaissance vehicle, as well as mobility and reliability improvements. Emplacement and displacement time is seven minutes. A standard Type 90B battalion would consist of three WZ 551 6 x 6 reconnaissance vehicles; battalion command vehicle based on a Mercedes-Benz 4 x 4 chassis; meteorological radar on two Steyr 4 x 4 vehicles; two Steyr 4 x 4 maintenance vehicles, one for mechanical and one for electronic maintenance; and three missile batteries.

System

Alternative Designation: Type 90
Type: Multiple Launch Rocket System
Caliber: 122mm
Chassis: Tiema SC2030 6 x 6 truck
Crew: INA
Displacement Time: Less than 10 min
Emplacement Time: Less than 10 min
Type 90 Battalion comprises: A typical Type 90 multiple launch rocket system battalion comprises the battalion headquarters and three firing units (companies). The battalion headquarter is equipped with: *A battalion command truck; *3 reconnaissance APC; *A meteorological radar truck; *A mechanical maintenance truck; *A electronic maintenance truck Each firing unit is equipped with: *A company command truck; *6 rocket launch trucks *6 reloading trucks

Dimensions

Length, Traveling: 9.84 m
Width, Traveling: 2.50 m
Height, Traveling: 3.25 m
Weight, Combat: 20,000 kg
Ground Clearance: 0.41 m

Automotive

Engine Name: INA
Engine Type: Air-Cooled Diesel
Engine Power: hp300
Cruising Range: km600
Speed, Maximum Road: km/h85
Speed, Average Cross: km/hINA
Speed Maximum Swim: Not Amphibious
Fording Depth: 0.90 m
Turning Radius: 12.00 m

Main Weapon System

↳*Launcher*

Name: INA
Type: The electrically powered launcher has four rows of 10 tubes mounted above each other on a rotating cradle assembly.
Elevation: 0% to +55%
Traverse: +/-102 deg
Azimuth Range: -102% to +1-2%
Stabilizers: The truck is equipped with two hydraulically operated stabilisers at rear which are lowered in preparation for the rocket launch.
Modes: The rocket launcher can be operated in manual, semi-automatic, or automatic modes. The electrical firing system fires the rockets in either single or in salvo with 0.5 seconds interval.
Operation: The launcher can be operated inside the driver's cab or remotely outside the vehicle.
Rate of Fire: 40 rds in 18-20 sec
Reloading Rack: The reloading rack located in front of the launcher can load the launcher in under 3 minutes.
Cover: The truck is equipped with a hydraulically operated foldable canvas cover, which covers the launcher and the reloading rack when the truck is in travelling mode.
Note: The vehicle is fitted with slope and gradient sensors, launcher elevation and and azimuth sensors, as well as GPS and computerised fire control system to ensure higher firing accuracy.

Missile

Rocket Type: The free rocket used by the WS-1 and WS-1B consists of the warhead and fuse, an FG-42/43 rocket motor and the tail section. The FG-42/43 rocket motor is a single chamber, solid rocket motor with an advanced hydroxy-terminated polybutadine (HTPB) composition rocket propellant. The rocket of the WS-2 system features four control surfaces in the middle section of the rocket for terminal guidance.

Warhead Type: The rocket can be fitted with various types of warheads including anti-armour/personnel submunition, blasting, fuel air explosive (FAE), and high-explosive (HE). The ZDB-2 blasting warhead is loaded with steel balls and prefabricated fragments. The SZB-1 submunition warhead is designed to destroy large area targets such as armour formation and infantry troops. When the SZB-1 submunition warhead detonates, around 500 bullets are expelled under high pressure.

Maximum Range: 40 km

Basic Load: 40 Rounds

Fire Control

Name: INA

Computerized FCS: Yes, The launcher is controlled by computer through a man-machine interface. Another interface connects to a battalion central command system. Instructions can be input directly from the interface or manually through push-buttons.

Direct Fire: Yes

Indirect Fire: Yes

Position Location System: Yes

Automatic Operating and Laying System: The automatic operating and laying system consists of five main subsystems: an HJ-1 mini-computer; launcher direction-finder (which requires less than 3 sec to display the launcher's magnetic azimuth angle); longitudinal and transversal slope sensors; launcher assembly elevation and traverse positi on sensors; and a special vehicle power supply interface unit.

Protection

Hull Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Type 90 is the second-generation truck-mounted 122mm 40-tube multiple launch rocket system developed by China North Industries Group Corporation (NORINCO) in the mid-1990s as a successor to the Type 81 122mm rocket system. The Type 90 has been promoted by NORINCO to the export market, but has yet received any order. The improved Type 90B was first revealed in 2004. The Chinese Type 90 122mm MLRS system utilizing/based on the Russian BM-21 Grad's launcher. The vehicle was developed as the replacement for the older Type 81, which it too had the same BM-21 Grad's launcher and entered PLA service around the early 1990's. The vehicle is based on the 2629 6X6 military truck, which is longer than the Type 81's. The increased length means that the vehicle can mount a reloading mechanism which contains a rack of 40 spare rockets. This is able to reload the launcher in a reported time of 3 minutes and allows the vehicle to remain in the fight for longer before having to withdraw to reload. The Type 90 fires 122mm fin-stabilised free rockets to a minimum range of 10~12km and a maximum range of 20~40km depending on the rocket type. The rocket can be fitted with various types of warheads including anti-armour/personnel sub-munitions, blasting, fuel air explosive (FAE), and high-explosive (HE). The PLA developed the Type 81 122mm 40-tube multiple launch rocket system based on the Soviet BM-21 Grad in the early 1980s. In the mid-1990s NORINCO revealed a new 122mm rocket system design known as Type 90. The biggest difference on the Type 90 is the reload

pack carrying 40 spare rockets, which can reload the rocket launcher within 3 minutes after the first launch, providing additional firepower with quick turnarounds. The launcher is mounted on the improved North-Benz 2629 6X6 truck, which possesses better performance compared to the Yanan SX2150 truck used by the Type 81. The Type 90 is also supported by a large formation of ground equipment including a battery command truck, rocket reloading trucks, reconnaissance APC, meteorological radar, and maintenance vehicles. Greater firing accuracy is ensured by the use of a computerized fire-control system integrated with GPS on the improved Type 90B. The weapon system could deliver intensive fire-power over a distance of 40km within a very short period. The weapon was designed to engage large area targets such as armour formation, airport, weapon storages, etc. NORINCO has developed a range of warheads for different purposes.

Haseb Iranian 107mm Multiple Rocket Launcher (MRL)

Tiers:

Variants:

- **Type 63 for mountain/airborne warfare:** This variant can be disassembled into manpack loads
- **Type 63 -1:** This variant's launcher is modified to four rows of three tubes; it has smaller road wheels. Tube construction is cast aluminum. The weight of the Type 63 -1 is reduced by 300 lb (136 kg) and it has a covered crew cabin.
- **Type 81:** This variant is a Type 63 on a turntable mounted on rear bed of 4 x 4 truck.
- **Iraqi 107-mm MRS:** The version is an Iraqi copy of the Type 63
- **South African 107-mm MRS:** South African 107-mm MRS
- **VTT-323:** The VTT-323 is the North Korean designation for the weapon.
- **107MM SP MRL 18 M1992:** North Korea Version
- **107MM SP MRL 24 M1992:** North Korea Version

Notes:

The Haseb Iranian 107mm Multiple Rocket Launcher (MRL) is a Iranian version of the Russian Type 63 The Type 63 multiple rocket launcher is a towed, 12-tube, 107mm rocket launcher produced by the People's Republic of China in the early 1960s and later exported and manufactured globally. Although no longer serving with active infantry units, the Type 63 is still in People's Liberation Army service with specialized formations such as mountain infantry units and special forces detachments. The Type 63 was widely used in the PLA until the late 1980s. It was adopted as the successor of the Type 50-5 of 102mm. China has also developed a Type 63 multiple rocket launcher of 130mm. The RPU-14 is a Soviet 140mm MRL of similar design to the Type 63. The launcher's 12 tubes are arranged in three removable rows of four each, mounted on a single-axle carriage with rubber tires. The Type 63 originally fired an 18.8 kilogram rocket (Type 63-2) with a 1.3 kilogram warhead.Ammunition for the Type 63 was later improved (Type 75 and Type 81 series), although the overall weight of the rocket remained the same. A fixed amount of propellant is contained in the rocket motor. The steel-cased rocket is stabilized with spin imparted by six angled nozzles in its base. Type 63 rockets may be launched without the launcher; improvised firing can employ tubing, rails or even dirt berms. The Type 63 was distributed on the basis of six per infantry regiment, or 18 per infantry division. For airborne and mountain units the lighter Type 63-I was developed. Both the Type 63 and its copies can be mounted on different kinds of armoured and unarmoured vehicles, for example the MT-LB, the Safir, the Mamba, the RG-32 Scout, the GAZ-66 and the M113.

Type 79 Chinese 305mm Anti-Tank Mine Laying Multiple Rocket Launcher

Tiers:

System

Alternative Designation: NA

Type: MRL Anti-Tank Mine Layer

Manufacturer: NORINCO began the project. It is unknown who completed the project.

Crew: INA

Passenger Capacity: NA

Maximum Effective Range: m2,600

Doctrinal Employment Consideration: Each Type 79 is deployed with 3 others to form a firing battery

Prime Mover: CA-30A, 6x6 truck

Weather Considerations: Can be used in temperatures from -40 degrees to +40 degrees Celsius

Mine Laying System

Type: Multiple-Rocket Launcher

Caliber: mm305

Number of Rockers per Salvo: 8

Rail System: Welded tubular steel launcher assembly frame

Reloading System: INA

Mines per Rocket: 10 (Type 69 plastic AT mines)

Maximum Area Covered by Full Battery Salvo: 600m x 350m

Time Required to Launch a Full Salvo: sec14

Elevation Range of Launcher: +4 - +50 degrees

Traverse Range: 95 degrees left and 45 degrees right

Muzzle Velocity: 185 m/s

Dimensions

Length: m6.44

Width: m2.27

Height: m2.93

Weight, Combat: Approximately 8,780kg

Smoke Equipment: No

Notes:

The Type 79 mine-laying rocket system, consisted of a tubular, welded steel launcher assembly frame mounted on the bed of a CA-30A 6 x 6 truck. The eight-round launcher could traverse 95 degrees left and 45 degrees right, with an elevation ranging from +4 degrees to +50 degrees. The sighting system was located on the left side of the launcher. Each rocket shell carried 10 Type 69 plastic anti-tank mines. A typical battery of four launchers was capable of laying down a minefield measuring 650m x 350m. Production of the missile and truck chassis has been completed. The missile production was started by Norinco, but finished by another company, presumably Chinese. The system is no longer reported in service with the People's Liberation Army (PLA). Ref; Military Periscope, July 2014.

Applique Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The Type 74 284-mm multiple rocket launcher fires heavy rockets that plant anti-tank mines. The system, mounted on the bed of a 6 x 6-wheel CA-30A truck, elevates and traverses a row of five rails. Each I-beam rail is 4.0 m long and holds a rocket above and below the rail. Each rocket carries 10 Type 69 or Type 70 plastic-case anti-tank mines. To lay a minefield covering 400 sq m, a battery of four Type 74 launchers fires a salvo of rockets each, planting 400 mines. All 10 rockets can be launched in 15 seconds. Note: NORINCO developed a newer solid propellant, 284 mm Type 85 mine-laying rocket shell. This has a maximum range of 3,500 m and contains 10 anti-tank mines. A complete battery salvo (4 launchers) has a laying zone of 700 × 500 m. The unguided solid propellant rockets are 2.6m long and weigh 156kg at launch. The vehicle cab is fitted with steel shutters that can be closed over the cab windows for blast protection. It accommodates two of the six crew members; the other four ride on an open bench seat behind the cab. Small stabilizing jacks are dropped from the rear of the truck bed to steady the vehicle during firing. The launcher entered service in the mid-1970s. It is no longer in production. There have been no known exports and NORINCO has ceased marketing the system, according to Jane's Armour and Artillery for Feb. 18, 2003. There are no known Type 74s in Chinese military service; the CA-30A truck utilized is obsolescent and no longer in production. However, it is possible that launchers could be fitted on a newer chassis in the future. Ref: Military Periscope, July 2014

Type 89 (PZH 89) Chinese 122mm Multiple Rocket Launcher

Tiers:

Variants:

- **Type 81:** The Type 81 is a 40-round launcher on 6 x 6 CQ261 Hong Yan truck chassis with 200-hp engine. The range for this system is 30 km. It is in service in China.
- **Type 83:** This is a 24-round launcher (two rounds of 12 tubes) on smaller 6 x 6 truck chassis.
- **Type 90:** Type 90 is similar to Type 81. It also has 40-round launcher on 6 x 6 truck -- in this case, the Tiema SC 2030 with 300-hp engine. The launcher can fire all 40 rockets in less than 20 seconds following two minutes for bringing the launcher into action. The HJ-1 computer is the core of the fully automatic mode, which also incorporates sensors for launcher elevation and azimuth, vehicle tilt and direction. Reload takes less than three minutes.

System

Alternative Designation: PHZ 89; PHZ89
Crew: ea5
Elevation Range: degrees0 - +55
Full Salvo Duration: sec20
Traverse Range: 66 degrees to the right and 102 degrees to the left

Commander: Has WG501 day periscope

Protection

Armor: Steel
NBC Protection: Yes
Smoke Equipment: INA

Notes:

The Chinese self-propelled 122mm multiple rocket launcher (MRL) is a well-armored tracked vehicle that carries a 40-tube array. The vehicle chassis is based on the Type 83 152mm self-propelled gun/howitzer. It appears very similar to the Soviet-designed BM-21 system. The MRL chassis is a low, tank-like hull with six unevenly spaced road wheels. The engine is located under the right side of the shallow glacis with the vehicle's driver under the left side. The rest of the crew is housed in an armored compartment at the rear, under the launcher. The crew compartment has two large vision blocks on each side and a rear door. On top of the hull, in place of the Type 83's large gun turret, the MRL has an elevating, traversable mount with four rows of 10 tubes. Salvo fire of all 40 rockets takes less than 20 seconds; the rockets can also be fired singly. Ahead of the launcher is a large automatic-reload magazine with an additional 40 rockets. The type was classified in 1989, although the 122mm, 40-round, rocket launcher is almost identical to the Russian 122mm BM-21 introduced in the 1960s. It is no longer marketed or produced. The MRL remains in service. Approximately 250 systems were produced, according MilitaryFactory.com (Feb. 28, 2016). Late model Type 89s have been modified to include a cover for the 40-round rocket pack. Additionally, the left rear side layer of the launcher has a fully enclosed and armored compartment. Ref: Military Periscope May 2017

↳

BM-27 Uragan Russian 220mm Multiple Rocket Launch (MRL)

Tiers:

Variants:

- **9P140 Uragan:** Standard variant on ZIL-135 truck
- **Uragan-1M:** Variant presented to the public in 2007; all processes are automated. Can also fire the 300 mm rockets of the BM-30 Smerch system. Reloading is simplified by substituting barrels; can be fitted with two banks of 6 300 mm launch tubes or 15 220 mm launch tubes. Deliveries to the Russian Army started as of September 2016
- **9A53 Uragan-U:** Successor with 2 × 15 launch tubes; presented in 2009 on 8×8 MZKT-7930. Thanks to its modular assembly the BM-30 Smerch and BM-21 Grad rockets can also be fired.
- **Bastion-03:** Prototype by Ukrainian company AvtoKrAZ, presented in 2010. Installed on a 6×6 truck type KrAZ-63221RA.

System

Alternative Designation: BM-27 Uragan, 9K57, BM-22, M1977

Type: 220mm Multiple Launch Rocket System

Chassis/Carriage: ZIL-135LM 8x8 wheeled

Manufacturer: Splav State Research and Production Enterprise

In Service: 1975-Present

Crew: ea4

Displacement Time: min3

Emplacement Time: min3

Note: The system consists of launch vehicles and transport/loaders, which enable the system to be reloaded. The system is not designed to withstand a lot of punishment, and is typically used to deliver a decisive strike before relocating.

Notes:

The BM-27 Uragan is a self-propelled multiple rocket launcher system designed in the Soviet Union. It began its service with the Soviet Army in the late 1970s, and was its first modern spin and fin stabilized heavy multiple rocket launcher. The BM-27 Uragan is capable of launching 220mm rockets from 16 launch tubes mounted on the rear of a ZIL-135 8x8 chassis. This vehicle is extremely similar to that used in the FROG-7 free flight rocket system. It has two gasoline engines that power its 20 tons to a maximum speed of 65 kilometers per hour. One engine drives the four wheels on the left of the truck, while the other engine drives the four wheels on the right. The ZIL-135 has eight wheel drive, but only the front and rear axles are used for steering. It has a maximum cruising range of 500 kilometers.

Variants:

- **BM-21-1:** Launch vehicles are mounted on a family of Ural-4320 truck chassis
- **2B17 or also BM-21-1:** This upgrade was presented for the first time in 2003 and was developed by Motovilikha Plants from Perm. The system is fitted with a satellite navigation system NAP SNS, automated fire control system ASUNO, APP laying system and can fire a new generation of rockets with a range of 40 km (25 mi). The truck is the Ural-43201.
- **9P138 "Grad-1"::** lighter 36-round version, mounted on a six-by-six ZIL-131 chassis. The vehicle with supporting equipment (rockets, transporter 9T450 and re-supply truck 9F380) is referred to as complex 9K55. The 9P138 can only use "short-range" rockets with a range of 15 km (9.3 mi). It used to be known in the West as BM-21b or M1976.
- **BM-21V "Grad-V":** (NATO designation M1975): Developed for Soviet airborne troops in 1969. A GAZ-66B four-by-four truck chassis is fitted with a 12-round 122 mm rocket launcher. The vehicle is sturdy enough to be air-dropped. Parts of the vehicle such as the canvas cab roof can be taken off or folded down to reduce its size during transit. Like the BM-21, the BM-21V has stabilizing jacks on the rear of the vehicle for support when firing. The launch vehicle has the industrial index of 9P125.
- **9A51 "Prima":** 50-round launcher on a Ural-4320 5t chassis. The vehicle together with fire control equipment, the ammunition transporter TZM 9T232M and the new rocket 9M53F is referred to as complex
- **"Grad-P Light portable rocket system":** he complete system comprises a 9P132 single-round man-portable launcher (it can be reloaded and used again), a 9M22M 122 mm high-explosive fragmentation rocket and a fire control panel. The system was developed in the middle of the 1960s for Soviet special units and was used by Vietnamese forces at war with the US, under the designation DKZ-B. It was not accepted for regular service with the Russian Army, but it was and is still popular with paramilitary and guerrilla forces.
- **BM-21PD "Damba":** 40-round launcher mounted on Ural-375D or 43201 truck chassis. Developed for protection of naval bases against underwater infiltrations, uses special ammunition PRS-60 (Protivodiversionnyi Reaktivnyi Snaryad). The vehicle together with ammunition transporter is referred to as complex DP-62 "Damba".
- **A-215 "Grad-M":** 22-round naval version, entered service in 1978.
- **9K51M "Tornado-G":** an advanced version of the original BM-21 vehicle with sophisticated fire control system, satellite navigation, and automatic target aiming.
- **BM-21A "BelGrad":** This is a modernized version, based on a MAZ-631705 6×6 truck with 425 hp diesel engine TMZ-8424. Between the cab and the launcher there is another pack of 40 rockets. The system was evaluated from 1997 and entered service in 2001.

Notes:

The BM-11 is a North Korean version of the Russian BM-21 The BM-21 "Grad" (Russian: БМ-21 "Град", lit. 'hail') is a Soviet truck-mounted 122 mm multiple rocket launcher. The weapons system and the M-21OF rocket which it fires evolved in the early 1960s and saw their first combat use in March 1969 during the Sino-Soviet border conflict. BM stands for boyevaya mashina (Russian: боевая машина – combat vehicle), and the nickname grad means "hail". The complete system with the BM-21 launch vehicle and the M-21OF rocket is designated as the M-21 field-rocket system. The complete system is more commonly known as a Grad multiple rocket launcher system. In NATO countries the system (either the complete system or the launch vehicle only) was initially known as M1964. Several other countries have copied the Grad or have developed similar systems. The M-21 field rocket system with a BM-21 launch vehicle (122 mm multiple rocket launcher (MRL) system) entered service with the Soviet Army in 1963 to replace the aging 140 mm BM-14 system. The launch vehicle consists of a Ural-375D six-by-six truck chassis fitted with a bank of 40 launch tubes arranged in a rectangular shape that can be turned away from the unprotected cab. The vehicle is powered by a water-cooled V-8 180 hp gasoline engine, has a maximum road speed of 75 km/h (47 mph), road range of up to 750 kilometers (470 mi), and can cross fords up to 1.5 m (4 ft 11 in) deep. The original vehicle together with supporting equipment (including the re-supply truck 9T254 with 60 rockets) is referred to by the GRAU index "9K51"; the launcher itself has the industrial index of "2B5". In 1976, the BM-21 was mounted on the newer Ural-4320 six-by-six army truck. The three-member crew can emplace the system and have it ready to fire in three minutes. The crew can fire the rockets from the cab or from a trigger at the end of a 64-meter (210 ft) cable. All 40 rockets can be away in as little as 20 seconds, but can also be fired individually or in small groups in several-second intervals. A PG-1M panoramic telescope with K-1

collimator can be used for sighting. The BM-21 can be packed up and ready to move in two minutes, which can be necessary when engaged by counter-battery fire. Reloading is done manually and takes about 10 minutes. Each 2.87-meter (9 ft 5 in) rocket is slowly spun by rifling in its tube as it exits, which along with its primary fin stabilization keeps it on course. Rockets armed with high explosive-fragmentation, incendiary, or chemical warheads can be fired 20 kilometers (12 mi). Newer high explosive and cargo (used to deliver anti-personnel or antitank mines) rockets have a range of 30 kilometers (19 mi) and more. Warheads weigh around 20 kilograms (44 lb), depending on the type. The number of rockets that each vehicle is able to quickly bring to bear on an enemy target makes it effective, especially at shorter ranges. One battalion of eighteen launchers is able to deliver 720 rockets in a single volley. The system has lower precision than typical artillery and cannot be used in situations that call for pinpoint accuracy. It relies on a large number of shells dissipating over an area for a certain hit rate on specific targets. Nonetheless, because of the short warning time for the impact of the whole volley, the BM-21 is still considered an effective weapon.

M-1993 North Korean 122mm Multiple Rocket Launcher (MRL)

Tiers:

Variants:

- **RM-70:** Basic model, as described.
- **RM-70/85:** Unarmored version of the RM-70, based on the Tatra T815 VPR9 8x8.1R truck with 265 hp engine T3-930-51. Combat weight: 26.1 t. Sometimes called RM-70M.
- **RM-70/85M:** Modernised vehicle with new fire control and navigation equipment, can use a new type of rocket with a range of 36 km. Slovakia has ordered 50 upgrade packages.
- **RM-70 Modular:** In December 2000, the Slovak Ministry of Defense and Delta Defence started the RM-70 Modular German-Slovak modernization project. RM-70 Modular allows this artillery system to launch either twenty-eight 122mm rockets, or six 227mm rockets as used on the M270 MLRS. This way the system became fully NATO interoperable. The truck cabin is entirely armored. The Slovak Republic signed for 26 upgraded artillery systems with the first one delivered on May 20, 2005. RM-70 Modular is being offered as an upgrade for RM-70 owners.
- **Vz.92 "Križan" VMZ:** Engineer vehicle, based on the Tatra T815 36.265 with a lightly armoured cabin. The vehicle comes in different configurations, the standard being a 40-round rocket launcher (for "Kuš" and "Krizhna-R" rockets), a mechanical mine layer for anti-tank mines (PT Mi-U or PT Mi-Ba-III) and two dispensers for anti-personnel mines (PP Mi-S1).
- **RM-70 Vampire:** Upgraded version integrated on a Tatra T-815-7 truck chassis powered by a Tatra T3C V8 engine with 270 kW of output, coupled with a Tatra 10 TS 210 N gearbox, with semi-automatic Tatra Norgen drive system and an additional gearbox Tatra 2.30TRS. It has a range of around 1,000 km (620 mi) and a top speed of 90 km/h (56 mph) with an armored and NBC-protected crew cabin.
- **LRSV-122 M-96 "Tajfun":** Modified version with 4 rows of 8 launch tubes on an unarmoured Tatra T813 truck. Like the M-77 Oganj and the Chinese Type 90A, the launcher and reloading pack are covered by a collapsible awning for protection and camouflage when traveling. Combat weight: 23.5 t. Only a very small number was built.

System

Alternative Designation: M-1993

Type: 122mm Multiple Rocket Launcher (MRL)

Crew: ea4-6

Mission: Main role of this artillery rocket system is to engage area targets, such as concentrations of troops and armored vehicles, artillery batteries, and other targets.

Chassis: The RM-70 uses chassis of the Tatra 813 8x8 truck.

Notes:

The M-1993 122mm Multiple Rocket Launcher is a North Korean version of the Czechoslovakian RM-70. The RM-70 (raketomet vzor 1970) multiple rocket launcher is a Czechoslovakian army version and heavier variant of the BM-21 Grad multiple rocket launcher, providing enhanced performance over its parent area-saturation rocket artillery system that was introduced in 1971 (the NATO designation is M1972). RM-70 was developed in Czechoslovakia as a successor for the RM-51, achieving initial operational capability with its Army in 1972. The launcher was being produced in Dubnica nad Váhom (Slovakia). Originally, it was sold to East Germany. After the Soviet Union collapse and the split of Czechoslovakia into the Czech Republic and Slovak Republic, it was sold to several states in Africa, America, Asia and Europe. RM-70 replaced the Ural-375D 6x6 truck by a Tatra T813 "Kolos" 8x8 truck as carrier platform for the 40-round launcher. The new carrier vehicle provides enough space for carrying 40 additional 122mm rockets pack for reload. Nevertheless, RM-70 performance remains near the same as Grad even in terms of vehicle's speed and range. This rocket launcher can fire both individual rounds and volleys, principally by means of indirect fire. It is designed for concentrated fire coverage of large areas (up to 3 hectares in one volley) by high explosive fragmentation shells. The fire is robust with almost 256 kg of explosives used in one volley of 40 rockets. The rockets used are either the original Soviet 9M22 and 9M28, or locally developed models. These are the JROF with a range of 20.75 km, the JROF-K with a range of 11 km, the "Trnovnik" with 63 HEAT-bomblets and with a range of 17.5 km, the "Kuš" with five PPMI-S1 anti-personnel mines or the "Krizhna-R" with 4 anti-tank mines PTMI-D and with a range of 19,450 m. The vehicle is provided with a central tyre pressure regulation system (to allow its adaptation to the nature of the traversed ground), a headlight with white light on the forward cab roof and, if necessary, with a snow plough SSP 1000 or a dozer blade BZ-T to arrange its own emplacement or to remove obstacles.

Type 63 Chinese 107mm Multiple Rocket Launcher (MRL)

Tiers:

Variants:

- **Type 63 for mountain/airborne warfare:** This variant can be disassembled into manpack loads
- **Type 63 -1:** This variant's launcher is modified to four rows of three tubes; it has smaller road wheels. Tube construction is cast aluminum. The weight of the Type 63 -1 is reduced by 300 lb (136 kg) and it has a covered crew cabin.
- **Type 81:** This variant is a Type 63 on a turntable mounted on rear bed of 4 x 4 truck.
- **Iraqi 107-mm MRS:** The version is an Iraqi copy of the Type 63
- **South African 107-mm MRS:** South African 107-mm MRS
- **VTT-323:** The VTT-323 is the North Korean designation for the weapon.
- **107MM SP MRL 18 M1992:** North Korea Version
- **107MM SP MRL 24 M1992:** North Korea Version

Notes:

The Multi-Barrel Rocket Launcher (MBRL) has 12 tubes arranged in three lines of four tubes each. All the tubes are parallel to each other and mounted co-axially on a cradle. Ammunition used with the MBRL is in the form of Rocket which consists of one piece. Warhead is attached with rocket motor. A fixed amount of propellant is contained in the rocket motor. The rocket is stabilized with a slow spin. The Type 63 (12-round) MRS is mounted on a rubber-tire split pole type carriage, while the Type 63-I is a packed model for airborne and mountain units. The Type 85 is a single manportable tripod-mounted launcher tube for use by special forces units. The NORINCO Type 81 (12-round) is mounted on a 4X4 truck, with a enlarged cab to accommodate the crew of four and 12 reload rounds. The vehicle suspension is locked for firing, and the entire system can be dismounted from the vehicle and placed on a tow carriage. The launcher can be fired from the cab or from a remote position. Several variants of North Korean design and manufacture are known to exist [which are evidently without a formal designation in the open literature], in addition to the basic configuration of 12 launch tubes in array of 3 rows of 4 tubes. Two other North Korean self-propelled versions exist: one with 18 tubes and one with 24 tubes. As with the Chinese variants, the North Korean 12-tube launcher can also be can be towed or mounted on a 4 leg stand, or mounted on any suitable wheeled or tracked vehicle. The Type 63 HE-Fragmentation Spin-Stabilized Rocket is an electrically initiated, rocket incorporating a high-explosive fragmentation warhead. It is normally fired from a trailer- or truck-mounted multiple launcher, but may also be fired from single-tube launchers mounted on small boats. It is a barrage weapon used against personnel and material. Rockets of early manufacture are painted battleship gray or dark green; later rockets are olive drab. The bourrelets and nozzle plate are unpainted. Markings, stenciled in black and providing manufacturing data and nomenclature, may vary on individual rockets. Setscrews lock the adapter to the warhead and the adapter and nozzle plate to the rocket motor. The nozzle closure screws over the base of the nozzle plate. A hole in the center of the nozzle closure is crimped around an insulated stud in the center of the initiator assembly, thus waterproofing the base of the rocket motor. The initiator assembly electrical contact is exposed through the center of the insulated stud. The nozzles are canted to provide spin. The Type 63-2 Rocket is an 18.8-kilogram (41.5-pound) rocket containing a main charge of TNT weighing 1.3 kilograms (2.9 pounds). The rocket is olive drab with black markings. The warhead is made of metal. The 107mm spin stabilized incendiary rocket contains an unknown amount of White Phosphorous (WP). The rocket is painted olive drab with black markings. The warhead is made of metal.

Type 90B Chinese 122mm Self-Propelled Multiple Launch Rocket System

Tiers:

Variants:

- **Type 90:** Standard Version
- **Type 90A:** able to fire unguided rockets, new computerised fire control, command post can lay and control Type 90A launchers units by remote control.

Notes:

The Type 90B is the second generation of Type 90 series MLRS (Multiple Launch Rocket System) of 122mm caliber. The weapon system is designed and manufactured by the Chinese Defense Company NORINCO. The first version of Type 90 MLRS was unveiled in the mid-1990s, followed by the Type 90B in 2004. The 122 mm Type 90B multiple launch rocket system is a mobile fire support system for the destruction of a variety of targets by means of multiple barrages of up to 40 rockets at a time. The Type 90B is able to be in combat position, to fire and leave its firing position in less than 7 minutes. A typical Type 90 multiple

launch rocket system battalion comprises the battalion headquarters and three firing units (companies). The battalion headquarter is equipped with: A battalion command truck; 3 reconnaissance APC; A meteorological radar truck; A mechanical maintenance truck; A electronic maintenance truck Each firing unit is equipped with: A company command truck; 6 rocket launch trucks 6 reloading trucks

Type 90A Chinese 122mm Multiple Launch Rocket System

Tiers:

Variants:

- **Type 90:** The Type 90 mounts a 40-round launcher on a Tiema SC2030 6X6 truck. The truck also carries a reload pack of 40 additional rockets; the launcher to be reloaded within 3 minutes.
- **Type 90B:** This is the latest variant of the system. The Type 90B system features a reconnaissance vehicle, as well as mobility and reliability improvements. Emplacement and displacement time is seven minutes. A standard Type 90B battalion would consist of three WZ 551 6 x 6 reconnaissance vehicles; battalion command vehicle based on a Mercedes-Benz 4 x 4 chassis; meteorological radar on two Steyr 4 x 4 vehicles; two Steyr 4 x 4 maintenance vehicles, one for mechanical and one for electronic maintenance; and three missile batteries.

System

Alternative Designation: Type 90A
Type: Multiple Launch Rocket System
Caliber: 122mm
Chassis: modified Mercedes-Benz 6 x 6 chassis, designated Tienna CX 2200
Crew: INA
Displacement Time: Less than 7 min
Emplacement Time: Less than 7 min
Type 90A Battalion comprises: A typical Type 90A battalion consists of a 6 x 6 battalion command vehicle, three 4 x 4 forward observation post vehicles and three missile batteries. Each battery consists of a command vehicle, six rocket launchers, six resupply vehicles and a maintenance vehicle.
Note: The command post vehicle can control a number of Type 90A systems by remote control.

Fording Depth: 0.90 m
Turning Radius: 12.00 m

Main Weapon System

↳*Launcher*

Name: INA
Type: The electrically powered launcher has four rows of 10 tubes mounted above each other on a rotating cradle assembly.
Elevation: 0% to +55%
Traverse: +/-102 deg
Azimuth Range: -102% to +1-2%
Stabilizers: The truck is equipped with two hydraulically operated stabilisers at rear which are lowered in preparation for the rocket launch.
Modes: The rocket launcher can be operated in manual, semi-automatic, or automatic modes. The electrical firing system fires the rockets in either single or in salvo with 0.5 seconds interval.
Operation: The launcher can be operated inside the driver's cab or remotely outside the vehicle.
Rate of Fire: 40 rds in 18-20 sec
Reloading Rack: The reloading rack located in front of the launcher can load the launcher in under 3 minutes.
Cover: The truck is equipped with a hydraulically operated foldable canvas cover, which covers the launcher and the reloading rack when the truck is in travelling mode.
Note: The vehicle is fitted with slope and gradient sensors, launcher elevation and and azimuth sensors, as well as GPS and computerised fire control system to ensure higher firing accuracy.

↳*Missile*

Rocket Type: The free rocket used by the WS-1 and WS-1B consists of the warhead and fuse, an FG-42/43 rocket motor and the tail section. The FG-42/43 rocket motor is a single chamber, solid rocket motor with an advanced hydroxy-terminated polybutadine (HTPB) composition rocket propellant. The rocket of the WS-2 system features four control surfaces in the middle section of the rocket for terminal guidance.
Warhead Type: The rocket can be fitted with various types of warheads including anti-armour/personnel submunition, blasting, fuel air explosive (FAE), and high-explosive (HE). The ZDB-2 blasting warhead is loaded with steel balls and prefabricated fragments. The SZB-1 submunition warhead is designed to destroy large area targets such as armour formation and infantry troops. When the SZB-1 submunition warhead detonates, around 500 bullets are expelled under high pressure.
Maximum Range: 40 km

Basic Load: 40 Rounds

Fire Control

Name: INA

Computerized FCS: Yes, The launcher is controlled by computer through a man-machine interface. Another interface connects to a battalion central command system. Instructions can be input directly from the interface or manually through push-buttons.

Direct Fire: Yes

Indirect Fire: Yes

Position Location System: Yes

Automatic Operating and Laying System: The automatic operating and laying system consists of five main subsystems: an HJ-1 mini-computer; launcher direction-finder (which requires less than 3 sec to display the launcher's magnetic azimuth angle); longitudinal and transversal slope sensors; launcher assembly elevation and traverse positi on sensors; and a special vehicle power supply interface unit.

Notes:

The M1991 is a 240mm Multiple Rocket Launcher System (MRLS) uses by the North Korean Armed Forces. The vehicle was first seen in 1991 and received the name of M-1991 which indicates the year that it was first observed by United States intelligence. The system fires the same 240 mm calibre unguided rockets as the M1985 and has similar HE, smoke, incendiary and chemical warhead capabilities. The M-1991 is only used by the North Korean army. In February 2012, North Korea announced an upgrade the previous model of its 240-millimeter rocket launchers, and named them 'Juche 100 Guns,' after the North's primary ideology of self-reliance. North Korea is expected to unveil the Juche 100 to the public during a massive military parade on April 15, 2012, during the 100th birthday of the North's founder Kim Il-sung. M1991 Multiple Rocket launcher System is assigned to MRLS battalions comprising three batteries, each of five 240 mm MRLS'.

RM-70 Czechoslovakian 122mm Multiple Rocket Launcher (MRL)

Tiers:

1 2 3 4

Variants:

- **RM-70:** Basic model, as described.
- **RM-70/85:** Unarmored version of the RM-70, based on the Tatra T815 VPR9 8x8.1R truck with 265 hp engine T3-930-51. Combat weight: 26.1 t. Sometimes called RM-70M.
- **RM-70/85M:** Modernised vehicle with new fire control and navigation equipment, can use a new type of rocket with a range of 36 km. Slovakia has ordered 50 upgrade packages.
- **RM-70 Modular:** In December 2000, the Slovak Ministry of Defense and Delta Defence started the RM-70 Modular German-Slovak modernization project. RM-70 Modular allows this artillery system to launch either twenty-eight 122mm rockets, or six 227mm rockets as used on the M270 MLRS. This way the system became fully NATO interoperable. The truck cabin is entirely armored. The Slovak Republic signed for 26 upgraded artillery systems with the first one delivered on May 20, 2005. RM-70 Modular is being offered as an upgrade for RM-70 owners.
- **Vz.92 "Križan" VMZ:** Engineer vehicle, based on the Tatra T815 36.265 with a lightly armoured cabin. The vehicle comes in different configurations, the standard being a 40-round rocket launcher (for "Kuš" and "Krizhna-R" rockets), a mechanical mine layer for anti-tank mines (PT Mi-U or PT Mi-Ba-III) and two dispensers for anti-personnel mines (PP Mi-S1).
- **RM-70 Vampire:** Upgraded version integrated on a Tatra T-815-7 truck chassis powered by a Tatra T3C V8 engine with 270 kW of output, coupled with a Tatra 10 TS 210 N gearbox, with semi-automatic Tatra Norgen drive system and an additional gearbox Tatra 2.30TRS. It has a range of around 1,000 km (620 mi) and a top speed of 90 km/h (56 mph) with an armored and NBC-protected crew cabin.
- **LRSV-122 M-96 "Tajfun":** Modified version with 4 rows of 8 launch tubes on an unarmoured Tatra T813 truck. Like the M-77 Oganj and the Chinese Type 90A, the launcher and reloading pack are covered by a collapsible awning for protection and camouflage when traveling. Combat weight: 23.5 t. Only a very small number was built.

System

Alternative Designation: RM-70

Type: 122mm Multiple Rocket Launcher (MRL)

Crew: ea4-6

Mission: Main role of this artillery rocket system is to engage area targets, such as concentrations of troops and armored vehicles, artillery batteries, and other targets.

Chassis: The RM-70 uses chassis of the Tatra 813 8x8 truck.

Displacement Time: INA

Emplacement Time: INA

Dimensions

Hull Armor: Vehicle has an armored cab. It provides protection against small arms fire and artillery shell splinters.

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The RM-70 (raketomet vzor 1970) multiple rocket launcher is a Czechoslovakian army version and heavier variant of the BM-21 Grad multiple rocket launcher, providing enhanced performance over its parent area-saturation rocket artillery system that was introduced in 1971 (the NATO designation is M1972). RM-70 was developed in Czechoslovakia as a successor for the RM-51, achieving initial operational capability with its Army in 1972. The launcher was being produced in Dubnica nad Váhom (Slovakia). Originally, it was sold to East Germany. After the Soviet Union collapse and the split of Czechoslovakia into the Czech Republic and Slovak Republic, it was sold to several states in Africa, America, Asia and Europe. RM-70 replaced the Ural-375D 6x6 truck by a Tatra T813 "Kolos" 8x8 truck as carrier platform for the 40-round launcher. The new carrier vehicle provides enough space for carrying 40 additional 122mm rockets pack for reload. Nevertheless, RM-70 performance remains near the same as Grad even in terms of vehicle's speed and range. This rocket launcher can fire both individual rounds and volleys, principally by means of indirect fire. It is designed for concentrated fire coverage of large areas (up to 3 hectares in one volley) by high explosive fragmentation shells. The fire is robust with almost 256 kg of explosives used in one volley of 40 rockets. The rockets used are either the original Soviet 9M22 and 9M28, or locally developed models. These are the JROF with a range of 20.75 km, the JROF-K with a range of 11 km, the "Trnovnik" with 63 HEAT-bomblets and with a range of 17.5 km, the "Kuš" with five PPMI-S1 anti-personnel mines or the "Krizhna-R" with 4 anti-tank mines PTMI-D and with a range of 19,450 m. The vehicle is provided with a central tyre pressure regulation system (to allow its adaptation to the nature of the traversed ground), a headlight with white light on the forward cab roof and, if necessary, with a snow plough SSP 1000 or a dozer blade BZ-T to arrange its own emplacement or to remove obstacles.

The M-1985 122mm multiple rocket launcher (MRL) is a 40 round, North Korean produced launcher mounted on an Isuzu truck. MRL 122 mm M1985: This is a more modern version, based on an Isuzu 6×6 truck and probably with a 40-round reload-pack mounted between the cab and the launcher

Lynx Israeli Multiple Rocket Launcher (MRL)

Tiers:

1 **2** 3 4

Variants:

- **Azerbaijan Lynx:** Indigenous MRL/missile TEL with Lynx launcher on 8x8 Kamaz-6350 truck. With autonomous FCS, it launches 122 / 160 mm rockets, or EXTRA ballistic missiles
- **Naiza:** Kazakh import/production MRL with Lynx for LAR-160 on Kamaz truck
- **LAROM:** Romanian 2-module MRL can launch 122-mm Grad or LAR-160 rockets

System

Alternative Designations: NA

Crew: 3-6

Chassis/Carriage: Various to include helicopters

Primary Components: Transporter-erector-launcher (TEL) and Mobile Command Post (MCP) van. Reload Modules will be trans-loaded at a TL point from a trans-loader truck with four modules, to service two launchers

Operational Range: Missile dependent. The LAR-160 has a max range of 45km. See other missile data in "Ammunition"

Reload Time: mins5

Time Required to Launch All Rockets: secsLess than 60

Dimensions

Height: INA

Length: INA

Width: INA

Weight: INA

Automotive Performance

Note: Dependent on users choice of platform

Ammunition

↳*LAR 160*

Minimum Indirect Fire Range (km): 10

Maximum Indirect Fire Range (km): 45

Warhead Weight (kg): 110

Rocket Length (m): 3.48

Rocket Diameter (mm): 160

Maximum Velocity (m/s): 1022

Warhead options: Frag-HE/PD or DPICM with time-fuze dispense

Note: The LAR-160 Rocket is a modern free flight, fin-stabilized, solid propellant, surface-to-surface 160mm artillery rocket packed in a launch pod.

↳*GRADLAR*

Description: Israeli upgrade package with improved FCS converts MRLs for modules of 122-mm Grad rockets and 21-45 km range. Any type of Grad 122-mm rocket can be used.

↳*LAR-160 or LAR*

Description: 160-mm rocket (13 per module) with a 45-km range. The warhead is a canister; to carry Frag-HE, sub-munitions, or any 155-mm round

↳*AccuLAR*

Description: ACCULAR is an autonomous, surface-to-surface GPS guided rocket based on IMI's LAR-160 artillery rocket. The missile has a range of 14-40 km, a diameter of 160 mm, a length of 3995 mm and a hit accuracy CEP of 10 meters. The missile's guidance and navigation is performed by a Flight Computer (FC), which includes a GPS. The IMI jet thruster kit controls the missile by establishing a trajectory correction for precise target engagement. Range – 40 km Hit Accuracy – 10 meters CEP Navigation – GPS Warhead – 35 kg Number of Rockets/POD – 11

↳*EXTRA (Extended Range Artillery)*

Description: The 300mm ballistic missile (4/launch module) ranges 150 km with a 10-m CEP. It has a 120-kg payload, and flies a ballistic trajectory, corrected with GPS. Various warheads are offered.

↳*Delilah*

Description: This cruise missile has a length of 3.2 m, weighing 230 kg. It cruises at Mach 0.3-0.7, and 8,600 m altitude. It can be launched from ships, aircraft, and the Lynx ground launcher (GL) to 250 km, with programmable guidance, and multiple waypoints. Delilah-GL has launch assist. Air, ship, and helicopter versions are offered. The missile uses GPS homing, or can loiter and use a CCD/FLIR seeker to home to target.

Fire Control

Collimator: INA

Fire Control Computer: Yes. System uses a modern C3I suite. The launcher is operated by a computerized fire-control system, which is fully integrated with the ACCS, so enabling each one to operate as a one-gun battery

Position Location System: GPS navigation

Additional Notes: Guided Rockets and missiles on Lynx and other MRLs/TELs can use the Trajectory Correction System (TCS). TCS can control >12 rockets/missiles equipped for Inertial/GPS guidance, vs 12 separate targets. Accuracy is 10 m. India tested TCS on the Pinaka MRL, and uses it in the recently tested Prahaar SRBM.

Protection

Note: Platform dependent

Notes:

Lynx is a multiple rocket launcher system developed and manufactured by Israel Military Industries (IMI) and used by Israel Defense Forces and other countries (Lynx is both the launcher module which can fit on various mounts, and the name of the Israeli launcher-vehicle system). It can be configured to carry a variety of rockets in two sealed pod containers: 40 (2 pods x 20 rockets each) 122mm Grad rockets; or 26 (2x13) 160mm LAR-160 or ACCULAR rockets; or eight (2x4) 306mm EXTRA rockets; or four (2x2) Predator Hawk tactical ballistic missiles; or two (2x1) Delilah missiles. The Lynx's sophisticated fire control system has been designed to automatically identify the sealed pod container rocket to set firing properties accordingly. The Lynx can be mounted on several different types of prime movers to include the AMX-13, helicopters, and the HMMWV. Note: The LAR (Light Artillery Rocket) family of systems includes launchers for any rocket regardless of length, diameter, weight, range or payload designed to meet load-carrying capacity. It is flexible, supporting 8, 10, or 13 rockets in 1 or 2 sealed launch pod containers.

Smoke Equipment: No

Notes:

The M77 is configured and operated in the same manner as the Czechoslovakian 122mm (40 round) multiple rocket launcher RM-70. The launcher is mounted over the rear axles with the reloader located behind the cab. During reloading, the launcher is rotated to the rear, two hydraulic cylinders raise the reloader, and then the rockets are pushed into the launcher. Unlike the RM-70, the M77 uses hydraulic cylinders rather than a sprocket and chain drive mechanism. The modified FAP2026 truck has four hydraulically emplaced firing jacks to provide firing stability. The rockets can be fired from inside the cab or with a remote-firing device. The M77 MRL is capable of mounting an antiaircraft machine gun for protection.

BM-1 Russian (Type 85, Chinese) 107mm Single Launch Surface to Surface Rocket System

Tiers:

1 2 3 4

System

Basic Load: NA
Armor Penetration: INA
Arming Mechanism: Spinning
Accuracy: Within 336m x 160m

Fire Control

Note:: INA, however appears to use direct lay or iron sights with range indicators

Notes:

The BM-1 is a Russian made, Single Launch Rocket System and is a single man-portable, tripod-mounted, launcher tube for 107 mm rockets which is designed for use by commando, guerrilla or special forces units. There is very little information available about this system however, photos and host nation news articles confirm their existence and use by guerrilla forces. The Type 85 is a Chinese made, single, man-portable tripod-mounted launcher tube for use by special forces units. The name “Katyusha” (Russian translation: “Little Katy”) was originally used by Soviet soldiers during World War II to refer to 82 mm and 132 mm rockets used by USSR forces. Today, however, reporters and analysts alike use the term for most of Hezbollah’s unguided artillery rockets fired from or designed for multiple rocket launchers (MRLs). According to a 2006 report, Hezbollah was estimated to hold between 7,000-8,000 107 mm and 122 mm Katyusha rockets, although this number has increased since.

2K6 Luna (FROG-5) Russian Artillery Rocket System

Tiers:

Variants:

- **FROG 3:** with 3R9 missile
- **FROG-7:** From 1965, the 2K6 Luna was replaced by the far more successful 9K52 Luna-M, which was known in the West as the FROG-7.

Notes:

The 2K6 Luna (Russian: Луна; English: moon) is a Soviet short-range artillery rocket complex. Luna rockets are solid-fuel, unguided and spin-stabilized. "2K6" is its GRAU designation. Its NATO reporting names are FROG-3 (with 3R9 missile) and FROG-5 (with 3R10 missile). From 1965, the 2K6 Luna was replaced by the far more successful 9K52 Luna-M, which was known in the West as the FROG-7. The Luna system was developed in NII-1 from 1953, under the supervision of N. P. Mazurov. Luna followed the earlier designs 2K1 Mars and 2K4 Filin. While NII-1 was responsible for the rocket, the launch and transporter-loader vehicles were designed by TsNII-58. The initial system name was S-125A "Pion". In 1957 the prototypes of the launch vehicle (SPU S-123A on Ob'yekt 160 chassis), the transloader (TZM S-124A on Ob'yekt 161 chassis) and the 3R5 rocket were ready for evaluations. These were carried out in 1958 in Kapustin Yar and in 1959 in the Transbaikal Military District. As a result of these evaluations, it was decided to abandon the TZM, to improve the SPU and to redesign the rocket. This led to the development of the 3R9 and 3R10 rockets. The decision to start series production was taken on 29 December 1959. The first five systems were ready in January 1960 after which the state acceptance trials were carried out until March of that same year. In 1960 the Luna system entered service with the Soviet Army where it remained until 1982. From 1960 till 1964, a total of 432 SPU 2P16s were produced. In the first year alone, 80 launch vehicles and 365 rockets were finished. he missile complex consisted of: * the launch vehicle SPU 2P16 (Ob'yekt 160), based on a modified PT-76B chassis with return rollers and fitted with a launch rail, elevation mechanism, stabilizing jacks and a generator. Combat weight was 18 t; * the rocket 3R9 with conventional HE warhead 3N15 and with a range of 12 to 44.6 km, * the rocket 3R10 with a 400 kg nuclear warhead 3N14 and with a range of 10 to 32.1 km; * a 2U663 missile transporter, based on the ZiL-157V, with 2 missiles; * a 2U662 vehicle to transport and store nuclear warheads; * a mobile crane ADK K52 (on MAZ-502), ADK K61 (on MAZ-200) or 9T31 (on Ural-375); * sets of maintenance vehicles PRTB-1, 2U659 etc.; * control and command vehicle PU-2 and * a training set with training rocket PV-65 or 3R11 with training warhead 3N16. There have been a couple of variants of the launch vehicle, for example the 2P21, also known as Br-226-II, on ZiL-134 8x8 truck, but these never entered service.

M1985 North Korean 240mm Multiple Launch Rocket System

Tiers:

Variants:

- **Fadjr 3:** Is an Iranian artillery rocket system, similar to the M1985. Iran have taken delivery of 9 M1985 artillery rocket systems from North Korea, based on the Isuzu 6x6 truck. It is understood that production technology has also been transferred to Iran. Iranian-built vehicles were based on a commercially available Mercedes-Benz truck chassis with 6x6 configuration. Production reportedly commenced in the 1990s.
- **M1991:** A more powerful North Korean artillery rocket system, fitted with 22 tubes for 240 mm rockets.

System

Alternative Designation: M1985
Type: 240mm Multiple launch rocket system
Crew: ea5
Chassis: The M1985 MLRS is based on a Japanese Isuzu 6x6 truck. The same chassis is used for the North Korean 122 mm MLRS. This launcher pack can be also adapted to any suitable cross-country truck.

Notes:

The North Koreans have produced two different 240mm rocket launchers, the 12 round M-1985 and 22 round M-1991. The M-1985 rocket pack is easily identified as it has 2 rows of 6 tubes and is mounted on a cab behind engine chassis. The M-1991 is mounted on a cab over engine chassis. Both launch packs could be adapted to any suitable heavy cross-country truck. In the fall of 1993, in a conversation with the Deputy Assistant Secretary of the Army (Research and Technology), the Commander-in-Chief, Combined Forces Command (CINC CFC) stated that the North Korean 240mm Multiple Rocket Launchers (MRLs) posed a significant psychological and political threat to South Korea and the CFC. This weapon poses a significant threat, in that a very large number of 240mm MRLs are poised north of the demilitarized zone (DMZ) and are targeted toward South Korean urban areas and military targets. According to some reports, the DPRK has about 200 of these launchers in service. North Korea continues to improve its military. Highlighting these enhancements is an ambitious program to improve ground forces capabilities. A key component of this initiative involves the deployment of large numbers of long-range 240mm multiple rocket launcher systems and 170mm self-propelled guns to hardened sites located near the Demilitarized Zone. According to one report, a South Korean security analyst suggested that DPRK artillery pieces of calibers 170mm and 240mm "could fire 10,000 rounds per minute to Seoul and its environs." North Korea has about 500 long-range artillery tubes within range of Seoul, and the total rate of fire of thjese artillery pieces would be between 2,000 and 4,000 rounds per minute. The DPRK's two hundred 240mm MRLs fire either 12 or 22 rounds, providing a maximum single salvo of no more than 4,400 rounds. These launchers can fire a first strike of many thousands of missiles and return in a few minutes to protected caves or to alternate firing positions. The MRLs move out from underground facilities (UGFs), fire from preplanned firing positions, and return to the UGFs. Examination of the available data on the UGF sites suggests that a number of possible "exit and return" methods for the MRLs may be possible. In this case, the launchers move directly from the firing points to the UGFs. This procedure makes it difficult to target the launchers, because once they fire it only takes 75 seconds to return to their UGFs. The MRLs can fire their complete set of rockets in 44 seconds. Data from the Joint Precision Strike Demonstration Project Office indicates that the crew then needs two minutes to lower the launcher, raise the stabilizing pads, and quickly return to the UGF. This gives a total exposure time of 164 seconds. However, it is possible that the MRLs could displace faster than the JSPD case or that they might take longer.

RT-2000 (Thunderbolt-2000) Taiwanese 8x8 Heavy Expanded Mobility Tactical Truck (HEMTT) Multiple Rocket Launcher (MRL)

Tiers:

System

Alternative Designation: RT-2000; Thunderbolt-2000

Smoke Equipment: No

Notes:

The Thunderbolt-2000 (Chinese: □□2000; pinyin: Léitíng 2000; RT/LT-2000) is a wheeled MLRS system used by the Republic of China (Taiwan) Army. It was created with the intention of attacking enemy forces when disembarking from sea. The prototype of the Thunderbolt-2000 weapon system was originally placed on the chassis of a M977 Heavy Expanded Mobility Tactical Truck. The production model utilises MAN HX81 8x8 wheeled trucks instead, with the first order batch including 57 launchers and 54 ammunition carriers/reloaders or local production of the same version. The LT-2000 was scheduled to enter service with all 3 main army groups in Taiwan from 2010, with each army group's artillery corps receiving 1 battalion of RT/LT-2000, featuring 3 companies/batteries with 6 RT/LT-2000 launchers each. The original CSIST LT-2000 prototype battery is in service with Kinmen Command, deployed there since mid-2000. Munitions: The LT/RT-2000 uses three types of munitions: Mk15 (60 rounds, 3 pods of 20 round each, 15 km range), Mk30 (27 rounds, 3 pods of 9 rounds each, 30 km range) and Mk45 (12 rounds, 2 pods of 6 rounds each, 45 km range). While the Mk15 is the 117 mm rockets used by the Kung Feng VI that carries 6,400 6.4mm size steel balls, the Mk30 rocket is a bit larger than the Mk15 at 180mm caliber and can carry either 267 rounds of M77 Dual Purpose Improved Conventional Munitions (DPICM) bomblets or 18,300 8mm size steel balls with range of 30 km. And Mk45 larger than the Mk30 at 227mm caliber as it can carry either 518 rounds of M77 bomblets or 25,000 8mm steel balls with range of 45 km. Other types of munitions also being developed by CSIST/ROC (Taiwan) Army, including FAE bomblets.

RM-70 Vampir Czechoslovakian 122mm Multiple Rocket Launcher (MRL)

Tiers:

Variants:

- **RM-70:** Basic model, as described.
- **RM-70/85:** Unarmored version of the RM-70, based on the Tatra T815 VPR9 8x8.1R truck with 265 hp engine T3-930-51. Combat weight: 26.1 t. Sometimes called RM-70M.
- **RM-70/85M:** Modernised vehicle with new fire control and navigation equipment, can use a new type of rocket with a range of 36 km. Slovakia has ordered 50 upgrade packages.
- **RM-70 Modular:** In December 2000, the Slovak Ministry of Defense and Delta Defence started the RM-70 Modular German-Slovak modernization project. RM-70 Modular allows this artillery system to launch either twenty-eight 122mm rockets, or six 227mm rockets as used on the M270 MLRS. This way the system became fully NATO interoperable. The truck cabin is entirely armored. The Slovak Republic signed for 26 upgraded artillery systems with the first one delivered on May 20, 2005. RM-70 Modular is being offered as an upgrade for RM-70 owners.
- **Vz.92 "Križan" VMZ:** Engineer vehicle, based on the Tatra T815 36.265 with a lightly armoured cabin. The vehicle comes in different configurations, the standard being a 40-round rocket launcher (for "Kuš" and "Krizhna-R" rockets), a mechanical mine layer for anti-tank mines (PT Mi-U or PT Mi-Ba-III) and two dispensers for anti-personnel mines (PP Mi-S1).
- **RM-70 Vampire:** Upgraded version integrated on a Tatra T-815-7 truck chassis powered by a Tatra T3C V8 engine with 270 kW of output, coupled with a Tatra 10 TS 210 N gearbox, with semi-automatic Tatra Norgen drive system and an additional gearbox Tatra 2.30TRS. It has a range of around 1,000 km (620 mi) and a top speed of 90 km/h (56 mph) with an armored and NBC-protected crew cabin.
- **LRSV-122 M-96 "Tajfun":** Modified version with 4 rows of 8 launch tubes on an unarmoured Tatra T813 truck. Like the M-77 Oganj and the Chinese Type 90A, the launcher and reloading pack are covered by a collapsible awning for protection and camouflage when traveling. Combat weight: 23.5 t. Only a very small number was built.

System

Alternative Designation: RM-70 Vampir

Type: 122mm Multiple Rocket Launcher (MRL)

Crew: ea4

Mission: Main role of this artillery rocket system is to engage area targets, such as concentrations of troops and armored vehicles, artillery batteries, and other targets.

Chassis: The RM-70 Vampir is based on a Tatra T815-7 heavy high mobility truck chassis.

Displacement Time: INA

Emplacement Time: INA

Note: It takes around 2 minutes to reload all 40 launch tubes. This integral reloading system significantly increases firepower of the vehicle, as the single RM-70 Vampir launcher vehicle can rapidly launch two salvos. The launch tubes can be also reloaded manually by the crew within around 7 minutes. Reloading usually takes remotely from the firing position, in order to avoid counter battery fire.

Notes:

RM-70 Vampir, a multiple launch rocket system (MLRS) developed by Excalibur Army, is an upgraded version of the RM-70 122 MLRS. The rocket launching system is intended to strike a range of enemy targets, including infantrymen, artillery units, motorised infantry, tanks, and other combat vehicles. The first Vampir prototype was developed in the first half of 2015 and gunnery tests were successfully conducted in October 2015. The MLRS was on display at IDEX 2017 held in February. RM-70 Vampire - Upgraded version integrated on a Tatra T-815-7 truck chassis powered by a Tatra T3C V8 engine with 270 kW of output, coupled with a Tatra 10 TS 210 N gearbox, with semi-automatic Tatra Norgen drive system and an additional gearbox Tatra 2.30TRS. It has a range of around 1,000 km (620 mi) and a top speed of 90 km/h (56 mph) with an armored and NBC-protected crew cabin.

Fajr-3 Iranian 240mm Multiple Rocket Launcher (MRL)

Tiers:

Variants:

- **Fadjr-5:** Fadjr 5 is a larger and more powerful version of the Fadjr 3. It has 4 launch tubes for 333 mm artillery rockets. It was developed in the 1990s.

System

Alternative Designation: Fadjr-3, Fajr-3
Type: Intermediate-Range Multiple Launch Rocket System (MLRS)
Manufacturer: Shahid Bagheri Industrial Group
Family: Fadjr
In Service: 1996-Present
Crew: ea5
Chassis: Mercedes-Benz 2624 truck chassis
Displacement Time: min2
Emplacement Time: min2
Reload: One dedicated resupply vehicle with a crane.
Note: At the time of its introduction it was one of the most capable artillery rocket systems in the world.

Dimensions

Length: m10.5
Width: m3.3
Height: m2.6

Weight, Combat: tons15

Ground Pressure: INA

Automotive

Engine Name: Mercedes-Benz, Model: INA

Engine Type: Diesel

Hull Armor: Unarmored

Turret Armor: Unarmored

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

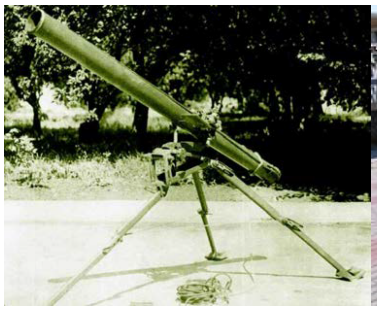
NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Fajr-3 (rarely Fadjr-3) is an Iranian heavy 240mm intermediate-range multiple rocket launcher. The Fajr-3 is a license-built copy, with slight modifications, of a North Korean MRL called the M-1985. The Fajr-3 was introduced in the 1990s and has since been exported to Hamas and Hezbollah. The Fajr-3 launcher fires twelve 5.2 meter long, 240 millimeter-calibre Fajr-3 artillery rockets, with a range of 43 kilometres, weighing 407 kilograms each and carrying 90-kilogram fragmentation warheads with 45 kg of high explosive (HE). Fajr means 'dawn' in Arabic.

9P132 Russian 122mm One-Round Rocket Launcher



Tiers:

System

Alternative Designation : DKZ-66, BM-21P, Grad-P, 9K510
Cailber/Length : mm122

Fire Control Systems

Collimator: K-1
Indirect Fire: PG-1M Panoramic Telescope (PANTEL)

Notes:

The 9P132 is a lightweight, man-portable, rocket launching system used by guerrilla, special purpose forces, or other light forces. The 9P132 is only effective as a harassment or interdiction weapon. The 9P132 is broken down for man-pack transport into two one-man loads – the tube, AKA “Grad-P” (27 kg) and the tripod sight assembly with a remote firing device (28 kg). The tripod legs fold for ease of handling. Each 9M22M rocket is broken down into two one-man loads for transport. It takes approximately two minutes for assembly of the rocket. When assembled, the launcher has three course elevation positions, with the final elevation set by means of an elevation screw. The crew uses an electrical remote control with an electrical impulse generator and battery to fire the launcher. The 9P132 is incapable of firing the 9-foot version rockets of the BM-21 and similar 122mm systems. The system was developed in the middle of the 1960s for Soviet special units and was used by Vietnamese forces at war with the US, under the designation DKZ-B. It was not accepted for regular service with the Russian Army, but it was and is still popular with paramilitary and guerrilla forces.

M2008 North Korean 122mm Multiple Rocket Launcher (MRL)

Tiers:

Variants:

- **BM-21-1:** Launch vehicles are mounted on a family of Ural-4320 truck chassis
- **2B17 or also BM-21-1:** This upgrade was presented for the first time in 2003 and was developed by Motovilikha Plants from Perm. The system is fitted with a satellite navigation system NAP SNS, automated fire control system ASUNO, APP laying system and can fire a new generation of rockets with a range of 40 km (25 mi). The truck is the Ural-43201.
- **9P138 "Grad-1"::** lighter 36-round version, mounted on a six-by-six ZIL-131 chassis. The vehicle with supporting equipment (rockets, transporter 9T450 and re-supply truck 9F380) is referred to as complex 9K55. The 9P138 can only use "short-range" rockets with a range of 15 km (9.3 mi). It used to be known in the West as BM-21b or M1976.
- **BM-21V "Grad-V":** (NATO designation M1975): Developed for Soviet airborne troops in 1969. A GAZ-66B four-by-four truck chassis is fitted with a 12-round 122 mm rocket launcher. The vehicle is sturdy enough to be air-dropped. Parts of the vehicle such as the canvas cab roof can be taken off or folded down to reduce its size during transit. Like the BM-21, the BM-21V has stabilizing jacks on the rear of the vehicle for support when firing. The launch vehicle has the industrial index of 9P125.
- **9A51 "Prima":** 50-round launcher on a Ural-4320 5t chassis. The vehicle together with fire control equipment, the ammunition transporter TZM 9T232M and the new rocket 9M53F is referred to as complex
- **"Grad-P Light portable rocket system":** he complete system comprises a 9P132 [vi] single-round man-portable launcher (it can be reloaded and used again), a 9M22M 122 mm high-explosive fragmentation rocket and a fire control panel. The system was developed in the middle of the 1960s for Soviet special units and was used by Vietnamese forces at war with the US, under the designation DKZ-B. It was not accepted for regular service with the Russian Army, but it was and is still popular with paramilitary and guerrilla forces.
- **BM-21PD "Damba":** 40-round launcher mounted on Ural-375D or 43201 truck chassis. Developed for protection of naval bases against underwater infiltrations, uses special ammunition PRS-60 (Protivodiversionnyi Reaktivnyi Snaryad). The vehicle together with ammunition transporter is referred to as complex DP-62 "Damba".
- **A-215 "Grad-M":** 22-round naval version, entered service in 1978.
- **9K51M "Tornado-G":** an advanced version of the original BM-21 vehicle with sophisticated fire control system, satellite navigation, and automatic target aiming.
- **BM-21A "BelGrad":** This is a modernized version, based on a MAZ-631705 6×6 truck with 425 hp diesel engine TMZ-8424. Between the cab and the launcher there is another pack of 40 rockets. The system was evaluated from 1997 and entered service in 2001.

System

Alternative Designation: M2008

Manufacturer: North Korea; Company: INA

In Service: 1963-Present

Type: 122mm Multiple Launch Rocket System

Family: BM-21 Series

Crew: ea5 (8 with 9K51 Complex)

Chassis: Ural 375-D 6x6 wheeled

Notes:

The M2008 is a North Korean Variant of the BM-21 and has the same characteristics and capabilities as the BM-21. The BM-21 "Grad" is a Soviet truck-mounted 122 mm multiple rocket launcher. The weapons system and the M-21OF rocket which it fires evolved in the early 1960s and saw their first combat use in March 1969 during the Sino-Soviet border conflict. BM stands for boyevaya mashina (Russian: боевая машина – combat vehicle), and the nickname grad means "hail". The complete system with the BM-21 launch vehicle and the M-21OF rocket is designated as the M-21 field-rocket system. The complete system is more commonly known as a Grad multiple rocket launcher system. In NATO countries the system (either the complete system or the launch vehicle only) was initially known as M1964. Several other countries have copied the Grad or have developed similar systems. The M-21 field rocket system with a BM-21 launch vehicle (122 mm multiple rocket launcher (MRL) system)

entered service with the Soviet Army in 1963 to replace the aging 140 mm BM-14 system. The launch vehicle consists of a Ural-375D six-by-six truck chassis fitted with a bank of 40 launch tubes arranged in a rectangular shape that can be turned away from the unprotected cab. The vehicle is powered by a water-cooled V-8 180 hp gasoline engine, has a maximum road speed of 75 km/h (47 mph), road range of up to 750 kilometers (470 mi), and can cross fords up to 1.5 m (4 ft 11 in) deep. The original vehicle together with supporting equipment (including the re-supply truck 9T254 with 60 rockets) is referred to by the GRAU index "9K51"; the launcher itself has the industrial index of "2B5". In 1976, the BM-21 was mounted on the newer Ural-4320 six-by-six army truck. The three-member crew can emplace the system and have it ready to fire in three minutes. The crew can fire the rockets from the cab or from a trigger at the end of a 64-meter (210 ft) cable. All 40 rockets can be away in as little as 20 seconds, but can also be fired individually or in small groups in several-second intervals. A PG-1M panoramic telescope with K-1 collimator can be used for sighting. The BM-21 can be packed up and ready to move in two minutes, which can be necessary when engaged by counter-battery fire. Reloading is done manually and takes about 10 minutes. Each 2.87-meter (9 ft 5 in) rocket is slowly spun by rifling in its tube as it exits, which along with its primary fin stabilization keeps it on course. Rockets armed with high explosive-fragmentation, incendiary, or chemical warheads can be fired 20 kilometers (12 mi). Newer high explosive and cargo (used to deliver anti-personnel or antitank mines) rockets have a range of 30 kilometers (19 mi) and more. Warheads weigh around 20 kilograms (44 lb), depending on the type. The number of rockets that each vehicle is able to quickly bring to bear on an enemy target makes it effective, especially at shorter ranges. One battalion of eighteen launchers is able to deliver 720 rockets in a single volley. The system has lower precision than typical artillery and cannot be used in situations that call for pinpoint accuracy. It relies on a large number of shells dissipating over an area for a certain hit rate on specific targets. Nonetheless, because of the short warning time for the impact of the whole volley, the BM-21 is still considered an effective weapon.

→→Medium Rocket Systems (Up to 100 km)

BM-30 Smerch Russian 300mm Multiple Launch Rocket System

Tiers:

Variants:

- **Smerch-M:** mproved version of the Smerch with new navigation and targeting systems and capable of launching extended-range rockets. This system is referred as 9A52-2. It is compatible with new extended-range rockets, that can reach up to 90 km. Recently it has been reported that Russia developed further improved 300 mm rockets with a maximum range of 120 km.
- **9A52-2T Smerch:** variant based on the Tatra 10x10 chassis. It was designed in Russia for the Indian MoD. This rocket system is in service with the Indian Army.
- **9A52-4 Tornado i:** is lighter variant of the Smerch, based on KamAZ 8x8 truck. It has a six-pack launcher pod for 300 mm rockets. So the 9A52-4 has half the firepower of the Smerch. The whole launcher pod is replaced after all rockets are fired. This system is compatible with 90 km rockets
- **Uragan-1M i:** is a new Russian artillery rocket system, that might become a replacement for the ageing Uragan and Smerch systems. It was first publicly revealed in 2016. The Uragan-1M carries two launching pods for 300 mm or 220 mm rockets. These rocket pods are interchangeable with those of the 9A52-4 Tornado system. Launcher vehicle is based on an MZKT-7930 high-mobility chassis with 8x8 configuration.
- **PHL 03:** is a Chinese copy of the Smerch. It was adopted by the Chinese army in 2004-2005. It incorporates newer technologies, as well as indigenous Chinese rockets with a maximum range of 130 km. China developed a number of indigenous versions of this artillery rocket system.
- **Olha:** is a Ukrainian version of the Smerch, which uses newly developed missiles, possibly with extended range. The Oliha uses the same launcher vehicle of the Smerch. It was planned that tests of this system will be completed in 2018 and production will commence.

System

Alternative Designation: 9A52-2 Smerch-M
Type: Multiple Launch Rocket System
Manufacturer: Splav State Research and Production Enterprise
In Service: 1987-Present

Notes:

The BM-30 Smerch 9A52 is a russian made heavy multiple rocket launcher. The BM-30 is designed and manufactured by the Russian Company Splav State Research and Production Association, Tula, Russia, which also manufactures the Uragan, Grad and Prima rocket launchers. The BM-30 Smerch 9A52 was first seen by the West in 1983, and it entered in the Russian army in 1987. The BM-30 Smerch 9K58 is designed to counter tactical missile systems, army aviation at staging airstrips, as well as rocket, artillery and mortar battalions and batteries, command post, and manpower concentration areas. A Smerch unit is typically composed of six launchers and six transloaders. Now it is used by Russian, Ukraine, Belarus, Kuwait, and United Arab Emirates, Indian and Chinese armed forces.At the time it was the most powerful multiple launch artillery rocket system in the world. Even today, after more than 30 years of service, it remains one of the deadliest systems of this type. Currently Russian Army operates just over 100 of these artillery rocket systems.

9A52-4 Tornado Russian 300mm Multiple Rocket Launcher

Tiers:

1 2 3 4

Variants:

- **9A52-4 Tornado:** The 9A52-4 Tornado system is a lightweight rocket launcher. There are two other systems; a modular MLRS based on the MZKT-79306 truck, which can carry two BM-27 Uragan or BM-30 Smerch launcher modules, and one based on the Kamaz 6x6 truck. The "Tornado-G" system is an upgrade package for the existing BM-21 Grad. The Russian government ordered 36 new "Tornado-G" based on the Kamaz 6x6 chassis, instead of the old systems based on the Ural-4320 truck.
- **9A53-G Tornado:** 9A53-G Tornado (2x15 1x40 122mm Upgraded BM-21 Grad Multiple Rocket Launcher Module, based on a Kamaz Truck or on a Ural-4320).
- **9A53-U Tornado:** 9A53-U Tornado (2x8 2x6 220mm Upgraded BM-27 Uragan Multiple Rocket Launcher Modules, based on a MZKT-79306).
- **9A53-S Tornado:** 9A53-S Tornado (2x6 2x4 300mm Upgraded BM-30 Smerch Multiple Rocket Launcher Modules, based on a MZKT-79306).

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

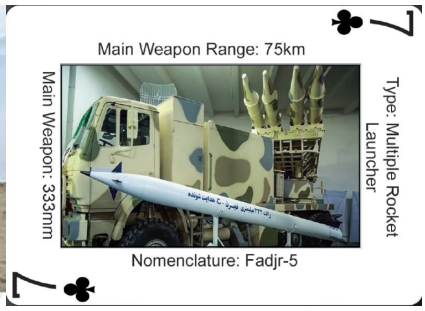
NBC Protection: INA

Smoke Equipment: INA

Notes:

The 9A52-4 Tornado is Russia's newest universal multiple rocket launcher. It was designed as a lightweight and universal version of the BM-30 Smerch, dubbed 9A52-2. It was first unveiled in 2007 as a more strategically and tactically mobile launcher, albeit at the expense of a slight reduction in firepower. This model is aimed at replacing the previous generation of Russian multiple rocket launchers, including BM-21 Grad, BM-27 Uragan and BM-30 Smerch. Currently the sole operator is Russian Ground Forces. A version will be approved for export. The 9A52-4 Tornado system is based on the chassis of the KamAZ-63501 8x8 military truck, which provides good tactical mobility. It is equipped with a single container with six launcher tubes for 300-mm rockets, which can fire all current Smerch rockets, including HE-FRAG, incendiary, thermobaric, cluster with anti-personnel or anti-tank mines. Cluster rounds may also carry self-targeting anti-tank munitions. The 800 kg standard rocket has a maximum range of 90 km. A range and direction correction system provides better accuracy compared to its predecessors. The 9A52-4 can launch rockets singularly, by a partial ripple or by a full salvo, which can cover an area of 32 hectares. A full salvo can be fired within 20 seconds. The 9A52-4 launching vehicle can be reloaded within 8 minutes. Launcher pods are designed for use with 122-mm and 220-mm rockets. The weapons system is equipped with an automated laying and fire control system, along with an autonomous satellite navigation and positioning system. Positioning and firing data are exchanged between the launch vehicle and the command vehicle.

Fadjr-5 Iranian 333mm Multiple Launch Rocket System (MLRS)



Tiers:

Variants:

- **Fadjr 5C:** Fadjr 5C is a new version unveiled in 2017. It uses 300 mm guided rockets similar to those of the Chinese SY-300. These have a range of up to 130 km. These rockets are accurate out to 200 meters using inertial guidance system, and out to 50 meters, using inertial guidance system with satellite navigation update. Due to significantly increased range and accuracy the Fadjr-5C is even more deadlier. It looks like the same launcher vehicle can use a mix of older 333 mm unguided rockets and new 300 mm guided rockets.

System

Alternative Designation: Fadjr-5, Fajr-5
Type: 333 mm Long-Range Multiple Launch Rocket System (MLRS)
Manufacturer: Iran
In Service: 1990s-Present
Family: Fadjr
Crew: ea5
Chassis: Mercedes-Benz 2631 truck chassis
Control Cab: The forward control cab accommodates 3 crew members, while the rest are seated in the rear cab.
Displacement Time: INA
Emplacement Time: INA
Reload Truck: Reload rockets are carried by escorting military truck, fitted with a crane.
Note: The Fajr is among the deadliest artillery rocket systems in the world.

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: No

Notes:

The Fajr-5 ("Dawn") is an Iranian 333mm long-range multiple launch rocket system (MLRS). The Fajr-5 was developed during the 1990s and has since been exported to various armed actors in the Middle East. The Fajr is among the deadliest artillery rocket systems in the world. The Fajr-5 launcher fires four 6.48 meter long, 333mm, Fajr-5 artillery rockets, with a range of 75 kilometers (50 mi), weighing 915 kilograms each and carrying 175kg fragmentation warheads with 90kg of high explosive (HE). Most Fajr-5 rockets are unguided; in 2017 Iran introduced a variant, the Fajr-5C, which adds GPS guidance. The Fajr-5 is primarily used by the Iranian Army Ground Force to attack large, fixed, high-value targets, like airfields and military bases. In addition, the system is also used by anti-Israel militant and terrorist groups to target Israeli population centers. Finally, the system has a niche role in use by the IRGC-N as an unguided anti-ship rocket system for the Persian Gulf.

9K52 Luna-M (FROG-7) Russian Medium-Range Artillery Rocket System

Tiers:

Variants:

- **9M21B:** Nuclear-armed variant, fitted with a 500 kg (1,213-lb) warhead.
- **9M21G:** This variant is fitted with a 390 kg (860-lb) warhead.
- **Laith-90:** Iraqi version with increased range (90 km) and submunition warhead.

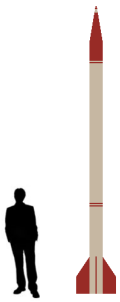
Notes:

The 9K52 Luna-M (Russian: Луна; English: moon, NATO reporting name FROG-7) is a Soviet short-range artillery rocket system. It fires unguided and spin-stabilized 9M21 rockets. "FROG" is an acronym for "Free Rocket Over Ground". The 9M21 rockets are mounted on a wheeled 9P113 transporter erector launcher (TEL) based on the ZIL-135 8x8 army truck. The TEL features a large hydraulic crane used for reloading rockets from 9T29 transporters (also ZIL-135 based). The 9M21 has a range up to 70 km and a CEP (circular error probable) between 500 m and 700 m. The road mobile rocket has a 550 kg warhead and is capable of delivering high explosive, nuclear, or chemical warheads. The FROG-7 was the latest addition to the "Free Rocket Over Ground" family of unguided, spin-stabilized, short-range (battlefield support) artillery rockets. The rocket was of conventional single-stage design, with a cylindrical warhead of the same diameter as the rocket body, giving it a cleaner, more modern appearance than its predecessors. The FROG-7 has a range of 70 km and a 550 kg warhead, and an impact area of approximately 2.8 km long by 1.8 km wide. The FROG-7 was capable of delivering HE, nuclear, or chemical warheads. The FROG-7 gave the Soviet division commander a deep interdiction/penetration nuclear threat. The FROG-7A was first introduced in 1965 as a replacement for earlier FROG variants, some of which had been in service since the mid-1950s. The FROG-1 and -2 were obsolete. The FROG-3, -4, and -5 variants, mounted on a non-amphibious version of the PT-76 light tank chassis, were obsolete in the USSR, but were still found in other Warsaw Pact armies at the end of the Cold War. The FROG-5 was still used as a training rocket, and the FROG-6 was a dummy rocket used for training purposes only. The FROG-7B, introduced in 1968, was essentially the same rocket as the FROG-7A but with a longer warhead section. Missiles of all modifications had the largest body diameter of 544 mm, the length of missiles of modifications 9M21B, F, E was 8960 mm, missiles of modifications 9M21B1 and E1 were 9400 mm. The speed of the rocket was about 1200 m/s. The FROG-7 was replaced by the SS-21 tactical ballistic missile which had greater range (120 km) as well as probable improvements in reaction time, missile reliability, accuracy, and handling characteristics. Since the SS-21 was mounted on a six-wheeled TEL similar to the SA-8/GECKO SAM system, it has improved cross-country capability and was probably amphibious. Like the SA-8, it probably has an air filtration and overpressure system for-collective chemical and biological protection. The SS-21 was first deployed in 1976 in the USSR and was reported in GSFG in 1981. The FROG-7 (9K52 Luna), the final version of the FROG family, was an unguided, spin-stabilized, short-range, battlefield support artillery rocket. The range of the FROG-7A rocket was 70 km with a CEP of 500 to 700 meters. It was fitted with either a 450 kg HE, 450 kg nuclear, or 36 kg chemical warheads. The improved FROG-7B carries a cargo warhead for delivering bomblets or mines. In addition to improvements in the rocket which give it greater range, a new transport-launch vehicle using a wheeled chassis has been developed based on the ZIL-135 [BAZ-135] 8x8 truck. This wheeled transporter erector launcher (TEL) carries one rocket and a crane. It incorporates a number of improvements in rocket handling such as the on-board crane. Reload missiles were placed on the TEL by that vehicle's own hydraulically operated crane on the right side of the launcher rail. A very similar vehicle was also used with the FROG-7 system to transport the reserve rockets. The earlier FROG'S used semitrailers towed by ZIL-157V tractor trucks, and needed crane trucks for reloading of the transport-launch vehicles. Preparation for firing can take 15 to 30 minutes depending on the situation. A typical FROG-7 battalion was equipped with two firing batteries each with two TELs and a D-band RMS (END TRAY) long-range meteorological radar. The cruising range of the transporter-erector-launcher vehicle was 400 km. The FROG-7 TEL vehicle provides no NBC protection for the crew. The single-rail launcher has limited traverse. In 1961, the Luna complex was adopted by the Soviet Army, which included the 2P16 tracked launcher, based on the amphibious tank PT-76, as well as 3P10 and 3P9 missiles with nuclear and high-explosive fragmentation warheads. Even before the Luna complex entered service with the Decree of the Council of Ministers of the USSR of 02.17.1961, work began on the development of its modernized version with an increased firing range. These works culminated in the creation of a virtually new tactical complex, which received the designation 9K52 "Luna-M". For this complex, a 9M21 rocket was created, a new launcher and a transport vehicle on a ZIL-135LM wheeled chassis. The first launch of the 9M21 rocket took place on December 27, 1961, and the 9K52 Luna-M complex was put into serial production and into service entered in 1964. Serial production was carried out at the Barricades factory. The advantage of the 9K52 Luna-M complex over its predecessor was that the control unit had its own hydro-mechanical crane with a lifting capacity of 3 tons (see photo on the side , above) This made it possible to abandon the semi-trailer transport vehicle, which transported two spare missiles and a self-propelled crane for reloading missiles. The 9P113 launcher provided highway speeds of up to 60 km / h, due to the use of

the wheelbase, the tremors and overloads of the warhead were significantly reduced (for the Luna complex, the maximum speed was theoretically up to 40 km / h, but already at a speed of 16 18 km / h on dirt roads there were overloads, unacceptable for a nuclear warhead). Both the 9P113 launcher and the 9T29 transport vehicle have very high cross-country ability. They were capable of overcoming steep slopes up to 30 ° and fords up to 1.2 m deep. The 9P113 installation was capable of performing at least 200 9M21 missile launches. To lock the launcher during the launch of the rocket, four swing-out supports with screw jacks were used. PU 9P113 has a hydraulically driven device for setting the guide to the position for launching the rocket, as well as the necessary equipment for prelaunch and launch. There were also communications equipment, navigation and orientation equipment, power supply and life support systems. 9M21 unguided single-stage solid-fuel rocket was designed to destroy manpower, military equipment, firearms and defensive structures located in the tactical depth of enemy defense. The missile was designed in several versions, different warheads: 9M21B with a nuclear warhead 9N32, 9M21F with a high-explosive fragmentation warhead 9N18F, 9M21G with a chemical warhead 9N18G and even 9M21D with a propaganda warhead 9N18A. High-explosive fragmentation warhead 9N18F contained 200 kg of highly active explosive TGA-40/60 and gave at least 15,000 fragments. In 1969, the 9N18K was put into service with a 420 kg fragmentation warhead containing 42 warheads weighing 7.5 kg each and providing for the defeat of manpower over an area of several hectares. Since the 9H32 warheads in nuclear equipment required constant temperature control to ensure a given yield, and there was no internal heating system in the warheads of the Luna-M, the 9P113 launcher and the 9T29 transport vehicle included electric heating cases designed for maintaining the temperature of nuclear warheads in a given temperature regime. On the cover itself was a temperature sensor, which provided the on and off heating spirals, depending on temperature. The number of thermal covers coincided with the number of missiles transported (for 9P113 - 1, for 9T29 - 3). To ensure the heating of the main engine during long-term parking without starting the marching engines, a gas unit was included in these units. The 9M21 missile part consists of three engines, a launch, a main cruise and a "crank" [spin stabilization] engine. All solid-fuel engines. Various missile flight ranges were achieved by using brake flaps, as well as by changing the elevation angle at launch trajectories. The starting engine was placed around the nozzle of the main engine. It works while the rocket moves along the guides of the launcher. The ignition of the charge of the starting engine was produced by the gases of the main engine, penetrating through special holes. The charge of the starting engine was made of single-channel cylindrical checkers of gunpowder RSI-60, arranged in a circle in three rows. The main (sustainer) engine provides a given range of missile flight. It works only on the active part of the trajectory, and then the flight takes place by inertia. The charge of the main engine consists of single-channel cylindrical blocks made of NMF-2 nitroglycerin (ballistic) gunpowder. The armored ends of the checkers hold the charge in the combustion process, provides centering of the rocket. The powder charge was divided in length into two parts. Each part was held in the chamber of the rocket engine with its diaphragms, which approximately halves the load at the attachment points. The operation of the solid propellant rocket motor was significantly affected by the initial temperature of the charge, which ultimately affects the magnitude of the engine thrust. This factor can be eliminated by adjustments to the elevation angle of the guide before starting. In addition, the 9M21 rocket provides for the use of replaceable nozzle bushings, the liners of which have different diameters of the critical section. At elevated temperatures, bushings with a large critical section were used; at lower temperatures, vice versa. This factor can be eliminated by adjustments to the elevation angle of the guide before starting. In addition, the 9M21 rocket provides for the use of replaceable nozzle bushings, the liners of which have different diameters of the critical section. At elevated temperatures, bushings with a large critical section were used; at lower temperatures, vice versa. This factor can be eliminated by adjustments to the elevation angle of the guide before starting. In addition, the 9M21 rocket provides for the use of replaceable nozzle bushings, the liners of which have different diameters of the critical section. At elevated temperatures, bushings with a large critical section were used; at lower temperatures, vice versa. The rocket engine was started by applying an electrical impulse through the onboard connector to the squibs, the initiation of which leads to ignition of the igniter from granular smoke powder, which, in turn, ignite the powder charge of the main engine. The rotation engine serves to compensate for the moment arising due to the eccentricity of the thrust vector, and was located in the region of the center of mass of the rocket. The engine nozzles through curved gas ducts were brought to the side surface of the rocket, the thrust vectors of the engine of rotation were directed tangentially to the surface of the body and create a torque. The crank engine runs on RSI-60 gunpowder, the operating time was ~ 0.4 s, it turns on after the rocket leaves the guides. In the tail part of 9M21 stabilizers were installed to ensure a stable flight of the rocket along the trajectory. When calculating the data for launching a 9M21 rocket, weather conditions were taken into account, namely the direction and average wind speed at altitude. To do this, the starter battery has a meteorological station, which makes several shots vertically up from a ballistic gun. In the direction and distance of the bullets (daytime with a red ribbon, nighttime - glowing) from the point of the shot, the direction and average wind speed were calculated. To prevent the unauthorized use of nuclear weapons, all launchers capable of launching rockets in nuclear equipment were equipped with code-blocking devices. In 9K52TS launchers, which did not involve the use of warheads in nuclear equipment, there were no code blocking devices. PU 9K52TS was not equipped with thermal covers. The 9M21 missiles were also supposed to be equipped with the 9K53 Luna-MB complex. The development of the Luna-MB complex was started by Decree of the Council of Ministers of 02/05/1962. The 9P114 launcher, which was created on the basis of a wheeled vehicle, allowing landing by Mi-6 or Mi-10 helicopters, was used in this complex. Work on the Luna-MB complex reached the stage of testing prototypes. However, quite a few difficulties were encountered, the main one of which was the need for a preliminary topographic and geodetic reference of the launch position, as well as the large “sailing” of the Mi-10 helicopter with the 9P114 launcher on the external sling. As a result, in 1965, work on this complex was discontinued. A significant drawback of the Luna-M complex was the low accuracy of firing, even the use of a nuclear warhead did not provide guaranteed destruction of well-targeted point targets such as a command post, etc. In this regard, according to the Decree of the Council of Ministers of July 20, 1966, the development of the Luna-3 rocket, equipped with a simplified control system, was begun. It was assumed that the circular probable deviation (CVO) of the new missile at a range of 70km would not exceed 500m. However, the flight tests conducted in

1968-1969 gave an even greater circular probable deviation compared to the prototype. The range corrector worked unsatisfactorily and the continuation of work on this OCD was deemed inappropriate. This complex became the most estensively deployed in the Soviet army, the peak of the deployment of combat vehicles of the complex occurred in 1986, when there were about 750 units in the troops. During the Cold War the most prominent short-range nuclear force [SNF] system at at the division level was the unguided free-rocket-over-ground (FROG), which in the Soviet Army was deployed in a battalion of four launchers. As of 1987 the Soviets were replacing FROGs with the more accurate, longer range SS-21s in some divisions opposite NATO. About 500 FROG and SS-21 launchers were opposite NATO. Another 215 FROG launchers were opposite China and in the Far East; some 100 were opposite Southwest Asia and eastern Turkey; and about 75 were in strategic reserve. Designed in 1968, a variant of the 9K52TS complex, designed for firing missiles with a high-explosive warhead, was widely exported to both Warsaw Pact and some non-Warsaw Pact nations. Armies of approximately 15 countries, including the armed forces of the Warsaw Pact, Cuba, Egypt, Iraq, Kuwait, Libya, the DPRK, and Yemen became its buyers. Laith, an Iraqi improved version of the FROG-7, had a 90 km range. The combat debut of the complex took place during the 1973 Arab-Israeli war. The Luna-M complex was used in a number of regional conflicts, including in Afghanistan, the Iran-Iraq war of 1980-88, and the Gulf War of 1991. The Syrian army began to use 9K52 Luna-M missile , also known under the NATO designation FROG-7, systems against terrorists. These systems, along with 9K72 Elbrus, for a long time formed the basis of the missile power of the Syrian army. The Soviet Union began delivering FROG-7 to its most faithful ally in the Middle East at the very beginning of the 70s. The Syrians quite successfully mastered this weapon.

Oghab Iranian 230mm Unguided Artillery Rocket



Tiers:

System

Alternative Designation: Oghab Missile
Type: 230mm Unguided Artillery Rocket
Manufacturer: Aerospace Industries Organization, Shahid Bagheri Industries
Warhead: Up to three
Engine: Solid-fuel rocket
Operational Range: 34–45 km
Maximum Speed: 750 m/s
Guidance System: None

Dimensions

Length: 4.82 m
Diameter: 23 cm
Weight, Combat: 360 kg

Notes:

The Iranian Oghab (Eagle) missile is an unguided 230 mm (9 in) artillery rocket with a range of 34–45 km (20–28 mi). It is spin-stabilized in flight but has a proven circular error probable in excess of 500 m (1,500 ft), making it a highly inaccurate weapon. It carries a 70 kg (150 lb) high explosive fragmentation warhead, though it may also be able to carry chemical warheads. According to US sources, a modified version has been developed that could be carried and fired from Iranian Air Force F-14 Tomcat and F-4 Phantom II aircraft. The launcher is an elevatable triple-rail launcher assembly fitted to a Mercedes-Benz LA 911B 4×4 truck chassis. The missile was developed from the Chinese Type-83 artillery rocket during the Iran–Iraq War, with the assistance of the People's Republic of China under an agreement signed in 1985. It entered service in 1986 and was immediately used in combat in an attack on the Iraqi city of Basra in December 1986. Around 260–270 Oghabs were reportedly fired during the war, though their effectiveness was limited. The missile's short range confined its use to attacks on Iraqi border cities and its lack of accuracy meant that Oghab attacks were far less effective than artillery barrages. The Oghab is used by the Iranian Army and the Revolutionary Guards. It is known to have been exported to Hezbollah.

9A53-S Tornado Russian 300mm Multiple Launch Rocket System

Tiers:

Variants:

- **Smerch-M:** mproved version of the Smerch with new navigation and targeting systems and capable of launching extended-range rockets. This system is referred as 9A52-2. It is compatible with new extended-range rockets, that can reach up to 90 km. Recently it has been reported that Russia developed further improved 300 mm rockets with a maximum range of 120 km.
- **9A52-2T Smerch:** variant based on the Tatra 10x10 chassis. It was designed in Russia for the Indian MoD. This rocket system is in service with the Indian Army.
- **9A52-4 Tornado:** is lighter variant of the Smerch, based on KamAZ 8x8 truck. It has a six-pack launcher pod for 300 mm rockets. So the 9A52-4 has half the firepower of the Smerch. The whole launcher pod is replaced after all rockets are fired. This system is compatible with 90 km rockets
- **Uragan-1M i:** is a new Russian artillery rocket system, that might become a replacement for the ageing Uragan and Smerch systems. It was first publicly revealed in 2016. The Uragan-1M carries two launching pods for 300 mm or 220 mm rockets. These rocket pods are interchangeable with those of the 9A52-4 Tornado system. Launcher vehicle is based on an MZKT-7930 high-mobility chassis with 8x8 configuration.
- **PHL 03:** is a Chinese copy of the Smerch. It was adopted by the Chinese army in 2004-2005. It incorporates newer technologies, as well as indigenous Chinese rockets with a maximum range of 130 km. China developed a number of indigenous versions of this artillery rocket system.
- **Olha:** is a Ukrainian version of the Smerch, which uses newly developed missiles, possibly with extended range. The Oliha uses the same launcher vehicle of the Smerch. It was planned that tests of this system will be completed in 2018 and production will commence.
- **9A53-G Tornado:** 9A53-G Tornado (2x15 1x40 122mm Upgraded BM-21 Grad Multiple Rocket Launcher Module, based on a Kamaz Truck or on a Ural-4320).
- **9A53-U Tornado:** 9A53-U Tornado (2x8 2x6 220mm Upgraded BM-27 Uragan Multiple Rocket Launcher Modules, based on a MZKT-79306).
- **9A53-S Tornado:** 9A53-S Tornado (2x6 2x4 300mm Upgraded BM-30 Smerch Multiple Rocket Launcher Modules, based on a MZKT-79306).

System

Alternative Designation: 9A53-S Tornado
Type: 300 mm Multiple Launch Rocket System
Manufacturer: NPO Splav
In Service: 2014-Present

Maximum Range: km70

Minimum Range: km20

Warhead Weight: kg233

Rocket Length: m7.6

Maximum Velocity: INA

Fuze Type: Electronic timing (ET)

Note: Additional Ammunition Types include: Smoke, Incendiary, Chemical, Leaflet, Fuel Air Explosive (FAE), R-90 expendable miniature UAV (experi-mental)

Fire Control

Name: INA

Computerized FCS: No

Direct Fire: No

Indirect Fire: PG-1M Panoramic Telescope (PANTEL)

Collimator: K-1

Protection

Hull Armor: It provides protection for the crew against small arms fire and artillery shell splinters. This vehicle lacks any defensive armament.

