Prime Mover: A shortened T-54 chassis with thinner armor and only four road wheels.
Emplacement Time (min): N/A
Displacement Time (min): N/A

Dimensions

Length, Hull: m6.22
Length, with Gun Forward: m8.46
Width: m3.27
Height, with Tarpaulin Top: m2.75
Weight: tons28.1
Ground Clearance: mm425

Automotive

Engine Name: V-54

Engine Type: 4-stroke, airless (mechanical)-injection, water-cooled 38.88 liter V12 diesel

Engine Power: hp520

Power-to-Weight Ratio: 18.5 hp/tonne

Suspension: individual torsion bar with hydraulic shock absorbers on the first and last road wheels

Fuel Capacity: 830 liters (including two externally mounted fuel tanks, 95 liters each)

Operational Range, Road: km/h420

Operation Range, Off-Road: km/h320

Speed, Road: km/h50

Speed, Off-Road: km/h30

Gradient: %60

Side Slope: %30

Vertical Step: m0.8

Trench: m2.7

Fording: m1.4

Main Weapon System

Gun, Caliber, Type: 57-mm recoil-operated air-cooled cannons, S-68

Number of Barrels: ea2

Rate of Fire: rds/minCyclic: 210-240 (105-120/gun) Practical: 140 (70/gun)

Loader Type: Two 5-round clips, manual, 10 rds

Reload Time: 4-8

Traverse: deg360

Traverse Rate: o/sec30

Elevation: deg-5 to +85

Elevation Rate: o/sec20

Basic Load: ea300

Main Weapon System Ammunition

Type: 57 x 348 SR APHE, Frag-T, APC-T, HVAP-T, HE-T. Uses same ammo as the towed single S-60

Max Effective Range: m4,000

Max Effective Altitude: m4,237 at 65o

Min Altitude: m0

Frag-T Projectile Weight: kg2.81

APC-T Projectile Weight: kg2.82

HE-T Projectile Weight: kg2.85

Muzzle Velocity: m/s1,000

Frag-T Fuze Type: Point Detonating

APC-T Fuze Type: Base Detonating Fuze

HE-T Fuze Type: (Yugoslavian, impact [super quick] action with pyrotechnical self-destruct)

Self-Destruct Time: sec13-17

Armor Penetration: mm CE130 at 1,000m, APHE 96 APC-T at 1,000 m

Armored Command Vehicle

Description: SYSTEM WILL LINK TO AN ACV WHICH MAY HAVE A RADAR FOR EW AND TARGET ACQUISITION. FOR EXAMPLE, SEE SBORKA ACV AND RADAR (PG 6-15).

Fire Control

Description: SIGHTS W/MAGNIFICATION: OPTICAL MECHANICAL COMPUTING REFLEX SIGHT (NOT RADAR CONTROLLED) LATER VARIANTS WERE FITTED WITH A MORE SOPHISTICATED SIGHTING SYSTEM, IDENTIFIED BY TWO SMALL PORTS IN FORWARD UPPER PORTION OF THE TURRET.

Other Fire Control: ABSENCE OF A TRACKING RADAR, A NIGHT VISION DEVICE, AND AN ENCLOSED TURRET MAKES THIS A DAYLIGHT, FAIR WEATHER WEAPON SYSTEM ONLY. OFF-CARRIAGE RADARS, SUCH AS THE SON-9/SON-9A (NATO FIRE CAN), RPK- 1/FLAP WHEEL, OR TYPE 311 CAN BE USED THE GUN IS LINKED TO THE BATTERY NET WHICH RECEIVES ANALOG VOICE RADIO ALERTS FOR APPROACHING AIRCRAFT, INCLUDING DIRECTION, ALTITUDE, AND DIRECTION. GUNS AND BATTERY/ BATTALION HAVE AIR WATCHES AND FORWARD OBSERVERS.