Applique Armor: Avaialble

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Southern army District rocket unit stationed in the Astrakhan vicinity in south Russia has been completely rearmed with superior 9A53-S tornado-S multiple launch rocket systems (MLRS). The heavy release rocket structures unit with 1,000 servicemen and over one hundred gadgets of navy hardware, along with combating and transporter-loader automobiles of the twister-S multiple release rocket structures were fashioned in overdue 2018. at the end of the 2019 training session, one of the large unit’s formations became granted the surprise pressure title. The 9A53-S tornado is the maximum powerful and customary lengthy-variety multiple rocket launcher within the international. This model is aimed at replacing the preceding technology of Russian a couple of rocket launchers, along with BM-21 Grad, BM-27 Uragan and BM-30 Smerch. The 9A53-S machine is primarily based at the chassis of the MZKT-79306 eight×eight military truck, which gives proper tactical mobility. it is equipped with a 300mm Upgraded BM-30 Smerch multiple Rocket Launcher Modules, which could fireplace all cutting-edge Smerch rockets, together with HE-FRAG, incendiary, thermobaric, cluster with anti-personnel or anti-tank mines. Each unit comprises 12 launchers that can fire a salvo or single missiles. The firing range is 120 km and can be increased up to 200 km. Tornado-S considerably accelerates the missions. It needs several minutes to fire the whole round of munitions and one minute to abandon the firing position and escape a retaliation strike. The Tornado-S t is a fully automatic weapon with new precision munitions of a bigger range. They have homing warheads. The power is comparable to Tochka-U missiles. However, Tochka-U can fire one missile while Tornado-S a salvo.

Munition

Rocket Caliber: mm273

Rocket Length: mm4,582

Rocket Weight: kg505

Warhead Weight: kg150

Circular Error Probable (CEP): 2% of range

Maximim Range: km80

Max Ord Alititude: m31,000 (at max range of 80km)

Minimum Range: km34

Max Time of Flight: sec165 (at max range of 80km)

Rocket Stabilization: The rocket is stabilized by tail fins and high-speed spin generated by a spin motor

High-Explosive (HE): The HE blast warhead contains 34kg of explosive that can be activated by a WJ-6A mechanical impact fuse or a MD-23A electronic proximity fuse

Submunitions: Contains 380 bomblets with a HEAT warhead

Armor Penetration: mmUp to 100

Fire Control System

Collimator: INA

Computerized: Yes

Note: There is also a standard optical sighting system on the left side of the launcher as an emergency back up. If required the rockets can also be launched by remote control away from the launcher.

Protection

NBC Protection: No

Self-Entrenching Blade: No

Smoke Equipment: No

Notes:

The WM-80 multiple launch rocket system was developed by China North Industries Group Corporation (NORINCO) based on the indigenous Type 83 273mm 4-tube artillery rocket system. The WM-80 did not enter PLA service, possibly due to the introduction of the more capable A-100 artillery rocket system. NORINCO has been promoting the weapon system to the export market and made one sale to Armenia in 1999. The WM-80 rocket system is composed of the multiple rocket launcher, the ammunition transporter/loader, fire command and control vehicles, and the maintenance vehicles. The fire command and control is composed of a brigade/regiment command vehicle, battalion command vehicle, surveillance/spotting radar, and meteorological radar. A total of six launcher vehicles and six resupply vehicles would be attached to each battery. The standard combat unit is considered to be the battalion with the customer choosing his own Table Of Equipment (TOE) if they so wish. Fire-control and command duties throughout the brigade are accomplished by use of an automatic distribution network. This consists of main computers located at the brigade, battalion and battery HQ command levels with various terminals and radio/wire communications links to automatically distribute the data as directed.

2K6 Luna (FROG-3) Russian Medium-Range Artillery Rocket System

Tiers:

Variants:

- **9M21B:** Nuclear-armed variant, fitted with a 500 kg (1,213-lb) warhead.
- **9M21G:** This variant is fitted with a 390 kg (860-lb) warhead.
- **Laith-90:** Iraqi version with increased range (90 km) and submunition warhead.

System

Alternative Designation: 2K6 Luna; NATO: FROG-3
Type: Medium-Range Artillery Rocket System
Description: . Its NATO reporting names are FROG-3 (with 3R9 missile) and FROG-5 (with 3R10 missile). From 1965, the 2K6 Luna was replaced by the far more successful 9K52 Luna-M, which was known in the West as the FROG-7.
Family: 9K52
Crew: ea5
Missile Complex: The missile complex consisted of 1. the launch vehicle SPU 2P16 (Ob'yekt 160), based on a modified PT-76B chassis with return rollers and fitted with a launch rail, elevation mechanism, stabilizing jacks and a generator. Combat weight was 18 t; 2. the rocket 3R9 with conventional HE warhead 3N15 and with a range of 12 to 44.6 km, 3. the rocket 3R10 with a 400 kg nuclear warhead 3N14 and with a range of 10 to 32.1 km; 4. a missile transporter 2U663 based on the ZiL-157V with 2 missiles; 5. a vehicle 2U662 to transport and store nuclear warheads; 6. a mobile crane ADK K52 (on MAZ-502), ADK K61 (on MAZ-200) or 9T31 (on Ural-375); sets of maintenance vehicles PRTB-1, 2U659 etc.; 7. control and command vehicle PU-2 and 8. a training set with training rocket PV-65 or 3R11 with training warhead 3N16.

Notes:

The Russian FROG-3 [Free Rocket Over Ground], FROG-4, and FROG-5 are three variants of a single unguided, spin stabilized, solid fuel rocket. The 2K6 Luna (English: moon) is a Soviet short-range artillery rocket complex. Luna rockets were solid-fuel, unguided and spin-stabilized. "2K6" is its GRAU designation. Its NATO reporting names are FROG-3 (with 3R9 missile) and FROG-5 (with 3R10 missile). From 1965, the 2K6 Luna was replaced by the far more successful 9K52 Luna-M, which was known in the West as the FROG-7. One of the first Soviet tactical missile systems with unguided missiles equipped with nuclear warheads. Intended for manning missile divisions of tank and motorized rifle divisions, was to be used as a means of clearing in the offensive zone of the compound. It has been developed since 1953, launched in full-scale design since 1956, and has been tested since 1958, and entered service in 1960. The developer was the Moscow NII-1 (now the Moscow Institute of Heat Engineering, the creators of Topol, Yars and Maces). The Luna system was developed in NII-1 from 1953, under the supervision of N. P. Mazurov. Luna followed the earlier designs 2K1 Mars and 2K4 Filin. While NII-1 was responsible for the rocket, the launch and transporter-loader vehicles were designed by TsNII-58. The initial system name was S-125A "Pion". In 1957 the prototypes of the launch vehicle (SPU S-123A on Ob'yekt 160 chassis), the transloader (TZM S-124A on Ob'yekt 161 chassis) and the 3R5 rocket were ready for evaluations. These were carried out in 1958 in Kapustin Yar and in 1959 in the Transbaikal Military District. As a result of these evaluations, it was decided to abandon the TZM, to improve the SPU and to redesign the rocket. This led to the development of the 3R9 and 3R10 rockets. The decision to start series production was taken on 29 December 1959. The first 5 systems were ready in January 1960 after which the state acceptance trials were carried out until March of that same year. In 1960 the Luna system entered service with the Soviet Army where it remained until 1982. From 1960 till 1964, a total of 432 SPU 2P16s was produced. In the first year alone, 80 launch vehicles and 365 rockets were finished. The missile complex consisted of the launch vehicle SPU 2P16 (Ob'yekt 160), based on a modified PT-76B chassis with return rollers and fitted with a launch rail, elevation mechanism, stabilizing jacks and a generator. Combat weight was 18 t; the rocket 3R9 with conventional HE warhead 3N15 and with a range of 12 to 44.6 km, the rocket 3R10 with a 400 kg nuclear warhead 3N14 and with a range of 10 to 32.1 km; a missile transporter 2U663 based on the ZiL-157V with 2 missiles; a vehicle 2U662 to transport and store nuclear warheads; a mobile crane ADK K52 (on MAZ-502), ADK K61 (on MAZ-200) or 9T31 (on Ural-375); sets of maintenance vehicles PRTB-1, 2U659 etc.; control and command vehicle PU-2 and a training set with training rocket PV-65 or 3R11 with training warhead 3N16.

Laith-90 Iraqi Medium-Range Artillery Rocket System

Tiers:

Variants:

- **9M21B:** Nuclear-armed variant, fitted with a 500 kg (1,213-lb) warhead.
- **9M21G:** This variant is fitted with a 390 kg (860-lb) warhead.
- **Laith-90:** Iraqi version with increased range (90 km) and submunition warhead.

System

Alternative Designation: Laith-90
Type: Medium-Range Artillery Rocket System
Family: 9K52
Crew: ea4
Launcher Chassis: 9P113 transporter Erector Launcher (TEL) based on the 8 x 8 BAZ-135 missile launcher
Displacement Time: min5
Emplacement Time: min5

Dimensions (9P113 transporter Erector Launcher)

Length, Vehcile: m9.30

Smoke Equipment: No

Notes:

The Laith-90 is a variant of the Russian 9K52 Luna-M (NATO: FROG-7), that has a increased missile range of 90km. The 9K52 Luna-M (Russian: Луна; English: moon, NATO reporting name FROG-7) is a Soviet short-range artillery rocket system. It fires unguided and spin-stabilized 9M21 rockets. "FROG" is an acronym for "Free Rocket Over Ground". The 9M21 rockets are mounted on a wheeled 9P113 transporter erector launcher (TEL) based on the ZIL-135 8x8 army truck. The TEL features a large hydraulic crane used for reloading rockets from 9T29 transporters (also ZIL-135 based). The 9M21 has a range up to 70 km and a CEP (circular error probable) between 500 m and 700 m. The road mobile rocket has a 550 kg warhead and is capable of delivering high explosive, nuclear, or chemical warheads. The FROG-7 was the latest addition to the "Free Rocket Over Ground" family of unguided, spin-stabilized, short-range (battlefield support) artillery rockets. The rocket was of conventional single-stage design, with a cylindrical warhead of the same diameter as the rocket body, giving it a cleaner, more modern appearance than its predecessors. The FROG-7 has a range of 70 km and a 550 kg warhead, and an impact area of approximately 2.8 km long by 1.8 km wide. The FROG-7 was capable of delivering HE, nuclear, or chemical warheads. The FROG-7 gave the Soviet division commander a deep interdiction/penetration nuclear threat. The FROG-7A was first introduced in 1965 as a replacement for earlier FROG variants, some of which had been in service since the mid-1950s. The FROG-1 and -2 were obsolete. The FROG-3, -4, and -5 variants, mounted on a non-amphibious version of the PT-76 light tank chassis, were obsolete in the USSR, but were still found in other Warsaw Pact armies at the end of the Cold War. The FROG-5 was still used as a training rocket, and the FROG-6 was a dummy rocket used for training purposes only. The FROG-7B, introduced in 1968, was essentially the same rocket as the FROG-7A but with a longer warhead section. Missiles of all modifications had the largest body diameter of 544 mm, the length of missiles of modifications 9M21B, F, E was 8960 mm, missiles of modifications 9M21B1 and E1 were 9400 mm. The speed of the rocket was about 1200 m/s. The FROG-7 was replaced by the SS-21 tactical ballistic missile which had greater range (120 km) as well as probable improvements in reaction time, missile reliability, accuracy, and handling characteristics. Since the SS-21 was mounted on a six-wheeled TEL similar to the SA-8/GECKO SAM system, it has improved cross-country capability and was probably amphibious. Like the SA-8, it probably has an air filtration and overpressure system for-collective chemical and biological protection. The SS-21 was first deployed in 1976 in the USSR and was reported in GSFG in 1981. The FROG-7 (9K52 Luna), the final version of the FROG family, was an unguided, spin-stabilized, short-range, battlefield support artillery rocket. The range of the FROG-7A rocket was 70 km with a CEP of 500 to 700 meters. It was fitted with either a 450 kg HE, 450 kg nuclear, or 36 kg chemical warheads. The improved FROG-7B carries a cargo warhead for delivering bomblets or mines. In addition to improvements in the rocket which give it greater range, a new transport-launch vehicle using a wheeled chassis has been developed based on the ZIL-135 [BAZ-135] 8x8 truck. This wheeled transporter erector launcher (TEL) carries one rocket and a crane. It incorporates a number of improvements in rocket handling such as the on-board crane. Reload missiles were placed on the TEL by that vehicle's own hydraulically operated crane on the right side of the launcher rail. A very similar vehicle was also used with the FROG-7 system to transport the reserve rockets. The earlier FROG'S used semitrailers towed by ZIL-157V tractor trucks, and needed crane trucks for reloading of the transport-launch vehicles. Preparation for firing can take 15 to 30 minutes depending on the situation. A typical FROG-7 battalion was equipped with two firing batteries each with two TELs and a D-band RMS (END TRAY) long-range meteorological radar. The cruising range of the transporter-erector-launcher vehicle was 400 km. The FROG-7 TEL vehicle provides no NBC protection for the crew. The single-rail launcher has limited traverse. In 1961, the Luna complex was adopted by the Soviet Army, which included the 2P16 tracked launcher, based on the amphibious tank PT-76, as well as 3P10 and 3P9 missiles with nuclear and high-explosive fragmentation warheads. Even before the Luna complex entered service with the Decree of the Council of Ministers of the USSR of 02.17.1961, work began on the development of its modernized version with an increased firing range. These works culminated in the creation of a virtually new tactical complex, which received the designation 9K52 "Luna-M". For this complex, a 9M21 rocket was created, a new launcher and a transport vehicle on a ZIL-135LM wheeled chassis. The first launch of the 9M21 rocket took place on December 27, 1961, and the 9K52 Luna-M complex was put into serial production and into service entered in 1964. Serial production was carried out at the Barricades factory. The advantage of the 9K52 Luna-M complex over its predecessor was that the control unit had its own hydro-mechanical crane with a lifting capacity of 3 tons (see photo on the side , above) This made it possible to abandon the semi-trailer transport vehicle, which transported two spare missiles and a

self-propelled crane for reloading missiles. The 9P113 launcher provided highway speeds of up to 60 km / h, due to the use of the wheelbase, the tremors and overloads of the warhead were significantly reduced (for the Luna complex, the maximum speed was theoretically up to 40 km / h, but already at a speed of 16 18 km / h on dirt roads there were overloads, unacceptable for a nuclear warhead). Both the 9P113 launcher and the 9T29 transport vehicle have very high cross-country ability. They were capable of overcoming steep slopes up to 30 ° and fords up to 1.2 m deep. The 9P113 installation was capable of performing at least 200 9M21 missile launches. To lock the launcher during the launch of the rocket, four swing-out supports with screw jacks were used. PU 9P113 has a hydraulically driven device for setting the guide to the position for launching the rocket, as well as the necessary equipment for prelaunch and launch. There were also communications equipment, navigation and orientation equipment, power supply and life support systems. 9M21 unguided single-stage solid-fuel rocket was designed to destroy manpower, military equipment, firearms and defensive structures located in the tactical depth of enemy defense. The missile was designed in several versions, different warheads: 9M21B with a nuclear warhead 9N32, 9M21F with a high-explosive fragmentation warhead 9N18F, 9M21G with a chemical warhead 9N18G and even 9M21D with a propaganda warhead 9N18A. High-explosive fragmentation warhead 9N18F contained 200 kg of highly active explosive TGA-40/60 and gave at least 15,000 fragments. In 1969, the 9N18K was put into service with a 420 kg fragmentation warhead containing 42 warheads weighing 7.5 kg each and providing for the defeat of manpower over an area of several hectares. Since the 9H32 warheads in nuclear equipment required constant temperature control to ensure a given yield, and there was no internal heating system in the warheads of the Luna-M, the 9P113 launcher and the 9T29 transport vehicle included electric heating cases designed for maintaining the temperature of nuclear warheads in a given temperature regime. On the cover itself was a temperature sensor, which provided the on and off heating spirals, depending on temperature. The number of thermal covers coincided with the number of missiles transported (for 9P113 - 1, for 9T29 - 3). To ensure the heating of the main engine during long-term parking without starting the marching engines, a gas unit was included in these units. The 9M21 missile part consists of three engines, a launch, a main cruise and a "crank" [spin stabilization] engine. All solid-fuel engines. Various missile flight ranges were achieved by using brake flaps, as well as by changing the elevation angle at launch trajectories. The starting engine was placed around the nozzle of the main engine. It works while the rocket moves along the guides of the launcher. The ignition of the charge of the starting engine was produced by the gases of the main engine, penetrating through special holes. The charge of the starting engine was made of single-channel cylindrical checkers of gunpowder RSI-60, arranged in a circle in three rows. The main (sustainer) engine provides a given range of missile flight. It works only on the active part of the trajectory, and then the flight takes place by inertia. The charge of the main engine consists of single-channel cylindrical blocks made of NMF-2 nitroglycerin (ballistic) gunpowder. The armored ends of the checkers hold the charge in the combustion process, provides centering of the rocket. The powder charge was divided in length into two parts. Each part was held in the chamber of the rocket engine with its diaphragms, which approximately halves the load at the attachment points. The operation of the solid propellant rocket motor was significantly affected by the initial temperature of the charge, which ultimately affects the magnitude of the engine thrust. This factor can be eliminated by adjustments to the elevation angle of the guide before starting. In addition, the 9M21 rocket provides for the use of replaceable nozzle bushings, the liners of which have different diameters of the critical section. At elevated temperatures, bushings with a large critical section were used; at lower temperatures, vice versa. This factor can be eliminated by adjustments to the elevation angle of the guide before starting. In addition, the 9M21 rocket provides for the use of replaceable nozzle bushings, the liners of which have different diameters of the critical section. At elevated temperatures, bushings with a large critical section were used; at lower temperatures, vice versa. This factor can be eliminated by adjustments to the elevation angle of the guide before starting. In addition, the 9M21 rocket provides for the use of replaceable nozzle bushings, the liners of which have different diameters of the critical section. At elevated temperatures, bushings with a large critical section were used; at lower temperatures, vice versa. The rocket engine was started by applying an electrical impulse through the onboard connector to the squibs, the initiation of which leads to ignition of the igniter from granular smoke powder, which, in turn, ignite the powder charge of the main engine. The rotation engine serves to compensate for the moment arising due to the eccentricity of the thrust vector, and was located in the region of the center of mass of the rocket. The engine nozzles through curved gas ducts were brought to the side surface of the rocket, the thrust vectors of the engine of rotation were directed tangentially to the surface of the body and create a torque. The crank engine runs on RSI-60 gunpowder, the operating time was ~ 0.4 s, it turns on after the rocket leaves the guides. In the tail part of 9M21 stabilizers were installed to ensure a stable flight of the rocket along the trajectory. When calculating the data for launching a 9M21 rocket, weather conditions were taken into account, namely the direction and average wind speed at altitude. To do this, the starter battery has a meteorological station, which makes several shots vertically up from a ballistic gun. In the direction and distance of the bullets (daytime with a red ribbon, nighttime - glowing) from the point of the shot, the direction and average wind speed were calculated. To prevent the unauthorized use of nuclear weapons, all launchers capable of launching rockets in nuclear equipment were equipped with code-blocking devices. In 9K52TS launchers, which did not involve the use of warheads in nuclear equipment, there were no code blocking devices. PU 9K52TS was not equipped with thermal covers. The 9M21 missiles were also supposed to be equipped with the 9K53 Luna-MB complex. The development of the Luna-MB complex was started by Decree of the Council of Ministers of 02/05/1962. The 9P114 launcher, which was created on the basis of a wheeled vehicle, allowing landing by Mi-6 or Mi-10 helicopters, was used in this complex. Work on the Luna-MB complex reached the stage of testing prototypes. However, quite a few difficulties were encountered, the main one of which was the need for a preliminary topographic and geodetic reference of the launch position, as well as the large “sailing” of the Mi-10 helicopter with the 9P114 launcher on the external sling. As a result, in 1965, work on this complex was discontinued. A significant drawback of the Luna-M complex was the low accuracy of firing, even the use of a nuclear warhead did not provide guaranteed destruction of well-targeted point targets such as a command post, etc. In this regard, according to the Decree of the Council of Ministers of July 20, 1966, the development of the Luna-3 rocket, equipped with a simplified control system, was begun. It was assumed that the circular

probable deviation (CVO) of the new missile at a range of 70km would not exceed 500m. However, the flight tests conducted in 1968-1969 gave an even greater circular probable deviation compared to the prototype. The range corrector worked unsatisfactorily and the continuation of work on this OCD was deemed inappropriate. This complex became the most extensively deployed in the Soviet army, the peak of the deployment of combat vehicles of the complex occurred in 1986, when there were about 750 units in the troops. During the Cold War the most prominent short-range nuclear force [SNF] system at at the division level was the unguided free-rocket-over-ground (FROG), which in the Soviet Army was deployed in a battalion of four launchers. As of 1987 the Soviets were replacing FROGs with the more accurate, longer range SS-21s in some divisions opposite NATO. About 500 FROG and SS-21 launchers were opposite NATO. Another 215 FROG launchers were opposite China and in the Far East; some 100 were opposite Southwest Asia and eastern Turkey; and about 75 were in strategic reserve. Designed in 1968, a variant of the 9K52TS complex, designed for firing missiles with a high-explosive warhead, was widely exported to both Warsaw Pact and some non-Warsaw Pact nations. Armies of approximately 15 countries, including the armed forces of the Warsaw Pact, Cuba, Egypt, Iraq, Kuwait, Libya, the DPRK, and Yemen became its buyers. Laith, an Iraqi improved version of the FROG-7, had a 90 km range. The combat debut of the complex took place during the 1973 Arab-Israeli war. The Luna-M complex was used in a number of regional conflicts, including in Afghanistan, the Iran-Iraq war of 1980-88, and the Gulf War of 1991. The Syrian army began to use 9K52 Luna-M missile , also known under the NATO designation FROG-7, systems against terrorists. These systems, along with 9K72 Elbrus, for a long time formed the basis of the missile power of the Syrian army. The Soviet Union began delivering FROG-7 to its most faithful ally in the Middle East at the very beginning of the 70s. The Syrians quite successfully mastered this weapon.

PHL-03 Chinese 300mm Multiple Rocket Launcher (MRL)

Tiers:

Variants:

- **AR2:** Export variant that is similar to its parent
- **AR1:** Version of the PHL-03 with rearranged rocket tubes. It was developed especially for export. This artillery system has a total of 8 launch tubes, arranged in 2 pods with 4 rockets each. The pods are factory fitted and sealed. Once all of the rockets are launched the pods are removed and replaced. Such artillery rocket systems are faster to reload, easier to store, and easier to maintain.
- **AR1A:** Has a total of 10 launch tubes arranged in 2 pods of 5 rockets each
- **AR3:** Has 8 launch tubes for 370mm guided rockets. These are arranged in 2 pods with 4 rockets each. These guided rockets have a maximum range of 220km and have capabilities similar to that of a short range ballistic missile.

System

Alternative Designation: Type 03

Smoke Equipment: 6 smoke grenade launchers

Cab: Protected against small arms and artillery splinters

Notes:

The Astros (Artillery Saturation Rocket System) II is a modular multiple rocket launcher capable of firing three different caliber wrap-around fin rockets (for improved accuracy) using several types of warheads. The universal modules enable the system to accomplish fire missions with ranges from 9 to 90 kilometers. The Astros II system consists of the following vehicles: universal multiple launcher (AV-LMU), ammunition supply vehicle (AV-RMD), command and control vehicle/fire control unit (AVVCC), mobile workshops (for field maintenance), and the optional electronic fire control unit (AV-UCF). All of the Astros II vehicles use the Tectran Enginharia 10 ton, 6x6, wheeled vehicle chassis. A typical firing battery consists of six AV-LMU launchers, six AV-RMD ammunition supply vehicles, and one AV-VCC fire control unit. An AV-VCC command and control unit and two mobile workshops are found at battalion level. The battalion level AV-VCC can coordinate and direct fire missions for three Astros batteries. The AV-RMD ammunition supply vehicle carries two complete loads for each launcher.

→Anti-Tank Gun Systems

Type 73 Chinese 100mm Towed Anti-Tank Gun

Tiers:

Variants:

- **A407:** This artillery system was designed by Arsenal-Resita and is very similar to the MT-12. It can fire the same range of ammunition as the T-54/55 tank and has a maximum range of 2,200 m (HEAT) or 4,000 m (APC-T). Subversions are the A407M1 and the A407M2. In Romanian Army service, the A407 is known as the 100 mm anti-tank gun M1977 (Romanian: Tun antitanc calibrul 100-mm Model 1977) and is normally towed by the DAC 887R truck. It can also be towed with the DAC 665T truck. The Model 2002 is an improved version, fitted with the automatic fire control system TAT-100.
- **Type 73:** This appears to be a copy of the Soviet T-12.
- **Type 86:** This is a 100mm smoothbore anti-tank gun that has some similarities with the 85mm Type 56 (D-44). It fires ammunition of the fixed type, including the Type 73 HE, Type 73 HEAT, Type 73 APFSDS and Type 86 APFSDS to a maximum range of 1,800 m.
- **2A19 or T-12:** 2A19 or T-12 is a Soviet smoothbore 100-mm anti-tank gun, which served as the primary towed anti-tank artillery in the Soviet and Bulgarian armies from the early 1960s to the late 1980s.

System

Alternative Designation: 2A29
Type: Towed Anti-Tank Gun
In Service: 1961-Present
Crew: 6 (commander, driver, gunner, loader, 2 ammunition handlers)
Displacement Time: INA
Emplacement Time: INA
Note: Thanks to the redesigned carriage, which has a bigger wheel base, the MT-12 can be towed by the MT-LB, at speeds up to 60 km/h on road or 25 km/h cross-country.

Dimensions

Length: 9.16 m
Barrel Length: 8.48 m
Width: 1.795 m
Height: 1.565 m
Weight: 2,750 kg

Main Weapon System

↳*System*

Name: 2A19
Type: Towed Anti-Tank Gun
Caliber: mm100
Carriage: Transport: Ural-375D (6x6) On road: 60 km/h (37 mph) Off road: 15 km/h (9 mph)
Elevation: −10° to +20°
Traverse: 27° left or right
Rate of Fire: 14 rpm (max possible) 10 rpm (max likely) 4 to 6 rpm (typical)
Muzzle Velocity: See Ammunition Types
Maximum Firing Range: See Ammunition Types

↳*Ammunition*

Type: Projectile
Caliber: 100mm
Shell: Fixed QF 100 × 910 mmR
Basic Load: When the MT-LB is used as the transporter, 20 rounds are typically carried (10 APFSDS, 4 HE-Frag, 6 HEAT). Since the weapon is a smoothbore, all the ammunition is finned for accuracy during flight.
Ammunition Types: APFSDS BM-2 APFSDS projectile. 3BM-2 APFSDS-T Tungsten Round weight: 19.34 kg (42.6 lb) Projectile weight: 5.65 kg (12.5 lb) Muzzle velocity: 1,575 m/s (5,170 ft/s) Maximum range: 3,000 m (3,300 yd) Penetration: 230 mm at 500 m (9 in at 550 yd) 180 mm at 2,000 m (7 in at 2,200 yd) 140 mm at 3,000 m (5.5 in at 3,300 yd) 3BM23/3UBM10 APFSDS Round weight: 19.9 kg (44 lb) Projectile weight: 4.55 kg (10.0 lb) Muzzle velocity: 1,548 m/s (5,080 ft/s) Maximum range: 3,000 m (3,300 yd) Penetration: 225 mm at 1000 m (8.8 in at 1100 yd) HEAT 3BK16M/3UBK8 Round weight: 23.1 kg (51 lb) Projectile weight: 9.5 kg (21 lb) Muzzle velocity: 975 m/s (3,200 ft/s) Maximum range: 1,000 m (1,100 yd) Penetration: 400 mm (16 in) HE-FRAG 3OF12/3OF35 Round weight: 28.9 kg (64 lb) Projectile weight: 16.7 kg (37 lb) Muzzle velocity: 700 m/s (2,300 ft/s) Maximum range (indirect): 8,200 m (9,000 yd) Guided projectile 9K117 Kastet 3UBK10/3UBK10M Main article: 9M117 Bastion Beam riding laser guided projectile. Round weight: 24.5 kg (54 lb) Projectile weight: 17.6 kg (39 lb) Average speed: 300 m/s (980 ft/s) Range: 100–5,000 m (110–5,470 yd) Penetration: 550–600 mm (22–24 in)

Fire Control

↳*Fire Control System*

Name: INA
Computerized FCS: No
Direct Fire: Yes
Indirect Fire: Yes
Sights: The standard equipment consists of the panoramic PG-1M sight for indirect fire, and an OP4M-40U telescope for direct fire. The APN-5-40 or APN-6-40 are used for direct fire by night.

Notes:

Type 73 - This appears to be a copy of the Soviet T-12. 2A19 or T-12 is a Soviet smooth-bore 100-mm anti-tank gun, which

served as the primary towed anti-tank artillery in the Soviet and Bulgarian armies from the early 1960s to the late 1980s. The T-12 entered service in 1961, replacing the BS-3 100 mm field gun. It was typically deployed in the anti-tank units of armored and motor rifle regiments to protect flanks against counter-attacks during rapid advances. In 1970, it was replaced in production by the T-12A or MT-12 "Rapira", which features a new smooth-bore gun, the 100 mm 2A29 gun, as well as a redesigned carriage and gun shield to protect the crew from machine gun fire and shell splinters. Thanks to the redesigned carriage, which has a bigger wheel base, the MT-12 can be towed by the MT-LB, at speeds up to 60 km/h on road or 25 km/h cross-country. The 2A29R "Ruta" or MT-12R is a version with a RLPK-1 radar for engaging targets in a poor visibility environment (smoke/fog). From 1981, the gun could fire laser beam-riding guided missiles 9M117 Kastet (weapon system 9K116) and carried the new designator 2A29K "Kastet" or MT-12K. The weapon was planned to be superseded by the 2A45 Sprut-B 125 mm smooth bore anti-tank gun. Modern western tanks' frontal armor protection is in excess of what can be penetrated by a 100 mm gun from anything but point-blank range – even using the most modern APFSDS round. For a tank that can maneuver to take advantage of the enemy's weaknesses this is less of a problem – but for a weapon that is primarily defensive, this is a serious problem. Today, the T-12 is applied mostly in the role of ordinary artillery, using FRAG-HE shells. In 2017, the Algerian military displayed a locally developed variant mounted on a Mercedes-Benz Zetros truck. It includes four stabilization legs to absorb firing impacts. The gun requires a crew of six: commander, driver of the towing vehicle, gun layer, loader, and two ammunition crewmen. When the MT-LB is used as the transporter, 20 rounds are typically carried (10 APFSDS, 4 HE-Frag, 6 HEAT). Since the weapon is a smooth-bore, all the ammunition is finned for accuracy during flight. The standard equipment consists of the panoramic PG-1M sight for indirect fire, and an OP4M-40U telescope for direct fire. The APN-5-40 or APN-6-40 are used for direct fire by night. The gun can be fitted with the LO-7 ski gear for travel across snow or swampy ground.

Armor Penetration: Armor penetration (BR-412B, 30° degrees) 500 m : 190 mm (547 yds : 6.29 in) 1000 m : 170 mm (1,093 yds : 6 in)

Notes:

The 100 mm field gun M1944 (BS-3) (Russian: 100-мм полевая пушка обр. 1944 г. (БС-3)) was a Soviet 100 mm anti-tank and field gun. The gun was successfully employed in the late stages of World War II, and remained in service into the 1950s, being replaced in Soviet service by the T-12 antitank gun and the 85 mm antitank gun D-48 in 1955. The BS-3 was also sold to a number of other countries and in some of these countries the gun is still in service. A number of BS-3 pieces are still stored in Russian Ground Forces arsenals. Also, in 2012, at least 12 BS-3 guns are active with the 18th Machine Gun Artillery Division, located on the Kuril Islands, used as anti-ship and anti-landing guns. The BS-3 was based on the B-34 naval gun. The development team was led by V. G. Grabin. The gun was employed by light artillery brigades of tank armies (20 pieces along with 48 ZiS-3) and by corps artillery. In the Second World War the BS-3 was successfully used as a powerful anti-tank gun. It was capable of defeating any contemporary tank at long range, excluding the Tiger Ausf B: to destroy that heavy tank the gun needed to shoot at less than 1600 m from the target. The gun was also used as a field gun. Though in this role it was less powerful than the 122 mm A-19, as it fired a smaller round, the BS-3 was more mobile and had a higher rate of fire.

Type 86 Chinese 100mm Towed Anti-Tank Gun

Tiers:

Variants:

- **A407:** This artillery system was designed by Arsenal-Resita and is very similar to the MT-12. It can fire the same range of ammunition as the T-54/55 tank and has a maximum range of 2,200 m (HEAT) or 4,000 m (APC-T). Subversions are the A407M1 and the A407M2. In Romanian Army service, the A407 is known as the 100 mm anti-tank gun M1977 (Romanian: Tun antitanc calibrul 100-mm Model 1977) and is normally towed by the DAC 887R truck. It can also be towed with the DAC 665T truck. The Model 2002 is an improved version, fitted with the automatic fire control system TAT-100.
- **Type 73:** This appears to be a copy of the Soviet T-12.
- **Type 86:** This is a 100mm smoothbore anti-tank gun that has some similarities with the 85mm Type 56 (D-44). It fires ammunition of the fixed type, including the Type 73 HE, Type 73 HEAT, Type 73 APFSDS and Type 86 APFSDS to a maximum range of 1,800 m.
- **2A19 or T-12:** 2A19 or T-12 is a Soviet smoothbore 100-mm anti-tank gun, which served as the primary towed anti-tank artillery in the Soviet and Bulgarian armies from the early 1960s to the late 1980s.

System

Alternative Designation: Type 86
Type: Towed Anti-Tank Gun

Height: mm1,840
Weight: 3,630 kg

Main Weapon System

↳*System*

Name: Type 86

Type: Towed Anti-Tank Gun

Caliber: mm100

Carriage: INA

Elevation: −4° to +38°

Traverse: 27° left or right

Rate of Fire: 14 rpm (max possible) 10 rpm (max likely) 4 to 6 rpm (typical)

Muzzle Velocity: 1,610 m/s. Also See Ammunition Types

Maximum Firing Range: 13,700 meters. Also See Ammunition Types

↳*Ammunition*

Type: Projectile

Caliber: 100mm

Shell: Fixed QF 100 × 910 mmR

Basic Load: When the MT-LB is used as the transporter, 20 rounds are typically carried (10 APFSDS, 4 HE-Frag, 6 HEAT). Since the weapon is a smoothbore, all the ammunition is finned for accuracy during flight.

Ammunition Types: The Type 86 fires the following types of 100 mm fixed ammunition: APFSDS Type 86 with a tungsten penetrator at a muzzle velocity of 1,610 m/s with an effective range of 1,800 m; when firing this round the maximum rate of fire is 4 to 5 rds/min APDS Type 73 with a tungsten penetrator at a muzzle velocity of 1,500 m/s with an effective range of 1,700 m HEAT Type 73 fin-stabilised projectile at a muzzle velocity of 1,010 m/s. APFSDS Type 73 with tungsten alloy penetrator with a maximum direct fire range of 1,700 m APFSDS Type 73 with the projectile having a length-to-diameter ratio of 13.3:1 and a maximum range in the direct fire role of 1,730 m HE Type 73 fin-stabilised projectile at a muzzle velocity of 900 m/s with a maximum range of 13,700 m. When firing these projectiles, the usual recoil length is between 1 and 1.14 m; maximum recoil length is 1.18 m. NORINCO is now marketing a 155 mm laser-guided artillery projectile and laser-guided (for example 105 mm) tank-launched projectiles. As far as it is known, no 100 mm laser-guided projectiles have been developed for this weapon. It is understood that these Chinese laser-guided anti-armour projectiles are based on Russian technology transfer.

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: Yes

Sights: A night vision device for sighting purposes is available.

Notes:

The Type 86 is the 100mm towed antitank gun developed in the late 1980s based on the high-pressure 100mm smooth-bore gun technology and the two-wheel carriage of the Type 73 100mm towed antitank gun. NORINCO claimed that the Type 86 is

capable of penetrating the frontal armor of the basic variant T-72 at a distance of 2,000m, and later improved variants could penetrate the T-72 and T-80 fitted with explosive reactive armor (ERA). The gun also outperforms Western 105mm tank guns. The Type 86 is in service with PLA motorized infantry divisions as the primary antitank artillery weapon. Description The Type 86 ordnance is smooth-bore and features a distinctive slotted muzzle brake. The breech mechanism has a vertical sliding block and the sighting mechanism is mounted to the left of the gun. The carriage uses split trails with a castor wheel on the left trail leg to assist in bringing the gun into action. A shield with sloping sides is fitted with an opening for the sight on the left side. Although the Type 86 is primarily an anti-tank weapon it can be used for the indirect fire role, even though the potential maximum range is limited by the maximum gun elevation of +38°. Maximum rate of fire is quoted as 8 to 10 rds/min. A night vision device for sighting purposes is available.

Type: Transporter erector launcher

Fire on the Move: No

↳*Missile*

Name: Naze'at 6-H rocket

Type: SS Ballistic Missile / Long-Range Artillery Rocket

Length: mm6,290

Diameter: mm356

Initial Weight: kg960

Propellant Weight: kg420

Propellant Type: Solid Hydroxyl-terminated polybutadiene

Warhead Weight: kg130

Maximum Range: km100

Minimum Range: km80

CEP: 500-1000 m

Average Action Time: 9 seconds

Specific Impulse: 240 seconds

Service Life: 7 Years

Speed: Mach 4-5

Fire Control

Note: No Guidance System however, TELs use GPS to set the launch site

Protection

Note (1): The TEL has no active or passive protection systems other than NBC

Note (2): The rocket has no counter measures

Notes:

The Naze'at 6-H is a Iranian close range ballistic missile (some classify it as rocket artillery) with a range of about 100 km. Like Iran's similar shaped Zelzal rockets, Naze'at rockets do not have a guidance system. The Naze'at 6-H is also widely known without the -H suffix, as the Naze'at 6. The Naze'at is launched from a transporter erector launcher (TEL) and carries a conventional warhead. It may be capable of carrying a chemical or biological warhead as well. A complete Naze'at system includes a TEL and communications vans, meteorological vans, and a GPS system for surveying the launch site. The reliability and accuracy of Naze'at rockets is assessed as poor as they have no guidance system.

Dimensions

Length: m10.8

Missile Weight: kg2,650

Diameter: 0.65 m (first stage), 0.5 m (second stage)

Fin Span: INA

Payload

Warhead Type: Single

Warhead Options: Conventional and Nuclear

Nuclear Yield: INA

Conventional Warhead Weight: kg190

Conventional Warheads Available: HE

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: No

Propulsion Characteristics

Engine: 2 Stage

Propellant: Solid for first stage, liquid for second

Speed: INA

Flight Ceiling: INA

Attack Altitude: NA

Fire Control

Guidance System: Inertial navigation system (INS) guidance with command updates

Notes:

The Iranian CSS-8 (M-7) is a short range, solid fueled, ballistic missile. It is believed Iran acquired 200 of the CSS-8 (M-7) from China in the late 1980s. Iran later renamed the system Tondar-69. Although the CSS-8 (M-7) entered into service in 1992, it may soon become obsolete as less than 100 of the missiles are in operation since only 20 tracked launcher vehicles are in service. Furthermore, the system is reported to have poor accuracy. Reports indicate that Iranian leaders were unsatisfied with the missile, with most pointing to its poor accuracy, as mentioned above, and light warhead. Iran subsequently began development of the Fateh-110 SRBM, which also uses solid-fuel.

Fateh-110 Iranian Surface to Surface Short Range Ballistic Missile (SRBM)

Tiers:

Variants:

- **The Fateh-110/I:** Has a maximum range of 200km (124 miles), and can carry a 650kg payload. It was declared operational in 2002.
- **The Fateh-110/II:** Has a range of 250km (155 miles), a payload of 450kg. Iran announced the development of this variant in 2004.
- **The Fateh-110/III:** Was announced in 2010 and designed to have more accuracy and a quicker launch time. It has a range of 300km, can carry a 650kgpayload.
- **The Fateh-110/IV:** Developed in 2012 and is designed to have precision targeting and has a guidance system. It also has a range of 300km, can carry a 650kg payload.
- **Zolfaghar:** On September 25, 2016, Iranian Defense Minister Hossein Dehghan announced that Iran's new Zolfaghar ballistic missile, a Fateh-110 variant, has a potential range of 700 km. The newest member of the Fateh-110 family of solid-fueled short-range ballistic missiles, Iran claims that Zolfaghar is equipped with a a sub-munition warhead. The Iranian Ministry of Defense released a video allegedly showing the Zolfaghar being fired and successfully hitting a small target. The authenticity of the video has not been verified.
- **Fateh-110 Anti-Ship Variants:** In 2014, the IRGC displayed two variants of the Fateh missile it called the Hormuz-1 and Hormuz-2. The Hormuz-1 is claimed to have anti-radiation capabilities for attacking radar systems, and in 2014, Iranian television broadcast images of commanders watching an attack on a target with radar antennae. The original claim was that Hormuz-2 was an anti-ship variant, but images of the missile suggested it had a similar radio frequency-transparent ray dome and not a window for an electro-optical infrared seeker, suggesting it is essentially the same as the Hormuz-1. Another anti-ship variant of the Fateh is the Khalij Fars, which does have the electro-optical seeker required to improve accuracy enough to potentially hit a moving target. Tehran claims that early version Khalij Fars entered service in 2008, but was not officially delivered to the Iranian military until a ceremony in March 2014. This ceremony featured Fateh missiles painted blue to suggest an anti-ship variant, but Iran put caps on the noses of the missile preventing verification of the EO/IR seekers. The Department of Defense did assess in the unclassified version of its 2014 report on the military power of Iran that it does possess an anti-ship ballistic missile capability.

System

Alternate Designation: Fateh-110, NP-110
Basing: Ground
Launch Platform(s): TEL

Effective Range: km300

Circular Error Probability: m100

Dimensions

Length: m8.86

Missile Weight: kg3,450

Diameter: m0.61

Fin Span: mINA

Payload

Warhead Type: Single

Warhead Options: HE, chemical, sub-munitions, nuclear

Nuclear Yield: mTINA

Conventional Warhead Weight: kg400-600

Conventional Warheads Available: HE, sub-munitions

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: No

Chemical Capable: Yes

Propulsion Characteristics

Engine: Single stage

Propellant: Solid

Speed: Mach 3.5

Flight Ceiling: km27

Fire Control

Guidance System: GPS and Inertial Guidance System

Notes:

Prompted by its experience in the war with Iraq in the 1980s, Iran actively pursued a ballistic missile arsenal that had greater precision and accuracy. As part of this effort, Iran began developing the Fateh-110 in 1995 (Victorious-110; also known as the NP-110) . The Fateh-110 is a solid fueled short range ballistic missile. The missile is also capable of carrying nuclear or biological warheads. As a road mobile system, the Fateh-110 series can be launched from any location. Iran developed four variations of the Fateh-110. Iran successfully tested its first solid-fueled surface-to-surface missile, state-run Tehran radio reported 31 May 2001. The guided Fateh-110 missile was developed at the government-owned Aerospace Industries, the radio said, adding "Fateh-110, a super-modern surface-to-surface missile, functions with combined solid-fuel, is able to cause great damage and finds targets with accuracy. The missile is classified among Iran's most efficient missiles.

DF-11 Chinese Surface to Surface Short Range Ballistic Missile

Tiers:

Variants:

- **DF-11A (CSS-7 Mod 2):** Extended Range: 500-600 km Improved variant of the DF-11, the DF-11A offers an increased range, larger payload, and improved accuracy. Development began in 1993, and its existence was first reported in 1998. The DF-11A measures 8.5 m in length and weighs approximately 4,200 kg. It can carry a 500 kg payload over a reported range of 500-600 km. Front fins are not located on the warhead assembly like those on the first DF-11 variant. Chinese developers added satellite navigation, improving the missile's accuracy to 150-200 m CEP. Unconfirmed reports suggest that an optical correlation terminal guidance system was later fitted, which would further improve the accuracy to 20-30 m CEP. The DF-11A conducted its first test flight in 1997, and it entered service with the PLA Second Artillery Corps in 1999.
- **DF-11AZT:** 800kg payload, 600km range, 100m CEP

System

Alternate Designation: Dong Feng-11, M-11, CSS-7, "East Wind"
Country of Origin: China, People's Republic of China
Basing: Ground
Launch Platform(s): WS2400 8×8 TEL (Transporter, Erector, Launcher)
Effective Range: km300
Circular Error Probability: m200
Time Required from Travel to Ready to Fire: min5

Dimensions

Length: m7.5 m
Missile Weight: kg3,800
Diameter: m.8

Fin Span: mINA

Payload

Warhead Type: Single

Warhead Options: Nuclear, Conventional, Chemical

Nuclear Yield: kT350

Conventional Warhead Weight: kg500-800

Conventional Warheads Available: HE, sub-munitions, FAE (fuel-air explosive)

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: No

Chemical Capable: Yes

Propulsion Characteristics

Engine: Single stage

Propellant: Solid

Speed: INA

Flight Ceiling: INA

Fire Control

Guidance System: Astro-inertial guidance (including ring-laser gyroscope) + Beidou (terminal radar)

Notes:

The Dong Feng-11 (DF-11) is a road-mobile, nuclear-capable, short-range ballistic missile (SRBM) developed by the People's Republic of China (PRC). A solid-fuel SRBM launched from a transporter erector launcher (TEL), the DF-11 can be launched with roughly 30 minutes of preparation and can reach ranges up to 300km. While the DF-11 has an estimated accuracy of 200m CEP, the PRC is reportedly working to increase its accuracy to 30 CEP by 2020 through the addition of Global Positioning System (GPS) and laser guidance systems.

Naze'at 10-H Iranian Close Range Ballistic Missile

Tiers:

Variants:

- **Naze'at 6-H:** Earlier version with less range compared to the Naze'at 10-H

System

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

The Naze'at 6-H and Naze'at 10-H (Persian: نازعات) are two Iranian long-range artillery rockets with ranges of about 100 km. The Naze'at 10-H is larger, more powerful, and has a longer range than the Nazeat 6-H. Like Iran's similar shaped Zelzal rockets, Naze'at rockets do not have a guidance system. Both systems are also widely known without the -H suffix, as the Naze'at 6 and Naze'at 10. The Naze'at 10 is launched from a transporter erector launcher (TEL) and carries a conventional warhead, and potentially a chemical or biological one. A complete Naze'at system includes a TEL and communications vans, meteorological vans, and a GPS system for surveying the launch site. Both Naze'at rockets have a closing velocity of mach 4-5. The reliability and accuracy of Naze'at rockets is assessed as poor.

OTR-21 Tochka (SS-21 Scarab) Russian Surface to Surface Short Range Ballistic Missile System

Tiers:

Variants:

- **Tochka-U (SS-21 Scarab-B),:** improved variant of the Tochka with a maximum range of 120 km. and improved CEP. It entered service in 1989.
- **SS-21 Scarab-C:** Its Russian designation is unknown. This missile system was developed in the 1990s. Range was increased to 185 km and CEP was further improved.
- **Oka (SS-23 Spider),:** essentially a longer version of the Tochka, with a maximum range of 480 km. The SS-23 Spider was eliminated due to the 1987 Intermediate-Range Nuclear Forces Treaty (or INF treaty) during the late 1980s.
- **KN-02,:** North Korean reversed-engineered and upgraded version of the Scarab-A, with a longer range and improved CEP.

System

Alternative Designation: OTR-21 Tockka; SS-21SS-21 Scarab; Scarab, Tochka, OTR-21, 9M79
Family: OTR-21
Type: Tactical Ballistic Missile System
Class: Short-range Ballistic Missile (SRBM)
Manufacturer: KBM (Kolomna)
In Service: 1976-Present
Crew: ea3
Chassis: BAZ-5921 6x6 mobile launcher vehicle
Displacement Time: minutes1.5
Emplacement Time: Less than 20 Min
Target Altitude Maximum: INA
Target Altitude Minimum: INA

Fire on the Move: INA

Probability of Kill: INA

Note #1: The main targets for this missile are airfields, command posts, support facilities, radars and air defense batteries, bridges and concentrations or troops and armored vehicles.

Note #2: The Tochka can carry conventional, nuclear or chemical warheads.

Dimensions

Length: m9.48

Width: m2.78

Height: m2.35

Weight, Combat: tons18.15

Ground Pressure: INA

Automotive

Engine Name: 5D20B-300

Engine Type: Diesel

Engine Power: hp300

Notes:

OTR-21 Tochka (Russian: оперативно-тактический ракетный комплекс (ОТР) «Точка» ("point"); English: Tactical Operational Missile Complex "Tochka") is a Soviet tactical ballistic missile. Its GRAU designation is 9K79; its NATO reporting name is SS-21 Scarab. It is transported in a 9P129 vehicle and raised prior to launch. It uses an inertial guidance system. The OTR-21 forward deployment to East Germany began in 1981, replacing the earlier Luna-M series of unguided artillery rockets.

→→Air-Launched Ballistic Missiles (ALBM) (50 km - 300 km)

→→Submarine-Launched Ballistic Missiles (SLBM) (50 km - 300 km)

→→Multiple-Launch Platform Ballistic Missiles (MLPBM) (50 km - 300 km)

→Short-Range Ballistic Missiles (SRBM) (301 km - 1,000 km)

→→Ground-Launched Ballistic Missiles (GLBM) (301 km - 1,000 km)

Dong-Feng 15 (DF-15, M-9,CSS-6) Chinese Short-Range Ballistic Missile

Tiers:

Variants:

- **DF-15A:** At 10m, the DF-15A is slightly longer than the DF-15, and it also has a rounded nose shape. This variant is also more accurate at 30m to 45m CEP due to sectored control fins at the rear of the missile, GPS updates and a radar terminal correlation system, and flip-out control fins on the re-entry vehicle (RV). The payload is reportedly 600kg and a 2009 report indicated that its maximum range is 900km.
- **DF-15B:** This missile was first revealed publicly during an October 2009 military parade in Beijing. Similar to the DF-15A, the DF-15B has components that reportedly increase the accuracy including four stabilizing fins, improved terminal guidance, and an active radar seeker and laser range finder. The accuracy is estimated to be 5m to 10m CEP. Its range is reported to be between 50km and 800km depending on the payload.
- **DF-15C:** An unconfirmed report in 2007 claimed that the PRC is developing a third variant of the missile designed to strike hardened underground facilities. This bunker buster will host a deep-penetration warhead and is likely designed to attack hardened underground military targets in Taiwan.

System

Alternate Designation: Dong Feng-15, M-9, CSS-6, East Wind-15
Country of Origin: China, People's Republic of China
Basing: Ground
Launch Platform(s): TAS5450 or WS-2400 TEL launchers (Transporter, Erector, Launcher)
Effective Range: km600
Circular Error Probability: m300

Time Required to go from Travel to Ready to Fire: mins30

Dimensions

Length: m9.1

Missile Weight: kg6,200

Diameter: m1

Fin Span: INA

Payload

Warhead Type: Single

Warhead Options: HE, nuclear, chemical, sub-munitions, (Possibly electromagnetic pulse (EMP), Fuel-Air Explosive (FAE), and mine-laying)

Nuclear Yield: kT50 to 350

Conventional Warhead Weight: kg500

Conventional Warheads Available: HE, sub-munitions

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: No

Chemical Capable: Yes

Propulsion Characteristics

Engine: Single

Propellant: Solid

Speed: INA

Flight Ceiling: INA

Fire Control

Guidance System: Inertial + Terminal radar/infrared imaging (See variants for the guidance system for each variant)

Notes:

The DF-15 (Dong Feng-15 / M-9 / CSS-6) is a short-range, road-mobile, solid-fueled ballistic missile developed and deployed by China. It has a maximum range of 900 km and can deliver a 500-750 kg payload, and can be equipped with a nuclear, chemical, conventional high explosive, or sub-munitions warhead. Additionally, it is possible, yet not confirmed, that the missile can be also be equipped with fuel-air explosive (FAE) or electromagnetic warheads. Depending on where the missiles are launched from within China, the DF-15A (900 km) has adequate range to strike Taiwan, the Korean Peninsula, and parts of northern India. It is believed that between 350-400 DF-15 missiles and 90-110 TEL launchers were operational in 2009 and that at least 30 missiles have been produced annually since.

SS-1C (Scud-B) Russian Surface to Surface Short Range Ballistic Missile

Tiers:

Variants:

- **Scud-A:** The first of the "Scud" series, designated R-11 (SS-1B Scud-A) originated in a 1951 requirement for a ballistic missile with similar performance to the German V-2 rocket. The R-11 was developed by engineer Viktor Makeev, who was then working in the OKB-1, headed by Sergey Korolev. It first flew on 18 April 1953, was fitted with an Isayev engine using kerosene and nitric acid as propellant. On 13 December 1953, a production order was passed with SKB-385 in Zlatoust, a factory dedicated to producing long-range rockets. In June 1955, Makeev was appointed chief designer of the SKB-385 to oversee the program and, in July, the R-11 was formally accepted into military service. The definitive R-11M, designed to carry a nuclear warhead, was accepted officially into service on 1 April 1958. The launch system was placed on an IS-2 chassis and received the GRAU designation 8K11; only 100 Scud-A launchers were built. The R-11M had a maximum range of 270 km, but when carrying a nuclear warhead, this was reduced to 150 km. Its purpose was strictly as a mobile nuclear strike vector, giving the Soviet Army the ability to hit European targets from forward areas, armed with a nuclear warhead with an estimated yield of 50 kilotons. A naval variant, the R-11FM (SS-N-1 Scud-A) was first tested in February 1955, and was first launched from a converted Project 611 (Zulu class) submarine in September of the same year. While the initial design was done by Korolev's OKB-1, the program was transferred to Makeev's SKB-385 in August 1955. It became operational in 1959 and was deployed onboard Project 611 and Project 629 (Golf Class) submarines. During its service, 77 launches were conducted, of which 59 were successful.
- **Scud-B:** The successor to the R-11, the R-17 (SS-1C Scud-B), renamed R-300 in the 1970s, was the most prolific of the series, with a production run estimated at 7,000. It served in 32 countries and four countries besides the Soviet Union manufactured copied versions. The first launch was conducted in 1961, and it entered service in 1964. The R-17 was an improved version of the R-11. It could carry nuclear, chemical, conventional or fragmentation weapons. At first, the Scud-B was carried on a tracked transporter erector launcher (TEL) similar to that of the Scud-A, designated 2P19, but this was not successful and a wheeled replacement was designed by the Titan Central Design Bureau, becoming operational in 1967. The new MAZ-543 vehicle was officially designated 9P117 Uragan. The launch sequence could be conducted autonomously, but was usually directed from a separate command vehicle. The missile is raised to a vertical position by means of hydraulically powered cranes, which usually takes four minutes, while the total sequence lasts about one hour.
- **Scud-C:** The Makeyev OKB also worked on an extended-range version of the R-17, known in the West as SS-1d Scud-C, that was first launched from Kapustin Yar in 1965. Its range was brought up to 500–600 km, but at the cost of a greatly reduced accuracy and warhead size. Eventually, the advent of more modern types in the same category, such as the TR-1 Temp (SS-12 Scaleboard), made the Scud-C redundant, and it apparently did not enter service with the Soviet armed forces.
- **Scud-D:** The R-17 VTO (SS-1e Scud-D) project was an attempt to enhance the accuracy of the R-17. The Central Scientific Research Institute for Automation and Hydraulics (TsNIAAG) began work on the project in 1968, but the first test launch was conducted only in September 1979. Development continued through the 1980s until the system was accepted into initial service as the 9K720 Aerofon in 1989. However, by this time, more advanced weapons were in use, such as the OTR-21 Tochka (SS-21) and the R-400 Oka (SS-23), and the Scud-D was not acquired by the Soviet armed forces. Instead it was proposed for export as an upgrade for Scud-B users, in the 1990s. Unlike previous Scud versions, the 9K720 had a warhead that separated from the missile's body, and was fitted with its own terminal guidance system. With a TV camera fitted in the nose, the system could compare the target area with data from an onboard computer library (DSMAC). In this way, it was thought to attain a circular error probable (CEP) of 50 m.
- **Hwasong-5/Shahab-1:** North Korea obtained its first Scud-Bs from Egypt in 1979 or 1980. These missiles were reverse engineered, and reproduced using North Korean infrastructure, including the 125 factory at Pyongyang, a research and development institute at Sanum-dong and the Musudan-ri Launch Facility. The first prototypes were completed in 1984, and designated Hwasong-5. They were exact replicas of the R-17Es obtained from Egypt. The first test flights occurred

in April 1984, but the first version saw only limited production, and no operational deployment, as its purpose was only to validate the production process. Production of the definitive version began at a slow rate in 1985. The type incorporated several minor improvements over the original Soviet design. The range was increased by 10 to 15 percent and it could carry High Explosive (HE) or cluster chemical warheads. Throughout the production cycle, until it was phased out in favour of the Hwasong-6 in 1989, the DPRK manufacturers are thought to have carried out small enhancements, in particular to the guidance system. In 1985, Iran acquired 90 to 100 Hwasong-5 missiles from North Korea. A production line was also established in Iran, where the Hwasong-5 was produced as the Shahab-1.

- **Hwasong-6/Shahab-2:** The Hwasong-6 was first test-flown in June 1990, and entered full-scale production the same year, or in 1991, until it was superseded by the Rodong-1. It features an improved guidance system, a range of 500 km, but saw its payload reduced to 770 kg, though the dimensions are identical to the original Scud. Due to difficulties in procuring MAZ-543 TELs, the North Koreans had to produce a local copy. By 1999, North Korea was estimated to have produced 600 to 1,000 Hwasong-6 missiles, of which 25 served for testing, 300 to 500 were exported, and 300 to 600 are used by the Korean People's Army. The Hwasong-6 was exported to Iran where it is known as the Shahab-2, and to Syria, where it is manufactured under license with Chinese assistance.[13] Also, according to SIPRI, 150 Scud-C were exported to Syria in 1991–96, 5 to Libya in 1999, 45 to Yemen in 2001–02.
- **Hwasong-7/Shahab-3:** The Rodong (also NoDong, Hwasong-7, or "Scud-C"), was the first North Korean missile to feature important modifications from the Scud design. Development began in 1988, and the first missile was launched in 1990, but it apparently exploded on its launch pad. A second test was carried out in May 1993 successfully. The main characteristics of the Rodong are a range of 1000 km and a CEP estimated at 2,000–4,000 m, giving the North Koreans the ability to strike Japan. The missile is substantially larger than the Hwasong series, and its Isayev 9D21 engine was upgraded with help from Makeyev OKB. Some assistance came also from China and Ukraine while a new TEL was designed using an Italian Iveco truck chassis and an Austrian crane. The rapidity with which the Rodong was designed and exported after just two tests came as a surprise for many Western observers, and led to some speculation that it was in fact based on a cancelled Soviet project from the Cold War period, but this has not been proven. Iran is known to have financed much of the Rodong program, and in return is allowed to produce the missile, as the Shahab-3. While the first prototypes may have been acquired as early as 1992, production began only in 2001, with assistance from Russia. The Rodong has also been exported to Egypt and Libya.
- **Hwasong-9/Scud-ER:** The Hwasong-9 [dubious – discuss] also called the Scud-ER (extended range), is essentially a North Korean modification of the Hwasong-6 that exchanges payload for greater range; estimates range from 700–800 km (430–500 mi) to as much as 995 km (618 mi) through a reduced payload of 450–500 kg (990–1,100 lb) and enlarging the fuel and oxidant tanks along with a slight enlargement of the fuselage. The missile is single-stage and road mobile employing an HE, submunition, chemical, or potentially miniaturized nuclear warhead with a CEP of 3 km (1.9 mi). Its range allows the North Korean military to strike anywhere on the Korean peninsula and threaten areas of Japan. Development of the Hwasong-9 reportedly began in 1991 and production started in 1994. Deployment began in 2003, intelligence imagery first observed it in 2005, and it was only first revealed publicly in 2007. Reports suggest Syria received Scud-ER missiles in 2000, giving them the ability to target all of Israel and southeastern Turkey, including Ankara; Syria reportedly converted its own Hwasong-6 production line in order to make the longer-range Hwasong-9. Scud-ER/Hwasong-9 demonstrated range of 1,000 km with 500 kg payload. South Korean and United States intelligence made assessment that missile can travel over 1,000 km, Japan previously rated its range at 1,000 km in 2015 white paper and considers to increase range estimate in 2016's white paper. The UN confirmed North Korea assisted Syria in development of manoeuvrable vehicle for "Scud D" since 2008. The UN also confirmed that the missile guidance and electronics were upgraded/improved.
- **Qiam 1:** Iran began development of the indigenous Qiam missile prior to 2010, when it was first publicly tested. It is developed from the Shahab-2/Hwasong-6. The Qiam 1 has a range of 750 km (470 mi) and 500 m (1,600 ft) (CEP) accuracy. The most noticeable difference from the Shahab-2 is a lack of fins—which could be used to reduce the missile's radar signature during ascent as fins reflect radar. Removing fins from a missile also reduces the structural mass, so the payload weight or missile range can be increased.[29][28] Without the fins and associated drag, the missile can be more responsive to changes in trajectory.[29] Iranian sources cite an improved guidance system on the missile, and analysts note that adjusting the missile's in-flight trajectory without fins requires a highly responsive guidance system. The Qiam 1's accuracy is also improved with the addition of a separable warhead. Other changes to the warhead include a "baby-bottle" shape, possibly to increase drag and thus stability during reentry at the expense of range, potentially increasing accuracy. The shape can also increase the terminal velocity of the warhead, making it harder to intercept. Deliveries began in either 2010 or 2011. The missile's first combat use was against ISIS militants on 18 June 2017. The Burkan 2-H used by the Houthis in Yemen is potentially related, or the Qiam 1 has potentially been used by that group.
- **Burkan-1:** The Houthi forces in Yemen unveiled the Burkan-1 (also spelled as Borkan 1 and Burqan 1) on 2 September 2016 when it was fired toward King Fahd International Airport. The missile's range is 800 kilometres (500 mi), greater than the Soviet-made Scud-B missiles the Houthi forces took control of in 2015. Missiles shot down mid-flight in October 2016 and July 2017 were claimed to target the holy city of Mecca by Saudi Arabia, while the Houthis claimed the targets were airports in the region
- **Burkan 2-H:** The Houthi forces in Yemen unveiled the Burkan 2-H (also spelled as Borkan H2 and Burqan 2H) when it was launched at Saudi Arabia on 22 July 2017. Analysts identify it as based on the Iranian Qiam 1/Scud-C,[47][36] Iranian Shahab-2/Scud-C, or Scud-D missile. Pictures indicate a "baby bottle" re-entry vehicle, like the Shahab-3 and Qiam 1 missiles. The missile's exact range is unknown, but is greater than 800 kilometres (500 mi). It has been

launched in July 2017, and a second launch was claimed on 4 November 2017, with the missile shot down over the Saudi Arabian capital, Riyadh.[39] According to the US State Department, the missile was actually an Iranian Qiam 1. Saudi Arabia's Ministry of Culture and Information also supplied the Associated Press with pictures from a military briefing of what it claimed were components from the intercepted missile bearing Iranian markings matching those on other pictures of the Qiam 1.

System

Alternate Designation: SS-1C; Scud-B

Country of Origin: Russia

Basing: Ground

Launch Platform(s): TEL

Engine: single-stage storable UDMH liquid propellant with RFNA oxidizer (Russian SG-02 Tonka 250)

Speed at Motor Cutoff: 2,865 knots (3,300 mph, 5,310 kmh, Mach 5.0)

Speed at Impact: >990 knots (1,140 mph, 1,835 kmh, Mach 1.5)

Maximum Range: 300 km

Pre-Launch Preparation: 2-4 hours

Time into Action: 1 hour from pre-surveyed site

Warhead: 5-80 kiloton nuclear; or conventional unitary blast fuel-air explosive; or 40 runway-penetrator submunitions with 410-ft (125-m) blast-damage radius; or 100 11-lb (5-kg) anti-personnel bomblets w/820-ft (250-m) blast-damage radius; or chemical warhead

Circular Error Probable (CEP): 450 m

Guidance System: simplified inertial guidance using three gyroscopes rocket-steered by small vanes on each fin extending into efflux

Dimensions

Missile Length: 11.25 m

Warhead Bay: 2.87 m

Missile Diameter: 0.88 m

Launch Weight: 5,900 kg

Nuclear Warhead Weight: 770-860 kg

Conventional Warhead Weight: 953 kg

Wheeled Launch Vehicle Length: m13.36

Wheeled Launch Vehicle Width: m3.02

Wheeled Launch Vehicle Height: m2.60

Wheeled Launch Vehicle Weight: kg37,400

Automotive

Wheeled Launch Vehicle Name: MAZ-543 8 x 8 Wheeled Launch Vehicle

Engine Name: 1 x D-12

Engine Type: liquid-cooled, V-12 diesel engine

Engine Power: 525 hp

Fuel Capacity: 800 liters
Maximum Road Speed: 55 kmh
Maximum Range: 650 km
Gradient: %30
Vertical Obstacle: 0.8 m
Trench: 3.4 m
Fording: 1.0 m

Notes:

The successor to the R-11, the R-17 (SS-1C Scud-B), renamed R-300 in the 1970s, was the most prolific of the series, with a production run estimated at 7,000. It served in 32 countries and four countries besides the Soviet Union manufactured copied versions. The first launch was conducted in 1961, and it entered service in 1964. The R-17 was an improved version of the R-11. It could carry nuclear, chemical, conventional or fragmentation weapons. At first, the Scud-B was carried on a tracked transporter erector launcher (TEL) similar to that of the Scud-A, designated 2P19, but this was not successful and a wheeled replacement was designed by the Titan Central Design Bureau, becoming operational in 1967. The new MAZ-543 vehicle was officially designated 9P117 Uragan. The launch sequence could be conducted autonomously, but was usually directed from a separate command vehicle. The missile is raised to a vertical position by means of hydraulically powered cranes, which usually takes four minutes, while the total sequence lasts about one hour.

SS-1D (Scud-C) Russian Surface to Surface Short Range Ballistic Missile

Tiers:

Variants:

- **Scud-A:** The first of the "Scud" series, designated R-11 (SS-1B Scud-A) originated in a 1951 requirement for a ballistic missile with similar performance to the German V-2 rocket. The R-11 was developed by engineer Viktor Makeev, who was then working in the OKB-1, headed by Sergey Korolev. It first flew on 18 April 1953, was fitted with an Isayev engine using kerosene and nitric acid as propellant. On 13 December 1953, a production order was passed with SKB-385 in Zlatoust, a factory dedicated to producing long-range rockets. In June 1955, Makeev was appointed chief designer of the SKB-385 to oversee the program and, in July, the R-11 was formally accepted into military service. The definitive R-11M, designed to carry a nuclear warhead, was accepted officially into service on 1 April 1958. The launch system was placed on an IS-2 chassis and received the GRAU designation 8K11; only 100 Scud-A launchers were built. The R-11M had a maximum range of 270 km, but when carrying a nuclear warhead, this was reduced to 150 km. Its purpose was strictly as a mobile nuclear strike vector, giving the Soviet Army the ability to hit European targets from forward areas, armed with a nuclear warhead with an estimated yield of 50 kilotons. A naval variant, the R-11FM (SS-N-1 Scud-A) was first tested in February 1955, and was first launched from a converted Project 611 (Zulu class) submarine in September of the same year. While the initial design was done by Korolev's OKB-1, the program was transferred to Makeev's SKB-385 in August 1955. It became operational in 1959 and was deployed onboard Project 611 and Project 629 (Golf Class) submarines. During its service, 77 launches were conducted, of which 59 were successful.
- **Scud-B:** The successor to the R-11, the R-17 (SS-1C Scud-B), renamed R-300 in the 1970s, was the most prolific of the series, with a production run estimated at 7,000. It served in 32 countries and four countries besides the Soviet Union manufactured copied versions. The first launch was conducted in 1961, and it entered service in 1964. The R-17 was an improved version of the R-11. It could carry nuclear, chemical, conventional or fragmentation weapons. At first, the Scud-B was carried on a tracked transporter erector launcher (TEL) similar to that of the Scud-A, designated 2P19, but this was not successful and a wheeled replacement was designed by the Titan Central Design Bureau, becoming operational in 1967. The new MAZ-543 vehicle was officially designated 9P117 Uragan. The launch sequence could be conducted autonomously, but was usually directed from a separate command vehicle. The missile is raised to a vertical position by means of hydraulically powered cranes, which usually takes four minutes, while the total sequence lasts about one hour.
- **Scud-C:** The Makeyev OKB also worked on an extended-range version of the R-17, known in the West as SS-1d Scud-C, that was first launched from Kapustin Yar in 1965. Its range was brought up to 500–600 km, but at the cost of a greatly reduced accuracy and warhead size. Eventually, the advent of more modern types in the same category, such as the TR-1 Temp (SS-12 Scaleboard), made the Scud-C redundant, and it apparently did not enter service with the Soviet armed forces.
- **Scud-D:** The R-17 VTO (SS-1e Scud-D) project was an attempt to enhance the accuracy of the R-17. The Central Scientific Research Institute for Automation and Hydraulics (TsNIAAG) began work on the project in 1968, but the first test launch was conducted only in September 1979. Development continued through the 1980s until the system was

accepted into initial service as the 9K720 Aerofon in 1989. However, by this time, more advanced weapons were in use, such as the OTR-21 Tochka (SS-21) and the R-400 Oka (SS-23), and the Scud-D was not acquired by the Soviet armed forces. Instead it was proposed for export as an upgrade for Scud-B users, in the 1990s. Unlike previous Scud versions, the 9K720 had a warhead that separated from the missile's body, and was fitted with its own terminal guidance system. With a TV camera fitted in the nose, the system could compare the target area with data from an onboard computer library (DSMAC). In this way, it was thought to attain a circular error probable (CEP) of 50 m.

- **Hwasong-5/Shahab-1:** North Korea obtained its first Scud-Bs from Egypt in 1979 or 1980. These missiles were reverse engineered, and reproduced using North Korean infrastructure, including the 125 factory at Pyongyang, a research and development institute at Sanum-dong and the Musudan-ri Launch Facility. The first prototypes were completed in 1984, and designated Hwasong-5. They were exact replicas of the R-17Es obtained from Egypt. The first test flights occurred in April 1984, but the first version saw only limited production, and no operational deployment, as its purpose was only to validate the production process. Production of the definitive version began at a slow rate in 1985. The type incorporated several minor improvements over the original Soviet design. The range was increased by 10 to 15 percent and it could carry High Explosive (HE) or cluster chemical warheads. Throughout the production cycle, until it was phased out in favour of the Hwasong-6 in 1989, the DPRK manufacturers are thought to have carried out small enhancements, in particular to the guidance system. In 1985, Iran acquired 90 to 100 Hwasong-5 missiles from North Korea. A production line was also established in Iran, where the Hwasong-5 was produced as the Shahab-1.
- **Hwasong-6/Shahab-2:** The Hwasong-6 was first test-flown in June 1990, and entered full-scale production the same year, or in 1991, until it was superseded by the Rodong-1. It features an improved guidance system, a range of 500 km, but saw its payload reduced to 770 kg, though the dimensions are identical to the original Scud. Due to difficulties in procuring MAZ-543 TELs, the North Koreans had to produce a local copy. By 1999, North Korea was estimated to have produced 600 to 1,000 Hwasong-6 missiles, of which 25 served for testing, 300 to 500 were exported, and 300 to 600 are used by the Korean People's Army. The Hwasong-6 was exported to Iran where it is known as the Shahab-2, and to Syria, where it is manufactured under license with Chinese assistance.[13] Also, according to SIPRI, 150 Scud-C were exported to Syria in 1991–96, 5 to Libya in 1999, 45 to Yemen in 2001–02.
- **Hwasong-7/Shahab-3:** The Rodong (also NoDong, Hwasong-7, or "Scud-C"), was the first North Korean missile to feature important modifications from the Scud design. Development began in 1988, and the first missile was launched in 1990, but it apparently exploded on its launch pad. A second test was carried out in May 1993 successfully. The main characteristics of the Rodong are a range of 1000 km and a CEP estimated at 2,000–4,000 m, giving the North Koreans the ability to strike Japan. The missile is substantially larger than the Hwasong series, and its Isayev 9D21 engine was upgraded with help from Makeyev OKB. Some assistance came also from China and Ukraine while a new TEL was designed using an Italian Iveco truck chassis and an Austrian crane. The rapidity with which the Rodong was designed and exported after just two tests came as a surprise for many Western observers, and led to some speculation that it was in fact based on a cancelled Soviet project from the Cold War period, but this has not been proven. Iran is known to have financed much of the Rodong program, and in return is allowed to produce the missile, as the Shahab-3. While the first prototypes may have been acquired as early as 1992, production began only in 2001, with assistance from Russia. The Rodong has also been exported to Egypt and Libya.
- **Hwasong-9/Scud-ER:** The Hwasong-9 [dubious – discuss] also called the Scud-ER (extended range), is essentially a North Korean modification of the Hwasong-6 that exchanges payload for greater range; estimates range from 700–800 km (430–500 mi) to as much as 995 km (618 mi) through a reduced payload of 450–500 kg (990–1,100 lb) and enlarging the fuel and oxidant tanks along with a slight enlargement of the fuselage. The missile is single-stage and road mobile employing an HE, submunition, chemical, or potentially miniaturized nuclear warhead with a CEP of 3 km (1.9 mi). Its range allows the North Korean military to strike anywhere on the Korean peninsula and threaten areas of Japan. Development of the Hwasong-9 reportedly began in 1991 and production started in 1994. Deployment began in 2003, intelligence imagery first observed it in 2005, and it was only first revealed publicly in 2007. Reports suggest Syria received Scud-ER missiles in 2000, giving them the ability to target all of Israel and southeastern Turkey, including Ankara; Syria reportedly converted its own Hwasong-6 production line in order to make the longer-range Hwasong-9. Scud-ER/Hwasong-9 demonstrated range of 1,000 km with 500 kg payload. South Korean and United States intelligence made assessment that missile can travel over 1,000 km, Japan previously rated its range at 1,000 km in 2015 white paper and considers to increase range estimate in 2016's white paper. The UN confirmed North Korea assisted Syria in development of manoeuvrable vehicle for "Scud D" since 2008. The UN also confirmed that the missile guidance and electronics were upgraded/improved.
- **Qiam 1:** Iran began development of the indigenous Qiam missile prior to 2010, when it was first publicly tested. It is developed from the Shahab-2/Hwasong-6. The Qiam 1 has a range of 750 km (470 mi) and 500 m (1,600 ft) (CEP) accuracy. The most noticeable difference from the Shahab-2 is a lack of fins—which could be used to reduce the missile's radar signature during ascent as fins reflect radar. Removing fins from a missile also reduces the structural mass, so the payload weight or missile range can be increased.[29][28] Without the fins and associated drag, the missile can be more responsive to changes in trajectory.[29] Iranian sources cite an improved guidance system on the missile, and analysts note that adjusting the missile's in-flight trajectory without fins requires a highly responsive guidance system. The Qiam 1's accuracy is also improved with the addition of a separable warhead. Other changes to the warhead include a "baby-bottle" shape, possibly to increase drag and thus stability during reentry at the expense of range, potentially increasing accuracy. The shape can also increase the terminal velocity of the warhead, making it harder to intercept. Deliveries began in either 2010 or 2011. The missile's first combat use was against ISIS militants on 18 June 2017. The Burkan 2-H used by the Houthis in Yemen is potentially related, or the Qiam 1 has potentially been

used by that group.

- **Burkan-1:** The Houthi forces in Yemen unveiled the Burkan-1 (also spelled as Borkan 1 and Burqan 1) on 2 September 2016 when it was fired toward King Fahd International Airport. The missile's range is 800 kilometres (500 mi), greater than the Soviet-made Scud-B missiles the Houthi forces took control of in 2015. Missiles shot down mid-flight in October 2016 and July 2017 were claimed to target the holy city of Mecca by Saudi Arabia, while the Houthis claimed the targets were airports in the region
- **Burkan 2-H:** The Houthi forces in Yemen unveiled the Burkan 2-H (also spelled as Borkan H2 and Burqan 2H) when it was launched at Saudi Arabia on 22 July 2017. Analysts identify it as based on the Iranian Qiam 1/Scud-C,[47][36] Iranian Shahab-2/Scud-C, or Scud-D missile. Pictures indicate a "baby bottle" re-entry vehicle, like the Shahab-3 and Qiam 1 missiles. The missile's exact range is unknown, but is greater than 800 kilometres (500 mi). It has been launched in July 2017, and a second launch was claimed on 4 November 2017, with the missile shot down over the Saudi Arabian capital, Riyadh.[39] According to the US State Department, the missile was actually an Iranian Qiam 1. Saudi Arabia's Ministry of Culture and Information also supplied the Associated Press with pictures from a military briefing of what it claimed were components from the intercepted missile bearing Iranian markings matching those on other pictures of the Qiam 1.

System

Alternate Designation: SS-1D, SCUD-C

Country of Origin: Russia

Basing: Ground

Launch Platform(s): TEL

Effective Range: km500

Circular Error Probability: m550

Time Required to go from Travel to Ready to Fire: INA

Note: The Scud-C has longer range, but is less accurate than the Scud-B and was deployed in fewer numbers.

Dimensions

Length: m11.25

Missile Weight: kg6,400

Diameter: m0.88

Fin Span: INA

Payload

Warhead Type: Single

Warhead Options: Conventional, Chemical

Nuclear Yield: NA

Conventional Warhead Weight: kg600

Conventional Warheads Available: HE

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: No

Chemical Capable: Yes

Propulsion Characteristics

Engine: Single

Propellant: Liquid

Speed: INA

Fire Control

Guidance System: Inertial

Notes:

The Makeyev OKB also worked on an extended-range version of the R-17, known in the West as SS-1d Scud-C, that was first launched from Kapustin Yar in 1965. Its range was brought up to 500–600 km, but at the cost of a greatly reduced accuracy and warhead size. Eventually, the advent of more modern types in the same category, such as the TR-1 Temp (SS-12 Scaleboard), made the Scud-C redundant, and it apparently did not enter service with the Soviet armed forces.

Iskander (SS-26 Stone) Russian Surface to Surface Short Range Ballistic Missile

Tiers:

Variants:

- **Note::** Early TEL variant (SPU 9P78) has one missile. The TELs can launch launch R-500 cruise missiles.
- **Iskander-E::** Export variant TEL with shorter range (280km). This missile was developed to comply with missile technology control regime which is no longer in effect.
- **Iskander-M::** Domestic TEL and missile with 400+km range.
- **Iskander-K::** Cruise missile only TEL with launcher assembly adapted to mount 6 each R-500 (3M14?) cruise missiles.

System

Alternative Designation: SS-26 Stone, SS-X-26, Stone, Tender, 9M720, 9M723, 9M723-1
Manufacturer: Votkinsk Plant State Production Association (Votkinsk) – missiles Production Association Barricades (Volgograd) – ground equipment KBM (Kolomna) – developer of the system
In Service: 2006-Present
Class: Short-Range Ballistic Missile (SRBM)
Chassis: MAZ-7930 (8x8)
Primary Components: Transporter-Erector-Launcher (TEL) and command vehicle: rear support includes a transport and loading vehicle (9T250E), maintenance vehicle, mobile test and repair station, data preparation post, and life support vehicle. The system can also be linked into an integrated fires command (IFC).
Crew: ea3
Payload: kg480-700
Note: At the time of its introduction it was considered the most advanced missile of its kind.

Dimensions (Launcher)

Length: m13.7
Width: m3.51
Height: m3.45
Combat Weight: tons40
Number Of Missiles: ea2

Automotive (Transporter Erector Launcher)

Engine Name: YaMZ-846

Engine Type: Diesel

Engine Power: hp500

Chassis: MAZ-7930 (8x8)

Range, Cruising: km1,000

Speed, Maximum Road: km/h70

Gradient: deg45

Side Slope: deg30

Speed, Maximum Swim: km/hNot Amphibious

Vertical Step: m-0.6

Trench: m2

Fording Depth: m1.4

Communications

Primary: Receiver R-174/GRR-5

Main Weapon System

↳*Missile Launching System*

Name: Transporter-erector-launcher vehicle (chassis of 8×8 MZKT-79306 ASTROLOG truck)

Type: Ballistic Missile and Cruise Missile Launcher

Maximum Launch Range: km500

Minimum Launch Range: km20

Direct Fire: Yes

Indirect Fire: No

Time to Launch: up to 4 min from highest readiness, up to 16 min from march

Interval Between Launches: less than one minute

Operating Temperature: −50 °C to +50 °C

Service Life: years10

Note: The mobility of the Iskander launch platform makes a launch difficult to prevent.

↳*Missiles*

Name: 9M723K1

Type: solid-propellant single-stage guided missiles

Basic Load: ea2

Engine: Single-stage solid propellant

Target Type: Independently

Warhead Weight: kg480–700

Warhead Types: thermonuclear weapon, High explosive fragmentation, submunition, penetration, fuel-air explosive,

EMP
Optically Guided Warhead: Yes
Operational Range: km400-500
Speed: m/s2,000
Burn Out Velocity: Mach 5.9 *Hypersonic)
Guidance System: Inertial guidance, optical DSMAC
Accuracy: m5-7
Moving Target Capable: Yes
Boost Phase: Yes, Thrust Vector Control (TVC)
Circular Error Probable (CEP): m5-7
Turning Capability: during flight it can maneuver at different altitudes and trajectories and can turn at up to 20 to 30 G to evade anti-ballistic missiles
Note #1: The missiles can be re-targeted during flight in the case of engaging mobile targets
Note #2: in flight, the missile follows a quasi-ballistic path, performing evasive maneuvers in the terminal phase of flight and releasing decoys in order to penetrate missile defense systems.

Protection

Armor Protection: None
NBC Protection: Yes
Countermeasures: Off-road mobility to concealed launch point, autonomous and passive operation at launch point. Missile non-ballistic trajectory in ascent conceals vehicle/launch point location. Missile reentry vehicle has decoys, and possible final-phase maneuver. With IR homing, jamming is ineffective. Final phase is most likely non-ballistic pitch-over into a dive.

Notes:

The Iskander (Western reporting name SS-26 Stone) short-range ballistic missile is a successor to the Oka (SS-23 Spider), which was eliminated under the Intermediate-Range Nuclear Forces (INF) treaty. It was first launched in 1996 and was initially designated by the West as the SS-X-26. At the time of its introduction it was considered the most advanced missile of its kind. The Iskander-M missile system was officially adopted by the Russian Army in 2006. This system can use different types of missiles. In 2013 it was reported that 5 types of missiles were already developed for Iskander, and 3 more missiles were still being developed. As of 2017 Russian Army reportedly operates 112 of these missile systems. At least one launcher was deployed in Syria. In 2016 Iskander-E ballistic missiles were delivered to Armenia. Some countries, including China and South Korea introduced their own clones of the Iskander. Ukraine is currently developing an equivalent system.

R-17 Elbrus (R-300 Scud B) Russian Short-Range Ballistic Missile

Tiers:

Variants:

- **SS-1D or Scud-C:** SS-1D or Scud-C, an extended-range version. It had a maximum range of 500-600 km. However warhead size and accuracy were greatly reduced. It was not adopted by the Soviet Army, as a more capable TR-1 Temp (Western reporting name SS-12 or Scaleboard) was selected
- **9K720 Aerofon (SS-1E or Scud-D):** 9K720 Aerofon (SS-1E or Scud-D). It had a warhead that separated from the missile body. Missile was also fitted with terminal guidance system and was much more accurate and had a CEP of 50 m. The systems was not acquired by the Soviet Army. As at the time more advanced ballistic missiles, such as the Tochka (SS-21 Scarab) were used. Instead in the 1990s it was proposed for export customers as an upgrade for their Scud-B systems.
- **Barkan-1:** Barkan-1 is a Yemeni version of the "Scud" series. Yemeni modifications resulted in an 800 km range.
- **Hwasong-6:** Hwasong-6 is a North Korean variant of the "Scud". It was introduced in 1991. The Hwasong-6 has a range of 500 km. It is also launched using a TEL, and has been exported to several other nations, some of which produce it under license.

System

Alternate Designation: the R-17 (SS-1C Scud-B), renamed R-300 in the 1970s
Basing: Ground
Launch Platform(s): TEL, MAZ-543A (8x8)
Chassis: The Scud-B is based on a MAZ-543A heavy high-mobility wheeled chassis.
Crew: 8
Effective Range: km300
Circular Error Probability: m450
Emplacement TIme: min4
Displacement Time: INA
Note: Each launcher vehicle is escorted by a whole host of support vehicle. It is escorted by reloading vehicle, fuel tanker, crane, command vehicle, positioning vehicle, and some other support vehicles. Also there is a vehicle which carries warhead for the missile. During the cold war Scuds were also escorted by decontamination vehicles.

Dimensions (Chassis: MAZ-543A)

Length: m12
Width: m3
Height: m3.5

Weight: tons37.4

Automotive (Chassis: MAZ-543A)

Engine Name: D12A-525

Engine Type: Diesel

Engine Power: hp525

Maximum Range: km450

Maximum Road Speed: km/h45

Maximum Off-Road Speed: km/h15

Gradient: %60

Vertical Step: m0.6

Side Slope: %30

Trench: m2.0

Fording Depth: m1.3

Missile System

↳*Launcher*

Name: 9P117 Uragan

Type: Transporter Erector Launcher (TEL)

Launch Sequence: The launch sequence could be conducted autonomously, but was usually directed from a separate command vehicle.

Note #1: The missile is raised to a vertical position by means of hydraulically powered cranes, which usually takes four minutes, while the total sequence lasts about one hour.

Note #2: carry nuclear, chemical, conventional or fragmentation weapons.

↳*Missile*

Name: R-17 Elbrus (SCUD-B)

Type: Short-Range Ballistic Missile

Length: m11.6

Diameter: m0.8

Engine: Liquid Fuel

Missile Weight: tons0.98

Warhead Type: These missiles have nuclear (100 kT), high explosive (1 016 kg), chemical (985 kg) and thermobaric warheads.

Maximum Range of Fire: km300

Minimum Range of Fire: km50

CEP: m450

Launch to Target Time: within 5 minutes

Guidance System: Inertial Guidance

Note: By modern standards this missile is inaccurate. Its CEP is about 450 m.

Fire Control

Guidance System: Inertial guidance system, IR homing

Notes:

The Scud is a mobile, Russian-made, short-range, tactical ballistic surface-to-surface (hence the nomenclature abbreviation SS) missile system. The SCUD-series guided missiles are single-stage, short-range ballistic missiles using storable liquid propellants. The Scud is derived from the World War II-era German V-2 rocket. Unlike the FROG series of unguided missiles, the SCUDs have movable fins. Warheads can be HE, chemical, or nuclear, and the missile, launched vertically from a small platform, has a range of 300 km. Unsophisticated gyroscopes guided the missile only during powered flight - which lasts about 80 seconds. Once the rocket motor shut down, the entire missile with the warhead attached coasted unguided to the target area. Consequently, Scuds had notoriously poor accuracy, and the farther they flew, the more inaccurate they became. SCUD missiles are found in SSM (SCUD) brigades at front/army level. The SCUD series of missiles gave the Soviet front and army commanders an integral nuclear weapons capability. Non-nuclear variants of the SCUD missiles have been exported to both Warsaw Pact and non-Warsaw Pact nations. The longer range SCUD B, also known as SS-1c, can be distinguished by the one meter greater length of the missile and the presence of two air bottles on the side of the superstructure in place of the single bottle used for the "SCUD A" missile. The SCUD B used unsymmetrical dimethylhydrazine (UDMH), a more powerful (and toxic) fuel than the kerosene used on the SCUD A, which required an engine redesign. They were transported originally on a heavy-tracked vehicle based on the JS heavy-tank chassis. This vehicle serves also as an erector and launcher for the missiles. The SCUD-B was introduced on the JS-3 tracked chassis in 1961 and appeared on the MAZ-543 wheeled chassis in 1965. The "SCUD B" missile has appeared on a new transporter-erector-launcher based on the MAZ-543 (8x8) truck. The introduction of this new powerful cross-country wheeled vehicle gave this missile system greater road mobility, reduces the number of support vehicles required, and still preserves a great choice in selecting off-road firing positions. The same basic chassis also has been used for the transporter-erector-launcher for the "SCALEBOARD" surface-to-surface guided missile. In the early 1980s, the SCUD-B was replaced by the SS-23, which has greatly improved range (500 km), increased accuracy, and reduced reaction and refire times. At launch, a basic Scud contains about 3,500 kilograms (7,700 pounds) of IRFNA and about 1,000 kilograms (2,200 pounds) of fuel. Most of the IRFNA and fuel is used within the first 80 seconds of flight when the missile is gaining enough speed to reach its target. When this speed is reached, the Scud is designed to shut off its engine by shutting off the propellant tanks (a fuel tank and an oxidizer tank). The unused propellants—roughly 150 kilograms (330 pounds) of RFNA and 50 kilograms (110 pounds) of fuel—remain on board for the remainder of the flight. In the early 1970s, the Soviet Army sought a replacement for the 9K72 Elbrus (SS-1C `Scud B') system, which had a very slow reaction time [around 90 minutes to prepare and fire] and its poor accuracy when using conventional warheads. The replacement system, codename 9K714 Oka [SS-23 Spider], was developed by KB Mashinostroyenia (Machine Industry Design Bureau) in Kolomna. This system was phased out in compliance with the INF Treaty in the late 1980s. Russia’s TBM inventory is limited to thousands of SS-1c/Scud B and SS-21/Scarab SRBMs as a result of the Intermediate Nuclear Force (INF) Treaty, which required the elimination of the FSU’s extensive stocks of MRBMs. A second SCUD-followon effort began in the form of the SS-26, which apparently entered service by 1999. The SS-26 SRBM is expected to be both a replacement for the SS-1c/Scud B and an export. By the early 1990s, the `Scud' system was unquestionably obsolete and many of the 9P117 launcher vehicles were retired due to age.

→→Air-Launched Ballistic Missiles (ALBM) (301 km - 1,000 km)

→→Vessel-Launched Ballistic Missiles (VLBM) (301 km - 1,000 km)

→→Submarine-Launched Ballistic Missiles (SLBM) (301 km - 1,000 km)

→→Multiple-Launch Platform Ballistic Missiles (MLPBM) (301 km - 1,000 km)

Shahab-3B Iranian Surface to Surface Medium Range Ballistic Missile

Tiers:

Variants:

- **Shahab-3C and D:** Little is known about Shahab-3C and Shahab-3D. From what can be gathered, the missiles have an improved precision, navigation system, and a longer range. The missiles were indigenoulys developed, and are being mass-produced. Iran has a production capacity of 70 units per year.

System

Alternate Designation: Meteor-3, Shooting Star-3
Country of Origin: Iran
Basing: Ground
Launch Platform(s): TEL or silo
Proliferation: Not proliferated
Effective Range: km1,300
Circular Error Probability: m50

Dimensions

Length: m16.6
Missile Weight: kg~16,000

Diameter: m1.25 or 1.38

Fin Span: mINA

Payload

Warhead Type: Multiple or Single

Warhead Options: Multiple: Cluster munition warheads in new models, each warhead can target different destinations. Single: Nuclear, HE, chemical, or sub-munitions

Nuclear Yield: INA

Conventional Warhead Weight: kg~700

Conventional Warheads Available: Cluster munitions, HE, chemical, or sub-munitions

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: INA

Chemical Capable: Yes

Propulsion Characteristics

Engine: Single Stage

Propellant: Liquid

Speed: km/s2.4

Flight Ceiling: km400

Fire Control

Guidance System: INS/gyroscope guidance

Notes:

The Shahab-3B differs from the basic production variant. It has improvements to its guidance system and warhead with a greater range, a few small changes on the missile body, and a new re-entry vehicle whose terminal guidance system and rocket-nozzle steering method are completely different from the Shahab-3's spin-stabilized re-entry vehicle. The new re-entry vehicle uses a triconic aeroshell geometry (or "baby bottle" design) which improves the overall lift to drag ratio for the re-entry vehicle. This allows greater range maneuverability which can result in better precision. The triconic design also reduces the overall size of the warhead from an estimated 1 metric ton to 700 kg.

DF-21D (CSS-5 Mod-4) Chinese Anti-Ship Ballistic Missile

Tiers:

1 **2** 3 4

Variants:

- **DF-21:** The Dong-Feng 21 (DF-21; NATO reporting name CSS-5 - Dong-Feng (simplified Chinese: □□; traditional Chinese: □□; lit.: 'East Wind')) is a two-stage, solid-fuel rocket, single-warhead medium-range ballistic missile (MRBM) in the Dong Feng series developed by China Changfeng Mechanics and Electronics Technology Academy. Development started in the late 1960s and was completed around 1985–86, but it was not deployed until 1991. It was developed from the submarine-launched JL-1 missile, and is China's first solid-fuel land-based missile. The U.S. Department of Defense in 2008 estimated that China had 60-80 missiles and 60 launchers; approximately 10-11 missiles can be built annually. Originally developed as a strategic weapon, the DF-21's later variants were designed for both nuclear and conventional missions. It is thought able to carry a high explosive and submunition warheads, as well as a nuclear warhead of 300 kt. The latest DF-21D was said to be the world's first anti-ship ballistic missile (ASBM). The DF-21 has also been developed into a space-capable anti-satellite weapon/anti-missile weapon carrier.
- **DF-21/A/C (CSS-5 Mod-1/2/3):** The basic variant DF-21 had a range of 1,770+ km, and a payload of 600 kg (1,300 lb) consisting of a single 500 kt nuclear warhead, with an estimated circular error probable (CEP) of 300~400 m; this version did not enter operational service. The DF-21A was operational by 1996 and has improved accuracy with an estimated CEP of 100~300 m. This version is reported to have a similar 1,770+ km range, with a potential extended range of 2,150 km (1,340 mi). Revealed in 2006, the DF-21C is a terminally guided version that has a maximum range believed to be about 1,700 km (1,100 mi) and accuracy estimated to be 50~10 m. The missile was the first dual-capable version, able to be armed with either a nuclear or conventional warhead. In 2010, the DF-21C was being deployed in central Western China.

System

Alternate Designation: DF-21D; CSS-5 Mod-4
Type: Anti-Ship Ballistic Missile
Launch Platform(s): Mobile Launcher
Maximum Range: 2,000 km
Warhead Type: Conventional or Nuclear
Warhead Weight: 600

Dimensions

Length: m10.7

Diameter: m1.4

Fin Span: INA

Missile Weight: kg47,700

Payload

Warhead Type: Conventional or Nuclear

Warhead Weight: 600kg

MIRV: No MIRV capability

Yield: 200-300kt

Propulsion Characteristics

Engine: Multistage

Propellant: Solid

Speed: Mach 10

Fire Control

Guidance System: Inertial/terminal radar/20m CEP

Accuracy: 20m CEP

Notes:

The Dong Feng 21D, or DF-21D, is a medium ranged, road mobile, ballistic missile developed by the People's Republic of China. A variant of the DF-21A, the DF-21D was deemed operational in 2012 and is the world's first anti-ship ballistic missile (ASBM) intended to attack ships at sea. Reaching speeds up to Mach 10 during the terminal phase, the DF-21D is the fastest MRBM to date and can surpass existing U.S. missile defense systems such as the sea-based AEGIS ballistic missile defense (BMD) system. In 2013, the DF-21D was tested against targets equivalent to U.S. surface ships which proved to be successful. By using both inertial and radar guidance systems, the ASBM increases speed upon reentering Earth's atmosphere to avoid missile defense structures and ensure a direct hit on moving sea-based targets. A variant of the DF-21D is currently in production with intentions of increasing its range and payload. Until the United States deploys adequate capabilities to defend against the DF-21D, U.S. aircraft carrier strike groups operating within the missile's range will remain vulnerable. With that in mind, the DF-21D is critical to China's anti-access/area denial (A2/AD) strategy in the Asia-Pacific region, which aims to limit U.S. freedom of movement by exploiting U.S. operational vulnerabilities. Using long-range precision-guided ballistic missiles such as the DF-21D, China puts all U.S. forces operating in the Asia-Pacific at risk, undercutting U.S. power projection in the region. In addition, the long-range standoff capability of the DF-21D grants China more operation flexibility in the field while minimizing the chance of a surprise attack. Consequently, this provides China with a significant operational advantage in the region.

DF-3 Chinese Surface to Surface Medium Range Ballistic Missile

Tiers:

Variants:

- **DF-3A:** The DF-3A is an upgraded variant of the DF-3 that became operational in August 1988. Like the DF-3, the DF-3A lacks significant road-mobile capabilities however it is deployed using a towed launcher. The improved missile possesses a range of up to 4,000km and a more accurate guidance system than the DF-3. Both missiles share the same propellants, diameter, and burn time, however the DF-3A has an improved version of the YF-2 engine.

System

Alternate Designation: CSS-2, Dong Feng-3, East Wind-3
Country of Origin: China
Basing: Ground
Launch Platform(s): Silo (DF-3A can be launched from a towed launcher)
Effective Range: km3,000
Circular Error Probability: m4,000
Time Required to go from Travel to Ready to Fire: mins120-150

Dimensions

Length: m24
Missile Weight: kg64,000
Diameter: m2.25
Fin Span: mINA

Payload

Warhead Type: Up to 3

Warhead Options: HE, Nuclear, or 3 separating reentry vehicles (RVs)

Nuclear Yield: A minimum of 50 kT per warhead, up to 3 (some estimates are up to 700kT)

Conventional Warhead Weight: kg2000

Conventional Warheads Available: HE

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: No

Chemical Capable: INA

Propulsion Characteristics

Engine: Single (YF-2A)

Propellant: Liquid (UDMH / AK-27S)

Speed: INA

Fire Control

Guidance System: Inertial

Notes:

Designed to be China's first modern missile, the DF-3 has a range of up to 3,000km and was deemed operational in 1971. The silo-based, single-stage, MRBM uses a liquid propellant and an inertial guidance system. The DF-3, and its improved variant the DF-3A, have largely been replaced by the DF-21 and only a minimal number of DF-3 missiles are suspected to exist today. Many outmoded DF-3 missiles have been outsourced to Saudi Arabia. The DF-3A is an upgraded variant of the DF-3 that became operational in August 1988. Like the DF-3, the DF-3A lacks significant road-mobile capabilities however it is deployed using a towed launcher. The improved missile possesses a range of up to 4,000km and a more accurate guidance system than the DF-3. Both missiles share the same propellants, diameter, and burn time, however the DF-3A has an improved version of the YF-2 engine. The DF-3 and the DF-3A proved that China possesses the technological capacity to produce MRBMs and granted China the chance to expand their A2/AD range. This also paved the way for many of China's advances in ballistic missiles such as the D-21 and its several variants.

Shahab-4 Iranian Medium Range Ballistic Missile

Tiers:

Variants:

- **Shahab-3C and D:** Little is known about Shahab-3C and Shahab-3D. From what can be gathered, the missiles have an improved precision, navigation system, and a longer range. The missiles were indigenoulys developed, and are being mass-produced. Iran has a production capacity of 70 units per year.

System

Alternate Designation: Meteor-3, Shooting Star-3
Basing: Ground
Launch Platform(s): TEL or silo
Proliferation: Not proliferated
Effective Range: km1,300
Circular Error Probability: m50

Dimensions

Length: m16.6
Missile Weight: kg~16,000
Diameter: m1.25 or 1.38
Fin Span: mINA

Payload

Warhead Type: Multiple or Single
Warhead Options: Multiple: Cluster munition warheads in new models, each warhead can target different destinations. Single: Nuclear, HE, chemical, or sub-munitions
Nuclear Yield: INA
Conventional Warhead Weight: kg~700
Conventional Warheads Available: Cluster munitions, HE, chemical, or sub-munitions
Multiple Independently targetable Reentry Vehicle (MIRV) Capable: INA
Chemical Capable: Yes

Propulsion Characteristics

Engine: Single Stage

Propellant: Liquid

Speed: km/s2.4

Flight Ceiling: km400

Fire Control

Guidance System: INS/gyroscope guidance

Notes:

The Shahab-4 (Persian: ۴-شهاب, meaning "Meteor-4") (a.k.a. IRIS) was an unbuilt Iranian space launch vehicle derived from the Shahab-3 medium-range ballistic missile. The IRIS/Shahab-4 project was initiated in 1988, but it never went beyond the drawing board. The design heritage of the IRIS was later incorporated into the Safir.

NoDong-1 North Korean Surface to Surface Medium Range Ballistic Missile

Tiers:

Variants:

- **Shahab-3 (Iran):** The Shahab-3 (Persian: Šahâb 3; meaning "meteor") is a medium-range ballistic missile (MRBM) developed by Iran and based on the North Korean Nodong-1. The Shahab-3 has a range of 1,000km, a MRBM variant can now reach 2,000km (can hit targets as far as Israel, Egypt, Romania, Bulgaria and Greece). It was tested from 1998 to 2003 and added to the military arsenal on July 7, 2003, with an official unveiling by Ayatollah Khamenei on July 20. With an accuracy of 140m CEP, the Shahab-3 missile is primarily effective against large, soft targets (like cities). Given the Shahab-3's payload capacity, it would likely be capable of delivering nuclear warheads. According to the IAEA, Iran, in the early 2000s may have explored various fusing, arming, and firing systems to make the Shahab-3 more capable of reliably delivering a nuclear warhead.
- **Ghauri (Pakistan):** The Ghauri–I (Urdu: I-غوری; official codename: Hatf–5 Ghauri–I) is a land-based surface-to-surface medium-range ballistic missile, in current service with the Pakistan Army's Strategic Forces Command— a subordinate command of Strategic Plans Division. Influenced from the design of Nodong-1 of North Korea, its extensive modification and engineering took place in Kahuta Research Laboratories (KRL) in 1990s with an objective of developing an electronic system that uses a single stage liquid fuel rocket motor to carry a payload of 700kg to a range of 1,500 km. This is enough to reach most, if not all of India. Two variants of the Ghauri were produced under the secretive missile research program started in 1987 and the development of a third variant was cancelled. The Ghauri-II uses increased motor assembly length and improved propellants for an increased range of 2,300km.

System

Alternate Designation: No Dong, Nodong, Hwasong, Nodong-A, Hwasong-7, Rodong

Basing: Ground

Launch Platform(s): TEL similar to the Russian-made MAZ-543 but with 10 wheels

Proliferation: Iran and Pakistan. Estimates are that Pakistan obtained 12-25 NoDong missiles. In regards to Iran, reports indicate that it received 150 NoDong 1/2 missiles. Iraq, Eqypt, Syria, and Libya are all believed to have negotiated to obtain the missile at some point, though there are no confirmed exports to these countries.

Effective Range: km900-1,300

Circular Error Probability: 2,000m (50m is GPS is integrated)

Time Required to go from Travel to Ready to Fire: mins60

Dimensions

Length: m16.2

Missile Weight: kg16,500

Diameter: m1.36

Fin Span: INA

Payload

Warhead Type: Single warhead

Warhead Options: Nuclear, chemical, HE or sub-munitions

Nuclear Yield: Medium yield

Conventional Warhead Weight: kg700-1,200

Conventional Warheads Available: HE, sub-munitions

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: INA

Chemical Capable: Yes (thickened VX)

Propulsion Characteristics

Engine: Single

Propellant: Liquid propellant

Speed: INA

Fire Control

Guidance System: Inertial

Notes:

The NoDong is a medium range ballistic missile indigenous to North Korea. The missile has a maximum range of 1250 km, making it capable of striking all of South Korea and Japan. The NoDong is liquid fueled and can carry a payload of 1,200kg. It is likely capable of carrying nuclear warheads. As a road-mobile system, the missile can be launched from any location and is concealable, making it more resilient to a preemptive strike. Believed to have been developed in the late 1980s as a part of a Soviet technological transfer, the NoDong is an enhanced version of the Soviet Scud-C missile. However, the development of the NoDong was not entirely an independent North Korean effort, but a collaboration of Chinese and Russian assistance. A derivative of the NoDong was used as the first stage of the long-range Taepodong-1 when it was launched in 1998. Although the rocket failed to reach orbit, the NoDong performed successfully as the first stage. The capabilities of the NoDong-1 missile are such that it can only effectively be used against large, soft targets like cities, airports, or harbors. Its range is sufficient to put parts of Japan within striking distance. However, the accuracy is extremely low for modern missiles and likely ineffective against hardened military targets unless it was equipped with a nuclear warhead. In 2006, it was estimated that North Korea’s inventory of NoDong-1 missiles was approximately 200. By 2009, reports indicated that this stockpile may have reached 300 missiles.

Shahab-3A Iranian Medium Range Ballistic Missile

Tiers:

Variants:

- **Emad:** Originated from: Iran Possessed by: Iran Class: Intermediate-Range Ballistic Missile (IRBM) Basing: Road-mobile Length: 16-16.5m Diameter: 1.25 to 1.38 m Launch weight: 19,000 kg Payload: 750 kg Warhead: Nuclear, chemical, HE, sub-munitions Propulsion: Liquid first-stage, liquid propelled Range: 1,700 km Status: Operational In service: 2015
- **Ghadr:** Originated from: Iran Possessed by: Iran Class: Intermediate-Range Ballistic Missile (IRBM) Basing: Road-mobile Length: 15.86m Diameter: 1.25 to 1.38 m Launch weight: 19,000 kg Payload: 800 kg Warhead: Nuclear, chemical, HE, submunitions Propulsion: Liquid first-stage, solid second-stage propellant Range: 1,950 km Status: Operational In service: 2007

System

Circular Error Probability: m140

Dimensions

Length: m16.6

Missile Weight: kg~16,000

Diameter: m1.25 or 1.38

Fin Span: mINA

Payload

Warhead Type: Multiple or Single

Warhead Options: Multiple: Five cluster munition warheads in new models, each warhead can target different destinations. Single: Nuclear, HE, chemical, or sub-munitions

Nuclear Yield: INA

Conventional Warhead Weight: kg~1,400 (280 kg each of 5 warheads)

Conventional Warheads Available: Cluster munitions, HE, chemical, or sub-munitions

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: INA

Chemical Capable: Yes

Propulsion Characteristics

Engine: Single Stage

Propellant: Liquid

Speed: km/s2.4

Flight Ceiling: km400

Fire Control

Guidance System: Inertial navigation system

Notes:

The Shahab-3 (Persian: Šahâb 3; meaning "meteor") is a medium-range ballistic missile (MRBM) developed by Iran and based on the North Korean Nodong-1. The Shahab-3 has a range of 1,000 kilometres (620 mi); a MRBM variant can now reach 2,000 kilometres (1,200 mi) (can hit targets as far as Israel, Egypt, Romania, Bulgaria and Greece). It was tested from 1998 to 2003 and added to the military arsenal on 7 July 2003, with an official unveiling by Ayatollah Khamenei on July 20. With an accuracy of 140 m CEP, the Shahab-3 missile is primarily effective against large, soft targets (like cities). Given the Shahab-3's payload capacity, it would likely be capable of delivering nuclear warheads. According to the IAEA, Iran in the early 2000s may have explored various fuzing, arming and firing systems to make the Shahab-3 more capable of reliably delivering a nuclear warhead. The forerunners to this missile include the Shahab-1 and Shahab-2. The then-Iranian Defence Minister Admiral Shamkhani has denied that Iran plans to develop a Shahab-4. Some successors to the Shahab have longer range and are also more maneuverable. Operating under the Sanam Industrial Group (Department 140), which is part of the Defense Industries Organization of Iran, the Shahid Hemmat Industrial Group (SHIG), led the development of the Shahab missile. US Air Force National Air and Space Intelligence Center estimates that as of June 2017 fewer than 50 launchers were operationally deployed.

→→Air-Launched Ballistic Missiles (ALBM) (1,001 km - 3,000 km)

DF-17 (Dong Feng-17) Chinese Ballistic Missile with the DF-ZF Hypersonic Glide Vehicle (HGV)

Tiers:

1 2 3 4

System

Alternate Designation: DF-17; Dong Feng-17; WU-14
Country of Origin: China
Class: Medium-range Ballistic Missile (MRBM) / Hypersonic Glide Vehicle (HGV)
Chassis: The DF-17 ballistic missile is based on a special wheeled chassis with 10x10 configuration.
Basing: Road-mobile
Missile Engine: INA
Missile Speed: Mach 5-10 (1.72-3.43 km/s) in its glide phase
Warhead Type: The missile is expected to be capable of delivering both nuclear and conventional payloads and may be capable of being configured to deliver a maneuverable reentry vehicle instead of an HGV.
Effective Range: 1,800-2,500 km
Circular Error Probability: 30m

Hypersonic Glide Vehicle (HGV)

Name: DF-ZF

Type: Hypersonic Glide Vehicle (HGV)

Manufacturer: 10th Research Institute, China Aerospace Science Industry Corporation (CASIC)

Description: The Chinese DF-ZF Hypersonic Glide Vehicle (HGV), dubbed WU-14, is a nuclear-capable hypersonic missile delivery vehicle designed to penetrate the United States ballistic missile defenses. The HGV payload is launched as the final stage of an intercontinental ballistic missile (ICBM).

Propellant: Single or Two-Stage; Solid

Speed: The HGV hypersonic vehicle is capable of speeds between Mach 5 (+6,000 kilometers per hour) and Mach 10 (+12,000 kilometers per hour) at altitudes of up to 62 miles (100 kilometers).

Note #1: An hypersonic cruise missile can perform precision strikes with relative low altitude and flat trajectory which makes it difficult to detect and neutralize by conventional air and missile defenses.

Note #2: The DF-ZF will bring a hypersonic capability to the PLARF. Missiles carrying the DF-ZF will have shorter flight times and be capable of performing evasive maneuvers at hypersonic speeds, which will complicate the ability of current missile defenses to intercept it. The current missiles believed to be capable of carrying the HGV are short- and medium-ranged but could strike targets in South Korea and Japan, including U.S. carriers and bases in the region. It is also capable of carrying nuclear payloads as well as conventional.

Dimensions

Chassis Length: INA

Missile Length: m11

Missile Diameter: INA

Missile Weight: kg15,000

Fin Span: INA

Automotive (Chassis: The DF-17 ballistic missile is based on a special wheeled chassis with 10x10 configuration)

Engine Name: INA

Engine Type: Diesel

Engine Power: 600 hp

Maximum Road Speed: 70 km/h

Maximum Range: 650 km

Gradient: %40

Side Slope: %20

Vertical Step: 0.4 m

Trench: 2.5 m

Fording: 1.2 m

Protection

Hull Armor: INA

Applique Armor: INA

Active Protection System: No

Smoke Equipment: No

Notes:

The DF-17 (Dong Feng-17) is a Chinese medium-range missile system equipped with a hypersonic glide vehicle. U.S. officials first confirmed the existence of DF-17 prototypes (DF-ZF/Wu-14) in 2014. Thge DF-17 mounts to the DF-ZF Hypersonic Glide Vehicle. China has invested significant resources in the DF-17 and its other hypersonic weapon programs. The People's Liberation Army (PLA) has reportedly done so to counter adversary missile defenses, as well as to develop a fast, long-range, high-precision strike capability that "leaves enemies with little time to react." While slower than a conventional ballistic reentry vehicle, HGVs' higher maneuverability and lower-altitude flight make them harder to track and predict their flight path, challenging legacy ballistic missile defense systems. In 2018, one U.S. official noted that China had conducted around 20 times the number of hypersonic weapons tests as the United States had in the preceding decade. China's 10th Research Institute is responsible for developing the DF-17 and other Chinese HGVs. Also known as the "Near Space Flight Vehicle Research Institute," the organization operates under the China Aerospace Science Industry Corporation (CASIC) 1st Academy. U.S. officials confirmed the DF-17's existence in 2014, identifying it as the Wu-14. News media later identified the missile as the DF-ZF – likely an early Chinese designation. Between January 2014 and November 2017, China conducted at least nine flight tests of the DF-17. Tests took place at the Taiyuan Satellite Launch Centre in Shanxi Province. The DF-17 is solid-fueled, measures around 11 m in length, and weighs around 15,000 kg. Its accompanying DF-ZF HGV reportedly reaches speeds of Mach 5-10 (1.72-3.43 km/s) in its glide phase. U.S. intelligence assessments suggest that the DF-17 possesses a range between 1,800 and 2,500 km. Although Chinese commentators have emphasized the DF-17's conventional mission, the missile may alternatively equip nuclear warheads. The DF-17 has demonstrated a high degree of accuracy in testing, with one U.S. government official saying a test warhead "within meters" of its intended, stationary target. U.S. defense officials have also said the DF-ZF HGV performed "extreme maneuvers" and "evasive actions" in previous test flights. Some reports suggest China could develop the DF-17 into a second-generation anti ship ballistic missile (ASBM), further enabling China's strategy to deter U.S. regional intervention. In January 2019, PLA officials claimed to have an anti ship DF-17 variant under development.

Hwasong-10 (Musudan) North Korean Intermediate-Range Ballistic Missile

Tiers:

System

Alternate Designation: Hwasong-10; BM-25; Musudan

Type: Intermediate-Range Ballistic Missile

Launch Platform(s): Transporter Erector Launcher (TEL): MAZ-547)

Basing: Road-Mobile

Crew: 3

Missile Engine Name: Soviet 4D10 engine and uses liquid propellant.

Type of Engine: Single-stage

Warhead Type: Nuclear, single warhead with a blast yield of up to 1 MT

Range of Fire: 2,500-4,000 km

CEP: INA

Note #1: The Hwasong 10 is based on a Soviet R-27 submarine-launched ballistic missile, but is slightly longer. Its development was assisted by Russians. In 1992, after the collapse of the Soviet Union, North Korea signed a contract with a Russian Makeyev Design Bureau to develop a space launch vehicle, based on the R-27 missile. Russian ballistic missile designers and engineers went to North Korea to develop this missile.

Note #2: The TEL vehicle can launch its missile from prepared sites or from unprepared positions during field deployment. Once the missile is launched, the TEL vehicle can be reloaded with another missile. Reloading is performed by a crane.

Dimensions

Missile Length: m12

Missile Diameter: m1.5

Missile Launch Weight: 20 tons

Throw Weight: 650 kg

Warhead Weight: The missile carries a singe warhead, which weights around 650 kg. Though other sources suggest that the warhead could weight 1 000-1 250 kg.

Automotive (Transporter Erector Launcher: MAZ-547)

Engine Name: INA

Engine Type: V12 Diesel

Engine Power: 525

Maximum Speed: 60 km/h

Maximum Range: INA

Fuel Capacity: INA

Protection

Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Self-Entrenching Blade: No

NBC Equipment: INA

Notes:

The Hwasong-10 (Chosŏn'gŭl: □□ 10□; hancha: □□ 10□), also known by the names BM-25 and Musudan (Korean: □□□; Hanja: □□ □), is a mobile intermediate-range ballistic missile developed by North Korea. Hwasong-10 was first revealed to the international community in a military parade on 10 October 2010 celebrating the Korean Worker's Party's 65th anniversary, although experts believe these were mock-ups of the missile.Hwasong-10 resembles the shape of the Soviet Union's R-27 Zyb submarine-launched missile, but is slightly longer. It is based on the R-27, which uses a 4D10 engine propelled by unsymmetrical dimethylhydrazine (UDMH) and nitrogen tetroxide (NTO). These propellants are much more advanced than the kerosene compounds used in North Korea's Scuds and Nodong missiles. Since April 2016 the Hwasong-10 has been tested a number of times, with two apparent partial successes and a number of failures. The Hwasong-10 was not shown in the April 2017 and February 2018 military parades, suggesting that the design had not been deployed. Assuming a range of 3200 km, the Musudan could hit any target in East Asia (including US military bases in Guam and Okinawa). Inventory is less than 50 launchers. In the mid-1990s, after the collapse of the Soviet Union, North Korea invited the Makeyev Design Bureau's ballistic missile designers and engineers to develop this missile, based on the R-27 Zyb. In 1992, a large contract between Korea Yon'gwang Trading Company and Makeyev Rocket Design Bureau of Miass, Russia was signed. The agreement stated that Russian engineers would go to the DPRK and assist in the development of the Zyb Space Launch Vehicle (SLV). It was decided that, as the Korean People's Army's MAZ-547A/MAZ-7916 Transporter erector launcher could carry 20 tonnes, and the R-27 Zyb was only 14.2 tonnes, the R-27 Zyb's fuel/oxidizer tank could be extended by approximately 2 metres. Additionally, the warhead was reduced from a three-warhead MIRV to a single warhead. The actual rocket design is a liquid fuel rocket, generally believed to use a hypergolic combination of unsymmetrical dimethylhydrazine (UDMH) as fuel, and nitrogen tetroxide (NTO) as oxidizer.[4] Once the fuel/oxidizer combination are fed into the missile, it could maintain a 'ready to launch' condition for several days, or even weeks, like the R-27 SLBM, in moderate ambient temperatures. A fueled Hwasong-10 would not have the structural strength to be safely land transported, so would have to be fueled at the launch site. It was originally believed that the rocket motors of Hwasong-10 is made up the second stage of the Taepodong-2, which North Korea unsuccessfully test fired in 2006. However analysis of the Unha-3 launch, believed to be based on the Taepodong-2, showed that the second stage did not use the same fuel as the R-27, and is probably based on Nodong rocket technology. Initially it was believed that there is a possibility that Hwasong-10 likewise is using the Nodong's kerosene and corrosion inhibited red fuming nitric acid (IRFNA) propellants, reducing the missile's range by about half. However it is unlikely that North Korea uses IRFNA propellants which will reduce its range by about half, after the experts acknowledged that the June 22 twin test range could be at 3,150 km if the missile was not launched in the lofted trajectory.

Hwasong-14 (KN-14) North Korean Intercontinental Ballistic Missile

Tiers:

Variants:

- **KN-08:** The KN-08 (North Korean: Hwasong-13; it has also been called the No Dong-C) is a three-stage, road-mobile intercontinental ballistic missile (ICBM) being developed by North Korea. The missile is believed to be powered by 4D10 engines adapted from those on the Soviet R-27 (NATO: SS-N-6) missiles. Pyongyang reportedly obtained some of these missiles in the early 1990s after the collapse of the Soviet Union.

System

Alternate Designation: Hwasong-14 KN-14
Type: Intercontinental Ballistic Missile
Launch Platform(s): MAZ-based vehicle. Six missiles were carried on 16-wheel transporter erector launchers (TEL),similar in size to those used by the Russian RT-2PM2 Topol-M missiles. The TELs are thought to be based on WS-51200 frames made by Wanshan Special Vehicle in China, possibly using technology from Minsk Automobile Plant.

Missile Engine: 3-stage liquid-propelled rocket

Missile Maximum Range: 9,000 km to 10,000 km

Missile Accuracy: 1.9 km) at 2,400 km

Dimensions

Missile Length: 16.9 m to 17.40 m

Missile Weight: INA

Warhead Weight: 400 kg

Automotive

Launcher: MAZ-based vehicle. Six missiles were carried on 16-wheel transporter erector launchers (TEL),similar in size to those used by the Russian RT-2PM2 Topol-M missiles.

Fire Control

Guidance System: INA

Protection

Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Self-Entrenching Blade: No

NBC Equipment: INA

Smoke Equipment: INA

Notes:

Compared to KN-08, the KN-14, is a slightly shorter, with a blunt and rounded nose cone. Due to the lack of evidence to analyze, it is unclear if the KN-14 is a three- or two-staged missile, but some analysts suggest the latter to be more likely. According to analysis by 38 North, the KN-14's robust design has the potential of a 50-60% reliability, whereas it is estimated that the KN-08 would operate only 30-40% of the time. Similar to the KN-08, the design of KN-14 appears comes from the Soviet-era R-27/SS-N-6 missiles. This seemed to be confirmed during the liquid-fueled engine test on April 9, 2016. While there is no video footage, images released of the test appear to show a pair of clustered 4D10 engines, which are used on the R-27.3 The images display the engines, embedded within a fuel tank fitted for an ICBM, spitting out bright orange exhaust, which is indicative of a highly efficient fuel called unsymmetrical dimethyl hydrazine (UDMH). The use of such fuel could increase KN-14's range.

Hwasong-13 (KN-08) North Korean Intercontinental Ballistic Missile

Tiers:

1 **2** 3 4

Variants:

- **KN-14 (KN-08 Mod 2):** This is an upgraded variant. It has two stages and a blunt, cone-shaped nose. First revealed on Oct. 10, 2015, it is believed to have a smaller warhead capability and shorter range. The KN-14 is thought to be road-mobile, similar to the KN-08. Later analysis has suggested this is a new missile, which has been designated the KN-20 (Hwasong-14).

System

Alternate Designation: Hwasong-13; Rodong-C; KN-08

Type: Intercontinental Ballistic Missile

Launch Platform(s): MAZ-based vehicle. Six missiles were carried on 16-wheel transporter erector launchers (TEL),similar in size to those used by the Russian RT-2PM2 Topol-M missiles. The TELs are thought to be based on WS-51200 frames made by Wanshan Special Vehicle in China, possibly using technology from Minsk Automobile Plant.

Missile Engine: 3-stage liquid-propelled rocket

Missile Maximum Range: 5,500 km to 11,500 km

Missile Accuracy: 1.9 km) at 2,400 km

Dimensions

Missile Length: 17.5 m to 19.75 m

Missile Diameter 1st to 2nd Stage: 1.8 m to 2.00 m

Missile Diameter 3rd Stage: 1.25 m

Missile Weight: INA

Warhead Weight: 300 kg to 700 kg

Automotive

Launcher: MAZ-based vehicle. Six missiles were carried on 16-wheel transporter erector launchers (TEL),similar in size to those used by the Russian RT-2PM2 Topol-M missiles.

Notes:

The Hwasong-13 (Korean: □□ 13□; Hanja: □□ 13□; lit. Mars-13), also known as Rodong-C (Korean: □□-□; Hanja: □□-C) or KN-08 under the U.S. naming convention,[3] is a road-mobile intercontinental ballistic missile believed to be under development by North Korea. The changes shown in the mock-up displayed in October 2015 indicated a change from a three to two-stage design. Mock-ups of the missile were first displayed during a military parade in April 2012 to mark the 100th anniversary of Kim Il Sung. Six missiles were carried on 16-wheel transporter erector launchers (TEL), similar in size to those used by the Russian RT-2PM2 Topol-M missiles. The TELs are thought to be based on WS-51200 frames made by Wanshan Special Vehicle in China, possibly using technology from Minsk Automobile Plant. UN investigators have concluded that the TELs were Chinese WS51200 trucks exported to North Korea for lumber transport. The North Koreans converted them into TELs by installing hydraulic gear and controls to erect a missile. Despite being converted to fire a missile, the truck would not be likely to survive damage from the rocket exhaust like a purpose-built TEL, making it a single-use launcher. Mock-ups were again paraded in 2013, with fewer discrepancies between them than in the previous year. The KN-08 was paraded again to celebrate the 70th anniversary of the founding of Korean Workers Party on 11 October 2015. In this parade, the missile featured a modified smaller-in-length but larger-in-diameter third stage plus re-entry vehicle section design, which has led to suggestions that North Korea might have perfected nuclear warhead miniaturization. The KN-08 mock-up dimensions are estimated to be: length of about 17.1 metres, and first and second stage diameter of about 1.9 metres, reducing to about 1.25 metres for the third stage. Liquid-fueled ICBMs generally only have two stages for best performance, with a few exceptions (usually when an existing design is upgraded). The three stage design of the KN-08 is puzzling.[20] While a three-stage design is common for solid propellant ICBMs, western analysts say that North Korea lacks the experience and ability to develop a solid-fueled ICBM. In early 2015, the U.S. Department of Defense announced that although they had not seen the KN-08 tested, they believed North Korea had the ability to put a nuclear weapon on a KN-08, and it was prudent to plan for that threat. The KN-08 theoretically poses a threat to the U.S. mainland, able to deliver a 500–700 kg (1,100–1,500 lb) payload 7,500–9,000 km (4,700–5,600 mi) to the American West Coast. Practically speaking however, its accuracy is likely "barely adequate" to target large cities, mobility would be limited to paved roads, and the system will require 1–2 hours of pre-launch fueling. In 2017, speculations were published, that the KN-08 may achieve an emergency operational status by 2020 It is reported on December 2, 2017, that the missile was canceled and that development team was sent to assist development of Hwasong-12 IRBM, Hwasong-14 and Hwasong-15 ICBMs. German analyst Norbert Brugge in interview on November 27, 2017 for Difesa Online, a military focused website claimed that Hwasong-10 and Hwasong-13 were likely canceled due to inability to solve engine problems.

RS-28 Sarmat Russian Intercontinental Ballistic Missile (ICBM)

Tiers:

1 2 3 4

System

Additional Designation: SS-X-30, PC-28, Capmat, Satan II
Range: 18,000 kilometres
Launch Platform: Silo
Circular Error Probability: m10

Dimensions

Length: m36
Diameter: m3.5
Weight: tonnes208
Speed: km/h25,500
Maximum Warhead Capacity: kg10,000

Payload

Note:: 10 heavy MIRVs; 16 light MIRVs; 24 hypersonic glide vehicles

↳ *Warheads (Multiple Independently Targetable re-entry Vehicles)*

Quantity: Up to 16
Note:: Each MIRV, which can be aimed at different targets, has the explosive yield of up to 750 kilotons (Hiroshima was 15 kilotons)

Hypersonic Glide Vehicle (HGV)

Name: YU-74 Avangard

Quantity: Up to 24

Note:: HGVs are capable of carrying a nuclear payload and can travel at 20 times the speed of sound. Their high speed, low trajectory, and mid-flight maneuverability make it difficult to engage with systems like the US's THAAD.

Fire Control

Note:: Inertial guidance, GLONASS, Astro-inertial

Protection

Note:: Like all silo based missiles, the RS-28 is most vulnerable while being transported. Otherwise, OPSEC of the exact location of the silo and the hardening of the silo itself provide the missile its best protection. Once the missile is in flight, terrestrial and space based counter-missile systems are the ICBM's greatest threat. It is expected that the RS-28 will carry countermeasures to defeat these threats.

Notes:

The RS-28 Sarmat (Russian: РС-28 Сармат, named after the Sarmatians, NATO reporting name SS-X-30) is a Russian liquid-fueled, MIRV equipped, heavy thermonuclear intercontinental ballistic missile (ICBM), under development by the Makeyev Rocket Design Bureau since 2009. It is intended to replace the R-36M ICBM (SS-18 'Satan') in Russia's arsenal. The Sarmat is one of the six new Russian strategic weapons unveiled by Russian President Vladimir Putin on 1 March 2018. One source suggests that the program is being accelerated and will make up 100% of Russia's fixed land-based nuclear arsenal by 2021. Some sources state that with the range of the RS-28, the missile could be launched to take a south pole trajectory thus avoiding the US's missile defense umbrella. The RS-28 will be 100 times more powerful than the bomb dropped on Hiroshima and one missile’s payload could destroy France. A regiment of the 62nd Missile Division, deployed in Uzhur, part of the 33rd Guards Missile Army, headquartered in Omsk in southwestern Siberia, will reportedly receive two silo-based RS-28 ICBMs in 2021 with four more ICBMs delivered the following year. In total, seven regiments with six missiles in a regiment plus one ten-missile regiment for a total count of 46 RS-28s will be deployed and split up between two missile divisions based in Dombarovskiy and Uzhur.

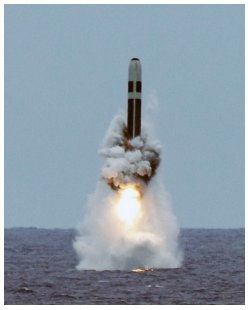
RSM-56 Bulava (SS-NX-30) Russian Submarine-Launched Ballistic Missile



Tiers:

System

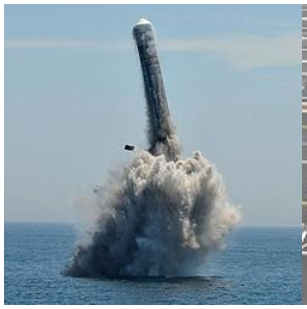
Alternate Designation: RSM-56 Bulava
Type: Submarine-Launched Ballistic Missile
Date of Introduction: 2018
Country of Origin: Russia
Length: 11.5 m (38 ft) (without warhead) 12.1 m (40 ft) (launch container)
Diameter: 2 m (6 ft 7 in) (missile) 2.1 m (6 ft 11 in) (launch container)
Weight: 36.8 t (36.2 long tons; 40.6 short tons)
Warhead: 6-10 × 100-150 kt MIRVs
Engine: Three stage solid and liquid head stage
Propellant: Solid propellant and liquid fuel
Operational Range: 8,000-8,300 km
Guidance System: Inertial guidance, possibly with Astro-inertial guidance and/or GLONASS update
Accuracy: 120-350 meters
Launch Platform: Borei-class submarines Typhoon-class submarine Dmitri Donskoi (as a testbed)

Notes:

The RSM-56 Bulava (Russian: Булава, lit. "mace", NATO reporting name SS-NX-30 or SS-N-32, GRAU index 3M30, 3K30) is a submarine-launched ballistic missile (SLBM) developed for the Russian Navy and deployed in 2013 on the new Borei class of ballistic missile nuclear submarines. It is intended as the future cornerstone of Russia's nuclear triad, and is the most expensive weapons project in the country. The weapon takes its name from bulava, a Russian word for mace. Designed by Moscow Institute of Thermal Technology, development of the missile was launched in the late 1990s as a replacement for the R-39 Rif solid-fuel SLBM. The Project 955/955A Borei-class submarines carry 16 missiles per vessel. Development and deployment of the Bulava missile within the Russian Navy is not affected by the enforcement of the new START treaty. A source in the Russian

defense industry told TASS on June 29, 2018 that the D-30 missile system with the R-30 Bulava intercontinental ballistic missile had been accepted for service in the Russian Navy after its successful four-missile salvo launch tests in 2018. The Bulava missile was developed by Moscow Institute of Thermal Technology under the leadership of chief designer Yury Solomonov. Although it utilizes some engineering solutions used for the recent RT-2PM2 Topol-M ICBM, the new missile has been developed virtually from scratch. Bulava is both lighter and more sophisticated than the Topol-M.[citation needed] The two missiles are expected to have comparable ranges, and similar CEP and warhead configurations.[citation needed] Bulava has a declared START throw weight of 1150 kg to 9,500 kilometers. The missile has three stages; the first and second stages use solid fuel propellant, while the third stage uses a liquid fuel to allow high maneuverability during warhead separation. The missile can be launched from an inclined position, allowing a submarine to fire them while moving.[citation needed] It has a low flight trajectory, and due to this could be classified as a quasi-ballistic missile. It possesses advance missile defense evasion capabilities making it resistant to any missile-defense systems. Borei-class submarines carrying Bulava missiles are expected to be an integral part of the Russian nuclear triad until 2040. Bulava can be loaded on TEL road mobile launchers, on railway BZhRK trains and other various launchers

JL-2 (CSS-N-14) Chinese Intercontinental-Range Submarine-Launched Ballistic Missile (SLBM)



Tiers:

1 2 3 4

System

:
:
:

↳ ***Missile***

Name: JL-2 (CSS-N-14)
Type: Intercontinental-Range Submarine-Launched Ballistic Missile (SLBM)
Basic Load: 12
Length: 13 m
Diameter: INA
Weight: 42,000 km
Warhead: 1 nuclear warhead
Blast Yield: 1 megaton of TNT
Propellant: Solid-fuel rocke
Operational Range: 7,200 km
Guidance System: Astro-inertial with Beidou
Launch Platform: Type 094 submarine

Notes:

The JL-2 (Chinese: □□-2; pinyin: Jù Làng Èr; literally: 'Giant Wave 2', NATO reporting name CSS-N-14) is a Chinese second-generation intercontinental-range submarine-launched ballistic missile (SLBM) deployed on the People's Liberation Army Navy's (PLAN) Type 094 submarines. It succeeds the JL-1 SLBM deployed on the Type 092 submarine. The JL-2 is the first Chinese SLBM that allows PLAN ballistic missile submarines to strike portions of the United States from the Chinese coast, and provide China with a viable sea-based nuclear deterrent. The JL-2 is a naval variant of the land-based DF-31. Their common 2-metre diameter solid fuel rocket motor was successfully tested in late 1983, and research and development efforts were reorganized starting in 1985 to produce both missiles. The first JL-2 at-sea launch occurred in 2001 from a Type 031 submarine. The program was delayed after a failed test in 2004. Successful launches occurred in 2005 and 2008. The missile was successfully fired from a Type 094 submarine, the intended operational platform, for the first time in 2009. A series of test launches

occurred in 2012. Another test launch occurred in January 2015. During the development of the missile, it was reported that China was considering modifying the missile to accommodate an anti-satellite warhead to give it a sea-based anti-satellite capability. Type 094 deterrence patrols with JL-2 missiles began in December 2015. As of 2017, 48 JL-2 launchers are deployed on submarines. The JL-2 is a three-stage, solid-fuelled missile, with a maximum range of 7,200 km (4,500 mi). Its payload is a single 1 Megaton warhead.

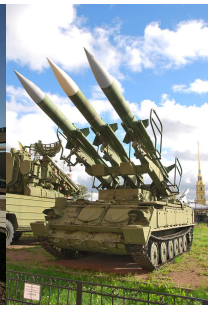
SAM-6 (Gainful) Iranian Surface-to-Air Missile System



Tiers:

Variants:

- **Gainful Mod 1 (SA-6b):** Initial operating capability (IOC) was reached in 1979. This system is mounted on a variant of the MT-LB general-purpose tractor that also carries missile guidance radar.

System

Alternative Designations: 2K12 Kub; SA-6 Gainful
Type: Tracked medium-range surface-to-air missile system
Target: Low to medium altitude FW and heli for SA-6a. FW, heli, CM for SA-6b FW, heli, TBM, CM, UAV, and ground targets for SA-6b/Kvadrat-M4.
Manufactuer: Ulyanovsk Mechanical Plant (SURNs) ZiK (TELs) Still in Service in over 25 countries through Russia, Africa, and Asia.
In Service: 1960-Present
Chassis: Modified PT-76
Launch Vehicle: 2P25 SPU Launch Vehicle
Crew: 3

Dimensions

Length, Hull: m6.79
Length, with Missiles: m7.39
Height, Hull Top: m1.80

Height, with Missiles: m3.45

Width: m3.18

Tracks Length on the Ground: m3.80

Track Width: m0.36

Ground Clearance: m0.40

Combat Weight: kg14,000

Ground Pressure: 0.48 kg/cm sq

Automotive

Engine Name: Model V-6R

Engine Type: water-cooled, in-line 6-cylinder diesel

Engine Power: 240 hp at 1,800 rpm

Power-to-weight ratio: 17.14 hp/metric ton

Fuel Capacity: 250 Liters

Suspension: torsion bar, 6 road wheels, rear drive, front idler, two hydraulic shock absorbers, no return rollers

Transmission: manual, 5 forward and 1 reverse gears

Electrical system: 24 v

Batteries: 2 x 12 v, 100 Ah (for vehicle)

Maximum Speed: km/h44

Maximum Range, Road: km/h260

Vertical Obstacle: m1.00

Trench: m2.50

Gradient: %60

Side Slope: %30

Fording: m1.10

Communications

Tactical Radio: Depends on which country the SA-6 is operating in.

Armament

Launcher: 2P25 SPU Launch Vehicle

Name: Kub-M3/3M9M3

Reaction Time (sec): sec22-24

Time Between Launches (sec): INA

Reload Time (min): min10

Fire on Move: No

Simultaneous targets launcher: ea1

Simultaneous targets battery: ea1

Simultaneous missiles battery: ea1-4

Emplacement Time (min): min5 or less

Displacement Time (min): min15 for a battery

↳*Missile (Option 1)*

Name: Kub-M1

Missiles per TEL: 3

Engagement Range: 4–23 km

Engagement Altitude: 80–8,000 m

Missile Speed: Mach 1.75

Maximum Target Speed: Mach 1.75

Response Time: sec22–24

Missile Weight: 630 kg

Deployment Time: Min5

Guidance System: semi-active radar homing

↳*Missile (Option 2)*

Name: Kub-M3

Missiles per TEL: 3

Engagement Range: 4–25 km

Engagement Altitude: 20–8,000 m

Missile Speed: Mach 2

Maximum Target Speed: Mach 1.75

Response Time: sec22–24

Missile Weight: 630 kg

Deployment Time: min5

Guidance System: semi-active radar homing

↳*Missile (Option 3)*

Name: Kub-M4 (Buk-M1)

Missiles per TEL: 3

Engagement Range: 4–24 km

Engagement Altitude: 30–14,000 m

Missile Speed: Mach 2

Maximum Target Speed: Mach 1.75

Response Time: sec24

Deployment Time: min5

Guidance System: semi-active radar homing

Fire Control

FCS Name: INA

Computerized FCS: Yes

EO sighting system: TV

Commander and driver: IR

IFF: Pulse-doppler

Radar Vehicle

Name: SURN 1S91 "Straight Flush" Radar

Type: fire control and guidance radar associated with surface-to-air „Kub“ (kyrillisch: Куб; english: cube, NATO-Bezeichnung: SA-5 Gammon) missile system.

Band: It is operating in C-Band surveillance and aquisition radar, combined with an operating in I-Band tracking and illuminating radar.

Peak Power: 600 kW

Maximum Range: km75

Beamwidth: deg1

Antenna Rotation: 15 or 20 min-1

↳*Additional Radar Systems Available*

Note: The 2K12 can also be used at a regimental level, if used as such it can be accompanied by a number of additional radar systems for extended air search at longer range and lower altitude, to supplement the 1S91 "Straight Flush". These systems include the: P-12 "Spoon Rest", a VHF early warning radar (also used by the SA-2), with a 200 kilometres (120 mi) range. P-40 "Long Track", an E band early warning radar (also used by the SA-4 and SA-8), with a 370 kilometres (230 mi) range. P-15 "Flat Face A", a UHF early warning radar (also used by the SA-3, with a 150 kilometres (93 mi) range. "Thin Skin" or "Side Net" E band height finding radar (also used by the SA-2, SA-4 and SA-5, range 240 km/148 miles) "Score Board" IFF radar The "Spoon Rest" and "Thin Skin" are mounted on a truck, "Long Track" on a tracked vehicle (a modified AT-T) and "Flat Face" on a van. It is unknown what kind of mounting the "Score Board" has. Without the P-40 "Long Track" mobile radar vehicle, the 2K12 is unable to track aircraft at high altitudes.

Protection

Hull Armor Type: 9.40 mm

Turret Armor: 9.40 mm

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes, collective overpressure and filtration

Smoke Protection: INA

Notes:

The SAM-6 (Gainful) is a export of the Russian 2K12 (NATO: SA-6 Gainful). The 2K12 "Kub" (NATO reporting name: SA-6 "Gainful") mobile surface-to-air missile system is a Soviet low to medium-level air defence system designed to protect ground forces from air attack. "2K12" is the GRAU designation of the system. Each 2K12 battery consists of a number of similar tracked vehicles, one of which carries the 1S91 (SURN vehicle, NATO designation "Straight Flush") 25 kW G/H band radar (with a range of 75 km (47 mi)) equipped with a continuous wave illuminator, in addition to an optical sight. The battery usually also includes four triple-missile transporter erector launchers (TELs), and four trucks, each carrying three spare missiles and a crane. The TEL is based on a GM-578 chassis, while the 1S91 radar vehicle is based on a GM-568 chassis, all developed and produced by MMZ. he 2K12 system shares many components with the 2K11 Krug (SA-4) system. In many ways they are designed to complement each other; 2K11 is effective at long ranges and high altitudes, 2K12 at medium ranges and intermediate altitudes. The system is able to acquire and begin tracking targets using the 1S91 "Самоходная установка разведки и наведения" (SPRGU - "Self-propelled Reconnaissance and Guidance Unit" / NATO: "Straight Flush" radar) at 75 km (47 mi) and begin illumination and guidance at 28 km (17 mi). IFF is also performed using this radar. It can only guide one or two missiles to a single target at any time. The missile is initially command guided with terminal semi-active radar homing (SARH), with target illumination provided by the "Straight Flush" radar. Detonation is via either the impact or proximity fuze. On the latest models, this vehicle is also fitted with an optical tracking system which allows engagement without the use of the radar (for active RF emissions stealth reasons, or due to heavy ECM jamming) in which case the effective altitude is limited to 14 km/46000 ft. The optical tracking method also allows engagements to altitudes below that where the radar is able to track targets. Maximum target speed is around Mach 2 for head-on engagements and Mach 1 for tail-chase engagements. Top speed of the missile is approximately Mach 2.8. In contrast to the elaborate Patriot missile or even the simpler Hawk system fielded by US forces, most of the system rides on two tracked self-propelled vehicles, rather than towed or mounted on trucks, and either the launcher or control vehicle can be set to launch in only 15 minutes after changing location.

HQ-7 (FM-80) Chinese Short-Range Air Defense Missile System

Tiers:

1 2 **3** 4

Variants:

- **FM-80 (Feimeng 80),:** export version of the HQ-7. It was revealed in 1989.
- **HHQ-7:** a naval version of the HQ-7. It was introduced in the 1990s. It has a bank of 8 missiles. For over a decade it was the standard Chinese ship-based air defense system. Currently a more capable HQ-9 with a longer range is being fitted on newly-built Chinese warships.
- **Shahab Tagheb:** an Iranian short-range air defense missile system. It was revealed in 1999. It was developed with Chinese assistance and by transferring technology of the HQ-7.
- **HQ-7A:** improved variant introduced in 1998. It has a maximum range of fire of 15 km. Detection range is 25 km and tracking range is 20 km. Also this missile has a maximum speed of 900 m/s in stead of 750 m/s.
- **HQ-7B:** latest variant, based on indigenous 6x6 armored chassis. It was first revealed somewhere in 2009. This air defense system is wisely used by the Chinese armed forces. It is more mobile due to its 6x6 configuration. This vehicle is more suited to follow motorized infantry, or mechanizes armored units.

System

Alternative Designation: HQ-7, FM-80, HongQi 7, Fei Meng, Flying Midge" or Flying Mongoose,
Type: Short-Range Air Defense Missile System
Family: HQ-7
Manufacturer: China, Company: INA
In Service: 1988-Present
Crew: ea3
Chassis: Thomson-Hotchkiss P4R chassis
Displacement Time: minutesINA
Emplacement Time: minutesINA
Fire on the Move: INA
Note #1: It is a reverse engineered copy of the French Crotale.

Note #2: A battery of HQ-7 consists of one vehicle with acquisition radar and two or three TELAR vehicles. Also each battery is supported by a maintenance group with around 10 support vehicles.

Dimensions (Thomson-Hotchkiss P4R Chassis)

Missile System

↳*Missile Launcher*

Name: INA

Type: TELAR vehicle

Firing Interval: 3 seconds

Operational Response Time: 6-10 seconds

Single-Shot Kill Rate: %85-90

↳*Missile*

Name: 4-cel or 8-cel missile launcher

Type: Short-Range Air Defense Missile

Length: m3

Diameter: m0.55

Wingspan: m0.55

Weight: kg84.5

Warhead Type: HE-FRAG

Warhead Weight: kg15

Maximum Range of Fire: kmup to 12

Minimum Range of Fire: m500-700

Maximum Altitude of Fire: km5.5

Minimum Altitude of Fire: m15

Basic Load: ea4

Speed: Mach 2.3 or 750 m/s

Missile Maneuverability: 20 G

Maximum Kill Distance at 400 m/s: km8.5

Maximum Kill Distance at 300 m/s: km10

Maximum Kill Distance at Helicopter: km12

Minimum Kill Distance: m500

Homing Range: km17

Target Seeking Range: km18.4

Guidance System: Radar

Note: The HQ-7 can engage helicopters, aircraft, cruise missiles, air-to-ground missiles and anti-radiation missiles.

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: No

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Optical Aiming System: Yes

Target Processing Unit: Yes, the system can process 30 targets & track 12 targets simultaneously

Generators: 4 x 40 kW generators

Target Processing Unit: Yes

Network: Wired Network

Radar #1

Name: INA
Type: Doppler Search Radar
Band: E/F Band
Range: km18.4
TV Tracking System: Yes
IR Localiser: Yes

Protection

Hull Armor: Protection against small arms fire and artillery shell splinters.
Turret Armor: Protection against small arms fire and artillery shell splinters.
Applique Armor: INA
Explosive Reactive Armor: No
Active Protection System: INA
Mine Clearing: No
Self-Entrenching Blade: INA
NBC Protection: Yes
Smoke Equipment: No
Countermeasures: Resists active and passive jamming and rejects ground and atmospheric clutter
IFF: Yes

Notes:

The HQ-7 SAM is used by PLA and PLAAF for short-range air-defense. At some PLAAF bases, the HQ-7 is deployed in hardened shelters. The PLA has mounted the HQ-7 on towed trailers. The HongQi 7 (HQ-7) short-range air defense missile system has been developed in China in the 1980s. It is a reverse engineered copy of the French Crotale. Sometimes it is referred as Sino Crotale. In 1978-1979 China imported some of the Thomson-CSF Crotale systems for evaluation. These where both land-based and ship-based versions. Some French R-440 Sea Crotale systems were purchased and installed on the Chinese warships. Eventually China reverse engineered this system. First Chinese clone of the ground-based version was produced for testing in 1983. In 1986-1988 it was approved for production. The HQ-7 was also deployed by the Chinese air force and protected the air bases from air attacks. Since 1989 the HQ-7 was proposed for export customers as the FM-80.

↳

R440 Crotale French 4x4 Short-Range Air Defense Missile System

Tiers:

Variants:

- **R440 Crotale:** The original Crotale SAM system, with both land and sea (Sea Crotale) systems. Over 330 systems and several thousand missiles were produced and exported to more than 15 countries.
- **HQ-7:** China developed the HQ-7 system partly from reverse-engineering Crotale. An improved version, the HQ-7A/FM-90, is known to exist.
- **Shahab Thaqeb:** In 2002 Iran revealed details concerning a domestically produced surface-to-air missile system, named Shahab Thaqeb. The system, mounted on a 4-wheel trailer, closely resemembled the Chinese HQ-7/FM-80/90 series which Iran had already received. It was unclear whether these systems were actually manufactured in Iran, or whether some portion of the assembly had been conducted domestically.
- **R460 SICA (Shahine):** Thomson-CSF (now Thales) developed a specific version of the Crotale known as "Shahine" for Saudi Arabia. The system became operational in 1980. The main visible differences are mainly the carrier (an AMX 30 armoured carrier instead of the non protected classic carrier), and that it carries a six missile firing unit (instead of four). The purpose of the changes was to allow the Shahine firing and acquisition units to follow and protect the armoured units of the Saudi Armed Forces on the battlefield. The Shahine units were among the first vehicles to liberate Kuwait City in February 1991 – a picture taken of the scene was widely publicised by Newsweek magazine.
- **Liberty Forward Area Air Defense System:** Developed in conjunction with LTV for the US Army's Line of Sight-Forward Heavy competition, the Liberty air defense system consisted of either 6 R460 SICA or 6 VT-1 missiles mounted on an M1A1 Abrams chassis along with a pair of 25mm cannons
- **Crotale NG (VT-1):** An updated version, New Generation. Finland was the first operator of the system. The cost of the system is roughly 8 million euros (excluding the vehicle). Greece is another user, and paid 1 Billion French Francs in 1998 for 11 systems: 9 for the Hellenic Air Force and 2 for the Hellenic Navy. In 2002 euros, that would have amounted up to 12 million euros per unit.
- **Crotale Mk.3 (system):** In January 2008, France test-fired the new Crotale Mk.3 system at the CELM missile launch test center in Biscarrosse. The Crotale Mk.3 system's VT1 missile successfully intercepted a Banshee target drone at 970 metre altitude and 8 km range in 11 seconds on 15 January 2008. Later, on 31 January 2008, the system successfully intercepted another target drone at a 500-metre altitude and 15 km range in 35 seconds.

System

Alternative Designation: R440 Crotale
Type: French Short-Range Air Defense Missile System
Family: Crotale
Function: The Crotale is a point defense system, designed to protect high value targets, such as airfields, military bases, ammunition depots, and so on. The original design aim of the Crotale was to engage supersonic low-flying aircraft.
Crew: ea3
Chassis: Thomson-Hotchkiss P4R 4x4 armored chassis
Displacement Time: minutes5

Emplacement Time: minutes5

Fire on the Move: No, it takes 5 minutes to launch the missiles from travelling.

Note #1: The Crotale is one of the most successful SAM design ever built. This air defense system still evolves and remains in production for more than 40 years. A wide range of its variants have been built. It is in service with 15 countries.

Note #2: A typical battery of the Crotale consists of two or three TELAR vehicle and one vehicle with acquisition radar. TELARs and acquisition and coordination unit are connected with cables. These are supported by a host of maintenance and support vehicles. It takes 2 minutes to reload all four missiles.

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Ground Pressure: INA

Note: There is no available information on the dimensions of the Thomson-Hotchkiss P4R 4x4 armored chassis.

Automotive

Engine Name: INA

Engine Type: Diesel

Engine Power: INA

Cruising Range: km600

Speed, Maximum Road: km/h80

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %30

Vertical Step: m0.5

Trench: m0.5

Fording Depth: m0.8

Note: mobility of this vehicle is rather limited. It was developed as a point defense system, rather than operate alongside land force maneuver elements. It takes about 5 minutes to launch missiles from travelling. There is also a towed variant, that is less mobile.

Communications

Tactical Radio: INA

Missile System

Name: VT-1

Turret Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Crotale EDIR is an all-weather short-range anti-air missile, which can be used to intercept low-flight anti-ship missiles and aircraft. It has been developed by Thomson CSF Matra and exists in two versions, a mobile land-based version and a ship-launched one. Originally the Crotale R440 system was developed by Rockwell International and Thomson-Houston (and Mistral) in France for South Africa, where it was named Cactus. However, the achievements of the system impressed the French Armed Forces, who purchased the system both for the air force and for the navy. The firing system includes the main sensors of the ship, the firing system of the turret, and a central coordination system. The turret holds eight missiles ready for launch in watertight containers. The magazine behind the turret holds 18 missiles. The French army first utilised a 4x4 wheeled vehicle, armed with four launchers. In order to ensure higher mobility, it was decided to mount the system on the chassis of the French AMX-30 main battle tank. At the same time, the number of launchers were increased to six. In Finnish Army service, the Crotale NG system has been mounted on Sisu Pasi vehicles. Here the number of launchers is eight. The Crotale system has also been installed on various military ships. For instance the French Navy La Fayette class frigates have a Crotale 8-tubed launcher near the helicopter flight deck.

Tor M2DT Russian Amphibious Short-Range Air Defense Missile System

Tiers:

Variants:

- **9K330 Tor:** he project was given strict design specifications to meet; Tor had to provide extended detection and tracking of fast, low radar cross section targets and be capable of quickly and efficiently dealing with massed air raids, whilst providing a high degree of automation and integration with other air defence assets. In order to meet these demanding specifications, the designers used a variety of new technologies, including advanced Passive electronically scanned array radar for improved detection and tracking performance, enhanced digital information processing, and vertically launched missiles to improve reaction time and increase the number of readily available munitions. After a period of testing and evaluation between December 1983 and December 1984, the land based system was accepted into service on 19 March 1986.
- **9K331 Tor-M1:** "Tor-M1", introduced in 1991 with the 9M331 missile, with greatly improved missile accuracy[4] and the ability to engage two targets simultaneously, minimum range 1.5 km (0.93 mi), minimum height 10 m. Even while the Tor was being introduced into service, work started on improving the system, resulting in an enhanced version, the Tor-M1. Many improvements over the original system were made; these included the addition of a second fire control channel, allowing two targets to be engaged at once; as well as upgrades to the optical tracking system and computer equipment. ECM protection and warhead design were also modified, as was the ammunition handling system. State tests, conducted between March and December 1989, showed that the result was a system which could engage more targets in a shorter time frame with reaction times reduced by over a second and an increased probability of target destruction.[2] Further modifications occurred partly as a response of insight gained from the 1995 NATO bombing in Bosnia and Herzegovina resulting in the Tor-M1-1, or Tor-M1V, which offered improved network connectivity and ECM functions as well as protection against countermeasures.
- **9K332 Tor-M2E:** Upgrades have continued over the lifetime of the system, with developer Almaz Antey unveiling the newest incarnation of the Tor missile system, the Tor-M2E, at the MAKS Airshow in 2007.
- **Tor-M1-2U:** Tor-M1-2U" entered service at the end of 2012. This system is designed to destroy aircraft, helicopters, UAVs, missiles, and other precision guided weapons, flying at medium, low and very low altitudes in all weather. The system is able to engage four targets simultaneously at a height of up to 10 kilometers. Its crew consists of three people. Deliveries are underway. It can hit targets on the move, at a speed of up to 25 km/h (includes all the necessary functions for independent fight).
- **3K95 Kinzhal (Naval Variant):** The 3K95 "Kinzhal" (Russian: Кинжал – dagger) is the naval version of the Tor missile system developed by Altair and has the NATO reporting name SA-N-9 Gauntlet. Using the same 9M330 missile as the land based version, the system can be mounted on vessels displacing over 800 tonnes and is known to be installed on Admiral Kuznetsov class aircraft carriers, Kirov class multimission cruisers, Udaloy class anti-submarine destroyers and Neustrashimy class frigates. The naval version of the later Tor-M1 is known as the "Yozh" (Russian: Ёж – hedgehog), while the export version of the Kinzhal is known as "Klinok"
- **Tor-M2KM:** The Tor-M2KM is a self-contained fighting module version of the system that can be mounted in various locations. In October 2016, it was loaded onto the helipad of the Admiral Grigorovich frigate by means of an ordinary wharf crane and fixed in position with steel chains to fire at simulated cruise missiles while the ship was underway. This could give advanced SAM capabilities to vessels without the capacity to install the larger and heavier Kinzhal system; it can also be mounted on a truck, building roof, or any horizontal surface at least 2.5 m wide and 7.1 m long. The module weighs 15 tons and contains all equipment needed to operate without any external support. It can go from standby to full alert in 3 minutes and acquire 144 air targets while simultaneously tracking the 20 most dangerous ones marked for priority by the two-man crew. The Tor-M2 km missiles have a range of 15 km.
- **Tor-M2DT:** The system is especially designed to be used for Arctic region at temperatures up to -50 degrees C based on the chassis of the DT-30PM tracked all-terrain vehicle and is capable of detecting over 40 air targets, especially high-precision weapons, and to track and engage up to four of them simultaneously at a range of up to 12 km and altitudes

up to 10 km with its 16 missiles even on the move. Its creation was completed in 2018 and the first delivery of 12 systems was held in November of the same year.

- **Tor-2E:** JSC Rosoboronexport, part of the Rostec State Corporation, has started promoting the newest Tor-E2 SAM system developed and produced by the Almaz-Antey Air and Space Defence Concern in 2018. Tor-E2 combat vehicle is an independent, mobile, all-terrain fighting unit that provides detection and identification of air targets on the march and at the halt, target lock-on and engagement at the halt, from a short stop and on the move. A battery of the four-channel Tor-E2 SAM systems, consisting of four combat vehicles, can simultaneously engage up to 16 targets flying from any direction at a range of at least 15 km and an altitude of up to 12 km. Each vehicle carries 16 missiles, twice as many as the previous version of the Tor system. In addition, the two Tor-E2 combat vehicles can operate in the "link" mode, which enables them to exchange information about the air situation at different altitude ranges and coordinate joint engagement operations. In this mode, one of the combat vehicles, acting from an ambush, receives information from the other one and does not reveal itself until the launch of the missile. A command post can be attached to a battery of four Tor-E2 combat vehicles to control and coordinate the Tor combat vehicles and interact with the customer's air defense control system.
- **HQ-17 (China Variant):** The HQ-17 (Hongqi-17) is China's reported variant of the Tor-M1 system. In 1996, China ordered 14 Tor-M1 missile systems from Russia which were delivered under contract in 1997. In 1999, another contract for 13 Tor-M1 systems was signed between Russia and China. Delivery of the systems took place in 2000.
- **FM-2000:** FM-2000 is a mobile short-range air-defence (SHORAD) system unveiled by China Aerospace Science and Industry Corporation at the 2018 Zhuhai Airshow and in service as of 2019. Its range is 15 km and engagement altitude is 10 km. It is carried on a 3 axle TEL. It is a version of the HQ-17.

System

Alternative Designation: Tor M2DT

Type: Short-Range Air Defense Missile System

Family: Tor Missile System

Manufacturer: Russia

In Service: 2018-Preseent

Crew: ea3

Chassis: DT-30PM tracked carrier

Displacement Time: INA

Emplacement Time: INA

Fire on the Move: Yes

Note: The DT-30PM tracked carrier was specially designed to operate over difficult terrain where there are no roads. It has articulated configuration the with two sections. The front section of the Tor M2DT has a fully enclosed forward control cab for the driver and operators. It also accommodates the engine. The rear unit carries missile launchers and radars.

Dimensions

Length: m16.3

Width: m3.1

Height, in Traveling Order: m4.5

Weight, Combat: 40-45 tons

Ground Pressure: INA

Missile System

Name: 9M338 missiles

Type: Short-Range Air Defense Missile

Launcher: The 9M338K is a designation of the missile in its launch container.

Missile Length, with Container: 2.94

Missile Diameter, with Container: 0.24

Fin Span: INA

Basic Load: 16

Missile Weight: kg163

Warhead Type: HE-FRAG

Warhead Weight: INA

Range of Fire: km16

Altitude of Fire: km10

Reload Time: Reloading vehicle of the Tor M2DT is fitted with a crane and carries reload missiles. It is also based on the same DT-30PM articulated all-terrain tracked carrier chassis. It takes around 30 to 45 minutes to reload a full set of 16 missiles.

Note: This system can engage all kinds of modern air targets. It can be used against aircraft, helicopters, UAVs, various missiles and precision guided munitions. It destroys targets that long- and medium-range air defense systems fail to hit.

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

Targets: The Tor M2DT can engage multiple targets simultaneously. It is claimed that this air defense system can deflect massive enemy air raids, when enemy extensively uses electronic countermeasures.

Note: The Tor M2DT can engage multiple targets simultaneously. It is claimed that this air defense system can deflect massive enemy air raids, when enemy extensively uses electronic countermeasures.

↳*Radar*

Name: INA

Type: INA

Function: INA

Frequency/Band: INA

Range: INA

Number of Targets System can Track: The Tor M2DT can engage multiple targets simultaneously

Protection

Hull Armor: The Tor M2DT is unarmored and carries no defensive weapons other than its air defense missiles.

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: No

Notes:

The system is especially designed to be used for Arctic region at temperatures up to -50 degrees C based on the chassis of the DT-30PM tracked all-terrain vehicle and is capable of detecting over 40 air targets, especially high-precision weapons, and to track and engage up to four of them simultaneously at a range of up to 12 km and altitudes up to 10 km with its 16 missiles even on the move. Its creation was completed in 2018 and the first delivery of 12 systems was held in November of the same year. The Tor-M2DT is an Arctic version of the Tor-M2 (NATO reporting name: SA-15 Gauntlet) system. It is designed to provide air and ballistic missile defense at the battalion level. The Tor-M2DT covers strategic administrative facilities, the first echelons of land formations from strikes by anti-radar and cruise missiles, glide bombs, planes, helicopters and unmanned aerial vehicles. It can operate in manual and automatic modes. The Tor system monitors the airspace and downs independently all the aerial targets unrecognized by the identification friend-or-foe device. The Tor-M2DT has been developed on the basis of a two-section prime mover to operate in the harsh conditions of the Arctic and the Extreme North and at a temperature of -50°C. It is based on the DT-30 tracked chassis to be able to float and move in cross-country terrain. The Tor-M2DT comprises 16 vertically-launched air defense missiles with a target engagement range of up to 12 kilometers (7 miles) and an altitude range of up to 10,000 meters. The upgraded target acquisition station is capable of detecting stealth aerial targets.

BTR-ZD Russian Airborne 23mm Self-Propelled Anti-Aircraft Gun

Tiers:

Variants:

- **BTR-DG (Ob'yekt 925G):** Cargo variant without bow machine guns, firing ports and periscopes. The troop compartment was modified to serve as a cargo compartment.
- **BTR-DG:** converted into an airborne SPAAG fitted with a specially built three-legged ZU-23-2 twin anti-aircraft autocannon mount over the roof of the cargo compartment.
- **BTR-D San:** BTR-D converted into an airborne armoured ambulance.
- **BREM-D:** (BREM-D stands for bronirovannaya remonto-evakuatsionnaya mashina desanta – armoured maintenance-recovery vehicle of the airborne) (Ob'yekt 932) – BTR-D converted into an airborne ARV. It carries specialized equipment for the repair and recovery of BMD-1 type vehicles. This equipment includes a light collapsible crane stored on the roof of the personnel compartment, which can be traversed through 180°, a recovery winch, a combination spade and dozer blade, a generator, towing equipment, electric welding system, tools and ready use spares. One of the 7.62 mm bow PKT tank machine guns was eliminated. This entered service in 1989 in very small numbers
- **BTR-RD "Robot":** BTR-D converted into an airborne ATGM team carrier with two 9P135M-1 ATGM launchers capable of firing 9M113 "Konkurs" (AT-5 Spandrel), 9M113M "Konkurs-M" (AT-5B Spandrel B), 9M111 "Fagot" (AT-4 Spigot) and 9M111-2 "Fagot" (AT-4B Spigot B) ATGMs. They can be used by the dismounted ATGM squad or fitted on a pintle mount on the right side of the hull. This is basically a BTR-D with a pintle mount added and with missile racks inside the troop compartment
- **BTR-ZD "Skrezhet":** (ZD stands for zenitnaya ustanovka) – BTR-D converted into an airborne air defense vehicle for carrying two MANPAD teams. The vehicle is fitted with racks for spare MANPAD missiles. It also is fitted with external stowage rails for a MANPAD on the right hand side of the roof of the troop compartment. It can also carry a complete ZU-23-2 twin anti-aircraft autocannon mount on the roof of the troop compartment.
- **NPDU "Sterkh":** (NPDU stands for nazemnyj punkt distantsionnogo upravleniya) – BTR-D converted into an airborne unmanned aerial vehicle carrier and launch vehicle of the "Stroy-P" set. It is used to launch Yak-061 "Pchela-1T" UAV for reconnaissance or jamming at ranges up to 60 km. The single-rail launcher is mounted on left hand side of the roof of the hull. It has large three-piece tube on forward right hand side of the roof of the hull. It entered service in 1990
- **BMD-1KSh "Soroka" (Ob'yekt 926):** (KSh stands for komandno-shtabnaya – command and staff) – airborne command post equipped with the R-123M, R-111 and R-130M or R-134 radio sets, as well as an AB1 portable 1 kW generator, the TNA-3 navigation system, folding CLOTHES HORSE type antennae around the superstructure and two slim antenna masts. Bow mounted machine guns and firing ports were removed. The commander's hatch is offset to the left and does not project forward. It's sometimes called BMD-KSh or KShM-D
- **BMD-1R "Sinitsa":** (R stands for radiostantsiya – signals vehicle) – Division-level command and signals vehicle equipped with R-161A2M radio set, one heavy telescopic antenna mast stowed along the left hand side of the roof of the hull and one slim elevatable antenna mast on the rear right hand side of the roof of the personnel compartment. Only a small number was delivered.

- **R-440-ODB "Kristall-BDS":** BTR-D converted into an airborne satellite communications vehicle with R-440 system with a range of 15,000 km. The vehicle has a roof-mounted satellite dish AK-12 that is covered with a cage-like structure during transport.
- **R-440-ODB "Kristall-BDS":** BTR-D converted into an airborne satellite communications vehicle with R-440 system with a range of 15,000 km. The vehicle has a roof-mounted satellite dish AK-12 that is covered with a cage-like structure during transport.
- **1V119 "Reostat":** BTR-D converted into an airborne artillery battalion fire direction vehicle. The vehicle is fitted with a turret equipped with NNP-21 and V-7 observation devices, three R-173 and R-159 radiosets, PAB-2AM aiming circle, three antennae mounts, DSP-30 and DAK-2 rangefinders. The turret was also equipped with PSNR-5K (1RL-133-1) "Tall Mike" ground surveillance radar mounted on the roof of the turret. Located over the turret front sights were the visors hinged in the center
- **2S9 Nona-S (Ob'yekt 925S) –:** Airborne self-propelled mortar, armed with a 120 mm 2A60 mortar. Entered service 1981.

System

Trench: m2

Fording Depth: mAmphibious

Note: The BTR-D is amphibious and is propelled on water by two waterjets

Communications

Primary: INA

Main Weapon System

Note #1: This air defense gun has only simple sights

Note #2: Vehicle has racks for shoulder-launched anti-aircraft missiles. Usually three missiles are carried

↳*System*

Name: ZU-23-2 (ZU-23)

Type: 23 mm anti-aircraft twin-barreled autocannon

Manufacturer: KBP Instrument Design Bureau

In Service: 1960-Present

Proliferation: Widely Proliferated

Number of Barrels: ea2

Length: m4.57

Barrel Length: m2.008

Width: m2.88

Height: m1.22

Weight: 0.95 tonnes

Crew: 2 -- gunner and commander

Action: Gas operated

Maximum Elevation: deg+90

Minimum Elevation: deg-10

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Rate of Fire: 2000 rpm cyclic, 400 rpm practical

Effective Firing Range: km2.5

↳*Ammunition*

Type: Rifle

Caliber: 23mm

Cartridge: 23x152B

Muzzle Velocity: INA

Baslic Load: INA

Secondary Weapon System

Note: The BTR-ZD carries two 7.62 mm machine guns, mounted in front of the hull and are operated by the troops.

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: 7.62mm

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

Manufacturer: Degtyaryov plant

In Service: 1961-Present

Proliferation: +1 Million

Length: mm1,203

Barrel Length: mm605

Weight, Gun Only: kg9

Weight, Tripod Only: kg7.7

Max Rate of Fire: 650 rds/min

Effective Rate of Fire: 250-300 rds/min

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,000

Accuracy of fire at 300 m: mm90

Fire Control

Name: INA

Computerized FCS: No, This air defense gun has only simple sights

Thermal Sight Vehicle Commander: Yes

Thermal Sight Gunner: Yes

Main Gun Stabilization: INA

Protection

Hull Armor: aluminum armor hull, which protects against small arms fire and artillery shell splinters

Turret Armor: INA

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

IR Signature: INA

Firing Ports: all-round firing ports

Notes:

The BTR-ZD is an airborne armored personnel carrier which carries two teams with man-portable air defense missiles. BTR-ZD "Skrezhet" (ZD stands for zenitnaya ustanovka) – BTR-D converted into an airborne air defense vehicle for carrying two MANPAD teams. The vehicle is fitted with racks for spare MANPAD missiles. It also is fitted with external stowage rails for a MANPAD on the right hand side of the roof of the troop compartment. It can also carry a complete ZU-23-2 twin anti-aircraft autocannon mount on the roof of the troop compartment

MIM-23A Hawk American Surface-to-Air Missile (SAM) System

Tiers:

Variants:

- **I-Hawk (Improved Hawk /Hawk B/MIM-23B):** This variant reached initial operating capability (IOC) in 1972. Upgrades from the original Hawk included solid-state electronics, factory certified and sealed missile round, all-altitude capability, digital automatic data processor for the information coordination central (ICC), improved solid-pro pellant rocket motor and a larger warhead.
- **Hawk Mobility Enhancement (HME):** This was jointly developed by Raytheon and the Dutch air force. It reduced number of vehicles in a Hawk firing unit from 14 trucks and trailers to seven, updated the Hawk launcher and simplified reloading.
- **Patriot /Hawk Interoperability:** This is a software upgrade to permitting Hawk missile platoons to receive targeting data from Patriot information coordination center (ICC). An April 1988 test simulated an interception of a short-range tactical missile by shooting down a missile traveling at Mach 2 and at an altitude of more than 25,000 ft (7,620 m).
- **Sparrow /Hawk Demonstration Program:** In 1985, Raytheon combined elements of two of its missile products into one system. The Sparrow /Hawk system replaced the three I-Hawks on the M192 launcher with eight AIM-7 Sparrow missiles (the original launcher had nine missiles).
- **NOAH (Norwegian Adapted Hawk):**
- **Iran MIM-23 Hawk variant:** Iran reportedly made several upgrades to MIM-23 missiles for the carriages of its F-14 Tomcats. Some were displayed in Tehran in September 1998.
- **Danish Enhanced Hawk (DEHAWK):** Introduced in December 2002, the Danish Enhanced Hawk (DEHAWK) was developed by Terma and Thales. After several years of delays, the program was handed over to the Danish Air Materiel Command.

System

Alternative Designation: MIM-23 Hawk, MIM-23A
Type: medium-range surface-to-air missile.
Family: MIM-23 Hawk Family
Manufacturer: Raytheon Company
In Service: 1960-Present
Crew: eaINA
Displacement Time: minutesINA
Emplacement Time: minutesINA
Fire on the Move: No
Note: The original Hawk has been phased out of NATO and U.S. service, although several countries have missiles in storage. All active Hawk missiles are the I-Hawk variant.

Dimensions

Length: m5.08

Diameter: m0.37

Wingspan: m1.21

Weight, Combat: kg590

Warhead Weight: kg45

Automotive

Engine Name: 1 x Aerojet dual-thrust solid-fuel rocket (M22E8 motor)

Engine Type: Solid-fuel rocket engine

Speed: Mach 2.5

Transporter: The Hawk missile is transported and launched from the M192 towed triple-missile launcher.

M22E8 Motor Burn Rate: seconds25-32

Communications

Missile System

Name: (M3) MIM-23A

Type: Semi-active Radar Homing Missile

Guidance: Semi-active Radar Homing

Length/Caliber: INA

Maximum Effective Range: km25

Minimum Effective Range: km2

Maximum Altitude: km14

Minimum Altitude: m30

Max Elevation: INA

Min Elevation: INA

Traverse Range: INA

Traverse Left: INA

Traverse Right: INA

Max Rate of Fire: INA

Launcher: M192 towed triple-missile launcher

Reflector: parabolic reflector

Warhead Type: Conventional high-explosive blast fragmentation

Warhead Weight: kg45

Warhead Fragments Speed: 2,000 meters per second

Warhead Fragments: 4,000 8-gram (0.28 oz) fragments

Warhead Fragments Arc: deg18

Fuze Type: w/proximity and contact fuzes

Speed: Mach 2.5

Guidance System: Semi-active radar homing

Kill Probability: 0.56

Fire Control

Note: The original Hawk system used 4 or in some models 6 radars: to detect (PAR and CWAR), to track (CWAR and HPIR) and to engage (HPIR and ROR) targets.

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

↳*Radar #1*

Name: AN/MPQ-35 (Basic Hawk)

Type: PAR Pulse Acquisition Radar

Radar Pulse Power: kW450

Pusle Length: 3 µs

Pulse Repetition Frequency: 800 and 667 Hz alternately

Radar Ghz Range: 1.25 to 1.35 GHz range

Antenna Dimensions: 6.7 m × 1.4 m

Rotation Rate: rpm20

Note: The BCC – Battery Control Central and the CWAR are synchronized by the PAR revolutions and the PAR system trigger.

↳*Radar #2*

Name: AN/MPQ-34 (Basic Hawk)

Type: CWAR Continuous Wave Acquisition Radar

Power Rating: Watts200

Frequency: 10 GHz (X-Band)

↳*Radar #3*

Name: AN/MPQ-33/39 (Basic Hawk)

Type: HPIR High Power Illuminating Radar

Power Output: Watts125

Operating Ghz Band: 10–10.25 GHz band

Note: The unit comes mounted on its own mobile trailer. Unit automatically acquires and tracks designated targets in azimuth elevation and range rate.

↳*Radar #4*

Name: AN/MPQ-37 (Basic Hawk)

Type: ROR Range Only Radar

Radar Type: Pulse Radar

Ku Band Frequency: 15.5-17.5 GHz

Power Output: kW120

Pusle Length: 0.6 µs

Pulse Repetition Frequency: 1600 Hz

Antenna: 1.2m dish

Range: 83 km (52 mi) versus 3 m2 (32 sq ft) target.

Protection

Turret Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

The Raytheon MIM-23 Hawk (or HAWK: Homing All the Way Killer) is an American medium-range surface-to-air missile. It was designed to be a much more mobile counterpart to the MIM-14 Nike Hercules, trading off range and altitude capability for a much smaller size and weight. Its low-level performance was greatly improved over Nike through the adoption of new radars and a continuous wave semi-active radar homing guidance system. Hawk was originally intended to attack aircraft, especially those flying at medium and low altitudes. It entered service with the Army in this role in 1959. In 1971 it underwent a major improvement program as the Improved Hawk, or I-Hawk, which made several improvements to the missile and replaced all of the radar systems with new models. Improvements continued throughout the next twenty years, adding improved ECCM, a potential home-on-jam feature, and in 1995, a new warhead that made it capable against short-range tactical missiles. Jane's reported that the original system's single shot kill probability was 0.56; I-Hawk improved this to 0.85. A typical Basic Hawk battery consists of: 1 × PAR: Pulse Acquisition Radar—a search radar with a 20 rpm rotation, for high/medium altitude target detection. 1 × CWAR: Continuous Wave Acquisition Radar—a search doppler radar with a 20 rpm rotation, for low altitude target detection. 2 × HPIR: High Power Illuminator doppler Radar—target tracking, illumination and missile guidance. 1 × ROR: Range Only Radar—K-band pulse radar which provides range information when the other systems are jammed or unavailable. 1 × ICC: Information Coordination Central 1 × BCC: Battery Control Central 1 × AFCC: Assault Fire Command Console—miniature battery control central for remote control of one firing section of the battery. The AFCC controls one CWAR, one HPI, and three launchers with a total of nine missiles. 1 × PCP: Platoon Command Post 2 × LCS: Launcher Section Controls 6 × M-192: Launchers with 18 missiles. 6 × SEA: Generators 56 kVA (400 Hz) each. 12 × M-390: Missile transport pallets with 36 missiles 3

× M-501: Missile loading tractors. 1 × [bucket loader] 1 × Missile test shop AN/MSM-43.

HQ-7B (FM-90) Chinese 6x6 Short-Range Air Defense Missile System

Tiers:

Variants:

- **FM-80 / HQ-7:** Improved version with E/F band TA radar, EO range of 15km, IR localizer and HQ-7 missile range of 7km

System

Alternative Designation: HQ-7B (FM-90)
Chassis / TELAR: P4R 4x4
Crew: ea3
Target: Helicopters, fixed wing aircraft, and cruise missiles, ARM missiles, ASM missiles
In Service: 2009-Present
Note: This air defense system is widely used by the Chinese armed forces. It is also being proposed for export customers as the FM-90. This air defense system has been exported to Pakistan

↳*Dimensions*

Height: m3.41
Length: m6.22
Width: m2.72
Weight: mt15

↳*Radar #1*

Name: Mirador IV pulse doppler
Detection Range: km18.5
Function: Target acquisition, surveillance
Antenna Rotation Rate: rpm60
Altitude Coverage: m0-4,500
Target Detection: 30 targets per rotation
Multiple Target Tracking: 12 targets
Frequency Band: E

Note: a battery of HQ-7B consists of one vehicle with acquisition radar and three TELAR vehicles. Also each battery is supported by a maintenance group with 10 support vehicles

↳*Radar #2*

Name: INA, located on launcher vehicle

Function: Fire control

Targets Tracked: 1

Missile Guidance, Simultaneous: 2

Detection Range: km17

Specification: Back-up binocular tracker

↳*Day / Night Camera*

Specification: Thermal sight

Field of View: degrees8.1 / 2.7

Elevation: degrees5.4 / 1.8

Range: km19

Protection

Armor Protection: Protection against small arms fire and artillery shell splinters

NBC Protection: Yes

Notes:

The original HongQi 7 (HQ-7) short-range air defense missile system has been developed in China in the 1980s. It was a copy of the French Crotale. In 1978-1979 China imported some of the Thomson-CSF Crotale systems for evaluation and reverse

engineered them. First Chinese clone was produced for testing in 1983. Its production commenced in the late 1980s. Sometimes it is referred as Sino-Crotale. Its improved variant, the HQ-7A, was introduced in 1998. The HQ-7B is the latest version, based on an indigenous 6x6 armored chassis. It was first revealed somewhere in 2009. This air defense system is widely used by the Chinese armed forces. It is also being proposed for export customers as the FM-90. This air defense system has been exported to Pakistan. A TELAR vehicle carries four missiles and is fitted with engagement radar. It appears that engagement radar is similar to that of the previous HQ-7A.

Crotale-NG (Export) Iranian Short-Range Air Defense System

Tiers:

Variants:

- **Generic:** SYSTEM IS IN A MODULAR POD, DESIGNED TO FIT ON SHIPS, VEHICLES, AND ON STATIONARY PLATFORMS. THE MODULAR ALL-WEATHER SYSTEM INCLUDES ACQUISITION, TRACKING, LAUNCH, AND SUPPORTING COMPUTER UNITS INTEGRATED ON ONE VEHICLE, FOR MANAGEMENT BY A SINGLE SYSTEM OPERATOR. VEHICLE PLATFORMS INCLUDE APCS, E.G., M113, KOREAN IFV, PIRANHA 10X10, AND THE XA-180 AS NOTED. THE SYSTEM CAN BE RETROFITTED ONTO EXISTING CROTALE LAUNCHER VEHICLES.
- **PEGASUS:** SOUTH KOREAN SYSTEM WITH A DIFFERENT MISSILE
- **Crotale Mk.3:** A Long range Version of the NG

System

Alternative Designations: Crotale-NG, R440 Crotale, HQ-7 (Chinese) R460 Crotale (Saudi Arabia), XA-181 (Finnish Launcher vehicle) This is not a modification to Crotale. It is a completely new modular system.
Date of Introduction: 1991-1992
Proliferation: At least 5 countries, all variants. Crotale NG entered production in 1990 and is in service with the Finnish Army (20 systems), and the French Air Force (12 shelter-mounted systems) and Navy.
Target: FW, heli, CM, ASM, UAV
Mission: The missions of the system are in front-line armoured brigade defence, permanent or semi-permanent site defence and area defence against air threats, such as fixed-wing aircraft, attack helicopters, cruise missiles, tactical missiles and saturation attacks with stand-off weapons released from aircraft and helicopters.
TELAR: XA-181 is XA-180 (PASI) 6x6 APC with Crotale NG launcher system
Crew: ea4
All Weather Operation: Yes, tracking and engagement and all weather operation.

↳*Automotive*

Missile Tracker: IR missile localizer on CCD camera for passive TV tracking

IFF: Yes

↳*Other Assets*

Description: The SAM system links to the IADS to get digital AD data and warnings. Associated radar for EW and TA data is radar at Brigade and Division Tier 1 and 2. System can also pass data to the net.

Protection

Armor Protection: mm6-12

Notes:

A modernized version, the Crotale NG (New Generation), entered production in 1990. This version used the new VT-1 missile with Mach 3.5 speed, load factor to 35G, 11 km range, 13 kg warhead (8 m kill-zone) and 6,000 m ceiling. The system includes a S-band Pulse Doppler radar (20 km), Ku-band TWT tracking radar (30 km), Thermal camera (19 km), Daylight CCD camera (15 km), and an IR localiser.[1] An early '90s proposal to fit the system (in its eight-round form) to a Leclerc tank chassis in order to provide a battlefield air defence vehicle for protecting armored formations on the move was not realised due to post-Cold War cutbacks. The missions of the system are in front-line armoured brigade defence, permanent or semi-permanent site defence and area defence against air threats, such as fixed-wing aircraft, attack helicopters, cruise missiles, tactical missiles and saturation attacks with stand-off weapons released from aircraft and helicopters.

SAM-22 (SA-22 Greyhound) Iranian Short-Range Air Defense Gun/Missile System

Tiers:

1 **2** 3 4

Variants:

- **PANTSIR-S1:** The gun/missile system module can be mounted on various chassis. The early version is mounted on a Ural-5323 truck, used for site defense of stationary targets. It had three radars and 2A72 gun. A production version has newer radars, guns, and 12 missile launchers.
- **PANTSIR-S1-0:** "Unified Armament Turret" with 8 launchers (12 SAMS) and 2 guns mounts on various chassis (e.g., trucks, BTR-80, BMP-3, BMD-3, trailers, and stands). Russians now offer this variant on the 2S6 (GM-352) chassis. A low cost version has missiles and only EO guidance.

System

Notes:

Iran imports many of their military weapons and equipment from China and Russia. The SAM-22 is a exported Pantsir-S1 (SA-22 Greyhound). The Pantsir missile system is a family of self-propelled, medium-range surface-to-air missile systems. Pantsir-S1

(Russian: Панцирь-С1, NATO reporting name SA-22 Greyhound) is the first version and is a combined short to medium range surface-to-air missile and anti-aircraft artillery weapon system produced by KBP of Tula, Russia. The system is a further development of 2K22 Tunguska (NATO reporting name: SA-19/SA-N-11) and represents the latest air defence technology by using phased array radars for both target acquisition and tracking. Although more are planned to made later into 2019, only 112 of the 200 made continue to operate due to newer, more efficient models being made. The Pantsir-S1 was designed to provide point air defence of military/industrial/administrative installations against aircraft, helicopters, precision munitions, cruise missiles and UAVs and to provide additional protection to air defence units from enemy air attacks employing precision munitions especially at the low to extremely low ranges. The first finished version was completed in 1995 with the 1L36 radar, later another was designed. It is a short to medium range ground-based air defence system, wheeled, tracked or stationary with two to three operators. Its air defense consists of automatic anti-aircraft guns and surface-to-air missiles with radar or optical target-tracking and radio-command guidance. Its purpose is the protection of civil and military point and area targets, for motorised or mechanised troops up to regimental size or as defensive asset of higher ranking air defence systems like S-300/S-400. The system has capability for anti-munitions missions. It can hit targets on the waterline/above-water. It can operate in a fully automatic mode. It has the ability to work in a completely passive mode. The probability of hitting a target for 1 rocket is not less than 0.7 with a reaction time of 4–6 seconds.It can fire missiles and gun armament while in motion. For its main radar station, early detection in height may be between 0-60° or 26-82° depending on the mode. The system has claimed significant advantages over other systems, such as Crotale NG (France), Roland-3 (France + USA), Rapier 2000 (UK), SeaRAM (Germany + USA). This is not confirmed by comparative testing, but clearly follows from declared limit of possibilities of systems (2010). In 2013, there was a variant with two radar stations for early detection * standing back to back *. The system has a modular structure which enables a fast and easy replacement of any part. After receiving target coordinates (from any source) it may defeat the target (using all the radar except the early detection radar) within a range from -5 to +85 degrees (vertical). The interval between missile launches is 1-1.5 seconds (a world record for analogue systems). S-400 Triumf and Pantsir missile system can be integrated into a two-layer defense system

96K6 Pantsir-S1 (SA-22 Greyhound) Russian Short-Range Air Defense Gun/Missile System

Output Power: kW150

RF Band: J

Notes:

The Pantsir missile system is a family of self-propelled, medium-range surface-to-air missile systems. Pantsir-S1 (Russian: Панцирь-С1, NATO reporting name SA-22 Greyhound) is the first version and is a combined short to medium range surface-to-air missile and anti-aircraft artillery weapon system produced by KBP of Tula, Russia. The system is a further development of 2K22 Tunguska (NATO reporting name: SA-19/SA-N-11) and represents the latest air defence technology by using phased array radars for both target acquisition and tracking. Although more are planned to made later into 2019, only 112 of the 200 made continue to operate due to newer, more efficient models being made. The Pantsir-S1 was designed to provide point air defence of military/industrial/administrative installations against aircraft, helicopters, precision munitions, cruise missiles and UAVs and to provide additional protection to air defence units from enemy air attacks employing precision munitions especially at the low to extremely low ranges. The first finished version was completed in 1995 with the 1L36 radar, later another was designed. It is a short to medium range ground-based air defence system, wheeled, tracked or stationary with two to three operators. Its air defense consists of automatic anti-aircraft guns and surface-to-air missiles with radar or optical target-tracking and radio-command guidance. Its purpose is the protection of civil and military point and area targets, for motorised or mechanised troops up to regimental size or as defensive asset of higher ranking air defence systems like S-300/S-400. The system has capability for anti-munitions missions. It can hit targets on the waterline/above-water. It can operate in a fully automatic mode. It has the ability to work in a completely passive mode. The probability of hitting a target for 1 rocket is not less than 0.7 with a reaction time of 4–6 seconds.It can fire missiles and gun armament while in motion. For its main radar station, early detection in height may be between 0-60° or 26-82° depending on the mode. The system has claimed significant advantages over other systems, such as Crotale NG (France), Roland-3 (France + USA), Rapier 2000 (UK), SeaRAM (Germany + USA). This is not confirmed by comparative testing, but clearly follows from declared limit of possibilities of systems (2010). In 2013, there was a variant with two radar stations for early detection * standing back to back *. The system has a modular structure which enables a fast and easy replacement of any part. After receiving target coordinates (from any source) it may defeat the target (using all the radar except the early detection radar) within a range from -5 to +85 degrees (vertical). The interval between missile launches is 1-1.5 seconds (a world record for analogue systems). S-400 Triumf and Pantsir missile system can be integrated into a two-layer defense system.

9K33 Osa (SA-8 Gecko) Russian 6x6 Amphibious Short-Range Tactical Surface-to-Air Missile System

Tiers:

1 2 3 4

Variants:

- **9K33 "Osa":** (US DoD designation SA-8A "Gecko") began development in 1960 and was introduced in 1971–1972 with four exposed 9M33 missiles per TELAR 9A33B and a maximum range of 12 km (7.5 mi).
- **4K33 "OSA-M":** (NATO reporting name SA-N-4 "Gecko") was introduced in 1972 and is the naval version of the system with two 9M33M missiles on a Zif-122 retractable rotating launcher and improved performance. It has been installed on Gepard class frigate, Kara class guided missile cruisers, Kiev class VTOL cruisers and also the Kirov, Slava and Krivak classes.
- **9K33M2 "Osa-AK":** (US DoD designation SA-8B "Gecko Mod-0") with TELAR 9A33BM2 was introduced in 1975 with the new six-missile box launcher, each 9M33M2 missile being a sealed round.
- **9K33M3 "Osa-AKM":** (US DoD designation SA-8B "Gecko Mod-1") with TELAR 9A33BM3 and missiles 9M33M3 was introduced in 1980 with the maximum range extended to 15 km (9.3 mi) and maximum altitude to 12 km (40,000 ft) as explained above. Most OSA-AKM systems also feature an IFF antenna.
- **Saman and Saman-M:** (Russian Саман – adobe) is a development of the Osa\Osa-M system into target drones, used for testing and training with air defense systems, including SAMs.

System

Alternative Designation: 9K33 Osa (SA-8 Gecko)
Type: Russian Short-Range Tactical Surface-to-Air Missile System
Family: INA
Manufacturer: Znamya Truda Plant
In Service: 1971-Present
Crew: ea5
Chassis: BAZ-5937
Displacement Time: minutes
Emplacement Time: minutes

Fire on the Move: No, The Osa can not launch missiles on the move. It launches them from stationary position or from short stops.

Airborne: Yes

Amphibious: Yes

Note: A battery of Osa consists of 4 combat vehicles and 2 reloading vehicles.

Dimensions

Length: m9.1

Width: m2.78

Height: 4.20 m (radar mast stowed)

Weight, Combat: kg18

Ground Pressure: INA

Ground Clearance: mm400

Automotive

Engine Name: 2D20B Diesel

Engine Type: Diesel

Engine Power: hp300

Maximum Range: km500

Speed, Maximum Road: km/h50

Speed, Average Cross: INA

Speed Maximum Swim: km/h8

Gradient: INA

Side Slope: INA

Vertical Step: 0.5

Trench: 1.2

Fording Depth: Amphibious

Communications

Tactical Radio: Azart-P (4km), Azart-N (12km), and Azart-BM (40km)

Missile System

↳*Launcher*

Name: 9A33 Transporter Erector Launcher and Radar (TELAR) Vehicle

Type: TELAR

Basic Load: 6 x SA-8 SAM

Note: There is also a reloading vehicle, which is based on a similar BAZ-5939 chassis. It carries 18 reload missiles in containers and is fitted with a crane. All six missiles are reloaded within 5 minutes.

↳*Missile (Option 1)*

Name: 9M33

Type: Surface-to-air missile

Manufacturer: Znamya Truda Plant

Variants: 9M33, 9M33M1, 9M33M2, 9M33M3, 9A33BM3

Length: mm3,158

Diameter: mm209.6

Missile Weight: kg170

Warhead Type: FRAG-HE

Detonation Mechanism: Contact and proximity

Guidance System: RF CLOS

Propellant: Solid propellant rocket motor

Operational Range: km15

Flight Altitude: m12,000

Boost Time: 2 s boost, then 15 s sustain

Speed: m/s1,020

Steering System: Dual-thrust rocket motor.

Accuracy: m5

Note: The 9K33 Osa (SA-8 Gecko) can also fire the following missiles: 9M33, 9M33M1, 9M33M2, 9M33M3, 9A33BM3

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

Optics: Infrared night-vision systems for commander and driver.

IFF Capable: Yes

↳*Target Acquisition and Fire COntrol Radar*

Name: Land Roll

Type: Target acquisition and command guidance radar for the SA-8 Gecko

Band, Surveillance: G-H (6-8 GHz)

Maximum Range, H-Band Surveillance Radar: 20-30 km

Band, Tracking Radar: J (14.2-14.8 GHz)

Maximum Range, H-Band Guidance Radar Radar: 20-25 km

Band, Guidance Radar: I (8-10 GHz)

Maximum Range, J-Band Detection Radar: 20 km

Traverse Left: deg180

Traverse Range: deg360

Traverse Right: deg180

Note #1: The normal SA-8 battery deployment consists of four SA-8 /Land Roll vehicles and one command vehicle. The SA-8 regiment headquarters consists of a Long Track radar or Thick Skin-B radar vehicle, as well as one command vehicle.

Note #2: The radar folds back 90 degrees to reduce the overall height of the vehicle for air transport or high-speed road travel.

Protection

Hull Armor: INA

Turret Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: collective overpressure protection with air filtration

Smoke Equipment: INA

Notes:

The 9K33 Osa (English: wasp; NATO reporting name SA-8 Gecko) is a highly mobile, low-altitude, short-range tactical surface-to-air missile system designed in the Soviet Union. Its export version name is Romb. The SA-8 was the first mobile air defense missile system incorporating its own engagement radars on a single vehicle. All versions of the 9K33 feature all-in-one 9A33 transporter erector launcher and radar (TELAR) vehicles which can detect, track and engage aircraft independently or with the aid of regimental surveillance radars. The six-wheeled transport vehicles BAZ-5937 are fully amphibious and air transportable. The road range is about 500 km. The 1S51M3-2 radar system on the SA-8 TELAR received the NATO codename Land Roll. It was derived from the naval `Pop Group' radar system but is smaller since it does not require the elaborate stabilisation system. An improved system designated the SA-8B `Gecko' Mod 1, was first seen in Germany in 1980. It had improvements added to the launcher configuration, carrying six missiles in ribbed containers. The system is reported to be of the frequency-agile monopulse type. It consists of an elliptical rotating surveillance antenna mounted on top of the array, operates in H band (6 to 8 GHz) and has a 30 km acquisition range against most targets. The large pulsed J band (14.5 GHz) engagement antenna is mounted below it in the centre of the array and has a maximum tracking range of about 20 km. Mounted on either side of the tracking radar antenna is a small J band parabolic dish antenna to track the missile. Below that is a small circular antenna which emits an I band uplink capture beam to gather the missile shortly after launch. The final antennas in the array are two small white rectangular ones, one on either side of the array mounted alongside the I band. These are used for command uplink to the missile. This twin antenna system permits the 'Land Roll' radar to control up to two missiles simultaneously against a single target. Furthermore, the two missiles can be guided on different frequencies to further complicate ECM. There is also a tubular device fitted to and above the tracking radar; this is a 9Sh33 electro-optical tracker. It can be used to track the target when the main tracking radar is jammed by ECM. A 9K33 battery comprises four 9A33B TELAR vehicles and two 9T217 transloader vehicles on BAZ-5939 chassis with reload missiles and a crane. A reload time of five minutes has been reported per TELAR. In addition to the TELARs, each regiment is also assigned a single radar collimation vehicle 9V914 (initially on the BAZ-5938 chassis but more often found on the ZiL-131 truck). This vehicle assists in the alignment of the TELAR's radar systems, ensuring accurate target tracking and engagement. Since its introduction this air defense system was exported to a number of countries. Currently the Osa and its variants are used by 19 countries, including Russia (400), Belarus, Greece (39), India (48), Poland (64) and Ukraine.