Protection

Armor Type: Welded-Stell

Armor: mm8-15

Notes:

The ZSU-57-2 Ob'yekt 500 is a Soviet self-propelled anti-aircraft gun (SPAAG), armed with two 57 mm autocannons. 'ZSU' stands for Zenitnaya Samokhodnaya Ustanovka, meaning "anti-aircraft self-propelled mount", '57' stands for the bore of the armament in millimetres and '2' stands for the number of gun barrels. It was the first Soviet mass-produced tracked SPAAG. In the USSR it had the unofficial nickname "Sparka", meaning "twin mount", referring to the twin autocannon with which the vehicle is armed. Based on past experiences with SPAAG designs, Soviet engineers designed a vehicle that used a modified T-54 chassis, with four twin road wheels per side instead of five, and much thinner armour. The vehicle was armed with twin 57 mm S-68 autocannon in a new, large, rotating, open-topped turret. The ZSU-57-2 consists of three compartments: driver's in the front, fighting in the middle and engine-transmission at the rear. The hull is more spacious in comparison with the T-54 because of the thinner armour and has different locations for some equipment. The general layout, with transverse mounting of the engine, is the same The driver's compartment is located on the left hand side of the front of the hull. The driver's seat is moved forward and to the left in comparison with its location in the T-54. The compartment is equipped with a single-piece hatch cover opening to the left and two periscopic vision devices. One of them can be replaced by the TVN-1 infrared vision device which is operated together with the infrared headlamp (active night vision), which is mounted on the right track board. A fire-fighting equipment signal panel and a spare parts case are also located in the driver's compartment. The open-topped box-type welded turret has a ball-bearing race ring 1850 mm in diameter. The turret rear can be removed, which makes replacement of the guns easier. The turret can be covered in the travelling position by a tarpaulin which has 16 plexiglass windows. To aim the guns, base data such as the target's speed, direction and range must be entered into the sighting system by the sight adjuster, who sits to the left of the guns at the rear of the turret. The target's speed and direction is determined by visual estimation, while range can also be estimated visually or with the rangefinder. The upper front of the turret has two small ports with armoured covers meant for collimators of the sight. To fire the guns, the breeches must first be opened. The left and right loaders, located in the forward part of the turret on both sides of the main armament, load clips into the magazines of their respective weapons. The loaders' travel seats should be stowed in clamps on the turret sides before opening fire. The gunner, seated on the left hand side in the middle of the turret, aims ("lays") the gun and opens fire using an electric trigger, which fires both barrels, or two foot pedals, which can fire either barrel independently. If manual mechanical backup gunlaying is used instead of electro-hydraulic drive, three crew members instead of two should work with the sight. The commander, who sits on the right hand side in the middle of the turret, lays the gun in azimuth, the gunner in elevation and the sight adjuster enters data into the sight. The loaders feed clips into the twin autocannon manually as needed, similar to the Bofors 40mm. The twin S-68s are recoil-operated and weigh 4,500 kg. Their construction was based on two 57 mm S-60 AA autocannons. The guns have a recoil of between 325 and 370 mm. The individual weapons cannot be swapped from one side to the other as they are mirror images. Each air-cooled gun barrel is 4365 mm long (76.6 calibers) and is fitted with a muzzle