Crotale-NG French Short-Range Air Defense System

Tiers:

Variants:

- **Generic:** SYSTEM IS IN A MODULAR POD, DESIGNED TO FIT ON SHIPS, VEHICLES, AND ON STATIONARY PLATFORMS. THE MODULAR ALL-WEATHER SYSTEM INCLUDES ACQUISITION, TRACKING, LAUNCH, AND SUPPORTING COMPUTER UNITS INTEGRATED ON ONE VEHICLE, FOR MANAGEMENT BY A SINGLE SYSTEM OPERATOR. VEHICLE PLATFORMS INCLUDE APCS, E.G., M113, KOREAN IFV, PIRANHA 10X10, AND THE XA-180 AS NOTED. THE SYSTEM CAN BE RETROFITTED ONTO EXISTING CROTALE LAUNCHER VEHICLES.
- **PEGASUS:** SOUTH KOREAN SYSTEM WITH A DIFFERENT MISSILE
- **Crotale Mk.3:** A Long range Version of the NG

System

Alternative Designations: Crotale-NG, R440 Crotale, HQ-7 (Chinese) R460 Crotale (Saudi Arabia), XA-181 (Finnish Launcher vehicle) This is not a modification to Crotale. It is a completely new modular system.

Target: FW, heli, CM, ASM, UAV

Mission: The missions of the system are in front-line armoured brigade defence, permanent or semi-permanent site defence and area defence against air threats, such as fixed-wing aircraft, attack helicopters, cruise missiles, tactical missiles and saturation attacks with stand-off weapons released from aircraft and helicopters.

TELAR: XA-181 is XA-180 (PASI) 6x6 APC with Crotale NG launcher system

Crew: ea4

All Weather Operation: Yes, tracking and engagement and all weather operation.

↳*Automotive*

Engine Name:

Engine Type: Diesel

Engine Power: 240-hp

Cruising Range: km800

Max Road Speed: km/h80

Dimensions

Height: m2.9

Weight: tons23

Main Weapon System

↳*Launcher*

Name: INA

Type: Launcher

↳*Missile*

Name: VT1 missile

Type: The VT1 missile is a land and sea based missile designed especially for short-range surface to air defence systems.

Function: The VT1 missile has been created to counter all threats including tactical missiles, pop-up helicopters, UAVs and aircrafts deploying high-maneuvering, low-level stand-off weapons. When combined with the Crotale Mk3, the hyper velocity and high maneuverability of the VT1 offer a class-leading performance and allows a system with a 15km no escape zone against high maneuvering targets.

Speed: Mach 3.5

Load Factor: grams35

Maximum Range: km15

Ceiling: m6,000

Warhead Weight: kg13

Fire Control

FCS Name: INA

Computerized FCS: Yes

Thermal Camera: Yes

Thermal; Camera Range: km19

Daylight CCD camera: Yes

Daylight CCD camera Range: km15

IR Localiser: Yes

↳*Radar*

Name: N/A

Type: S-band Pulse Doppler radar

Function: Fire Control, tracking

Antenna: Planar array Detection Range (km): Aircraft: 20

Hovering Rotary Wing Aircraft: 11

Altitude Coverage: m0-5000

Multiple Target Tracking: Automatic track-while-scan for up to 8 targets.

Frequency Band: Ku

ECCM: Wideband frequency agile

Detection Range: km30

Frequency: GHz35 doppler TWT (travelling wave tube)

Automatic Aqquisition: Yes

Multi-Target Detection: Yes

IFF: Yes

↳*Sights with Magnification*

Day Camera: Mascot, CCD TV Field of view (□): 2.4 Elevation (□): 1.8 Range (km): 15

Night Camera: Night Camera: Castor, thermal Field of view (□): 8.1/2.7 Elevation (□): 5.4/1.8 Range (km): 19

Missile Tracker: IR missile localizer on CCD camera for passive TV tracking

IFF: Yes

↳*Other Assets*

Description: The SAM system links to the IADS to get digital AD data and warnings. Associated radar for EW and TA data is radar at Brigade and Division Tier 1 and 2. System can also pass data to the net.

Protection

Armor Protection: mm6-12

Notes:

A modernized version, the Crotale NG (New Generation), entered production in 1990. This version used the new VT-1 missile with Mach 3.5 speed, load factor to 35G, 11 km range, 13 kg warhead (8 m kill-zone) and 6,000 m ceiling. The system includes a S-band Pulse Doppler radar (20 km), Ku-band TWT tracking radar (30 km), Thermal camera (19 km), Daylight CCD camera (15 km), and an IR localiser.[1] An early '90s proposal to fit the system (in its eight-round form) to a Leclerc tank chassis in order to provide a battlefield air defence vehicle for protecting armored formations on the move was not realised due to post-Cold War cutbacks. The missions of the system are in front-line armoured brigade defence, permanent or semi-permanent site defence and area defence against air threats, such as fixed-wing aircraft, attack helicopters, cruise missiles, tactical missiles and saturation attacks with stand-off weapons released from aircraft and helicopters.

Shahab Saghib (Shooting Star) Iranian Short-Range Air Defense Missile System

Tiers:

Variants:

- **FM-80 (Feimeng 80),:** export version of the HQ-7. It was revealed in 1989.
- **HHQ-7:** a naval version of the HQ-7. It was introduced in the 1990s. It has a bank of 8 missiles. For over a decade it was the standard Chinese ship-based air defense system. Currently a more capable HQ-9 with a longer range is being fitted on newly-built Chinese warships.
- **Shahab Tagheb:** an Iranian short-range air defense missile system. It was revealed in 1999. It was developed with Chinese assistance and by transferring technology of the HQ-7.
- **HQ-7A:** improved variant introduced in 1998. It has a maximum range of fire of 15 km. Detection range is 25 km and tracking range is 20 km. Also this missile has a maximum speed of 900 m/s in stead of 750 m/s.
- **HQ-7B:** latest variant, based on indigenous 6x6 armored chassis. It was first revealed somewhere in 2009. This air defense system is wisely used by the Chinese armed forces. It is more mobile due to its 6x6 configuration. This vehicle is more suited to follow motorized infantry, or mechanizes armored units.

System

Alternative Designation: HQ-7, FM-80, HongQi 7, Fei Meng, Flying Midge" or Flying Mongoose,
Type: Short-Range Air Defense Missile System
Family: HQ-7
Manufacturer: China, Company: INA
In Service: 1988-Present
Crew: ea3
Chassis: Thomson-Hotchkiss P4R chassis
Displacement Time: minutesINA
Emplacement Time: minutesINA
Fire on the Move: INA
Note #1: It is a reverse engineered copy of the French Crotale.
Note #2: A battery of HQ-7 consists of one vehicle with acquisition radar and two or three TELAR vehicles. Also each battery is supported by a maintenance group with around 10 support vehicles.

Dimensions (Thomson-Hotchkiss P4R Chassis)

Length: mINA
Width: mINA

Height: mINA

Missile System

↳*Missile Launcher*

Name: INA

Type: TELAR vehicle

Firing Interval: 3 seconds

Operational Response Time: 6-10 seconds

Single-Shot Kill Rate: %85-90

↳*Missile*

Name: 4-cel or 8-cel missile launcher

Type: Short-Range Air Defense Missile

Length: m3

Diameter: m0.55

Wingspan: m0.55

Weight: kg84.5

Warhead Type: HE-FRAG

Warhead Weight: kg15

Maximum Range of Fire: kmup to 12

Minimum Range of Fire: m500-700

Maximum Altitude of Fire: km5.5

Minimum Altitude of Fire: m15

Basic Load: ea4

Speed: Mach 2.3 or 750 m/s

Missile Maneuverability: 20 G

Maximum Kill Distance at 400 m/s: km8.5

Maximum Kill Distance at 300 m/s: km10

Maximum Kill Distance at Helicopter: km12

Minimum Kill Distance: m500

Homing Range: km17

Target Seeking Range: km18.4

Guidance System: Radar

Note: The HQ-7 can engage helicopters, aircraft, cruise missiles, air-to-ground missiles and anti-radiation missiles.

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: No

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Optical Aiming System: Yes

Target Processing Unit: Yes, the system can process 30 targets & track 12 targets simultaneously

Generators: 4 x 40 kW generators

Target Processing Unit: Yes

Network: Wired Network

↳*Radar #1*

Name: INA

Type: Doppler Search Radar

Band: E/F Band

Range: km18.4

TV Tracking System: Yes

IR Localiser: Yes

Protection

Hull Armor: Protection against small arms fire and artillery shell splinters.

Turret Armor: Protection against small arms fire and artillery shell splinters.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: No

Countermeasures: Resists active and passive jamming and rejects ground and atmospheric clutter

IFF: Yes

Notes:

Shahab Saghib (Shooting Star) is based on the Chinese FM-80. The HQ-7 is a Chinese clone of the French Thales/Thomson CSF Crotale SAM. During the 1970s the French supplied samples of the Crotale which was promptly reverse engineered. The cloned Crotale has been built in two configurations, a high mobility variant for PLA Army units on a 4 x 4 cloned French Thomson-Hotchkiss P4R armoured vehicle, and a less mobile PLA-AF air field defence system, using either a trailer or a truck platform. Since then, derivative variants have emerged in the FM-90 series, in addition to the shipboard variants. The Thomson-Hotchkiss P4R vehicle uses either a diesel or gasoline engine driving an alternator which powers electrical motors driving the wheels. Chinese sources sometimes label the P4R as a B-20. A naval variant of the Crotale as also been developed. A four round elevating tube launcher turret is used, mounting the Ku-band Automatic Command to Line Of Sight monopulse radar dish antenna. Export variants are the FM-80 and improved FM-90 with a FLIR tracker and longer ranging missiles. HQ-7/FM-80/90 batteries are typically supported by an acquisition radar system, the FM-90 usually on a new design indigenous 6 x 6 light armoured personnel carrier. The HQ-7 SAM is used by PLA and PLAAF for short-range air-defense. At some PLAAF bases, the HQ-7 is deployed in hardened shelters. The PLA has mounted the HQ-7 on towed trailers. The HongQi 7 (HQ-7) short-range air defense missile system has been developed in China in the 1980s. It is a reverse engineered copy of the French Crotale. Sometimes it is referred as Sino Crotale. In 1978-1979 China imported some of the Thomson-CSF Crotale systems for evaluation. These where both land-based and ship-based versions. Some French R-440 Sea Crotale systems were purchased and installed on the Chinese warships. Eventually China reverse engineered this system. First Chinese clone of the ground-based version was produced for testing in 1983. In 1986-1988 it was approved for production. The HQ-7 was also deployed by the Chinese air force and protected the air bases from air attacks. Since 1989 the HQ-7 was proposed for export customers as the FM-80.

Yitian Chinese 6x6 Self-Propelled Short-Range Air-Defense System

Tiers:

System

Alternate Designation: Yitian is a short-range air-defense (SHORAD)

Type: Short-Range Air-Defense (SHORAD)

Crew: 4 (Commander, two Operators and a Driver)

Chassis: The Yitian can be mounted to a variety of vehicles

Displacement Time: minINA

Emplacement Time: minINA

Maximum Effective Range: m6,000

Minimum Effective Range: m300

Effective Kill Altitude: m15-4,000

Basic Combat Load: INA

Fire on the Move: INA

Fuse Type: Laser Proximity Fuze

Single-Shot Probability of Kill: %80

Launchers: ea8

Notes: Norinco suggests that a Yitian battery should consist of a command vehicle, six launchers, two missile resupply vehicles, a missile testing and maintenance vehicle and a mechanical/electronic maintenance vehicle.

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: tons16

Automotive

Notes: The Yitian is modular and can be carried on a variety of wheeled or tracked chassis, such as the WMZ-551 6 x 6 wheeled or EQ-2050 high-mobility vehicle. In Chinese service, it is integrated with the WMZ-551 vehicle.

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Thermal Day Sensors: Yes

Thermal Night Sensors: Yes

Laser Rangefinder: Yes

Automatic Target Tracker: Yes

Tarket Tracking Range: km10

E/O Detection Range: km12

Operational Modes: Two Modes, Mode 1: Company Command, Mode 2: Individual Vehicle Mode.

System Reaction Time: sec6-8

↳*Radar*

Type: Rotating Antenna Acquisition Radar

Frequency/Band: 3D X-Band

Radar Acquisition (Fighter Target): km18

Radar Acquisition (Cruise Missile Target): km8

Radar Tracking Range: km10

Advanced Electro-Optical Range: km12

Number of Targets: INA

Notes:

The Yitian is a short-range air-defense (SHORAD) system built by China for the domestic and export market. Its primary mission is to provide low-altitude protection for armored units against fixed-wing aircraft, helicopters, unmanned aerial vehicles and other airborne threats. The manufacturer also claims the system has an anti-cruise missile capability. The system consists of eight canister-launched TY-90 infrared homing missiles and two sensor systems mounted on a turret. The radar systems include a rotating antenna acquisition radar on top with an advanced electro-optical package beneath it. The three-dimensional X-band tracking radar can be folded down for transport. The E/O package includes day and thermal sights, laser rangefinder and an automatic target tracker. The E/O system has a detection range of 7 mi (12 km) and tracking range of 6 mi (10 km), according to the manufacturer.

2K12 Kub (SA-6 Gainful) Russian Surface-to-Air Missile System

Tiers:

Variants:

- **Gainful Mod 1 (SA-6b):** Initial operating capability (IOC) was reached in 1979. This system is mounted on a variant of the MT-LB general-purpose tractor that also carries missile guidance radar.

System

Alternative Designations: 2K12 Kub; SA-6 Gainful
Type: Tracked medium-range surface-to-air missile system
Target: Low to medium altitude FW and heli for SA-6a. FW, heli, CM for SA-6b FW, heli, TBM, CM, UAV, and ground targets for SA-6b/Kvadrat-M4.
Manufactuer: Ulyanovsk Mechanical Plant (SURNs) ZiK (TELs) Still in Service in over 25 countries through Russia, Africa, and Asia.
In Service: 1960-Present
Chassis: Modified PT-76
Launch Vehicle: 2P25 SPU Launch Vehicle
Crew: 3

Dimensions

Length, Hull: m6.79
Length, with Missiles: m7.39
Height, Hull Top: m1.80
Height, with Missiles: m3.45
Width: m3.18

Tracks Length on the Ground: m3.80

Track Width: m0.36

Ground Clearance: m0.40

Combat Weight: kg14,000

Ground Pressure: 0.48 kg/cm sq

Automotive

Engine Name: Model V-6R

Engine Type: water-cooled, in-line 6-cylinder diesel

Engine Power: 240 hp at 1,800 rpm

Power-to-weight ratio: 17.14 hp/metric ton

Fuel Capacity: 250 Liters

Suspension: torsion bar, 6 road wheels, rear drive, front idler, two hydraulic shock absorbers, no return rollers

Transmission: manual, 5 forward and 1 reverse gears

Electrical system: 24 v

Batteries: 2 x 12 v, 100 Ah (for vehicle)

Maximum Speed: km/h44

Maximum Range, Road: km/h260

Vertical Obstacle: m1.00

Trench: m2.50

Gradient: %60

Side Slope: %30

Fording: m1.10

Communications

Tactical Radio: Depends on which country the SA-6 is operating in.

Armament

Launcher: 2P25 SPU Launch Vehicle

Name: Kub-M3/3M9M3

Reaction Time (sec): sec22-24

Time Between Launches (sec): INA

Reload Time (min): min10

Fire on Move: No

Simultaneous targets launcher: ea1

Simultaneous targets battery: ea1

Simultaneous missiles battery: ea1-4

Emplacement Time (min): min5 or less

Displacement Time (min): min15 for a battery

↳*Missile (Option 1)*

Name: Kub-M1

Missiles per TEL: 3

Engagement Range: 4–23 km

Engagement Altitude: 80–8,000 m

Missile Speed: Mach 1.75

Maximum Target Speed: Mach 1.75

Response Time: sec22–24

Missile Weight: 630 kg

Deployment Time: Min5

Guidance System: semi-active radar homing

↳*Missile (Option 2)*

Name: Kub-M3

Missiles per TEL: 3

Engagement Range: 4–25 km

Engagement Altitude: 20–8,000 m

Missile Speed: Mach 2

Maximum Target Speed: Mach 1.75

Response Time: sec22–24

Missile Weight: 630 kg

Deployment Time: min5

Guidance System: semi-active radar homing

↳*Missile (Option 3)*

Name: Kub-M4 (Buk-M1)

Missiles per TEL: 3

Engagement Range: 4–24 km

Engagement Altitude: 30–14,000 m

Missile Speed: Mach 2

Maximum Target Speed: Mach 1.75

Response Time: sec24

Deployment Time: min5

Guidance System: semi-active radar homing

Fire Control

FCS Name: INA

Computerized FCS: Yes

EO sighting system: TV

Commander and driver: IR

IFF: Pulse-doppler

Radar Vehicle

Name: SURN 1S91 "Straight Flush" Radar

Type: fire control and guidance radar associated with surface-to-air „Kub“ (kyrillisch: Куб; english: cube, NATO-Bezeichnung: SA-5 Gammon) missile system.

Band: It is operating in C-Band surveillance and aquisition radar, combined with an operating in I-Band tracking and illuminating radar.

Peak Power: 600 kW

Maximum Range: km75

Beamwidth: deg1

Antenna Rotation: 15 or 20 min-1

↳*Additional Radar Systems Available*

Note: The 2K12 can also be used at a regimental level, if used as such it can be accompanied by a number of additional radar systems for extended air search at longer range and lower altitude, to supplement the 1S91 "Straight Flush". These systems include the: P-12 "Spoon Rest", a VHF early warning radar (also used by the SA-2), with a 200 kilometres (120 mi) range. P-40 "Long Track", an E band early warning radar (also used by the SA-4 and SA-8), with a 370 kilometres (230 mi) range. P-15 "Flat Face A", a UHF early warning radar (also used by the SA-3, with a 150 kilometres (93 mi) range. "Thin Skin" or "Side Net" E band height finding radar (also used by the SA-2, SA-4 and SA-5, range 240 km/148 miles) "Score Board" IFF radar The "Spoon Rest" and "Thin Skin" are mounted on a truck, "Long Track" on a tracked vehicle (a modified AT-T) and "Flat Face" on a van. It is unknown what kind of mounting the "Score Board" has. Without the P-40 "Long Track" mobile radar vehicle, the 2K12 is unable to track aircraft at high altitudes.

Protection

Hull Armor Type: 9.40 mm

Turret Armor: 9.40 mm

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes, collective overpressure and filtration

Smoke Protection: INA

Notes:

The 2K12 "Kub" (NATO reporting name: SA-6 "Gainful") mobile surface-to-air missile system is a Soviet low to medium-level air

defence system designed to protect ground forces from air attack. "2K12" is the GRAU designation of the system. Each 2K12 battery consists of a number of similar tracked vehicles, one of which carries the 1S91 (SURN vehicle, NATO designation "Straight Flush") 25 kW G/H band radar (with a range of 75 km (47 mi)) equipped with a continuous wave illuminator, in addition to an optical sight. The battery usually also includes four triple-missile transporter erector launchers (TELs), and four trucks, each carrying three spare missiles and a crane. The TEL is based on a GM-578 chassis, while the 1S91 radar vehicle is based on a GM-568 chassis, all developed and produced by MMZ. he 2K12 system shares many components with the 2K11 Krug (SA-4) system. In many ways they are designed to complement each other; 2K11 is effective at long ranges and high altitudes, 2K12 at medium ranges and intermediate altitudes. The system is able to acquire and begin tracking targets using the 1S91 "Самоходная установка разведки и наведения" (SPRGU - "Self-propelled Reconnaissance and Guidance Unit" / NATO: "Straight Flush" radar) at 75 km (47 mi) and begin illumination and guidance at 28 km (17 mi). IFF is also performed using this radar. It can only guide one or two missiles to a single target at any time. The missile is initially command guided with terminal semi-active radar homing (SARH), with target illumination provided by the "Straight Flush" radar. Detonation is via either the impact or proximity fuze. On the latest models, this vehicle is also fitted with an optical tracking system which allows engagement without the use of the radar (for active RF emissions stealth reasons, or due to heavy ECM jamming) in which case the effective altitude is limited to 14 km/46000 ft. The optical tracking method also allows engagements to altitudes below that where the radar is able to track targets. Maximum target speed is around Mach 2 for head-on engagements and Mach 1 for tail-chase engagements. Top speed of the missile is approximately Mach 2.8. In contrast to the elaborate Patriot missile or even the simpler Hawk system fielded by US forces, most of the system rides on two tracked self-propelled vehicles, rather than towed or mounted on trucks, and either the launcher or control vehicle can be set to launch in only 15 minutes after changing location.

HQ-61A Chinese Surface to Air Missile

Tiers:

Variants:

- **RF-61 Naval Variant (HQ-61B):** The naval version, the RF-61, weighs 648 lbs (320 kg), has a maximum slant range of 6.21 mi (10 km) and a maximum vertical range of 5 mi (8 km). It is said to be capable of operating in "severe sea conditions." The naval variant was fitted to the JIANGWEI-class frigates beginning in 1992. It was located on a long deckhouse forward of the bridge and on the after deckhouse abaft the mainmast. The missile magazine was probably below the launcher. Fog Lamp** missile fire-control radars were fitted mid-way up each mast. Reports indicated the RF-61s were being replaced on the JIANGWEI-class frigates by the HQ-11 (LY-60). A July 30, 2015, report in The Diplomat (Tokyo) indicates that the RF-61s were removed in order to convert the vessels into coast guard cutters. The JIANGWEI-class vessels were the only ones that w ere fitted with the RF-61, according to A New Direction for China's Defense Industry(2005). With their removal the system may no longer be in service.

System

Alternate Designations: Red Leader 61, SD-1, RF-61, CSA-N-2, H-61, HQ-41
Engine: 1 x single-stage solid-propellant rocket
Speed: Mach 3
Maximum Range: 10 km
Minimum Range: 3 km
Maximum Altitude: 10,000 m
Minimum Altitude: 50 m
Warhead: High-explosive (HE) chain-type
Guidance: Guidance is provided by the Type 571 radar system. SAR seeker w/ECCM capability.
Fuze: Dual proximity and IR

Dimensions

Length: 3.99 m
Wingspan: 1.17 m
Diameter: 286 mm
Weight: 310 kg

Notes:

The cumbersome HQ-61 series has been largely superceded by the HQ-7 and HQ-64 point defense SAMs. The Chinese HQ-61 HongQi/Hungchi (Red Leader) is a surface-to-air missile (SAM) system for land-mobile and shipboard use. The shipboard RF-61, the first in Chinese service, reportedly entered service before the vehicle-mounted HQ-61. The HQ-61 appears similar visually to the U.S. Sparrow, but is slightly longer and heavier and has a semi-active radar (SAR) homing seeker and midcourse command link guidance. The missile is a thin, pointed cylinder with cruciform steerable foreplanes at mid-body and cruciform delta tailplanes aft that are indexed 45 degrees to the foreplanes. The missile’s SAR homing seeker tracks continuous wave (CW) illumination from a target-illuminating radar and is reported to have good electronic counter countermeasures (ECCM) capabilities. The system can handle only one missile at a time. Detonation is by a dual-fuze system (proximity and infrared). The HQ-61 is powered by a solid-propellant rocket. The rectangular, traversable mount is topped by an elevating, twin-rail launcher that is pivoted at the rear. There is little visible difference between land-mobile and shipboard mounts. The land-mobile version is deployed in groups of four launch vehicles (tracked or on 6 x 6-wheeled chassis). Other vehicles transport target acquisition radars (C-band Type 571), target-tracking and illumination radars, a battery command post and mobile generators. Source: Military Periscope, June 2017

→→Medium-Range Missile Systems

50R6 Vityaz (S-350E) Russian Medium-Range Air Defense Missile System

Tiers:

Variants:

- **S-350E:** S-350E is a downgraded export version.

System

Alternative Designation: S-350 Knight
Type: Medium-Range Air Defense Missile System
Family: S-350
Manufacturer: Northwest Regional Center of Almaz-Antey (GOZ, ZRTO)
In Service: 2019-Present
Crew: The TEL vehicle has a crew of three.
Chassis: BAZ-6909
Displacement Time: minutes5
Emplacement Time: minutes5
Fire on the Move: No
Note: The S-350 Vityaz (knight) is a short-to-mid range air defense missile system. It was developed by Almaz-Antey company as a replacement for the ageing S-300PS, which was developed back in the early 1980s, and Buk M1-2 system, which is now over 20 years old.

Dimensions (BAZ-6909 Launcher Vehicle)

Length: m11.3

Width: m2.75

Height: m2.85

Weight, Empty: tons22

Weight, Combat: INA

Ground Pressure: INA

Payload Capacity: tons18-20

Automotive (BAZ-6909 Launcher Vehicle)

Engine Name: YaMZ-8424.10

Gradient: %60

Sidel Slope: %40

Vertical Step: m0.6

Trench: m2

Fording Depth: m1.2

Missile System

↳*Launcher*

Name: 50P6 Launcher Vehicle

Chassis: BAZ-6909 special wheeled chassis with 8x8 configuration.

Maximum Elevation: +90

Minimum Elevation: INA

Traverse Range: INA

Traverse Left: INA

Travese Right: INA

↳*Missile (Option 1)*

Name: 9M96E

Type: Vertically-launched Direct Impact missile

Basic Load: 12

Length: m4.75

Diameter: mm240

Weight: kg333

Warhead Weight: kg24

Speed: INA

Kill Probability vs. Aircraft: %90

Kill Probability vs Harpoon Missiles: %70

Maximum Range: km60

Minimum Range: km1

Maximum Altitude: km20

Minimum Altitude: m5

Note: he 9M96E is a variant of the 9M96 active radar-homing interceptor missile.

↳*Missile (Option 2)*

Name: 9M96E2

Type: Vertically-launched Direct Impact missile

Basic Load: 12

Length: m5.65

Diameter: mm240

Weight: kg420

Warhead Weight: kg24

Speed: m/s1,800

Kill Probability vs. Aircraft: %90

Kill Probability vs Harpoon Missiles: %70

Maximum Range: km120

Minimum Range: km1

Maximum Altitude: km30

Minimum Altitude: m5

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

Number of Targets: This air defense system can engage 12 to 16 targets simultaneously, including aircraft and ballistic missiles.

Radar Vehicle

Name: 50N6A

Number of Radar Vehicles: 1 - 2

Type: The 50N6A is the MFMTR Multi-Function Mobile Tracking Radar which is used with the Vityaz 50R6 ground-to-air defense missile system.

Chassis: BAZ-69092 with 6x6 configuration.

Function: Designed for the rapid acquisition and initial tracking of inbound ballistic missiles within a 90 degree sector.

Frequency/Band: X Band

Range: INA

Number of Targets System can Detect: The roof-mounted MFMTR X-band phased array radar of the fire-control system can detect and track up to 40 targets simultaneously.

Number of Targets System can Engage: The Radar can engage eight tragets typically using two missiles per target to ensure a high-kill probability.

Search Sector: deg90

Maximum Elevation: deg+45

Minimum Elevation: INA

Tracking Error Range: m250

Simultaneous Target Detection: Yes

Multiple Target Tracking: Yes

Missile Up-Link: Yes

Note: The radar contains a Rotating phased-array antenna (60 rpm) with Full electronic scanning, with large deflection (+/- 45° in elevation and bearing).

↳*Command Post Vehicle*

Name: 50K6A

Number of Command Vehicles: 1

Type: Command Post Vehicle

Coverage: Fully autonomous combat work with interaction with other remote systems.

Note: Command post can target up to 32 missiles on various targets at once.

Protection

Hull Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

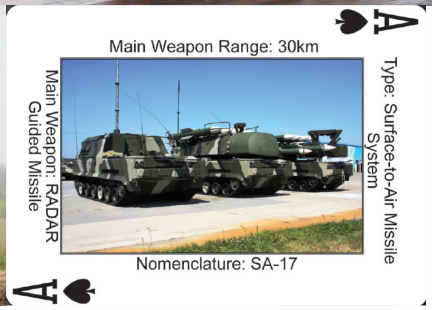
NBC Protection: INA

Smoke Equipment: INA

Notes:

The S-350 Vityaz is an advanced mobile medium-range air defense system being developed by Almaz-Antey Concern as the replacement for the S-125 Pechora (SA-3 Goa) and Buk-M1/2 (SA-11 Gadfly and SA-17 Grizzly) missile systems by 2015/2016 as well as aging S-300PS air defense systems. The missile weapon system consists of command post, an X-band multi-functional fire control, tracking and surveillance radar, and up to three missile launchers with 12, originally 10, 9M96E missiles or two 9M100 short-range missiles replacing one 9M96E missile. The rotating phased array X-band radar has been designed for operations in high clutter and heavy jamming environments. All the Vityaz components are mounted on 8x8 all-terrain trucks or similar vehicles. The weapon system is designed to engage a wide spectrum of threats at ranges of up to 40 kilometers such as fixed- an rotary-wing aircraft, Unmanned Aerial Vehicles (UAVs), cruise missiles and tactical ballistic missiles. The Vityaz is able to detect and track up to 40 targets simultaneously while engaging eight of them with two missiles per target. Its development started in 2007. A Russian press article, released in August 2011, stated that the Vityaz leveraged some technology from the S-300 air defense system family but with each launch vehicle carrying 16 missiles instead of only four. The new air defense system combat capabilities also surpass largely those of the S-300 family. The Russian Armed Forces expect to deploy the Vityaz medium-range air defense system along with the Morfei, S-400 and S-500 air defense systems to produce a highly effective multi-layered air defense network capable to shoot down targets flying from altitudes of five kilometers to near space. The 50R6A Vityaz missile system consists of: * 1-2 50N6A multifunctional passively electronically scanned array radar stations. 360° coverage for early detection, target illumination and missile guidance.[5] * 1 50K6A command post, fully autonomous combat work with interaction with other remote systems. * 1-8 50P6 launcher (12-96 missiles). * 9M96/9M96E(E2) guided missiles; passive guidance and other missiles with active homing guidance.[6] 12– 120 km (7.5–74.6 mi) range, aerodynamic control surfaces and jet engines of control surfaces. * 9M100 guided missiles; 10–15 km (6.2–9.3 mi) range; infrared passive homing; aerodynamic control surfaces and jet engines of control; maximum maneuver 60 G-20 surfaces.

Buk-M2 (SA-17 Grizzly) Russian Medium-Range Air Defense Missile System



Tiers:

1 2 3 4

Variants:

- **9K37-1 'Buk-1:** First Buk missile system variant accepted into service, incorporating a 9A38 TELAR within a 2K12M3 Kub-M3 battery.
- **9K37 'Buk':** he completed Buk missile system with all new system components, back-compatible with 2K12 Kub.
- **9K37M1 'Buk-M1:** An improved variant of the original 9K37 which entered into service with the then Soviet armed forces.
- **9K37M1-2 'Buk-M1-2' ('Gang' for export markets):** An improved variant of the 9K37M1 'Buk-M1' which entered into service with the Russian armed forces.
- **9K317 'Ural':** initial design of Buk-M2 which entered into service with the Russian armed forces
- **9K317E 'Buk-M2E:** revised design for export markets
- **9K37M1-2A 'Buk-M1-2A:** redesign of Buk-M1-2 for the use of 9M317A missile
- **Buk-M2EK:** A wheeled variant of Buk-M2 on MZKT-6922 chassis exported to Venezuela and Syria.
- **9K317M 'Buk-M3:** A SAM battalion has 36 target channels in total

System

Alternative Designation: 9K317 Buk-M2; SA-17; 9K37M1, Grizzly, Beech M2E

Family: Muk

In Service: 2008-Present

Type: Medium-Range Air Defense Missile System

Manufacturer: Almaz-Antey:

Crew: ea4

Chassis: GM-569 chassis

Note: In terms of organisation, one Buk-M1-2 brigade consisted of four "divisions" (approximately a battalion set), with a single 9S52 Polyana-D4 Brigade C2 vehicle in control of all four "divisions". One "divizion" was composed of three batteries, with one 9S470 command vehicle and one 9S18 search radar vehicle responsible for three batteries. Each battery was composed of two 9A310M1-2 TELARs and one 9A39M1-2 TEL/transloader vehicle. It should be noted that "divizion" means 'division', but this measurement takes on a different meaning when dealing with Russian anti-air unit sets as opposed to

personnel or armour formations, and so the term has been transliterated rather than translated to reflect this difference of meaning and avoid confusion. It is perhaps most accurately translated into English as a battalion set. The table below displays the principle vehicles known to be included within a "divizion"

Dimensions (GM-5955 chassis)

Length: m9.3
Width: m3.25
Height: m3.8
Weight, Combat: tons34
Ground Pressure: 0,8 kg/cm2

Automotive (GM-569 chassis)

Engine Name: INA
Engine Type: Multifuel liquid-cooled diesel
Engine Power: hp840
Cruising Range: km500
Speed, Maximum Road: km/h65
Speed, Average Cross: km/h45
Speed Maximum Swim: km/hNot Amphibious
Chassis Weight: kg24,000
Max Load: kg11,500
Wheelbase: mm4,50
Fuel Distance: km500

Transporter Erector Launcher and Radar (TELAR) Vehicle

Name: 9A310M1-2 TELAR vehicle
Chassis: GM-569 chassis
Basic Load (9M317M missiles): ea6
Array Radar: two array radars. the first radar if for target tracking and fire control by illumination of the target and the the secondary radar is a smaller backup array radar
Fire Control Radar Band: C Band
Antena Type: phased array antenna
Continuous Wave (CW) Illumination Capable: Yes
Target Detecting Capability: detecting targets with an RCS of at least 2 m2 out to a maximum range of 120 km
IR Tracking: Yes, electro-optical IR tracking system
Steering: electronic beam steering
Fire Control Radar: 9S35M1-2 (NATO: Fire Dome) fire control radar
Launch Rails: ea4
CRT TV Displays: Yes

Radar Band: X-Band

Antennas: 2 ea, with 2 transmitters

Target Tracking Range (Altitude of at least 3km): km65-70

Target Tracking Range (Altitude lower than 3km): km40

Beam Width for the Pulsed Transmitter: 1.3 deg in azimuth and 2.5 deg in elvecation

Beam Width for the CW Transmitter: 1.4 deg azimuth and 2.65 in elevation

Tracking System: 9Sh38-3 electro-optical tracking system

NOTE: The missiles of the Buk-M2 can be launched from either the 9A310M1-2 TELAR vehicle, or the 9A39M1-2 TEL/transloader vehicle

↳*Ammunition (Option 1)*

Name: 9M317 Missile

Type: surface-to-air missile

Maximum Effective Range: km45

Maximum Altitude: km25

Speed: m/s1,230

Capable of Engaging Targets Traveling at Speeds of: m/s1,200

Fuze Type: Proximity fuze

Generator: solid propellant-based gas generator.

Length: m5.55

Foward Body Diameter: mm330

Main Body Diameter: mm400

Weight: kg715

Storage Container: 9Ya266 transport container

Storage Life: years10

Training Missiles: 9M317UD and the 9M317UR Missiles

Guidance Principle: semi-active radar homing guidance principle

Autopilot Capable: Yes

Radar Reciever: 9E420 semi-active radar homing receiver

Warhead Type: HE-FRAG

Warhead Weight: kg70

Launcher Type: 9A310 TELAR vehicle, or the 9A39 TEL/transloader vehicle

↳*Ammunition (Option 2)*

Name: 9M317MA

Type: solid-propellant surface-to-air missile

Maximum Effective Range: km35

Maximum Altitude: km22

Speed: m/s850

Capable of Engaging Targets Traveling at Speeds of: m/s800

Fuze Type: proximity fuze

Generator: solid propellant-based gas generator

Length: m5.55

Forward Body Diameter: mm330

Main Body Diameter: mm400

Weight: kg690

Storage Container: 9Ya266 transport container

Storage life: years10

Training Missiles: 9M38UD and the 9M38UR Missiles

Guidance Principle: semi-active radar homing guidance principle

Autopilot: Yes

Inertial Navigation System Enabled: Yes

Radar Receiver: 9E50M1 semi-active radar homing receiver

Warhead Type: HE-FRAG

Warhead Weight: kg70

Launcher Type: 9A310 TELAR vehicle, or the 9A39 TEL/transloader vehicle

Targeting and Guidance Systems Vehicles

↳*Search Radar Vehicle*

Name: 9S18M1-2 Kupol-M1 (NATO: Snow Drift)

Chassis: GM-567M chassis

Maximum Speed: km/h56

Maximum Range: km/h250

Fuel Timeline: A maximum of 2 hours of fuel.

Crew: 3 (driver-mechanic, an operator, and a senior operator)

Array Radar: flat-faced 3D pulsed phased array radar

Radar Band: S Band

Maximum Target Range: km160

Minimum Target Range: km10

Number of Targets Capable of Tracking (Range of 10km): ea75

Maximum Altitude: km25

Search Modes: one for aerial threats, the second for ballistic threats

Range Resolution: m200

Angular Coordinate Resolution: 3° in azimuth and 4.5° in elevation

Rotational Speeds: 5 individual settings.3.6 s, 4.5 s, 6 s, 12 s, 60 s to complete a single rotation.

Road March State to Ready State Timeline: min5

↳*Fire Control Radar Vehicle*

Name: 9A36M

Chassis: GM-5955 chassis

Antenna: 21 m telescoping mast

Radar Capability: detecting targets with an RCS of at least 2 meters squared out to a maximum range of 120 km

Number of Targets: 10 simultaneous targets

Steering: electronic beam steering

Operating Mode: two: the first being a track while scan mode and the second being the pure target tracking mode

C2 Systems Vehicles

Name: 9S470M1-2

Chassis: GM-579 chassis with six roadwheels

Combat Weight: tons29.87

Maximum Speed: km/h65

Crew: ea6

TV Displays: four CRT TV displays and control equipment

Antenna Type: omnidirectional antenna

Range Accuracy: m400-700

Note: The 9S470M1-2 is capable of processing and co-ordinating information on 75 simultaneous targets within 100 km and at a maximum altitude of 20 km

Notes:

Buk-M2E (SA-17 Grizzly) Buk-M2E (NATO name: SA-17 Grizzly) is a medium-range advanced defence missile complex (ADMC) designed and manufactured by Almaz-Antey. The Buk-M2E surface-to-air missile (SAM) system is an export variant of the Buk-M2, which entered into service with the Russian Army in 2008. The possibility of sudden intense attacks launched from unmanned aircraft land and subtle precision and high-speed weapons, simultaneously from several directions, with flying at altitudes up to extremely low confronts medium-range SAMs with requirements for versatility, multi-channel, omnidirectional, high performance and low fire reaction time. The main condition for organizing counter saturation air attack is defense echelon construction of ground facilities. With this organization, defense of ground objects extends the range of tasks assigned to the medium-range SAM. First, before the medium-range SAM the problem arises from maximum range goals manned flying a combat mission without entering the zone of the defense: aircraft-jamming directors and management, carrier aircraft unmanned aerial vehicles. Secondly, there is the problem of massive defeat at the boundaries of self-defense attack at extremely low altitudes CR and ORS, which radar detection occurs at a range of limited radio horizon. Multi-channel, multi-functional highly mobile medium-range SAM "Buk-M2E" designed to engage aircraft strategic and tactical aircraft, helicopters, including hovering, cruise missiles and other aerodynamic flying objects in the whole range of their possible application, tactical ballistic missiles and air-driven bombs under intense electronic and fire enemy countermeasures, as well as surface and ground bombardment radiocontrast purposes. SAM can be used for air defense troops (military facilities) in different forms of fighting, administrative and industrial facilities and areas of the country. The SAM "Buk-M2E" is able to conduct operations independently (stand-alone) and in the grouping of air defense forces under the control of the automated control system of antiaircraft missile brigade (mixed group of air defense forces) "Glade-D4M1" or other automated solution to having export supply and matched with a complex communication protocol. The Command post (CP) provides simultaneous processing of complex information about the traffic situation on 50 targets according to their own station detection and targeting (SOC) and a

higher command post exercises and distribution of targets between the firing of self-propelled unit (SDA), and radar illumination and guidance (RPN). The complex provides a complete set of simultaneous firing up to 24 air targets flying from any direction at altitudes ranging from 0,015 km to 23-25 km. The SAM uses inertial guidance with updating method with homing in the terminal phase of flight. The complex and its combat vehicles take measures to protect against high-precision weapons defeat (regulation of radiation screens, laser irradiation sensors, aerosol veil). The time to bring combat weapons complex embattled deployment from the march and the clotting time of no more than 5 minutes (for RPN - 12 min.) Exchange of technical information and command between the complex is provided by means of radio or two-wire communication lines. Transport base combat assets may be tracked or wheeled chassis with high cross. Weatherproof complex and works in different climatic zones in the temperature range from -50 o C to +50 o C, with humidity up to 98%. The crew compartment has an air conditioning and heater. The complex power system is driven by a gas turbine engine, which can also work on external power supplies.

2K11 Krug (SA-4 Ganef) Russian Medium-Range Surface-to-Air Missile (SAM) System

Tiers:

Variants:

- **Krug-A:** first operational deployment version, entered service in 1967
- **Krug-M::** a modified version of Krug-A, entered service in 1971
- **Krug-M1:** a modified version of Krug-M, entered service in 1974

System

Alternative Designation: SA-4 Ganef; 2K11 Krug; 2K11 ZRD-SD
Type: Medium-Range Surface-to-Air Missile (SAM) System
Family: INA
Manufacturer: MZiK
Crew: ea3-5
Chassis: GM-123 chassis
In Service: 1965-present 1965- 1990s (USSR) Other Countries: See proliferation
Displacement Time: INA
Emplacement Time: INA

Dimensions

Length, Hull: m7.5
Width: m3.2
Height, with Missiles: m4.472
Weight, Combat: kg28,200 kg
Ground Pressure: INA
Track, Length on Ground: m5
Track, Width: m0.54
Ground Clearance: m0.44

Automotive

Engine Name: V59

Engine Type: V-12 water-cooled diesel

Engine Power: hp420

Maximum Range: km780

Speed, Maximum Road: km/h35

Speed Maximum Swim: Not Amphibious

Fording Depth: INA

Fuel Capacity: 850 liters

Suspension: torsion bar, 7 road wheels, front drive, rear idler, 2 hydraulic shock absorbers, 4 return rollers

Communications

Note: Depends on what country the 2K11 Krug is being used in.

Main Weapon System

↳*Launcher*

Name: 2P24 SPU launch vehicle

Crew: ea3-5

Maximum Elevation: deg+70

Minimum Elevation: INA

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

↳*Missile*

Name: 9M33

Type: Suface-to-Air Missile

Length: m8,784

Diameter: cm86

Weight: 2,453 kg

Engine: solid fuel rocket motors inside boosters attached to the outside of the missile

Propellant: Kerosene fuelled ramjet

Speed: Mach 4

Basic Load: ea2

Operational Range: km55

Flight Altitude: 24,500 metres

Booster Time: Four solid fuel booster rocket motors

Guidance System: Radio command

Warhead Type: Frag-HE

Warhead Weight: 150 kg

Detonation Mechanism: Contact and proximity fuzes

Note: Additional Missiles the 2K11 Krug can be equipped with: 2 x 3M8; or 2 x 3M8M; or 2 x 3M8M1 (SA-4a); or 2 x3M8M2 (SA-4b); or 2 x 3M8M3 missiles; Note: Missile types can be mixed

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes, An electro-optical fire-control system is fitted for heavy electronic countermeasures environments

Direct Fire: Yes

Indirect Fire: Yes

Night Vision: infrared night-vision system

Optics: electro-optical fire-control system on launcher

Guidance System: radio command with semi-active radar terminal homing

↳*On-Board Radar*

Note: The Ganef launch vehicle carries no onboard radar. See Mobile Missile Guidance Station

Transporter/Loader Vehicle

Name: Ural-375 TZM (transportno-zaryazhayushchaya mashina) transporter-loader vehicle

Mobile Missile Guidance Vehcile

Name: 1S32 Pat Hand SSNR (samokhodnaya stantsiya navendeniya raket) mobile missile guidance station

Type: H-band continuous wave fire control and guidance radar

Band: H-Band

Maximum Range: km128

Antenna: The vehicle carries a large circular antenna for target tracking and a smaller antenna for missile guidance.

SSNR: Russian acronym for radar vehicle

Note: It is used to track targets and guide one or two Ganefs to intercept.

Protection

Hull Armor: mm15

Turret Armor: mm15

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes, Collective overpressure

Smoke Equipment: INA

Notes:

The 2K11 Krug (NATO code SA-4 Ganef) is a Soviet-made medium-range air defense missile. The development of the system started in 1958. The first version, Krug-A, entered service in 1967, with extensively modified versions, the Krug-M in 1971 and the Krug-M1 in 1974, which were developed to rectify problems discovered during army service. It was first unveiled during a military parade in Moscow in May 1965. Modified versions, the Krug-M in 1971 and the Krug-M1 in 1974 were developed to rectify problems discovered during army service. The 2K11 was briefly operated by the Soviet army during the war in Afghanistan in 1979 and 1980, but was withdrawn several months after the initial invasion. In 1997, it was reported that, between 1993 and 1996, some 27 fire units of Krug and 349 missiles had been sold to Armenia. The SA-4 system has three major components: a 2P24 SPU (samokhodnaya puskovaya ustanovka) mobile launcher unit; a Ural-375 TZM (transportno-zaryazhayushchaya mashina) transporter-loader vehicle; and a 1S32 Pat Hand SSNR (samokhodnaya stantsiya navendeniya raket) mobile missile guidance station mounted on an AT-T chassis. A typical Ganef battery has one Pat Hand SSNR, three 2P24 SPUs and four TZMs. The Ganef launch vehicle carries no onboard radar. The guidance of the missiles depends on the Pat Hand radar. During wartime, a fourth SPU could be added to the unit. The battery also often has two 23-mm ZU-23 towed anti-aircraft guns and a technical support section. A missile launch battalion has three launch batteries and a Long Track early warning radar. A brigade has three battalions, an additional Long Track radar and a Thin Skin B height-finding radar. The Krug had several features that improved the survivability of the radar against anti-radiation missiles. In PI mode (ПИ) the system only briefly illuminated the target and the computer calculated it's prolonged path based on data received from early warning radars. After a longer passive period the main radar illuminated the calculated flight direction of the target for a few seconds and recalculate path of the target if necessary (if the distance between the calculated track and the actual position is greater than 7 km). As a result, the system emitted detectable signals only for a few seconds in every few minutes, making it difficult to jam or launch an anti-radar missile against Krug. The system was also able to tracking the target in full-passive automated PNS (ПНС) mode based on the data provided by "Long Track" mobile EWR via radio datalink. In this mode it was almost impossible to detect the Krug system until the moment of missile launch, because Krug did not emit radiation at all. In 3M mode (3m aka three-point) the krug track on jamming signal emitting container (e.g., AN/ALQ-99). So the jamming signal that supposed to protect the aircraft made it to a target.

MIM-23B Shahin Iranian Surface-to-Air Missile (SAM) System

Tiers:

Parent:

MIM-23 Hawk American Surface-to-Air Missile (SAM) System

Variants:

- **I-Hawk (Improved Hawk /Hawk B/MIM-23B):** This variant reached initial operating capability (IOC) in 1972. Upgrades from the original Hawk included solid-state electronics, factory certified and sealed missile round, all-altitude capability, digital automatic data processor for the information coordination central (ICC), improved solid-pro pellant rocket motor and a larger warhead.
- **Hawk Mobility Enhancement (HME):** This was jointly developed by Raytheon and the Dutch air force. It reduced number of vehicles in a Hawk firing unit from 14 trucks and trailers to seven, updated the Hawk launcher and simplified reloading.
- **Patriot /Hawk Interoperability:** This is a software upgrade to permitting Hawk missile platoons to receive targeting data from Patriot information coordination center (ICC). An April 1988 test simulated an interception of a short-range tactical missile by shooting down a missile traveling at Mach 2 and at an altitude of more than 25,000 ft (7,620 m).
- **Sparrow /Hawk Demonstration Program:** In 1985, Raytheon combined elements of two of its missile products into one system. The Sparrow /Hawk system replaced the three I-Hawks on the M192 launcher with eight AIM-7 Sparrow missiles (the original launcher had nine missiles).
- **NOAH (Norwegian Adapted Hawk):** INA
- **Iran MIM-23 Hawk variant:** Iran reportedly made several upgrades to MIM-23 missiles for the carriages of its F-14 Tomcats. Some were displayed in Tehran in September 1998.
- **Danish Enhanced Hawk (DEHAWK):** Introduced in December 2002, the Danish Enhanced Hawk (DEHAWK) was developed by Terma and Thales. After several years of delays, the program was handed over to the Danish Air Materiel Command.

System

Alternative Designation: MIM-23B Shahin, Shahin
Type: Medium-range surface-to-air missile.
Family: MIM-23 Hawk Family
Manufacturer: Raytheon Company
In Service: 1971-Present
Crew: eaINA
Displacement Time: minutesINA
Emplacement Time: minutesINA
Fire on the Move: No

Note #1: The original Hawk has been phased out of NATO and U.S. service, although several countries have missiles in storage. All active Hawk missiles are the I-Hawk variant.

Note #2: Product Improvement Plan In 1973 the US Army started an extensive multi-phase Hawk PIP (Product Improvement Plan), mainly intended to improve and upgrade the numerous items of ground equipment. Phase I Phase I involved replacement of the CWAR with the AN/MPQ-55 Improved CWAR (ICWAR), and the upgrade of the AN/MPQ-50 PAR to Improved PAR (IPAR) configuration by the addition of a digital MTI (Moving Target Indicator). The first PIP Phase I systems were fielded between 1979 and 1981. Phase II Developed from 1978 and fielded between 1983 and 1986. upgraded the AN/MPQ-46 HPI to AN/MPQ-57 standard by replacing some of the vacuum tube based electronics with modern solid-state circuits, and added an optical TAS (Tracking Adjunct System). The TAS, designated OD-179/TVY, is an electro-optical (TV) tracking system that increases Hawk operability and survivability in a high-ECM environment. Phase III The PIP Phase III development was started in 1983, and was first fielded by U. S. forces in 1989. Phase III was a major upgrade which significantly enhanced the computer hardware and software for most components of the system, a new CWAR the AN/MPQ-62, added single-scan target detection capability, and upgraded the HPI to AN/MPQ-61 standard by addition of a Low-Altitude Simultaneous Hawk Engagement (LASHE) system. LASHE allows the Hawk system to counter saturation attacks by simultaneously intercepting multiple low-level targets. The ROR was phased out in Phase III Hawk units.

Dimensions

Length: m5.03

Diameter: m0.37

Wingspan: m1.21

Weight, Combat: kg640

Warhead Weight: kg54

Automotive

Engine Name: 1 x Aerojet dual-thrust solid-fuel rocket (M112 motor)

Engine Type: Solid-fuel rocket engine

Speed: Mach 2.7

Transporter: The Hawk missile is transported and launched from the M192 towed triple-missile launcher.

M112 Motor Burn Rate: a 5-second boost phase and a sustain phase of around 21 seconds.

M112 Motor Weight: 395 kg including 295 kg of propellant.

Communications

Note: See Fire Control

Missile System

Name: MIM-23B

Type: Semi-active Radar Homing Missile

Guidance: Semi-active Radar Homing

Length/Caliber: INA

Maximum Effective Range: km35

Minimum Effective Range: km1.5

Maximum Altitude: km18

Minimum Altitude: m30

Max Elevation: INA

Min Elevation: INA

Traverse Range: INA

Traverse Left: INA

Traverse Right: INA

Max Rate of Fire: INA

Launcher: M192 towed triple-missile launcher

Reflector: low side lobe, high-gain plane antenna to reduce sensitivity to ground clutter

Warhead Type: Conventional high-explosive blast fragmentation

Warhead Weight: kg54

Warhead Fragments Speed: 2,000 meters per second

Warhead Fragments: 14,000 2-gram (0.071 oz) fragments

Warhead Fragments Arc: deg70

Fuze Type: radio frequency proximity and impact fuses

Speed: Mach 2.5

Guidance System: X-band CW monopulse semi-active radar seeker.

Kill Probability: 0.85 (Improvement from the MIM-23A)

Mean Time Between Failures (MTBF): 300-400 hours

Peak Velocity: 500 m/s

Maximum Maneuver Speed: 15 Gs

Fire Control

Note: The original Hawk system used 4 or in some models 6 radars: to detect (PAR and CWAR), to track (CWAR and HPIR) and to engage (HPIR and ROR) targets.

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Digital Data Processing Central Information Coordinator: Yes, for Target Processing, Threat Ordering, and Intercept Evaluation.

↳*Radar #1*

Name: AN/MPQ-50 (Improved Hawk to Phase III)

Type: PAR Pulse Acquisition Radar

Digital MTI (Moving Target Indicator): Yes

Frequency: 500 to 1,000 MHz

Band: C-Band

Peak Operating Power: 1,000 watts

High PRF Range: 104 km

Low PRF Range: 96 km

↳*Radar #2*

Name: AN/MPQ-48 (Improved Hawk)

Type: CWAR Continuous Wave Acquisition Radar

Power Rating: Watts400

Frequency: 10 GHz (X-Band)

Range: 69 km (43 mi) (CW) to 63 km (39 mi) (FM) versus 3 m2 (32 sq ft) target.

↳*Radar #3*

Name: AN/MPQ-46 (Improved Hawk – Phase I)

Type: HPIR High Power Illuminating Radar

Power Output: Watts125

Operating GHz Band: 10-20 GHz J band

Range: 99 km (62 mi) (high PRF) to 93 km (58 mi) (low PRF) versus 3 m2 (32 sq ft) target.

↳*Radar #4*

Name: AN/MPQ-51 (Improved Hawk – Phase II)

Type: ROR Range Only Radar

Frequency: 15.5-17.5 GHz)

Pusle Radar: Yes

Power Output: 120 kW

Pusle Length: 0.6 µs

Pulse Repetition Frequency: 1600 Hz

Range: 83 km (52 mi) versus 3 m2 (32 sq ft) target.

Protection

Hull Armor: INA

Turret Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

The Raytheon MIM-23 Hawk (or HAWK: Homing All the Way Killer) is an American medium-range surface-to-air missile. Iran reportedly made several upgrades to MIM-23 missiles for the carriages of its F-14 Tomcats. Some were displayed in Tehran in September 1998. The Iranian Air Force has its own version of the MIM-23 Hawk, the Shahin, which it claims to be under production. A typical Phase-III MIM-23B Hawk battery consists of: 1 × PAR: Pulse Acquisition Radar—a search radar with a 20 (+/−2) rpm rotation, for high/medium altitude target detection. 1 × CWAR: Continuous Wave Acquisition Radar—a search doppler radar with a 20 (+/−2) rpm rotation, for low altitude target detection. 2 × HIPIR: HIgh Power Illuminator doppler Radar—target tracking, illumination and missile guidance. 1 × FDC: Fire Direction Center 1 × IFF: Identification Friend or Foe Transceiver 6 × DLN: Digital Launchers with 18 missiles. 6 × MEP-816: Generators 60KW (400 Hz) each. 12 × M-390: Missile transport pallets with 36 missiles 3 × M-501: Missile loading tractors. 1 × [bucket loader]

Iron Dome Israeli Missile Defense System

Tiers:

Variants:

- **C-Dome:** This is a proposed naval variant of the Iron Dome system.

System

Alternative Designation: Iron Dome
Type: The Iron Dome is a mobile short-range defense system designed to shoot down rockets, artillery and, potentially, mortar rounds in all weather conditions. It is intended to serve as part of a two-tiered missile defense system along with the Stunner (David's Sling) interceptor system. The Iron Dome is aimed at defeating Kassam and Katyusha rockets fired by militants from the Gaza Strip and Lebanon.
Crew: INA
Chassis: Components including the launcher and battle management shelter are based on flatracks. These are transported by heavy military trucks, fitted with palletized loading systems. Radar is also carried on a flatbed truck and can be dismounted prior to operation. So all components can be picked-up, transported and unloaded in a different site by heavy military trucks. It seems that all components of the Iron Dome system can be used while still on the trucks.
Displacement Time: INA
Emplacement Time: INA
Note #1: A battery of the Iron Dome consists of 3 to 4 launchers, radar, and battle management and missiles control unit.
Note #2: The system can operate day and night and in adverse weather conditions.

Dimensions

Length: INA
Width: INA
Height: INA

Weight, Combat: INA

Missile System

Name: Tamir interceptor missiles

Type: Surface-to-Air Missile

Basic Load: 20 x Tamir interceptor missiles

Length: 3 m

Diameter: 0.16 m

Weight: 90 kg

Steering Fins: Yes

Wahread Type: Fragmentation

Warhead Weight: INA

Estimate Effectiveness: 75 to 95%

Missile Reload Vehicle: Reload missiles are carried by another military truck, fitted with a crane.

Note: The launcher unit is deployed and operated remotely via a secure wireless connection.

Fire Control and Radar Systems

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: INA

Battle Management System: A battery of the Iron Dome consists of 3 to 4 launchers, radar, and battle management and missiles control unit. Components including the launcher and battle management shelter are based on flatracks.

↳*Radar*

Name: INA

Note: Radar of the Iron Dome detects targets and monitors their trajectory. It is deployed and operated remotely via a secure wireless connection. This missile defense system also acquires preliminary information from other Israeli radars.

Protection

Hull Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

NBC Protection: No

Smoke Equipment: INA

Notes:

Iron Dome (Hebrew: כִּפַּת בַּרְזֶל, kippat barzel) is a mobile all-weather air defense system developed by Rafael Advanced Defense Systems and Israel Aerospace Industries. The system is designed to intercept and destroy short-range rockets and artillery shells fired from distances of 4 kilometres (2.5 mi) to 70 kilometres (43 mi) away and whose trajectory would take them to an Israeli populated area. Israel hopes to increase the range of Iron Dome's interceptions, from the current maximum of 70 kilometres (43 mi) to 250 kilometres (160 mi) and make it more versatile so that it could intercept rockets coming from two directions simultaneously. Iron Dome was declared operational and initially deployed on 27 March 2011 near Beersheba. On 7 April 2011, the system successfully intercepted a BM-21 Grad launched from Gaza for the first time. On 10 March 2012, The Jerusalem Post reported that the system shot down 90% of rockets launched from Gaza that would have landed in populated areas. By November 2012, official statements indicated that it had intercepted over 400 rockets. By late October 2014, the Iron Dome systems had intercepted over 1,200 rockets. In addition to their land-based deployment, Iron Dome batteries will in the future be deployed at sea, where they will protect off-shore gas platforms in conjunction with Israel's Barak 8 missile system. Iron Dome is part of a future multi-tiered missile defense system that Israel is developing, which includes Arrow 2, Arrow 3, Iron Beam, Barak 8 and David's Sling. The system is designed to counter short-range rockets and 155 mm artillery shells with a range of up to 70 kilometers. According to its manufacturer, Iron Dome will operate day and night, under adverse weather conditions, and can respond to multiple threats simultaneously. Iron Dome has three central components: *Detection & Tracking Radar: the radar system is built by Elta, an Israeli defense company and subsidiary of Israel Aerospace Industries, and by the IDF. *Battle Management & Weapon Control (BMC): the control center is built for Rafael by mPrest Systems, an Israeli software company. *Missile Firing Unit: the unit launches the Tamir interceptor missile, equipped with electro-optic sensors and several steering fins for high maneuverability. The missile is built by Rafael. The system's radar is referred to as EL/M-2084. It detects the rocket's launch and tracks its trajectory. The BMC calculates the impact point according to the reported data, and uses this information to determine whether the target constitutes a threat to a designated area. Only when that threat is determined, is an interceptor missile fired to destroy the incoming rocket before it reaches the predicted impact area.

Khordad-3 Iranian Medium-Range Surface-to-Air Missile (SAM) System

Tiers:

Parent:

Ra'ad (Thunder) Iranian Surface-to-Air Missile (SAM) System

Variants:

- **3rd Khordad:** The 3rd Khordad is the most advanced version of the Ra'ad air defense system. It has the greatest reported range of any of the variants.
- **Tabas:** The Tabas is a transporter-erector-launcher radar variant of the Ra'ad fitted with a radar similar to the "Fire Dome" radar fitted to the Buk-M1. It can reportedly only engage a single target at a time, while providing guidance to two missiles.
- **Alam al Hoda:** The Alam al Hoda is a transporter-erector-launcher in the Ra'ad family. The TEL can carry three missiles.

System

Alternative Designation: Khordad-3, 3-Khordad, Ra'ad 3
Type: Surface-to-Air Missile (SAM) System
Family: Ra'ad
Manufacturer: IRGC aerospace force
In Service: 2012-Present
Crew: eaINA.
Chassis: MZKT-6922
Displacement Time: minutesINA
Emplacement Time: minutesINA
Fire on the Move: No
Note: A 3rd Khordad battalion consists of four batteries, each consisting of one 3rd Khordad TELARs linked to two Alam al Hoda TELs for a total of four TELARS and eight TELs. Overall air surveillance is achieved with a Bashir 3D phased array surveillance radar operating in the S-band with a range of 190 mi (350 km).

Dimensions (Chassis: MZKT-6922)

Length: m7.5
Width: m3.3

Payload: 5000 kg plus trailer 5000 kg (on road), or 3,500 kg plus trailer 4000 kg off road.

Main Weapon System

Note: The S-125 is fired from trainable launchers which are normally fixed, but can be relocated. The crew loads the missiles with the aid of a conveyor onto the ground-mounted, trainable launcher for firing, with both twin and quadruple launchers in use. A pair of missiles are carried in tandem on a modified truck or tracked vehicle. The S-125 is normally transported from battalion storage areas on modified ZIL-131 (6 x 6) or ZIL-157 (6 x 6) trucks and loaded onto the launchers. Approximately one minute is required to load the missiles onto the launch rails, but nearly an hour is required between missile launches due to missile preparation, truck transit and other reloading procedures.

↳*Missile Launcher*

Description: Towed twin or quad-rail launcher

Displacement Time : min100; 30 Pechora-M

Reaction Time : sec8; 2-3 Pechora-M

Reload Time : min50 (quad launcher)

↳*Missile (Option 1)*

Name: V-600 (5V24)

Type: SAM

Length : mm6.1

Diameter : mm550.0

Propulsion : Solid fuel booster

Altitude, Maximum : m18,300.0

Altitude, Minimum : m20, 7.5 blast radius

Combat Load : rds2 or 4

Fuze Type: Proximity RF, 20 m detection

Guidance: Command RF

Kill Radius : m12.5

Probability of Hit: PCT70 FW, 70 heli; 80 Pechora-M, -2M

Range, Maximum : m 25,000; 28,000 Pechora-2A

Range, Minimum : m 2400.0

Simultaneous Missiles: 2 per target

Speed : km/h650-1,150

Warhead Type: Fragmenting Rod-HE

Velocity : km/h4321.0

Weight: kg946.0

↳*Missile (Option 2)*

Name: V-601 (or 5V27)

Type: SAM

Length: 6.09 m

Diameter: m0.375

Wing Span: 2.2 m

Weight: kg953

Warhead Weight: 70 kg warhead containing 33 kg of HE and 4,500 fragments

Propellant: Solid propellant rocket motor

Minimum Range: km3.5

Maximum Range: km35

Intercept Altitudes: 00 m and 18 km

Fire Control System

↳*Radar #1*

Name: FLAT FACE (P-15) Radar

Function: Target Acquisition

Range: 200-250 km

Frequency: C band (UHF)

Associated Weapon System: SA_3 GOA possibly SA-8 GECKO SAM, LOW BLOW missile control radar

Number of Missiles: Can guide three missiles simultaneosly

Power: 380kw

PRF: 200-700pps

Vehicle Mount: Long-range surveillance and target acquisition is handled by the van-mounted P-15 FLAT FACE) radar.

Parabolic Reflectors: Two eliptical parabolic reflectors measuring 11x5.5 m. Reflectors arranged one above the other on van roof.

Note #1: The P-15 radar has been replaced in many S-125 units by the P-15M SQUAT EYE radar.

Note #2: Target data generated by these tracking radars is passed to the battalion's LOW BLOW trailer-mounted fire control radar.

↳*Radar #2*

Name: LOW BLOW

Function: A Fire Control, Trk/FC, and Missile Guidance Radar

Frequency, Fire Control: I band

Range, Fire Control: km40

Scan, Fire Control: Scan (trough) 16HZ

Frequency, Trk/FC: I band

Range, Trk/FC: km40-85

Scan, Trk/FC: Scan (Para) 25HZ

Frequency, Missile Guidance: D band

Range, Missile Guidance: km29

Mount: Four-wheeled trailer-mounted

Parabolic Dishes: Two scanning parabolic dishes one above the other

Associated Weapon System: SA-3 GOA SAM, FLAT FACE, SQUAT EYE acquisition radar.

↳*Radar #3*

Name: SIDE NET (PRV-11)

Function: Height Radar

Frequency: E band, 2.7 GHz

Pulse Repetition Time (PRT): 3 and 1,3 ms

Pulsewidth: 3 and 1.5 µs

Pulse Repetition Frequency (PRF): 330 and 730 Hz

Peak Power: 1.2 MW

Average Power: 1.3 kW

Maximum Range: km28

Maximum Altitude: km32

Associated Weeapon System: SA-2/3/5

↳*Radar Upgrade (SQUAT EYE would replace the FLAT FACE (P-15 Radar)*

Name: SQUAT EYE (P-15M(2))

Function: Target Acquisition

Maximum Range: km128

Frequency: C-band

Power: 380kw

Associated Weapon System: SA-3/5

Protection

Hull Armor: INA

Turret Armor: INA

Notes:

The S-125 Neva/Pechora, NATO reporting name SA-3 Goa) Soviet surface-to-air missile system was designed by Aleksei Isaev to complement the S-25 and S-75. It has a shorter effective range and lower engagement altitude than either of its predecessors and also flies slower, but due to its two-stage design it is more effective against more maneuverable targets. It is also able to engage lower flying targets than the previous systems, and being more modern it is much more resistant to ECM than the S-75. The 5V24 (V-600) missiles reach around Mach 3 to 3.5 in flight, both stages powered by solid fuel rocket motors. The S-125, like the S-75, uses radio command guidance. The launchers are accompanied by a command building or truck and three primary radar systems: * P-15 "Flat Face" or P-15M(2) "Squat Eye" 380 kW C-band target acquisition radar (also used by the SA-6 and SA-8, range 250 km/155 miles) * SNR-125 "Low Blow" 250 kW I/D-band tracking, fire control and guidance radar (range 40 km/25 miles, second mode 80 km/50 miles) * PRV-11 "Side Net" E-band height finder (also used by SA-2, SA-4 and SA-5, range 28 km/17 miles, max height 32 km/105,000 ft) The S-125 system uses 2 different missile versions. The V-600 (or 5V24) had the smallest warhead with only 60 kg of high explosive. It had a range of about 15 km. The later version is named V-601 (or 5V27). It has a length of 6.09 m, a wing span of 2.2 m and a body diameter of 0.375 m. This missile weighs 953 kg at launch, and has a 70 kg warhead containing 33 kg of HE and 4,500 fragments. The minimum range is 3.5 km, and the maximum is 35 km (with the Pechora 2A). The intercept altitudes are between 100 m and 18 km. The S-125M (1970) system uses 5V27. The intercept altitudes are between 20 m and 14 km. The minimum range is 2.5 km, and the maximum is 22 km. The S-125M1 (1978) system uses 5V27D. In the early 1980s established for each system 1-2 radar simulator (against anti radar missiles assigned). The S-125 is somewhat mobile, an improvement over the S-75 system. The missiles are typically deployed on fixed turrets containing two or four but can be carried ready-to-fire on ZIL trucks in pairs. Reloading the fixed launchers takes a few minutes.

Type 03 (Chu-SAM) Japanese 300mm Medium-Range Surface-to-Air Missile System

Tiers:

Variants:

- **Chu-SAM Kai:** This is an upgraded variant with improved sensors and networking features. It has greater range and can defeat more complex threats, such as cruise and air-to-ground missiles.

System

Alternative Designation: Type 03; Chu-SAM; SAM-4
Type: Medium-Range Surface-to-Air Missile System
Configuration: 8x8
Manufacturer: Mitsubishi Heavy Industries
In Service: 2003-Present
Crew: INA
Chassis: The SAM's vehicle chassis is based on the Kato Works Ltd/Mitsubishi Heavy Industries NK series heavy crane truck.
Displacement Time: INA
Emplacement Time: INA
Fire on the Move: No
Note: The system as a whole is based on 8x8 cross country trucks, including command center, radar unit, launcher and transloader.

Dimensions

Chassis Length: INA
Chassis Width: INA
Chassis Height: INA
Chassis Weight, Combat: INA
Ground Pressure: INA

Automotive

Engine Name: INA

Engine Type: INA

Engine Power: INA

Cruising Range: INA

Speed, Maximum Road: INA

Speed, Average Cross: INA

Speed Maximum Swim: INA

Fording Depth: INA

Missile System

Name: Type 03 Missile

Type: Medium-Range Surface-to-Air Missile

Length: 4.90 m

Diameter: 0.33 m

Weight: 570 kg

Engine: 1 x single-stage solid rocket

Speed: Mach 2.5

Range: 50 km

Altitude: 10,000 m

Warhead: high-explosive fragmentation w/proximity fuze

Guidance System: inertial w/command updates and active radar terminal seeker

Fire Control and Radar Systems

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

↳*Radar*

Name: INA

Type: Phased Array Antenna

Maximum Number of Targets to Track: tracks up to 100 targets

Maximum Number of Targets to Target: 12

Note: A data link guides the missile towards a predicted area of intercept where the missile's own seeker takes over. The active radar homing seeker on the missile is derived from the Type 99 air to air missile.

Protection

Hull Armor: The trucks are not armored and the system is not protected in any way.

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

Type 03 Medium-Range Surface-to-Air Missile (03□□□□□□□□□□, maru-san-shiki-chu-kyori-chi-tai-kuu-yuudou-dan) or SAM-4 or Chu-SAM (□SAM, Chū-Samu) is a Japanese developed surface-to-air missile system currently in service with the Japan Army as JGSDF. The SAM's vehicle chassis is based on the Kato Works Ltd/Mitsubishi Heavy Industries NK series heavy crane truck. It uses a state-of-the-art active electronically scanned array radar. The Chu-SAM air defense system is based on 8×8 cross country unarmored trucks, including a command center, radar unit, launcher, and transloader, with each unit equipped with six missiles that travel at Mach 2.5. The system can track up to 100 targets simultaneously and target 12 at the same time, engaging fighter jets, helicopters, and cruise missiles.

Tabas Iranian Medium-Range Air Defense Missile System

Tiers:

Variants:

- **Sevom Khordad:** Sevom Khordad (also known as 3rd Khordad) is a further improved version of the Tabas. It uses an active phased array radar. It is capable of reaching targets within range of up to 105 km and at an altitude of up to 30 km altitude. This system was officially displayed in 2016. By 2019 it was the most advanced and powerful Iranian medium-range air defense missile system.

System

Alternative Designation: Tabas

Type: Medium-Range Air Defense Missile System

Crew: ea3

Chassis: It was officially displayed in 2016. It uses a 6x6 wheeled chassis, based on IVECO commercial truck, though with many design changes.

Displacement Time: INA

Emplacement Time: INA

Note #1: A battery contains 1 Transporter Erector Launcher and Radar (TELAR) and 2 Transporter Erector Launcher (TEL) vehicles. These are based on a heavily modified IVECO 6x6 commercial truck chassis. Each vehicle carrier 3 missiles. So a single battery has 9 ready-to-fire missiles. A battalion has 4 batteries with 4 TELARs and 8 TELs and can engage multiple targets simultaneously

Note #2: Each battalion additionally includes a Bashir S-band 3D phased array surveillance radar which has a detection range of 350 km. The battalion also has a command and control (C2) unit, based on IVECO truck chassis. The C2 unit provides communication between Tabas batteries. Furthermore, the C2 unit can connect other air defense systems of the Raad family, including the older Raad and further improved Sevom Khordad, into a single air defense network. This allows to cover large area and targets can be engaged with a wide range of missiles from the cheapest Taer-1 missiles to the most capable Taer-2s. This adds the capability of facing different types of threats with different types of interceptors. In case of heavy jamming when even the X-band engagement radar can’t handle its duty, the C2 unit can provide an additional data link, connecting the system to electro-optical engagement systems of Raad batteries, in order to guide missiles toward targets.

Dimensions

Length: 7.5 m

Width: 3.3 m

Height: 5.1 m

Weight, Combat: INA

Automotive

Engine Name: IVECO

Engine Type: Diesel

Engine Power: INA

Cruising Range: km500

Speed, Maximum Road: 65 km/h

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Missile System

Missile Name: This system uses Taer-1 and Taer-2 missiles

Type: Surface-to-Air Missile

Missile Diameter: INA

Missile Length: INA

Missile Maximum Range: 75 km

Missile Maximum Altitude: 25 km

Note #1: This air defense system can engage aircraft and helicopters. Most likely that Tabas can also engage ballistic missiles, cruise missiles, anti-radiation missiles, smart bombs and unmanned aerial vehicles.

Note #2: There is very little unclassified information online about the Tabas.

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

Note: It can reportedly only engage a single target at a time, while providing guidance to two missiles.

↳*Radar*

Name: Bashir S-band 3D phased array surveillance radar

Type: Phased Array Radar

Frequency/Band: S-Band

Range: 350 km

Note: Bashir Radar Bashir radar systemThis radar was seen at the 2017 IRGC Aerospace Force Exhibition, and then images of its close-up were displayed in the national media. The Bashir radar has a flat antenna based on a base that has a 360 degree rotation and looks like a phased array type. In fact, the Bashir radar scans the environment on the horizon with the mechanical rotation of the antenna, which is a common structure in many radars. In addition, in advanced radars, the ambient scanning is carried out in altitude with a change in the angle of the waves, which is also commonly used in the Bashir radar. The antenna shape also shows that the radar uses smaller wavelengths such as L and S bands that have a higher accuracy in determining the position of targets compared to the HF / VHF / UHF bands,

but still to search for and track radar targets in and out. Medium and long rackets are used. In the Bashir radar, similar to the overall design of the radar, its antenna and its base, and the location and shape of the antenna of the friend recognition system from the enemy, there are significant differences in these parts and the lateral components as compared to similar radars. The integrated antenna level, the difference in the number of antenna elements in the IFF system and the 3 components mounted on the back and on the sides of the antenna are among these differences, which indicate the native design of the Bashir radar, while modeling the successful and successful foreign radars.

Protection

Hull Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

Tabas missile radar system Tabas radar systemThe Tabas missile defense system has been designed and traced for destruction targets in the medium range and medium to high. The radar of this system is flat-panel, and it seems that it has the ability to change the mechanical angle in 2 horizontal and vertical directions. Although Tabas is designed to achieve less costly systems than the 3rd Khordad missile system, it has fewer targets for fighting, but due to the firing of missiles from the TAERER-2 family by the Tabas radar, it is naturally high and at least about 100 km is estimated.

Ra'ad (Thunder- 1) Iranian Medium-Range Surface-to-Air Missile (SAM) System

Tiers:

Variants:

- **3rd Khordad:** The 3rd Khordad is the most advanced version of the Ra'ad air defense system. It has the greatest reported range of any of the variants.
- **Tabas:** The Tabas is a transporter-erector-launcher radar variant of the Ra'ad fitted with a radar similar to the "Fire Dome" radar fitted to the Buk-M1. It can reportedly only engage a single target at a time, while providing guidance to two missiles.
- **Alam al Hoda:** The Alam al Hoda is a transporter-erector-launcher in the Ra'ad family. The TEL can carry three missiles.

System

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: No

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Camera Optics Range: km80

Note: Fire control radars for accurately determining the position of the target in the sky require high resolution and high resolution. Hence, due to the inherent error of several hundred to several hundred meters, the VHF / HF band radar detects positions in air defense sets of these radars only for The initial identification was used and the fire control task was delivered to radar in bands such as x. On the other hand, the range of these radars falls sharply against aircraft with low radar cross-sections.

↳*Radar*

Name: Alam-Al-Hoodi Air Defense System

Type: Long-range radar

Band: VHF

Range: INA

Number of Targets System can Track: INA

Note #1: The Alam-Al-Hoodi Air Defense System utilizes a long-range radar in the VHF band (the ability of this frequency spectrum to detect radar cross-sectional targets is very low), as well as parts of the Thunderbolt air defense systems. Fire control radars for accurately determining the position of the target in the sky require high resolution and high resolution. Hence, due to the inherent error of several hundred to several hundred meters, the VHF / HF band radar detects positions in air defense sets of these radars only for The initial identification was used and the fire control task was delivered to radar in bands such as x. On the other hand, the range of these radars falls sharply against aircraft with low radar cross-sections. Previously, activities have been seen to use VHF radars for initial detection and transfer of data with lower frequency radars or other types of sensors to control fire and provide practical solutions to counteract the world's most secret targets. But according to information published at the IRGC Aerospace Force, the radar of Alam-al-Hoda (the main radar of the Al-Hoda Air Defense System) is engaged in the discovery, tracing, and directing of fire against targets, which, in view of the inherent problems of the frequency band, Determining the exact location of the goals is unprecedented. Therefore, Irans experts must find a way to overcome this problem. The radar consists of two main horizontal and vertical sections, which, with its large length of transport, can be folded onto a two-axle trailer, and its displacement capabilities are faster and faster. It should be noted that in general, fuzzy arrays have the ability to quickly scan the environment, have high stability against electronic warfare, and are able to detect and track a large number of targets. Obviously, as the next target of the Thunderbolt air defense systems is reaching the level of capabilities of systems such as the S-300, other components of this defense suite should also be developed within Iran. Therefore, it can be concluded that the Radar of Al-Hadi as an Iranian example is one of the important species of the Nebo radar, a radar explored as similar to the radars of Bashir and Ghadir and Aliam, each one with the ingenuity and ingenuity of young engineers. Specialists of the Iranian lines have found differences with similar or similar foreign samples forming a modern and integrated set of national air defense. While the provision of airborne radars and air defense complexes that are in full compliance with indigenous needs is today much more difficult than before, the internal construction of these radars and missiles required not only to meet the basic needs of defense. But on the way to cover more and more of all the necessary areas and, in the long run, will replace the existing systems with modern and native products.

Note #2: Each battalion additionally includes a Bashir S-band 3D phased array surveillance radar which has a detection range of 350 km. The battalion also has a command and control (C2) unit, based on IVECO truck chassis. The C2 unit provides communication between Raad batteries. Furthermore, the C2 unit can connect other air defense systems of the Raad family, including the improved Tabas and further improved Sevom Khordad, into a single air defense network. This

allows to cover large area and targets can be engaged with a wide range of missiles from the cheapest Taer-1 missiles to the most capable Taer-2s. This adds the capability of facing different types of threats with different types of interceptors. In case of heavy jamming when even the X-band engagement radar can’t handle its duty, the C2 unit can provide an additional data link, connecting the system to electro-optical engagement systems of Raad batteries, in order to guide missiles toward targets.

Notes:

Raad or Ra'd (Persian: رعد, meaning "thunder") is an Iranian aerial defence system deployed in September 2012. The system is designed to enhance Iran's capabilities in terms of defense, and as a partner to Bavar 373 air defense system. According to Fars news agency the Raad is designed to confront fighter jets, cruise missiles, smart bombs, helicopters and drones. The system is also designed specially for US fighters. The system is equipped with "Taer" (Bird) missiles, which can trace and hit targets in ranges up to 50 km and in altitudes from 25 to 27 km (75,000 feet), Ra'd is ranked as a mid-range radar system and air defense system. The Raad 1 mounts a turret appearing to be identical to the Russian 2S1 122mm self propelled howitzer, but on the chassis of the Iranian Boragh APC, a variant of the Chinese WZ-501/503 series, themselves copies of the Russian BMP-1. The artillery piece used was either the standard Russian type 122mm howitzer, manufactured under the designation HM51L by the Armaments Industries Group of the Iranian Defense Industries Organization, or the improved HM51 howitzer. As of 2008 Iran was the sole operator of the system, maintaining a mixed force of upgraded 2S1 and Raad 1 self-propelled howitzers. Iran first announced the "Thunder"-1 type 122mm self-propelled howitzer developed by the Hadid Artillery Factory in early 2002. The chassis was under the responsibility of the Shahid Kladuz Industrial Complex (SKDIC) of the DIO. The combat system is partly handled by the Hadid Artillery Factory. The shape of the "Thunder"-1 self-propelled howitzer is very similar to that of the Soviet 2S1 "Dianzhu" 122mm self-propelled howitzer. Therefore, Iranian military personnel would refer to the 2S1 self-propelled howitzer when developing the gun. The "Thunder"-1 self-propelled howitzer adopts the layout commonly used by similar self-propelled artillery, that is, the cockpit and power cabin are arranged at the front of the vehicle body, the rear is a combat cabin, and the turret is mounted above the combat cabin. The gun features an all-welded steel structure with a maximum armor thickness of 17 mm to withstand light weapons and shell fragments. The chassis of the "Thunder"-1 self-propelled howitzer was improved from the chassis of the Iranian "Bolager" infantry fighting vehicle. The main change was that the body at the rear of the cockpit was raised. The "Thunder"-1 self-propelled howitzer is 6.65 meters long and 3.25 meters wide. It has 4 crew members and 17.5 tons of combat weight. The power unit is the air-cooled BF-8L513 four-stroke eight-cylinder turbocharged diesel engine from Germany Deutz. The maximum power is 231.5 kW. Manual transmission, 2 forward gears and 1 reverse gear, the suspension device is torsion bar type, there are 6 hanging rubber load wheels on each side of the vehicle, the driving wheel is in front, the induction wheel is behind, and there is a supporting pulley in the middle. The maximum speed is 65 km / h, the maximum off-road speed is 4 5 km / h, and the maximum stroke is 400 km. The chassis of the "Thunder"-1 self-propelled howitzer was improved from the chassis of the Iranian "BORAQ" infantry fighting vehicle. The Soviet 2S1 "Dianzhu" 122mm self-propelled howitzer and the Iranian "Thunder"-1 self-propelled howitzer are very similar in appearance, the biggest difference is the use of different chassis. The "Thunder"-1 self-propelled howitzer is equipped with a fully enclosed 3-person turret. The top of the turret is equipped with optical equipment for direct shooting and inter-shot shooting. The turret is equipped with a HM-51 type with a diameter of 122 mm and a diameter of 122 mm. Artillery (imitation of the Soviet 2A31 122mm howitzer), when the marching artillery is placed in the front of the truck body and locked by the fastener. The high-low range of the HM-51 gun is -3° to +72°, the muzzle velocity is 721 m/s, and the range is 15.2 km when the ZBK-13 propellant is used to launch the 122 mm high-explosive grenade. The life of the gun can reach 3000 rounds. The gun is equipped with an automatic loading machine with a maximum firing rate of 4-5 rounds. The gun can also be loaded when shooting at a large elevation angle. The shell carries 35 rounds. The types of shells include grenades, flares, and smoke bombs. The auxiliary weapon of the Thunder "-1 type self-propelled howitzer is a 12.7 mm high-altitude machine gun.

9K37 Buk (SA-11 Gadfly) Russian Medium-Range Surface-to-Air Missile System

Tiers:

Variants:

- **SA-6B/ KUB-M4/KVADRAT-M4:** Hybrid Unit with SA-6, and or BUK-M1/SA-11 Type TELARS.
- **BUK-M:** System with SA-11 missile. It had the inadequate tube arm, replaced by snow drift. Few BNs were fielded. Most SA-11 units use BUK-M1.
- **BUK-M1-2 AND SA-17/GRIZZLY:** Upgrade systems.

System

Alternative Designation : Buk-M1, Gang; For Hybrid Threat Buk-M1 is a Tier 2 system.
Date of Introduction: 1979
Description: Brigade assets include bde/btry CPs and radars, TELARs, launcher-loaders, TM-9T229 missile transporter, maintenance and test units. The 6 batteries have 1 TELAR and 1 LL each.
Proliferation: Azerbaijan, Belarus, Finland, India, Iran, Russian, Syria, Ukraine
Target: FW, heli, CM, UAV, guided bomb, artillery rocket, ground targets, ships

Simultaneous Missiles: 2 per target

Speed, Maximum Missile: m/s1,200

Speed, Maximum Target : m/s830

Fire Control Systems

Navigation System: Yes

Notes: Use of LLs is transforming SA-11 units. They appear to be updated and modified SA-6 TELs (2P25s), economically converted to expand the unit missile load, yet requiring SA- 11 batteries to have only one expensive TELAR. Thus the force can expand with existing stocks of SA-6.

↳*C2 Vehicle*

Name: 9S470M1

Function: Battery Command Post

Data Link : Wire and radio AD net, to IADS net, and to SA- 10/Osnova

Targets Tracked: 15 (with 6 at TELs)

↳*Radar #1*

Name: 9S35 Fire Dome Radar

Function: Dual (acquisition and fire control)

Detection Range : km80 (2 m2), 100 (3m2)

Frequency : GHz6-10 GHz (H/I band)

Guidance Range : km42 km

Other Assets: SA-11 digitally links to the IADS (e.g., aircraft, intel , and other SAM units. SA- 10/20/11 FO radars share data with other units in the IADS net. Other assets are FOs and ELINT, e.g., Orion.

Targets Tracked: 1 per SPL vehicle

Note: The 9S35 Fire Dome provides a limited search and acquisition capability, a tracking capability and CW illumination for terminal guidance of the semi-active homing SAM seekers. It incorporates an IFF interrogator, optical tracker, datalink, and is powered by the TELAR's gas turbine generator. A shared antenna is employed for two X-band transmit/receive channels. These respectively provide a pulsed mode for search and track functions, with linear chirp for compression, and a CW mode for illumination. Monopulse angle tracking is employed for jam resistance. For target tracking the antenna and feed system provide a mainlobe with 2.5° width in azimuth and 1.3° in elevation. For CW illumination the antenna and feed system provide a mainlobe with 1.4° width in azimuth and 2.65° in elevation. Operating autonomously, the 9S35 will take 4 seconds to sweep a 120° sector, with an elevation of 6° to 7°. When cued to acquire and track, with will take 2 seconds to sweep a 10° x 7° az/elev solid angle. Average power output in pulsed tracking modes varies between 0.5 and 1 kiloWatt, with CW illumination at 2 kiloWatts. The search and monopulse angle tracking receivers are both rated at a Noise Figure of NF=10 dB. The range error is cited at 175 metres, the angular

error at less than 1°. The radar can switch from standby mode to combat operation in twenty seconds.

↳*Radar #2*

Name: 9S18M1 SNOW DRIFT

Description: Armored tracked chassis w/ phased array radar and dipole antenna

Azimuth Coverage : deg:360 with rotation

Type: Spoon Rest

Detection Altitude: km25

Detection Range : km100-150

Displacement Time: min5

Emplacement Time : min5

Frequency: Centimetric 3-D phased array

Function: Battery target acquisition radar

Other Radars: Regiment/Bde will have

Range Precision: 400

Targets Tracked: 75

↳*Sights*

Acquisition Range : km20

Type: TV optial auto-tracker

Protection

Armor Protection: Small arms (est)

NBC Protection: INA

Notes:

The 9K37 Buk / SA-11 Gadfly was developed to fill two compatible basic requirements, the first being to provide a replacement for the 1960s developed 2K12 Kub / 2K12 / SA-6 Gainful Surface to Air Missile system, the second being the provision of a common missile round for the M-22 Uragan / SA-N-7 Gadfly Surface to Air Missile system for medium sized naval surface combatants. Key design imperatives were to provide a design with a better capability to engage multiple targets compared to the 2K12 / SA-6 Gainful, with an easier to maintain weapon system and missile round, with improved kinematic performance, improved countermeasures resistance, and a capability against 10 to 12G manoeuvring targets, and TBMs such as the Lance. Development was initiated early in 1972, with Tikhomirov NIIP responsible for system design, and Novator, at that stage engaged in the development of the 9M82/9M83 / SA-12 missile round, tasked with developing the new missile. Agat were tasked with developing a new semi-active homing radar seeker. The development process was split into two phases to accelerate the deployment of the new missile and engagement radar, with the hybrid 2K12M4 system using the 1S91 Straight Flush, and a new 9A38 TELAR replacing the 2P25M3. The new design departed fundamentally from the 2K12 / SA-6 Gainful in system configuration, as each TELAR was equipped with a 9S35 Fire Dome engagement radar, which provided tracking and CW illumination for the missile seekers. The newer Metrovagonmash GM-569 series chassis was adopted. This design strategy removed the fundamental bottleneck in the firing rate of the 2K12 / SA-6 Gainful, where every TEL depended on the fine tracking and illumination provided by the 1S91 Straight Flush. The 2K12M4 hybrid, armed with either 3M9M4 or 9K37-1 missile rounds, would not suffer target saturation in the manner of earlier variants. This strategy of using a tracking nd illuminating radar on each TELAR remains unique to Soviet/Russian Army Air Defence SAMs, also used with the S-300V / SA-12 Giant/Gladiator system and its 9A82/9A83 TELARs. the 9S35 Fire Dome illuminator was thus compatible with the 1SB4M missile seeker, and compatible data link terminals were required. This variant attained IOC in 1978. The cross compatibility between the 9K37 and 2K12 systems continues to be reflected in various contemporary block upgrades which involve the retrofit of 9K37 components into 2K12 systems, including the newer missile rounds. The second phase of the development resulted in the

new 9S470 self propelled command post, the 9S18 Kupol / Tube Arm acquisition radar, the 9A39 TELAR, and the 9A310 TEL/transloader designs, forming the new 9K37-1 Buk / SA-11 Gadfly system. The battery structure was also a departure from the 2K12 model, with the 9S18 Kupol / Tube Arm acquisition radar and 9S470 command post structure much closer in concept to that used in the S-300V / SA-12 with its 9S15 Bill Board acquisition radar and 9S457 command post. All system components were designed, like the S-300V / SA-12, to shoot and scoot in five minutes. IOC was achieved in 1980. While the new system design provided many performance improvements over the 2K12 / SA-6 Gainful, and permitted a greater rate of fire, the system did not perform well against TBMs, anti-radiation missiles, cruise missiles and anti-tank helicopters in hover. Development of the improved 9M37M1 Buk M1 variant commenced in 1979 and IOC was achieved in 1983. The 9M37M1 Buk M1 variant has been exported. The new variant introduced a range of incremental improvements to system components, resulting in the 9S470M1 command post, the 9A310M1 TELAR with improved 9S35M1 Fire Dome and 9Sh38-3 electro-optical tracker, the 9A39M1 TEL/transloader, and the entirely new 9S18M1 Kupol M1 / Snow Drift engagement radar. The Snow Drift was a radical departure from the Tube Arm, and used similar planar array antenna technology to the 9S15 Bill Board series. The end of the Cold War saw the 9K37M1 in production, and development of the follow-on 9K37M1-2 Buk M1-2 was initiated during the later 1990s. This variant was intented to expand the target set further, to encompass strategic and tactical aircraft, helicopters in hover, cruise missiles, tactical ballistic missiles, air to surface missiles, precision-guided munitions, maritime surface targets, and high value ground targets. The latter was to include parked aircraft on airfields, missile launchers and command posts. This variant introduced a substantially new missile round design, the 9M317 designed by DNPP. It uses a redesigned semi-active homing seeker using P-nav, a midcourse guidance datalink channel, inertial navigation system, more capable proximity and contact fusing, and a more lethal combined effects warhead. A dual pulse motor is employed. The new missile is described as multirole, due to the range of target types it is intended to kill. It is claimed to be capable to intercepting a 12G target. The most recent variant of this family of weapons is the 9K317 Buk M2 / SA-17 Grizzly, exported as the 9K317E Ural. This variant incorporates some of the most prominent design changes to date. A new 8 round 9A316 TEL/Transloader has been introduced. The new fully autonomous 9A317 TELAR is equipped with a 9S36 passive phased array antenna equipped radar, replacing the mechanically steered antenna in earlier 9S35 Fire Dome equipped TELARs. This is intended to provide the capability to concurrently engage four targets with a single TELAR, and improve countermeasures resistance. A more basic TELAR, the 9A318, is also provided. The baseline 9S18M series acquisition radar is replaced by the 9S117 Kupol M2E. The most interesting component of this design is the standalone mast mounted 9S36 phased array, designed to provide extended low altitude and surface coverage, in air defence but also maritime coastal defence applications. This design uses a 21 metre telescoping and elevating mast which mounts a radar head with the 9S36. Each mast mounted 9S36 engagement radar controls a pair of 9A316 TEL/Transloaders. The 9K317 Buk M2/M2E / SA-17 Grizzly is offered on the baseline tracked chassis, but also on the new wheeled 6 x 6 MZKT-6922 TELAR vehicle, in testing through 2010. The Belarus integrator Agat, best known for designing command posts, is also offering the 9K39MB Buk MB, a digital block upgrade to the baseline 1980s analogue 9K39 Buk.

MEADS German Medium-Range Air Defense System

Tiers:

1 **2** 3 4

System

Alternative Designation: MEADS
Type: Medium-Range Air Defense System
Manufacturer: The Medium Extended Air Defense System or MEADS was jointly developed by Germany, Italy and the United States.
Mission: The main role of the MEADS is to defend maneuver forces and key installations against aircraft, helicopters, UAVs, as well as tactical and short-range ballistic missiles (with a maximum range of up to 1 000 km), and cruise missiles.
Crew: INA
Chassis: Components of the German MEADS systems are based on MAN SX45 military trucks.
Displacement Time: INA
Emplacement Time: INA
Note: The complete battery includes six launcher vehicles, one surveillance radar, two multifunctional fire control radar, two battle management systems, and reloading vehicles, that carry spare missiles for the launchers.

Dimensions

Length: 10.5 m
Width: 2.55 m
Height: 3.92 m
Weight, Empty: 13 tons
Weight, Combat: INA

Automotive

Engine Name: MAN D2066 LFG

Engine Type: Diesel

Engine Power: hp440

Cruising Range: km750

Speed, Maximum Road: km/h88

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %40

Vertical Step: 0.6 m

Trench: 1.9 m

Fording Depth: up to 1.5 m

Missile System

Name: MIM-104F Missile

Type: Surface-to-Air Missile

Length: 5.21 m

Diameter: INA

Fin Span: INA

Missile Weight: 312 kg

Warhead Type: HE-FRAG

Warhead Weight: INA

Maximum Range: 40 km

Maximum Altitude: 20 km

Elevation: MEADS launcher fires nearly vertically at a 70° launch position

Traverse: 360 deg

Basic Load: Each launcher vehicle of the MEADS is equipped with 12 missiles.

Reload: The MEADS launchers use a palletized load handling system. So the whole set of 12 missiles can be rapidly reloaded.

Note: This missile is highly maneuverable and destroys targets by ramming them. Yet still it has a small HE-FRAG warhead to enhance the kill probability.

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

Battle Management Systems: 2 x Battle Management Systems. The battle management system is basically a command and control element of the MEADS. It provides battle management for the launcher units. It calculates optimal engagements and sends firing commands to the launcher vehicles. At least two launchers can fire simultaneously in order to defended against multiple threats or massed missile attacks.

↳*Radar #1*

Name: INA

Type: Surveillance Radar

Frequency/Band: INA

Range: INA

Coverage: 360 deg

Note: The surveillance radar provides long-range detection of low radar cross-section objects. This radar operates below detection frequency of current anti-radiation missiles.

↳*Radar #2*

Name: INA

Type: Fire COntrol Radar

Frequency/Band: X-band solid-state phased array radar with an Active Electronically Scanned Array (AESA).

IFF: Yes

Note: It provides precision tracking and discrimination and classification capabilities. The radar uses its main beam for missile guidance, eliminating the need for a separate guidance array.

Protection

Hull Armor: The MAN SX45 is also available with an integrated armored cab, which provides protection against 7.62x51 mm armor-piercing rounds, artillery shell splinters and withstands 8 kg anti-tank mine blast. An integrated cab can be equipped with remotely controlled weapon stations, fitted with a 12.7 mm heavy machine gun or 40 mm automatic grenade launcher.

Applique Armor: The MAX SX family has a modular cab, which can be fitted with add-on armor protection kit. This kit was jointly developed by MAN and Krauss-Maffei Wegmann. It provides protection against 7.62x39 mm rounds, artillery shell splinters, grenades, small anti-personnel mines. Armored modules are attached to the outside of the cab. Armored kit can be installed within 10 hours in field conditions.

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

Germany is considered the architect and driving force behind greater European collaboration across defense. The country has played a pivotal role in developing largescale European programs, including the development of the Medium Extended Air Defense System (MEADS). Development of the Medium Extended Air Defense System began in 2004 as a U.S.-Italian-German partnership that shared costs for a new air and missile defense (AMD) system. As member to the tri-lateral partnership, Germany shared costs for a new Integrated Air and Missile Defense (IAMD) system. The system enables coalition

interoperability and regional operation and is developed to incorporate other radars and launchers – both existing and future – as part of a regional air and missile defense system. After a comprehensive review, the German Federal Ministry of Defense announced in 2015 it would make MEADS the foundation of Taktisches Luftverteidigungssystem (TLVS), its next-generation AMD system, designed to replace Patriot. The MEADS program submitted a proposal to the German Ministry of Defense in July 2016 to continue Lockheed Martin's development partnership with MBDA and use MEADS technology as the basis for Germany's next-generation TLVS.

MR-SAM Indian Medium-Range Air Defense Missile System

Tiers:

1 2 3 4

System

Alternative Designation: MR-SAM
Type: Medium-Range Air Defense Missile System
Mission: The MR-SAM system was designed to intercept enemy aircraft, missiles, helicopters and drones at a range of up more than 70 km.
Crew: INA
Chassis: INA
Displacement Time: INA
Emplacement Time: INA
Note: Three launcher units will comprise a battery. These will be supported by a control and management unit, radar unit, associated reloading vehicles and maintenance vehicles.

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Automotive

Engine Name: INA
Engine Type: INA

Engine Power: INA

Cruising Range: INA

Speed, Maximum Road: INA

Speed, Average Cross: INA

Speed Maximum Swim: INA

Fording Depth: INA

Missile System

Name: Barak 8 Missile

Type: Surface-to-Air Missile

Basic Load: 8 x Barak 8 Missiles

Length: 4.5 m

Diameter: 0.54 m

Fin Span: 0.94 m

Missile Weight: 274 kg

Warhead Type: Fragmentation with proximity fuse

Warhead Weight: 60 kg

Speed: Mach 2

Maximum Range of Fire: more than 70 km

Maximum Altitude: 16 km

Note #1: The missiles are fired vertically from the canister-launchers and provide 360 degree coverage. The vertical launch systems holds 2 stacks of 4 ready-to-fire missiles.

Note #2: All missiles can be fired within 20 seconds

Fire Control and Radar Systems

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

↳*Radar*

Name: EL/M-2084

Type: Target and Tracking Radar

Frequency/Band: INA

Range: 470 km

Note: The ELM-2084 is an Israeli ground-based mobile 3D AESA multi-mission radar (MMR) family produced by ELTA, a subsidiary of Israel Aerospace Industries. The radar is capable of detecting and tracking both aircraft and ballistic targets

and providing fire control guidance for missile interception or artillery air defense. As a tactical radar, the ELM 2084 is a mobile system consisted of the radar unit, a control module, a cooling unit and a power generator. It can be mounted on a variety of transport platforms. The radar was designed to accommodate medium range operational needs in the battlefield: detection, classification and tracking of targets. The Radar's main missions are: *Hostile weapon location – detection and tracking of hostile ballistic projectiles, calculating enemy launchers or artillery position. *Early warning – impact point calculation for warning of civil population and military rear units. *Friendly fire ranging – tracking of friendly artillery and providing corrections to the firing unit. *Aerial surveillance – detecting and tracking aircraft, maintaining continuous aerial picture. *Firing control radar – for various air defense systems, including Iron Dome, David's Sling, Skyhunter, and SPYDER-MR (Medium Range). Notable features of the radar: *Advance technology AESA radar *Extensive operational experience, due to participation in large number of interceptions *Interoperability with modern battle management systems and several different interceptor missiles. *The radar is advertised as capable of processing all types of threats – aerial and ballistic including low radar cross-section (RCS) targets.

Protection

Hull Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The Medium-Range Surface-to-Air Missile (MRSAM) is being developed by India’s Defence Research and Development Organisation (DRDO) in collaboration with Israel Aerospace Industries (IAI). It is expected to enter service with the Indian Air Force (IAF) in 2017. The missile is designed to provide the armed forces with air defence capability against a variety of aerial threats at medium ranges. Each MRSAM weapon system comprises of one command and control system, one tracking radar, missiles, and mobile launcher systems. The mobile launcher is used to transport, emplace and launch up to eight canisterised missiles in two stacks. It can fire the missiles in single or ripple firing modes from the vertical firing position. The combat management system simplifies the process of engaging a variety of threats. It identifies and tracks the threat using tracking radar. The system calculates the distance between the target and the launcher, and then determines if the identified target is a friend or a foe. The target information is, then, transmitted to the mobile launcher. The weapon is 4.5m-long, weighs approximately 276kg, and is equipped with canards and fins for control and manoeuvrability.

S-125 Neva/Pechora (SA-3 Goa) (Export) North Korean 6x6 Surface-to-Air Missile System

Tiers:

1 2 3 4

Variants:

- **SA-3A: :** Two-rail launcher. Missiles without interstage fins.
- **SA-3B (GOA MOD 1):** SA-3B (GOA Mod 1): two-rail launcher. Missiles have inter-stage fins. SA-3C: four-rail launcher.
- **NEWA SC:** Polish modernized system
- **PECHORA-M :** Upgrade fielded in 1994 and used in at least 3 countries. It has digitized FCS, and laser/EO/thermal auto-tracker for use without a radar. It added the Kasta-2E2 TA EW radar.
- **PECHORA-2/UNV MODEL 1999 :** Further upgrade with truck-mounted low blow FC radar), tracks 2 targets. It is resistant to aircraft ECM.
- **PECHORA-2M:** Russian mobile variant of -2, with launcher mounted on a truck chassis modified into a transporter-erector-launcher (TEL). Other changes: the 2-rail launcher has a storage compartment underneath for support and test equipment. Navigation and automated fire control terminal are mounted onboard. The cab has room for two or three crew members. The latest missile is 5V27DE. The trailer-mounted unv model 1999 FC radar (up to 300 m away) can emplace and displace in 5 minutes or less. This system has been

System

Alternative Designation: NICKNAMES SA-3 Goa (NATO reporting name for S-125) SA-N-1 Goa (NATO reporting name for Volna) M-1 Volna (naval version of S-125) Neva (Soviet service nickname) Pechora (export model nickname) ItO 79 (Finnish service)

Type: Russian Surface-to-Air Missile System

Manufacturer: JSC Defense Systems (Pechora-M)

In Service: 1961-Present

Crew: INA

Chassis: The S-125 is normally transported from battalion storage areas on modified ZIL-131 (6 x 6) or ZIL-157 (6 x 6) trucks and loaded onto the launchers.

Emplacement Time: Approximately one minute is required to load the missiles onto the launch rails, but nearly an hour is required between missile launches due to missile preparation, truck transit and other reloading procedures.

Displacement Time: See Emplacement

Target Types: FW, heli, CM; Also ASMs, UAVs Pechora-M

Dimensions (Chassis: ZIL-131)

Length: m7.04

Width: m2.49

Height, Cab: m2.49

Height, Transport Body: m2.97

Wheelbase: m3.30

Curb Weight: kg6,700

Automotive (Chassis: ZIL-131)

Engine Name: INA

Engine Type: V8 gasoline (carburetor)

Engine Power: INA

Maximum Road Distance: INA

Maximum Speed: km/h80

Seating Capacity: ea3

Payload: 5000 kg plus trailer 5000 kg (on road), or 3,500 kg plus trailer 4000 kg off road.

Main Weapon System

Note: The S-125 is fired from trainable launchers which are normally fixed, but can be relocated. The crew loads the missiles with the aid of a conveyor onto the ground-mounted, trainable launcher for firing, with both twin and quadruple launchers in use. A pair of missiles are carried in tandem on a modified truck or tracked vehicle. The S-125 is normally transported from battalion storage areas on modified ZIL-131 (6 x 6) or ZIL-157 (6 x 6) trucks and loaded onto the launchers. Approximately one minute is required to load the missiles onto the launch rails, but nearly an hour is required between missile launches due to missile preparation, truck transit and other reloading procedures.

↳*Missile Launcher*

Description: Towed twin or quad-rail launcher

Displacement Time : min100; 30 Pechora-M

Reaction Time : sec8; 2-3 Pechora-M

Reload Time : min50 (quad launcher)

↳*Missile (Option 1)*

Name: V-600 (5V24)

Type: SAM

Length : mm6.1

Diameter : mm550.0

Propulsion : Solid fuel booster

Altitude, Maximum : m18,300.0

Altitude, Minimum : m20, 7.5 blast radius

Combat Load : rds2 or 4

Fuze Type: Proximity RF, 20 m detection

Guidance: Command RF

Kill Radius : m12.5

Probability of Hit: PCT70 FW, 70 heli; 80 Pechora-M, -2M

Range, Maximum : m 25,000; 28,000 Pechora-2A

Range, Minimum : m 2400.0

Simultaneous Missiles: 2 per target

Speed : km/h650-1,150

Warhead Type: Fragmenting Rod-HE

Velocity : km/h4321.0

Weight: kg946.0

↳*Missile (Option 2)*

Name: V-601 (or 5V27)

Type: SAM

Length: 6.09 m

Diameter: m0.375

Wing Span: 2.2 m

Weight: kg953

Warhead Weight: 70 kg warhead containing 33 kg of HE and 4,500 fragments

Propellant: Solid propellant rocket motor

Minimum Range: km3.5

Maximum Range: km35

Intercept Altitudes: 00 m and 18 km

Fire Control System

↳*Radar #1*

Name: FLAT FACE (P-15) Radar

Function: Target Acquisition

Range: 200-250 km

Frequency: C band (UHF)

Associated Weapon System: SA_3 GOA possibly SA-8 GECKO SAM, LOW BLOW missile control radar

Number of Missiles: Can guide three missiles simultaneosly

Power: 380kw

PRF: 200-700pps

Vehicle Mount: Long-range surveillance and target acquisition is handled by the van-mounted P-15 FLAT FACE) radar.

Parabolic Reflectors: Two eliptical parabolic reflectors measuring 11x5.5 m. Reflectors arranged one above the other on van roof.

Note #1: The P-15 radar has been replaced in many S-125 units by the P-15M SQUAT EYE radar.

Note #2: Target data generated by these tracking radars is passed to the battalion's LOW BLOW trailer-mounted fire control radar.

↳*Radar #2*

Name: LOW BLOW

Function: A Fire Control, Trk/FC, and Missile Guidance Radar

Frequency, Fire Control: I band

Range, Fire Control: km40

Scan, Fire Control: Scan (trough) 16HZ

Frequency, Trk/FC: I band

Range, Trk/FC: km40-85

Scan, Trk/FC: Scan (Para) 25HZ

Frequency, Missile Guidance: D band

Range, Missile Guidance: km29

Mount: Four-wheeled trailer-mounted

Parabolic Dishes: Two scanning parabolic dishes one above the other

Associated Weapon System: SA-3 GOA SAM, FLAT FACE, SQUAT EYE acquisition radar.

↳*Radar #3*

Name: SIDE NET (PRV-11)

Function: Height Radar

Frequency: E band, 2.7 GHz

Pulse Repetition Time (PRT): 3 and 1,3 ms

Pulsewidth: 3 and 1.5 µs

Pulse Repetition Frequency (PRF): 330 and 730 Hz

Peak Power: 1.2 MW

Average Power: 1.3 kW

Maximum Range: km28

Maximum Altitude: km32

Associated Weeapon System: SA-2/3/5

↳*Radar Upgrade (SQUAT EYE would replace the FLAT FACE (P-15 Radar)*

Name: SQUAT EYE (P-15M(2))

Function: Target Acquisition

Maximum Range: km128

Frequency: C-band

Power: 380kw

Associated Weapon System: SA-3/5

Protection

Hull Armor: INA

Turret Armor: INA

Notes:

The S-125 Neva/Pechora, NATO reporting name SA-3 Goa) Soviet surface-to-air missile system was designed by Aleksei Isaev to complement the S-25 and S-75. It has a shorter effective range and lower engagement altitude than either of its predecessors and also flies slower, but due to its two-stage design it is more effective against more maneuverable targets. It is also able to engage lower flying targets than the previous systems, and being more modern it is much more resistant to ECM than the S-75. The 5V24 (V-600) missiles reach around Mach 3 to 3.5 in flight, both stages powered by solid fuel rocket motors. The S-125, like the S-75, uses radio command guidance. The launchers are accompanied by a command building or truck and three primary radar systems: * P-15 "Flat Face" or P-15M(2) "Squat Eye" 380 kW C-band target acquisition radar (also used by the SA-6 and SA-8, range 250 km/155 miles) * SNR-125 "Low Blow" 250 kW I/D-band tracking, fire control and guidance radar (range 40 km/25 miles, second mode 80 km/50 miles) * PRV-11 "Side Net" E-band height finder (also used by SA-2, SA-4 and SA-5, range 28 km/17 miles, max height 32 km/105,000 ft) The S-125 system uses 2 different missile versions. The V-600 (or 5V24) had the smallest warhead with only 60 kg of high explosive. It had a range of about 15 km. The later version is named V-601 (or 5V27). It has a length of 6.09 m, a wing span of 2.2 m and a body diameter of 0.375 m. This missile weighs 953 kg at launch, and has a 70 kg warhead containing 33 kg of HE and 4,500 fragments. The minimum range is 3.5 km, and the maximum is 35 km (with the Pechora 2A). The intercept altitudes are between 100 m and 18 km. The S-125M (1970) system uses 5V27. The intercept altitudes are between 20 m and 14 km. The minimum range is 2.5 km, and the maximum is 22 km. The S-125M1 (1978) system uses 5V27D. In the early 1980s established for each system 1-2 radar simulator (against anti radar missiles assigned). The S-125 is somewhat mobile, an improvement over the S-75 system. The missiles are typically deployed on fixed turrets containing two or four but can be carried ready-to-fire on ZIL trucks in pairs. Reloading the fixed launchers takes a few minutes.

HQ-16 Chinese 6x6 Medium-Range Surface-to-Air Missile System

Tiers:

Variants:

- **HQ-16A:** An improved version that uses an improved missile with slightly better performance.
- **HQ-16B:** A 70-km range version of the HQ-16 has been developed by the China Academy of Defense Technology (CASIC), according to IHS Jane's Defence Weekly(Sept. 7, 2016). Development of this variant reportedly began in 2005. The HQ-16B title is a Western designation.
- **LY-80:** An export version of the HQ-16A.
- **HHQ-16 (Red Sea 16):** This is the naval variant installed on China’s Type 054A JIANGKAI II-class frigates. The missile can reportedly intercept sea-skimming missiles flying less than 30 ft (10 m) above the surface of the ocean. Aboard the JIANGKAI II-class frigates, a single, 32-cell vertical launch system carries the missiles. Guidance is provided by four MR090 Front Dome C/X-band fire-control radars.
- **HQ-17:** According to some reports, this is an improved version of the HQ-16 with range of 56 mi (90 km). This variant may include digital electronics, new display screens, and improved training and simulation facilities. (Military Periscope, June 2017)

System

Alternative Designation: HQ-16A, LY-80 (Export Version), Hong Qi 16 (Red Flag 16), CSA-16
Function: In Chinese armed forces the HQ-16 fits the gap between the short-range HQ-7 and medium- to long rande HQ-9. This air defense system is mainly used to protect stationary assets such as airfields, command posts, concentration of troops, bridges, and other important targets.
Chassis: 6 x 6 high mobility wheeled truck based upon the Taian TA5350
Target: Aircraft, cruise missiles, UAVs, and short and medium range ballistic missiles
Crew: INA

Dimensions (Chassis: TA5350)

Length: INA
Width: INA

Height: INA

Weight, Empty: tons15

Payload Capacity: tons15

Automotive (Chassis: TA5350)

Engine Name: Deutz BF6M1015

Engine Type: Turbocharged Diesel

Engine Power: hp250

Fording Depth: m1

Range, Cruising: km1,000

Maximum Road Speed: km/h85

Gradient: %60

Side slope: %30

Vertical step: m.5

Trench: m.6

Other Capabilities: Central tire inflation system

Crew Capacity: 1 driver, 5 passengers

Main Weapon System

↳*Launcher*

Name: INA

Type: Transporter-Erector-Launcher on a 6 x 6 chassis with cold-launch vertical launch tubes.

Missile Storage: Missiles are store in containers and are launched vertically.

Firing Position: In the firing position, the wheels are raised off the ground and the vehicle is supported at four points by hydraulic jacks: two at the rear and one on each side.

Note: The HQ-16 launcher is based on Taian TA5350 6x6 special wheeled chassis. The TEL carries 6 containers with missiles. Missiles are launcher vertically. Two missiles can be launched within a short period of time.

↳*Missile*

Name: INA. It is reported that the missile is very similar to the 9M38 Missile.

Type: Surface-to-air missile

Length: m5

Diameter: m0.34

Weight: kg330

Warhead Type: HE-Frag

Warhead Weight: kg70

Maximum Altitude: km10

Minimum Altitude: m100

Fire on Move: No

Elevation: Vertical Launch

Probability of Kill: 85% vs aircraft and 60% vs cruise missiles

Guidance System: inertial navigation, radio mid-course updates, semi-active terminal homing

Missile Speed: Mach 4

Range of Proximity Fuse: m35

Maximum Range vs. Aircraft: km40

Cruise Missile Range: km3.5 to 18

Fire Control System

IFF: Yes, within the radar

Guidance System: Inertial navigation, radio mid-course updates, semi-active terminal homing

↳*Search Radar Guidance Vehicle*

Name: INA

Type: Search Radar Guidance Vehicle

Maximum Range: km150

Maximum Altitude: km20

Band: solid-state S-band three-dimensional mast-mounted passive phased-array radar.

IFF: Yes

Note: When a target is identified, the vehicle automatically performs identification-friend-or-foe (IFF), threat analysis and flight-path processing tasks. It then provides target eng agement data to the tracking-and-guidance radar.

↳*Tracking-and-Guidance Radar Vehicle*

Name: INA

Type: Tracking-and-Guidance Radar Vehicle

Function: The tracking-and-guidance radar provides target acquisition, tracking and identification of target types. It controls the missile launch and illuminates the target after the missile is fired.

Maximum Range: km85

Band: L-Band

Fire Control and Guidance: Fire control and guidance can be provided for up to eight missiles.

Targets: It can detect up to six targets and track four simultaneously.

Protection

Armor Hull: Protection from small arms fire and projectile splinters

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The HQ-16 is a Chinese-made, medium range, surface-to-air missile system which was introduced in the Chinese armed forces in September 2011. The HQ-16 is produced by China Aerospace Science and Technology Corp (CASC). Using advanced technologies of intermittent illumination, semi-active radar homing guidance, phased array radar, vertical cold launch, and radio communication network, the HQ-16 can be operated in a strong elector-magnetic interference environment and in all weather conditions. The HQ-16 is a land based version of the HHQ-16 system used in ships and fired from VLS (Vertical Launch System) containers. The HQ-16 is based on a joint development of the Russian Buk-M1 (SA-11 'Gadfly') and Buk-2M (SA-17 'Grizzly') Surface-to-Air Missile (SAM) systems for use from mobile ground vehicles and later from ships. The HQ-16 is able to engage aerial targets at high altitude. The mid-range HQ-16 is also able to intercept very low-flying targets at a distance of up to about 40 kilometers, filling the gap between the HQ-7 short-range SAM and the HQ-9 long-range SAM systems. The HQ-16 missile can hit targets at an altitude from 400 to 10,000 meters. According to the SIPRI (Stockholm International Peace Research Institute) arms transfers' database, three units of the LY-80 (HQ-16 alternated designation) were ordered by Pakistan in 2014 and delivered in 2015/2016. The Pakistan Army formally inducted the LY-80 (HQ-16) medium-range surface-to-air missile (SAM) system on March 12, 2017. In January 2018, the Pakistani army performed the first live firing with the LY-80 during the Al Bayza-2019 military exercise. The HQ-16 is mainly used to protect stationary assets such as airfields, bridges, command posts, concentrations of troops, and other high value assets. The battalion of the HQ-16 consists of twelve launcher vehicles (four in each battery), a command and control vehicle, three tracking and guidance radar vehicles (one in each battery), a target searching radar vehicle, and several missile transport and reloading vehicles, and power supply vehicles, most using the same 6 x 6 chassis.

MIM-23B I-Hawk American Surface-to-Air Missile (SAM) System

Tiers:

1 2 3 **4**

Parent:

MIM-23 Hawk American Surface-to-Air Missile (SAM) System

Variants:

- **I-Hawk (Improved Hawk /Hawk B/MIM-23B):** This variant reached initial operating capability (IOC) in 1972. Upgrades from the original Hawk included solid-state electronics, factory certified and sealed missile round, all-altitude capability, digital automatic data processor for the information coordination central (ICC), improved solid-pro pellant rocket motor and a larger warhead.
- **Hawk Mobility Enhancement (HME):** This was jointly developed by Raytheon and the Dutch air force. It reduced number of vehicles in a Hawk firing unit from 14 trucks and trailers to seven, updated the Hawk launcher and simplified reloading.
- **Patriot /Hawk Interoperability:** This is a software upgrade to permitting Hawk missile platoons to receive targeting data from Patriot information coordination center (ICC). An April 1988 test simulated an interception of a short-range tactical missile by shooting down a missile traveling at Mach 2 and at an altitude of more than 25,000 ft (7,620 m).
- **Sparrow /Hawk Demonstration Program:** In 1985, Raytheon combined elements of two of its missile products into one system. The Sparrow /Hawk system replaced the three I-Hawks on the M192 launcher with eight AIM-7 Sparrow missiles (the original launcher had nine missiles).
- **NOAH (Norwegian Adapted Hawk):** INA
- **Iran MIM-23 Hawk variant:** Iran reportedly made several upgrades to MIM-23 missiles for the carriages of its F-14 Tomcats. Some were displayed in Tehran in September 1998.
- **Danish Enhanced Hawk (DEHAWK):** Introduced in December 2002, the Danish Enhanced Hawk (DEHAWK) was developed by Terma and Thales. After several years of delays, the program was handed over to the Danish Air Materiel Command.

System

Alternative Designation: MIM-23B Hawk, MIM-23 I-Hawk
Type: medium-range surface-to-air missile.
Family: MIM-23 Hawk Family
Manufacturer: Raytheon Company
In Service: 1971-Present
Crew: eaINA
Displacement Time: minutesINA
Emplacement Time: minutesINA
Fire on the Move: No

Note #1: The original Hawk has been phased out of NATO and U.S. service, although several countries have missiles in storage. All active Hawk missiles are the I-Hawk variant.

Note #2: Product Improvement Plan In 1973 the US Army started an extensive multi-phase Hawk PIP (Product Improvement Plan), mainly intended to improve and upgrade the numerous items of ground equipment. Phase I Phase I involved replacement of the CWAR with the AN/MPQ-55 Improved CWAR (ICWAR), and the upgrade of the AN/MPQ-50 PAR to Improved PAR (IPAR) configuration by the addition of a digital MTI (Moving Target Indicator). The first PIP Phase I systems were fielded between 1979 and 1981. Phase II Developed from 1978 and fielded between 1983 and 1986. upgraded the AN/MPQ-46 HPI to AN/MPQ-57 standard by replacing some of the vacuum tube based electronics with modern solid-state circuits, and added an optical TAS (Tracking Adjunct System). The TAS, designated OD-179/TVY, is an electro-optical (TV) tracking system that increases Hawk operability and survivability in a high-ECM environment. Phase III The PIP Phase III development was started in 1983, and was first fielded by U. S. forces in 1989. Phase III was a major upgrade which significantly enhanced the computer hardware and software for most components of the system, a new CWAR the AN/MPQ-62, added single-scan target detection capability, and upgraded the HPI to AN/MPQ-61 standard by addition of a Low-Altitude Simultaneous Hawk Engagement (LASHE) system. LASHE allows the Hawk system to counter saturation attacks by simultaneously intercepting multiple low-level targets. The ROR was phased out in Phase III Hawk units.

Dimensions

Length: m5.03

Diameter: m0.37

Wingspan: m1.21

Weight, Combat: kg640

Warhead Weight: kg54

Automotive

Engine Name: 1 x Aerojet dual-thrust solid-fuel rocket (M112 motor)

Engine Type: Solid-fuel rocket engine

Speed: Mach 2.7

Transporter: The Hawk missile is transported and launched from the M192 towed triple-missile launcher.

M112 Motor Burn Rate: a 5-second boost phase and a sustain phase of around 21 seconds.

M112 Motor Weight: 395 kg including 295 kg of propellant.

Communications

Note: See Fire Control

Missile System

Name: MIM-23B

Type: Semi-active Radar Homing Missile

Guidance: Semi-active Radar Homing

Length/Caliber: INA

Maximum Effective Range: km35

Minimum Effective Range: km1.5

Maximum Altitude: km18

Minimum Altitude: m30

Max Elevation: INA

Min Elevation: INA

Traverse Range: INA

Traverse Left: INA

Traverse Right: INA

Max Rate of Fire: INA

Launcher: M192 towed triple-missile launcher

Reflector: low side lobe, high-gain plane antenna to reduce sensitivity to ground clutter

Warhead Type: Conventional high-explosive blast fragmentation

Warhead Weight: kg54

Warhead Fragments Speed: 2,000 meters per second

Warhead Fragments: 14,000 2-gram (0.071 oz) fragments

Warhead Fragments Arc: deg70

Fuze Type: radio frequency proximity and impact fuses

Speed: Mach 2.5

Guidance System: X-band CW monopulse semi-active radar seeker.

Kill Probability: 0.85 (Improvement from the MIM-23A)

Mean Time Between Failures (MTBF): 300-400 hours

Peak Velocity: 500 m/s

Maximum Maneuver Speed: 15 Gs

Fire Control

Note: The original Hawk system used 4 or in some models 6 radars: to detect (PAR and CWAR), to track (CWAR and HPIR) and to engage (HPIR and ROR) targets.

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Digital Data Processing Central Information Coordinator: Yes, for Target Processing, Threat Ordering, and Intercept Evaluation.

↳*Radar #1*

Name: AN/MPQ-50 (Improved Hawk to Phase III)

Type: PAR Pulse Acquisition Radar

Digital MTI (Moving Target Indicator): Yes

Frequency: 500 to 1,000 MHz

Band: C-Band

Peak Operating Power: 1,000 watts

High PRF Range: 104 km

Low PRF Range: 96 km

↳*Radar #2*

Name: AN/MPQ-48 (Improved Hawk)

Type: CWAR Continuous Wave Acquisition Radar

Power Rating: Watts400

Frequency: 10 GHz (X-Band)

Range: 69 km (43 mi) (CW) to 63 km (39 mi) (FM) versus 3 m2 (32 sq ft) target.

↳*Radar #3*

Name: AN/MPQ-46 (Improved Hawk – Phase I)

Type: HPIR High Power Illuminating Radar

Power Output: Watts125

Operating GHz Band: 10-20 GHz J band

Range: 99 km (62 mi) (high PRF) to 93 km (58 mi) (low PRF) versus 3 m2 (32 sq ft) target.

↳*Radar #4*

Name: AN/MPQ-51 (Improved Hawk – Phase II)

Type: ROR Range Only Radar

Frequency: 15.5-17.5 GHz)

Pusle Radar: Yes

Power Output: 120 kW

Pusle Length: 0.6 µs

Pulse Repetition Frequency: 1600 Hz

Range: 83 km (52 mi) versus 3 m2 (32 sq ft) target

Protection

Hull Armor: INA

Turret Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

The Raytheon MIM-23 Hawk (or HAWK: Homing All the Way Killer) is an American medium-range surface-to-air missile. The MIM-23 I-Hawk or MIM-23B has a larger 74 kg (163 lb) blast-fragmentation warhead, a smaller and improved guidance package, and a new M112 rocket motor. The new warhead produces approximately 14,000 2-gram (0.071 oz) fragments that cover a much larger 70 degree arc. The missiles M112 rocket motor has a boost phase of 5 seconds and a sustain phase of 21 seconds. The motors total weight is 395 kg (871 lb) including 295 kg (650 lb) of propellant. This new motor improves the engagement envelope to 1.5 to 40 km (0.93 to 24.85 mi) in range at high altitude, and 2.5 to 20 km (1.6 to 12.4 mi) at low altitude, the minimum engagement altitude is 60 meters (200 ft). The missile was operational in 1971. All US units had converted to this standard by 1978. A typical Phase-III MIM-23B Hawk battery consists of: 1 × PAR: Pulse Acquisition Radar—a search radar with a 20 (+/−2) rpm rotation, for high/medium altitude target detection. 1 × CWAR: Continuous Wave Acquisition Radar—a search doppler radar with a 20 (+/−2) rpm rotation, for low altitude target detection. 2 × HIPIR: HIgh Power Illuminator doppler Radar—target tracking, illumination and missile guidance. 1 × FDC: Fire Direction Center 1 × IFF: Identification Friend or Foe Transceiver 6 × DLN: Digital Launchers with 18 missiles. 6 × MEP-816: Generators 60KW (400 Hz) each. 12 × M-390: Missile transport pallets with 36 missiles 3 × M-501: Missile loading tractors. 1 × [bucket loader]

9K317M Buk-M3 (9K37M3) Russian Medium-Range Air Defense Missile System

Tiers:

1 2 3 4

System

Alternative Designation: 9K317M Buk-M3 (SA-X-27); SA-17

Family: Muk

Type: Medium-Range Air Defense Missile System

Manufacturer: Almaz-Antey:

In Service: 2016-Present

Crew: ea4

Chassis: GM-5955 chassis

Dimensions (GM-5955 chassis)

Length: m7.5

Width: m3.3

Height: m5.1

Weight, Combat: tons34

Ground Clearance: mm450

Ground Pressure: kg/mINA

Automotive (GM-5955 chassis)

Engine Name: V-46

Engine Type: Multifuel Diesel

Engine Power: hp710

Cruising Range: km500

Speed, Maximum Road: km/h70

Speed, Average Cross: km/hINA

Speed Maximum Swim: km/hNot Amphibious

Transporter Erector Launcher and Radar (TELAR)

Name: 9A317M

Chassis: GM-5955 chassis

Basic Load (9M317M missiles): ea6

Array Radar: two array radars. the first radar if for target tracking and fire control by illumination of the target and the the secondary radar is a smaller backup array radar

Fire Control Radar Band: C Band

Antena Type: phased array antenna

Continuous Wave (CW) Illumination Capable: Yes

Target Detecting Capability: detecting targets with an RCS of at least 2 m2 out to a maximum range of 120 km

IR Tracking: Yes, electro-optical IR tracking system

Steering: electronic beam steering

↳***Missile (Option 1)***

Name: 9M317M Missile

Type: surface-to-air missile

Engine: dual-mode solid-propellant rocket engine

Maximum Altitude: km35

Maximum Speed: m/s1,550

Maximum G Force: g24

Maximum Effective Range: km70

Minimum Effective Range: km2.5

Fuze Type: 9E346 radio proximity fuze

Turbogenerator: solid propellant-based gas generator

Missile Length: m5.18

Missile Diameter: mm360

Missile Weight: kg581

Rear Control Fins Length: mm820

Missile Storage Life: years10

Guidance System: semi-active radar homing guidance system

Autopilot: Yes

Inertail Navigation: Yes

Radar Homing Receiver: 9E432 semi-active radar homing receiver for terminal phase guidance

Warhead Weight: kg62

Warhead Type: HE-FRAG

Active Seeker: 9E432 semi-active seeker

Basic Load: ea6

Note #1: Unlike its predesesors, the Buk-M3 carries its missiles in launch containers rahter than the naked missle being mounted on launch rails atop the launch vehicle

Note: #2: The 9M317M is capable of engaging targets travelling as fast as 3,000 meters per second.

↳*Missile (Option 2)*

Name: 9M317MA

Type: surface-to-air missile

Active Seeker: ARGSN 9B-1103M active seeker

Engine: dual-mode solid-propellant rocket engine with an extended burn time

Maximum Effective Range: km70

Minimum Effective Range: km2

Maximum Altitude: km35

TELAR Types: The 9M317MA can be launched from either the 9A317M TELAR vehicle, or the 9A316M TEL.

Maximum Speed: m/s1,550

Maximum G Force: g24

Fuze Type: 9E346 radio proximity fuze

Turbogenerator: solid propellant-based gas generator

Missile Length: m5.18

Missile Diameter: mm360

Missile Weight: kg581

Rear Control Fins Length: mm820

Guidance System: active radar homing guidance system

Radar Seeker: ARGSN 9B-1103M active radar seeker

Warhead Weight: kg62

Warhead Type: HE-FRAG

Note: The 9M317MA is capable of engaging targets travelling as fast as 3,000 meters per second.

Targeting and Guidance Systems Vehicles

↳*Search Radar Vehicle*

Name: 9S18M1-3 Kupol-M1-3 (NATO: Snow Drift)

Chassis: GM-5955 chassis

Maximum Speed: km/h56

Maximum Range: km/h250

Fuel Timeline: A maximum of 2 hours of fuel

Crew: 3 (driver-mechanic, an operator, and a senior operator)

Array Radar: flat-faced 3D pulsed phased array radar

Radar Band: S Band

Maximum Target Range: km150

Minimum Target Range: km10

Number of Targets Capable of Tracking: ea120

Maximum Altitude: km25

Search Modes: one for aerial threats, the second for ballistic threats

Range Resolution: m200

Angular Coordinate Resolution: 3° in azimuth and 4.5° in elevation

Rotational Speeds: 5 individual settings. 4 s, 5 s, 6 s, 9 s, 60 s to complete a single rotation.

Road March State to Ready State Timeline: min5

↳***Fire Control Radar Vehicle***

Name: 9A36M

Chassis: GM-5955 chassis

Antenna: 21 m telescoping mast

Radar Capability: detecting targets with an RCS of at least 2 meters squared out to a maximum range of 120 km

Number of Targets: 10 simultaneous targets

Steering: electronic beam steering

Operating Mode: two: the first being a track while scan mode and the second being the pure target tracking mode

Notes:

The Buk M3 (Beech M3) is a brand new Russian air defense system. It uses new missile and has advanced electronic components. It has much improved capabilities comparing with the older Buk systems. It outperforms even the old S-300P long-range air defense system. A single Buk-M3 complex (including several launch vehicles) is capable of engaging up to 36 different targets simultaneously from any angle, while a single fire-control radar is capable of supporting the engagement of up to 6 different targets simultaneously within a sector 120° in azimuth and 85° in elevation. In terms of organisation, one Buk-M3 brigade would be expected to consist of four "divisions" (approximately a battalion set), with a single 9S52 Polyana-D4 Brigade C2 or similar vehicle in control of all four "divisions". One "divizion" is typically composed of three batteries, with one command vehicle and one search radar vehicle responsible for three batteries. Each battery would be composed battery would consist of 2 launch vehicles. These launch vehicles can be either one 9A317M TELAR and a 9A316M TEL, or two 9A316M TELs and a single 9S36M illumination and guidance radar vehicle. It should be noted that "divizion" means 'division', but this measurement takes on a different meaning when dealing with Russian anti-air unit sets as opposed to personnel or armour formations, and so the term has been transliterated rather than translated to reflect this difference of meaning and avoid confusion. It is perhaps most accurately translated into English as a battalion set. The table below displays the principle vehicles known to be included within a "divizion" (battalion set):

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: INA

Direct Fire: Yes

Indirect Fire: Yes

↳*Radar*

Name: Flap Lid

Type: Phased Array Radar

Function: Target Radar

Frequency/Band: I/J-Band

Maximum Range: km300

Number of Targets System can Track: Flap Lid provides for the simultaneous tracking of six targets with each of these being engaged by two missiles.

Counter Measure: It is stated that the radar is highly resistant to electronic countermeasures and has a high-resolution capability.

Sector of Interest: The whole radar cabin is mounted on a turntable and used to slew the phased array to cover a 60 or 100 degree sector of interest.

Target Elecation Coverage: Flap Lid has a target elevation coverage reported to be from 0 to 50º, but is believed to have been modified to provide cover up to 75º for ballistic missile defence.

Protection

Hull Armor: INA
Applique Armor: No
Explosive Reactive Armor: No
Active Protection System: No
Mine Clearing: No
Self-Entrenching Blade: No
NBC Protection: INA
Smoke Equipment: INA

Notes:

The KN-06 (Korean: □□ 5□; MR: Pon'gae-5) is a North Korean surface-to-air missile system. The system was first shown publicly at the 65th anniversary of the Workers' Party of Korea on October 10, 2010. The KN-06 is a long-range SAM that bears resemblance to the Russian S-300 and Chinese FT-2000. Imagery of missile launch tubes shows they are larger in diameter, but shorter than the S-300's missiles. The missiles are mounted on locally produced, stretched 6X6 KamAZ 55111 (Taebaeksan 96) launcher trucks, with each holding two or three missile tubes. The KN-06 is reportedly capable of hitting targets minimum up to 250 kilometres (160 mi) away. The system is equipped with a Flap Lid type phased array radar. A test launch occurred in June 2011. Another test launch, attended by Kim Jong-Un was reported on 2 April 2016. As of May 2017, it was reportedly still undergoing testing. The system underwent final testing on May 28, 2017 with KCNA reporting that 'glitches' previously identified during testing had been resolved. It said the new system would be mass-produced and deployed across the country. As many as 156 KN-06 launchers could be operational according to the Center for Strategic and International Studies.

S-200 Dubna (SA-5 Gammon) (Export) North Korean Surface-to-Air Missile (SAM) System

Tiers:

Variants:

- **SA-5a (S-200A Angara):** This missile attained initial operating capability in 1962 on the "Tallinn line" with conventional warheads. System includes a V-860/5V21 or V-860P/5V21A missile; range, 88 mi (160 km); and ceiling, 66,000 ft (20 km).
- **SA-5b (S-200V Vega):** This version reached initial operating capability in 1970 with nuclear warhead. Other versions include the S-200 Vega with a V-870 missile and range 186 mi (300 km). Also: S-200M Vega-M with a V-880E/5V28E missile, export version, high-explosive warhead only, with a range of 155 mi (250 km) and, ceiling of 95,000 ft (29 km).
- **SA-5c (S-200D Dubna):** The SA-5c's initial operating capability was attained in 1975 with a dual-capable (nuclear or conventional) warhead and upgraded terminal homing capability. Characteristics include a 5V25V, V-880M/5V28M or V-880MN/5V28MN2 missile, with a range of 248 mi (400 km) and a ceiling of 125,000 ft (40 km).
- **SA-5d:** This designation was briefly used for the SA-X-12 Gladiator missile.
- **SA-5e:** This variant attained initial operating capability in 1983 with a passive anti-radiation seeker. It was probably designed to be used against AWACS aircraft

System

Alternative Designation: SA-5 Gammon; S-200 Angara (Russian system designation) S-200 Volga (Russian system designation) S-200 Vega (Russian system designation) V-860 (Russian missile designator) 5V28 (Russian missile designator)

Type: A very long range, medium-to-high altitude surface-to-air missile (SAM) system.

Family: SA-5 Series

In Service: 1967-Present

Wars: First Libyan Civil War Syrian Civil War

Notes:

The S-200 Volga (SA-5 Gammon**) is a Russian long-range, high-altitude strategic surface-to-air missile (SAM). It is a fixed-site, point defense SAM that relies on long range early warning and ground control intercept radars (Big Back, Bar Lock , Tin Shield and Side Net) for target tracking information and 5N62 series Square Pair** radar for fire control. The S-200 surface-to-air missile system was designed for the defense of the most important administrative, industrial and military installations from all types of air attack. S-200 provides defeat of modern and advanced aircraft, including air command and control centers, AWACS aircraft, aircraft jamming creation and other manned and unmanned aerial vehicles. The S-200 is an all-weather system that can be operated in various climatic conditions. By 1966, the S-200 was officially accepted into service in order to replace the failed anti-ballistic missile RZ-25/5V11 "Dal". The Dal was assigned the NATO reporting name SA-5 "Griffon" before it was cancelled. The first S-200 operational regiments were deployed in 1966 with 18 sites and 342 launchers in service by the end of the year. By 1968 there were 40 sites, and by 1969 there were 60 sites. The growth in numbers then gradually increased throughout the 1970s (1,100 launchers) and early 1980s until the peak of 130 sites and 2,030 launchers was reached in 1980–1990. Each missile is launched by 4 solid-fueled strap-on rocket boosters.[7] After they burn out and drop away (between 3 and 5.1 seconds from launch) it fires a 5D67 liquid fueled sustainer rocket engine (for 51–150 seconds) which burns a fuel called TG-02 Samin (50% xylidine and 50% triethylamine), oxidized by an agent called AK-27P Melange (red fuming nitric acid enriched with nitrogen oxides, phosphoric acid and hydrofluoric acid). Maximum range is between 150 km (81 nmi) and 300 km (160 nmi), depending on the model. The missile uses radio illumination mid-course correction to fly towards the target with a terminal semi-active radar homing phase. Maximum target speed is around Mach 6 for new model and Mach 4 for earlier model. Effective altitude is 300 m (980 ft) to 20,000 m (66,000 ft) for early models and up to 35,000 m (115,000 ft) for later models. The warhead is either 217 kg (478 lb) high-explosive fragmentation (16,000 × 2 g fragmentation pellets and 21,000 × 3.5 g pellets) triggered by radar proximity fuse or command signal, or a 25 kt nuclear warhead triggered by command signal only. Each missile weighs around 7,108 kg (15,670 lb) at takeoff. The system utilises radio semi active guidance throughout the missile's flight, which is far more accurate at long range than the command guidance method used by the earlier S-75 Dvina and other missiles. The existence of an optional terminal passive radar homing mode for use against airborne early warning (AEW) aircraft remains unconfirmed. Peak missile speed is around Mach 8 and the single-shot kill probability is quoted as 0.85, presumably against a high altitude bomber-type target. The fire control radar of the S-200 system is the 5N62 (NATO: Square Pair) H band continuous wave radar, whose range is 270 km (170 mi). It is used for both the tracking of targets and their illumination. Additional radar systems * P-14/5N84A "Tall King" A-band early warning radar (range 600 km (370 mi), 2–6 RPM, maximum search altitude 46 km (29 mi)) * "Big Back" E-band early warning radar 600 km (370 mi) Kabina 66/5N87 "Back Net" or "Back Trap" E-band early warning radar (with special low-altitude search mod, range 370 km (230 mi), 3–6 RPM) * P-35/37 "Bar Lock\Bar Lock B" 1,000 kW E\F-band target detection and tracking radar (with integrated IFF, range 392 km (244 mi), 7 RPM) * "Side Net" or "Odd Pair" E-band height finding radar (also used by the SA-2, SA-4 and SA-6, range 240 km (150 mi), 3–6 RPM) P-15M(2) "Squat Eye" 380 kW C-band target detection radar (range 128 km (80 mi)

SA-20C (S-300PMU-2) Iranian-Long Range Air Defense Missile System

Tiers:

Parent:

SA-20 Gargoyle (S-300PMU-1) Russian Surface-to-Air Missile (SAM) System

Variants:

- **S-300PMU2 Favorit/SA-20B:** This is an upgraded variant with larger 9M96E and 9M96E2 missiles developed for the S-400 . It can also fire the previous 5V55K , 5V55R , 48N6E and 48N6E2 missiles. It is equipped with an improved guidance system. Unveiled in 1997, the system has an increased range of 124 mi (200 km). The 48N6E2 missile features a warhead designed to destroy ballistic missiles.

System

Alternative Designation: SA-20C, Iranian S-300PMU-2)
Manufacturer: MZiK
Type: long range surface-to-air missile systems. multi-channel mobile air defense system
Family: S-300 Family
In Service: 1997-Present
Crew: eaINA
Chassis: MAZ-543 Special Wheeled Chassis
Displacement Time: INA
Emplacement Time: 5 Minutes
Maximum Range of Fire: km165
Maximum Altitude: km27
Number of Targets Engaged Simultaneously: ea6
Reload Vehicile: 5T58 reload vehicle
Note #1: Capable of hitting ballistic and aerodynamic targets. Became the first multi-channel anti-aircraft missile system, is able to accompany each system (ADMS) to 6 goals and build them up to 12 missiles
Note #2: A typical SA-20 battery consists of 48 missiles on 12 mobile launchers. Each battery can launch a 48N6 missile every three seconds.

Dimensions (MAZ-543 Special Wheeled Chassis)

Length: m11.7

Width: m3.07

Height: m2.92

Maximum Load: tons15

Ground Pressure: INA

Automotive (MAZ-543 Special Wheeled Chassis)

Engine Name: D12A-525 38.9-liter Diesel

Engine Type: Diesel

Engine Power: hp525

Cruising Range: km650

Speed, Maximum Road: km/h65

Speed, Average Cross: km/hINA

Speed Maximum Swim: km/hNot Amphibious

Configuration: 8x8

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.6

Trench: m2

Fording Depth: m1.3

Communications

Note: See Fire Control

Missile System

Note #1: The S-300 family missiles have four clipped folding triangular moving control fins at the rear and four thrust vector control vanes in the motor efflux.

Note #2: Missiles are vertically launched by a hot gas cartridge in the canister base. The motor ignites once the missile reaches an altitude of 25 m.

↳*Missile Launcher*

Name: 5P85S or 5P85D launchers

Type: Tube Launcher

Anti-Ballistic Missile (ABM) Capability: Yes

Note: The missiles can be fired in a salvo with an interval between 3 and 5 seconds

↳*Missile (Option 1)*

Name: 48N6E2

Engine Type: Single-stage, solid-fuel-propelled

Type: INA

Length: m7.5

Width: m0.5

Weight: kg1,780

Warhead Weight: 70-100 kg

Maximum Range: km200

Guidance System: Track-via-missile

TVM Guidance Capable: Yes

ABM Capable: Yes

Maximum Velocity: m/s2,000

Speed: Mach 6

Kill Probability: 0.70 to 0.93 single shot

Ballistic Targets Range: km5-40

Basic Load: 4 per TEL

Maximum Altitude: km28

Minimum Altitude: m10

Note: The 48N6E2 can engage targets with a maximum speed of Mach 8.

↳*Missile (Option 2)*

Name: 5V55R/5V55KD

Type: INA

Length: m7

Diameter: mm450

Weight: kg1,450

Warhead Weight: kg100

Maximum Range: km90

Guidance System: SARH

Maximum Velocity: m/s1,900

Maximum Target Speed: m/s1,150

Basic Load: 4 per TEL

↳*Missile (Option 3)*

Name: 9M96E1

Type: INA

Length: INA

Width: INA

Weight: kg330

Warhead Weight: kg24

Maximum Range: km40

Guidance System: Active radar homing

Maximum Velocity: m/s900

Maximum Target Speed: 4,800–5,000 m/s

Basic Load: 4 per TEL

Probability of Kill: 0.7 against a tactical ballistic missile

↳*Missile (Option 4)*

Name: 9M96E2

Type: INA

Width: INA

Weight: kg420

Warhead Weight: kg24

Maximum Range: km120

Guidance System: Active radar homing

Maximum Velocity: m/s1,000

Maximum Target Speed: 4,800–5,000 m/s

Basic Load: 4 per TEL

Probability of Kill: 0.7 against a tactical ballistic missile

Fire Control

Command Post Vehicle: 54K6E2 Command Post Vehicle

↳*Fire Control System*

Name: 83M6E2 Command and Control System

Computerized FCS: Yes

Direct Fire: Yes, no less than 1km

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Number of Targets Engaged Simultaneously: ea6

GPS/GLONASS Enabled: Yes

Loran-C Capable: Yes

Fiber-optic Gyros: Yes

Note #1: The vehicle lowers four hydraulic jacks for launch

Note #2: The S-300PMU2 air defense missile system can simultaneously engage up to 36 air targets by 72 missiles.

↳*Radar #1*

Name: 64N6 BIG BIRD

Type: Surveillance and Target Acquisition Radar

NATO Reporting Name: BIG BIRD

Frequency/Band: 3D S-band radar

Target Detection Range: km600

Simultaneously Detected Targets: +300

Note #1: It has 3 400 elements on each side (a total of 7 800), which is a great number for a radar in this band

Note #2: Regiment Radar

↳*Radar #2*

Name: 30N6E2 Tomb Stone

Type: Illumination and Guidance Radar

Mission: primarily designed to be used as an engagement radar and to track targets and guide missiles to impact using a command link channel

NATO Reporting Name: FLAP LID B

NATO Frequency Band: I-J

Target Detection Range: km300

Azimuth Detection: deg360

Number of Tragets Detection: ea100

Simultaneously Engaged Targets: ea6

Maximum Target Speed: 30 - 2,800 m/s

Antenna: Antenna RPN 30N6E2 may rise to a special mobile tower 40V6M.

Chassis: The 30N6E2 Tomb stone radar is mounted on the high mobility truck chassis 8x8 MAZ-7910 vehicle derived from the MAZ-543

Missile Control: km72

Time Ready to Work: min5

Maximum Elevation: deg+60

Minimum Elevation: deg-3

↳*Radar #3*

Name: 96L6E - CHEESE BOARD Radar

Type: 3D early-warning and acquisition radar

NATO Reporting Name: CHEESE BOARD

Introduction Date: 1997

NATO Frequency Band: INA

Target Detection Range: km300

Simultaneously Tracked Targets: ea100

Works in Conjunction with: the 83M6E2 control post and S-300MPU2 launchers

Chassis: MAZ-7930 (8x8) truck chassis and is intended for use with the S-300PMU and S-300PMU1 air defence systems as an upgrade to replace several existing radar's with a single more capable system

Band: C-Band

Crew: Three operators are needed to run the set. Up to five operator consoles are provided

Antenna: The phased-array antenna with 96 radiating rows employs mechanical beamsteering in azimuth and electronic beamsteering in elevation

Antenna Rotation: 5-10 rpm

Mean Time Betweeen Critical Failure: 10,000 hours

High Jam Resistance: Yes

Frequency Hoppying: Yes

High Clutter Rejection: Yes

Operation Modes: There are two operation modes implemented: Low altitude targets can be acquired by constraining the mainlobe elevation angle between -3° and +1.5° using an antenna rotation of 5 rpm

Note: The 96L6E “Cheese Board” is designed to replace the 36D6 “Tin Shield B” and 76N6 “Clam Shell”.

Protection

Hull Armor: INA

Turret Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Camouflage Nets: Yes, Standard

Note: Protection. Additional elements of protection are the placement of components of C-300 in the trenches (practiced as placing on the hills for a better view and more rapid care of the horizon, and in the trenches for stealth and protection against fragments of explosions).

Notes:

The SA-20C is a exported version of the S-300PMU-2 The S-300PMU-2 or SA-20B Favorit air defense missile system was developed specially for export. It evolved from the S-300PM-2, which was developed for the Russian Armed Forces. The S-300PMU-2 has the highest capabilities in the S-300P family. It was introduced in 1997. As of 2016 this system is 19 years old. The S-300PMU-2 is referred in the West as SA-20B Gargoyle. It uses a 30N6E1 (Tomb Stone) radar. This radar has a range of 300 km, can detect 100 targets, track and engage 36 of them and guide 72 missiles. It is worth noting that earlier radars of the S-300 family could simultaneously engage only 6 targets and guide 12 missiles. The S-300PMU-2 Favourite (DoD designation SA-20B), introduced in 1997 (presented ready 1996), is an upgrade to the S-300PMU-1 with range extended once again to 195 km (121 mi) with the introduction of the 48N6E2 missile. This system is apparently capable against not just short range ballistic missiles, but now also medium range ballistic missiles. It uses the 83M6E2 command and control system, consisting of the

54K6E2 command post vehicle and the 64N6E2 surveillance/detection radar. It employs the 30N6E2 fire control/illumination and guidance radar. Like the S-300PMU-1, 12 TELs can be controlled, with any mix of 5P85SE2 self-propelled and 5P85TE2 trailer launchers. Optionally it can make use of the 96L6E all altitude detection radar and 76N6 low altitude detection radar. A version titled HQ-15 is currently in Chinese service.

S-200 Dubna (SA-5 Gammon) Russian Surface-to-Air Missile (SAM) System

Tiers:

Variants:

- **SA-5a (S-200A Angara):** This missile attained initial operating capability in 1962 on the "Tallinn line" with conventional warheads. System includes a V-860/5V21 or V-860P/5V21A missile; range, 88 mi (160 km); and ceiling, 66,000 ft (20 km).
- **SA-5b (S-200V Vega):** This version reached initial operating capability in 1970 with nuclear warhead. Other versions include the S-200 Vega with a V-870 missile and range 186 mi (300 km). Also: S-200M Vega-M with a V-880E/5V28E missile, export version, high-explosive warhead only, with a range of 155 mi (250 km) and, ceiling of 95,000 ft (29 km).
- **SA-5c (S-200D Dubna):** The SA-5c's initial operating capability was attained in 1975 with a dual-capable (nuclear or conventional) warhead and upgraded terminal homing capability. Characteristics include a 5V25V, V-880M/5V28M or V-880MN/5V28MN2 missile, with a range of 248 mi (400 km) and a ceiling of 125,000 ft (40 km).
- **SA-5d:** This designation was briefly used for the SA-X-12 Gladiator missile.
- **SA-5e:** This variant attained initial operating capability in 1983 with a passive anti-radiation seeker. It was probably designed to be used against AWACS aircraft

System

Alternative Designation: SA-5 Gammon; S-200 Angara (Russian system designation) S-200 Volga (Russian system designation) S-200 Vega (Russian system designation) V-860 (Russian missile designator) 5V28 (Russian missile designator)
Type: A very long range, medium-to-high altitude surface-to-air missile (SAM) system.
Family: SA-5 Series
In Service: 1967-Present
Wars: First Libyan Civil War Syrian Civil War
Crew: eaINA

Missile System

Note #1: This system is apparently capable against not just short range ballistic missiles, but now also medium range ballistic missiles.

Note #2: Against ballistic targets, such as theater ballistic missiles the S-300PMU-2 system uses the 48N6E2 missiles. Role of the 9M96E2 is to defeat more capable targets, like high speed re-entry vehicles in 35 km altitude, and ballistic missiles with a range of more than 2 000 km. The 9M96E is also capable of engaging cruise missiles, anti-radiation missiles, guided bombs and other precision guided munitions. The 48N6 missiles has single shot kill probability of 80% to 93% for an aerial target, 40% to 85% for cruise missiles and 50% to 77% for theater ballistic missiles. The 9M96 missiles has a single shot kill probability of 70% against Harpoon class missile and 90% against a manned aircraft.

↳*Missile Launcher*

Name: Like the S-300PMU-1, 12 TELs can be controlled, with any mix of 5P85SE2 self-propelled and 5P85TE2 trailer launchers.s

Type: The missiles use "cold" vertical launch - before starting sue-tainer they launched from a container to height over 30 metres.

Anti-Ballistic Missile (ABM) Capability: Yes

Note #1: The missiles can be fired in a salvo with an interval between 3 and 5 seconds

↳*Missile (Option 1)*

Name: 48N6E2 missile

Engine Type: Single-stage, solid-fuel-propelled

Type: SAM

Length: m7.5

Diameter: 0.5

Weight: kg1,800

Warhead Weight: kg150

Maximum Range: km200

Speed: Mach 6

Maximum Altitude: m10

Minimum Altitude: km28

Maximum Target Speed: Mach 8

Ballistic Missile Engagement: Yes, his missile is optimized to engage ballistic missiles.

Guidance System: Track-via-missile

Basic Load: 4 per TEL

↳*Missile (Option 2)*

Name: 9M96E1

Type: SAM

Length: m4.75

Diameter: m0.24

Weight: kg330

Warhead Weight: kg24

Maximum Range: km40

Maximum Altitude: km20

Guidance System: Active radar homing

Maximum Velocity: m/s900

Maximum Target Speed: 4,800–5,000 m/s

Basic Load: 4 per TEL

Probability of Kill: 0.7 against a tactical ballistic missile

↳*Missile (Option 3)*

Name: 9M96E2

Type: SAM

Length: m5.56

Diameter: m0.24

Weight: kg420

Warhead Weight: kg24

Maximum Range: km120

Maximum Altitude: km35

Guidance System: Active radar homing

Maximum Velocity: m/s1,000

Maximum Target Speed: 4,800–5,000 m/s

Basic Load: 4 per TEL

Probability of Kill: 0.7 against a tactical ballistic missile

Guidance System: Active radar homing

Fire Control

Command Post Vehicle: The 54K8 command-post vehicle has six operator positions. The command post can monitor data within a 300-km radius and can track 100 targets while controlling up to six interceptions. Two missiles can be launched against each target if required.

↳*Fire Control Radar System Vehicle*

Name: 30N6E2 (Tomb Stone) fire control/illumination and guidance radar

Computerized FCS: Yes

Direct Fire: Yes, no less than 1km

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Maximum Detection Range: km300

Missile Control: up to 72

Time to work: min5

Number of Targets Detection: 100

Number of Targets to Track and Engage: 36

Maximum Elevation: deg+60

Minimum Elevation: deg-3

Azimuth Detection: deg360

Maximum Target Speed: 30 - 2,800 m/s

↳*Air Surveillance Radar Vehicle*

Name: 64N6E2

Type: Long-range air surveillance radar

Maximum Detection Range: km600

Band: S-Band

Jamming Resistance: Yes, The system has high resistance against jamming.

Note: It is the most capable radar of the S-300 missile system and has a key role of defeating ballistic missiles and electronic warfare aircraft.

↳*Command Post Vehicle*

Name: 83M6E2 Command Post (CP)

Note: The 83M6E2 command post (CP) is intended for operational control of multichannel SAM system S-300 PMU, S-300 PMU1. S-300 PMU2, S-200DE and S-200VE and cooperation among SAM system groupings and with higher command. The 83M6E2 is a highly mobile automated control aid providing the above SAM systems with designation of targets including modem and future aircraft, cruise missiles, ballistic targets and other air attack means over the entire range of there practical employment, cooperation between SAM systems (also under intensive jamming conditions). To control the SAM systems, the 83M6E2 uses its own radar data and data received from the controlled SAM systems, as well as information derived from higher control aids, electronic reconnaissance troops and neighbouring SAM systems groupings.

↳*All-Altitude Detector and Acquisition Radar Vehicle*

Name: 96L6

Type: All-Altitude Detector and Acquisition Radar

Band: L-Band

Maximum Range: km300

Detect and Track Targets: 100

Target Class Identification: It identifies 4 target classes, including aircraft, helicopters, remotely piloted aerial vehicles, and missiles. It is claimed that this radar can also detect stealthy targets.

Protection

Hull Armor: INA

Turret Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Camouflage Nets: Yes, Standard

Note: Protection. Additional elements of protection are the placement of components of C-300 in the trenches (practiced as placing on the hills for a better view and more rapid care of the horizon, and in the trenches for stealth and protection against fragments of explosions).

Notes:

The S-300PMU-2 or Favorit air defense missile system was developed specially for export. It evolved from the S-300PM-2, which

was developed for the Russian Armed Forces. The S-300PMU-2 has the highest capabilities in the S-300P family. It was introduced in 1997. As of 2016 this system is 19 years old. The S-300PMU-2 is referred in the West as SA-20B Gargoyle. It uses a 30N6E1 (Tomb Stone) radar. This radar has a range of 300 km, can detect 100 targets, track and engage 36 of them and guide 72 missiles. It is worth noting that earlier radars of the S-300 family could simultaneously engage only 6 targets and guide 12 missiles. Unlike the previous S-300PMU-1, the S-300PMU-2 don't use the 36D6 (Tin Shield) and 76N6 (Clam Shell) radars. Instead the system uses 96L6 all-altitude detector and acquisition radar. The 96L6 works in L-band. It has a 300 km range and very high resolution. The system can detect and track 100 targets. It identifies 4 target classes, including aircraft, helicopters, remotely piloted aerial vehicles, and missiles. It is claimed that this radar can also detect stealthy targets. The S-300PMU2 Favorit system is comprised of: * 83M6E2 command post (CP) * up to six 90Zh6E2 air defence missile complexes * 48N6E2 air defence missiles * technical support facilities. A battery of the S-300PMU-2 also includes the 30N6E2 X-band engagement radar, the 96L6E L-band acquisition radar, eight (maximum of twelve are supported) 5P58TE/SE or 5T58-2 TELs with missiles a 54K6E2 or 55K6E command post and a 22T6E2 missile loader. Also battalions uses one or two 64N6E2 S-band radars.

S-300P (SA-10 Grumble) Russian 8x8 Long-Range Surface-to-Air Missile System

Tiers:

Variants:

- **S-300PS/S-300PM:** introduced in 1985 and is the only version thought to have been fitted with a nuclear warhead. This model saw the introduction of the modern TEL and mobile radar and command-post vehicles that were all based on the MAZ-7910 8 × 8 truck
- **S-300PMU:** introduced in 1992 for the export market and featured the upgraded 5V55U missile which still utilised the intermediate SARH terminal guidance method and smaller warhead of the 5V55R but increased the engagement envelope to give this missile roughly the same range and altitude capabilities as the newer 48N6 missile (max. range 150 km/93 mi). The radars were also upgraded, with the surveillance radar for the S-300PMU being designated 64N6 (BIG BIRD) and the illumination and guidance radar being designated 30N6-1 in the GRAU index
- **S-300PMU-1/2 (SA-20):** The S-300PMU-1 (Russian: С-300ПМУ-1, US DoD designation SA-20A, NATO reporting name SA-20 Gargoyle) was also introduced in 1993 with the new and larger 48N6 missiles for the first time in a land-based system and introduced all the same performance improvements from the S300FM version including the increased speed, range, TVM guidance and ABM capability.[14][15] The warhead is slightly smaller than the naval version at 143 kg (315 lb). This version also saw the introduction of the new and more capable 30N6E TOMB STONE radar.
- **S-300PMU-2:** ntroduced in 1997 (presented ready 1996), is an upgrade to the S-300PMU-1 with range extended once again to 195 km (121 mi) with the introduction of the 48N6E2 missile. This system is apparently capable against not just short range ballistic missiles, but now also medium range ballistic missiles.

System

Alternative Designations: S-300PM
Target: FW, heli, TBM, CM, ASM, UAV
Primary Components per Battery: 1 5P85S cmd TEL. 1 5P85D slaveTEL. 1 5P85 trailer launcher. 1 30N6 radar/fire control vehicle A 5P85SU launcher has a command shelter behind the cab. A 5P58DU TEL does not.

Communications

VHF Radio: R-168 Akveduk
HF Radio: R-161 Poisk

Weapon System

↳*Launcher System*

Name: 5P85-1 Launch Vehicles
Type: INA
Launcher Maximum Elevation: deg+90
Launcher Minimum Elevation: INA
Max Targets Engaged: 6 simultaneously
Max Missiles Guided: 12 simultaneously
Set-ip Time: 9 to 11 seconds
Close-down Time: min5
Rate of Fire: 1/3-5 sec
Armament: 4 x 5V55R SAMs per launcher

↳*Missile*

Name: 5V55R
Type: Radar Guided Missile
Length: m7

Diameter: 450mm

Weight: 1,450 kg

Warhead Weight: 100 kg

Maximum Target Speed: m/s1,150

Maximum Velocity: 1,900 m/s

Operational Range: 47 km - 75 km

Note #1: The S-300P can fire the following list of missiles: 5V55K; 5V55R; 5V55V; 5V55KD; 5V55U

Note #2: missile has active radar w/terminal homing system that can engage up to 6 targets at once

Fire Control

Note: The original S-300P utilises a combination of the 5N66M continuous-wave radar Doppler radar for target acquisition and the 30N6 FLAP LID A I/J-band phased array digitally steered tracking and engagement radar. Both are mounted on trailers.

↳*Radar #1*

Name: 30N6 Flap Lid FLAP Lid

Type: Engagement Radar

Antenna: 2.75 sq m

Band: I-J (8-20 GHz)

Interception Range: km90

Minimum Interception Altitude: m25

Maximum Target Velocity: 4,200 kmh

Target Elevation Coverage: 0-50 degrees

Screening angle: 100 degrees

Mount: The 30N6 FLAP LID A is mounted on a small trailer

Note: The 36D6 TIN SHIELD radar can also be used to augment the S-300 system to provide earlier target detection than the FLAP LID radar allows. It can detect a missile-sized target flying at an altitude of 60 metres (200 ft) at least 20 km (12 mi) away, at an altitude of 100 m (330 ft) at least 30 km (19 mi) away, and at high altitude up to 175 km (109 mi) away. In addition a 64N6 BIG BIRD E/F band target acquisition radar can be used which has a maximum detection range of 300 km (190 mi).

↳*Radar #2*

Name: 76N6 Clam Shell

Type: Acquisition Radar

Band: I (8-10 GHz)

Power: 1.4 kW continuous wave

Turn-on Time: 3 min

Setup Time (40V6M mast): 1 hour

Detection Range, Target Flying at 500 meters: km90

Detection Range, Target Flying at 1,000 meters: km120

Target Tracking: up to 180

Target Resolution Azimuth: deg1

Target Resolution Range: 1.9 km

Target Resolution Velocity: 8.7 kmh

Minimum detectable Radar Cross-Section (RCS): 0.02 sq m

Maximum Target Speed: Mach 2.1

Average Power: 1.4 kW

Peak Power: 55.0 kW

Mean Time Between Failures: 100 hours

Mount: he 76N6 CLAM SHELL (5N66M etc.) is mounted on a large trailer with a mast which is between 24 and 39 m (79 and 128 ft) tall. Usually is used with a mast.

↳***Radar #3***

Name: 64N6 (Big Bird) Surveillance Radar

Type: Designation Radar

Crew: ea6

Weight: 60,000 kg

Band: 2 GHz

Coverage Azimuth: 360 deg or 180 deg

Elevation Detection Mode: deg13.4

Elevation Tracking Mode: deg28

Ballistic Target Detection Sector Azimuth: deg60

Ballistic Target Detection Sector Elevation: 0-55 deg; or 20-75 deg

64N6E2: 0-75 deg

Detection Range (Mig-21 Type Target): km260

Detection Range, Ballistic Target: km127

Accuracy Range: m150

Accuracy Azimuth: deg0.5

Accuracy Elevation: deg0.5

Scan Rate: sec12

Tracking: 200 targets simultaneously

Emplacement Time: 5 min

Displacement Time: INA

Mount: The 64N6 BIG BIRD is mounted on a large trailer along with a generator and typically towed with the now familiar 8-wheeled truck

Protection

Note: INA. There is very little information about the protection capabilities of the SA-10.

Notes:

The S-300P (transliterated from Russian С-300П, NATO reporting name SA-10 Grumble) is the original version of the S-300 system which became operational in 1978. In 1987, over 80 of these sites were active, mainly in the area around Moscow. The P suffix stand for PVO-Strany (country air defence system). An S-300PT unit consists of a 36D6 (NATO reporting name TIN SHIELD) surveillance radar, a 30N6 (FLAP LID) fire control system and 5P85-1 launch vehicles. The 5P85-1 vehicle is a semi-trailer truck. Usually a 76N6 (CLAM SHELL) low altitude detection radar is also a part of the unit. This system broke substantial new ground, including the use of a passive electronically scanned array radar and multiple engagements on the same Fire-control system (FCS). Nevertheless, it had some limitations. It took over one hour to set up this semi-mobile system for firing and the hot vertical launch method employed scorched the TEL. 9S32 engagement radar It was originally intended to fit the Track Via Missile (TVM) guidance system onto this model. However, the TVM system had problems tracking targets below 500 m. Rather than accept the limitation, the Soviets decided that the tracking of low altitude targets was a must and decided to use a pure command-guidance system until the TVM head was ready. This allowed the minimum engagement altitude to be set at 25 m.

HQ-22 Chinese Long-Range Air Defense Missile System

Tiers:

1 2 3 4

System

Alternative Designation: HQ-22

Type: Long-Range Air Defense Missile System

Crew: INA

Chassis: The launcher is based on a Hanyang special chassis with 8x8 configuration.

Mission: The HQ-22 air defense system can engage aircraft, helicopters, UAVs, ballistic and cruise missiles.

Displacement Time: INA

Emplacement Time: INA

Note: A typical battery of HQ-22 includes 3 launcher vehicles. A battery can engage 6 air targets simultaneously.

Notes:

The HQ-22, also known as FK-3, is a long-range air defense system developed by China to engage a wide range of aerial targets at ranges of up to 170 kilometers. The missile system has been designed to engage fourth generation aircraft, helicopters, cruise missiles and drones as well as a variety of aerodynamic threats. Besides, the new weapon system has been designed to withstand to electronic countermeasures and operate in heavy jamming environments. This new air defense system relies on 8x8 vehicles that transport four vertically launched missiles each. The HQ-22 long-range surface-to-air missile system was unveiled at the China Airshow 2016.

S-200 Dubna (SA-5 Gammon) (Export) Iranian Surface-to-Air Missile (SAM) System

Tiers:

Variants:

- **SA-5a (S-200A Angara):** This missile attained initial operating capability in 1962 on the "Tallinn line" with conventional warheads. System includes a V-860/5V21 or V-860P/5V21A missile; range, 88 mi (160 km); and ceiling, 66,000 ft (20 km).
- **SA-5b (S-200V Vega):** This version reached initial operating capability in 1970 with nuclear warhead. Other versions include the S-200 Vega with a V-870 missile and range 186 mi (300 km). Also: S-200M Vega-M with a V-880E/5V28E missile, export version, high-explosive warhead only, with a range of 155 mi (250 km) and, ceiling of 95,000 ft (29 km).
- **SA-5c (S-200D Dubna):** The SA-5c's initial operating capability was attained in 1975 with a dual-capable (nuclear or conventional) warhead and upgraded terminal homing capability. Characteristics include a 5V25V, V-880M/5V28M or V-880MN/5V28MN2 missile, with a range of 248 mi (400 km) and a ceiling of 125,000 ft (40 km).
- **SA-5d:** This designation was briefly used for the SA-X-12 Gladiator missile.
- **SA-5e:** This variant attained initial operating capability in 1983 with a passive anti-radiation seeker. It was probably designed to be used against AWACS aircraft

System

Alternative Designation: SA-5 Gammon; S-200 Vega
Type: A very long range, medium-to-high altitude surface-to-air missile (SAM) system.
Family: SA-5 Series
In Service: 1967-Present
Wars: First Libyan Civil War Syrian Civil War
Crew: eaINA
Displacement Time: minINA
Emplacement Time: minINA
Fire on the Move: No
Guidance System: Semi-active radar homing

Dimensions

Missile Length: m10.72

Wingspan: m2.85

Mainbody Diamter: m0.85

Solid Propellant Booster Length: m4.90

Solid Propellant Booster Width: m0.48

Note: Each Missile has four jettisonable, wraparound solid propellant boosters

Automotive

Engine: 4 x solid-fuel boosters; solid-fuel second stage

Speed: Mach 4

Maximum Range: km7

Minimum Range: km300

Notes:

The S-200 Volga (SA-5 Gammon**) is a Russian long-range, high-altitude strategic surface-to-air missile (SAM). It is a fixed-site, point defense SAM that relies on long range early warning and ground control intercept radars (Big Back, Bar Lock , Tin Shield and Side Net) for target tracking information and 5N62 series Square Pair** radar for fire control. The S-200 surface-to-air missile system was designed for the defense of the most important administrative, industrial, and military installations from all types of air attack. S-200 provides defeat of modern and advanced aircraft, including air command and control centers, AWACS aircraft, aircraft jamming creation and other manned and unmanned aerial vehicles. The S-200 is an all-weather system that can be operated in various climatic conditions. By 1966, the S-200 was officially accepted into service in order to replace the failed anti-ballistic missile RZ-25/5V11 "Dal". The Dal was assigned the NATO reporting name SA-5 "Griffon" before it was cancelled. The first S-200 operational regiments were deployed in 1966 with 18 sites and 342 launchers in service by the end of the year. By 1968 there were 40 sites, and by 1969 there were 60 sites. The growth in numbers then gradually increased throughout the 1970s (1,100 launchers) and early 1980s until the peak of 130 sites and 2,030 launchers was reached in 1980–1990. Each missile is launched by 4 solid-fueled strap-on rocket boosters.[7] After they burn out and drop away (between 3 and 5.1 seconds from launch) it fires a 5D67 liquid fueled sustainer rocket engine (for 51–150 seconds) which burns a fuel called TG-02 Samin (50% xylidine and 50% triethylamine), oxidized by an agent called AK-27P Melange (red fuming nitric acid enriched with nitrogen oxides, phosphoric acid and hydrofluoric acid). Maximum range is between 150 km (81 nmi) and 300 km (160 nmi), depending on the model. The missile uses radio illumination mid-course correction to fly towards the target with a terminal semi-active radar homing phase. Maximum target speed is around Mach 6 for new model and Mach 4 for earlier model. Effective altitude is 300 m (980 ft) to 20,000 m (66,000 ft) for early models and up to 35,000 m (115,000 ft) for later models. The warhead is either 217 kg (478 lb) high-explosive fragmentation (16,000 × 2 g fragmentation pellets and 21,000 × 3.5 g pellets) triggered by radar proximity fuse or command signal, or a 25 kt nuclear warhead triggered by command signal only. Each missile weighs around 7,108 kg (15,670 lb) at takeoff. The system utilises radio semi active guidance throughout the missile's flight, which is far more accurate at long range than the command guidance method used by the earlier S-75 Dvina and other missiles. The existence of an optional terminal passive radar homing mode for use against airborne early warning (AEW) aircraft remains unconfirmed. Peak missile speed is around Mach 8 and the single-shot kill probability is quoted as 0.85, presumably against a high altitude bomber-type target. The fire control radar of the S-200 system is the 5N62 (NATO: Square Pair) H band continuous wave radar, whose range is 270 km (170 mi). It is used for both the tracking of targets and their illumination. Additional radar systems * P-14/5N84A "Tall King" A-band early warning radar (range 600 km (370 mi), 2–6 RPM, maximum search altitude 46 km (29 mi)) * "Big Back" E-band early warning radar 600 km (370 mi) Kabina 66/5N87 "Back Net" or "Back Trap" E-band early warning radar (with special low-altitude search mod, range 370 km (230 mi), 3–6 RPM) * P-35/37 "Bar Lock\Bar Lock B" 1,000 kW E\F-band target detection and tracking radar (with integrated IFF, range 392 km (244 mi), 7 RPM) * "Side Net" or "Odd Pair" E-band height finding radar (also used by the SA-2, SA-4 and SA-6, range 240 km (150 mi), 3–6 RPM) P-15M(2) "Squat Eye" 380 kW C-band target detection radar (range 128 km (80 mi)

YJ-12B Chinese Coastal Defense Missile System

Tiers:

Cab Seating: INA

Dimensions

Length: 16.35 m
Width: 3.05 m
Height: 2.82 m
Weight, Curb: 22.5 t
Payload Capacity: 42.5 t

Automotive

Engine Name: Deutz
Engine Type: Diesel
Engine Power: hp544

Cruising Range: km650

Speed, Maximum Road: km/h70

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: deg40

Side Slope: deg20

Vertical Step: m0.4

Trench: m2.5

Fording Depth: m1.2

Main Weapon System

↳*Launcher*

Name: YJ-12B

Note: The YJ-12B can be seen as a ground-launched version of the naval YJ-12 anti-ship missile, that is carried by warships.

↳*Missile*

Name: YJ-12 Missile

Type: Supersonic Anti-Ship Cruise Missile

Length: 6.3 m

Diameter: 0.756 m

Weight: 2,500 kg

Warhead Type: HE-FRAG

Engine: integrated ramjet/booster propulsion system

Operational Range: 500 km

Maximum Speed: Mach 3

Guidance System: Inertial with active radar homing

Protection

Armor: Protection from small arms and shell splinters

Applique Armor: INA

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The YJ-12B is a new China's coastal defense missile system. Its images first emerged in 2018. This system was first publicly

revealed in 2019. It is in service with the China's military. It is a general purpose heavy duty missile transporter developed from the original WS2500 and is built by Wanshan Special Vehicle. Its other contemporary is the larger HTF5680A1. The WS2600 is a heavy duty TEL co-developed by a joint Chinese and Belarusian venture. The WS2600 is slightly bigger than the WS2500 and a larger version of the original WS2400 with an additional axle to support the increased payload. Due to its larger size, the WS2600 is able to carry much heftier missiles, of which its most common payload is the DF-21C medium-range ballistic missile and the DF-21D anti-ship ballistic missile. Both the WS2500 and WS2600 form one of the main TEL carriers of China's MRBM and ASBM stockpiles. Like the WS2500, the TEL has a 4-door cab, which allows the WS2600 to easily accommodates the driver and 7 additional passengers.

HQ-10 (SA-20 Gargoyle) Chinese Long-Range Air Defense Missile System

Tiers:

Variants:

- **S-300PMU2 Favorit/SA-20B:** This is an upgraded variant with larger 9M96E and 9M96E2 missiles developed for the S-400 . It can also fire the previous 5V55K , 5V55R , 48N6E and 48N6E2 missiles. It is equipped with an improved guidance system. Unveiled in 1997, the system has an increased range of 124 mi (200 km). The 48N6E2 missile features a warhead designed to destroy ballistic missiles.

System

Alternative Designation: SA-20 Gargoyle, SA-20A Gargoyle, S-300PMU-1, С-300ПМУ-1
Manufacturer: MZiK
Type: long range surface-to-air missile systems. multi-channel mobile air defense system
Family: S-300 Family
In Service: 1993-Present
Crew: ealNA
Chassis: MAZ-543 Special Wheeled Chassis
Displacement Time: INA
Emplacement Time: 5 Minutes
Maximum Range of Fire: km150
Maximum Altitude: km27
Number of Targets Engaged Simultaneously: ea6
Reload Vehicile: 5T58 reload vehicle
Note #1: Capable of hitting ballistic and aerodynamic targets. Became the first multi-channel anti-aircraft missile system, is able to accompany each system (ADMS) to 6 goals and build them up to 12 missiles

Note #2: A typical SA-20 battery consists of 48 missiles on 12 mobile launchers. Each battery can launch a 48N6 missile every three seconds.

Dimensions (MAZ-543 Special Wheeled Chassis)

Length: m11.7

Width: m3.07

Height: m2.92

Maximum Load: tons15

Ground Pressure: INA

Automotive (MAZ-543 Special Wheeled Chassis)

Engine Name: D12A-525 38.9-liter Diesel

Engine Type: Diesel

Engine Power: hp525

Cruising Range: km650

Speed, Maximum Road: km/h65

Speed, Average Cross: km/hINA

Speed Maximum Swim: km/hNot Amphibious

Configuration: 8x8

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.6

Trench: m2

Fording Depth: m1.3

Communications

Note: See Fire Control

Missile System

Note #1: The S-300 family missiles have four clipped folding triangular moving control fins at the rear and four thrust vector control vanes in the motor efflux.

Note #2: Missiles are vertically launched by a hot gas cartridge in the canister base. The motor ignites once the missile reaches an altitude of 25 m.

↳*Missile Launcher*

Name: 5P85S or 5P85D launchers

Type: Tube Launcher

Anti-Ballistic Missile (ABM) Capability: Yes

Note: The missiles can be fired in a salvo with an interval between 3 and 5 seconds

↳*Missile (Option 1)*

Name: 48N6/48N6E

Engine Type: Single-stage, solid-fuel-propelled

Type: INA

Length: m7.5

Width: m0.5

Weight: kg1,780

Warhead Weight: 70-100 kg

Maximum Range: km150

Guidance System: Track-via-missile

TVM Guidance Capable: Yes

ABM Capable: Yes

Maximum Velocity: m/s2,000

Kill Probability: 0.70 to 0.93 single shot

Ballistic Targets Range: km5-40

Basic Load: 4 per TEL

↳*Missile (Option 2)*

Name: 5V55R/5V55KD

Type: INA

Length: m7

Diameter: mm450

Weight: kg1,450

Warhead Weight: kg100

Maximum Range: km90

Guidance System: SARH

Maximum Velocity: m/s1,900

Maximum Target Speed: m/s1,150

Basic Load: 4 per TEL

↳*Missile (Option 3)*

Name: 9M96E1

Type: INA

Length: INA

Width: INA

Weight: kg330

Warhead Weight: kg24

Maximum Range: km40

Guidance System: Active radar homing

Maximum Velocity: m/s900

Maximum Target Speed: 4,800–5,000 m/s

Basic Load: 4 per TEL

Probability of Kill: 0.7 against a tactical ballistic missile

↳*Missile (Option 4)*

Name: 9M96E2

Type: INA

Width: INA

Weight: kg420

Warhead Weight: kg24

Maximum Range: km120

Guidance System: Active radar homing

Maximum Velocity: m/s1,000

Maximum Target Speed: 4,800–5,000 m/s

Basic Load: 4 per TEL

Probability of Kill: 0.7 against a tactical ballistic missile

Fire Control

Command Post Vehicle: The 54K8 command-post vehicle has six operator positions. The command post can monitor data within a 300-km radius and can track 100 targets while controlling up to six interceptions. Two missiles can be launched against each target if required.

↳*Fire Control System*

Name: 83M6E command and control system, although it is also compatible with the older Baikal-1E and Senezh-M1E CCS command and control systems.

Computerized FCS: Yes

Direct Fire: Yes, no less than 1km

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Number of Targets Engaged Simultaneously: ea6

Note #1: The vehicle lowers four hydraulic jacks for launch

Note #2: The S-300PMU1 air defense missile system can simultaneously engage up to 36 air targets by 72 missiles.

↳*Radar #1*

Name: 64N6E

Type: Regiment Radar

NATO Reporting Name: BIG BIRD

Frequency/Band: C-Band

Target Detection Range: km300

Simultaneously Detected Targets: 300

↳*Radar #2*

Name: 30N6E(1)

Type: Fire control/illumination and guidance radar

NATO Reporting Name: FLAP LID B

NATO Frequency Band: H-J

Target Detection Range: km200

Simultaneously Tracked Targets: ea6

Simultaneously Engaged Targets: ea6

↳*Radar #3*

Name: 36D6

Type: INA

NATO Reporting Name: TIN SHIELD

NATO Frequency Band: E/F

Target Detection Range: km180-360

Simultaneously Tracked Targets: ea120

↳*Radar #4*

Name: 96L6E

Type: All altitude detection

NATO Reporting Name: CHEESE BOARD

NATO Frequency Band: INA

Target Detection Range: km300

Simultaneously Tracked Targets: ea100

Protection

Hull Armor: INA

Turret Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Camouflage Nets: Yes, Standard

Note: Protection. Additional elements of protection are the placement of components of C-300 in the trenches (practiced as placing on the hills for a better view and more rapid care of the horizon, and in the trenches for stealth and protection against fragments of explosions).

Notes:

The Chinese HQ-D is a export of the Russian S-300PMU-1 (NATO: SA-20 Gargoyle). The SA-20 Gargoyle (S-300PMU-1) Russian Surface-to-Air Missile (SAM) System was first introduced in 1993 with the new and larger 48N6 missiles for the first time in a land-based system and introduced all the same performance improvements from the S300FM version including the increased speed, range, TVM guidance and ABM capability. The warhead is slightly smaller than the naval version at 143 kg (315 lb). This version also saw the introduction of the new and more capable 30N6E TOMB STONE radar. The S-300PMU1 air defense missile system can simultaneously engage up to 36 air targets by 72 missiles. The S-300PMU-1 was introduced in 1993 and for the first time introduces several different kinds of missiles in a single system. In addition to the 5V55R and 48N6E missiles the S-300PMU-1 can utilise two new missiles, the 9M96E1 and 9M96E2. Both are significantly smaller than the previous missiles at 330 and 420 kg (730 and 930 lb) respectively, and carry smaller 24 kg (53 lb) warhead. The 9M96E1 has an engagement range of 1–40 km (0.62–25 mi) and the 9M96E2 of 1–120 km (0.62–75 mi). They are still carried 4 per TEL. Rather than just relying on aerodynamic fins for manoeuvring, they use a gas-dynamic system which allows them to have an excellent probability of kill (Pk) despite the much smaller warhead. The Pk is estimated at 0.7 against a tactical ballistic missile for either missile. The S-300PMU-1 typically uses the 83M6E command and control system, although it is also compatible with the older Baikal-1E and Senezh-M1E CCS command and control systems. The 83M6E system incorporates the 64N6E (BIG BIRD) surveillance/detection radar. The fire control/illumination and guidance radar used is the 30N6E, optionally matched with a 76N6 low altitude detection radar and a 96L6E all altitude detection radar. The 83M6E command and control system can control up to 12 TELs, both the self-propelled 5P85SE vehicle and the 5P85TE towed launchers. Generally support vehicles are also included, such as the 40V6M tow vehicle, intended for lifting of the antenna post

S-500 Russian Long-Range Air Defense and Anti-Ballistic Missile System

Tiers:

1 2 3 4

System

Alternative Designation: Prometheus, Prometey, 55R6M, Triumfator-M, Samoderzhets
Crew: ea3
Chassis: S-500 launcher, based on the BAZ-69069 chassis
Displacement Time: See Emplacement
Emplacement Time: It has been reported that the S-500 can launch missiles within 10 minutes from travelling. Also it can be considered as a survivable system, as after launching its missiles it can briefly redeploy.
Maximum Effective Range: km600
Target Altitude Maximum: km200
Target Altitude Minimum: mINA
Fire on the Move: No
Probability of Kill: INA
Note #1: It can be seen as an advanced version of the S-400.
Note #2: The S-500 missiles will be used only against the most important targets, such as intercontinental ballistic missiles, AWACS and jamming aircraft.

Dimensions

Length: m14.5
Width: m3
Height: INA
Weight: tons54

Automotive

Engine Name: INA

Engine Type: Diesel

Engine Power: 550

Maximum Road Speed: km/h70

Maximum Road Range: km1,000

Gradient: %60

Side Slope: %30

Vertical Step: m0.6

Trench: m2

Fording: m1.7

Communications

Tactical Radio: VHF: Azart-P (4km), Azart-N (12km), and Azart-BM (40km).

Main Weapon System

Note: Some sources claim that this system is capable of tracking 5-20 ballistic targets and intercepting up to 5-10 ballistic targets simultaneously. It can defeat ballistic missiles travelling at a speed of 5-7 kilometers per second. It has been reported that this air defense system can also target low orbital satellites.

↳*Launcher*

Name: 77P6 launch vehicle, based on the BAZ-69096 10x10 truck

Type: Launch Vehicle

↳*Missile (Option 1)*

Name: 77N6 missile

Type: A new Surface-to-Air Missile that source say, "In May 2018, Russia conducted the longest range surface-to-air missile test to date with the S-500. According to reports citing unnamed sources familiar with U.S. intelligence on the program, the S-500 was able to hit a target just shy of 300 miles (482 km) away, which is some 50 miles further than the previous record."

Length: INA

Diameter: INA

Weight: INA

Maximum Range: km500-600

Maximum Altitude: km40

Note #1: The S-500 will likely use a variety of missiles in addition to the 77N6 missile series, currently under development for the S-400, as a hit-to-kill interceptor for ballistic missile targets.

↳*Missile (Option 2)*

Name: 40N6E

Type: Surface-to-Air Missile

Maximum Range: 400 km

Maximum Altitude: 185 km

Maximum Velocity: 3840 m/s

Maximum Target Velocity: 4,800 m/s

Weight: 1,893 kg

Guidance System: Semi-active radar homing or active radar homing

Note: With an active radar homing head, climbs to designated altitude then guidance switches to search & destroy mode. Effective against low-altitude targets at extremely long range (below the radio horizon).

↳*Missile (Option 3)*

Name: 48N6DM/ 48N6E3

Type: Surface-to-Air Missile

Maximum Range: 250 km

Maximum Altitude: 60 km

Maximum Velocity: 2,000 m/s

Maximum Target Velocity: 4,800 m/s

Weight: 1,835 kg

Guidance System: Semi-active radar homing

S-500 Components

↳*55K6MA and 85Zh6-2 Command Posts Vehicles*

Chassis: based on BAZ-69092-12 6x6

↳*91N6A(M) Acquisition and Battle Management Radar*

Chassis: towed by the BAZ-6403.01 8x8 tractor

Note: A modification of the 91N6 (Big Bird)

↳*96L6-TsP Acquisition Radar*

Chassis: BAZ-69096 10x10

Note: an upgraded version of the 96L6 (Cheese Board)

↳*76T6 Multimode Engagement Radar*

Chassis: BAZ-6909-022 8x8

↳*77T6 ABM Engagement Radar*

Chassis: BAZ-69096 10x10

Protection

Armor: All systems are light skinned

NBC Protection: Likely

Notes:

The S-500 is a new-generation surface-to-air missile system. It is designed for intercepting and destroying intercontinental ballistic missiles, hypersonic cruise missiles, and aircraft. It is also designed to defend against Airborne Early Warning and Control System (AWACS) aircraft and other jamming aircraft. With a planning range of 600 km (370 mi) for ballistic missiles (BM) and 500 km (310 mi) for aircraft, the S-500 is able to detect and simultaneously engage up to 10 ballistic hypersonic targets flying at a speed of 5 kilometers per second (3.1 mi/s; 18,000 km/h; 11,000 mph) to a limit of 7 km/s (4.3 mi/s; 25,000 km/h; 16,000 mph). It can destroy hypersonic cruise missiles and other aerial targets to include spacecraft at speeds of higher than Mach 5. The altitude of a target can be as high as 200 km (120 mi). It is effective against ballistic missiles with a launch range of 3,500 km (2,200 mi), the radar reaches a radius of 3,000 km (1,300 km for the EPR 0,1 square meter). Other targets that the S-500 has been successful at engaging include unmanned aerial vehicles, low Earth orbit satellites, space weapons launched from hypersonic aircraft, drones, and hypersonic orbital platforms. The system is highly mobile and is capable of rapid deployability. Experts believe that the system's capabilities can affect enemy intercontinental ballistic missiles at the middle and end portions of flight, but reports by Almaz-Antey say that the external target-designation system (RLS Voronezh-DM and missile defense system A-135 radar Don-2N) will be capable of mid-early flight portion interception of enemy ballistic missiles, which is one of the final stages of the S-500 project. The S-500 and its crew have a response time of less than 4 seconds (Compared to the S-400's less than 10). The S-500 will work with the S-400 and replace the S-300. It is anticipated that initially, the S-500 will be deployed to protect Moscow and critical infrastructure however, a naval version is being developed to be deployed in the new Lider-class destroyer which is to enter service in 2020. The S-500 will consist of: * 77P6 launch vehicle, based on the BAZ-69096 10x10 truck * 55K6MA and 85Zh6-2 command posts, based on BAZ-69092-12 6x6 * 91N6A(M) acquisition and battle management radar, a modification of the 91N6 (Big Bird) towed by the BAZ- * 6403.01 8x8 tractor * 96L6-TsP acquisition radar, an upgraded version of the 96L6 (Cheese Board) on BAZ-69096 10x10 * 76T6 multimode engagement radar on BAZ-6909-022 8x8 * 77T6 ABM engagement radar on BAZ-69096 10x10

S-300V (SA-12b Giant) Russian Long-Range Air Defense Missile System

Tiers:

Variants:

- **SA-12a Gladiator:** The S-300V with a 9M83 SA-12a GLADIATOR missile 9A93 SA-12a GLADIATOR TELAR
- **S-300VM:** S-300VM is an upgraded version of the S-300V. It seems that it is also called S-300V3. Western reporting name for this system is SA-23 Gladiator/Giant. It has new command post vehicle and new radars. It fires improved 9M83M and 9M82M missiles with a longer range. Missiles have a range of 200 km and can reach targets at altitude of 30 km. The S-300VM is in service with Russia.
- **Antey 2500:** Antey 2500 an export version of the S-300VM. It can engage up to 24 aircraft or up to 16 ballistic missiles simultaneously. This system can engage ballistic missiles at a range of 250 km and aircraft at a range of 200 km. Two battalions of these air defense systems were exported to Venezuela. These were delivered in 2013. Estimated export price of this system is 1 billion dollars.
- **S-300V4:** S-300V4 improved version. It seems that this system is also called S-300VMD. It has a range of 300 km. Russian armed forces issued production order for this air defense system. Deliveries commenced in 2014.

System

Alternative Designation: S-300V; SA-12b Giant
Type: The S-300V air defense missile system was developed to engage short- and intermediate-range ballistic missiles, cruise missiles, strategic and tactical aircraft, as well as early warning and electronic warfare aircraft.
Family: S-300 Family
Crew: ea3
In Service: 1988-Present
Emplacement Time: min5
Displacement Time: min5
Note #1: A battery of the S-300V typically includes up two six launchers in two variants, command post vehicle, surveillance radar, sector surveillance radar, and up to 6 reloading vehicles/launchers in two variants.
Note #2: S-300V system may be controlled by an upper level command post system 9S52 Polyana-D4 integrating it with Buk missile system into a brigade

Dimensions

Hull Length: m9.50
Hull Width: m2.90
Hull Height: m3.30
Weight, Total: tons50
Chassis Weight: 20,000 kg
Ground Pressure: INA

Automotive

Engine Name: V-84
Engine Type: Diesel
Engine Power: hp840
Cruising Range: km250
Speed, Maximum Road: km/h53
Speed, Average Cross: INA
Speed Maximum Swim: Not Amphibious
Gradient: %40
Side Slope: %20
Vertical Step: 0.7
Trench: 2.5
Fording Depth: m1.2

Communications

Radio: R-168 Akveduk, Russia’s fifth generation tactical radio system

Missile System

↳*Launcher*

Name: 9A82 SA-12b GIANT TELAR
Type: TELAR
Maximum Elevation: +90
Minimum Elevation: INA
Note: The TELARs are not capable of autonomous engagements, requiring the support of the GRILL PAN radar.

↳*Missile*

Name: 9M82 SA-12b GIANT missile
Type: Semi-Active Radar Homing Missile
Basic Load: carries only two 9M82 SA-12b GIANT missiles

Length: m8.5

Diameter: mm800

Weight: 4,730 kg

Warhead Type: HE fragmentation

Warhead Weight: 150 kg

Guidance System: Semi-Active Radar Homing Missile

Maximum Velocity: m/s2,400

Maximum Range, Aircraft: km13

Maximum Range, SRBM: km25

Maximum Range, Ballistic Targets: km40

Minimum Range, Ballistic Targets: km20

Maximum Altitude: 30,000 m

Minimum Altitude: 1,000 m

Maximum Speed: 2,400 m/s, Mach 8.00

Chance to Defeat Ballistic Missiles: 40-65% chance of defeating ballistic missile.