brake. They can be elevated or depressed between −5° and +85° at a speed of between 0.3° and 20° per second, the turret can traverse 360° at a speed of between 0.2° and 36° per second. Drive is from a direct current electric motor and universal hydraulic speed gears (a manual mechanical drive is also provided in case of electrohydraulic failure; with the use of mechanical drive, elevation speed is 4.5° per second and the turret traverse speed is 4° per second). The guns firing together are capable of firing up to 210–240 fragmentation and armour-piercing tracer (AP-T) shells per minute, with a practical rate of fire of between 100 and 140 rounds per minute.[3] Muzzle velocity is 1,000 m/s. Each clip has 4 rounds, each of which weighs 6.6 kg; the charge in each round consists of 1.2 kg of 11/7 nitrocellulose powder, a projectile weighs 2.8 kg. Maximum horizontal range is 12 km (with an effective range against ground targets of up to 4 km / 2.5 miles. Maximum vertical range is 8.8 km with a maximum effective vertical range of 4.5 km / 14,750 ft). Fragmentation rounds have a safety-destructor which activates between 12 and 16 seconds after being fired to ensure the shells won't fall back to ground, so the maximum slant range of anti-aircraft fire is 6.5–7 km.[16] BR-281 armour-piercing rounds are able to penetrate 110 mm armour at 500 m or 70 mm armour at 2,000 m (at 90° impact angle). The S-68 autocannon was the most powerful AA gun installed on SPAAGs at that time. According to the statistical data of the Air Defence Research Institute No. 2, a direct hit of a single 57 mm shell could destroy a contemporary jet aircraft. In order to shoot down a jet bomber of the Canberra type, an average of 1.7 hits were deemed necessary. The vehicle carries 300 rounds, and the ammunition is stowed as follows: 176 rounds in clips inside the turret, 72 rounds in clips in the hull front, and 52 separate (unclipped) rounds in special compartments under the turret floor. Armour-piercing rounds in clips are placed in the rear part of the turret to the left and right of the guns. Empty shell cases and clips are removed via a conveyor belt through a special port in the turret rear into an external metal wire basket on the back of the turret.

Gepard German 35mm Self-Propelled Anti-Aircraft Gun

Tiers:

Variants:

- **German version:** Search radar: S band, 15 km range Tracking radar: Ku band, 15 km range Laser rangefinder
- **Netherland's version:** Search radar: X band, 15 km range Tracking radar: X/Ka band, 13 km range

System

Alternative Designations: 5PFZ-B2L Upgrade variant known as FlakPz 1A2
Crew: 3
Chassis: Leopard 1 tank chassis
Manufacturer: Krauss-Maffei Wegmann
Targets: Helicopters and Low-Flying Aircraft
In Service: See Proliferation
Note #1: The vehicle is based on the hull of the Leopard 1 tank with a large fully rotating turret carrying the armament—a pair of 35 mm Oerlikon KDA autocannons and the two radar dishes—a general search radar at the rear of the turret and the tracking radar, and a laser rangefinder, at the front between the guns.
Note #2: Since the eighties, Stinger teams have been accompanying the Gepard units to take advantage of their long-range scanning capacity. To combine this capacity in a single unit, a missile system upgrade that mounts the NATO ManPad Stinger surface-to-air missile (in twin packs) to the autocannons was developed. The system was tested by the German Bundeswehr but not bought due to budget restrictions and the fielding of the Ozelot Light Flak (leFla) System

Notes:

The Flugabwehrkanonenpanzer Gepard ("anti-aircraft cannon tank Cheetah", better known as the Flakpanzer Gepard) is an all-weather-capable German self-propelled anti-aircraft gun (SPAAG)[1]. It was developed in the 1960s and fielded in the 1970s, and has been upgraded several times with the latest electronics. It constituted a cornerstone of the air defence of the German Army (Bundeswehr) and a number of other NATO countries. In Germany, the Gepard was phased out in late 2010 to be replaced by "Leichtes Flugabwehrsystem (LeFlaSys)", a mobile and stationary air defence system using the LFK NG missile and the new MANTIS gun system. The mobile platform of SysFla will likely be based on the GTK Boxer.

PGZ-07/PGZ-09 (Type 07) Chinese 35mm Self-Propelled Anti-Aircraft Gun

Tiers:

1 **2** 3 4

System

Alternative Designation: Type 07, PGZ-09, Type 09
Chassis: PLZ-05 self propelled artillery
Crew: ea3
Target: Low to medium altitude, fixed wing, rotary wing, UAS, and cruise missiles
Night Vision: Yes
Range: m50-5,000
Laser Range Finder: Yes
All Weather / IR Sighting: Yes
Basic Load: 2,380 rounds. 560 per gun loaded and 630 per gun at the ready.