Note: The larger 9M82 is used to engage intermediate-range ballistic missiles, AWACS and jamming aircraft at ranges of up to 100 km. Warheads of 9M82 and 9M83 missiles are packed with 150 kg of explosives

Launcher/Loader Vehcile (LLV)

Name: 9A85 GLADIATOR Launcher/Loader Vehicle (LLV)

Crew: ea3

Crane: Yes

Basic Load: carries only two 9M82 SA-12b GIANT missiles

Reloading Time: 50-60 minutes

Note #1: There are two variants of reloading vehicles

Note #2: These vehicles are combination of the TEL and reloading vehicle. A unique capability of these vehicles is that they can launch missiles themselves. Firing data is acquired from the launcher vehicle

Command Station

Name: 9S457 Command Station (Command Post Vehicle)

Crew: ea7

Mission: It controls radars and up to 4 launcher vehicles

Target Tracking: It can track up to 70 air targets simultaneously. It prioritizes which targets should be attacked first and transmits firing data to launcher vehicles

Note: he CPV and its associated radars can detect up to 200 targets, track as many as 70 targets and designate 24 of the targets to the brigade's four GRILL PAN radar systems for engagement by the SA-12a and SA-12b TELARs

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: INA

Indirect Fire: Yes

↳*Radar #1*

Name: 9S15 BILL BOARD Surveillance Radar system

Type: Phased-Array Surveillance Radar system

Traverse Range: deg360

Traverse Left: deg360

Traverse Right: deg360

Crew: ea4

Detection Range: km330

Aircraft Detection: At a range of 240 km aircraft are detected with a chance of 50%

Ballistic Missile Detection: It detects ballistic missiles at a range of about 150 km

Antenna Rotating Speed: sec6-12

Target Detection: up to 200 targets

Target Coverage Elevation: 0-55º in Elevation

Target Coverage Range: 10-250 km

Target Coverage Accuracy: 30-35 min of arc in azimuth and 250 m in range

↳*Radar #2*

Name: 9S19 HIGH SCREEN Sector Radar system

Type: Sector Radar system

Purpose: The HIGH SCREEN sector radar supporst the ATBM role, providing surveillance of anticipated azimuths of threat missiles

Crew: ea4

Mission: t is used to detect high speed targets, such as ballistic missile warheads

Detection Range: km175

Maximum Targets, Simultaneous: maximum being 16 simultaneous targets

Note: The radar is switches to a tracking mode when high speed targets are detected, automatically transmiting the trajectory parameters to the Command Post Vehicle

↳*Radar #3*

Name: 9S32 GRILL PAN Guidance Radar system

Type: Parabolic dish target-illumination radar on telescoping mast on missile launch vehicle

Purpose: The GRILL PAN radar system controls the battery's launcher vehicles (TELARs and LLVs)

Sector Scan: 90-deg sector scan through 50 deg elevation on separate vehicle

Guidance System: inertial guidance with semi-active terminal homing

Band: X-Band

Multichannel: Yes

Peak Power: kW150

Maximum Range: km250

Beamwidth: deg0.5

Antenna: ransmission type of space fed phased-array antenna

Maximum Targets, Simultaneous: It can simultaneously track up to 12 targets and control up to six missiles against these targets

Radar Cross-Section: radar cross-section of 2m2 at a range of 150 km in manual mode and 140 km in automatic mode

Note: The GRILL PAN tracks targets assigned to it by the CP while simultaneously maintaining a horizon search for new targets

Protection

Hull Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: No

Note: The S-300V is considered as a survivable system. Once all the missiles are launched the launcher vehicles can briefly redeploy. It uses shoot, scoot and hide tactics in order to avoid being destroyed.

Notes:

The S-300V air defense missile system was developed to engage short- and intermediate-range ballistic missiles, cruise missiles, strategic and tactical aircraft, as well as early warning and electronic warfare aircraft. It was designed to counter the threat posed by Lance and Pershing ballistic missiles. The main role of the S-300V is to protect task forces and vital industrial and military installations against massed air attacks. Its reporting name in the West is SA-12 or Gladiator/Giant. The S-300V consists of: 9M82 SA-12b GIANT missile 9M83 SA-12a GLADIATOR missile 9A82 SA-12b GIANT TELAR 9A93 SA-12a GLADIATOR TELAR 9A84 GIANT Launcher/Loader Vehicle (LLV) 9A85 GLADIATOR Launcher/Loader Vehicle (LLV) 9S15 BILL BOARD Surveillance Radar system 9S19 HIGH SCREEN Sector Radar system 9S32 GRILL PAN Guidance Radar system 9S457 Command Station Note: The S-300V comes in two versions: 1. SA-12a Gladiator 2. SA-12b Giant Once equipped with 9M83 missiles is referred in the West as SA-12A or Gladiator. When equipped with 9M82 missiles it is referred as SA-12B or Giant. The 9M83 SA-12a GLADIATOR is a dual-role anti-missile and anti-aircraft missile with a maximum range between 75 and 90 km. The 9M82 SA-12b GIANT missile, configured primarily for the ATBM role, is a longer range system [maximum range between 100 and 200 km] with a longer fuselage with larger solid-fuel motor. The 9A82 SA-12b GIANT and 9A93 SA-12a GLADIATOR TELAR vehicles are similar, though the 9A83-1 carries four 9M83 SA-12a GLADIATOR missiles, whereas the 9A82 carries only two 9M82 SA-12b GIANT missiles. The configuration of the vehicles command radar is also different. On the 9A83-1 the radar is mounted on a folding mast providing 360º coverage in azimuth and full hemispheric coverage in elevation. The radar on the 9M82 TELAR is mounted in a semi-fixed position over the cab, providing 90º coverage on either side in azimuth and 110º in elevation. The TELARs are not capable of autonomous engagements, requiring the support of the GRILL PAN radar. The 9S457-1 Command Post Vehicle is the command and control vehicle for the SA-12 system, which is supported by the BILL BOARD A surveillance radar and the HIGH SCREEN sector radar. The CPV and its associated radars can detect up to 200 targets, track as many as 70

targets and designate 24 of the targets to the brigade's four GRILL PAN radar systems for engagement by the SA-12a and SA-12b TELARs. The BILL BOARD A radar provides general surveillance, with the antenna rotating every 6-12 seconds. The radar, which can detect up to 200 targets, provides target coverage of 0-55º in elevation and 10-250 km in range with an accuracy is 30-35 min of arc in azimuth and 250 m in range. and. The HIGH SCREEN sector radar supports the ATBM role, providing surveillance of anticipated azimuths of threat missiles. The radar is switches to a tracking mode when high speed targets are detected, automatically transmitting the trajectory parameters to the Command Post Vehicle. The CPV prioritizes the threat and instructs the HIGH SCREEN radar to track specific missiles, with the maximum being 16 simultaneous targets. The GRILL PAN radar system controls the battery's launcher vehicles (TELARs and LLVs). It can simultaneously track up to 12 targets and control up to six missiles against these targets The radar can acquire targets with a radar cross-section of 2m2 at a range of 150 km in manual mode and 140 km in automatic mode. The GRILL PAN tracks targets assigned to it by the CP while simultaneously maintaining a horizon search for new targets. The LLVs (9A85 GLADIATOR and 9A83 GLADIATOR) resemble normal TELARs, but with a loading crane rather than command radars. While the primary role of the LLV is to replenish the TELARs, they can also erecting and launch missiles if needed, though they are dependent on the use of command radars from neighboring TELARs.

S-300PMU-1 (SA-20 Gargoyle) Russian Long-Range Air Defense Missile System

Tiers:

Variants:

- **S-300PMU2 Favorit/SA-20B:** This is an upgraded variant with larger 9M96E and 9M96E2 missiles developed for the S-400 . It can also fire the previous 5V55K , 5V55R , 48N6E and 48N6E2 missiles. It is equipped with an improved guidance system. Unveiled in 1997, the system has an increased range of 124 mi (200 km). The 48N6E2 missile features a warhead designed to destroy ballistic missiles.

System

Alternative Designation: SA-20 Gargoyle, SA-20A Gargoyle, S-300PMU-1, С-300ПМУ-1
Manufacturer: MZiK
Type: long range surface-to-air missile systems. multi-channel mobile air defense system
Family: S-300 Family
In Service: 1993-Present
Crew: eaINA
Chassis: MAZ-543 Special Wheeled Chassis
Displacement Time: INA
Emplacement Time: 5 Minutes
Maximum Range of Fire: km150
Maximum Altitude: km27
Number of Targets Engaged Simultaneously: ea6
Reload Vehicile: 5T58 reload vehicle
Note #1: Capable of hitting ballistic and aerodynamic targets. Became the first multi-channel anti-aircraft missile system, is able to accompany each system (ADMS) to 6 goals and build them up to 12 missiles

Note #2: A typical SA-20 battery consists of 48 missiles on 12 mobile launchers. Each battery can launch a 48N6 missile every three seconds.

Dimensions (MAZ-543 Special Wheeled Chassis)

Length: m11.7

Width: m3.07

Height: m2.92

Maximum Load: tons15

Ground Pressure: INA

Automotive (MAZ-543 Special Wheeled Chassis)

Engine Name: D12A-525 38.9-liter Diesel

Engine Type: Diesel

Engine Power: hp525

Cruising Range: km650

Speed, Maximum Road: km/h65

Speed, Average Cross: km/hINA

Speed Maximum Swim: km/hNot Amphibious

Configuration: 8x8

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.6

Trench: m2

Fording Depth: m1.3

Communications

Note: See Fire Control

Missile System

Note #1: The S-300 family missiles have four clipped folding triangular moving control fins at the rear and four thrust vector control vanes in the motor efflux.

Note #2: Missiles are vertically launched by a hot gas cartridge in the canister base. The motor ignites once the missile reaches an altitude of 25 m.

↳*Missile Launcher*

Name: 5P85S or 5P85D launchers

Type: Tube Launcher

Anti-Ballistic Missile (ABM) Capability: Yes

Note: The missiles can be fired in a salvo with an interval between 3 and 5 seconds

↳*Missile (Option 1)*

Name: 48N6/48N6E

Engine Type: Single-stage, solid-fuel-propelled

Type: INA

Length: m7.5

Width: m0.5

Weight: kg1,780

Warhead Weight: 70-100 kg

Maximum Range: km150

Guidance System: Track-via-missile

TVM Guidance Capable: Yes

ABM Capable: Yes

Maximum Velocity: m/s2,000

Kill Probability: 0.70 to 0.93 single shot

Ballistic Targets Range: km5-40

Basic Load: 4 per TEL

↳*Missile (Option 2)*

Name: 5V55R/5V55KD

Type: INA

Length: m7

Diameter: mm450

Weight: kg1,450

Warhead Weight: kg100

Maximum Range: km90

Guidance System: SARH

Maximum Velocity: m/s1,900

Maximum Target Speed: m/s1,150

Basic Load: 4 per TEL

↳*Missile (Option 3)*

Name: 9M96E1

Type: INA

Length: INA

Width: INA

Weight: kg330

Warhead Weight: kg24

Maximum Range: km40

Guidance System: Active radar homing

Maximum Velocity: m/s900

Maximum Target Speed: 4,800–5,000 m/s

Basic Load: 4 per TEL

Probability of Kill: 0.7 against a tactical ballistic missile

↳*Missile (Option 4)*

Name: 9M96E2

Type: INA

Width: INA

Weight: kg420

Warhead Weight: kg24

Maximum Range: km120

Guidance System: Active radar homing

Maximum Velocity: m/s1,000

Maximum Target Speed: 4,800–5,000 m/s

Basic Load: 4 per TEL

Probability of Kill: 0.7 against a tactical ballistic missile

Fire Control

Command Post Vehicle: The 54K8 command-post vehicle has six operator positions. The command post can monitor data within a 300-km radius and can track 100 targets while controlling up to six interceptions. Two missiles can be launched against each target if required.

↳*Fire Control System*

Name: 83M6E command and control system, although it is also compatible with the older Baikal-1E and Senezh-M1E CCS command and control systems.

Computerized FCS: Yes

Direct Fire: Yes, no less than 1km

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Number of Targets Engaged Simultaneously: ea6

Note #1: The vehicle lowers four hydraulic jacks for launch

Note #2: The S-300PMU1 air defense missile system can simultaneously engage up to 36 air targets by 72 missiles.

↳*Radar #1*

Name: 64N6E

Type: Regiment Radar

NATO Reporting Name: BIG BIRD

Frequency/Band: C-Band

Target Detection Range: km300

Simultaneously Detected Targets: 300

↳*Radar #2*

Name: 30N6E(1)

Type: Fire control/illumination and guidance radar

NATO Reporting Name: FLAP LID B

NATO Frequency Band: H-J

Target Detection Range: km200

Simultaneously Tracked Targets: ea6

Simultaneously Engaged Targets: ea6

↳*Radar #3*

Name: 36D6

Type: INA

NATO Reporting Name: TIN SHIELD

NATO Frequency Band: E/F

Target Detection Range: km180-360

Simultaneously Tracked Targets: ea120

↳*Radar #4*

Name: 96L6E

Type: All altitude detection

NATO Reporting Name: CHEESE BOARD

NATO Frequency Band: INA

Target Detection Range: km300

Simultaneously Tracked Targets: ea100

Protection

Hull Armor: INA

Turret Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Camouflage Nets: Yes, Standard

Note: Protection. Additional elements of protection are the placement of components of C-300 in the trenches (practiced as placing on the hills for a better view and more rapid care of the horizon, and in the trenches for stealth and protection against fragments of explosions).

Notes:

The SA-20 Gargoyle (S-300PMU-1) Russian Surface-to-Air Missile (SAM) System was first introduced in 1993 with the new and larger 48N6 missiles for the first time in a land-based system and introduced all the same performance improvements from the S300FM version including the increased speed, range, TVM guidance and ABM capability. The warhead is slightly smaller than the naval version at 143 kg (315 lb). This version also saw the introduction of the new and more capable 30N6E TOMB STONE radar. The S-300PMU1 air defense missile system can simultaneously engage up to 36 air targets by 72 missiles. The S-300PMU-1 was introduced in 1993 and for the first time introduces several different kinds of missiles in a single system. In addition to the 5V55R and 48N6E missiles the S-300PMU-1 can utilise two new missiles, the 9M96E1 and 9M96E2. Both are significantly smaller than the previous missiles at 330 and 420 kg (730 and 930 lb) respectively, and carry smaller 24 kg (53 lb) warhead. The 9M96E1 has an engagement range of 1–40 km (0.62–25 mi) and the 9M96E2 of 1–120 km (0.62–75 mi). They are still carried 4 per TEL. Rather than just relying on aerodynamic fins for manoeuvring, they use a gas-dynamic system which allows them to have an excellent probability of kill (Pk) despite the much smaller warhead. The Pk is estimated at 0.7 against a tactical ballistic missile for either missile. The S-300PMU-1 typically uses the 83M6E command and control system, although it is also compatible with the older Baikal-1E and Senezh-M1E CCS command and control systems. The 83M6E system incorporates the 64N6E (BIG BIRD) surveillance/detection radar. The fire control/illumination and guidance radar used is the 30N6E, optionally matched with a 76N6 low altitude detection radar and a 96L6E all altitude detection radar. The 83M6E command and control system can control up to 12 TELs, both the self-propelled 5P85SE vehicle and the 5P85TE towed launchers. Generally support vehicles are also included, such as the 40V6M tow vehicle, intended for lifting of the antenna post

HQ-9 (Hong Qi 9) Chinese 8x8 Long-Range Air Defense Missile System

Tiers:

Variants:

- **HQ-9A:** Upgraded electronics and software. Production began by 2013. Range: 200 km. Altitude: 30,000 m. Dual seeker. Improved electronic equipment and software provide the HQ-9A with higher accuracy and probability of kill. Can have semi-active radar homing (SARH).
- **HQ-9B / HHQ-9B:** Range: 200 km. Altitude: 30,000 m. Dual seeker. Found on the LUYANG III class destroyers in 2014. Longer 300 km range; an additional seeker provides semi-active radar homing (SARH) and infrared homing modes.
- **HQ-9C:** Expected to have an active radar homing mode. Currently in development; incorporates fully active radar homing,
- **HHQ-9:** Naval variant identical to HQ-9; launched from VLS tubes in Lanzhou class destroyers.
- **HHQ-9A:** Naval variant identical to HQ-9A.
- **FT-2000:** Anti-radiation system; range of up to 100 km.
- **FD-2000:** Identical to original HQ-9, but designed for export with minor electronic improvements

System

Alternative Designation: HQ-9, FT-2000, Hóng Qí
Manufacturer: CPMIEC
Type: Track-Via-Missile (TVM), Self-propelled surface-to-air missile (SAM) system
Family: INA
Crew: ea1+5
Chassis: Tai'an TAS5501 10 x 10 high mobility cross country truck
Displacement Time: minINA
Emplacement Time: minINA
Target: Low-flying aircraft, cruise missiles, air-to-ground missiles, and tactical ballistic missiles. Effective against any airborne radar system.
Maximum Effective Range: km200
Minimum Effective Range: km12
Target Altitude Maximum: m3,000
Target Altitude Minimum: m20,000
Fire on the Move: No
System Reaction Time: seconds10

Fuse Type: Active Fuze, which activates at 5 km from the target.

Probability of Kill: INA

Note: The HQ-9 can intercept various aircraft, helicopters, UAVs, cruise missiles, air-to-ground missiles, guided bombs and theater ballistic missiles at medium- to long ranges.

Dimensions

Length (Vehicle): m11

Width (Vehicle): m3

Height (Vehicle): m3

Weight, Combat (Vehicle): tons18

Payload Capacity: tons20

Ground Pressure: kg/mINA

Weight, Warhead: kg180

Automotive

Prime Mover: Tai'an TAS5501 10 x 10 high mobility cross country truck

Engine Name: Deutz Turbocharged Diesel

Engine Type: Turbocharged Diesel

Engine Power: hp517

Vehicle Diameter: mm466

Cruising Range: km800

Speed, Maximum Road: km/h80

Speed, Average Cross: km/h70

Speed Maximum Swim: Not Amphibious

Vehicle Configuration: 8x8

Gradient: deg45

Side Slope: deg30

Vertical Step: m0.5

Trench: m1.8

Fording Depth: m1.1

All Wheel Drive: Yes

Central Tire Inflation System: Yes

Communications

↳*TBR-142*

VHF FM Transceiver: Yes, TBR-142(I)

VHF Range: km1 to 50

Megahertz: MHz40.000 to 59.975

Output Power: Watts1 to 0.3

Power Source: 12V Ni-Ca Rechargeable Battery or external 12V DC power source

Dimensions: mm217x135x58

Weight: kg2.7

Antennas: 3 Total: a 1.3m whip antenna, a 0.3m short antenna, and a 10m wire antenna

Proliferated: Widely with Artillery/Gun/Missile/Reconnaissance Units

Control Device: TBR-142(II)

Multi-function Field Phone: TBR-142(IIID)

Anti-Aircraft Control Unit: TBR-142(IIIG)

ZXY88-200 C2 Capable: Yes

Messaging: Capability – Limited

Amplifier: Available

Physical Conditions: Terrain and Weather favorable

Missile System

Name: Taian TAS5380

Guidance: inertial guidance in the initial stages with radio command mid-course correction and TVM for end game.

launcher Type: TAS5380 8 × 8

Fuse Type: Active Fuze, which activates at 5 km from the target.

Missile Type: two-stage missiles with thrust vector control.

Rocket Engine: Two-stage solid propellant rocket

Missile Length: m6.8

Missile Weight: kg1,300

Warhead Weight: kg180

Warhead Type: HE-FRAG

Missile Speed: Mach4.2

Maximum Effective Range: km200

Minimum Effective Range: kg12

Maximum Altitude: m3,000

Minimum Altitude: m20,000

Launch Type: Verticaly Cold Launched

Min Elevation: degINA

Max Elevation: deg+90

Traverse Range: deg360

Max Rate of Fire: rds/minINA

Missile Engagement Time: seconds12-15

Time the Max Rate of Fire can be Sustained: INA

Range Finder Type: system Inertial guidance with mid-course update and terminal active radar homing

Self-Destruct Time: INA

Thrust Vector Control: Yes

Note: Equivalent to the Russian S-300

Fire Control

Note: To reduce the cost, the HQ-9 is designed to be flexible enough to employ a wide range of radars, both the search/surveillance/acquisition radar and the tracking/engagement/fire control radar (FCR).

↳*Fire Control System*

Name: HT-233 Radar

Computerized FCS: Yes, KS-1 SAM, SJ-212, itself an enlarged and improved version of the SJ-202 fire control radar (FCR) used in HQ-2J.[H-200 & SJ-231 FCRs of latter models of KS-1 SAM are also compatible with HQ-9.

Direct Fire: INA

Indirect Fire: Yes

Fire Control Sensors: Yes

Guidance: Track via Missile (TVM) semi-active radar homing

↳*Radar #1*

Name: HT-233 Radar

Type: Primary Target Radar

Function: Primary radar for the HQ-9. Fire Control Radar (Some reports state that this radar can also search and target like the radar found the the U.S. Patriot system)

Frequency/Band: G (4-6 GHz) 300 MHz

Range: km300

Number of Targets System can Track: ea100

Azimuth of Search: deg120

Elevation of Search: deg0-90

Number of Missile Radar can Guide at once: 6 missiles to 6 targets or 6 missiles to 3 targets (2 missiles to each target)

Peak Power Output: MW1 (Average 60 kW)

Note: most advanced FCRs HQ-9 could employ

Lens Arrangement: AN/MPQ-53

:

Guiding System: The HT-233 Radar can guide up to 6 missiles to 6 seperate targets, or to 3 targets witha pair of missile for each target

Radar #2

Name: Type 305B Radar

Type: Standar Search Radar

Alternate Designation: LLQ-305B

Function: Standard search radar for HQ-9. This 3-D radar has an antenna height of 3.5 meters, and employs sixty 350 mm waveguide feeds. It operates in the S-band at a wavelength of 11.67 cm. Mechanically steered planar array with electronic beam-steering for height-finding. It is similar to many radars used in the West but is build for greater mobility in the field, making is more survivable.

Variant: YLC-2V acquisition radar

↳*Radar #3*

Name: Type 120 Radar

Type: Low altitude search radar

Alternate Designation: LLQ-120

Fuction: Low altitude search radar. A telescoping radar with an antenna height of 2.3 meters folded, and 7 meters unfolded. Uses a feed network of sixteen 230mm wave guides. It rotates at a maximum of ten revolutions per minute, and operates in the L-band at a wavelength of 23.75 cm. Uses a hydraulically elevated mast to increase low altitude coverage. Operating in L-band improves detection range against stealth aircraft and cruise missiles.

Variant: JY-11B

↳*Radar #4*

Name: Type 305A radar

Type: Search Radar

Function: Type 305A (also known as LLQ-305A) radar is another search radar for HQ-9 system. This AESA radar is designed maximize the anti-ballistic capability of HQ-9, and it resembles Thales Ground Master 400 AESA radar. Very little info is released about this radar other than it can also act as Fire-control radar.

↳*Radar #5*

Name: YLC-20 passive sensor

Type: Search Radar

Function: Although Type 305 radars are effective against stealthy targets such as F-35, full stealth target such as B-2 is difficult to detect. YLC-20 passive radar was conceptually based on KRTP-91 Tamara passive sensor, incorporating experience obtained from documentation acquired during the abortive attempt to procure six Czech VERA passive sensors. YLC-20 passive radar was first revealed in 2006.

↳*Radar #6*

Name: DWL002 passive sensor

Type: Passive Radar

Function: DWL002 passive radar is the development of earlier YLC-20, incorporating Kolchuga passive sensor, four of which were sold to China. Like its predecessor YLC-20, DWL002 is also developed by China Electronics Technology Corp. (CETC).

Protection

↳

Hull Armor: INA

Turret Armor: INA

Applique Armor: No, Not supposed to be stationed near the front line of the battle field

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

IR Signature: No

Notes:

The HQ-9 (Hong Qi-9) is a Surface to Air missile (SAM) engineered to attack airborne radars, essentially a surface to air anti-radiation missile (ARM) that can attack single or multiple electromagnetic radiating systems in the 1-18 Ghz band. It is also effective against fixed wing aircraft, rotary wing aircraft, and UAVs. The HQ-9 has limited success against cruise missiles and ballistic missiles. Sources conflict in identifying the organization for combat of the HQ-9 battery and battalion. We assess that the following is true: A HQ-9 battery will usually have 8 TELs, 1 HT-233 Radar, and a TWS-312 CP. In addition, associated support vehicles (generator, missile resupply) may be seen in the area. The battery can operate independently of the battalion as listed above with some degradation in search capability. This degradation will be eliminated when the organization is deployed as a battalion as this will bring additional radars to include the Type 120 Low Angle Search Radar and the Type 305B Radar. The battalion formation will include 3 batteries (24 TELs) though some sources state that the battalion can control 48 TELs. The battalion also deploys with a site survey team which does not deploy with the battery, missile resupply, and its own TWS 312 Command Post. It is safe to assume that other mission and soldier support items will be found in the area of the HQ-9 formation. The HQ-9 has been designed to be able to use several of the Chinese radars. The assessment above is the most likely deployment course of action. Refs:

S-300V (SA-12a Gladiator) Russian Long-Range Air Defense Missile System

Tiers:

Variants:

- **SA-12b Giant:** The S-300V with a 9M82 SA-12b GIANT missile and 9A82 SA-12b GIANT TELAR
- **S-300VM:** S-300VM is an upgraded version of the S-300V. It seems that it is also called S-300V3. Western reporting name for this system is SA-23 Gladiator/Giant. It has new command post vehicle and new radars. It fires improved 9M83M and 9M82M missiles with a longer range. Missiles have a range of 200 km and can reach targets at altitude of 30 km. The S-300VM is in service with Russia.
- **Antey 2500:** Antey 2500 an export version of the S-300VM. It can engage up to 24 aircraft or up to 16 ballistic missiles simultaneously. This system can engage ballistic missiles at a range of 250 km and aircraft at a range of 200 km. Two battalions of these air defense systems were exported to Venezuela. These were delivered in 2013. Estimated export price of this system is 1 billion dollars.
- **S-300V4:** S-300V4 improved version. It seems that this system is also called S-300VMD. It has a range of 300 km. Russian armed forces issued production order for this air defense system. Deliveries commenced in 2014.

System

Alternative Designation: S-300V; SA-12s Gladiator; 9K81 Antey-300
Type: The S-300V air defense missile system was developed to engage short- and intermediate-range ballistic missiles, cruise missiles, strategic and tactical aircraft, as well as early warning and electronic warfare aircraft.
Family: S-300 Family
Crew: ea3
In Service: 1988-Present
Displacement Time: min5
Emplacement Time: min5
Note #1: A battery of the S-300V typically includes up two six launchers in two variants, command post vehicle, surveillance radar, sector surveillance radar, and up to 6 reloading vehicles/launchers in two variants.
Note #2: S-300V system may be controlled by an upper level command post system 9S52 Polyana-D4 integrating it with Buk missile system into a brigade

Dimensions

Hull Length: m9.30

Hull Width: m4.50

Hull Height: m3.40

Weight: tons50

Ground Pressure: INA

Communications

Missile System

↳*Launcher*

Name: 9A93 SA-12a GLADIATOR TELAR

Type: TELAR

Maximum Elevation: +90

Minimum Elevation: INA

Note: The TELARs are not capable of autonomous engagements, requiring the support of the GRILL PAN radar.

↳*Missile*

Name: 9M83 SA-12a GLADIATOR Missile

Type: Semi-Active Radar Homing Missile

Basic Load: Carries four 9M83 SA-12a GLADIATOR missiles

Length: m7.0

Diameter: mm800

Weight: 2,345 kg

Warhead Type: HE fragmentation

Warhead Weight: 150 kg

Guidance System: Semi-Active Radar Homing Missile

Maximum Velocity: m/s1,700

Operational Range: 6–75 km

Maximum Altitude: km25

Minimum Altitude: m250

Maximum Speed: 1,700 m/s, Mach 5.75

Chance to Defeat Ballistic Missiles: 40-65% chance of defeating ballistic missile

Chance to Defeat Cruise Missiles: 50-70% defeating cruise missile

Chance to Defeat Enemy Aircraft: 70-90% chance of defeating enemy aircraft

Launcher/Loader Vehcile (LLV)

Name: 9A85 GLADIATOR Launcher/Loader Vehicle (LLV)

Crew: ea3

Crane: Yes

Basic Load: Four 9M82 missiles

Reloading Time: 50-60 minutes

Note #1: There are two variants of reloading vehicles

Note #2: These vehicles are combination of the TEL and reloading vehicle. A unique capability of these vehicles is that they can launch missiles themselves. Firing data is acquired from the launcher vehicle

Command Station

Name: 9S457 Command Station (Command Post Vehicle)

Crew: ea7

Mission: It controls radars and up to 4 launcher vehicles

Target Tracking: It can track up to 70 air targets simultaneously. It prioritizes which targets should be attacked first and transmits firing data to launcher vehicles

Note: he CPV and its associated radars can detect up to 200 targets, track as many as 70 targets and designate 24 of the targets to the brigade's four GRILL PAN radar systems for engagement by the SA-12a and SA-12b TELARs

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: INA

Indirect Fire: Yes

↳*Radar #1*

Name: 9S15 BILL BOARD Surveillance Radar system

Type: Phased-Array Surveillance Radar system

Traverse Range: deg360

Traverse Left: deg360

Traverse Right: deg360

Crew: ea4

Detection Range: km330

Aircraft Detection: At a range of 240 km aircraft are detected with a chance of 50%

Ballistic Missile Detection: It detects ballistic missiles at a range of about 150 km

Antenna Rotating Speed: sec6-12

Target Detection: up to 200 targets

Target Coverage Elevation: 0-55º in Elevation

Target Coverage Range: 10-250 km

Target Coverage Accuracy: 30-35 min of arc in azimuth and 250 m in range

↳*Radar #2*

Name: 9S19 HIGH SCREEN Sector Radar system

Type: Sector Radar system

Purpose: The HIGH SCREEN sector radar supporst the ATBM role, providing surveillance of anticipated azimuths of threat missiles

Crew: ea4

Mission: t is used to detect high speed targets, such as ballistic missile warheads

Detection Range: km175

Maximum Targets, Simultaneous: maximum being 16 simultaneous targets

Note: The radar is switches to a tracking mode when high speed targets are detected, automatically transmiting the trajectory parameters to the Command Post Vehicle

↳*Radar #3*

Name: 9S32 GRILL PAN Guidance Radar system

Type: Parabolic dish target-illumination radar on telescoping mast on missile launch vehicle

Purpose: The GRILL PAN radar system controls the battery's launcher vehicles (TELARs and LLVs)

Sector Scan: 90-deg sector scan through 50 deg elevation on separate vehicle

Guidance System: inertial guidance with semi-active terminal homing

Band: X-Band

Multichannel: Yes

Peak Power: kW150

Maximum Range: km250

Beamwidth: deg0.5

Antenna: ransmission type of space fed phased-array antenna

Maximum Targets, Simultaneous: It can simultaneously track up to 12 targets and control up to six missiles against these targets

Radar Cross-Section: radar cross-section of 2m2 at a range of 150 km in manual mode and 140 km in automatic mode

Note: The GRILL PAN tracks targets assigned to it by the CP while simultaneously maintaining a horizon search for new targets

Protection

Hull Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: No

Note: The S-300V is considered as a survivable system. Once all the missiles are launched the launcher vehicles can briefly redeploy. It uses shoot, scoot and hide tactics in order to avoid being destroyed.

Notes:

The S-300V air defense missile system was developed to engage short- and intermediate-range ballistic missiles, cruise missiles, strategic and tactical aircraft, as well as early warning and electronic warfare aircraft. It was designed to counter the threat posed by Lance and Pershing ballistic missiles. The main role of the S-300V is to protect task forces and vital industrial and military installations against massed air attacks. Its reporting name in the West is SA-12 or Gladiator/Giant. The S-300V consists of: 9M82 SA-12b GIANT missile 9M83 SA-12a GLADIATOR missile 9A82 SA-12b GIANT TELAR 9A93 SA-12a GLADIATOR TELAR 9A84 GIANT Launcher/Loader Vehicle (LLV) 9A85 GLADIATOR Launcher/Loader Vehicle (LLV) 9S15 BILL BOARD Surveillance Radar system 9S19 HIGH SCREEN Sector Radar system 9S32 GRILL PAN Guidance Radar system 9S457 Command Station Note: The S-300V comes in two versions: 1. SA-12a Gladiator 2. SA-12b Giant Once equipped with 9M83 missiles is referred in the West as SA-12A or Gladiator. When equipped with 9M82 missiles it is referred as SA-12B or Giant. The 9M83 SA-12a GLADIATOR is a dual-role anti-missile and anti-aircraft missile with a maximum range between 75 and 90 km. The 9M82 SA-12b GIANT missile, configured primarily for the ATBM role, is a longer range system [maximum range between 100 and 200 km] with a longer fuselage with larger solid-fuel motor. The 9A82 SA-12b GIANT and 9A93 SA-12a GLADIATOR TELAR vehicles are similar, though the 9A83-1 carries four 9M83 SA-12a GLADIATOR missiles, whereas the 9A82 carries only two 9M82 SA-12b GIANT missiles. The configuration of the vehicles command radar is also different. On the 9A83-1 the radar is mounted on a folding mast providing 360º coverage in azimuth and full hemispheric coverage in elevation. The radar on the 9M82 TELAR is mounted in a semi-fixed position over the cab, providing 90º coverage on either side in azimuth and 110º in elevation. The TELARs are not capable of autonomous engagements, requiring the support of the GRILL PAN radar. The 9S457-1 Command Post Vehicle is the command and control vehicle for the SA-12 system, which is supported by the BILL BOARD A surveillance radar and the HIGH SCREEN sector radar. The CPV and its associated radars can detect up to 200 targets, track as many as 70 targets and designate 24 of the targets to the brigade's four GRILL PAN radar systems for engagement by the SA-12a and SA-12b TELARs. The BILL BOARD A radar provides general surveillance, with the antenna rotating every 6-12 seconds. The radar, which can detect up to 200 targets, provides target coverage of 0-55º in elevation and 10-250 km in range with an accuracy is 30-35 min of arc in azimuth and 250 m in range. and. The HIGH SCREEN sector radar supports the ATBM role, providing surveillance of anticipated azimuths of threat missiles. The radar is switches to a tracking mode when high speed targets are detected, automatically transmitting the trajectory parameters to the Command Post Vehicle. The CPV prioritizes the threat and instructs the HIGH SCREEN radar to track specific missiles, with the maximum being 16 simultaneous targets. The GRILL PAN radar system controls the battery's launcher vehicles (TELARs and LLVs). It can simultaneously track up to 12 targets and control up to six missiles against these targets The radar can acquire targets with a radar cross-section of 2m2 at a range of 150 km in manual mode and 140 km in automatic mode. The GRILL PAN tracks targets assigned to it by the CP while simultaneously maintaining a horizon search for new targets. The LLVs (9A85 GLADIATOR and 9A83 GLADIATOR) resemble

normal TELARs, but with a loading crane rather than command radars. While the primary role of the LLV is to replenish the TELARs, they can also erecting and launch missiles if needed, though they are dependent on the use of command radars from neighboring TELARs.

Sevom Khordad (3rd Khordad) Iranian Long-Range Air Defense Missile System

Tiers:

1 2 3 4

Variants:

- **Note:** The Raad (Thunder) family contains 3 different systems which came into service one after another. The original Raad air defense missile system was officially displayed in 2012. It was a medium-range system of new design. It uses two electro-optical systems to provide both detection and engagement coverage. Each launcher vehicle carrier 3 missiles, plus and additional passive radar. The second member of the family was Tabas. Its name refers to the desert of Tabas incident in 1980. This improved air defense missile system was officially displayed in 2014. Tabas is equipped with a mechanical radar and also carries 3 missiles. It can reach targets at a maximum range of up to 75 km. The third, so far the most advanced member of Raad family is the Sevom Khordad. (Sevom - Third, Khordad - third month of Iranian calendar). The name "Sevom Khordad" refers to the 3rd day of 3rd month of the Iranian calendar, which coincides with the liberation of the city of Khorramshahr during Iran–Iraq War.

System

Alternative Designation: Sevom Khordad; 3rd Khordad

Type: Medium-Range Air Defense Missile System

Crew: INA

Chassis: The Sevom Khordad uses the same 6x6 wheeled chassis as Raad and Tabas systems.

Displacement Time: INA

Emplacement Time: INA

Note #1: The 3rd Khordad is the most advanced version of the Ra'ad air defense system. It has the greatest reported range of any of the variants.

Note #2: A battery contains 1 TELAR and 2 TEL vehicles. So a single battery has 9 ready-to-fire missiles. A battalion has 4 batteries with 4 TELARs and 8 TELs and can engage 16 targets simultaneously. Each battalion additionally includes a Bashir S-band 3D phased array surveillance radar which has a detection range of 350 km. The battalion also has a command and control (C2) unit, based on IVECO truck chassis. The C2 unit provides communication between Sevom Khordad batteries. Furthermore, the C2 unit can connect other air defense systems of the Raad family, including Raad and Tabas, into a single air defense network. This allows to cover large area and targets can be engaged with a wide range of missiles from the cheapest Taer-1 missiles to the most capable Taer-2s. This adds the capability of facing different types of threats with different types of interceptors. In case of heavy jamming when even the X-band engagement radar can’t handle its duty, the C2 unit can provide an additional data link, connecting the system to electro-optical engagement systems of Raad batteries, in order to guide missiles toward targets.

Dimensions

Length: 7.5 m

Width: 3.3 m

Height: 5.1 m

Weight, Combat: INA

Automotive

Engine Name: IVECO, Model: INA

Engine Type: Diesel

Engine Power: INA

Cruising Range: 500 km

Speed, Maximum Road: 65 km/h

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Missile System

Name: 3rd Khordad TELAR

Note: The system can engage two targets at a time.

↳*Missile (Option 1)*

Name: Taer-2B Missile

Type: Surface-to-Air Missile

Diameter: INA

Length: INA

Maximum Effective Range: 105 km

Maximum Intercept Altitude: 25,000 m

Speed: INA

Guidance System: Radar, mid-course update

↳*Missile (Option 2)*

Name: Sayyad-2C Missile

Type: Surface-to-Air Missile

Diameter: INA

Length: INA

Maximum Effective Range: up to 75 km

Maximum Intercept Altitude: up to 30 km

Speed: Mach 4.5+

Guidance System: Radar, mid-course update

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

↳*Internal Radar*

Name: INA

Type: Phased Array Engagement Radar

Frequency/Band: X-Band

Target Identification: Each Sevom Khorad TELAR can detect 100 targets at once.

Target Engagement: It can engage 4 targets simultaneously and guide 2 missiles on each target.

Note: It employs a phased-array radar on its transporter-erector-launcher radar (TELAR) that is visually similar to the Chair Back radar on the Buk-M2. The phased-array radar can reportedly provide guidance for up to two additional Alam al Hoda transporter-erector-launchers.

↳*External Radar Vehicle*

Name: Bashir

Type: 3D phased Array Surveillance Radar

Frequency/Band: S-band

Maximum Detection Range: 350 km

Protection

Hull Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Sevom Khordad, also known as the 3rd Khordad is the most advanced version of the Ra'ad air defense system. It has the greatest reported range of any of the variants. It employs a phased-array radar on its transporter-erector-launcher radar (TELAR) that is visually similar to the Chair Back radar on the Buk-M2. The phased-array radar can reportedly provide guidance for up to two additional Alam al Hoda transporter-erector-launchers. The system can employ Taer-2B missiles as well as the Sayyad-2C missile that is based off of the American SM-1R. The Sayyad-2C has a reported range of 46 miles and a maximum intercept altitude of 100,000 ft. The missile has a maximum speed of Mach 4.5. When fitted on the 3rd Khordad, the Sayyad missiles are not carried in canisters. The system can engage two targets at a time. The name comes from the Persian date (May 24) that Iran recaptured Khorramshahr in 1982 during the Iran-Iraq war. A 3rd Khordad battalion consists of four batteries, each consisting of one 3rd Khordad TELARs linked to two Alam al Hoda TELs for a total of four TELARS and eight TELs. Overall air surveillance is achieved with a Bashir 3D phased array surveillance radar operating in the S-band with a range of 190 mi (350 km). The 3rd Khordad is a specialised variant of the Iranian Raad medium range air defence system which entered service

in the mid 2010s, and deploys Taer-2B missiles from mobile transporter erector launchers. The missile systems have been mass produced and are heavily relied on today by the country’s air defence forces - complementing longer ranged platforms acquired from Russia including the S-200 and the S-300PMU-2. The 3rd Khordad is the longest ranged variant of the Raad system, and reportedly retains an engagement range of up to 200km. The platform can engage up to four targets with up to eight missiles simultaneously, and makes use of a powerful phased array radar. The successful testing of the missile system against a high end American drone is likely to have significant consequences for the balance of power in the Middle East - with Iran’s adversaries likely to be more wary about the risks of engaging the country’s indigenous defence systems. Iran itself may well speed up development of new long range missile platforms domestically - and the incident may also affect the military's decision making regarding the need to import more sophisticated foreign weapons systems such as the Russian S-400 which is reportedly currently under consideration.

S-400 Triumph (SA-21 Growler) Russian Long-Range Surface-to-air Missile System

Tiers:

System

Alternative Designations: Triumf, Triumph as a translation
Target: FW, IRBMs to 3,500 km, heli, CM, ASM, UAV, and artillery rocket
Crew: INA

↳Primary Components

Description: Group/brigade 2-8 bns and 91N6 E2. Each bn has 6-12 trailer launchers (TLs, aka mobile erectorlaunchers or MELs) , 55K6E 8x8 van, 5T58-2 SAM transporter, 22T6-2 loading crane, and radars. Battery (firing unit) has 3 TLs.

ARMAMENT

↳Trailer Launcher (TL) or MEL

Name: 5P85TE2
Tractor: BAZ-64022 6x6 tractor
Missiles per Launcher: 3 x 40N6, 4 x 9M96E2 (current likely mix)
Automotive Performance: For 5P85TE2 TL
Cruising Range (km): 800 (est)
Road/ Dirt Road Speed (km/h): 60/30 (est)

↳Missile

Name: 40N6 “big missile”

Type: Solid-fuel

Launch Mode: Vertical launch

Launch Range (km): 5-400

Max Range TBMs: 40

Targets: 28-48

Guidance: Track-Via-Missile, missile active radar homing, home on jam

Warhead Type: Frag-HE

Warhead Weight (kg): 180+

Fuze Type: Radio command

Probability of Hit (Ph%): 90 FW. 80 heli

Simultaneous missiles: up to 2 per target (doubles probability of hit)

Weight (kg): 2,000, 2,800 in canister

↳*9M96E2/9M96M "small missile"*

Description: A canister of 4 can fit on the SA-21 launcher in place of a big missile. It is possible that most launchers in most batteries (by the Near Term) will have 2 canisters of small missiles (8 total).

↳*Other Missiles*

Description: The system can also launch older missiles for SA-10 and SA-20 systems. There are reports of a 48N6DM missile, which offers longer range than the 48N6. This may have been an interim missile for use until 40N6 was fielded.

Missiles

Description: Typical Combat Load

TEL and trailer launcher: 7

40N6 (with 1x 9M96E2 canister): 3, Near Term 2

9M96M/E2 ("small missile"): 4, Near Term 8

SA-18S MANPADS: 2

ARMAMENT

Name: 92N2E

Description: This VHF target acquisition radar is at Brigade level. The first search priority is stealth aerial systems. Because of limited sector coverage, it is likely that up to 4 will be used.

Detection Range (km): At least 400

Azimuth Coverage (°): 120, 360 with rotation

Function: Dual (TA/FC) radar vehicle and CP

Unit Associated With: Trailer with KrAZ-260 tractor

Mobility: MAZ-7930 8x8 van

Operation: Digital links to battery, battalion, and brigade/IADS processing center

Emplacement/Displacement time (min): 15

Range (km): 400

Targets Tracked Simultaneously: up to 150

Frequency Band: I/J, 3-D phased array

NATO Designation: GRAVESTONE

Unit: Battery (SAM system), for 3 launchers

Detection and Guidance (km): 400 auto-track

Targets Engaged Simultaneously: up to 6 (est)

Missiles Guided Simultaneously: up to 12 (est)

OTHER ASSETS

Description: A RECENT COUNTER-STEALTH RADAR SYSTEM IS THE NEBO-M MOBILE MULTI-BAND SYSTEM, WITH THREE VEHICLES. RLM-D HAS L-BAND RADAR. RLM-S HAS X-BAND. RLM-M HAS A VHF RADAR, SIMILAR TO NEBO-SVU. THE SYSTEM IS SPECIFICALLY DESIGNED AGAINST STEALTH AIRCRAFT AND F-35. A RECENT RUSSIAN CONTRACT CALLS FOR 100 SYSTEMS TO REPLACE NEBO-SVU IN SA-20B/S-400 UNITS, AND WILL BE INCLUDED IN SA-23/S-300V4 UNITS.

VARIANTS

Description: THE S-400 SERIES USES A NEW ARRAY OF TRUCKS, TRACTORS, AND TRAILERS. DUE TO S-400 PRODUCTION DELAYS, THE SA-20 SERIES WAS CONFUSED WITH IT. MANY S-400 UPGRADES CAN BE APPLIED TO SA-10, SA-12, AND SA-23. CHINA IS ORDERING SA-20B AND UPGRADING OTHER LAUNCHERS TO SA-20B CAPABILITY.

↳*S-400/SA-21A*

Description: THE SYSTEM WAS FIELDED IN 2007 WITH RUSSIAN VEHICLES. EARLY UNITS ARE STRATEGIC AND USE ONLY 40N6 400-KM BIG MISSILES. MOST LAUNCHERS CAN ALSO MOUNT CANISTERS OF 9M96 SERIES SMALL MISSILES.

↳*SA-21B/S-400M/SAMODERZHETS*

Description: UNLIKE THE OTHER. SAMS, SA-21A’S 40N6 WILL RANGE 400 KM.

NOTES

Description: THERE ARE ALSO REPORTS OF A SYSTEM IN DEVELOPMENT CALLED S-500, WITH LONGER RANGE AND A DESIGN VELOCITY OF 10,000 M/S. NO DETAILS ARE AVAILABLE. THE PHASED-ARRAY RADARS FEATURE LOW DETECTION, AND HIGH JAM RESISTANCE.

Notes:

The S-400 Triumph (NATO reporting name: SA-21 Growler), previously known as the S-300PMU-3, is an anti-aircraft weapon system developed in the 1990s by Russia's Almaz Central Design Bureau as an upgrade of the S-300 family. It has been in service with the Russian Armed Forces since 2007. In 2017 the S-400 was described by The Economist as "one of the best air-defence systems currently made". According to Siemon Wezeman Senior Researcher of SIPRI the S-400 "is among the most advanced air defence systems available"

→Infrared/Command Guidance Missile Systems

→→Short-Range Missile Systems (Less than 30 km)

Rapier (Export) Iranian Surface-to-Air Missile System

Tiers:

Variants:

- **Laserfire Rapier:** With the range of upgrades and new components, the original low-cost Rapier system was gone. In order to address international market requirements for a lower-cost system, BAC started development of the "Rapier Laserfire" in 1982. Laserfire replaced the original optical tracker unit with a new lidar (laser radar) illuminating system that is considerably smaller, allowing the entire system to be mounted on a single pallet that could itself be mounted on a truck or other flatbed vehicle. Laserfire used a millimetric Doppler radar. Due to its very high frequency of operation and ability to transform its beamshape from narrow azimuth and high elevation to wide azimuth and narrow elevation, Laserfire was able to detect helicopters hovering or travelling at low altitude and in areas of high clutter by detecting the movement of the helicopter's rotor blades. Initial engagement is similar to the original Rapier, but the target was illuminated and automatically tracked by a high power YAG:Nd laser. After the missile was launched the laser alternately illuminated the target and missile to determine their locations, and guidance was sent to the missile as normal (see laser guidance). Laserfire thus represented a fairly major upgrade to the original optical system, allowing semi-automatic engagements, and greatly reducing operator skill and training requirements. On the downside, Laserfire no longer has the optical system of the original, which served an important second duty by allowing the aircraft to be visually identified at long range. Additionally, while the Laserfire tracking system was capable of being operated at night, target acquisition was optical, like the original Rapier.
- **Field Standard B1:** Shortly after introducing FSA, "Field Standard B" (FSB) added a number of basic upgrades. Additionally, the search radar was upgraded to be easily shut down in case of an anti-radiation missile attack. FSB included lessons from the Falklands campaign, notable the 'pointing stick' that enabled the detachment commander of a fire unit to point the aiming unit at a target.
- **Darkfire Rapier/Field Standard B2:** In 1985 development started on a new tracker that replaced the original optical system with a new IR thermal imager system to improve its abilities, especially at night. This version was known as "Rapier Darkfire" for this reason. Trials of the new system started in 1987, and were deployed operationally in 1990 as "Field Standard B2" (FSB2), the earlier upgrades retroactively becoming FSB1. This system was also known as "Rapier 90". Cooling for the imager was provided by bottles of compressed gas. FSB2 also introduced a number of improvements that greatly improved Rapier capabilities. First and foremost was the Tactical Control Console that allowed four Rapier launchers to be controlled from a central location. The launchers themselves were upgraded to carry six missiles instead of four, improving battery capacity. Finally, the search radar was updated to use a new planar array radar, although its capabilities remained generally the same as the earlier model.
- **Rapier 2000/Field Standard C:** In 1992, shortly after the introduction of Rapier 90, another major upgrade series started at MBDA (previously Matra BAe Dynamics). Emerging as "Rapier 2000", or "Field Standard C" (FSC) in British service, the system reached its ultimate form. Development of the FSC system began at the end of the 1980s and the systems first entered service in 1996. By this time the Cold War was over and British air defence capabilities were significantly reduced, with fewer and smaller batteries, albeit every fire unit with Blindfire. There is also an export version of this version, known as Jernas. Malaysia is the first export customer for Jernas. FSC was effectively a new system, although Blindfire was little changed and it could fire both Mk 1 and Mk 2 missiles. The Surveillance radar was removed from the launcher and became a separate element and each launcher now carried eight missiles. With the missiles increasingly relying on radar guidance since the introduction of Blindfire, it made sense to upgrade the original

search radar to something much more modern. This was supplied by the Alenia Marconi "Dagger", a 3D pulse doppler radar with an integrated Cossor IFF Mark 10 system. Dagger is mounted on its own trailer, so the radome on top of the launcher unit was no longer needed. In its place, a much more modern optical tracking system was added. The new tracker used a Stirling-cycle cooler instead of compressed gas bottles. The use of much smaller electronics greatly reduced stack height of the whole launcher, allowing an additional two missiles to be added, for a total of eight. In operation, the Rapier 2000 is similar to earlier Blindfire-equipped systems. Targets are acquired visually or through the Dagger radar, and then the Blindfire and optical tracker are slewed onto the target. The optical system can be used solely to track the missile, or it can be used for all guidance, like the original Rapier. In either case the engagement is entirely automatic, with no operator guidance needed. The optical system can also be used as a search system, seeking out IR sources, allowing radar-quiet operation. In 2006 a Ministry of Defence study in Ground Based Air Defence recommended further reductions, based on a reduced air threat and the improved air defence capabilities afforded by the Typhoon fighter. These included removing the role from the RAF Regiment as a measure to preserve Royal Artillery units in the face of significant cuts to the Army. Nevertheless, the Royal Artillery units were placed under command of the HQ 1 Group RAF (within HQ Air Command) and the Joint Ground-Based Air Defence HQ was formed.

- **Tracked Rapier:** With sales to Iran came the additional requirement for a fully mobile version of Rapier to protect the Chieftain tanks being supplied on a UK MOD contract. BAC responded by adapting the Rapier system to fit on the M548, a cargo-carrier version of the ubiquitous M113. Development started in 1974 as "Tracked Rapier", with the first public showing at the 1977 Paris Air Show as a static display unit. The system had not yet been fully developed when the Shah fell from power in 1978. The vehicles were later purchased by the British Army as part of a Fixed-price Develop and Supply contract. The first production Tracked Rapier was accepted on time and to cost at Wellington Barracks in early 1981, and entered service with 11 (Sphinx) Air Defence Battery, of 22 Air Defence Regiment, Royal Artillery in 1983 in Napier Barracks near Dortmund. The initial proposal for the system was to simply mount the towed launcher, (less its running gear) and its petrol generator set on the flat bed of the M548 carrier. When this was shown to Mr G.R. Jefferson, the GW Managing Director, he was not very impressed. Aware of the amount of money available, he required a much more extensive change. Greville Beale and Adrian Pollicutt led development of a very significant new arrangement was produced in quite a short period.

System

Alternative Designation: Rapier

Type: Surface-to-Air Missile System

Family: Rapier Series

In Service: 1971-Present

Crew: ea6

Chassis: The launcher is carried on a two-wheeled A-frame trailer. In the firing position, the wheels are removed and it is stabilized on four adjustable legs.

Displacement Time: INA

Emplacement Time: INA

Fire on the Move: No

Rapier Fire Unit: A Rapier fire unit includes the trailer-mounted launcher with four missiles and surveillance radar, tripod-mounted optical tracker and generator. Two light trucks are used for towing the launcher and a trailer carrying nine reload missiles.

Rapier Battery: A battery typically includes a headquarters and a repair section equipped with a Land Rover with diagnostic and performance test gear and a trailer with ready use spare parts. There is also a battery repair team with two vehicles: one for optical and hydraulic repairs and one for major electronic repairs. An ordnance spares vehicle is also provided.

Airborne Capable: Yes, Individual Rapier components can be transported slung under helicopters such as the SA 330 Puma or CH-47 Chinook . A C-130 cargo aircraft can carry a complete system with radar tracker or two optical systems.

Targets: Supersonic, Low-Level, High-Maneuverability Aircraft, Unmanned Aerial Vehicles, Supersonic Missiles, Cruise Missiles, and Fixed/Rotary-Wing Aircraft

Automotive

Note: The launcher is carried on a two-wheeled A-frame trailer. In the firing position, the wheels are removed and it is

stabilized on four adjustable legs.

Mine Clearing: No
Self-Entrenching Blade: No
NBC Protection: INA
Smoke Equipment: No

Notes:

Rapier is a surface-to-air missile developed for the British Army to replace their towed Bofors 40/L70 anti-aircraft guns. The system is unusual as it uses a manual optical guidance system, sending guidance commands to the missile in flight over a radio link. This results in a high level of accuracy, therefore a large warhead is not required. Entering service in 1972, it eventually replaced all other anti-aircraft weapons in Army service; both the Bofors guns used against low-altitude targets and the Thunderbird missile[4] used against longer-range and higher-altitude targets. As the expected air threat moved from medium-altitude strategic missions to low-altitude strikes, the fast reaction time and high maneuverability of the Rapier made it more effective than either of these weapons, replacing most of them by 1977. Rapier was later selected by the RAF Regiment to replace their Bofors guns and Tigercat missiles. It also saw international sales. It remains one of the UK's primary air-defence weapons, and its deployment is expected to continue until 2020. The original Rapier took the form of a wheeled launcher with four missiles, an optical tracker unit, a generator, and trailer of stores. The launcher consists of a vertical cylindrical unit carrying two missiles on each side, the surveillance radar dish and "Identification Friend or Foe" (IFF) system under a radome on top, the guidance computer and radar electronics at the bottom, and a prominent parabolic antenna for sending guidance

commands to the missiles on the front. The search radar was of the pulsed Doppler type with a range of about 15 km. The aerial, located at the top of the launcher, rotated about once a second, looking for moving targets through their doppler shift. When one was located, a lamp would light up on the Selector Engagement Zone (SEZ), a box containing 32 orange lamps arranged in a circle about the size of an automobile steering wheel. The radar operator could also blank out returns from other directions, providing jamming resistance. The optical tracker unit was made up of a stationary lower section and a rotating upper section. The lower section housed the operator controls, while the upper section housed the tracking optics. The operator's optical system was a modified telescope containing a Dove prism to prevent the image 'toppling' as the optics rotate in azimuth. This system meant that, unlike a periscope, the operator did not have to move in order to track the target. The upper section also contained a separate missile tracking system that was slaved to the operator's optics, based on a television camera optimized for the IR band. Upon detection of a target, the optical tracking system would be slewed to target azimuth and the operator would then search for the target in elevation. The operator's field of view would depend on the target range: "wide" at about 20 degrees or "track" at about 4.8 degrees. When the target was found the operator switches to "track" and uses a joystick to keep the target centred in the telescope. Once a steady track was established the missile was fired. The TV camera on the tracker was tuned to track the four flares on the missile's tail. Like the operator's telescope, the TV system had two views, one about 11 degrees wide for the initial "capture", and another at 0.55 degrees for midcourse tracking. The difference between the line-of-sight of the operator's telescope and the missile's flare was calculated by the computer in the base of the launcher. Guidance updates were sent to the missile through the transmitter on the launcher platform, and received on small antennas on the rear of the mid-body fins. The operator simply kept the telescope's crosshairs on the target using the joystick, and the missile would automatically fly into the line-of-sight, a system of operation known as SACLOS. The basic concept is very similar to the one used by most anti-tank missiles, with the exception that those systems normally use small wires to send guidance information to the missile, rather than a radio link. The missile contained a small 1.4 kg warhead with a contact fuse and a single-stage solid-rocket motor that accelerated the missile to about 650 m/s (about Mach 2). Engagement time to the maximum effective range was about 13 seconds. Response time from the start of the target detection to missile launch is about 6 seconds, which has been repeatedly confirmed in live firing. The whole system, along with its crew, was delivered by two Land Rovers designated as the Fire Unit Truck (FUT) and the Detachment Support Vehicle (DSV). Royal Artillery batteries comprised three troops each of four fire units while RAF Regiment squadrons had eight fire units. By 1980 each Royal Artillery fire unit consisted of a (24 volt) 101 FC 1 tonne Land Rover towing the Rapier Launcher and carrying 4 missiles on board, a 109-inch 3/4 ton 24v FFR (Fitted For Radio) Land Rover towing a 1-ton Missile Supply Trailer (MST), containing up to a further 10 missiles. Blindfire radar (see below) was only provided for 1⁄3 of fire units in British Army service, and for all fire units in the RAF Regiment.

CSA-41 (FM-80) Iranian Short-Range Air Defense Missile System

Tiers:

Variants:

- **FM-80 (Feimeng 80),:** export version of the HQ-7. It was revealed in 1989.
- **HHQ-7:** a naval version of the HQ-7. It was introduced in the 1990s. It has a bank of 8 missiles. For over a decade it was the standard Chinese ship-based air defense system. Currently a more capable HQ-9 with a longer range is being fitted on newly-built Chinese warships.
- **Shahab Tagheb:** an Iranian short-range air defense missile system. It was revealed in 1999. It was developed with Chinese assistance and by transferring technology of the HQ-7.
- **HQ-7A:** improved variant introduced in 1998. It has a maximum range of fire of 15 km. Detection range is 25 km and tracking range is 20 km. Also this missile has a maximum speed of 900 m/s in stead of 750 m/s.
- **HQ-7B:** latest variant, based on indigenous 6x6 armored chassis. It was first revealed somewhere in 2009. This air defense system is wisely used by the Chinese armed forces. It is more mobile due to its 6x6 configuration. This vehicle is more suited to follow motorized infantry, or mechanizes armored units.

System

Alternative Designation: CSA-4A, HQ-7, FM-80, HongQi 7, Fei Meng, Flying Midge" or Flying Mongoose,

Type: Short-Range Air Defense Missile System

Family: HQ-7

Manufacturer: China, Company: INA

In Service: 1988-Present

Crew: ea3

Chassis: Thomson-Hotchkiss P4R chassis

Displacement Time: minutesINA

Emplacement Time: minutesINA

Fire on the Move: INA

Note #1: It is a reverse engineered copy of the French Crotale.

Note #2: A battery of CSA-4A's consists of one vehicle with acquisition radar and two or three TELAR vehicles. Also each battery is supported by a maintenance group with around 10 support vehicles.

Dimensions (Thomson-Hotchkiss P4R Chassis)

Length: mINA

Width: mINA

Height: mINA

Weight, Combat: kgINA

Ground Pressure: kg/mINA

Automotive (Thomson-Hotchkiss P4R Chassis)

Engine Power: hpINA

Cruising Range: km600

Speed, Maximum Road: km/h80

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: deg60

Side Slope: deg30

Vertical Step: m0.5

Trench: m0.5

Fording Depth: m0.5

Communications

Missile System

↳*Missile Launcher*

Name: INA

Type: TELAR vehicle

Firing Interval: 3 seconds

Operational Response Time: 6-10 seconds

Single-Shot Kill Rate: %85-90

↳*Missile*

Name: 4-cel or 8-cel missile launcher

Type: Short-Range Air Defense Missile

Length: m3

Diameter: m0.55

Wingspan: m0.55

Weight: kg84.5

Warhead Type: HE-FRAG

Warhead Weight: kg15

Maximum Range of Fire: kmup to 12

Minimum Range of Fire: m500-700

Maximum Altitude of Fire: km5.5

Minimum Altitude of Fire: m15

Basic Load: ea4

Speed: Mach 2.3 or 750 m/s

Missile Maneuverability: 20 G

Maximum Kill Distance at 400 m/s: km8.5

Maximum Kill Distance at 300 m/s: km10

Maximum Kill Distance at Helicopter: km12

Minimum Kill Distance: m500

Homing Range: km17

Target Seeking Range: km18.4

Note: The CSA-4A can engage helicopters, aircraft, cruise missiles, air-to-ground missiles and anti-radiation missiles.

Guidance System: Command + electro-optical tracking

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: No

Indirect Fire: Yes

Fire Control Sensors: Yes

IADS Integration: INA

Optical Aiming System: Yes

Target Processing Unit: Yes, the system can process 30 targets & track 12 targets simultaneously

Generators: 4 x 40 kW generators

Target Processing Unit: Yes

Network: Wired Network

↳*Radar #1*

Name: INA

Type: Doppler Search Radar

Band: E/F Band

Radar Range: km18.4

Radar Homing Range: km17

Radar Antenna: Ku-band Automatic Command to Line Of Sight monopulse radar dish antenna

TV Tracking System: Yes

IFF: Yes

IR Localiser: Yes

Protection

Hull Armor: Protection against small arms fire and artillery shell splinters.

Turret Armor: Protection against small arms fire and artillery shell splinters.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: Yes

Smoke Equipment: No

Countermeasures: Resists active and passive jamming and rejects ground and atmospheric clutter

IFF: Yes

Notes:

Iran imports many of their military weapons and equipment from Russia and China. The CSA-4A is a export model of the HQ-7 (FM-80) Chinese Short-Range Air Defense Missile System. The HQ-7 SAM is used by PLA and PLAAF for short-range air-defense. At some PLAAF bases, the HQ-7 is deployed in hardened shelters. The PLA has mounted the HQ-7 on towed trailers. The HongQi 7 (HQ-7) short-range air defense missile system has been developed in China in the 1980s. It is a reverse engineered copy of the French Crotale. Sometimes it is referred as Sino Crotale. In 1978-1979 China imported some of the Thomson-CSF Crotale systems for evaluation. These where both land-based and ship-based versions. Some French R-440 Sea Crotale systems were purchased and installed on the Chinese warships. Eventually China reverse engineered this system. First Chinese clone of the ground-based version was produced for testing in 1983. In 1986-1988 it was approved for production. The HQ-7 was also deployed by the Chinese air force and protected the air bases from air attacks. Since 1989 the HQ-7 was proposed for export customers as the FM-80.

SAM-15 (SA-15 Gauntlet) Iranian Short-Range Surface-to-Air Missile (SAM) System

Tiers:

Variants:

- **9K331 Tor M1:** "Tor-M1", introduced in 1991 with the 9M331 missile, with greatly improved missile accuracy and the ability to engage two targets simultaneously, minimum range 1.5 km (0.93 mi), minimum height 0,01 km.
- **9K332 Tor-M2E:** Upgrades have continued over the lifetime of the system, with developer Almaz Antey unveiling the newest incarnation of the Tor missile system, the Tor-M2E,[26] at the MAKS Airshow in 2007.
- **Tor-M1-2U:** "Tor-M1-2U" entered service at the end of 2012. This system is designed to destroy aircraft, helicopters, UAVs, missiles, and other precision guided weapons, flying at medium, low and very low altitudes in all weather.
- **3K95 Kinzhal (Naval Variant):** The 3K95 "Kinzhal" (Russian: Кинжал – dagger) is the naval version of the Tor missile system developed by Altair and has the NATO reporting name SA-N-9 Gauntlet. Using the same 9M330 missile as the land based version, the system can be mounted on vessels displacing over 800 tonnes and is known to be installed on Admiral Kuznetsov class aircraft carriers, Kirov class multimission cruisers, Udaloy class anti-submarine destroyers and Neustrashimy class frigates.
- **Tor-M2KM:** The Tor-M2 km is a self-contained fighting module version of the system that can be mounted in various locations. In October 2016, it was loaded onto the helipad of the Admiral Grigorovich frigate by means of an ordinary wharf crane and fixed in position with steel chains to fire at simulated cruise missiles while the ship was underway. This could give advanced SAM capabilities to vessels without the capacity to install the larger and heavier Kinzhal system; it can also be mounted on a truck, building roof, or any horizontal surface at least 2.5 m wide and 7.1 m long.
- **Tor-M2DT:** The system is especially designed to be used for Arctic region at temperatures up to -50 degrees C based on the chassis of the DT-30PM tracked all-terrain vehicle and is capable of detecting over 40 air targets, especially high-precision weapons, and to track and engage up to four of them simultaneously at a range of up to 12 km and altitudes up to 10 km with its 16 missiles even on the move. Its creation was completed in 2018 and the first delivery of 12 systems was held in November of the same year
- **Tor-2E:** JSC Rosoboronexport, part of the Rostec State Corporation, has started promoting the newest Tor-E2 SAM system developed and produced by the Almaz-Antey Air and Space Defense Concern in 2018. Tor-E2 combat vehicle is an independent, mobile, all-terrain fighting unit that provides detection and identification of air targets on the march and at the halt, target lock-on and engagement at the halt, from a short stop and on the move. A battery of the four-channel Tor-E2 SAM systems, consisting of four combat vehicles, can simultaneously engage up to 16 targets flying from any direction at a range of at least 15 km and an altitude of up to 12 km.
- **HQ-17 (China Variant):** The HQ-17 (Hongqi-17) is China's reported variant of the Tor-M1 system.
- **FM-2000:** FM-2000 is a mobile short-range air-defence (SHORAD) system unveiled by China Aerospace Science and Industry Corporation at the 2018 Zhuhai Airshow. Its range is 15 km and engagement altitude is 10 km. It is carried on a 3 axle TEL. It is a version of the HQ-17

System

Alternative Designation: Tor, SA-15
Type: Low to medium altitude, short-range surface-to-air missile
Family: 9K330 Series
Manufacturer: IEMZ Kupol Metrowagonmash (GM chassis designer), MZKT (wheeled chassis designer)
In Service: 1986-Present

Crew: ea3

Chassis: GM-355 special tracked chassis

Displacement Time: Less than 5 min

Emplacement Time: 3 min

Fire on the Move: No

Reloading Vehicle: Reloading vehicle is based on Ural-4320 6x6 heavy truck

Fully Reload Time: 18 Minutes

Note: This system can engage all kinds of modern air targets. It is used against aircraft, helicopters, UAVs, various missiles and precision guided munitions. It destroys targets that long- and medium-range air defense systems fail to hit.

Dimensions

Length: m8

Width: m3.2

Height, Combat Configuration: m4

Hull Armor: All-welded steel

Turret Armor: All-welded steel

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Air-Transportable: Yes

IFF: Yes

Notes:

The Tor missile system (Russian: "Top"; English: torus) is an all-weather low to medium altitude, short-range surface-to-air missile system designed for engaging airplanes, helicopters, cruise missiles, precision guided munitions, unmanned aerial vehicles and short-range ballistic threats (Anti-Munitions). Originally developed by the Soviet Union under the GRAU designation 9K330 Tor, the system is commonly known by its NATO reporting name, SA-15 "Gauntlet". A navalized variant was developed under the name 3K95 "Kinzhal", also known as the SA-N-9 "Gauntlet". Tor was also the first air defence system in the world designed from the start to shoot down precision guided weapons like the AGM-86 ALCM day and night, in bad weather and jamming situations. Tor can detect targets while on the move. The vehicle must stop intermittently when firing, although trials are being conducted to eliminate this restriction. The closest foreign equivalent to the Tor, in function and operation, are systems like the British Rapier missile and French Crotale missile systems, which some consider to have somewhat less performance[8][9][10] than Tor (the other two systems being based on somewhat older equipment). All three systems are mobile and self-propelled, Tor using the 9A330 combat vehicle, which carries a crew of four (one driver, three operators), and acts as an autonomous Transporter, Launcher, And Radar unit, or TLAR (similar to but not a TELAR, as it does not erect the missile to a launch position). The 9A330 is based on the GM-355 chassis manufactured by MMZ, the Tor-M1 using the improved GM-5955. It is equipped with NBC (nuclear, biological and chemical) protection. Like Rapier and Crotale, in addition to the tracked vehicle, there are also static and towed versions of the Tor, as well as a wheeled one. Mobility time is 3 minutes and it can be transported by any transport means (including aerial). The reaction time of the original Tor is 7–8 (standard) / 7–10 (if it is in motion) seconds. Arranged in a similar fashion to the previous 9K33 Osa and 9K22 Tunguska (Russian: Тунгуска) air defense systems, Tor's TLAR features a turret with a top mounted target acquisition radar, and frontal tracking radar, with 8 ready to fire missiles stored vertically between the two radars. The target acquisition radar is a F band pulse doppler 3D radar, equipped with a truncated parabolic antenna, and a mechanically, later electronically, scanned in azimuth with a 32 degree sector view, and has an average power output of 1.5 kW, which provides a maximum detection range of 25 km/16 mi. For reference, a McDonnell Douglas F-15 at an altitude of 6 km has a detection probability of 0.8 at this range. The electronic ‘heart’ of the system is a digital fire control system, which allows detection of up to 48 targets and the tracking of ten at any one time, and integrates IFF functionality; the IFF antenna being mounted above the search radar. The target engagement radar is a G band/H band (later K band) pulse doppler radar with an (in azimuth) passive electronically scanned array antenna. The radar is classed as a thinned array (design using fewer elements) incorporating only 570 phase shifters and uses linear polarization. The radar has an average power output of 0.6 kW providing a maximum detection range of 20 km/12 mi. An F-15 type aircraft had a detection probability of 0.8 at this range. Originally Tor could only engage one target at a time, and with only two of its missiles. Later variants of the Tor system (Tor-M1 and M2E) incorporate additional fire control channels, as well as improved fire control computers, allowing the system to engage two (M1) and then four (M2E) targets, whilst simultaneously guiding up to four (M1) and then eight (M2E) missiles. There is also a small antenna on the top of the target engagement radar to communicate with missiles after launch. Together these radars carry the NATO reporting name "Scrum Half". To reduce the dimensions of the vehicle, the target acquisition radar can be folded down horizontally when travelling, and the tracking radar can partially rotate away from vertical. To allow engagements in the ECM heavy environment that is the modern battlefield, the 9K332 is equipped with an optical tracking system, complementing the main radar. As a fully mobile system, the Tor is capable of acquiring and tracking targets while the TLAR is moving. Due, however, to the interference with launch operations while on the move, missiles can be fired only when the system is in a stationary position. Once set up, the reaction time (from target detection to engagement) is described as 5–8 seconds, depending on the variant; however, reaction time is somewhat longer (around 10 seconds) whilst in motion and firing in short halts. To facilitate this mode of operation, an auxiliary power unit (APU) is fitted so that the main engine can be shut down while the radar and missile system continue to operate when stationary, enabling long periods of readiness. The digital computers allowed for a higher degree of automation than any previous Soviet system of its type. Target threat classification is automatic and the system can be operated with little operator input, if desired. The high performance computing system combined with a passive electronically scanned array radar are the main reasons for the system's high degree of accuracy, ability to intercept small, fast and highly maneuverable targets, and the very fast reaction times of the system. Typically, a battery of four Tor vehicles is accompanied by the mobile Ranzhir-M (Russian: "Ранжир-М") command center, which provides automatic interaction with the SA-15,8,13,16. It allows for efficient allocation of tasks between the individual Tor-M1 crews and allows each TLAR to be linked into a wider air defense system, thereby increasing target detection range and reducing reaction time. Tor vehicles are accompanied by the mobile Polyana-D4, which provides automatic interaction with the SA-15,17,19,23 (S-300V, Buk, Tor, Tunguska), (integrates all functions of several different systems into a single whole + various air force aircraft + direct transfer of target designation). Tor-M1 receiving commands from Ranzhir-M / Polyana-D4 can shoot down targets in the range of 0–84 degrees. Tor-M1 system (the time of creating the version, 1991) can operate in a * pair *, then the angle of observation was 0–64 degrees (vertical). Combat vehicle of antiaircraft Tor missile system provides simultaneous detection of up to 48 targets.

9K31 Strela-1 (SA-9 Gaskin) Russian 4x4 Infrared Guided Surface-to-Air Missile System

Tiers:

System

Alternative Designations: 9K31 Strela-1; SA-9 Gaskin

Type: Infrared Guided Surface-to-Air Missile System

Name: 9A31M

Chassis: BRDM-2

Crew: 3 (commander, gunner and driver)

Dimensions

Length: m5.8

Width: m2.4

Height, while Traveling: m2.3

Weight: kg7,000

Ground Clearance: m0.43

Automotive

Engine Name: GAZ 41

Engine Type: V-8 water-cooled petrol

Engine Power: hp140

Cruising Range: km750

Speed, Maximum Road: km/h100

Speed, Maximum Water: km/h10

Fuel Capacity: 290 litres

Armament

Launcher: INA

Name: 9M31

Reaction Time: sec6

Time Between Launches: sec5

Reload Time: min5

Fire on the Move: No, stop or short halts

Emplacement Time: < 2.0 min

Displacement Time: < 2.0 min

Range: Max. Range: 4,200 m (6,100 tail aspect) Min. Range: 800 m

Altitude: Max. Altitude: 3,500 m Min. Altitude: 30 m

Dimensions: Length: 1.80 Diameter: 120

Weight: kg32

Missile Speed: m/s580

Propulsion: Single-stage solid propellant

Guidance: Photo contrast IR-homing, 1-3□m

Warhead Type: Frag-HE

Warhead Weight: kg2.6

Fuze Type: Proximity and Contact

Probability of Hit: (Ph%60 FW, 70 heli

Simultaneous missiles: ea2 per Target

Self-Destruct: Yes

Auxiliary Weapon: None

Operational Range: km6.5

Weapons and Ammunition Types

9M31M missiles: Typical Combat Load 6

Ready: Typical Combat Load 4

With Add-on racks: Typical Combat Load +2

Fire Control

Sights with Magnification: INA

Elecro-optical/ Infrared System: Day Range (m): 6,500 Night Range (m): 2,000 tail chase only

Navigation: Inertial

IFF: INA

RF Direction-Finder: The FLAT BOX-A passive system uses several Pelengator sensors mounted on the vehicle to detect aircraft navigation signals for early warning and DF of approach azimuth. Detection range is up to 30 km. Many forces with this older air defense system are not proficient in using the RF DF system.

Guidance Systemm: Infrared homing

Associated Vehicles Radars

Name: PPRU-1/Ovod AD ACV

Chassis: MTLB-U

Radar: DOG EAR (use in OPFOR units)

Function: Target Acquisition

Frequency: F/G band

Range: 80 detection, 35 tracking

Other Radars: The SA-9 can also link to the IADS to get analog AD data and warnings.

Radar: Gundish: In the earlier unit configuration, an SA-9 platoon is employed in an AD battery/ battalion with ZSU-23-4 SPAA guns. The radar on those systems supports the SA-9 platoon by providing detection and warning. Some of the users employ truck-mounted J-band GUN DISH acquisition radar in the platoons, instead of the Pelengator system.

Protection

Hull Armor Type: mm5-14

Turret Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Protection: INA

Notes:

The 9K31 Strela-1 is a highly mobile, short-range, low altitude infra-red guided surface-to-air missile system. Originally developed by the Soviet Union under the GRAU designation 9K31, it is commonly known by its NATO reporting name, SA-9 "Gaskin". The system consists of a BRDM-2 amphibious vehicle, mounting two pairs of ready-to-fire 9M31 missiles. The 9K31 is based on the BRDM-2 4x4 chassis. The driver and commander are seated in the front and the gunner in the turret. Up to four launch container can be attached to the turret. During travel the missiles are lowered. The 9K31 is a stand alone system, but usually it operates in pairs or groups of four. Target information is relayed by radio by other air defense systems. he turret is fitted with four 9M31 Strela-1 surface to air missiles with infrared guidance. The maximum effective range is 4.2 km and maximum altitude is 3 km. Due to the limitations of the seeker the maximum range can only be achieved under favorable circumstances. Effectiveness during head-on engagements and at night is much reduced.

Sayyad-1 (SA-2 Guideline) Iranian Strategic Surface-to-Air (SAM) System

Tiers:

Variants:

- **SA-2A (Guideline Mod 0):** This was the initial variant of the SA-2, which was deployed around Moscow, Leningrad and in the Baku region. It was guided by the Fan Song A radar system. It was probably a pre-production version.
- **SA-2B (Guideline Mod 1):** This improved version replaced the Mod 0. It is slightly longer than the Guideline Mod 0 and is guided by the Fan Song B radar system.
- **SA-2C (Guideline Mod 2):** Developed at the same time as the Guideline-B, this variant is equipped with a modified Fan Song C/D G-band engagement radar. The missile itself has a longer engagement range and can attack targets that are at lower altitudes than earlier versions of the SA-2.
- **SA-2D (Guideline Mod 3):** This short-lived variant fired V-750AK missiles and operated with the Fan Song E radar. It was more capable of defeating targets in hostile electronic warfare environments. It was eventually superseded in Soviet service by the Guideline Mod 4.
- **SA-2E (Guideline Mod 4):** This variant, also known as the S-75M Volga, used the V-755 missile, which was characterized by a swelled warhead section that could be fitted with a 25 kT nuclear warhead. It was guided by the Fan Song F radar.
- **SA-2F (Guideline Mod 5):** This variant, also designated the S-75M3 Volkhov, was developed with some technology derived from the SA-3 Goa ** (see separate record). It utilizes the improved Fan Song E radar, which is much more capable of hitting targets in a heavy ECM environment. This is accomplished by deploying a two-man t eam in a "dog house" on top of the radar. These two crewmembers track targets when the normal automatic tracking system has been jammed.
- **S-75 Volga 2A:** This version was developed in 1995. Twelve digital assemblies replaced 78 analog assemblies. It fired an upgraded V-755 missile and used a modernized Fan Song F radar. It was primarily intended for export.
- **S-75 Volga 2T:** Belarusian firm Tetraedr in 2004 began offering the S-75 Volga 2T upgrade kit. This included digital electronics and enhanced radars, launch control and missiles.
- **SA-N-2:** This is the naval version of the SA-2. The mount included a twin-arm launcher fed by a large drum magazine. A navalized version of the Fan Song E radar was equipped, along with a High Lune** height finding radar.
- **Iraqi modified SA-2 Guideline:** Iraq announced in 1989 that it had modified a number of SA-2s with an infrared terminal guidance system that improved the missile's capability against targets in high ECM environments. If the missile lost lock at this stage, the weapon could switch back to radio guidance. Iraq also attempted other modifications
- **CSS-8:** his is a short-range ballistic missile based on the SA-2.
- **Sayyad-1:** This is an Iranian reverse-engineered version of the SA-2. It is believed to have entered service in 1998. The design is also influenced by the Chinese HQ-2 and may feature some North Korean technology.
- **Sayyad-2:** This is an Iranian upgrade of the Sayyad-1, based on both the SA-2 and the Chinese HQ-2.
- **RM-75MVU-1/VU-1 target missiles:** his is a low-altitude (RM-75MVU-1) and high-altitude (RM-75VU-1) target missile based on the SA-2 was announced by Russia in mid-2004. The target missiles were to be used to test new surface-to-air missile systems being designed by the Almaz research and production association.
- **Qaher-1/-M2:** These variants based on the S-75/SA-2 have been used by Houthi rebels in Yemen. The Qaher-1 was revealed in 2015 with a range of 186.4 mi (300 km) and warhead weighing 440.9 lb (200 kg).

System

Alternative Designation: Volga-75SM, S-75 Dvina, V-75 Volkhov

In Service: 1998-Present

Manufacturer: Raspletin KB-1 (head developer), Grushin MKB Fakel (missile developer), Lavochkin OKB

Crew: eaINA

Wars: Vietnam War, Six-Day War, Indo-Pakistani War of 1965, Indo-Pakistani War of 1971, Yom Kippur War, Cold War, Iran–Iraq War, Gulf War, War in Abkhazia (1992–93), First Libyan Civil War, Syrian Civil War, Yemeni Civil War (2015–present), Saudi Arabian-led intervention in Yemen, Saudi–Yemeni border conflict (2015–present)

Guidance System: Radio command guidance from Fan Song A/B; or E/F-band missile control radar; or Fan Song D/E G-band missile control radar Many installations have Spoon Rest early warning radar.

Note: Each battalion will typically have six, semi-fixed, single-rail launchers for their V-750 missiles positioned approximately 60 to 100 m (200 to 330 ft) apart from each other in a hexagonal "flower" pattern, with radars and guidance systems placed in the center. It was this unique "flower" shape that led to the sites being easily recognizable in reconnaissance photos. Typically another six missiles are stored on tractor-trailers near the center of the site.

Dimensions

Booster Diameter: m0.70

Second Stage Diameter: m0.50

Length: m10.47

Wingspan: m2.50

Total Weight: INA

Automotive

Primary Propulsion Type: solid-fuel booster

Primary Propulsion Duration: 4-5 sec

Secondary Propulsion Type: liquid-fuel (nitric acid/hydrocarbon) sustainer

Secondardy Propulsion Duration: 22 sec

Note: The missiles themselves are carried by a special transloader semi-trailer, which is towed by a Zil truck.

Fire Control System

↳*Radar #1*

Name: Spoon Rest

Type: Spoon Rest is a Russian ground-based, early warning radar that later evolved into the Knife Rest** series.

Band: A

Frequency: 147-161 MHz

Pulse Width: 4-6 microseconds

Maximum Range: km275

Vertical Beamwidth: deg2.5

Horizontal Beamwidth: deg7-9

Peak Power: 180-350 kW

Pulse Repetition Frequency (PRF): 310-400 Hz

↳*Radar #2*

Name: P-15 Flat Face

Type: 2D UHF radar developed and operated by the former Soviet Union

Band: L-Band

Frequency: 810-950 MHz

Peak Power: kW400

Maximum Range: km250

↳*Radar #3*

Name: PRV-11 Side Net

Type: Side Net is a ground-based height-finding radar used in a ground control intercept (GCI) mode with early-warning radars Bar Lock , Back Net and Tall King

Band: E Band

Frequency: 2,560-2,710 MHz

Antenna Height: m8.50

Antenna Width: m3.50

Average Range: km180

Maximum Range: km400

NOD CYCLES/SEC: 5-30

Pulse Width: 3/1.5 micro sec

Average Power: 1.3 kW

Peak Power: 1.2 MW

↳*Radar #4*

Name: Fan Song A/B/F

Type: Fire control & Tracking Radar

Band: E/F, G Band

Frequency: 3 GHz (S-band)

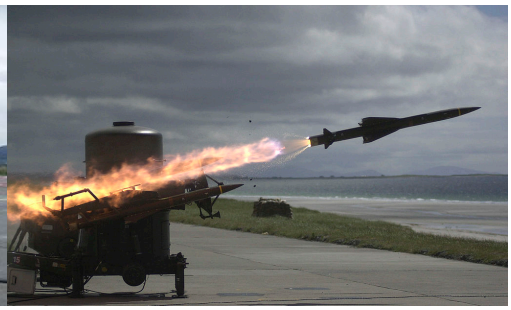
Peak Power: 600 kW

Maximum Range: km60

Notes:

The Sayyad-1 (SA-2/Guideline) is a two-stage medium-to-high altitude, radar-tracking SAM. Because its range is generally 35 to 50-kms, it is more of an MRAD system than LRAD. The weapon is a national-level asset usually found in the rear area with the mission of site defense of static assets such as supply and command installations. It is fired from a single-rail ground-mounted launcher that can be moved by a truck. The missiles are carried on a special transloader-semi-trailer towed by a ZIL truck. AN SA-2 regiment consists of three battalions, each having a single firing battery. Each battery has six launchers arranged in a star formation, centrally positioned fan song fire control radar, and a loading vehicle. The two forward batteries usually locate 40 to 50 km behind front lines; the third battery locates approx.. 80 km behind. Limitations include limited effectiveness against updated ECM, restricted mobility, and limited effectiveness against low-altitude targets.

Rapier British Towed Surface-to-Air Missile System



Tiers:

Variants:

- **Laserfire Rapier:** With the range of upgrades and new components, the original low-cost Rapier system was gone. In order to address international market requirements for a lower-cost system, BAC started development of the "Rapier Laserfire" in 1982. Laserfire replaced the original optical tracker unit with a new lidar (laser radar) illuminating system that is considerably smaller, allowing the entire system to be mounted on a single pallet that could itself be mounted on a truck or other flatbed vehicle. Laserfire used a millimetric Doppler radar. Due to its very high frequency of operation and ability to transform its beamshape from narrow azimuth and high elevation to wide azimuth and narrow elevation, Laserfire was able to detect helicopters hovering or travelling at low altitude and in areas of high clutter by detecting the movement of the helicopter's rotor blades. Initial engagement is similar to the original Rapier, but the target was illuminated and automatically tracked by a high power YAG:Nd laser. After the missile was launched the laser alternately illuminated the target and missile to determine their locations, and guidance was sent to the missile as normal (see laser guidance). Laserfire thus represented a fairly major upgrade to the original optical system, allowing semi-automatic engagements, and greatly reducing operator skill and training requirements. On the downside, Laserfire no longer has the optical system of the original, which served an important second duty by allowing the aircraft to be visually identified at long range. Additionally, while the Laserfire tracking system was capable of being operated at night, target acquisition was optical, like the original Rapier.
- **Field Standard B1:** Shortly after introducing FSA, "Field Standard B" (FSB) added a number of basic upgrades. Additionally, the search radar was upgraded to be easily shut down in case of an anti-radiation missile attack. FSB included lessons from the Falklands campaign, notable the 'pointing stick' that enabled the detachment commander of a fire unit to point the aiming unit at a target.
- **Darkfire Rapier/Field Standard B2:** In 1985 development started on a new tracker that replaced the original optical system with a new IR thermal imager system to improve its abilities, especially at night. This version was known as "Rapier Darkfire" for this reason. Trials of the new system started in 1987, and were deployed operationally in 1990 as "Field Standard B2" (FSB2), the earlier upgrades retroactively becoming FSB1. This system was also known as "Rapier 90". Cooling for the imager was provided by bottles of compressed gas. FSB2 also introduced a number of improvements that greatly improved Rapier capabilities. First and foremost was the Tactical Control Console that allowed four Rapier launchers to be controlled from a central location. The launchers themselves were upgraded to carry six missiles instead of four, improving battery capacity. Finally, the search radar was updated to use a new planar array radar, although its capabilities remained generally the same as the earlier model.
- **Rapier 2000/Field Standard C:** In 1992, shortly after the introduction of Rapier 90, another major upgrade series started at MBDA (previously Matra BAe Dynamics). Emerging as "Rapier 2000", or "Field Standard C" (FSC) in British service, the system reached its ultimate form. Development of the FSC system began at the end of the 1980s and the systems first entered service in 1996. By this time the Cold War was over and British air defence capabilities were significantly reduced, with fewer and smaller batteries, albeit every fire unit with Blindfire. There is also an export version of this version, known as Jernas. Malaysia is the first export customer for Jernas. FSC was effectively a new system, although Blindfire was little changed and it could fire both Mk 1 and Mk 2 missiles. The Surveillance radar was removed from the launcher and became a separate element and each launcher now carried eight missiles. With the missiles increasingly relying on radar guidance since the introduction of Blindfire, it made sense to upgrade the original search radar to something much more modern. This was supplied by the Alenia Marconi "Dagger", a 3D pulse doppler radar with an integrated Cossor IFF Mark 10 system. Dagger is mounted on its own trailer, so the radome on top of the launcher unit was no longer needed. In its place, a much more modern optical tracking system was added. The new tracker used a Stirling-cycle cooler instead of compressed gas bottles. The use of much smaller electronics greatly reduced stack height of the whole launcher, allowing an additional two missiles to be added, for a total of eight. In operation, the Rapier 2000 is similar to earlier Blindfire-equipped systems. Targets are acquired visually or through the

Dagger radar, and then the Blindfire and optical tracker are slewed onto the target. The optical system can be used solely to track the missile, or it can be used for all guidance, like the original Rapier. In either case the engagement is entirely automatic, with no operator guidance needed. The optical system can also be used as a search system, seeking out IR sources, allowing radar-quiet operation. In 2006 a Ministry of Defence study in Ground Based Air Defence recommended further reductions, based on a reduced air threat and the improved air defence capabilities afforded by the Typhoon fighter. These included removing the role from the RAF Regiment as a measure to preserve Royal Artillery units in the face of significant cuts to the Army. Nevertheless, the Royal Artillery units were placed under command of the HQ 1 Group RAF (within HQ Air Command) and the Joint Ground-Based Air Defence HQ was formed.

- **Tracked Rapier:** With sales to Iran came the additional requirement for a fully mobile version of Rapier to protect the Chieftain tanks being supplied on a UK MOD contract. BAC responded by adapting the Rapier system to fit on the M548, a cargo-carrier version of the ubiquitous M113. Development started in 1974 as "Tracked Rapier", with the first public showing at the 1977 Paris Air Show as a static display unit. The system had not yet been fully developed when the Shah fell from power in 1978. The vehicles were later purchased by the British Army as part of a Fixed-price Develop and Supply contract. The first production Tracked Rapier was accepted on time and to cost at Wellington Barracks in early 1981, and entered service with 11 (Sphinx) Air Defence Battery, of 22 Air Defence Regiment, Royal Artillery in 1983 in Napier Barracks near Dortmund. The initial proposal for the system was to simply mount the towed launcher, (less its running gear) and its petrol generator set on the flat bed of the M548 carrier. When this was shown to Mr G.R. Jefferson, the GW Managing Director, he was not very impressed. Aware of the amount of money available, he required a much more extensive change. Greville Beale and Adrian Pollicutt led development of a very significant new arrangement was produced in quite a short period.

System

Alternative Designation: Rapier

Type: Surface-to-Air Missile System

Family: Rapier Series

In Service: 1971-Present

Crew: ea6

Chassis: The launcher is carried on a two-wheeled A-frame trailer. In the firing position, the wheels are removed and it is stabilized on four adjustable legs.

Displacement Time: INA

Emplacement Time: INA

Fire on the Move: No

Rapier Fire Unit: A Rapier fire unit includes the trailer-mounted launcher with four missiles and surveillance radar, tripod-mounted optical tracker and generator. Two light trucks are used for towing the launcher and a trailer carrying nine reload missiles.

Rapier Battery: A battery typically includes a headquarters and a repair section equipped with a Land Rover with diagnostic and performance test gear and a trailer with ready use spare parts. There is also a battery repair team with two vehicles: one for optical and hydraulic repairs and one for major electronic repairs. An ordnance spares vehicle is also provided.

Airborne Capable: Yes, Individual Rapier components can be transported slung under helicopters such as the SA 330 Puma or CH-47 Chinook . A C-130 cargo aircraft can carry a complete system with radar tracker or two optical systems.

Targets: Supersonic, Low-Level, High-Maneuverability Aircraft, Unmanned Aerial Vehicles, Supersonic Missiles, Cruise Missiles, and Fixed/Rotary-Wing Aircraft

Automotive

Note: The launcher is carried on a two-wheeled A-frame trailer. In the firing position, the wheels are removed and it is stabilized on four adjustable legs.

Notes:

Rapier is a surface-to-air missile developed for the British Army to replace their towed Bofors 40/L70 anti-aircraft guns. The system is unusual as it uses a manual optical guidance system, sending guidance commands to the missile in flight over a radio link. This results in a high level of accuracy, therefore a large warhead is not required. Entering service in 1972, it eventually replaced all other anti-aircraft weapons in Army service; both the Bofors guns used against low-altitude targets and the Thunderbird missile[4] used against longer-range and higher-altitude targets. As the expected air threat moved from medium-altitude strategic missions to low-altitude strikes, the fast reaction time and high maneuverability of the Rapier made it more effective than either of these weapons, replacing most of them by 1977. Rapier was later selected by the RAF Regiment to replace their Bofors guns and Tigercat missiles. It also saw international sales. It remains one of the UK's primary air-defence weapons, and its deployment is expected to continue until 2020. The original Rapier took the form of a wheeled launcher with four missiles, an optical tracker unit, a generator, and trailer of stores. The launcher consists of a vertical cylindrical unit carrying two missiles on each side, the surveillance radar dish and "Identification Friend or Foe" (IFF) system under a radome on top, the guidance computer and radar electronics at the bottom, and a prominent parabolic antenna for sending guidance commands to the missiles on the front. The search radar was of the pulsed Doppler type with a range of about 15 km. The aerial, located at the top of the launcher, rotated about once a second, looking for moving targets through their doppler shift. When one was located, a lamp would light up on the Selector Engagement Zone (SEZ), a box containing 32 orange lamps arranged in a circle about the size of an automobile steering wheel. The radar operator could also blank out returns from other directions, providing jamming resistance. The optical tracker unit was made up of a stationary lower section and a rotating upper section. The lower section housed the operator controls, while the upper section housed the tracking optics. The

operator's optical system was a modified telescope containing a Dove prism to prevent the image 'toppling' as the optics rotate in azimuth. This system meant that, unlike a periscope, the operator did not have to move in order to track the target. The upper section also contained a separate missile tracking system that was slaved to the operator's optics, based on a television camera optimized for the IR band. Upon detection of a target, the optical tracking system would be slewed to target azimuth and the operator would then search for the target in elevation. The operator's field of view would depend on the target range: "wide" at about 20 degrees or "track" at about 4.8 degrees. When the target was found the operator switches to "track" and uses a joystick to keep the target centred in the telescope. Once a steady track was established the missile was fired. The TV camera on the tracker was tuned to track the four flares on the missile's tail. Like the operator's telescope, the TV system had two views, one about 11 degrees wide for the initial "capture", and another at 0.55 degrees for midcourse tracking. The difference between the line-of-sight of the operator's telescope and the missile's flare was calculated by the computer in the base of the launcher. Guidance updates were sent to the missile through the transmitter on the launcher platform, and received on small antennas on the rear of the mid-body fins. The operator simply kept the telescope's crosshairs on the target using the joystick, and the missile would automatically fly into the line-of-sight, a system of operation known as SACLOS. The basic concept is very similar to the one used by most anti-tank missiles, with the exception that those systems normally use small wires to send guidance information to the missile, rather than a radio link. The missile contained a small 1.4 kg warhead with a contact fuse and a single-stage solid-rocket motor that accelerated the missile to about 650 m/s (about Mach 2). Engagement time to the maximum effective range was about 13 seconds. Response time from the start of the target detection to missile launch is about 6 seconds, which has been repeatedly confirmed in live firing. The whole system, along with its crew, was delivered by two Land Rovers designated as the Fire Unit Truck (FUT) and the Detachment Support Vehicle (DSV). Royal Artillery batteries comprised three troops each of four fire units while RAF Regiment squadrons had eight fire units. By 1980 each Royal Artillery fire unit consisted of a (24 volt) 101 FC 1 tonne Land Rover towing the Rapier Launcher and carrying 4 missiles on board, a 109-inch 3/4 ton 24v FFR (Fitted For Radio) Land Rover towing a 1-ton Missile Supply Trailer (MST), containing up to a further 10 missiles. Blindfire radar (see below) was only provided for 1⁄3 of fire units in British Army service, and for all fire units in the RAF Regiment.

FB-6A Chinese 4x4 Mobile Short-Range Air Defense System

Tiers:

System

Alternative Designation: FB-6A Missile Launching Vehicle

Type: Short Range Air Defense System

Crew: ea2

Chassis: Shenyang SFQ2040

Maximum Effective Range: m6,000

Minimum Range: m500

Target Altitude (Max): m4,500

Target Altitude (Min): m15

Fire on the Move: INA; its parent, the US Avenger can fire on the move so, it is prudent to assume that the FB-6A can also

Protection

Vehicle Armor: No

Pedistal Armor: No

Applique Armor: No

NBC Protection: Over-pressure in pedestal only

Notes:

The FB-6A is a copy of the US Army's AN/TWQ-1 Avenger Short Range Air Defense (SHORAD) system. The HMMWV copy that carries the pedestal launcher is the Shenyang SFQ2040. The main difference between FN-6A and its successor FB-6A is that the SAM system is broken down into two portions in the FB-6A: FB-6A SAM system consists of two vehicles, one carrying the engagement radar, while the other carrying the missile launcher and missiles. Although the 12.7 mm heavy machine gun is no longer the standard equipment of FB-6A system, it can be added as an option, and is interchangeable with other machine guns. The total numbers of missiles carried by the launching vehicle of FB-6A remain the same as FN-6A, still totaling eight. A command vehicle and 8 launching vehicles form an air defense battery when fighting as a coherent unit, and this in turn can be integrated into larger air defense networks. Alternatively, the launching vehicle can be directly integrated into larger air defense networks without the need of the command vehicle. The launch vehicle can be task organized to fight alone without the radar however, aircraft acquisition become more difficult and engagement times become longer.

HQ-17A (FM-2000) Chinese Short-Range Air Defense Missile System

Tiers:

1 2 3 4

Variants:

- **FM-2000:** FM-2000 is an export version of the HQ-17A. It was first publicly revealed in 2018. It uses a Dongfeng high mobility chassis with 6x6 configuration.

System

Alternative Designation: HQ-17A

Type: Short-Range Air Defense Missile System

Family: HQ

Status: Operational; Exported to Cyprus, Egypt, Greece, Iran, Ukraine, and Venezuela

Crew: ea3

Chassis: The HQ-17A uses a new wheeled chassis instead of tracked. In terms of capabilities it is broadly similar to the Russian Tor M2 system. Overall it resembles versions of the Tor, based on a Belarusian MZKT-6922 high mobility wheeled chassis.

Displacement Time: minutes5

Emplacement Time: minutes5

Fire on the Move: INA

Note: The HQ-17A launcher vehicle carries both radars and missiles.

Mine Clearing: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The HQ-17A is a new China's short-range air defense system. It evolved from the HQ-17 (China's copy of the Russian Tor). China imported a total of 35 Tor M1 systems from Russia and offered to co-produce this air defense system in China. However Russia reportedly refused. Eventually China copied the Tor M1 and developed its indigenous version - the HQ-17, which featured some improvements, including a modern radar. The HQ-17A is a further development. This could be a good indication

of how self-sufficient and advanced is China's weapon industry. Pre-production version of the HQ-17A, was first publicly revealed in 2018 in the form of FM-2000 air defense missile system. Operational HQ-17A systems were first publicly revealed in 2019 during a military parade. The HQ-17A uses a new wheeled chassis instead of tracked. In terms of capabilities it is broadly similar to the Russian Tor M2 system. Overall it resembles versions of the Tor, based on a Belarusian MZKT-6922 high mobility wheeled chassis. Some components of the HQ-17A, such as the radar, might be actually more advanced than those of the Russian Tor. The HQ-17A can engage all kinds of modern air targets, including aircraft, helicopter, UAVs, cruise missiles and precision guided munitions. Basically it is intended to destroy targets that long- and medium- range air defense systems failed to hit. The HQ-17A was designed to protect mechanized formations. Though it can be also used to protect important stationary assets, such as military bases, airfields, ports, supply depots, command centers and so on. For this role an expensive tracked chassis was not required. The HQ-17A launcher vehicle carries both radars and missiles. A total of 16 missiles. Missiles are launched vertically. Maximum range of fire is around 15 km. Missiles can reach their targets at an altitude of up to 10 km. Hit probability of a single missile against aircraft is up to around 45-80%. The HQ-17A uses wheeled chassis with all-wheel drive configuration. It seems that this chassis is produced by Dongfeng motor corporation. Vehicle has good cross-country mobility and can travel over difficult terrain. A central tyre pressure system is fitted as standard. The cab is lightly armored and provides some degree of protection against small arms fire and shell splinters.

9M337 Sosna-R Russian Short-Range Air Defense Missile System

Tiers:

Variants:

- **Palma close-in weapon system:** This is a naval anti-aircraft gun system that can be equipped with eight Sosna-R missiles. It also has two AO-18KD 30-mm cannons. It has reportedly been purchased by at least one (unspecified) country. See separate record for more information.
- **Mobile/Tracked Sosna-R SAM:** This is a tracked air defense system featuring an upgraded MT-LB armored fighting vehicle chassis with a turret supporting 12 Sosna-R missiles in the ready-to-launch position. Two advanced electro-optical packages for acquisition, tracking and laser guidance are situated between the two banks of six missiles. The sights are said to be operational under almost all weather conditions. Once all 12 missiles have been launched, the system can be reloaded manually in about 12 minutes from a support vehicle carrying additional missiles. The system may be integrated with tracked or wheeled vehicles.
- **Sosna SHORAD system:** The Sosna system consisted of Sosna-R missiles and a twin-barrel 30-mm 2A38M cannon. Mounted on a wheeled, towed chassis it had four containerized ready-to-launch Sosna-R missiles. The cannon had a range of 13,100 ft (4,000 m). The Sosna featured a 360-degree target-acquisition radar and a gyro-stabilized multisensory turret with room for four sensors. An electro-optical fire-control system was equipped with laser-beam control for the missiles. It was offered for sale in 2003. However, development was ultimately shelved in favor of a self-propelled version.

System

Alternative Designation: 9M337 Sosna-R
Type: Short-Range Air Defense Missile System
Family: Sosna
Mission: The system is intended to protect against all types of air threats including high-precision weapons e.g. cruise missiles and guided aircraft missiles in the area of the system responsibility: in range – up to 10 km, in altitude – up to 5 km
Manufacturer: High Precision Systems
In Service: 2017-Present
Crew: ea3
Chassis: MT-LB Armored Personnel Carrier
Displacement Time: INA
Emplacement Time: INA
Fire on the Move: Yes
Launch Platforms: Sosna vehicle Palma CIWS Palash CIWS
Note: The (M337 Sosna-R (SA-24) Turret can be mounted on any vehcile that has a payload of more than 3,500 kg

Chassis Dimensions (MT-LB Armored Personnel Carrier)

Hull Length: m6.45
Width: m2.85
Height: m1.87
Length of Track on Ground: m3.80
Track Width Standard: mm350
Track Width Wide: mm570
Ground Clearance: mm400

Automotive (MT-LB Armored Personnel Carrier)

Engine Name: 1 x YaMZ 238V liquid-cooled, V-8 Diesel Engine
Engine Type: Diesel Engine
Engine Power: hp240 hp at 2,100 rpm
Power-to-Weight Ratio: 20.16 hp/metric ton
Transmission: manual w/1 reverse gear and 6 forward gears
Fuel Capacity: liters450
Cruising Range: km500
Speed, Maximum Road: km/h62
Speed, Average Cross: km/h
Speed Maximum Swim: km/h5-6
Suspension: torsion bar, 6 road wheels, front drive, rear idler, 2 shock absorbers, no return rollers
Gradient: %60
Side Slope: %30
Vertical Obstacle: m0.70
Trench: m2.70
Fording Depth: Amphibious

Communications

Primary: INA

Missile System

Name: 9M337 Sosna-R (SA-24)
Launcher Type: Tracked SAM Launcher
Length, Transport-Launch Canister: m2.20
Diameter, Transport-Launch Canister: m0.15
Launcher Weight: kg30.0
Missile Length: m2.20

Missile Booster Diameter: m0.13

Missile Forward Section Diameter: m0.07

Missile and Container Weight: kg42.0

Warhead Type: 1× Fragmented-rod warhead 1× AP-Frag warhead tandem warhead with high-explosive rod-fragmentation warhead for proximity detonation and an armor-piercing fragmentation warhead that goes off on impact

Warhead Weight: kg7.2

Missile Speed: m/s900

Detonation Mechanism: Fuze

Maximum Range: km10

Minimum Range: m1,300

Maximum Altitude: km10

Minimum Altitude: INA

Guidance System: The system features a two-stage solid-propellant missile. During the first phase of flight the missile is guided by radio command. The booster falls away, and the second stage is guided to the target by a laser beam

Max Elevation: INA

Min Elevation: INA

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Load Factor: g52

Reaction Time: 5-8 seconds

Reloading: 10 minutes

Fuze Type: The missile is equipped with an impact/proximity fuze with a continuous circular pattern and an adaptive burst time for maximum target effect

Basic Load: 12 missiles in twin launchers, each with six tubes

Note: The light weight of the missile eliminates the need for a dedicated transport/reloading vehicle

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes, a Missile FLight-Control Unit that is linked to the ECM-Protected Electro-Optical Control System

Fire on the Move: Yes

Thermal Camera: Yes

TV Camera: Yes

Laser Rangfinder: Yes

Passive Mode Capable: Yes, passive optical detection capability provides 360-degree coverage from -5 degrees to 60 degrees in azimuth

Jamming Resistant: Yes

Optronic Combat Control System: Yes, a multi-channel, automatic, day/night electro-optical sensor system that operates in nearly all weather conditions

Gyrostabilized Sensor: Yes

Sector Scan: Yes, 60-degree horizontal and 20-degree azimuth sectors

Automatic Target Designation Mode: Yes

Thermal Imaging Channel: Yes

Thermal and Laser Channels for MIssile Guidance: Yes

Direct Fire: Yes, the system is capable of firing at ground targets

Indirect Fire: Yes

Note #1: The Sosna-R is able to operate effectively under the control of various types of old, modern and prospective battery command posts, the most preferable of which is the FPU "Assembly-M1-2" (9S80M1-2) and is resistant to jamming

Note #2: It can track 50 targets simultaneously and engage one while moving

Protection

Hull Armor: 7-14 mm Maximum

Turret Armor: 7-14 mm Maximum

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The SOSNA-R 9M337 hyper-velocity beam rider missile is a two-stage missile designed for interception of fired wing aircraft and helicopters, as well as guided weapons and cruise missiles. The system is intended to protect against all types of air threats including high-precision weapons e.g. cruise missiles and guided aircraft missiles in the area of the system responsibility: in range – up to 10 km, in altitude – up to 5 km. Structure principles * mount of missile armament with a launcher in one combat vehicle, air search and target tracking equipments, missile flight control units that are combined by integrated optronic combat control system * missile armament consists of 12 high-speed high-precision maintenance-free missiles SOSNA-R deployed in a launcher. Light weight of the missiles allows to dispose of a transport/loading vehicle from the system * optimal configuration of surface-to-air guided missile (SAM) payload allows to improve impact effect due to increased weight of spread warheads and application of impact/non-impact laser fuse with continuous circular beam pattern and adaptive burst time * special multichannel automatic high-precision practically all-weather and day/night optronic control system * combined missile control system: radio command system in start zone; remote orientation in laser beam after engine division and missile targeting to the line-of-sight * optronic combat control system with sector scan and in the automate target designation mode provide autonomous target detection capability. State trials of Russia’s new short-range air defense missile system would begin in summer 2015, Tochmash design bureau told RIA Novosti on 19 May 2015. The system, dubbed Sosna ["Pine"], was expected to replace Strela-10M air defense systems in service with the Russian armed forces. “Last year, we successfully completed the preliminary tests of this system. In summer, the state trials of the system at testing grounds of the Land forces will begin,” Tochmash Managing Director Vladimir Slobodchikov said. “The outcome of the trials will determine whether this system will be put in service with the Russian Army,” Slobodchikov said. According to Tochmash, the Sosna system “is intended to protect against all types of air threats including high-precision weapons like cruise missiles and guided aircraft missiles in the area of

the system responsibility: in range – up to 10 km, in altitude – up to 5 km.” Slobodchikov noted that a number of foreign countries, including those of the South-East Asia region and the Middle East, have shown interest in acquiring the Russian Sosna system. Sosna participated in military exhibitions in South Africa and United Arab Emirates and would be exhibited in Peru and Brunei. Several Sosna vehicles will typically operate together with a command vehicle carrying a surveillance system. Each Sosna vehicle had 12 ready-to-fire missiles and could be reloaded in 12 minutes. It uses the same Sosna-R two-stage missile that is used with the company's Palma naval air defence system, which is in service with the Russian and Vietnamese navies. One variant of the system features high fire power due to the combination of the missiles and 30mm 2F38 twin-barreled air defense automatic gun.

9K35M Strela-10M (SA-13 Gopher) Russian Short-Range Surface-to-Air Missile (SAM) System

Tiers:

Variants:

- **Strela-10M:** improved air defense missile system. It entered service with the Soviet Army in 1979. Its missile has improved guidance. It distinguishes targets from infrared decoys. Therefore it is more effective.
- **Strela-10M2:** it is a further development of the Strela-10M. It can receive target data from air defense command posts or nearby radars. There is a 30-60% possibility to engage fighter aircraft with a single missile. Vehicle is fitted with floatation buoys on either side of the hull. It is fully amphibious and can ford rivers and lakes. On water it is propelled by its tracks. Amphibious speed on water is 5-6 km/h. It entered service with the Soviet Army in 1981.
- **Strela-10M3:** is a further development of the system. It can additionally engage UAVs and cruise missiles. Missile has improved resistance to enemy countermeasures. Warhead contains 5 kg of explosive material instead of 3 kg. It is more efficient against small-size air targets, such as UAVs. These missiles weight 42 kg. These can be used by all other versions of the Strela-10. The Strela-10M3 entered service with the Soviet Army in 1989.
- **Strela-10M3-K:** a proposed Russian upgrade, based on refurbished BTR-60 APC 8x8 wheeled chassis.
- **Strela-10M4:** a proposed Russian upgrade of the -10M, -10M2 and -10M3 systems.
- **Strela-10T:** a proposed Belarusian upgrade.
- **Luchnik-E:** a proposed Russian upgrade. It has 8 ready to use Igla short-range surface-to-air missiles.

System

Alternative Designation: 9K35 Strela-10, SA-13 "Gopher, 9K35
Type: Short-Range Surface-to-Air Missile (SAM) System
Manufacturer: Saratovskiy Zenit Machine Plant (Muromteplovoz Joint Stock Company for the 9K35M3-K)
In Service: 1976-Present
Family: Strela
Crew: ea3
Chassis: MT-LB multi-purpose armored vehicle.
Displacement Time: INA
Emplacement Time: INA
Note: Reload missiles are carried by escorting Ural-4320 6x6 truck, fitted with a crane.

Missile System

↳*Missile Launcher*

Name: INA

Type: INA

Basic Load: ea8

Note #1: Missiles are visually aimed.

Note #2: Four missiles are mounted on the turret in boxes, ready to launch, and eight more are carried inside the vehicle as reloads. Reloading takes around 3 minutes.

↳*Missile*

Name: 9M37

Type: Short-Range Surface-to-Air Missile (SAM) System

Length: m2.19

Wingspan: mm360

Diameter: m0.12

Weight: kg40

Warhead Type: HE-FRAG

Warhead Weight: kg3

Maximum Range of Fire: m5,000

Minimum Range of Fire: m800

Maximum Altitude: m3,500

Minimum Altitude: m25

Detonation Mechanism: contact and laser proximity fuzes

Propellant: Single-stage solid propellant rocket motor

Speed: m/s550

Guidance System: dual-mode passive 'photocontrast'/IR seeker

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: 7.62mm

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: +1 Million

Max Rate of Fire: 650 rds/min

Effective Rate of Fire: 250-300 rds/min

Length, Overall: mm1,203

Length, Barrel: mm605

Weight (Gun Only): 9 kg

Weight (Tripod Only): 7.7 kg

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Name: 57-N-323S

Type: Rifle

Caliber: 7.62 mm

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,000

Accuracy of fire at 300 m: 90 mm

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: INA

Electro-Optical Guidance: Yes

Guidance: Dual-guidance mode -- optical "photo-contrast" and dual-band passive infrared (IR)

↳*Radar #1 (Separate Vehicle)*

Name: "DOG EAR" Radar

Type: Acquisition Radar

Proliferation: Angola Air Force [10] (9K35 Strela-10) Azerbaijan Army [N/A] (9K35 Strela-10) Belarus Air Force [N/A] (9K35 Strela-10) Bosnia-Herzegovina Air Force [1] (9K35M3 Strela-10M3) Croatia Army [9] (9K35 Strela-10) Cuba Army [200] (9K35 Strela-10) Czech Republic Air Force [N/A] (9K35 Strela-10) Georgia Army [N/A] (9K35 Strela-10) India Army [250] (9K35 Strela-10) Jordan Army [92] (9K35 Strela-10) Kazakhstan Air Force [N/A] (9K35 Strela-10) Macedonia Air Force [8] (9K35 Strela-10) North Korea Army [N/A] (9K35 Strela-10) Russia Airborne Forces [30] (Strela-10MN) Army [400] (9K35M3 Strela-10M3) Marines [N/A] (9K35 Strela-10) Serbia Army [5] (9K35M Strela-10M) Slovak Republic Army [48] (9K35 Strela-10) Syria Army [N/A] (9K35 Strela-10) Turkmenistan Army [13] (9K35 Strela-10 mod) Ukraine Army [N/A] (9K35 Strela-10)

Function: The radar supplies target alerting information to the SA-13 Gopher (Russian 9K35 Strela-10) surface-to-air missile (SAM) system.

Vehicle Mount: The Dog Ear (with the Russian designation of 9S80) is a Russian ground-based, target-acquisition radar mounted on an MT-LB multi-purpose tracked vehicle or MT-LBu armored command and reconnaissance vehicle (ACRV).

Band: F-G (3-6 GHz)

Antenna Type: open-mesh, rounded-rectangle parabolic antenna.

Maximum Range, Acquisition: km80

Maximum Range, Tracking: km35

Note #1: Target acquisition requires a separate vehicle mounting a Dog Ear** forward alerting radar.

Note #2: Deployment usually involves one system for each air defense battery/battalion.

↳*Radar #2 (On Missile Vehicle)*

Name: 9S86 "SNAP SHOT"

Type: Rangefinding

Maximum Range: m10,000

Minimum Range: m450

Note: located between the two pairs of missile canisters on the transporter erector launcher and radar (TELAR)

↳*Radar #3 (On Missile Vehicle)*

Name: 9S16 (NATO "Flat Box-B")

Type: Radar warning

Traverse Range: deg360

Maximum Elevation: deg40

Minimum Elevation: INA

Protection

Hull Armor: Protection from small arms fire and projectile fragments.

Turret Armor: Protection from small arms fire and projectile fragments.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

Strela-10M (9M31M) This variant has an uncooled lead sulphide (PbS) seeker. The 9K35 is the successor of the 9K31 Strela-1 (SA-9 "Gaskin") and can also use the Strela-1's missiles in place of the 9M37. Development of the 9K37 Strela-10SV system was initiated July 24, 1969. The decision to begin the development of a new non-all-weather system was taken despite the simultaneous development of an all-weather hybrid gun/missile system 9K22 "Tunguska" mainly as an economical measure. It was also seen as advantageous to have a system capable of fast reaction times and immunity to heavy radio-frequency jamming. Rather than being mounted on an amphibious but lightly armoured BRDM chassis like the 9K31, the 9K35 is mounted on a more mobile tracked, modified MT-LB, with more room for equipment and missile reloads. Provision for amphibious capability is provided in some variants in the form of polyurethane-filled floats. The Strela-10SV system and its 9M37 missile were tested in Donguzkom range from 1973 to 1974, but the results were disappointing: the system was found deficient in terms of missile probability of kill, vehicle reliability, among other things. Acceptance to service was thus delayed until May 16, 1976, by which time improvements had been introduced to the system. Development of the system continued throughout the years through Strela-10M, -10M2 and -10M3 variants introducing among other things improved radio communications and provision for better integration to the Soviet integrated air defence system air picture data. Also improved missiles (9M37M and 9M333) have been developed and by September 2007 the 9K35M3-K Kolchan variant, mounted on a BTR-60 wheeled chassis, was displayed for the first time at the Moscow Air Show MAKS 2007. The Russian Armed Forces will receive 72 advanced mobile “night” short-range anti-aircraft missile complexes “Strela-10M4″ by 2016. In 2014, the Russian Airborne Troops received the first batch of 18 “Strela-10M4″ vehicles. Modernization of equipment extends the “life” of an air defense system for 3–5 years. The SA-13 Gopher Strela-10M is expected to be replaced by the Sosna anti-aircraft missile system. The system is based on the MT-LB chassis consisting of 2x6 Sosna-R 9M337 (SA-24) beam rider missiles with a range of 10 km and altitude of 5 km. The 9K35 is a SAM system with electro-optical guidance. It has the capability to use radars for target acquisition and range. Some vehicles have a pintle-mounted PKT 7.62 mm machine gun in front of the forward hatch for local protection. Other vehicles have been seen with additional support railings for the system on the rear deck. The following is a list of associated equipment: * 9A34M2, 9A34M3-K: launcher vehicle with 9S86 "SNAP SHOT" range only radar located between the two pairs of missile canisters on the transporter erector launcher and radar (TELAR) (maximum radar range is 450 to 10,000 m). * 9A35M2, 9A35M3-K: launcher vehicle with 9S16 (NATO "Flat Box-B") passive radar detection system that gives a 360° azimuth and minimum 40° elevation coverage * 9F624 and 9F624M training simulator * 9S482M7 Control Post. * 9U111: a 1,950 kg trailer-mounted 12 kW generator unit, designed to feed power to up to four 9A35M2, * * 9A35M3-K or 9A34M2, 9A34M3-K launcher vehicles at a distance of up to 30 m by cable while conducting maintenance or training operations. * 9V839M: system checkout vehicle * 9V915M, 9V915M-1: technical maintenance vehicle MT-LBU "DOG EAR" F/G-band target acquisition radar (maximum range 80 km/50 miles) * Ranzhir-M 9S737M (GRAU designation 9S737); is a mobile command center for a mixed grouping of air defense forces, such as Tor, Tunguska, Strela-10, and Igla.

AN/TWQ-1 Avenger American 4x4 Mobile Air Defense Missile System

Tiers:

Variants:

- **Boeing/Shorts Starstreak Avenger:** Boeing teamed with Shorts Brothers PLC (now part of Thales) to offer an Avenger system in which one Stinger pod was replaced with a pod of four Starstreak Hyper-velocity laser-guided missiles, in the hopes of attracting a U.S. Army contract under the Forward Area Air Defense System Line-of-Sight Rear (FAADS-LOS-R) program. Test installation was carried out in mid-1990 and firing trials followed from mid-1991 in the U.K. Starstreak would have complemented the Stinger by improving the overall systems ability to deal with low hovering helicopters which frequently do not provide enough contrast for lock-on by infrared guided missiles. Starstreak also has the ability to be used against un-armored and lightly armored ground vehicles.
- **Boeing/Matra Guardian:** In the 1990s Boeing teamed with Matra of France to offer the Avenger modified by the substitution of standard triple launcher boxes for Matra Mistral missiles in place of the quadruple Stinger pods of the standard Avenger. One demonstrator vehicle was built in 1992 and test firings took place in France. The project was dropped around 1997.
- **Avengers during the Iraq War:** Due to the lack of serious airborne threats during much of the Iraq War, along with the pressing need for ground assets for combat roles such as convoy protection, the Avenger was pressed into this role. The FLIR/laser rangefinder combined with the .50 cal machine gun has proved to be very effective, but was limited by no-fire zones, particularly to the front of the vehicle. A program was instituted to remove one of the missile pods and move the machine gun to that position to enable a 360° field of fire. The upgrade also increased the ammunition capacity to 650 rounds.
- **Avenger DEW:** Another potential variant proposed by Boeing is an Avenger with a Directed Energy Weapon (DEW). Boeing completed an initial test of a 1 kilowatt laser mounted where the right missile pod would be. The M3P .50 cal has been replaced by the M242 Bushmaster as its close defense weapon.
- **Avenger Multi-Role Weapon System:** Test firing demonstrations took place in 2004 of this variant modified by re-locating the M3P machine gun over the turret cab to allow a 360-degree field of fire, increasing ready-use machine gun ammunition stowage to 600 rounds, and providing the option to substitute launchers for 2 FGM-148 Javelin missiles in place of 1 Stinger pod.
- **Accelerated Improved Interceptor Initiative (AI3):** In February 2012, Raytheon was awarded a contract to develop the AI3, a modified AIM-9 Sidewinder missile mounted on the Avenger launcher, to perform counter rocket, artillery, mortar (C-RAM), counter unmanned aerial vehicle (C-UAV), and counter cruise missile duties. In 2013, the US Army decided to not buy the system. In August 2014, the system successfully intercepted a UAV and cruise missile target featuring a semi-active radar homing seeker in a test.
- **Other variants:** Boeing have proposed that the Avenger PMS turret could be mounted on other vehicles such as Unimog truck, BV-206 all-terrain vehicles, M113 APC, and M548 tracked cargo carrier as well as being used as a stationary ground mount on a pallet for defense of static targets. The Avenger PMS has been demonstrated with a mock-up of two 70 mm helicopter-type rocket pods carrying a total of 36 rockets to give the system greater multi-mission utility. Other missiles such as the Bofors RBS 70/Bolide have been proposed for use on the Avenger PMS. In March 2017, Boeing revealed a modernized Avenger system fitted with AIM-9X Sidewinder and Longbow Hellfire missiles on the sides and a directed energy weapon affixed to the top. It is also planned to be integrated onto other platforms including the JLTV, Stryker, and Bradley Fighting Vehicle. While Boeing had configured a Stryker with the Avenger turret to fulfill the Army's Interim Maneuver-Short-Range Air Defense (IM-SHORAD) requirement, the Army ultimately decided against the idea, feeling it would require major modifications to the vehicle and because of the company's desire for the service to supply the turrets, of which there were a limited amount existing readily in the inventory.

System

:
:
:
Role: Short-range surface-to-air shoot-on-the-move air defense weapon; protection for the maneuver force
Components: HMMWV, C2i, radars, platforms and stinger missiles, and a .50 caliber machine gun

↳*AN/TWQ-1 Avenger (Launcher)*

Name: AN/TWQ-1 Avenger
Type: Surface-to-Air Missile System
In Service: 1989-Present
Manufacturer: Boeing
Crew: 2 (Basic), 3 (STC)
Missile: FIM-92 Stinger missiles
Targets: Cruise missiles, UAVs, low-flying, high-speed fixed-winged aircraft, and helicopters

↳*Missile*

Name: FIM-92 Stinger missiles
Type: Infrared homing surface-to-air missile (SAM).
Length: m1.52
Diameter: mm70.1
Weight: kg15.19
Warhead: High explosive annular blast fragmentation
Warhead Weight: kg3
Engine: Solid-fuel rocket motor
Guidance System: Infrared homing
Speed: m/s750
Operational Range: It has an outward targeting range of up to 4,800 m and can engage low altitude enemy threats at up to 3,800 m.

Dimensions

Length: m4.95 m
Width: m2.18 m
Height: m2.64
Weight: 3,900 kg

Automotive

Engine Name: INA

Engine Type: Detroit Diesel cooled V-8

Engine Power: hp135

Maximum Range: 443 km

Maximum Speed: 89 km/h

Mobility: Highly mobile, Mounted atop a 4×4 Heavy High Mobility Multipurpose Wheeled Vehicle (HMMWV)

Protection

Armor: INA

Smoke: INA

Notes:

The Avenger Air Defense System, designated AN/TWQ-1 under the Joint Electronics Type Designation System, is an American self-propelled surface-to-air missile system which provides mobile, short-range air defense protection for ground units against cruise missiles, unmanned aerial vehicles, low-flying fixed-wing aircraft, and helicopters. The Avenger was originally developed for the United States Armed Forces and is currently used by the U.S. Army. The Avenger system was also used by the U.S. Marine Corps. The Avenger comes mainly in three configurations, the Basic, Slew-to-Cue, and the Up-Gun. The Basic configuration consists of a gyro-stabilized air defense turret mounted on a modified heavy Humvee. The turret has two Stinger missile launcher pods, each capable of firing up to 4 fire-and-forget infrared/ultraviolet guided missiles in rapid succession. The Avenger can be linked to the Forward Area Air Defense Command, Control, Communications and Intelligence (FAAD C3I) system, which permits external radar tracks and messages to be passed to the fire unit to alert and cue the gunner. The Slew-to-Cue (STC) subsystem allows the commander or gunner to select a FAAD C3I reported target for engagement from a display on a Targeting Console developed from VT Miltope's Pony PCU. Once the target has been selected, the turret can be automatically slewed directly to the target with limited interaction by the gunner. The Up-Gun Avenger was developed specifically for the 3rd Armored Cavalry Regiment for the Regiment's 2005 deployment to Iraq. The modification was designed to allow the Avenger to perform unit and asset defense in addition to its air defense mission. The right missile pod was removed and the M3P .50 cal machine gun was moved to the pod's former position. This allowed for the removal of the turret's cab safety limits which enabled the gun to be fired directly in front of the HMMWV. Eight of the unit's Avengers were modified to this configuration. With the 3rd ACR's redeployment from Iraq, the Up-Gun Avenger completed its role in Operation Iraqi Freedom and the Avengers have been scheduled to be converted back to STC systems.

SA-15 Gauntlet (9K330 Tor) Russian Short-Range Surface-to-Air Missile System

Tiers:

Variants:

- **Tor-M1:** 9K331 "Tor-M1", introduced in 1991 with the 9M331 missile, with greatly improved missile accuracy and the ability to engage two targets simultaneously, minimum range 1.5 km (0.93 mi), minimum height 0,01 km.
- **Tor-M2E:** 9K332 upgrades have continued over the lifetime of the system, with developer Almaz Antey unveiling the newest incarnation of the Tor missile system, the Tor-M2E,[26] at the MAKS Airshow in 2007.
- **Tor-M1-2U:** "Tor-M1-2U" entered service at the end of 2012. This system is designed to destroy aircraft, helicopters, UAVs, missiles, and other precision guided weapons, flying at medium, low and very low altitudes in all weather.
- **3K95 Kinzhal (Naval Variant):** The 3K95 "Kinzhal" (Russian: Кинжал – dagger) is the naval version of the Tor missile system developed by Altair and has the NATO reporting name SA-N-9 Gauntlet. Using the same 9M330 missile as the land based version, the system can be mounted on vessels displacing over 800 tonnes and is known to be installed on Admiral Kuznetsov class aircraft carriers, Kirov class multimission cruisers, Udaloy class anti-submarine destroyers and Neustrashimy class frigates.
- **Tor-M2KM:** The Tor-M2 km is a self-contained fighting module version of the system that can be mounted in various locations. In October 2016, it was loaded onto the helipad of the Admiral Grigorovich frigate by means of an ordinary wharf crane and fixed in position with steel chains to fire at simulated cruise missiles while the ship was underway. This could give advanced SAM capabilities to vessels without the capacity to install the larger and heavier Kinzhal system; it can also be mounted on a truck, building roof, or any horizontal surface at least 2.5 m wide and 7.1 m long.
- **Tor-M2DT:** The system is especially designed to be used for Arctic region at temperatures up to -50 degrees C based on the chassis of the DT-30PM tracked all-terrain vehicle and is capable of detecting over 40 air targets, especially high-precision weapons, and to track and engage up to four of them simultaneously at a range of up to 12 km and altitudes up to 10 km with its 16 missiles even on the move. Its creation was completed in 2018 and the first delivery of 12 systems was held in November of the same year
- **Tor-2E:** JSC Rosoboronexport, part of the Rostec State Corporation, has started promoting the newest Tor-E2 SAM system developed and produced by the Almaz-Antey Air and Space Defense Concern in 2018. Tor-E2 combat vehicle is an independent, mobile, all-terrain fighting unit that provides detection and identification of air targets on the march and at the halt, target lock-on and engagement at the halt, from a short stop and on the move. A battery of the four-channel Tor-E2 SAM systems, consisting of four combat vehicles, can simultaneously engage up to 16 targets flying from any direction at a range of at least 15 km and an altitude of up to 12 km.
- **HQ-17 (Chinese Variant):** The HQ-17 (Hongqi-17) is China's reported variant of the Tor-M1 system.
- **FM-2000:** FM-2000 is a mobile short-range air-defence (SHORAD) system unveiled by China Aerospace Science and Industry Corporation at the 2018 Zhuhai Airshow. Its range is 15 km and engagement altitude is 10 km. It is carried on a 3 axle TEL. It is a version of the HQ-17

System

Alternative Designation: Tor, SA-15

Type: Low to medium altitude, short-range surface-to-air missile

Family: 9K330 Series

Manufacturer: IEMZ Kupol Metrowagonmash (GM chassis designer), MZKT (wheeled chassis designer)

In Service: 1986-Present

Crew: ea3

Chassis: GM-355 special tracked chassis

Displacement Time: Less than 5 min

Emplacement Time: 3 min

Fire on the Move: No

Reloading Vehicle: Reloading vehicle is based on Ural-4320 6x6 heavy truck

Fully Reload Time: 18 Minutes

Note: This system can engage all kinds of modern air targets as well as engage between 2-4 targets simultaneous depending on model (M1 vs. M2). It is used against aircraft, helicopters, UAVs, various missiles and precision guided munitions. It destroys targets that long- and medium-range air defense systems fail to hit.

Dimensions

Length: m8

Width: m3.2

Height, Combat Configuration: m4

Weight, Combat: tons32

Ground Pressure: kg/mINA

Automotive

Engine Name: V-46-2S1

Engine Type: Diesel

Engine Power: hp780

Cruising Range: km580

Speed, Maximum Road: km/h65

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: deg60

Side Slope: deg30

Vertical Step: m1

Trench: m2

Fording Depth: m1

Hydropneumatic Suspension: Yes

Adjustable Ground Clearance: Yes

Communications

HF Radio: R-176 Antey

VHF Radio: Azart-P (4km), Azart-N (12km), and Azart-BM (40km)

Missile System

↳*Missile Launcher*

Name: 9A331 Combat Vehicle

Type: Vertical Launch

Note: The SA-15 can only engage one target at a time.

↳*Missile*

Name: 9M330

Type: Surface-to-Air Missile (SAM)

Length: m2.89

Diameter: m0.23

Wingspan: mm650

Weight: kg165

Engine: thruster jets with 2-stage solid-fuel rockets

Warhead Type: HE-FRAG

Warhead Weight: kg14.8

Range of Fire: km5-12

Maximum Altitude: km10

Minimum Altitude: km06

Basic Load: ea8

Guidance System: Radio Command Guidance System

Kill Probability against Helicopters: 50-88%

Kill Probability against Aircraft: 26-75%

Kill Probability against UAVs: 85-95%

Maximum Speed: Mach 3

Maximum Target Speed: kph3,060

Minimum Target Speed: kph0

Maximum Range: km12

Minimum Range: m100

Load Limit: 30 Gs

Fuze Type: RF proximity

Detonation Mechanism: RF Proximity

Propellant: Solid-fuel rocket

Boost time: Cold launch ejection for 20 m

Steering system: Gas dynamic control system, with four control surfaces

Note: The higher the target the higher the probability to hit the target.

Fire Control

Note: The Tor combat vehicle has radar and missiles based on a single vehicle.

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: No

Indirect Fire: Yes

Fire Control Radar: J/K-band

Fire Control Sensors: Yes

IADS Integration: INA

Reaction Time (Target Detection to Launch): 8-12 seconds

↳*Radar #1*

Name: INA

Type: 3D pulse Doppler

Maximum Range against Aircraft: 25-27 km

Maximum Range against Helicopters: 12 km

Maximum Range against UAVs: 9-15 km

Search for Targets on the Move: Yes

Detect and Intercept Anti-Radiation Missiles: Yes

Coverage: up to 48 targets

Surveillance Band: G/H-band

Detection Range: km25

Guidance: Command; active terminal homing

Protection

Hull Armor: All-welded steel

Turret Armor: All-welded steel

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Air-Transportable: Yes

IFF: Yes

Notes:

The Tor missile system (Russian: "Top"; English: torus) is an all-weather low to medium altitude, short-range surface-to-air missile system designed for engaging airplanes, helicopters, cruise missiles, precision guided munitions, unmanned aerial vehicles and short-range ballistic threats (Anti-Munitions). Originally developed by the Soviet Union under the GRAU designation 9K330 Tor, the system is commonly known by its NATO reporting name, SA-15 "Gauntlet". A navalized variant was developed under the name 3K95 "Kinzhal", also known as the SA-N-9 "Gauntlet". Tor was also the first air defence system in the world designed from the start to shoot down precision guided weapons like the AGM-86 ALCM day and night, in bad weather and jamming situations. Tor can detect targets while on the move. The vehicle must stop intermittently when firing, although trials are being conducted to eliminate this restriction.

9K35 Strela-10 (SA-13 Gopher) Russian Short-Range Surface-to-Air Missile System

Tiers:

Variants:

- **Strela-10M:** improved air defense missile system. It entered service with the Soviet Army in 1979. Its missile has improved guidance. It distinguishes targets from infrared decoys. Therefore it is more effective.
- **Strela-10M2:** it is a further development of the Strela-10M. It can receive target data from air defense command posts or nearby radars. There is a 30-60% possibility to engage fighter aircraft with a single missile. Vehicle is fitted with floatation buoys on either side of the hull. It is fully amphibious and can ford rivers and lakes. On water it is propelled by its tracks. Amphibious speed on water is 5-6 km/h. It entered service with the Soviet Army in 1981.
- **Strela-10M3:** is a further development of the system. It can additionally engage UAVs and cruise missiles. Missile has improved resistance to enemy countermeasures. Warhead contains 5 kg of explosive material instead of 3 kg. It is more efficient against small-size air targets, such as UAVs. These missiles weight 42 kg. These can be used by all other versions of the Strela-10. The Strela-10M3 entered service with the Soviet Army in 1989.
- **Strela-10M3-K:** a proposed Russian upgrade, based on refurbished BTR-60 APC 8x8 wheeled chassis.
- **Strela-10M4:** a proposed Russian upgrade of the -10M, -10M2 and -10M3 systems.
- **Strela-10T:** a proposed Belarusian upgrade.
- **Luchnik-E:** a proposed Russian upgrade. It has 8 ready to use Igla short-range surface-to-air missiles.

System

Alternative Designation: 9K35 Strela-10, SA-13 "Gopher, 9K35
Type: Short-Range Surface-to-Air Missile (SAM) System
Manufacturer: Saratovskiy Zenit Machine Plant (Muromteplovoz Joint Stock Company for the 9K35M3-K)

In Service: 1976-Present

Family: Strela

Crew: ea3

Chassis: MT-LB multi-purpose armored vehicle.

Displacement Time: INA

Emplacement Time: INA

Note: Reload missiles are carried by escorting Ural-4320 6x6 truck, fitted with a crane.

Dimensions

Length: m6.45

Width: m2.85

Height: m2.22

Height in Combat Configuration: m3.96

Weight, Combat: tons12.1

Speed Maximum Swim: INA

Gradient: deg60

Side Step: deg30

Vertical Step: m0.6

Trench: m2.4

Fording Depth: m1.2 m / Amphibious

Missile System

↳*Missile Launcher*

Name: INA

Type: INA

Basic Load: ea8

Note #1: Missiles are visually aimed.

Note #2: Four missiles are mounted on the turret in boxes, ready to launch, and eight more are carried inside the vehicle as reloads. Reloading takes around 3 minutes.

↳***Missile***

Name: 9M37
Type: Short-Range Surface-to-Air Missile (SAM) System
Length: m2.19
Wingspan: mm360
Diameter: m0.12
Weight: kg40
Warhead Type: HE-FRAG
Warhead Weight: kg3
Maximum Range of Fire: m5,000
Minimum Range of Fire: m800
Maximum Altitude: m3,500
Minimum Altitude: m25
Detonation Mechanism: contact and laser proximity fuzes
Propellant: Single-stage solid propellant rocket motor
Speed: m/s550
Guidance System: dual-mode passive 'photocontrast'/IR seeker
Note:

Coaxial Weapon System

↳***System***

Name: 7.62mm PKT (Kalashnikov's Machine Gun)
Type: 7.62mm
Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
In Service: 1961-present
Manufacturer: Degtyaryov plant
Proliferation: +1 Million
Max Rate of Fire: 650 rds/min
Effective Rate of Fire: 250-300 rds/min
Length, Overall: mm1,203
Length, Barrel: mm605
Weight (Gun Only): 9 kg
Weight (Tripod Only): 7.7 kg
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

↳*Ammunition*

Name: 57-N-323S

Type: Rifle

Caliber: 7.62 mm

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,000

Accuracy of fire at 300 m: 90 mm

Fire Control

Name: INA

Computerized FCS: Yes

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: INA

Electro-Optical Guidance: Yes

Guidance: Dual-guidance mode -- optical "photo-contrast" and dual-band passive infrared (IR)

↳*Radar #1 (Separate Vehicle)*

Name: MT-LBU "DOG EAR"

Type: Acquisition Radar

Band: F/G-band

Maximum Range: km80

Note: Target acquisition requires a separate vehicle mounting a Dog Ear** forward alerting radar.

↳*Radar #2 (On Missile Vehicle)*

Name: 9S86 "SNAP SHOT"

Type: Rangefinding

Maximum Range: m10,000

Minimum Range: m450

Note: located between the two pairs of missile canisters on the transporter erector launcher and radar (TELAR)

↳*Radar #3 (On Missile Vehicle)*

Name: 9S16 (NATO "Flat Box-B")

Type: Radar warning

Traverse Range: deg360

Maximum Elevation: deg40

Minimum Elevation: INA

Protection

Hull Armor: Protection from small arms fire and projectile fragments.

Turret Armor: Protection from small arms fire and projectile fragments.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The 9K35 Strela 10 / SA-13 Gopher was developed as a replacement for the 9K31 Strela 1 / SA-9 Gaskin, and was intended to provide a system with better mobility and a longer ranging and more lethal missile design. Development was initiated in 1969, in parallel with the 2K22 Tunguska / SA-19 Grison, the intent being to provide a complementary system with a btter capability in heavily jammed environments, where the radar directed SPAAG might be at a disadvantage. Design requirements included the ability to engage closing targets with speeds of up to 415 m/s and receding targets at 310 m/s, at altitudes between 25 m and 3,500 m, at ranges between 800 and 5,000 m. A single shot Pk between 0.5 and 0.6 for targets with load factors between 3 and 5G was envisaged. The system was to be relatively autonomous capable of providing point defence for maneuver formations. The system was to be air transportable by An-12 Cub and Mi-6 helicopter, and able to cross bodies of water. The Nudelman bureau was tasked with missile design and Geofizika tasked with developing the seeker. IOC was achived in 1976 with Red Army air defence units. The baseline 9M37 Strela-10SV variant fitted with a 9E47 Virazh two colour infrared/visible band seeker deployed on the 9K35 TELAR from 1976. Development of the improved 9K37M Strela-10M with a 9E47M seeker, deployed on the 9A35M TELAR, started in 1977, with IOC in 1979. The third missile variant, the further improved 9K37M2 Strela-10M2 deployed on the 9K35M2 TELAR from 1981. The last Cold War variant was the Strela-10M3 deployed on the 9K35M3 TELAR from 1989, this variant using the 9M333 missile which was supplied with a 9E425 three channel seeker, the first infrared, the second using a visible band television contrast lock design, and the third a passive homing channel intended to home on the emissions from jamming equipment. The 9M333 included a new autopilot and IR background rejection processing, as well as a laser proximity fuse with eight rather than four lobes for engaging small targets,and a larger and more lethal warhead. The 9K35M3 included an improved 9Sh127 optical sighting system for the gunner with WFOV and NFOV modes. The 9K35 / SA-13 Gopher system employs a coherent pulse Doppler millimetric band 9S86 Snap Shot range and radial velocity finding radar. Two TELARs were developed on the MT-LB tracked chassis, these being the 9A35 TELAR equipped with the 9S16 Flat Box-B radio-frequency passive detection system, and the 9A34 without it. The Flat Box antenna suite comprised multiple antennas on the top of the MT-LB hull and an additional antenna package on the electrically powered TELAR turret. Typically one 9A35 was deployed with three 9A34 TELARs. All TELARs carry four ready rounds and four stowed reloads. The Gryuza variant employs the 9A34A TELAR which is equipped with an Azovsky L-136 MAK-F infrared search and track (IRST) system, intended to cue to gunner to targets. the system is claimed to be capable of passively acquiring an F-15 class target at 10 to 15 km range day or night. This system is detailed under 9K35A Gyurza / SA-13 Gopher SAM System Upgrade. A typical battery deploys with three 9A34 series TELARS, one 9A35 series TELAR, and a single PPRU-1/1M command post, although early variants often used the PU-12M series command post. Typically the PPRU-1 or -1M is equipped with the X-band 9S80/9S80M/M1 Ovod / Dog Ear battery acquisition radar. A digital variant of the this command post, the PPRU-1M-2, has been recently displayed, equipped with an entirely new planar array solid state digital 9S80M1-2 radar.

T38 Stilet Belarusian Short-Range Air Defense System

Tiers:

1 2 3 4

Variants:

- **Note:** There was a variant of the T38 Stilet air defense system co-developed with Ukrainian Luch design bureau. This missile would use a new Belarusian missile, developed by the Tetraedr. However in 2014 this development was suspended due to ongoing military conflict in Ukraine.

System

Alternative Designation: T38 Stilet

Type: Short-Range Air Defense System

Crew: ea4

Chassis: The T38 uses new MZKT-6922 chassis

Displacement Time: minutes5

Emplacement Time: minutes5

Fire on the Move: INA

Note: Battery of the T38 Stilet comprises of TELAR vehicles, and is supported by 6 KamAZ trucks, that are used as a basis for mobile command center, reloading vehicle, maintenance vehicle and other support vehicles.

Dimensions

Length: m9

Width: m3.3

Height: m5.1

Weight, Combat: 30 tons

Automotive

Engine Name: YaMZ-7513.10-04

Engine Type: Diesel

Engine Power: hp420

Operational Range: km840

Speed, Maximum Road: km/h80

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: INA

Side Slope: INA

Vertical Step: m0.58

Trench: m0.6

Fording Depth: INA

Missile System

Name: T381 launcher vehicle

Launcher: The Stileto TELAR vehicle carries 8 missiles arranged in 2 launcher pods with 4 missiles each.

Missile Types: It can fire 9M33M2 and 9M33M3 missiles used by the Osa.

Max Elevation: INA

Min Elevation: INA

Traverse Range: INA

Traverse Left: INA

Traverse Right: INA

Max Rate of Fire: INA

Note: The T38 STILET air defence missile system uses the T383 Transportation and Loading Vehicle (TLV) for loading and unloading missiles to/from containers. It also provides transportation for missiles and temporary storage.

↳*Missile*

Name: 9M33M3 Missile

Type: Surface-to-Air Missile

Length: 3158 mm

Diameter: 209.6 mm

Weight: 170 kg

Warhead: Frag-HE

Warhead Weight: 16 Kg

Detonation Mechanism: Contact and proximity

Propellant: Solid propellant rocket motor

Operational Range: km12.5 - 20

Flight Altitude: 12,000 metres

Boost Time: 2 s boost, then 15 s sustain

Speed: 1020 m/s

Guidance System: Command to Line-Of-Sight (CLOS)

Steering System: dual-thrust rocket motor.

Accuracy: 5 m

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: Yes

Indirect Fire: Yes

Fire Control Sensors: INA

Probability of Kill: 90%

Note: he system is also capable of detecting targets with minimal radar cross section of 0.03m² and has an emplacement / displacement time of five minutes.

↳*Radar*

Note: The combat vehicle is further fitted with target acquisition radar, target tracking radar, two-channel missile sighting radar and two-channel command-transmit radar.

Protection

Turret Armor: INA

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The T38 STILET is a short-range air defence missile system (ADMS) designed and built by Tetraedr to provide enhanced combat and performance capabilities to air defence units. The system, which is a modernised version of OSA-1T ADMS, can be deployed to strike all types of aerial platforms moving at low and medium altitudes. It is integrated with radars to acquire and identify targets while on the move and at halt. Up to two missiles are used by the ADMS to engage a target from short halt or from stationary position. It can be lifted by an IL-76-class cargo aircraft and transported by rail. The development of T38 STILET missile system began in 2008. It was later exhibited at the IDEX 2011 (International Defence Exhibition and Conference) in Abu

Dhabi as well as at the MILEX 2014 (Exhibition of Armaments and Military Equipment) in Republic of Belarus. The T38 STILET air defence missile system first performed five live firings at the 174 training test range of the Air Force and Air Defense of the Republic of Belarus in October 2010. It did this using the 9M33M3 missiles. During the tests, the weapons successfully destroyed high-velocity, small-sized IVTs-M1 aerial target simulators. A year later, in October 2011, the ADMS successfully engaged two small-sized high-velocity IVTs-M1 aerial target simulators and three angle reflectors. Tetraedr demonstrated combat mission readiness of the T38 STILET missile system with the 9M33M2(3) surface-to-air missiles during integration tactical military exercise conducted by the Ministry of Defence of the Republic of Belarus in February 2014. SHARE TYPE Short-range air defence missile system MANUFACTURER Tetraedr CREW Four NUMBER OF MISSILES CARRIED EightExpand T38 Stilet ADMS The T38 STILET is a short-range air defence missile system (ADMS) designed and built by Tetraedr to provide enhanced combat and performance capabilities to air defence units. It is integrated with radars to acquire and identify targets while on the move and at halt. Up to two missiles are used by the ADMS to engage a target from short halt or from stationary position. It can be lifted by an IL-76-class cargo aircraft and transported by rail. The development of T38 STILET missile system began in 2008. It was later exhibited at the IDEX 2011 (International Defence Exhibition and Conference) in Abu Dhabi as well as at the MILEX 2014 (Exhibition of Armaments and Military Equipment) in Republic of Belarus. Test firings of T38 STILET ADMS S-125-2TM / Pechora-2TM Medium Range Air Defence Missile System S-125-2TM is an upgraded version of S-125 / Pechora air defence missile system (ADMS). The T38 STILET air defence missile system first performed five live firings at the 174 training test range of the Air Force and Air Defense of the Republic of Belarus in October 2010. It did this using the 9M33M3 missiles. During the tests, the weapons successfully destroyed high-velocity, small-sized IVTs-M1 aerial target simulators. A year later, in October 2011, the ADMS successfully engaged two small-sized high-velocity IVTs-M1 aerial target simulators and three angle reflectors. Tetraedr demonstrated combat mission readiness of the T38 STILET missile system with the 9M33M2(3) surface-to-air missiles during integration tactical military exercise conducted by the Ministry of Defence of the Republic of Belarus in February 2014. T38 missile system mounted on T381 CV The T38 STILET missile system is mounted on the T381 Combat Vehicle (CV), which is operated by a crew of four. The highly-mobile vehicle features MZKT-69222T self-propelled wheeled chassis driven by a powerful diesel engine. An electro-optical system is fitted on the vehicle, as is navigation and communication systems, map-positioning, air conditioning and a heating system. It also comes with an automatic launch system and launch device, electric power supply system and functional check and combat crew training equipment. A digital master computer and crew commander’s automated workstation can also be found on-board the CV. The combat vehicle is further fitted with target acquisition radar, target tracking radar, two-channel missile sighting radar and two-channel command-transmit radar. The T38 STILET air defence missile system can carry up to eight T382 surface-to-air guided missiles in the Transportation-and-Launch Container (TLC). The two-stage, bi-calibre and solid-propellant missile features a power unit consisting of a booster and a sustainer. A radio fuse installed in the missile ensures effective destruction of the target by actuating a non-contact explosion of the warhead. Targets flying at a maximum speed of 900m/s, at altitudes varying between 25m and 10km, can be destroyed by the missile system. It can also detect targets within a range of 40km, whilst the maximum slant range of target destruction is 20km. A maximum cross range of 10km can be achieved by the ADMS. The probability of killing the target with one missile is 90%. The system is also capable of detecting targets with minimal radar cross section of 0.03m² and has an emplacement / displacement time of five minutes. The T38 STILET air defence missile system uses the T383 Transportation and Loading Vehicle (TLV) for loading and unloading missiles to/from containers. It also provides transportation for missiles and temporary storage. The T385 maintenance vehicle is utililised to carry out maintenance of the combat vehicle. Other technical support assets of the missile system include T384 alignment vehicle, T386 automated mobile check-up and testing station along with the T387 Ground Equipment Kit (GEK).

→→Medium-Range Missile Systems (More than 31 km)

S-75 Dvina (SA-2 Guideline) (Export) North Korean Strategic Surface-to-Air Missile System

Tiers:

Variants:

- **SA-2A (Guideline Mod 0):** This was the initial variant of the SA-2, which was deployed around Moscow, Leningrad and in the Baku region. It was guided by the Fan Song A radar system. It was probably a pre-production version.
- **SA-2B (Guideline Mod 1):** This improved version replaced the Mod 0. It is slightly longer than the Guideline Mod 0 and is guided by the Fan Song B radar system.
- **SA-2C (Guideline Mod 2):** Developed at the same time as the Guideline-B, this variant is equipped with a modified Fan Song C/D G-band engagement radar. The missile itself has a longer engagement range and can attack targets that are at lower altitudes than earlier versions of the SA-2.
- **SA-2D (Guideline Mod 3):** This short-lived variant fired V-750AK missiles and operated with the Fan Song E radar. It was more capable of defeating targets in hostile electronic warfare environments. It was eventually superseded in Soviet service by the Guideline Mod 4.
- **SA-2E (Guideline Mod 4):** This variant, also known as the S-75M Volga, used the V-755 missile, which was characterized by a swelled warhead section that could be fitted with a 25 kT nuclear warhead. It was guided by the Fan Song F radar.
- **SA-2F (Guideline Mod 5):** This variant, also designated the S-75M3 Volkhov, was developed with some technology derived from the SA-3 Goa ** (see separate record). It utilizes the improved Fan Song E radar, which is much more capable of hitting targets in a heavy ECM environment. This is accomplished by deploying a two-man t eam in a "dog house" on top of the radar. These two crewmembers track targets when the normal automatic tracking system has been jammed.
- **S-75 Volga 2A:** This version was developed in 1995. Twelve digital assemblies replaced 78 analog assemblies. It fired an upgraded V-755 missile and used a modernized Fan Song F radar. It was primarily intended for export.
- **S-75 Volga 2T:** Belarusian firm Tetraedr in 2004 began offering the S-75 Volga 2T upgrade kit. This included digital electronics and enhanced radars, launch control and missiles.
- **SA-N-2:** This is the naval version of the SA-2. The mount included a twin-arm launcher fed by a large drum magazine. A navalized version of the Fan Song E radar was equipped, along with a High Lune** height finding radar.
- **Iraqi modified SA-2 Guideline:** Iraq announced in 1989 that it had modified a number of SA-2s with an infrared terminal guidance system that improved the missile's capability against targets in high ECM environments. If the missile lost lock at this stage, the weapon could switch back to radio guidance. Iraq also attempted other modifications
- **CSS-8:** his is a short-range ballistic missile based on the SA-2.
- **Sayyad-1:** This is an Iranian reverse-engineered version of the SA-2. It is believed to have entered service in 1998. The design is also influenced by the Chinese HQ-2 and may feature some North Korean technology.
- **Sayyad-2:** This is an Iranian upgrade of the Sayyad-1, based on both the SA-2 and the Chinese HQ-2.
- **RM-75MVU-1/VU-1 target missiles:** his is a low-altitude (RM-75MVU-1) and high-altitude (RM-75VU-1) target missile based on the SA-2 was announced by Russia in mid-2004. The target missiles were to be used to test new surface-to-air missile systems being designed by the Almaz research and production association.
- **Qaher-1/-M2:** These variants based on the S-75/SA-2 have been used by Houthi rebels in Yemen. The Qaher-1 was revealed in 2015 with a range of 186.4 mi (300 km) and warhead weighing 440.9 lb (200 kg).

System

Alternative Designation: Volga-75SM, S-75 Dvina, V-75 Volkhov

Function: The SA-2 Guideline is a long-range, high-altitude, surface-to-air missile (SAM) in widespread use in Russia and other countries.

In Service: 1957-Present

Manufacturer: Raspletin KB-1 (head developer), Grushin MKB Fakel (missile developer), Lavochkin OKB

Crew: INA

Wars: Vietnam War, Six-Day War, Indo-Pakistani War of 1965, Indo-Pakistani War of 1971, Yom Kippur War, Cold War, Iran–Iraq War, Gulf War, War in Abkhazia (1992–93), First Libyan Civil War, Syrian Civil War, Yemeni Civil War (2015–present), Saudi Arabian-led intervention in Yemen, Saudi–Yemeni border conflict (2015–present)

Guidance System: Radio command guidance from Fan Song A/B; or E/F-band missile control radar; or Fan Song D/E G-band missile control radar Many installations have Spoon Rest early warning radar.

Note: Each battalion will typically have six, semi-fixed, single-rail launchers for their V-750 missiles positioned approximately 60 to 100 m (200 to 330 ft) apart from each other in a hexagonal "flower" pattern, with radars and guidance systems placed in the center. It was this unique "flower" shape that led to the sites being easily recognizable in reconnaissance photos. Typically another six missiles are stored on tractor-trailers near the center of the site.

Dimensions

Booster Diameter: m0.70

Second Stage Diameter: m0.50

Length: m10.47

Wingspan: m2.50

Total Weight: INA

Automotive

Primary Propulsion Type: solid-fuel booster

Primary Propulsion Duration: 4-5 sec

Secondary Propulsion Type: liquid-fuel (nitric acid/hydrocarbon) sustainer

Secondardy Propulsion Duration: 22 sec

Note: The missiles themselves are carried by a special transloader semi-trailer, which is towed by a Zil truck.

Communications

Secondary: INA

Missile System

↳*Missile Launcher*

Name: INA

Type: Rail Guided

Launcher Weight: kg2,165

Launch Rail/Tubes: Single rail, ground mounted (not mobile)

Reload Time: min12

Note: S-75 Dvina and equipped with either V-750 or V-750V missiles.

↳***Missile***

Name: Either the V-750 or V-750V missiles.

Type: Standard

Missile Length: m10.60

Missile Diameter: m0.70

Weight at Launch: kg2,300

Warhead Weight: kg190

Warhead Type: HE 200kg (295kg SA-2E) 188kg (HQ-2B/F/J/P), possible nuclear

Guidance System: Command

Maximum Velocity (Mach): Mach 4

Bursting Radius Low Altitude: m125-135

Bursting Radius High Altitude: m250

Kill Radius: m65

CEP: m76

Maximum Effective Range: km30

Minimum Effective Range: km7

Maximum Altitude: m22,000

Minimum Altitude: m3,000

Fire Control System

↳***Radar #1***

Name: Spoon Rest

Type: Spoon Rest is a Russian ground-based, early warning radar that later evolved into the Knife Rest** series.

Band: A

Frequency: 147-161 MHz

Pulse Width: 4-6 microseconds

Maximum Range: km275

Vertical Beamwidth: deg2.5

Horizontal Beamwidth: deg7-9

Peak Power: 180-350 kW

Pulse Repetition Frequency (PRF): 310-400 Hz

↳***Radar #2***

Name: P-15 Flat Face

Type: 2D UHF radar developed and operated by the former Soviet Union

Band: L-Band

Frequency: 810-950 MHz

Peak Power: kW400

Maximum Range: km250

↳*Radar #3*

Name: PRV-11 Side Net

Type: Side Net is a ground-based height-finding radar used in a ground control intercept (GCI) mode with early-warning radars Bar Lock , Back Net and Tall King

Band: E Band

Frequency: 2,560-2,710 MHz

Antenna Height: m8.50

Antenna Width: m3.50

Average Range: km180

Maximum Range: km400

NOD CYCLES/SEC: 5-30

Pulse Width: 3/1.5 micro sec

Average Power: 1.3 kW

Peak Power: 1.2 MW

↳*Radar #4*

Name: Fan Song A/B/F

Type: Fire control & Tracking Radar

Band: E/F, G Band

Frequency: 3 GHz (S-band)

Peak Power: 600 kW

Maximum Range: km60

Notes:

The S-75 (Russian: C-75; NATO reporting name SA-2 Guideline) is a Soviet-designed, high-altitude air defence system, built around a surface-to-air missile with command guidance. Following its first deployment in 1957 it became one of the most widely deployed air defence systems in history. It scored the first destruction of an enemy aircraft by a surface-to-air missile, with the shooting down of a Taiwanese Martin RB-57D Canberra over China on 7 October 1959 that was hit by a salvo of three V-750 (1D) missiles at an altitude of 20 km (65,600 ft). This success was credited to Chinese fighter aircraft at the time in order to keep the S-75 program secret. This system first gained international fame when an S-75 battery, using the newer, longer-range and higher-altitude V-750VN (13D) missile was deployed in the 1960 U-2 incident, when it shot down the U-2 of Francis Gary Powers overflying the Soviet Union on May 1, 1960. The system was also deployed in Cuba during the Cuban Missile Crisis, when it shot down another U-2 (piloted by Rudolf Anderson) overflying Cuba on October 27, 1962, almost precipitating a nuclear war. North Vietnamese forces used the S-75 extensively during the Vietnam War to successfully defend Hanoi and Haiphong against US bombing. It has also been locally produced in the People's Republic of China under the names HQ-1 and HQ-2. Each battalion will typically have six, semi-fixed, single-rail launchers for their V-750 missiles positioned approximately 60 to 100 m (200 to 330 ft) apart from each other in a hexagonal "flower" pattern, with radars and guidance systems placed in

the center. It was this unique "flower" shape that led to the sites being easily recognizable in reconnaissance photos. Typically another six missiles are stored on tractor-trailers near the center of the site. The V-750 is a two-stage missile consisting of a solid-fuel booster and a storable liquid-fuel upper stage, which burns red fuming nitric acid as the oxidizer and kerosene as the fuel. The booster fires for about 4–5 seconds and the main engine for about 22 seconds, by which time the missile is traveling at about Mach 3. The booster mounts four large, cropped-delta wing fins that have small control surfaces in their trailing edges to control roll. The upper stage has smaller cropped-deltas near the middle of the airframe, with a smaller set of control surfaces at the extreme rear and (in most models) much smaller fins on the nose. The missiles are guided using radio control signals (sent on one of three channels) from the guidance computers at the site. The earlier S-75 models received their commands via two sets of four small antennas in front of the forward fins while the D model and later models used four much larger strip antennas running between the forward and middle fins. The guidance system at an S-75 site can handle only one target at a time, but it can direct three missiles against it. Additional missiles could be fired against the same target after one or more missiles of the first salvo had completed their run, freeing the radio channel. The missile typically mounts a 195 kg (430 lb) fragmentation warhead, with proximity, contact, and command fusing. The warhead has a lethal radius of about 65 m (213 ft) at lower altitudes, but at higher altitudes the thinner atmosphere allows for a wider radius of up to 250 m (820 ft). The missile itself is accurate to about 75 m (246 ft), which explains why two were typically fired in a salvo. One version, the SA-2E, mounted a 295 kg (650 lb) nuclear warhead of an estimated 15 kiloton yield or a conventional warhead of similar weight. Typical range for the missile is about 45 km (28 mi), with a maximum altitude around 20,000 m (66,000 ft). The radar and guidance system imposed a fairly long short-range cutoff of about 500 to 1,000 m (1,600 to 3,300 ft), making them fairly safe for engagements at low level.

S-75 Dvina (SA-2 Guideline) Russian Strategic Surface-to-Air Missile System

Tiers:

Variants:

- **SA-2A (Guideline Mod 0):** This was the initial variant of the SA-2, which was deployed around Moscow, Leningrad and in the Baku region. It was guided by the Fan Song A radar system. It was probably a pre-production version.
- **SA-2B (Guideline Mod 1):** This improved version replaced the Mod 0. It is slightly longer than the Guideline Mod 0 and is guided by the Fan Song B radar system.
- **SA-2C (Guideline Mod 2):** Developed at the same time as the Guideline-B, this variant is equipped with a modified Fan Song C/D G-band engagement radar. The missile itself has a longer engagement range and can attack targets that are at lower altitudes than earlier versions of the SA-2.
- **SA-2D (Guideline Mod 3):** This short-lived variant fired V-750AK missiles and operated with the Fan Song E radar. It was more capable of defeating targets in hostile electronic warfare environments. It was eventually superseded in Soviet service by the Guideline Mod 4.
- **SA-2E (Guideline Mod 4):** This variant, also known as the S-75M Volga, used the V-755 missile, which was characterized by a swelled warhead section that could be fitted with a 25 kT nuclear warhead. It was guided by the Fan Song F radar.
- **SA-2F (Guideline Mod 5):** This variant, also designated the S-75M3 Volkhov, was developed with some technology derived from the SA-3 Goa ** (see separate record). It utilizes the improved Fan Song E radar, which is much more capable of hitting targets in a heavy ECM environment. This is accomplished by deploying a two-man t eam in a "dog house" on top of the radar. These two crewmembers track targets when the normal automatic tracking system has been jammed.
- **S-75 Volga 2A:** This version was developed in 1995. Twelve digital assemblies replaced 78 analog assemblies. It fired an upgraded V-755 missile and used a modernized Fan Song F radar. It was primarily intended for export.
- **S-75 Volga 2T:** Belarusian firm Tetraedr in 2004 began offering the S-75 Volga 2T upgrade kit. This included digital electronics and enhanced radars, launch control and missiles.
- **SA-N-2:** This is the naval version of the SA-2. The mount included a twin-arm launcher fed by a large drum magazine. A navalized version of the Fan Song E radar was equipped, along with a High Lune** height finding radar.
- **Iraqi modified SA-2 Guideline:** Iraq announced in 1989 that it had modified a number of SA-2s with an infrared terminal guidance system that improved the missile's capability against targets in high ECM environments. If the missile lost lock at this stage, the weapon could switch back to radio guidance. Iraq also attempted other modifications
- **CSS-8:** his is a short-range ballistic missile based on the SA-2.
- **Sayyad-1:** This is an Iranian reverse-engineered version of the SA-2. It is believed to have entered service in 1998. The design is also influenced by the Chinese HQ-2 and may feature some North Korean technology.
- **Sayyad-2:** This is an Iranian upgrade of the Sayyad-1, based on both the SA-2 and the Chinese HQ-2.
- **RM-75MVU-1/VU-1 target missiles:** his is a low-altitude (RM-75MVU-1) and high-altitude (RM-75VU-1) target missile based on the SA-2 was announced by Russia in mid-2004. The target missiles were to be used to test new surface-to-air

missile systems being designed by the Almaz research and production association.
- **Qaher-1/-M2:** These variants based on the S-75/SA-2 have been used by Houthi rebels in Yemen. The Qaher-1 was revealed in 2015 with a range of 186.4 mi (300 km) and warhead weighing 440.9 lb (200 kg).

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: 10 x smoke grenade launchers

Notes:

The South Korean K30 Biho (Flying Tiger) twin 30 mm self-propelled anti-aircraft weapon was developed to meet the operational requirements of the Republic of Korea Armed Forces for a highly mobile short range air defense system suited to the operational and terrain conditions of the Korean peninsula. It combines an electro-optically guided 30 mm gun system with a surveillance radar system on a K200 chassis. It supplements the K263A1 Chungung, a self-propelled 20 mm Vulcan system. The K30 is primarily built by Hanwha Defense. A K30 Biho system consists of twin 30 mm guns, a TPS-830K surveillance and fire-control radar, an electro-optical targeting system (EOTS), panoramic periscope, forward looking infrared system (FLIR), laser rangefinder (LRF), thermal sight, a TV camera, and a digital fire-control system. The combined targeting system of EOTS, FLIR, and LRF has a targeting range of over 10 km (6.2 mi). The TPS-830K radar can detect and track a 2 m2 (22 sq ft)-RCS

target from a range of 17 km (11 mi). The cannons have a cyclic rate of fire of 600 rpm and an effective anti-aircraft range of 3,000 m (1.9 mi), and each is loaded with 300 rounds of ammunition. In December 2013, DAPA announced that the Biho had been integrated with the Shingung surface-to-air missile to increase its coverage to 7 km. Two pods each containing two missiles are mounted, one of each side of the turret. Design integration with the missiles was completed in 2014, and by October 2015 the system was in full-rate production. The upgraded vehicle was in service by late 2018. The TPS-830K radar of K30 is an X-band (8 to 12.5 GHz) surveillance and fire-control pulse-Doppler radar, specialized for use against low-flying aircraft. Its features include real-time early warning, multiple target detection, an integral L-band (1 to 2 GHz) Identification Friend or Foe (IFF) subsystem, pulse compression, frequency agility, and adaptive moving target indication as an anti-chaff measure. It supplies ballistic computation data to the digital fire-control system to direct the aim of the electro-optical targeting system, which then aligns the 30 mm guns with the target for accurate fire. The radar can be installed on a separate vehicle (usually a 5-ton six-wheeled truck with a self-towed generator unit) to serve as an independent surveillance platform for other short range air defense systems. The secondary FLIR system and laser rangefinder supplements the TPS-830K radar to provide additional targeting means in case the radar is rendered inoperative, or is turned off to retain the element of surprise against aircraft that are equipped with radar warning receivers. The K30 adapts the chassis of the K200 infantry fighting vehicle, but has some differences. It has an extra roadwheel in its suspension and uses a D2840L engine instead of the D2848T engine of the K200, with an increase in engine power from 350 horsepower to 520 horsepower, necessary since the K30 weighs almost twice as much as the K200. Allison Transmission's X200-5K transmission is likewise replaced by S&T Dynamics' HMPT500-3EK/4EK to accommodate the more powerful engine. The modified chassis largely retains the protection and amphibious capability of the original chassis.

2S6 Tunguska Russian 30mm Self-Propelled Anti-Aircraft System

Tiers:

1 2 **3** 4

Variants:

- **2S6:** first version of the vehicle with four missiles, two either side of the turret.
- **2S6M:** the production version with eight missiles
- **2S6M1:** digital interface Ranzhir automated command-and-control system, new fire control system, new missile 9M311M with a maximum range of 10 km. Existing 2S6M Tunguska will be gradually upgraded to the new standard.

System

Alternative Designation: 2S6 Tunguska

Type: tracked self-propelled anti-aircraft weapon armed with a surface-to-air gun and missile system.

In Service: 1982-Present

Crew: ea4

Chassis: GM-352M tracked vehicle

Displacement Time: INA

Emplacement Time: INA

Note: Battery of Tunguskas includes six 2S6 combat vehicles, six reloading vehicles, and five various technical assistance vehicles, including repair and maintenance vehicles, mobile workshop and missile test vehicles. A battery of Tunguskas can automatically receive fire control information from Ranzhir mobile command center.

Flight Ceiling: 3,500 m

Boost Time: 2 stages: boost to 900 m/s, then sustained 600 m/s stage to range

Maximum Speed: 900 m/s

Guidance Speed: Radio Command guidance

Steering System: rocket motor with four steerable control surfaces

Accuracy: 5 m

Fire Control

FCS Name: INA

Computerized FCS: Yes

IFF: Yes, IFF system (1RL138), operating in C-and D-band

Direct-view Optics (DVO): Yes

Radar System

Note: Radar detection range of the original 2S6 Tunguska is 17-18 km and tracking range is 11-16 km. Since its introduction no less than four different variants of search radars were used. Guidance is performed by a gunner who uses optical sight. Reaction time of the system is 10 seconds.

Protection

Hull Armor: The armor protects the Tunguska from small arms fire and shell splinters. This allows the Tunguska to be used near the front line. However the Tunguska remains vulnerable to most kinds of direct fire. The standoff range of its missiles increases the survivability against combat helicopters with long range anti-tank missiles and ground attack aircraft. NBC protection and fire suppression systems are present.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

Introduction The 2S6 Tunguska is a self-propelled anti-aircraft gun and SAM system of Soviet origin. It was developed in the 1970's as a more capable successor to the widely used ZSU-23-4 Shilka. The main role of the Tunguska is to protect armor and infantry units against helicopters and ground attack aircraft. The Tunguska was to be more than twice as effective in combat than its predecessor. Therefore it uses larger caliber projectiles and missiles were integrated later during the design. Layout The Tunguska has a somewhat similar layout as the German Gepard, which entered service with West Germany while the Tunguska was in development. The Tunguska is based on a tracked chassis. The turret is located in the front and the engine and drivetrain are located at the rear. A double barrel 2A38M autocannon is located on each side of the turret. Eight ready to launch surface to air missiles are fitted alongside the guns. Firepower The Tunguska is armed with both guns and missiles. The two twin barrel 2A38M autocannon fire 30mm projectiles. The combined cyclic rate of fire is about 5.000 rpm. The Tunguska can fire its guns on the move against aerial targets. The missiles can only be launched while halted. Sensor systems The Tunguska features a tracking radar at the front of the turret. At the rear of the turret the surveillance radar is located. When in use the radar rotates continuously. When on the move the surveillance radar is stowed behind the turret. The tracking radar can track targets up to an altitude of 3.5 km. The surveillance radar has a range of 18 km. Mobility The tracked chassis provides good mobility in the field. This allows it to keep up with the tracked combat vehicles it is meant to protect. The water-cooled V12 diesel engine provides up to 780 hp. The maximum speed is 65 km/h on roads.

2S6M Tunguska-M Russian 30mm Self-Propelled Anti-Aircraft System

Tiers:

Variants:

- **2S6:** first version of the vehicle with four missiles, two either side of the turret.
- **2S6M:** the production version with eight missiles
- **2S6M1:** digital interface Ranzhir automated command-and-control system, new fire control system, new missile 9M311M with a maximum range of 10 km. Existing 2S6M Tunguska will be gradually upgraded to the new standard.

System

Alternative Designation: 2K22M, Tunguska-M

Maximum Effective Range: m8,000-10,000

Minimum Effective Range: m2,500

Speed: m/s600-900

Tracking Rate: INA

Warhead Type: Frag-HE

Warhead Weight: kg9

Fuze Type: Proximity

Self Destruct: INA

System Reaction Time: sec6-12

Fire on the Move: No (must be at a halt to fire the missile)

Fire Control

FCS Name: INA

Computerized FCS: Yes

IFF: Yes, IFF system (1RL138), operating in C-and D-band

Direct-view Optics (DVO): Yes

Radar System

Note: the HOT SHOT radar system, which consists of a surveillance radar with a maximum range of 18 km, and a tracking radar with a maximum range of 13 km

↳*Radar #1*

Name: 1RL144 Radar

Type: Target Acquisition Radar (TAR)

Function: This radar provides primary search capability in addition to measurement of range and bearing

Frequency/Band: E-band

Maximum Range: km20

Antenna Location: antenna is mounted at the rear of the turret and is folded down when not in use

Antenna Rotation: The antenna rotates at approximately 1 r/s, which gives a rapid update of the airspace around the 2S6M

Fan Beam: The TAR emits a fan beam covering 4.50 in azimuth and 150 in elevation. The beam is pointed at a constant elevation of 7.50 to permit detection of low-altitude targets.

↳*Radar #2*

Name: 1RL144M

Type: Target Tracking Radar (TTR)

Function: The tracking radar constantly relays target range, elevation and bearing to the fire-control computer, and on the basis if these data the computer generated the laying commands for the weapon system.

Frequency/Band: J-band

Maximum Range: km18

Antenna Location: antenna is mounted at the front section of the turret and has two fundamental functions that depend on whether the guns or missiles are selected.

Optical Sight: A stabilized optical sight is used as a back up tracking channel, allowing target data to be relayed to the fire-control computer. This sight is also used to calculate the deviation of a missile's flight path from the line-of-sight, these data being automatically relayed to the fire control computer and used to generate correction signals.

Gun Engagement: During a gun engagement, the TTR functions as an automatic target tracker, feeding target position data to the fire-control computer.

Missile Engagement: During missile engagement, the tracking radar locks onto the target and then lays the optical sight on the target. Subsequently the gunner assumes the target-tracking function with the electro-optic sight, and the radar is used for relaying guidance commands to the SA-19 missile.

Notes:

The 2S6 Tunguska 2K22 (NATO code SA-19 Grison) is a Russian-made self-propelled air defence system which combines gun and missile armament. The development of the 2S6 Tunguska began in 1970 after a request by the Russian army for a new self-propelled anti-aircraft weapon system to replace the old ZSU-23-4 self-propelled anti-aircraft gun. The first version entered service in 1986 were only four missiles, two either side, in the ready to launch position. The second version to enter service

with the Russian army, and the current production model vehicle, is designated the 2S6M or 2K22M, he has eight missiles, four to each side of the turret. The Tunguska vehicle uses a tracked chassis GM-352M which is also used for the ground-to-air missile system Buk-M1 SA-11 Gadfly. A typical 2K22/2K22M battery would consist of six 2S6/2S6M self-propelled air defence vehicles, six reload vehicles and associated support and maintenance vehicles. The 2S6 Tunguska is intended to protect tank and motorized units from low-flying aircraft and helicopters, some types of cruise-missile, as well as to engage light armour ground targets and manpower of the enemy.

2S6M1 Tunguska-M1 Russian 30mm Self-Propelled Anti-Aircraft System

Tiers:

1 2 3 4

Variants:

- **2S6:** first version of the vehicle with four missiles, two either side of the turret.
- **2S6M:** the production version with eight missiles
- **2S6M1:** digital interface Ranzhir automated command-and-control system, new fire control system, new missile 9M311M with a maximum range of 10 km. Existing 2S6M Tunguska will be gradually upgraded to the new standard.

System

Alternative Designation: 2S6M1 Tunguska-M1
Date of Introduction: 2003
Type: tracked self-propelled anti-aircraft weapon armed with a surface-to-air gun and missile system.
Family: 2K22 Tunguska
Proliferation: Belarus: a number of 2S6 India: according to various data, from 20 to 92 2S6 units, as of 2012 Morocco: 12 complexes 2K22M1 as of 2012, according to Military Balance 2012, page 340 Myanmar Russia: more than 250 complexes 2K22 as of 2012, according to Military Balance 2012, page 193. 21 Tunguska-M1s were delivered in 2012-2017. Syria: 6 2S6M1 units delivered in 2008 Yemen: a number of 2S6M1, as of 2005. According to Stockholm International Peace Research Institute neither supply nor licensed production of 2S6M1 in Yemen is made.
In Service: 2003-Present
Crew: ea4

Chassis: GM-5975 chassis

Displacement Time: INA

Emplacement Time: INA

Note: The Tunguska-M1 is much more effective than the previous Tunguska-M. All previous Tunguskas can be upgraded to this standard.

Notes:

2S6M1 Tunguska-M1 if a further improved variant with improved fire control system. It is based on a GM-5975 special tracked chassis and uses new 9M311-M1 missiles. These have a range of 10 km. These missiles have improved optical tracking and accuracy. Laser proximity fuse was replaced by a radio proximity fuse. The new missiles can engage small targets, such as cruise missiles. The Tunguska-M1 is much more effective than the previous Tunguska-M. All previous Tunguskas can be upgraded to this standard. The 2S6M1 entered service with the Russian Army in 2003. A total of 21 Tunguska-M1 systems were delivered in 2012-2017. The is a modernized variant of the basic 2K22 Tunguska system that was introduced in 2003. It features a digital interface for the Ranzhir automatic command-and-control system, which enables remote, automated target designation for any Tunguska launch vehicle from higher echelons; modernization of the fire-control radar; improved fire-control software, which increases engagement capability against fast-moving targets in the electro-optical mode; new 9M311M or 9M311-1M missiles; and upgraded target angular speed-measuring devices, which increases accuracy for both the missiles and guns. Other improvements included automatic external target designation, reception and transmission and processing equipment by radio with the battery command post. This allows the command post to automatically distribute targets among the battery; gunner's assistance system, which performs automatic high-speed, two-coordinate optical tracking; upgraded missile coordination calculation equipment that improves jamming resistance; and modified heading and roll/pitch control system that reduces disturbances to gyros while the system is moving, reducing line of sight stabilization errors and enhancing the stability of the 30-mm cannons.

Type 95 SPAAA (PGZ95) Chinese Self-Propelled Anti-Aircraft Artillery

Tiers:

System

Alternative Designation: Type 95 SPAAA; PGZ95. Earlier in development the system was designated Type 90-II and Type 90-III

Type: Self-Propelled Anti-Aircraft Artillery

Crew: 3 (commander, gunner, driver)

Chassis: The vehicle uses a tracked armoured chassis with six road wheels, a drive sprocket, an idler and three return rollers on each side.

Displacement Time: INA

Emplacement Time: INA

Note: The system consists of a full-tracked armored chassis and a power-operated turret boasting four 25-mm cannons (firing 800 rounds a minute) and four fire-and-forget SAMs.

Notes:

The Type 95 (PLA military designation: PGZ95 – Chinese: 95□□□□□□; pinyin: 95 shi zixing gaoshepao, "Type 95 self-propelled anti-aircraft artillery") is a Chinese self-propelled anti-aircraft vehicle. It is armed with four 25 mm caliber cannons and optionally four fire-and-forget QW-2 infrared homing missiles. It was first displayed publicly at the Beijing Military Parade in 1999. Earlier in development the system was designated Type 90-II and Type 90-III. The vehicle uses a tracked armored chassis with six road wheels, a drive sprocket, an idler and three return rollers on each side. The vehicle has a crew of three: driver, commander, and gunner. The engine is located at the front of the vehicle, with the driver sitting on the left side. The driver is provided with a hatch and three vision blocks for visibility when buttoned up. Behind the driver sits the commander, who is provided with a raised hatch, also fitted with three vision blocks. Towards the rear of the hull is the large powered one-man turret. Mounted on the front of the turret in an armored box is the electro-optical tracking equipment which consists of a TV tracking camera, and infra-red tracking camera and a laser rangefinder. The tracking cameras have a day range of approximately 6,000 meters and a night range of 5,000 meters. The laser rangefinder has a range of between 500 and 5,500 meters with an accuracy of 5 meters. Mounted on either side of the turret are two 25 millimeter Type 87 25x183mmB gas-operated cannons. It shares the same ammunition with the ZPT-90 auto-cannon mounted on the infantry fighting vehicle variant of the WZ-551, and the cartridge itself is a bored-out and longer-cased derivative of the 2A14's 23x152mmB cartridge. The cannons have a rate of fire of 600–800 rpm each, eject spent shell casings to either side of the vehicle. About 1,000 rounds are carried. The cannons are used to engage targets out to a range of 2,500 meters and at altitudes of up to 2,000 meters. Additionally two QW-2 infra-red homing missiles can be mounted above the cannons on each side. The QW-2 missiles are based on a shoulder-launched missile and can engage targets flying between 10 and 3,500 meters in altitude at a slant range of between 500 and 6,000 meters, but has to be manually reloaded which is known to take about 2.45 minutes. To the rear of the turret is the CLC-1 S-band pulse-doppler search radar which has a reported range of 11 kilometers, and is optimized to detect low-flying targets. Finally, an array of four electrically fired smoke grenades are mounted on either side of the turret, aimed to fire forward and to either side of the vehicle. A large door which opens to the left is provided in the rear of the hull. The system can automatically optically track targets and provide the gunner with an alert when the target is within range. The gunner can also manually aim the guns, using either the optical system or an external backup ring sight provided on the outside of the turret. The system has a reaction time of around 10 seconds when in radar search mode, and six seconds in optical mode. The

vehicle also provides a simulator function for training. A battery control vehicle using the same chassis is also built. It has a crew of five people. It uses a S-band CLC-2 surveillance radar with a maximum range of 45 kilometers and a maximum altitude of 4,500 meters. The communication system in the vehicle allows it to communicate digitally to a range of up to 5 kilometers and via a normal radio link up to 15 kilometers. Additionally it can use signal wire to communicate up to 500 meters. An Auxiliary Power Unit (APU) provides power for the electronics. A single 12.7 mm heavy machine gun is provided for self-defense. A typical Type 95 battery consists of six SPAAA vehicles, and a single command vehicle. Additionally, three ammunition re-supply trucks, a test/repair truck and a power supply truck support each battery.

Function: Fire Control

Detection Range: km80

Tracking Range: km35

Frequency: 2.7-2.9 GHz

Frequency Band: E Band

Peak Power: kw300

Notes:

The Type 56 Chinese 14.5mm Towed Anti-Aircraft Gun is a Chinese built version of the Russian ZPU-4. The ZPU-4 is a quadruple

anti-aircraft version of the basic Soviet 14.5mm machine gun. Introduced in 1949, it was used in Korea and was later considered the most dangerous opposition to U.S. helicopters in Vietnam. It was used by Iraqi forces during Operation Desert Storm. The Type 56 is the Chinese version. The quad ZPU-4 uses a four-wheel carriage similar to that once used by the obsolete 25mm automatic antiaircraft gun M1940. In firing position the weapon is towered onto firing jacks. In many units it has been replaced by the newer and more powerful twin 23mm automatic antiaircraft gun ZU-23. All weapons in this series fire the API (BS 41) projectiles weighing 64.4 grams having a muzzle velocity of 1000 meters per second which will penetrate 32 mm of armour. The ZPU-4 uses four 14.5 mm Vladimirova KPV (Krubnokalibernyj Pulemet Vladimirova) heavy machine gun, which has a quick-change barrel, mounted on a wheeled chassis. In the firing position, the wheels are raised off the ground and the carriage is supported at four points, screw jacks at each end of the carriage and on outriggers on each side of the carriage that are also provided with screw jacks. The weapon can be brought into action in 15 to 20 seconds but can, if required, be fired with the wheels in the travelling position. The ZPU-4 14.5 mm twin guns can fired the following fixed ammunition: - API (BS 41) projectile weighing 64.4 g, with a muzzle velocity of 1,000 m/s, which will penetrate 32 mm of conventional steel armour at an incidence of 0º at a range of 500 m - API-T (BZT) projectile weighing 59.56 g - I-T (ZP) projectile weighing 59.68 g. The ZPU-4 14.5 mm twin guns has an effective slant range of 1,402 m, effective limit at +45º elevation is 975 m while effective altitude limit at +65º is 1,280 m. The quadruple guns ZPU-4 uses a four-wheel carriage similar to that once used by the obsolete 25 mm automatic anti-aircraft gun M1940. In firing position, the weapon is lowered onto firing jacks. Rhe ZPU-4 can be brought in and out of action in about 15 to 20 seconds, and can be fired with the wheels in the traveling position if needed. Two ammunition boxes are mounted at the front of the wheeled chassis, one under each gun. Each ammunition boxes can carried 2,400 rounds of 14.5 mm. The ZPU-4 is equipped with a single optical sight. Improved optical gun sights was added later in its production.

Elevation: deg-8 to +90

Elevation Rate: o/sec29

Reaction time: 8

Notes: The ZPU-4 can be fired from a brief stop (<10 sec) with wheels in travel position.

Main Armament Ammunition

Type: API, API-T, HEI, AP-T, HEI-T

Max Range: m8,000

Max. Effective (slant) Range: m2,200

Max Altitude: m5,000

Max Effective Altitude: m0-1,400

Name: BZT-44M API-T

Effective Altitude: m0-2,200

Weapons and Ammunition Types

4 barreled KPV 14.5-mm heavy machinegun: Typical Combat Load 4,800 rds (1,200 rds/barrel)

Fire Control

On-Carriages: Optical mechanical computing sight Telescope, ground targets

Off-Carriage: Generally, there is no organic radar except with variants NK Type 56 and M1983. Many radars are available Optional Radar: SON-9/SON-9A, aka FIRE CAN (NATO)

Function: Fire Control

Detection Range: km80

Tracking Range: km35

Frequency: 2.7-2.9 GHz

Frequency Band: E

Peak Power: kw300

Notes:

The ZPU-4 is a quadruple anti-aircraft version of the basic Soviet 14.5mm machine gun. Introduced in 1949, it was used in Korea and was later considered the most dangerous opposition to U.S. helicopters in Vietnam. It was used by Iraqi forces during Operation Desert Storm. The Type 56 is the Chinese version. The quad ZPU-4 uses a four-wheel carriage similar to that once used by the obsolete 25mm automatic antiaircraft gun M1940. In firing position the weapon is towered onto firing jacks. In many units it has been replaced by the newer and more powerful twin 23mm automatic antiaircraft gun ZU-23. All weapons in this series fire the API (BS 41) projectiles weighing 64.4 grams having a muzzle velocity of 1000 meters per second which will

penetrate 32 mm of armour. The ZPU-4 uses four 14.5 mm Vladimirova KPV (Krubnokalibernyj Pulemet Vladimirova) heavy machine gun, which has a quick-change barrel, mounted on a wheeled chassis. In the firing position, the wheels are raised off the ground and the carriage is supported at four points, screw jacks at each end of the carriage and on outriggers on each side of the carriage that are also provided with screw jacks. The weapon can be brought into action in 15 to 20 seconds but can, if required, be fired with the wheels in the travelling position. The ZPU-4 14.5 mm twin guns can fired the following fixed ammunition: - API (BS 41) projectile weighing 64.4 g, with a muzzle velocity of 1,000 m/s, which will penetrate 32 mm of conventional steel armour at an incidence of 0º at a range of 500 m - API-T (BZT) projectile weighing 59.56 g - I-T (ZP) projectile weighing 59.68 g. The ZPU-4 14.5 mm twin guns has an effective slant range of 1,402 m, effective limit at +45º elevation is 975 m while effective altitude limit at +65º is 1,280 m. The quadruple guns ZPU-4 uses a four-wheel carriage similar to that once used by the obsolete 25 mm automatic anti-aircraft gun M1940. In firing position, the weapon is lowered onto firing jacks. Rhe ZPU-4 can be brought in and out of action in about 15 to 20 seconds, and can be fired with the wheels in the traveling position if needed. Two ammunition boxes are mounted at the front of the wheeled chassis, one under each gun. Each ammunition boxes can carried 2,400 rounds of 14.5 mm. The ZPU-4 is equipped with a single optical sight. Improved optical gunsights was added later in its production.

Oerlikon GDF-006 Swiss 35mm Towed Anti-Aircraft Gun

Tiers:

1 2 3 4

Variants:

- **GDF-001:** XABA sight
- **GDF-002:** Introduced in 1980. Improved Ferranti sight and digital data bus. The gun has 112 rounds ready and 126 in reserve (238 rounds total)
- **GDF-003:** Minor enhancements including protective covers and automatic weapon lubrication.
- **GDF-005:** Introduced in 1985. Fitted with Gunking 3D computer-controlled sight with a laser range finder and digital fire control system. Integrated power supply and diagnostics. 280 rounds on the gun and an automatic re-loading system.
- **GDF-007:** GDF-005 upgraded with AHEAD system.
- **GDF-009:** Unveiled at IDEF 2015, held in May 2015 in Istanbul. To date, its exterior significantly changed, although the installation has retained the design of the original serial versions of the systems.Unlike other variants, this one relies on an internal power source.The GDF-009 model is based on a four-wheeled carriage, and is raised off the ground by three stabilisers when deployed in the firing position. It also features an automatic levelling system that can compensate for a maximum tilt angle of up to 7°.Mounted on the forward part of the carriage is the integrated battery, which functions as the gun's power supply unit and can be recharged from an external source if required.
- **AHEAD:** An upgrade for the GDF series guns built around a special projectile which explodes at a pre-calculated point in front of the target, sending a cone of 152 tungsten sub-projectiles at the target. Used by Canada, Pakistan, Greece, Oman, Spain, Taiwan, and Chile (unconfirmed).

System

Alternative Designations: GDF-006
Crew: 3
Carriage: 4-wheeled/2-axle towed chassis
Emplacement: 1.5 minutes
Displacement: 1.5 minutes
Note: Initial operating capability was achieved in 1985. It is fitted with the Contraves Gun King digital optronic sighting system. There is three-dimensional target tracking with laser rangefinder, periscope sight and digital computer. It has an integrated power supply on the mount; the battery power is sufficient for five combat cycles before IPS must be restarted. It also includes an autonomous gun sighting system.

Dimensions

Length, Traveling: 7.80 m
Length, Firing: 8.83 m
Barrel Length: 3.15 m

Width, Traveling: 2.26 m

Width, Firing: 4.49 m

Height, Traveling: 2.60 m

Height, Firing: 1.72 m

Ground Clearance: 330 mm

Weight, Traveling: 6,700 kg

Weight, Without Ammunition: 6,300 kg

Main Weapon System

Ammunition Types: HE-T/HEI-T, HE/HEI, HEI(BF), SAPHEI/SAPHEI-T, APDS/FAPDS, TP-T/TP, AHEAD

NDF-A Package: The NDF-A is the simplest of three combat improvement kits for existing mounts. It offers a Ferranti sight, automatic breech block lubrication, a rate-of-fire limiter for better accuracy and a permanently attached camouflage kit.

NDF-B Package: The variants is the same as NDF-A, with the addition of an automatic reload system and gunner cab.

AHEAD Ammunition: Advanced Hit Efficiency and Destruction (AHEAD) ammunition was developed in late 1980s for service in mid-1990s. The GDF muzzle is fitted with three-coil muzzle-velocity sensor; Sky Guard fire-control software is modified. When the AHEAD round is fired, its passage through the rear two coils is timed and its exact muzzle velocity determined and used to set the time fuze in the projectile through the forward coil. When the timer triggers the fuze, the shell is fractured into a cone of heavy-metal fragments that spray the target. A 25-round burst is capable of generating a spray of 3,800 fragments. The system is designed to provide quick kills against small targets at long-ranges.

↳*System*

Name: KDC-002 Gun

Type: Towed Anti-Aircraft Gun

Caliber: mm35

Bore: 35-mm/90-cal, rifled

Elevation: -5 deg to 92 deg (-89 mils to 1,634 mils)

Elevation Rate: 56 deg (1,000 mils)/sec

Traverse: 360 deg (6,400 mils)

Traverse Rate: 112 deg (2,000 mils)

Breech Type: gas-operated positive lock

Recoil System: hydromechanical

Maximum Range: 4,000 m

Muzzle Velocity: 1,175 mps

Rate of Fire: 550 rounds/min per barrel

↳*Ammunition (Option 1)*

Type: HE-T/HEI-T

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 535 g

Explosive: 98 g

Propellant: 330 g

Weight of Complete Round: 1,565 g

↳*Ammunition (Option 2)*

Type: HE/HEI

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 550 g

Explosive: 112 g

Propellant: 330 g

Weight of Complete Round: 1,552 g

↳*Ammunition (Option 3)*

Type: HEI(BF)

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 550 g

Explosive: 70 g

Propellant: 330 g

Weight of Complete Round: 1,552 g

Fire Control System

FCS Name: INA

Computerized FCS: INA

Sight: Ferranti sight

Laser Rangefinder: Yes

Digital Computer: Yes

Autonomous Gun Sighting System: Yes, Contraves Gun King digital optronic sighting system.

Note: Most GDF mounts are integrated with an external fire-control system, usually the Super Fledermaus or Skyguard system.

Radar System

Radar Vehicle Name: Skyguard Radar Fire-Control System.

Skyguard Radar Details: The Skyguard system is contained within a towed trailer, mounted on the roof of which is a pulse doppler search radar, a pulse doppler tracking radar and a co-axial television camera. The trailer also houses the crew of two and a small petrol generator. Skyguard is an all-weather air defense system for the control of aircraft at low altitude and at low and medium altitude range up to 3,000 m. The maximum effective distance is given as 4,000 m. The system takes the air surveillance, target acquisition, calculation of the derivative-action values and the control of two Oerlikon 35 mm anti-aircraft guns. Skyguard is served by four people. It was created by Oerlikon-Buehrle. The weapon was introduced in the 1960s in the Swiss Army and got updates in 1975, 1995 and 2010. They are still in use. It had replaced the system Contraves

Super Fledermaus in the Swiss Air Force. The Skyguard radar system was used in the German Air Force for surveillance of low-altitude flight zones. The radar unit is readied quickly through the use of hydraulic systems for antenna erection and leveling after deployment. A typical fire unit using the Skyguard consists of two twin 35 mm gun platforms with a single Skyguard fire control radar. Skyguard systems can also incorporate an optional SAM module based on the GDF's mount and radar system but with the guns replaced by four missile canisters. It can be armed with either Aspide or RIM-7 Sea Sparrow missiles. In Greek service the Skyguard system with RIM-7M is known as the VELOS.

Note: Typical battery includes two gun mounts with separate generators, single Skyguard.

Protection

Armor: INA

Notes:

GDF-006 The GDF-006 is a further development of the basic GDF system. Features include: *High rate of fire; *Ahead capability (programmable air burst munition); *High hit probability; *High impact efficiency; *Rapid response to FCU target data in remote mode; *Two 35-mm positively locked, gas operated automatic cannons with automatic weapon lubrication; *Automatic muzzle velocity measurement and projectile fuze programming; *High mobility with four-wheel trailer mount; *Rapid deployment at the firing position by tilting the wheels hydraulically; and *Accurate positioning which is statically determined through automatic leveling of a three-point hydraulic support. Additionally, the GDF-006 is fitted with the Advanced Hit Efficiency and Destruction (AHEAD) ammunition was developed in late 1980s for service in mid-1990s. The GDF muzzle is fitted with three-coil muzzle-velocity sensor; Sky Guard fire-control software is modified. When the AHEAD round is fired, its passage through the rear two coils is timed and its exact muzzle velocity determined and used to set the time fuze in the projectile through the forward coil. When the timer triggers the fuze, the shell is fractured into a cone of heavy-metal fragments that spray the target. A 25-round burst is capable of generating a spray of 3,800 fragments. The system is designed to provide quick kills against small targets at long-ranges. The Oerlikon GDF or Oerlikon 35 mm twin cannon is a towed anti-aircraft gun made by Oerlikon Contraves (renamed as Rheinmetall Air Defence AG following the merger with Rheinmetall in 2009). The system was originally designated as 2 ZLA/353 ML but this was later changed to GDF-001. It was developed in the late 1950s and is used by around 30 countries. The system uses twin autocannons, firing 35×228mm NATO-standard ammunition. It was originally designated 353 MK and is now designated as the KD series. The same KD series 35mm cannons are used in the Leopard 1 based Gepard and Type 74 tank based Type 87 SPAAG and Marksman self-propelled anti-aircraft guns (SPAAG). The system could be paired with the off-gun (remote) Super Fledermaus fire control radar, which in the late 1970s was upgraded to the Skyguard system. The weapons was aimed either directly, by way of an advanced sighting system, or automatically, by locking onto the target with radar. Early models carried 112 rounds ready to fire, and an additional 126 stored on the chassis as reloads. Later versions with automated reloading carry 280 rounds total. A typical engagement burst is 28 rounds

AZP S-60 (Export) North Korean 57mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **AK-725:** Naval version of the S-60 gun. Introduced in 1958. Mounted in single, double and quadruple mounts (designated ZIF-31) on many early Soviet destroyers.
- **ZIF-72:** Naval version which is enclosed in a metal housing and fully automatic. Also exported to India. Introduced in the mid-1970s.
- **ZSU-57-2::** Self-propelled version with two 57 mm S-60 guns (designated S-68)
- **Type-80::** Chinese version of the ZSU-57-2.
- **BM-57:** Updated version.
- **AU-220M Baikal::** Remote weapon station with fire control system using BM-57

System

Alternative Designations: AZP S-60
In Service: 1950-Present
Crew: 7
Carriage: Four Wheel
Prime Movers: Ural-375D
Max Towed Speed: km/h60

Length of Barrel: m4.4
Width Overall: m2.054

Height: m2.37

Weight: kg4,500

Main Armament

Type: 57-mm Automatic Cannon

Caliber: mm57

Number of Barrels: 1 each

Service Life of Barrel: INA

Cyclic Rate of Fire: rds/min105-120

Reload Type: sec4-8

Practical Rate of Fire: rds/min70

Loader Type: 4 Round Clip, Manual

Reaction time: sec4.5

Maximum Elevation: deg+85

Minimum Elevation: deg-4

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Muzzle Velocity: m/s1,000

Maximum Firing Range, Radar Guided: m6,000

Maximum Firing Range, Optical Guided: m4,000

Main Armament Ammunition

↳*Ammunition (Option 1)*

Name: UBR-281/281U

Type: APCBC-HE-T

Projectile Weight: grams2,820

Bursting Charge: grams13

Muzzle Velocity: m/s1,000

Note: Anti-tank round with sharp penetrator, blunt cap and an aerodynamic cover, with tracer and a delayed-action base fuze.Penetration 96 mm RHA at 1,000 m range or 106 mm at 500 m.UBR-281 and -281U are loaded with the same projectile and differ only by details in case mouth and swage grooves.

↳*Ammunition (Option 2)*

Name: 3UO6

Type: HE

Projectile Weight: INA

Bursting Charge: grams154

Muzzle Velocity: m/s1,000

Notes: Similar to UOR-281U but with proximity fuze AR-51 installed. Fuze operating with RPK-1 system together. Not to be confused with later smart shells which Russia developed.

↳*Ammunition (Option 3)*

Name: UOR-281U

Type: HE-T

Projectile Weight: grams2,850

Bursting Charge: grams168

Muzzle Velocity: m/s1,000

Note: Similar to UOR-281; some sources state the shell is the same as in UOR-281 and the round differs from it only in details of the case mouth and swage grooves (as with the UBR round),[8] while others claim a slightly larger HE filling

Fire Control

Rangefinder: D-49

Radar Name: Son-9/Son-9A (NATO FIRE CAN)

Radar Function: Fire Control

Radar Detection Range: km80

Radar Tracking Range: km35

Radar Frequency: 2.7-2.9 GHz

Radar Frequency Band: E

Radar Peak Power: kw300

Alternative Radar RPK- 1/FLAP WHEEL Range (km): km34

Notes:

The S-60 is a towed, road-transportable, short- to medium-range, single-barrel 57-mm antiaircraft gun system. The S-60 recoil-operated weapon replaced the earlier 37mm models in most Warsaw Pact units. It is a powerful weapon, well suited to attack armored vehicles as well as low-flying aircraft. In addition to on-carriage optical fire control, the S-60 also employs off-carriage fire control with the PUAZO-6/60 director and the SON-9 or SON-9A radars. Originally the PUAZO-5 director and SON-4 radar were used. Further improved director/radar combinations became available in subsequent years. Recognition features of the S-60 are the long, thin tube with multi-perforated muzzle brake, distinctive gun shield which folds down and the horizontal feed tray which holds the four-round clips. The normal Soviet prime mover is the Ural-375 truck. The four-wheel carriage can be leveled and stabilized on jacks to form a point firing base. Loading is accomplished by 4-round horizontally fed clips. The S-60 also has an ammunition ready rack that can hold 4 four-round clips near ammunition feed mechanism on left side of the breech. A twin version, the S-68, is mounted on the self-propelled ZSU-57-2, and twin and quad versions are used by the Soviet Navy. It should be noted that the ammunition for the 57mm antiaircraft guns is not_ interchangeable with that used by the 57mm antitank and assault guns. This is due to the different configuration and dimensions of the cartridge cases. Besides on-carriage optical fire control, the S-60 also employs an off-carriage FLAP WHEEL fire control radar, mounted on a separate van. The towed S-60 system lacks the mobility of the newer SAM systems with which it is being replaced. A self-propelled version, the ZSU-57-2, with twin 57-mm guns mounted on a modified T-54 tank chassis, was introduced in 1957. The ZSU-57-2 has the same characteristics as the S-60 except that it is not radar-controlled. It is now considered obsolete.

M-1939 (61-K) Russian 37mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **Type 55:** copy of the single barreled 37 mm M1939
- **Type 63:** twin 37 mm guns with vertical stabilization mounted on a T-34 chassis.
- **Type 65:** copy of the twin barreled 37 mm
- **Type 74:** upgraded version of the Type 65 with a greater rate of fire
- **Type 74SD:** Type 74 with servo system removed for operation with Type 800 laser course director system
- **Type 79-III:** upgraded version of the Type 74 with electro-optical director, and powered traverse and elevation.
- **Type 76:** Naval version of the twin 37 mm.
- **P793:** Advanced twin-barrel version, with electro-optical predicting sight and higher rate of fire and lengthened barrels giving a higher muzzle velocity (1,000 m/s). Operated by a crew of 5 or 6.

Notes:

The 37 mm automatic air defense gun M1939 (61-K) (Russian: 37-мм автоматическая зенитная пушка образца 1939 года (61-K)) is a Soviet 37 mm calibre anti-aircraft gun developed during the late 1930s and used during World War II. The land-based version was replaced in Soviet service by the ZSU-57-2 during the 1950s. Guns of this type were successfully used throughout the Eastern Front against dive bombers and other low- and medium-altitude targets. It also had some usefulness against lightly armoured ground targets. Crews of the 37 mm AD guns shot down 14,657 Axis planes. The mean quantity of 37 mm ammunition to shoot down one enemy plane was 905 rounds. The Soviet Navy purchased a number of Bofors 25 mm Model 1933 guns in 1935, trials of the weapon were successful and it was decided to develop a 45 mm version of the weapon designated the 49-K. The development under the guidance of leading Soviet designers M. N. Loginov, I. A. Lyamin and L. V. Lyuliev was successful, but the army thought that the 45 mm calibre was a little too large for an automatic field weapon. In January 1938 the Artillery Factory Number 8 in Sverdlovsk was ordered to develop a 37 mm weapon based on the same design. The task was fulfilled by the chief designer of the factory, Mikhail Loginov, and his assistant Lev Loktev. Firing trials of the new 61-K were conducted in October 1938. Competitive firing trials were conducted in 1940 between the 61-K and the Bofors 40 mm/56. There were no substantial differences found between them. The weapon was initially installed as a single-barrel weapon on a four-wheeled ZU-7 carriage, and was soon ready for service. An initial order for 900 units was placed. The gun was operated by a crew of eight men. A total of 200 rounds of ammunition were carried which were fed into the gun in five-round clips. Total Soviet production was around 20,000 units, ending in 1945. However, it has also been produced in Poland, China and North Korea. Armour penetration of the armour-piercing (AP) rounds is reported as 37 millimetres of rolled homogeneous armour (RHA) at 60°at 500 metres range and 28 millimetres of RHA at 90° at 1,500 metres range.

ZU-23-2 Russian 23mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **ZU-23M:** Upgraded variant, designed by the Nudelman Precision Engineering Design Bureau (KB Tochmash). Has new targeting system (which includes laser rangefinder, television channel, optical mechanic device, can be reinforced with thermo location channel and a television system for usage at night) and electromechanic turn system. Optionally, the mount can be fitted with two short-range air-defence missiles, such as the 9M32M "Strela-2M" or the 9M39 "Igla
- **ZU-23M1:** This is the current model, developed by Open Joint Stock Company Podolsky Electromechanical Plant of Special Engineering "PEMZ Spetsmash" and Closed Joint Stock Company "NTC Elins" and offered by Rosoboronexport. Like the ZU-23M, it has an upgraded fire control system and can optionally be fitted with two launchers for the "Igla" series missile, usually the 9M342 "Igla-S"
- **ZU-23/ZOM1:** It consists of the "missile-gun firing module" (strel'bovoj modul) ZU-23/ZOM1-SM; the "missile-launching module" (puskovoj modul) ZU-23/ZOM1-PM armed with four 9M333 "Strela-10" missiles; a remote control module (modul distantsionnogo upravleniya) ZU-23/ZOM1-MU and a portable generator AB-1. Depending on the wishes of the client, the system can be delivered without the -SM module (ZU-23/ZOM1-1), without the -PM module (ZU-23/ZOM1-2), without the remote control (ZU-23/ZOM1-3), or without -PM and -MU modules (ZU-23/ZOM1-4). The latter can be carried by the Samum 4x4 wheeled chassis vehicle and the first export contract has been signed as of early 2019
- **Type 80:** Chinese variant
- **Type 85:** Chinese variant produced by China for export only

System

Alternative Designations: ZU-23-2; ZU-23
In Service: 1962-Present
Crew: 5
Carriage: Two-Wheeled

Number of Barrels: ea2

Breech Mechanism: Vertical Sliding Wedge

Cyclic Rate of Fire: rd/min1,600-2,000

Practical Rate of Fire: rd/min400 in 10-30 rd bursts

Feed: 50-rd ammunition canisters fitted on either side of the upper mount assembly

Loader Type: Magazine

Reload Time: sec15

Traverse: deg360

Traverse Rate: INA

Elevation: deg-10 to +90

Elevation Rate: deg/sec54

Reaction time: sec8

Main Armament Ammunition

Description: Can fire the same ammunition as ZSU-23-4. Best mix for modern versions (ZU-23M and ZU-23M1) is 1,200 APDS-T and 1,200 FAPDS. Rounds are ballistically matched and no HEI is required.

Type: 23x152 HE-I, HEI-T, API-T, TP

Max Effective Range: m2,500+

Max Effective Altitude: m1,500

Projectile Weight: INA

Muzzle Velocity: m/s970

FUZE TYPE: API-T: BASE IGNITING

Self-Destruct: sec11

Penetration: 19 @ 1000 m API-T INA for APDS-T 16+ @ 1500 m, FAPDS-T (helicopter simulant laminate array)

Max Effective Range: 2,500, 2,000 m against light armored ground targets such as LAVs

HE-I Projectile Weight: kg0.18

HEI-T Projectile Weight: kg0.19

HE-I Fuze Type: Point detonating

HEI-T Fuze Type: Point detonating

Weapons and Ammunition Types

2 x 23-mm AA guns: Typical Combat Load 2,400

Fire Control

Sights with Magnification: Optical mechanical sight for AA fire. Straight tube telescope for ground targets.

Range: m2,000

Azimuth warning receiver: 1L15-1

Notes:

The ZU-23-2 (2A13) mounts two 23 mm autocannons on a small trailer which can be converted into a stationary mount for firing the guns. While in this position the wheels are moved aside. The autocannon can be prepared for firing from the march position in 30 seconds and in emergency can be fired from the traveling position. The weapon is aimed and fired manually, with the help of the ZAP-23 optical-mechanical sight which uses manually entered target data to provide limited automatic aiming. It also has a straight-tube telescope T-3 for use against ground targets such as infantry as well as unarmored or lightly armoured vehicles. The ammo is fed by a conveyor belt from two ammunition boxes. Each of the ammunition boxes is located on the side of the twin autocannon and each carries 50 rounds. The fumes created by firing the weapon are partially removed through the side openings in the barrels. Normally, once each barrel has fired 100 rounds it becomes too hot and is therefore replaced with a spare barrel. Each weapon is normally provided with two replacement barrels as part of its standard equipment.
Tulamashzavod Joint Stock Company is offering to upgrade the 2A14 guns to the 2A14M standard with a barrel life of 10,000 rounds instead of 8,000 rounds. The cannon carriage is based on the earlier ZPU-2 anti-aircraft twin heavy machine gun, which mounted two KPV 14.5 mm heavy machine guns. ZU-23-2 can be identified by different placement of the ammunition boxes (at right angles to the gun carriage) and by muzzle flash suppressors. In another similarity to the ZPU series, single-barrel and four-barrel versions of the ZU-23 were also developed. However, these versions never entered service. The ZU-23-2 can be towed by a number of different vehicles. In USSR and later Russia the most frequently used towing vehicles for it were GAZ-66 4x4 trucks and GAZ-69 4x4 light trucks.

L70 Swedish 40mm Towed Anti-Aircraft Autocannon

Tiers:

Variants:

- **L/70 BOFI (Bofors Optronic Fire control Instrument) gun system:** Electro optic fire control system (with a computer and laser range finder) and proximity fused ammunition. A "fair weather system"
- **L/70 BOFI-R (All weather):** Multisensor fire control system with a J band radar. Provides automatic acquisition and tracking with an effective range of 4 km without external radar input.
- **L/70 REMO (Renovation and Modernisation):** Package aimed at extending life span and increasing effectiveness. Higher rate of fire, new fire control system/air burst programming, and ammunition.
- **L/70 40mm Netherlands upgrade:** New servo system, amplifiers, increased rate of fire (to 300 rds/min), ammo racks, and diesel power unit.
- **L/70 40mm Spanish upgrade:** Felis electro optic automatic tracking system (HD TV set, automatic tracking, telemetry laser, portable target designator, and radar interface)
- **AOS 40mm L70 FADM (Field Air Defense Mount):** Singapore Technologies electric drive aiming system
- **TRIDON 40mm L/70:** Bofers installed Volvo 725 6x6 truck with fully enclosed, armor protected cab for a crew of five, with only two crew required. Did not enter service.
- **LVS 40mm L/70:** Equipped with LVS modular fire-control system by Saab. Entered service with the Swedish Army and Royal Thai Army in 1994 and 1997.

System

Alternative Designation: L/70
Type: 40mm Towed Anti-Aircraft Autocannon
In Service: 1948-Present
Crew: 4-6
Carriage: INA
Displacement Time: INA
Emplacement Time: INA

Dimensions

Length, Traveling: 7.29 m
Barrel Length: 2.80 m
Width, Traveling: 2.23 m
Width, Firing: 4.44 m
Height, Traveling: 2.35 m

Height, Firing: 1.94 m

Ground Clearance: 390 mm

Weight, Traveling: 4,800 kg

Cannon

Note: The two loaders, who stand to feed four-round clips into the feed guides, have guard rails to help them keep their feet while the mount rapidly slews to a new bearing. An ammunition stay can be rigged that will feed 26 rounds into the gun without loader intervention. Ammunition racks for 48 rounds (12 clips) are fitted to the rear of the platform.

↳*System*

Name: L/70

Type: 40mm Anti-Aircraft Autocannon

Caliber: 40mm

Bore: 40 mm/70 cal, rifled; fitted w/flash hiders

Breech Type: automatic vertical sliding block

Recoil System: concentric hydro-spring

Elevation: -4 deg to 90 deg

Elevation Rate: 45 deg/sec

Traverse: 360 deg

Traverse Rate: 85 deg/sec

Cyclic Rate of Fire: 260 rds/min

Maximum Range: 3,000-4,000 m

↳*Ammunition (Option 1)*

Name: INA

Type: HCHE

Caliber: mm40

Length: 534 mm

Weight: 0.87 kg

Muzzle Velocity: 1,030 mps

↳*Ammunition (Option 2)*

Name: INA

Type: PFHE

Caliber: 40mm

Length: 534 mm

Weight: 0.88 kg

Muzzle Velocity: 1,025 mps

↳*Ammunition (Option 3)*

Name: INA

Type: APC-T

Caliber: 40mm

Length: 534 mm

Weight: 0.92 kg

Muzzle Velocity: 1,010 mps

Fire Control

Name: INA

Computerized FCS: Local fire control for the basic system consists of two NIFE SRS 5 sights. The gun is aimed by the gunner, who uses a joystick. The L/70 is usually operated as part of a centralized air defense system that includes remote target designation and tracking by such systems as the Signaal L4/5 and Flycatcher systems and the Contraves Super Fledermaus and Skyguard. Upgrade programs as well as the BOFI Fair Weather and All Weather optronic fire-control systems are described in "Variants," below.

Direct Fire: Yes

Indirect Fire: No

Collimator: INA

Notes:

L70 Swedish 40mm Anti-Aircraft Autocannon By the end of World War II, jet aircraft had so increased the speed of attack that the Bofors simply could not get enough rounds into the air to counter the aircraft before it had already flown out of range. In order to effectively engage these threats, the gun would have to have longer range and a higher rate of fire, thereby increasing the number of rounds fired over the period of an engagement. Bofors considered either updating the 40 mm, or alternately making a much more powerful 57 mm design. In the end they did both. The new 40 mm design used a larger 40×365R round firing a slightly lighter 870 g shell at a much higher 1,030 m/s (3,379 fps) muzzle velocity. The rate of fire was increased to 240 rounds per minute[1] (4.0 rounds per second), similar to the German Flak 43. Additionally, the carriage was modified to be power-laid, the power being supplied by a generator placed on the front of the carriage. The first version was produced in 1947, accepted in 1948 as the "40 mm lvakan m/48", and entered Swedish service in 1951. Additional changes over the years have improved the firing rate first to 300 rpm (5.0 rounds per second), and later to 330 rpm (5.5 rps). Foreign sales started, as they had in the past, with the Netherlands and the United Kingdom. In November 1953 it was accepted as the NATO standard anti-aircraft gun, and was soon produced in the thousands. The L/70 was also used as the basis for a number of SPAAGs, including the U.S. Army's failed M247 Sergeant York. The UK's RAF Regiment adopted the L70 to replace its L60 guns in 1957, retiring its last examples in 1977 and replacing them with the Rapier system. In 1970s Zastava Arms acquired from Bofors license to produce L/70 version together with laser-computer group. Ammunition 40mm for L/70 is locally produced for domestic use and export in Sloboda Čačak. In 1979 the Royal Netherlands Air Force acquired 25 KL/MSS-6720 Flycatcher radar system and upgraded 75 of their 40L70s to create 25 firing units for static air base defence. The improved guns had an increased rate of fire (300 rounds/min) and the loading mechanism was provided with extended guides so that it could hold 22 cartridges. A 220 V diesel generator was mounted onto the undercarriage. This generator was powered by a Volkswagen diesel engine. In 1989 the Royal Netherlands Army acquired 30 Flycatcher systems. Each Flycatcher was fielded with two modified Bofors 40L70G guns. The 'G' stands for 'Gemodificeerd', which is the Dutch word meaning 'modified'. In the 40L70G version the loading mechanism was further improved and could be recognized by open rear guides. The 40L70G guns were also provided with muzzle velocity radars. Early in the 1990s the Royal Netherlands Air Force 40L70s were upgraded to the 'G' version. In some versions of the Swedish Army Combat Vehicle 90 there is a cartridge fed, automatic version of the L/70 autocannon installed. In order to fit inside the vehicle, the gun is mounted upside down. New armour piercing and programmable ammunition have also been developed. Germany has used L/70 guns on its Class 352, Class 333 and Class 332 mine hunting vessels, although these will be replaced by Rheinmetall MLG 27 remote-controlled gun systems until 2008. Until the early 80s L/70 guns guided by D7B radars were in widespread use in the anti-aircraft role in the German Navy and German Air Force until replaced by Roland SAMs. The L/70 is also used by the Indian Abhay IFV which carries 210 APFSDS and high explosive rounds.

Oerlikon GDF-005 Swiss 35mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **GDF-001:** XABA sight
- **GDF-002:** Introduced in 1980. Improved Ferranti sight and digital data bus. The gun has 112 rounds ready and 126 in reserve (238 rounds total)
- **GDF-003:** Minor enhancements including protective covers and automatic weapon lubrication.
- **GDF-005:** Introduced in 1985. Fitted with Gunking 3D computer-controlled sight with a laser range finder and digital fire control system. Integrated power supply and diagnostics. 280 rounds on the gun and an automatic re-loading system.
- **GDF-007:** GDF-005 upgraded with AHEAD system.
- **GDF-009:** Unveiled at IDEF 2015, held in May 2015 in Istanbul. To date, its exterior significantly changed, although the installation has retained the design of the original serial versions of the systems.Unlike other variants, this one relies on an internal power source.The GDF-009 model is based on a four-wheeled carriage, and is raised off the ground by three stabilisers when deployed in the firing position. It also features an automatic levelling system that can compensate for a maximum tilt angle of up to 7°.Mounted on the forward part of the carriage is the integrated battery, which functions as the gun's power supply unit and can be recharged from an external source if required.
- **AHEAD:** An upgrade for the GDF series guns built around a special projectile which explodes at a pre-calculated point in front of the target, sending a cone of 152 tungsten sub-projectiles at the target. Used by Canada, Pakistan, Greece, Oman, Spain, Taiwan, and Chile (unconfirmed).

System

Alternative Designations: GDF-005
Crew: 3
Carriage: 4-wheeled/2-axle towed chassis
Emplacement: 1.5 minutes
Displacement: 1.5 minutes
Note: Initial operating capability was achieved in 1985. It is fitted with the Contraves Gun King digital optronic sighting system. There is three-dimensional target tracking with laser rangefinder, periscope sight and digital computer. It has an integrated power supply on the mount; the battery power is sufficient for five combat cycles before IPS must be restarted. It also includes an autonomous gun sighting system.

Dimensions

Length, Traveling: 7.80 m
Length, Firing: 8.83 m
Barrel Length: 3.15 m

Width, Traveling: 2.26 m

Width, Firing: 4.49 m

Height, Traveling: 2.60 m

Height, Firing: 1.72 m

Ground Clearance: 330 mm

Weight, Traveling: 6,700 kg

Weight, Without Ammunition: 6,300 kg

Main Weapon System

Ammunition Types: HE-T/HEI-T, HE/HEI, HEI(BF), SAPHEI/SAPHEI-T, APDS/FAPDS, TP-T/TP, AHEAD

NDF-A Package: The NDF-A is the simplest of three combat improvement kits for existing mounts. It offers a Ferranti sight, automatic breech block lubrication, a rate-of-fire limiter for better accuracy and a permanently attached camouflage kit.

NDF-B Package: The variants is the same as NDF-A, with the addition of an automatic reload system and gunner cab.

↳*System*

Name: KDC-002 Gun

Type: Towed Anti-Aircraft Gun

Caliber: mm35

Bore: 35-mm/90-cal, rifled

Elevation: -5 deg to 92 deg (-89 mils to 1,634 mils)

Elevation Rate: 56 deg (1,000 mils)/sec

Traverse: 360 deg (6,400 mils)

Traverse Rate: 112 deg (2,000 mils)

Breech Type: gas-operated positive lock

Recoil System: hydromechanical

Maximum Range: 4,000 m

Muzzle Velocity: 1,175 mps

Rate of Fire: 550 rounds/min per barrel

↳*Ammunition (Option 1)*

Type: HE-T/HEI-T

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 535 g

Explosive: 98 g

Propellant: 330 g

Weight of Complete Round: 1,565 g

↳*Ammunition (Option 2)*

Type: HE/HEI
Caliber: mm35
Projectile Length: 387 mm
Projectile Weight: 550 g
Explosive: 112 g
Propellant: 330 g
Weight of Complete Round: 1,552 g

↳*Ammunition (Option 3)*

Type: HEI(BF)
Caliber: mm35
Projectile Length: 387 mm
Projectile Weight: 550 g
Explosive: 70 g
Propellant: 330 g
Weight of Complete Round: 1,552 g

Fire Control System

FCS Name: INA
Computerized FCS: INA
Sight: Ferranti sight
Laser Rangefinder: Yes
Digital Computer: Yes
Autonomous Gun Sighting System: Yes, Contraves Gun King digital optronic sighting system.
Note: Most GDF mounts are integrated with an external fire-control system, usually the Super Fledermaus or Skyguard system.

Radar System

Radar Vehicle Name: Skyguard Radar Fire-Control System.
Skyguard Radar Details: The Skyguard system is contained within a towed trailer, mounted on the roof of which is a pulse doppler search radar, a pulse doppler tracking radar and a co-axial television camera. The trailer also houses the crew of two and a small petrol generator. Skyguard is an all-weather air defense system for the control of aircraft at low altitude and at low and medium altitude range up to 3,000 m. The maximum effective distance is given as 4,000 m. The system takes the air surveillance, target acquisition, calculation of the derivative-action values and the control of two Oerlikon 35 mm anti-aircraft guns. Skyguard is served by four people. It was created by Oerlikon-Buehrle. The weapon was introduced in the 1960s in the Swiss Army and got updates in 1975, 1995 and 2010. They are still in use. It had replaced the system Contraves Super Fledermaus in the Swiss Air Force. The Skyguard radar system was used in the German Air Force for surveillance of low-altitude flight zones. The radar unit is readied quickly through the use of hydraulic systems for antenna erection and leveling after deployment. A typical fire unit using the Skyguard consists of two twin 35 mm gun platforms with a single Skyguard fire control radar. Skyguard systems can also incorporate an optional SAM module based on the GDF's mount and radar system but with the guns replaced by four missile canisters. It can be armed with either Aspide or RIM-7 Sea Sparrow

missiles. In Greek service the Skyguard system with RIM-7M is known as the VELOS.

Note: Typical battery includes two gun mounts with separate generators, single Skyguard.

Protection

Armor: INA

Notes:

GDF-005: Initial operating capability was achieved in 1985. It is fitted with the Contraves Gun King digital optronic sighting system. There is three-dimensional target tracking with laser rangefinder, periscope sight and digital computer. It has an integrated power supply on the mount; the battery power is sufficient for five combat cycles before IPS must be restarted. It also includes an autonomous gun sighting system. The Oerlikon GDF or Oerlikon 35 mm twin cannon is a towed anti-aircraft gun made by Oerlikon Contraves (renamed as Rheinmetall Air Defence AG following the merger with Rheinmetall in 2009). The system was originally designated as 2 ZLA/353 ML but this was later changed to GDF-001. It was developed in the late 1950s and is used by around 30 countries. The system uses twin autocannons, firing 35×228mm NATO-standard ammunition. It was originally designated 353 MK and is now designated as the KD series. The same KD series 35mm cannons are used in the Leopard 1 based Gepard and Type 74 tank based Type 87 SPAAG and Marksman self-propelled anti-aircraft guns (SPAAG). The system could be paired with the off-gun (remote) Super Fledermaus fire control radar, which in the late 1970s was upgraded to the Skyguard system. The weapons was aimed either directly, by way of an advanced sighting system, or automatically, by locking onto the target with radar. Early models carried 112 rounds ready to fire, and an additional 126 stored on the chassis as reloads. Later versions with automated reloading carry 280 rounds total. A typical engagement burst is 28 rounds

Type 55 Chinese 37mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **Type 63:** Twin 37 mm guns with vertical stabilization mounted on a T-34 chassis.
- **Type 65:** Copy of the twin barreled 37 mm
- **Type 74:** Upgraded version of the Type 65 with a greater rate of fire
- **Type 74SD:** Type 74 with servo system removed for operation with Type 800 laser course director system
- **Type 79-III:** Upgraded version of the Type 74 with electro-optical director, and powered traverse and elevation.
- **Type 76:** Naval version of the twin 37 mm.
- **P793:** Advanced twin-barrel version, with electro-optical predicting sight and higher rate of fire and lengthened barrels giving a higher muzzle velocity (1,000 m/s). Operated by a crew of 5 or 6.

Notes:

The Type 55 37mm Towed Anti-Aircraft Gun is a Chinese version of the Russian M1939 (61-K) 37mm Anti-Aircraft Gun. The 37 mm automatic air defense gun M1939 (61-K) (Russian: 37-мм автоматическая зенитная пушка образца 1939 года (61-К)) is a Soviet 37 mm caliber anti-aircraft gun developed during the late 1930s and used during World War II. The land-based version was replaced in Soviet service by the ZSU-57-2 during the 1950s. Guns of this type were successfully used throughout the Eastern Front against dive bombers and other low- and medium-altitude targets. It also had some usefulness against lightly armored ground targets. Crews of the 37 mm AD guns shot down 14,657 Axis planes. The mean quantity of 37 mm ammunition to shoot down one enemy plane was 905 rounds. The Soviet Navy purchased a number of Bofors 25 mm Model 1933 guns in 1935, trials of the weapon were successful and it was decided to develop a 45 mm version of the weapon designated the 49-K. The development under the guidance of leading Soviet designers M. N. Loginov, I. A. Lyamin and L. V. Lyuliev was successful, but the army thought that the 45 mm caliber was a little too large for an automatic field weapon. In January 1938 the Artillery Factory Number 8 in Sverdlovsk was ordered to develop a 37 mm weapon based on the same design. The task was fulfilled by the chief designer of the factory, Mikhail Loginov, and his assistant Lev Loktev. Firing trials of the new 61-K were conducted in October 1938. Competitive firing trials were conducted in 1940 between the 61-K and the Bofors 40 mm/56. There were no substantial differences found between them. The weapon was initially installed as a single-barrel weapon on a four-wheeled ZU-7 carriage, and was soon ready for service. An initial order for 900 units was placed. The gun was operated by a crew of eight men. A total of 200 rounds of ammunition were carried which were fed into the gun in five-round clips. Total Soviet production was around 20,000 units, ending in 1945. However, it has also been produced in Poland, China and North Korea. Armor penetration of the armor-piercing (AP) rounds is reported as 37 millimetres of rolled homogeneous armor (RHA) at 60°at 500 metres range and 28 millimetres of RHA at 90° at 1,500 metres range.

- **GDF-007:** GDF-005 upgraded with AHEAD system.
- **GDF-009:** Unveiled at IDEF 2015, held in May 2015 in Istanbul. To date, its exterior significantly changed, although the installation has retained the design of the original serial versions of the systems.Unlike other variants, this one relies on an internal power source.The GDF-009 model is based on a four-wheeled carriage, and is raised off the ground by three stabilisers when deployed in the firing position. It also features an automatic levelling system that can compensate for a maximum tilt angle of up to 7°.Mounted on the forward part of the carriage is the integrated battery, which functions as the gun's power supply unit and can be recharged from an external source if required.
- **AHEAD:** An upgrade for the GDF series guns built around a special projectile which explodes at a pre-calculated point in front of the target, sending a cone of 152 tungsten sub-projectiles at the target. Used by Canada, Pakistan, Greece, Oman, Spain, Taiwan, and Chile (unconfirmed).

System

Alternative Designations: GDF-007
Crew: 3
Carriage: 4-wheeled/2-axle towed chassis
Emplacement: 1.5 minutes
Displacement: 1.5 minutes
Note: Initial operating capability was achieved in 1985. It is fitted with the Contraves Gun King digital optronic sighting system. There is three-dimensional target tracking with laser rangefinder, periscope sight and digital computer. It has an integrated power supply on the mount; the battery power is sufficient for five combat cycles before IPS must be restarted. It also includes an autonomous gun sighting system.

Dimensions

Length, Traveling: 7.80 m
Length, Firing: 8.83 m
Barrel Length: 3.15 m

Width, Traveling: 2.26 m

Width, Firing: 4.49 m

Height, Traveling: 2.60 m

Height, Firing: 1.72 m

Ground Clearance: 330 mm

Weight, Traveling: 6,700 kg

Weight, Without Ammunition: 6,300 kg

Main Weapon System

Ammunition Types: HE-T/HEI-T, HE/HEI, HEI(BF), SAPHEI/SAPHEI-T, APDS/FAPDS, TP-T/TP, AHEAD

NDF-A Package: The NDF-A is the simplest of three combat improvement kits for existing mounts. It offers a Ferranti sight, automatic breech block lubrication, a rate-of-fire limiter for better accuracy and a permanently attached camouflage kit.

NDF-B Package: The variants is the same as NDF-A, with the addition of an automatic reload system and gunner cab.

AHEAD Ammunition: Advanced Hit Efficiency and Destruction (AHEAD) ammunition was developed in late 1980s for service in mid-1990s. The GDF muzzle is fitted with three-coil muzzle-velocity sensor; Sky Guard fire-control software is modified. When the AHEAD round is fired, its passage through the rear two coils is timed and its exact muzzle velocity determined and used to set the time fuze in the projectile through the forward coil. When the timer triggers the fuze, the shell is fractured into a cone of heavy-metal fragments that spray the target. A 25-round burst is capable of generating a spray of 3,800 fragments. The system is designed to provide quick kills against small targets at long-ranges.

↳*System*

Name: KDC-002 Gun

Type: Towed Anti-Aircraft Gun

Caliber: mm35

Bore: 35-mm/90-cal, rifled

Elevation: -5 deg to 92 deg (-89 mils to 1,634 mils)

Elevation Rate: 56 deg (1,000 mils)/sec

Traverse: 360 deg (6,400 mils)

Traverse Rate: 112 deg (2,000 mils)

Breech Type: gas-operated positive lock

Recoil System: hydromechanical

Maximum Range: 4,000 m

Muzzle Velocity: 1,175 mps

Rate of Fire: 550 rounds/min per barrel

↳*Ammunition (Option 1)*

Type: HE-T/HEI-T

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 535 g

Explosive: 98 g

Propellant: 330 g

Weight of Complete Round: 1,565 g

↳*Ammunition (Option 2)*

Type: HE/HEI

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 550 g

Explosive: 112 g

Propellant: 330 g

Weight of Complete Round: 1,552 g

↳*Ammunition (Option 3)*

Type: HEI(BF)

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 550 g

Explosive: 70 g

Propellant: 330 g

Weight of Complete Round: 1,552 g

Fire Control System

FCS Name: INA

Computerized FCS: INA

Sight: Ferranti sight

Laser Rangefinder: Yes

Digital Computer: Yes

Autonomous Gun Sighting System: Yes, Contraves Gun King digital optronic sighting system.

Note: Most GDF mounts are integrated with an external fire-control system, usually the Super Fledermaus or Skyguard system.

Radar System

Radar Vehicle Name: Skyguard Radar Fire-Control System.

Skyguard Radar Details: The Skyguard system is contained within a towed trailer, mounted on the roof of which is a pulse doppler search radar, a pulse doppler tracking radar and a co-axial television camera. The trailer also houses the crew of two and a small petrol generator. Skyguard is an all-weather air defense system for the control of aircraft at low altitude and at low and medium altitude range up to 3,000 m. The maximum effective distance is given as 4,000 m. The system takes the air surveillance, target acquisition, calculation of the derivative-action values and the control of two Oerlikon 35 mm anti-aircraft guns. Skyguard is served by four people. It was created by Oerlikon-Buehrle. The weapon was introduced in the 1960s in the Swiss Army and got updates in 1975, 1995 and 2010. They are still in use. It had replaced the system Contraves

Super Fledermaus in the Swiss Air Force. The Skyguard radar system was used in the German Air Force for surveillance of low-altitude flight zones. The radar unit is readied quickly through the use of hydraulic systems for antenna erection and leveling after deployment. A typical fire unit using the Skyguard consists of two twin 35 mm gun platforms with a single Skyguard fire control radar. Skyguard systems can also incorporate an optional SAM module based on the GDF's mount and radar system but with the guns replaced by four missile canisters. It can be armed with either Aspide or RIM-7 Sea Sparrow missiles. In Greek service the Skyguard system with RIM-7M is known as the VELOS.

Note: Typical battery includes two gun mounts with separate generators, single Skyguard.

Protection

Armor: INA

Notes:

GDF-007 This is a further development of the basic GDF system. Features include: *High rate of fire; *Ahead capability (programmable air burst munition); *High hit probability; *High impact efficiency; *Rapid response to FCU target data in remote mode; *High performance sighting system and fire control for autonomous target engagement in local mode; *Self-defense capability; *Two 35-mm positively locked, gas operated automatic cannons with automatic weapon lubrication; *Automatic reloading; *Quick firing readiness after emplacement due to independent power supply unit; *Automatic muzzle velocity measurement and projectile fuze programming; *Built-in test and diagnostics; *High mobility with four-wheel trailer mount; *Rapid deployment at the firing position by tilting the wheels hydraulically; and *Accurate positioning, which is statically determined through automatic leveling of a three-point hydraulic support. Additionally, the GDF-006 is fitted with the Advanced Hit Efficiency and Destruction (AHEAD) ammunition was developed in late 1980s for service in mid-1990s. The GDF muzzle is fitted with three-coil muzzle-velocity sensor; Sky Guard fire-control software is modified. When the AHEAD round is fired, its passage through the rear two coils is timed and its exact muzzle velocity determined and used to set the time fuze in the projectile through the forward coil. When the timer triggers the fuze, the shell is fractured into a cone of heavy-metal fragments that spray the target. A 25-round burst is capable of generating a spray of 3,800 fragments. The system is designed to provide quick kills against small targets at long-ranges. The Oerlikon GDF or Oerlikon 35 mm twin cannon is a towed anti-aircraft gun made by Oerlikon Contraves (renamed as Rheinmetall Air Defence AG following the merger with Rheinmetall in 2009). The system was originally designated as 2 ZLA/353 ML but this was later changed to GDF-001. It was developed in the late 1950s and is used by around 30 countries. The system uses twin autocannons, firing 35×228mm NATO-standard ammunition. It was originally designated 353 MK and is now designated as the KD series. The same KD series 35mm cannons are used in the Leopard 1 based Gepard and Type 74 tank based Type 87 SPAAG and Marksman self-propelled anti-aircraft guns (SPAAG). The system could be paired with the off-gun (remote) Super Fledermaus fire control radar, which in the late 1970s was upgraded to the Skyguard system. The weapons was aimed either directly, by way of an advanced sighting system, or automatically, by locking onto the target with radar. Early models carried 112 rounds ready to fire, and an additional 126 stored on the chassis as reloads. Later versions with automated reloading carry 280 rounds total. A typical engagement burst is 28 rounds

M1939 (52-K) Russian 85mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **M1939, KS-12 (Soviet):** This is the original 85-mm anti-aircraft variant with built-up construction. Gun was later used in the SU-85 self-propelled gun and the T-34/85 medium tank. The M1939 designator has also been used to identify a 37-mm towed anti-aircraft gun. See separate database entry under that designator.
- **M1944:** This was a modified KS-12 with monobloc construction, longer barrel and reshaped muzzle brake that saw only limited use. Sources disagree on the Russian designations, some citing KS-12A, others KS-18.
- **Type 56:** This is the Chinese-built copy of KS-12.

System

Alternative Designation: M1939 (52-K)
Type: 85mm Towed Anti-Aircraft Gun
In Service: 1939-Present
Crew: ea7
Chassis: 2-axle and 4-wheeled with outriggers
Displacement Time: INA
Emplacement Time: INA

Indirect Fire: INA

Notes:

The 85 mm air defense gun M1939 (52-K) (Russian: 85-мм зенитная пушка обр. 1939 г. (52-К)) was an 85 mm (3.3 in) Soviet anti-aircraft gun, developed under guidance of leading Soviet designers M. N. Loginov and G. D. Dorokhin. This gun was successfully used throughout the German-Soviet War against level bombers and other high- and medium-altitude targets. In emergencies they were utilized as powerful anti-tank weapons. The barrel of the 52-K was the basis for the family of 85-mm Soviet tank guns. After the war some 52-Ks were refitted for peaceful purposes as anti-avalanche guns in mountainous terrain. Virtually every country behind the Iron Curtain received this gun after World War II for their air defense. In the Soviet Union itself, these guns were largely superseded by the 100 and 130 mm guns. Adopted in 1939, the 85-mm M1939, like its counterpart the 88-mm gun, was meant for air defense. Like many anti-aircraft (AA) guns of the era it was provided with antitank ammunition in the event a tank should appear. 85-mm M1939 guns were organized into heavy anti-aircraft regiments of 16 guns. The regiments were organized into divisions of the field anti-aircraft forces.

Type 90 (PG99) Chinese 35mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **Type 90B:** The Type 90B is the second generation of Type 90 series MLRS (Multiple Launch Rocket System) of 122mm caliber.
- **Type 90A:** able to fire unguided rockets, new computerised fire control, command post can lay and control Type 90A launchers units by remote control.

System

Alternative Designation: PG99, GDF-002
Description: Towed Twin 35mm Anti-Aircraft Gun
Crew: 5
Primary Targets: High-speed, low-flying aircraft, helicopters, unmanned aerial vehicles (UAV) and cruise missiles
Reaction time to an identified threat: secs6
Emplacement Time: secs90
Displacement Time: secs90
Rate of Fire: 1,100 rpm total, including both barrels
Range: m3,200
Power Source: External electric power. Manual power can be used in an emergency.
Weight: kg6,800
Traverse: degrees360
Elevation: -5 degrees / +92 degrees (electric); -8 degrees / +95 degrees (manual)
Maximum Aiming Speed (Traverse): degrees per second120
Maximum Aiming Speed (Elevation): degrees per second60
Power Station: kW40

Automotive

Notes:: The Type 90 is mounted on a cradle which is designed to carry the guns and the mobile platform. It contains the hydro-mechanical recoil mechanism, which absorbs the recoil forces. The lower part of the cradle comprises the two-axle chassis and the outriggers with the leveling spindles for four-point support in the firing positions. Raising and lowering the leveling spindles and raising the wheels are done electro-hydraulically or manually in the case of power failure. The Type 90

35mm twin-barrel can be towed by any military truck.

Maximum Towing Speed (Road): km/h80

Maximum Towing Speed (Cross Country): km/h30

Notes:

The Type 90 is Chinese licensed copy of GDF-002 35mm anti-aircraft gun with twin barrels. The proven twin 35mm towed AA gun system represents the advanced development by NORINCO of a high performance, extremely accurate and reliable air defense gun. The gun is in service with the Chinese armed forces to provide field air defense for the ground forces at the division and group army level. The Type 90 was designed to engage high-speed, low-flying aircraft, helicopters, unmanned aerial vehicles (UAV) and cruise missiles. The Type 90 is suitable for point and coastal air defense. It is usually deployed near military bases, airfields, tunnels, islands, and along the coast to defend Sea Land of Communication (SLOC), ports, bridges and other important assets. The system’s reaction time to an airborne target is only 6 seconds, and the whole system can be set up

or taken down within 90 seconds.

Notes:

The Type 74 37mm Towed Anti-Aircraft Gun is a upgraded version of he Type 65 twin 37mm Towed Gun. The 37 mm automatic air defense gun M1939 (61-K) (Russian: 37-мм автоматическая зенитная пушка образца 1939 года (61-K)) is a Soviet 37 mm caliber anti-aircraft gun developed during the late 1930s and used during World War II. The land-based version was replaced in Soviet service by the ZSU-57-2 during the 1950s. Guns of this type were successfully used throughout the Eastern Front against dive bombers and other low- and medium-altitude targets. It also had some usefulness against lightly armored ground targets. Crews of the 37 mm AD guns shot down 14,657 Axis planes. The mean quantity of 37 mm ammunition to shoot down one enemy plane was 905 rounds. The Soviet Navy purchased a number of Bofors 25 mm Model 1933 guns in 1935, trials of the weapon were successful and it was decided to develop a 45 mm version of the weapon designated the 49-K. The development under the guidance of leading Soviet designers M. N. Loginov, I. A. Lyamin and L. V. Lyuliev was successful, but the army thought that the 45 mm caliber was a little too large for an automatic field weapon. In January 1938 the Artillery Factory Number 8 in Sverdlovsk was ordered to develop a 37 mm weapon based on the same design. The task was fulfilled by the chief designer of the factory, Mikhail Loginov, and his assistant Lev Loktev. Firing trials of the new 61-K were conducted in October 1938. Competitive firing trials were conducted in 1940 between the 61-K and the Bofors 40 mm/56. There were no substantial differences found between them. The weapon was initially installed as a single-barrel weapon on a four-wheeled ZU-7 carriage, and was soon ready for service. An initial order for 900 units was placed. The gun was operated by a crew of eight men. A total of 200 rounds of ammunition were carried which were fed into the gun in five-round clips. Total Soviet production was around 20,000 units, ending in 1945. However, it has also been produced in Poland, China and North Korea. Armour penetration of the armor-piercing (AP) rounds is reported as 37 millimetres of rolled homogeneous armor (RHA) at 60°at 500 metres range and 28 millimetres of RHA at 90° at 1,500 metres range.

- **ZU-23-2:** The ZU-23-2, also known as ZU-23, is a russian made towed 23 mm anti-aircraft twin-barreled automatic cannon. At the end of World War II the standard anti-aircrfat gun was the ZPU series, armed with 14.5 mm machine gun. ZU-23-2 was developed in the late 1950s. It was designed to engage low-flying targets at a range of 2.5 km as well as armoured vehicles at a range of 2 km and for direct defense of troops and strategic locations against air assault usually conducted by helicopters and low-flying airplanes. During the Invasion of Grenada in October 1983, a ZU-23-2 shut down an American helicopter. ZU-23-2 entered service with the Soviet Army in 1960. ZU-23-2 is often mounted on trucks for use in both anti-aircraft and fire support roles. It can also be mounted on the roof of the MT-LB multi-purpose tracked APCs. Specially modified three-legged ZU-23-2 is used in BTR-DG based airborne SPAAG. Cheap, easy to operate and still effective, the ZU-23-2 is still used by the Russian Army and by more than 20 other armies in the word.

System

Alternative Designation: ZU-23; 2A13

Type: 23mm Towed Anti-Aircraft Gun

Caliber: 23mm

Crew: 6

Carriage: The ZU-23 consists from twin 2A14 Guns, light carriage mount based on two wheel chassis

Elevation: 90 deg

Traverse: 360 deg

Rate of Fire: 2,000 Rounds Per Minute

Maximum Firing Range: 2.5 km

Maximum Altitude: 2 km

Emplacement Time: For the ZU-23 preparation for firing from the march position there is a normative in 30 seconds.

Displacement Time: INA

Barrel Replacement: There is ability to replace quickly both barrels in the battlefield as they are overheating. Replacement operation takes 15 - 20 seconds and the spare barrels their self are completed with the gun.

Dimensions

Length: 4,570mm

Barrel Length: 87.3 Caliber

Width: 1,830mm

Height: INA

Weight, Combat: 950 kg

Ammunition

Name: INA

Type: Rifle

Caliber: 23mm

Muzzle Velocity: 970 m/s

Basic Load: INA

Belt: Feeding is provided from the 50 cartridge belts each, placed in the ammunition boxes.

Fire Control

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: No

Sights: ZAP-23 automatic anti-aircraft sight, and additional sight used to fire at the ground targets.

Notes:

The ZU-23 Anti-Aircraft Artillery Gun was developed referring to the 1954 year Soviet Union requirements. The 2A14 Gun was developed for this gun in 1957. It's polygon tests took part till 1959 and finally in 1960 it entered service with the Soviet Army under the indexation as the ZU-23 23-mm Twin Anti-Aircraft Gun and also as the 2A13 as modifications with single or four barrels left only as test examples. At the moment the ZU-23 is used by the Russian Army and by more than 20 other countries of the world.

PUAZO 6-19 or 6-19M: fire control director

Note: FIRE CAN, LONG TRACK, FLAT FACE, WHIFF

Notes:

The Type 59 is a Chinese version of the Russian KS-19 100mm Towed Anti-aircraft gun 100 mm air defense gun KS-19 was a Soviet anti-aircraft gun. Initially deployed aboard ships as the B-34 during the Second World War, a ground-mounted version

was introduced into service after the war as the KS-19. The KS-19 is a heavy towed anti aircraft gun that has largely disappeared from front line arsenals due to increased use of more effective surface-to-air missiles. Being a towed weapon an external form of mobility was required, usually an AT-S Medium or AT-T Heavy tracked artillery tractor. The 15 man crew were carried on the tractor along with ready use ammunition for the gun. Ammunition was loaded as a single round into the loading tray and a well trained crew could fire 15 rounds maximum per minute. Anti Aircraft ammunition includes high explosive, high explosive fragmentation and fragmentation types. The KS-19's onboard sights can be used to engage air targets; however increased accuracy was achieved if used in conjunction with a fire control radar such as the SON 9 (NATO Reporting name 'Fire Can') and PUAZO-6/19 director. As the KS-19 is a heavy caliber Anti-Aircraft gun it also has some utility in the ground role especially against armored targets. As a result of this two armor piecing rounds were produced: the AP-T (Armour Piercing-Tracer) and APC-T (Armour Piercing Capped-Tracer) with the AP-T round reportedly able to penetrate 185 mm of armor at 1000 m. The KS-19 was used in action by communist forces in both Korea and Vietnam.

ZPU-1 Russian 14.5mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **ZPU-4:** Type 56 – Chinese-built version. MR-4 – Romanian-built version with a two-wheel carriage designed locally.
- **ZPU-2:** Type 58 – Chinese-built version. PKM-2 – Polish-built version.
- **ZU-2:** INA
- **ZPU-1:** Type 75 and Type 75-1 - Chinese built-versions. BTR-40A SPAAG – A BTR-40 APC with a ZPU-2 gun mounted in the rear. Entered service in 1950. BTR-152A SPAAG – A BTR-152 with a ZPU-2 mounted in the rear. Entered service in 1952.

System

Alternative Designation: ZPU-1
Type: 14.5mm Towed Anti-Aircraft Gun
Caliber: 14.5mm
Crew: 4

Barrels: 1
Elevation: +88/−8 deg
Traverse: 360 deg
Maximum Firing Range: 8,000 m
Maximum Firing Altitude: 5,000 m
Effective Altitude: 1,400 m
Emplacement Time: INA
Displacement Time: INA

Dimensions

Length, Traveling: 3.44 m
Width, Traveling: 1.62 m
Height, Traveling: 1.34 m
Weight, Firing: 413 kg

Ammunition

Basic Load: 1,200 Rounds

↳*Ammunition (Option 1)*

Name: BS.41

Type: API

Projectile Weight: 64.4 g (2.27 oz)

Muzzle Velocity: 1,000 m/s

Armor Penetration: Armor-penetration at 500 m (550 yd) is 32 mm (1.3 in) of RHA at 90 degrees.

Note: Full metal jacket bullet round with a tungsten carbide core.

↳*Ammunition (Option 2)*

Name: BZT

Type: API-T

Projectile Weight: 59.56 g (2.101 oz)

Muzzle Velocity: 1,005 m/s

Armor Penetration: INA

Note: Full metal jacket round with a steel core. Tracer burns to at least 2,000 m (2,200 yd).

↳*Ammunition (Option 3)*

Name: ZP

Type: I-T

Projectile Weight: 60.0 g (2.12 oz).

Muzzle Velocity: INA

Armor Penetration: INA

Note: "Instantaneous Incendiary" bullet with internal fuze, incendiary in tip, tracer container in base.

Fire Control

Computerized FCS: No

Direct Fire: Yes

Indirect Fire: No

Notes:

The ZPU (Russian: ЗПУ; зенитная пулемётная установка/zenitnaya pulemotnaya ustanovka, meaning "anti-aircraft machine gun mount") is a family of towed anti-aircraft gun based on the Soviet 14.5×114mm KPV heavy machine gun. It entered service with the Soviet Union in 1949 and is used by over 50 countries worldwide. Development of the ZPU-2 and ZPU-4 began in 1945, with development of the ZPU-1 starting in 1947. All three were accepted into service in 1949. Improved optical predicting gunsights were developed for the system in the 1950s. All weapons in the ZPU series have air-cooled quick-change barrels and can fire a variety of ammunition including API (B32), API (BS41), API-T (BZT) and I-T (ZP) projectiles. Each barrel has a maximum rate of fire of around 600 rounds per minute, though this is practically limited to about 150 rounds per minute. The quad-barrel ZPU-4 uses a four-wheel carriage similar to that once used by the obsolete 25 mm automatic anti-aircraft gun M1940. In firing position, the weapon is lowered onto firing jacks. It can be brought in and out of action in about 15 to 20

seconds, and can be fired with the wheels in the traveling position if needed. The double-barrel ZPU-2 was built in two different versions; the early model has large mud guards and two wheels that are removed in the firing position, and the late model has wheels that fold and are raised from the ground in the firing position. ZPU-2 turned out to be too heavy for the Airborne Troops, so a new UZPU-2 (later redesignated as ZU-2) was developed from ZPU-1. The single-barrel ZPU-1 is carried on a two-wheeled carriage and can be broken down into several 80-kilogram pieces for transport over rough ground. Versions of the weapon are built in China, North Korea and Romania. The series was used during the Korean War by Chinese and North Korean forces, and was later considered to be the most dangerous opposition to U.S. helicopters in Vietnam. Later it was used by Morocco and the Polisario Front in the Western Sahara War. It was also used by Iraqi forces during Operation Desert Storm and again in Operation Iraqi Freedom. In 1974 the Cyprus National Guard artillery batteries used their ZPU-2's against the Turkish air force. In the Russian military, it was replaced by the newer and more powerful ZU-23 23 mm twin automatic anti-aircraft gun. During the Lebanese Civil War, the Lebanese militias mounted the ZPU-2 and ZPU-4 on various vehicles, such as M113 armored personnel carriers, to create self-propelled support vehicles. The ZPU has seen widespread use by both sides in the Libyan Civil War, Syrian Civil War, and Yemeni Civil War, being often mounted on technical pickup trucks. The weapon has also been heavily used in the being installed on pickup trucks and is credited for bringing down several Syrian Air Force helicopters

Samavat Iranian 35mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **GDF-001:** XABA sight
- **GDF-002:** Introduced in 1980. Improved Ferranti sight and digital data bus. The gun has 112 rounds ready and 126 in reserve (238 rounds total)
- **GDF-003:** Minor enhancements including protective covers and automatic weapon lubrication.
- **GDF-005:** Introduced in 1985. Fitted with Gunking 3D computer-controlled sight with a laser range finder and digital fire control system. Integrated power supply and diagnostics. 280 rounds on the gun and an automatic re-loading system.
- **GDF-007:** GDF-005 upgraded with AHEAD system.
- **GDF-009:** Unveiled at IDEF 2015, held in May 2015 in Istanbul. To date, its exterior significantly changed, although the installation has retained the design of the original serial versions of the systems.Unlike other variants, this one relies on an internal power source.The GDF-009 model is based on a four-wheeled carriage, and is raised off the ground by three stabilisers when deployed in the firing position. It also features an automatic levelling system that can compensate for a maximum tilt angle of up to 7°.Mounted on the forward part of the carriage is the integrated battery, which functions as the gun's power supply unit and can be recharged from an external source if required.
- **AHEAD:** An upgrade for the GDF series guns built around a special projectile which explodes at a pre-calculated point in front of the target, sending a cone of 152 tungsten sub-projectiles at the target. Used by Canada, Pakistan, Greece, Oman, Spain, Taiwan, and Chile (unconfirmed).

System

Alternative Designations: Samavat
Crew: 3
Carriage: 4-wheeled/2-axle towed chassis
Emplacement: 1.5 minutes
Displacement: 1.5 minutes

Dimensions

Length, Traveling: 7.80 m
Length, Firing: 8.83 m
Barrel Length: 3.15 m
Width, Traveling: 2.26 m
Width, Firing: 4.49 m
Height, Traveling: 2.60 m

Height, Firing: 1.72 m

Ground Clearance: 330 mm

Weight, Traveling: 6,700 kg

Weight, Without Ammunition: 6,300 kg

Main Weapon System

Ammunition Types: HE-T/HEI-T, HE/HEI, HEI(BF), SAPHEI/SAPHEI-T, APDS/FAPDS, TP-T/TP, AHEAD

NDF-A Package: The NDF-A is the simplest of three combat improvement kits for existing mounts. It offers a Ferranti sight, automatic breech block lubrication, a rate-of-fire limiter for better accuracy and a permanently attached camouflage kit.

NDF-B Package: The variants is the same as NDF-A, with the addition of an automatic reload system and gunner cab.

NDF-C Package: The NDF-C version is the same as NDF-A, but substituting Gun King for the Ferranti sight and adding integrated power supply.

↳*System*

Name: KDC- gun

Type: Towed Anti-Aircraft Gun

Caliber: mm35

Bore: 35-mm/90-cal, rifled

Elevation: -5 deg to 92 deg (-89 mils to 1,634 mils)

Elevation Rate: 56 deg (1,000 mils)/sec

Traverse: 360 deg (6,400 mils)

Traverse Rate: 112 deg (2,000 mils)

Breech Type: gas-operated positive lock

Recoil System: hydromechanical

Maximum Range: 4,000 m

Muzzle Velocity: 1,175 mps

Rate of Fire: 550 rounds/min per barrel

↳*Ammunition (Option 1)*

Type: HE-T/HEI-T

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 535 g

Explosive: 98 g

Propellant: 330 g

Weight of Complete Round: 1,565 g

↳*Ammunition (Option 2)*

Type: HE/HEI

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 550 g

Explosive: 112 g

Propellant: 330 g

Weight of Complete Round: 1,552 g

↳***Ammunition (Option 3)***

Type: HEI(BF)

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 550 g

Explosive: 70 g

Propellant: 330 g

Weight of Complete Round: 1,552 g

Fire Control System

FCS Name: INA

Computerized FCS: INA

Sight: Ferranti sight

Note: Most GDF mounts are integrated with an external fire-control system, usually the Super Fledermaus or Skyguard system.

Radar System

Radar Vehicle Name: Skyguard Radar Fire-Control System.

Skyguard Radar Details: The Skyguard system is contained within a towed trailer, mounted on the roof of which is a pulse doppler search radar, a pulse doppler tracking radar and a co-axial television camera. The trailer also houses the crew of two and a small petrol generator. Skyguard is an all-weather air defense system for the control of aircraft at low altitude and at low and medium altitude range up to 3,000 m. The maximum effective distance is given as 4,000 m. The system takes the air surveillance, target acquisition, calculation of the derivative-action values and the control of two Oerlikon 35 mm anti-aircraft guns. Skyguard is served by four people. It was created by Oerlikon-Buehrle. The weapon was introduced in the 1960s in the Swiss Army and got updates in 1975, 1995 and 2010. They are still in use. It had replaced the system Contraves Super Fledermaus in the Swiss Air Force. The Skyguard radar system was used in the German Air Force for surveillance of low-altitude flight zones. The radar unit is readied quickly through the use of hydraulic systems for antenna erection and leveling after deployment. A typical fire unit using the Skyguard consists of two twin 35 mm gun platforms with a single Skyguard fire control radar. Skyguard systems can also incorporate an optional SAM module based on the GDF's mount and radar system but with the guns replaced by four missile canisters. It can be armed with either Aspide or RIM-7 Sea Sparrow missiles. In Greek service the Skyguard system with RIM-7M is known as the VELOS.

Note: Typical battery includes two gun mounts with separate generators, single Skyguard.

Protection

Armor: INA

Notes:

The Samavat is an Iranian copy of the 35-mm GDF that was first publicly displayed in 2008. Some reports claim the Samavat is similar to the GDF-001; it is said to utilize a Skyguard GCS. GDF-001 This is the first production variant. It is fitted with a Xaba optical sight. Many were updated with NDF-A, B or C kits. The Oerlikon GDF or Oerlikon 35 mm twin cannon is a towed anti-aircraft gun made by Oerlikon Contraves (renamed as Rheinmetall Air Defence AG following the merger with Rheinmetall in 2009). The system was originally designated as 2 ZLA/353 ML but this was later changed to GDF-001. It was developed in the late 1950s and is used by around 30 countries. The system uses twin autocannons, firing 35×228mm NATO-standard ammunition. It was originally designated 353 MK and is now designated as the KD series. The same KD series 35mm cannons are used in the Leopard 1 based Gepard and Type 74 tank based Type 87 SPAAG and Marksman self-propelled anti-aircraft guns (SPAAG). The system could be paired with the off-gun (remote) Super Fledermaus fire control radar, which in the late 1970s was upgraded to the Skyguard system. The weapons was aimed either directly, by way of an advanced sighting system, or automatically, by locking onto the target with radar. Early models carried 112 rounds ready to fire, and an additional 126 stored on the chassis as reloads. Later versions with automated reloading carry 280 rounds total. A typical engagement burst is 28 rounds

KS-12 Russian 85mm Towed Anti-Aircraft Gun

Tiers:

System

Alternative Designation: KS-12
Type: 85mm Towed Anti-Aircraft Gun
Caliber: 85mm
Crew: 7
Carriage: The 85mm cannon is mounted to four wheeled carriage with two axles, one at the front and one at the rear.
Mobility: 50 km/h maximum towed speed by truck
Rate of Fire: 15 - 20 rds/min
Maximum Firing Range: 10,000 m vertical and 15,650 m horizontal
Elevation: +82°/-3°
Traverse: 360°
Protection: An armour shield can be mounted at the front each side of the 85mm cannon.
Emplacement Time: Less than 5 Minutes
Displacement Time: Less than 5 Minutes

Dimensions

Length: 7.04 m
Width: 2.15 m
Height: 2.25 m
Weight, Combat: 4,300 kg

Ammunition

Name: INA

Type: AP (Armor-Piercing) and FRAG (FRAGmentation).

Caliber: 85mm

Basic Load: INA

Fire Control

Computerized FCS: The weapon system is fitted with fire control equipment which can be used in conjunction with the PUAZO-6/12 director and the SON-9/SON-9A (NATO designation `Fire Can') A/B-band fire-control radar.

Direct Fire: Yes

Indirect Fire: Yes

Collimator: INA

Notes:

The KS-12 85mm single shot AA gun is mounted on a 4 wheeled towed carriage. The Chinese variant is the Type-72. The 85-mm anti-aircraft gun of 1939 is also known as the KS-12. The new gun had good characteristics - 800 m / s initial projectile speed of 9.2 kg and a range of 10.5 km - allowed the new anti-aircraft gun to fight very effectively against armored and high-flying targets. The gun had inertial semi-automatic shutter. High results were supposed to show and shooting from an anti-aircraft gun at ground armored targets. Thus, even before the outbreak of hostilities, the KS-12 anti-aircraft gun went into mass production. Although long withdrawn from Russian service, it remains operational in several countries, including North Korea. The 85-mm anti-aircraft gun of 1939 appeared as a natural result of the development of Russian anti-aircraft artillery, which originated in 1914, when the designer of the Putilov factory F. Lander developed the first 76-mm anti-aerostatic gun of 1914. In 1915 and in 1928, this system was subjected to modernization, which increased the vertical firing range at a maximum elevation angle of up to 6,500 m; it was replaced by a 76-mm anti-aircraft gun of the 1931 model. In 1938, on the instructions of the GAU, several prototypes of the modernized 76-mm gun were manufactured. Installed on a four-wheeled carriage, it weighed 4200 kg - significantly less than the previous one. In this form, it is accepted into service as a 1938 anti-aircraft gun. However, the increase in speed and "ceiling" of the aircraft, increasing their survivability demanded an increase in the reach of anti-aircraft guns at height and an increase in the power of the projectile. At the end of the 1930s, it became obvious that the rapid development of aviation would lead to significant problems in the future in the event of opposition from aviation and air defense forces. Thus, the already available means of air defense could not adequately guarantee sufficient effectiveness. There was a need to give the army a long-range anti-aircraft gun, the weapon had to be powerful enough to hit high-flying armored targets. It was decided to base the 76.2-mm gun of the Rheinmetall company and to proceed from this when creating an anti-aircraft gun. The designers of the plant number 8 in 1937-1938 did this. The 76.2-mm gun had a large margin of safety embedded in the casing, breech and gun carriage. As a result, a new gun at that time was developed (not counting the single instances that appeared) of an 85-mm caliber.

Type 59 Chinese 57mm Towed Anti-Aircraft Gun

Tiers:

1 2 3 4

Variants:

- **AK-725:** Naval version of the S-60 gun. Introduced in 1958. Mounted in single, double and quadruple mounts (designated ZIF-31) on many early Soviet destroyers.
- **ZIF-72:** Naval version which is enclosed in a metal housing and fully automatic. Also exported to India. Introduced in the mid-1970s.
- **ZSU-57-2::** Self-propelled version with two 57 mm S-60 guns (designated S-68)
- **Type-80::** Chinese version of the ZSU-57-2.
- **BM-57:** Updated version.
- **AU-220M Baikal::** Remote weapon station with fire control system using BM-57

System

Radar Detection Range: km80

Radar Tracking Range: km35

Radar Frequency: 2.7-2.9 GHz

Radar Frequency Band: E

Radar Peak Power: kw300

Alternative Radar RPK- 1/FLAP WHEEL Range (km): km34

Notes:

The Type 59 57mm Towed Anti-Aircraft Gun is a Chinese version of the Russian S-60 57mm Towed Anti-Tank Gun. The S-60 is a towed, road-transportable, short- to medium-range, single-barrel 57-mm antiaircraft gun system. The S-60 recoil-operated weapon replaced the earlier 37mm models in most Warsaw Pact units. It is a powerful weapon, well suited to attack armored vehicles as well as low-flying aircraft. In addition to on-carriage optical fire control, the S-60 also employs off-carriage fire control with the PUAZO-6/60 director and the SON-9 or SON-9A radars. Originally the PUAZO-5 director and SON-4 radar were used. Further improved director/radar combinations became available in subsequent years. Recognition features of the S-60 are the long, thin tube with multi-perforated muzzle brake, distinctive gun shield which folds down and the horizontal feed tray which holds the four-round clips. The normal Soviet prime mover is the Ural-375 truck. The four-wheel carriage can be leveled and stabilized on jacks to form a point firing base. Loading is accomplished by 4-round horizontally fed clips. The S-60 also has an ammunition ready rack that can hold 4 four-round clips near ammunition feed mechanism on left side of the breech. A twin version, the S-68, is mounted on the self-propelled ZSU-57-2, and twin and quad versions are used by the Soviet Navy. It should be noted that the ammunition for the 57mm antiaircraft guns is not_ interchangeable with that used by the 57mm antitank and assault guns. This is due to the different configuration and dimensions of the cartridge cases. Besides on-carriage optical fire control, the S-60 also employs an off-carriage FLAP WHEEL fire control radar, mounted on a separate van. The towed S-60 system lacks the mobility of the newer SAM systems with which it is being replaced. A self-propelled version, the ZSU-57-2, with twin 57-mm guns mounted on a modified T-54 tank chassis, was introduced in 1957. The ZSU-57-2 has the same characteristics as the S-60 except that it is not radar-controlled. It is now considered obsolete.

Oerlikon GDF-002 Swiss 35mm Towed Anti-Aircraft Gun

Tiers:

Variants:

- **GDF-001:** XABA sight
- **GDF-002:** Introduced in 1980. Improved Ferranti sight and digital data bus. The gun has 112 rounds ready and 126 in reserve (238 rounds total)
- **GDF-003:** Minor enhancements including protective covers and automatic weapon lubrication.
- **GDF-005:** Introduced in 1985. Fitted with Gunking 3D computer-controlled sight with a laser range finder and digital fire control system. Integrated power supply and diagnostics. 280 rounds on the gun and an automatic re-loading system.
- **GDF-007:** GDF-005 upgraded with AHEAD system.
- **GDF-009:** Unveiled at IDEF 2015, held in May 2015 in Istanbul. To date, its exterior significantly changed, although the installation has retained the design of the original serial versions of the systems.Unlike other variants, this one relies on an internal power source.The GDF-009 model is based on a four-wheeled carriage, and is raised off the ground by three stabilisers when deployed in the firing position. It also features an automatic levelling system that can compensate for a maximum tilt angle of up to 7°.Mounted on the forward part of the carriage is the integrated battery, which functions as the gun's power supply unit and can be recharged from an external source if required.
- **AHEAD:** An upgrade for the GDF series guns built around a special projectile which explodes at a pre-calculated point in front of the target, sending a cone of 152 tungsten sub-projectiles at the target. Used by Canada, Pakistan, Greece, Oman, Spain, Taiwan, and Chile (unconfirmed).

System

Alternative Designations: GDF-002
Crew: 3
Carriage: 4-wheeled/2-axle towed chassis
Emplacement: 1.5 minutes
Displacement: 1.5 minutes
Note: This has a digital data link from the Super Fledermaus or Skyguard radar fire-control system. Typical battery includes two gun mounts with separate generators, single Skyguard. There is a Ferranti Type GSA Mk 3 with optical alignment sight; target range is entered by gunner.

Dimensions

Length, Traveling: 7.80 m
Length, Firing: 8.83 m
Barrel Length: 3.15 m
Width, Traveling: 2.26 m

Width, Firing: 4.49 m

Height, Traveling: 2.60 m

Height, Firing: 1.72 m

Ground Clearance: 330 mm

Weight, Traveling: 6,700 kg

Weight, Without Ammunition: 6,300 kg

Main Weapon System

Ammunition Types: HE-T/HEI-T, HE/HEI, HEI(BF), SAPHEI/SAPHEI-T, APDS/FAPDS, TP-T/TP, AHEAD

NDF-A Package: The NDF-A is the simplest of three combat improvement kits for existing mounts. It offers a Ferranti sight, automatic breech block lubrication, a rate-of-fire limiter for better accuracy and a permanently attached camouflage kit.

NDF-B Package: The variants is the same as NDF-A, with the addition of an automatic reload system and gunner cab.

NDF-C Package: The NDF-C version is the same as NDF-A, but substituting Gun King for the Ferranti sight and adding integrated power supply.

↳*System*

Name: KDC- gun

Type: Towed Anti-Aircraft Gun

Caliber: mm35

Bore: 35-mm/90-cal, rifled

Elevation: -5 deg to 92 deg (-89 mils to 1,634 mils)

Elevation Rate: 56 deg (1,000 mils)/sec

Traverse: 360 deg (6,400 mils)

Traverse Rate: 112 deg (2,000 mils)

Breech Type: gas-operated positive lock

Recoil System: hydromechanical

Maximum Range: 4,000 m

Muzzle Velocity: 1,175 mps

Rate of Fire: 550 rounds/min per barrel

↳*Ammunition (Option 1)*

Type: HE-T/HEI-T

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 535 g

Explosive: 98 g

Propellant: 330 g

Weight of Complete Round: 1,565 g

↳*Ammunition (Option 2)*

Type: HE/HEI

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 550 g

Explosive: 112 g

Propellant: 330 g

Weight of Complete Round: 1,552 g

↳*Ammunition (Option 3)*

Type: HEI(BF)

Caliber: mm35

Projectile Length: 387 mm

Projectile Weight: 550 g

Explosive: 70 g

Propellant: 330 g

Weight of Complete Round: 1,552 g

Fire Control System

FCS Name: INA

Computerized FCS: INA

Sight: Ferranti sight

Note: Most GDF mounts are integrated with an external fire-control system, usually the Super Fledermaus or Skyguard system.

Radar System

Radar Vehicle Name: Skyguard Radar Fire-Control System.

Skyguard Radar Details: The Skyguard system is contained within a towed trailer, mounted on the roof of which is a pulse doppler search radar, a pulse doppler tracking radar and a co-axial television camera. The trailer also houses the crew of two and a small petrol generator. Skyguard is an all-weather air defense system for the control of aircraft at low altitude and at low and medium altitude range up to 3,000 m. The maximum effective distance is given as 4,000 m. The system takes the air surveillance, target acquisition, calculation of the derivative-action values and the control of two Oerlikon 35 mm anti-aircraft guns. Skyguard is served by four people. It was created by Oerlikon-Buehrle. The weapon was introduced in the 1960s in the Swiss Army and got updates in 1975, 1995 and 2010. They are still in use. It had replaced the system Contraves Super Fledermaus in the Swiss Air Force. The Skyguard radar system was used in the German Air Force for surveillance of low-altitude flight zones. The radar unit is readied quickly through the use of hydraulic systems for antenna erection and leveling after deployment. A typical fire unit using the Skyguard consists of two twin 35 mm gun platforms with a single Skyguard fire control radar. Skyguard systems can also incorporate an optional SAM module based on the GDF's mount and radar system but with the guns replaced by four missile canisters. It can be armed with either Aspide or RIM-7 Sea Sparrow missiles. In Greek service the Skyguard system with RIM-7M is known as the VELOS.

Note: Typical battery includes two gun mounts with separate generators, single Skyguard.

Protection

Armor: INA

Notes:

GDF-002: This has a digital data link from the Super Fledermaus or Skyguard radar fire-control system. Typical battery includes two gun mounts with separate generators, single Skyguard. There is a Ferranti Type GSA Mk 3 with optical alignment sight; target range is entered by gunner. The Oerlikon GDF or Oerlikon 35 mm twin cannon is a towed anti-aircraft gun made by Oerlikon Contraves (renamed as Rheinmetall Air Defence AG following the merger with Rheinmetall in 2009). The system was originally designated as 2 ZLA/353 ML but this was later changed to GDF-001. It was developed in the late 1950s and is used by around 30 countries. The system uses twin autocannons, firing 35×228mm NATO-standard ammunition. It was originally designated 353 MK and is now designated as the KD series. The same KD series 35mm cannons are used in the Leopard 1 based Gepard and Type 74 tank based Type 87 SPAAG and Marksman self-propelled anti-aircraft guns (SPAAG). The system could be paired with the off-gun (remote) Super Fledermaus fire control radar, which in the late 1970s was upgraded to the Skyguard system. The weapons was aimed either directly, by way of an advanced sighting system, or automatically, by locking onto the target with radar. Early models carried 112 rounds ready to fire, and an additional 126 stored on the chassis as reloads. Later versions with automated reloading carry 280 rounds total. A typical engagement burst is 28 rounds

PUAZO 6-19 or 6-19M: fire control director

Notes:

100 mm air defense gun KS-19 was a Soviet anti-aircraft gun. Initially deployed aboard ships as the B-34 during the Second World War, a ground-mounted version was introduced into service after the war as the KS-19. The KS-19 is a heavy towed anti

aircraft gun that has largely disappeared from front line arsenals due to increased use of more effective surface-to-air missiles. Being a towed weapon an external form of mobility was required, usually an AT-S Medium or AT-T Heavy tracked artillery tractor. The 15 man crew were carried on the tractor along with ready use ammunition for the gun. Ammunition was loaded as a single round into the loading tray and a well trained crew could fire 15 rounds maximum per minute. Anti Aircraft ammunition includes high explosive, high explosive fragmentation and fragmentation types. The KS-19's onboard sights can be used to engage air targets; however increased accuracy was achieved if used in conjunction with a fire control radar such as the SON 9 (NATO Reporting name 'Fire Can') and PUAZO-6/19 director. As the KS-19 is a heavy calibre Anti-Aircraft gun it also has some utility in the ground role especially against armored targets. As a result of this two armor piecing rounds were produced: the AP-T (Armour Piercing-Tracer) and APC-T (Armour Piercing Capped-Tracer) with the AP-T round reportedly able to penetrate 185 mm of armor at 1000 m. The KS-19 was used in action by communist forces in both Korea and Vietnam.

Oerlikon GDF-001 Swiss 35mm Towed Anti-Aircraft Gun

GDF-001 This is the first production variant. It is fitted with a Xaba optical sight. Many were updated with NDF-A, B or C kits. The Oerlikon GDF or Oerlikon 35 mm twin cannon is a towed anti-aircraft gun made by Oerlikon Contraves (renamed as Rheinmetall Air Defence AG following the merger with Rheinmetall in 2009). The system was originally designated as 2 ZLA/353 ML but this was later changed to GDF-001. It was developed in the late 1950s and is used by around 30 countries. The system uses twin autocannons, firing 35×228mm NATO-standard ammunition. It was originally designated 353 MK and is now designated as the KD series. The same KD series 35mm cannons are used in the Leopard 1 based Gepard and Type 74 tank based Type 87 SPAAG and Marksman self-propelled anti-aircraft guns (SPAAG). The system could be paired with the off-gun (remote) Super Fledermaus fire control radar, which in the late 1970s was upgraded to the Skyguard system. The weapons was aimed either directly, by way of an advanced sighting system, or automatically, by locking onto the target with radar. Early models carried 112 rounds ready to fire, and an additional 126 stored on the chassis as reloads. Later versions with automated reloading carry 280 rounds total. A typical engagement burst is 28 rounds

AZP S-60 Russian 57mm Towed Anti-Aircraft Gun

Tiers:

1 2 3 4

Variants:

- **AK-725:** Naval version of the S-60 gun. Introduced in 1958. Mounted in single, double and quadruple mounts (designated ZIF-31) on many early Soviet destroyers.
- **ZIF-72:** Naval version which is enclosed in a metal housing and fully automatic. Also exported to India. Introduced in the mid-1970s.
- **ZSU-57-2::** Self-propelled version with two 57 mm S-60 guns (designated S-68)
- **Type-80::** Chinese version of the ZSU-57-2.
- **BM-57:** Updated version.
- **AU-220M Baikal::** Remote weapon station with fire control system using BM-57

System

Alternative Designations: AZP S-60
In Service: 1950-Present
Crew: 7
Carriage: Four Wheel
Prime Movers: Ural-375D
Max Towed Speed: km/h60
Emplacement Time: min1
Displacement Time: min3

Dimensions

Length Overall: m8.5
Length of Barrel: m4.4
Width Overall: m2.054

Height: m2.37

Weight: kg4,500

Main Armament

Type: 57-mm Automatic Cannon

Caliber: mm57

Number of Barrels: 1 each

Service Life of Barrel: INA

Cyclic Rate of Fire: rds/min105-120

Reload Type: sec4-8

Practical Rate of Fire: rds/min70

Loader Type: 4 Round Clip, Manual

Reaction time: sec4.5

Maximum Elevation: deg+85

Minimum Elevation: deg-4

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Muzzle Velocity: m/s1,000

Maximum Firing Range, Radar Guided: m6,000

Maximum Firing Range, Optical Guided: m4,000

Main Armament Ammunition

↳*Ammunition (Option 1)*

Name: UBR-281/281U

Type: APCBC-HE-T

Projectile Weight: grams2,820

Bursting Charge: grams13

Muzzle Velocity: m/s1,000

Note: Anti-tank round with sharp penetrator, blunt cap and an aerodynamic cover, with tracer and a delayed-action base fuze.Penetration 96 mm RHA at 1,000 m range or 106 mm at 500 m.UBR-281 and -281U are loaded with the same projectile and differ only by details in case mouth and swage grooves.

↳*Ammunition (Option 2)*

Name: 3UO6

Type: HE

Projectile Weight: INA

Bursting Charge: grams154

Muzzle Velocity: m/s1,000

Notes: Similar to UOR-281U but with proximity fuze AR-51 installed. Fuze operating with RPK-1 system together. Not to be confused with later smart shells which Russia developed.

↳*Ammunition (Option 3)*

Name: UOR-281U

Type: HE-T

Projectile Weight: grams2,850

Bursting Charge: grams168

Muzzle Velocity: m/s1,000

Note: Similar to UOR-281; some sources state the shell is the same as in UOR-281 and the round differs from it only in details of the case mouth and swage grooves (as with the UBR round),[8] while others claim a slightly larger HE filling

Fire Control

Rangefinder: D-49

Radar Name: Son-9/Son-9A (NATO FIRE CAN)

Radar Function: Fire Control

Radar Detection Range: km80

Radar Tracking Range: km35

Radar Frequency: 2.7-2.9 GHz

Radar Frequency Band: E

Radar Peak Power: kw300

Alternative Radar RPK- 1/FLAP WHEEL Range (km): km34

Notes:

The S-60 is a towed, road-transportable, short- to medium-range, single-barrel 57-mm antiaircraft gun system. The S-60 recoil-operated weapon replaced the earlier 37mm models in most Warsaw Pact units. It is a powerful weapon, well suited to attack armored vehicles as well as low-flying aircraft. In addition to on-carriage optical fire control, the S-60 also employs off-carriage fire control with the PUAZO-6/60 director and the SON-9 or SON-9A radars. Originally the PUAZO-5 director and SON-4 radar were used. Further improved director/radar combinations became available in subsequent years. Recognition features of the S-60 are the long, thin tube with multi-perforated muzzle brake, distinctive gun shield which folds down and the horizontal feed tray which holds the four-round clips. The normal Soviet prime mover is the Ural-375 truck. The four-wheel carriage can be leveled and stabilized on jacks to form a point firing base. Loading is accomplished by 4-round horizontally fed clips. The S-60 also has an ammunition ready rack that can hold 4 four-round clips near ammunition feed mechanism on left side of the breech. A twin version, the S-68, is mounted on the self-propelled ZSU-57-2, and twin and quad versions are used by the Soviet Navy. It should be noted that the ammunition for the 57mm antiaircraft guns is not_ interchangeable with that used by the 57mm antitank and assault guns. This is due to the different configuration and dimensions of the cartridge cases. Besides on-carriage optical fire control, the S-60 also employs an off-carriage FLAP WHEEL fire control radar, mounted on a separate van. The towed S-60 system lacks the mobility of the newer SAM systems with which it is being replaced. A self-propelled version, the ZSU-57-2, with twin 57-mm guns mounted on a modified T-54 tank chassis, was introduced in 1957. The ZSU-57-2 has the same characteristics as the S-60 except that it is not radar-controlled. It is now considered obsolete.

Type 65 Chinese 37mm Twin-Barrel Anti-Aircraft Gun

Tiers:

Variants:

- **Type 74:** The Type 74 is an improved variant of the Type 65 introduced in 1974. The weapon share the same 37mm cannon and ammunitions as the Type 65, but can be operated either manually or remotely by the fire-control unit consisting of an electro-optical director and a target searching radar. This enables the weapon to operate under day/night, all-weather conditions.

System

Alternative Designations: INA
Description: The Type 65 is the twin-37mm towed anti-aircraft artillery (AAA)
Crew: 5 to 8
Carriage: 4 Wheeled/ 2 Axle Towed
Primer Mover: INA
Max Towed Speed: km/h60
Cross Country Tow Speed: km/h25
Emplacement Time: min1
Displacement Time: min3
Fording Depth: m0.7
Tuning Radius: m8

Dimensions

Length, Traveling: m6.21

Main Armament Ammunition

Type: AP-T, HE-T, HEI-T

Max Effective (Slant) Range): m3,500

Max Effective (grnd targets) Range: m3,500

Max Effective Altitude: m3,000

Min Altitude: m0

Self-destruct time: sec8-12

Self-destruct range: m3,700-4,700

Fire Control

Description: Sights w/magnification: optical mechanical computing sight Azimuth warning receiver: 1l15-1 Off-carriage radar: Optional. The Chinese Type 311 continuous wave I/J-band fire control radar was designed and produced to support 37mm and 57mm guns. The trailer-mount radar with computer automation can conduct surveillance and target acquisition. It has at least three variants, with ranges of 30km (311-A), 35km (311-B), and 40km (311-C). Target tracking range is 25km for the -A variant. Emplacement time is 15 minutes. Radar gives user weapons night-time and adverse weather capability. This radar has been exported.

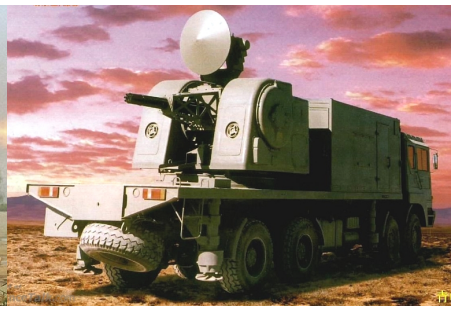
Other Fire Control: The gun is linked to the battery net which receives analog voice radio alerts for approaching aircraft, including direction and altitude. Guns and battery/ battalion have air watches and forward observers.

Notes:

The Type 65 is the twin-37mm towed anti-aircraft artillery (AAA) developed in the 1960s as a successor to the Soviet M1939 single-barrel 37mm AAA (produced in China as Type 55). The weapon was designed primarily to engage airborne targets within the distance of 8,500m (or slant range of 3,500m), but it can also be used against land or water surface targets. Based on the Type 65 design, the PLA developed a number of derivations including the Type 74/74SD towed AAA, Type 79-III towed AAA, Type 76 shipboard AAA, and Type 88 self-propelled AAA.

→→Self-Propelled Anti-Aircraft Guns

LD 2000 (LuDun-2000) Chinese 8x8 Mobile Air Defense Gun Missile System



Tiers:

Variants:

- **LD 2000 with Missiles:** Some LD 2000s have up to 6 SAMs attached to the side(s) of the gun mount (see pictures). Versions with missiles have an additional radar mounted on top of the shelter between the cab of the truck and the gun. Missile option include: TY-90, DK-9, and HQ-10 SAM
- **LD 2000 with 11 barreled "Gatling" gun:** Has higher rate of fire than the seven-barreled version.

System

Alternative Designation: HQ-6A, LD2000 Gai,
Chassis: 8 x 8, WS-2400
Manufactuer: NORINCO
Crew: ea9
Target: Low altitude, high speed cruise missiles; low altitude aircraft; and UAVs traveling less than Mach 2
Number of Tracks System Can Manage: targetsUp to 48
Reaction Time: sec9.8
Range: 2.5km for gun attacking air threats and 3km attacking ground threats; 6km for SAMs
In Service: 2005-Present
Note: LD2000 includes a combat unit that consists of an Intelligence & Command Vehicle (ICV) and up to eight Combat Vehicles (CV), supported by Ammunition Supply Vehicles (ASV). and other combat support vehicles. Besides the ready-to-service basic configuration and extended configuration, LD2000 also can be upgraded to multi-layer gun-missile integrated air defense system

Dimensions (Chassis: WS2400)

Length: m11.44

Width: m3.05

Height: m2.97

Weight, Empty: tons19

Automotive (Chassis: WS2400)

Engine Name: Deutz Diesel

Engine Type: Diesel

Engine Power: 517

Payload Capacity: tons22

Operational Range: km650

Speed: km/h75

Communications

Main Weapon System

Note #1: The 30-mm cannon is remotely controlled and mounted to the rear of the truck

Note #2: The cannon is operated by a gunner in the fully enclosed module to the behind the cab

↳***System***

Name: Type 730C (Land Based)

Type: "Gatling" Gun

Cailber/Length: mm30

Crew: Automated, with human oversight

Barrels: ea7

Length: INA

Diameter: INA

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Maximum Elevation: INA

Fire on Move: No

Minimum Elevation: INA

Reaction Time: sec9.8

Rate of Fire: rpm4,600 - 5,800 cyclic

Maximum Effective Range: 2.5km attacking air threats and 3km attacking ground threats

Basic Load: 1,000 rounds (500 rounds in each of two magazines located on either side of the cannons. Each magazine

is loaded with a type of 30mm ammunition, AP, APDS, or HEI)

Feed System: Two ammunition boxes, each holding 500 rounds (total 1000 rounds)

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

↳*Ammunitionn*

Name: INA

Type: Sabot Armor-Piercing Rounds

Caliber: mm30

Muzzle Velocity: INA

Basic Load: 1,000 rounds (500 rounds in each of two magazines located on either side of the cannons. Each magazine is loaded with a type of 30mm ammunition, AP, APDS, or HEI)

Note: The LD2000 can fire tungsten APDS and HEI ammunitions for improved airborne weapon target destruction. One direct hit of APDS projectile will definitely detonate the warhead of incoming air-to-ground weapon target

Secondary Weapon Systemm

↳*Missile System*

Name: TY-90 (Sky Swallow-90)

Type: Suface-to-Air Missile

Manufacturer: China Aviation Industry Corporation I

Length: m1.9

Diameter: mm90

Weight: kg20

Warhead Weight: kg3

Detonation Mechanism: Impact / proximity

Engine: Solid-fuel rocket motor

Propellant: Solid fuel

Operational Range: 0.5 – 6 km

Flight Ceiling: km6

Flight Altitude: 0 – 6 km

Speed: > Mach 2

Guidance System: ImIR IR

Basic Load: ea6

Fire Control System

FCS Name: OFC-3

Computerized FCS: Yes

FCS Type: Photoelectric tracking system

Laser Rangefinder: Yes

IFF: INA

Guidance System: TR47C J-band radar OFC-3 electro-optical fire control system

Main Gun Stabilization: INA

Night Vision Camera: Yes

↳***Radar***

Name: TR47C

Type: Fire Control Radar

Band: J

CCD Camera: Yes

Laser Rangefinder: Yes

Infrared Thermal Imager: Yes

Detection Range, Small Target: km10

Azimuth Scan: azimuth is scanned mechanically, while the elevation is scanned electronically, incorporating a total of 169 transceivers of phased array technology that enables the radar to pick up the splashes of 30 mm rounds

Number of targets: Up to 48

Note: The system can track a sea-skimming target with 0.1 square metre radar cross section at 8 km, extended to 15 km if the radar cross section is increased to 2 square metres, and further extended to 20 km if the radar cross section is increased to 10 square metres, though the targets could not be engaged until much closer (3 km) due to the limited range of the gun

Protection

Hull Armor: INA

Turret Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The LD2000 (LuDun-2000) is a ground-based anti-aircraft air defense weapon system designed, developed and manufactured by the Chinese Defense Company NORINCO (China North Industries Corporation). The system was unveiled during the defense exhibition IDEX in 2005. Modern critical ground assets are vulnerable to a growing number of precision-guided weapon and aerial threats, and particularly to cruise missiles. In response. China North Industries Corporation (NORINCO) has developed a unique and effective solution to these threats - LD2000 Ground-Based Close-In Weapon System based on the proven CIWS of naval application. LD2000 is the effective and efficient weapon system for close-in air defense in various scenarios. With highly accurate firepower and multiple target engagement capability. The LD2000 achieves satisfying hit probability to typical low-altitude, high-speed cruise missile targets. The system is also highly capable of intercepting low-altitude aircraft and UAV. The LD2000 can intercept flying targets at a velocity of Mach 2 or below. It has a reaction time of 9.8 sec and the capability to track

up to 48 targets.

M-1985 North Korean 57mm Self-Propelled Anti-Aircraft Gun

Tiers:

1 2 3 4

System

Alternative Designations: M-1985

Description: Self-propelled anti-aircraft gun (SPAAG), armed with two 57 mm autocannons

Crew: 6

Chassis: YW 531 APC

Emplacement Time (min): N/A

Displacement Time (min): N/A

Dimensions

Length, Hull: 5.476 m

Length, with Gun Forward: m8.46

Width: 2.978 m

Weight: tons12.6

Ground Clearance: mm425

Automotive

Engine Name: KHD BF8L 413F

Engine Type: 8-cylinder air-cooled, turbo-charged diesel

Engine Power: hp320

Suspension: individual torsion bar with hydraulic shock absorbers on the first and last road wheels

Fuel Capacity: INA

Operational Range, Road: km/h500

Speed, Road: km/h65

Speed, Off-Road: km/h46

Gradient: %60

Side Slope: %30

Vertical Step: m0.8

Trench: m2.7

Fording: m1.4

Main Weapon System

Gun, Caliber, Type: 57-mm recoil-operated air-cooled cannons,

Number of Barrels: ea2

Rate of Fire: rds/min150-180 rds/min per barrel

Loader Type: Two 5-round clips, manual, 10 rds

Reload Time: 4-8

Traverse: deg360

Traverse Rate: o/sec30

Elevation: 0 to 87 degrees

Elevation Rate: o/sec20

Basic Load: ea300

Azimuth: Unlimited

Main Weapon System Ammunition

Type: 57 x 348 SR APHE, Frag-T, APC-T, HVAP-T, HE-T. Uses same ammo as the towed single S-60

Max Effective Range: m4,000

Max Effective Altitude: m4,237 at 65o

Min Altitude: m0

Frag-T Projectile Weight: kg2.81

APC-T Projectile Weight: kg2.82

HE-T Projectile Weight: kg2.85

Muzzle Velocity: m/s1,000

Frag-T Fuze Type: Point Detonating

APC-T Fuze Type: Base Detonating Fuze

HE-T Fuze Type: (Yugoslavian, impact [super quick] action with pyrotechnical self-destruct)

Self-Destruct Time: sec13-17

Armor Penetration: mm CE130 at 1,000m, APHE 96 APC-T at 1,000 m

Fire Control System

Computerize FCS: Optical mechanical computing sight

Direct Fire: Yes

Indirect Fire: Yes

Protection

Armor Type: Welded-Stell

Armor: 14 mm maximum, welded steel

Notes:

This twin 57mm automatic AA gun, which is evidently without a formal designation in the open literature, [though possibly designated M-1985] is a DPRK-produced system mounted on a modified YW 531 APC. It is generally similar to, but distinct from, the Russian ZSU-57-2 system.

ZSU-57-2 (Ob'yekt 500) Russian 57mm Self-Propelled Anti-Aircraft Gun

Tiers:

1 2 3 4

System

Alternative Designations: ZSU-57-2
Description: self-propelled anti-aircraft gun (SPAAG), armed with two 57 mm autocannons
Crew: 6
Carriage: 4 road wheels/T-54 modified chassis
Chassis: T-54