↳*Dimensions*

Height: 4.82m with radar up; 3.4m with radar down
Length: m6.7
Width: m3.2
Weight: mt35

Name: INA

Location: Above Turret

Range of Traverse: 360 degrees

Range of Elevation: INA

Type: Doppler

Range of Radar: Approximately 20 km

Automotive

Engine Name: INA

Engine Power: hp800

Engine Type: 8V150 diesel

Fording Depth: mINA

Range, Cruising: km450

Speed, Max on Road: kph55

Communications

VHF Radio: R-168-100U (Standard VHF)

↳*Data*

Note: System can connect via data-link to communicate with other systems in the battalion

Main Weapon System

↳*Weapon #1 (2 x 35mm Cannons)*

Name: GDF-002, PG99

Cailber/Length: 35mm

Type: Anti-Aircraft Gun similar if not the Oerlikon 35mm KDA autocannon used on the German Gepard.

Length: INA

Diameter: INA

Fire on Move: No

Maximum Range: m4,000

Rate of Fire: rds/min1,100

Action: Gas Operated

Reload Time: sec7.5

Note: The gun mount is electrically powered with an off carriage power supply unit and manual controls are provided for emergency use.

↳*Ammunition*

Name: INA

Caliber: mm35

Ammunition Types: The 35mm twin-gun can fire four types of lethal and versatile ammunitions, HEI (High Explosive Incendiary), HEI-T (High Explosive Incendiary Tracer), SAPHEI-T (Semi-armor-piercing high-explosive incendiary Tracer) and TP-T (Target Practice Tracer) cartridges

Muzzle Velocity: m/s1,175

Basic Load: 2,380 rounds. 560 per gun loaded and 630 per gun at the ready.

Fire Control System

FCS Name: INA

Computerized FCS: Yes

IFF: Yes

Laser Range Finder: Yes

Infrared Goniometer: Yes

Thermal Image Tracker: Yes

Doppler Radar: Yes

Optical / Day Sight: Yes

Protection

Armor, Hull: Protection from small arms fire and projectile splinters

NBC Protection: Yes, optional

Armor: Light armor protects against small arms and shrapnel. Steel front slope also protects against small arms fire.

Smoke Generation: Yes, 8 x Smoke Grenade Launchers

Notes:

The PGZ-07, now renamed as PGZ-09 is a Chinese-made 35mm self-propelled anti-aircraft gun. Some pictures take in Nanning Guagnxi show that the PGZ-07 is in service with Chinese armed forces (PLA People's Liberation Army). There is only one PLA division stationed in Nanning, the 123rd Mechanized Infantry Division. The PGZ-07 can fire five types of lethal and versatile ammunitions, HEI (High Explosive Incendiary), HEI-T (High Explosive Incendiary Tracer), SAPHEI-T (Semi-armor-piercing high-explosive incendiary), PMBDPF and TP-T (Target Practice Tracer) cartridges. The PGZ-07 anti-aircraft gun system can defeat almost any air threat, as well as various ground and surface targets, including light armored vehicles.

Type 88 (PGZ88) Chinese 37mm Self-Propelled Anti-Aircraft Gun

Tiers:

1 2 **3** 4

System

Alternative Designation: Type 88; PGZ88
Type: 37mm Self-Propelled Anti-Aircraft Gun
Crew: ea4

Name: INA

Type: Surveillance Radar

Maximum Detection Range: 15 km

Maximum Detection Altitude: 3 km

Protection

Hull Armor: Protection from small arms fire and shell splinters

Turret Armor: Chassis of the Type 88 is well protected for a SPAAG system, however turret has only thin armor, which protects against small arms fire.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Type 88, the PLA's first generation fully automatic self-propelled anti-aircraft artillery [SPAAA] system, features a Type 74 twin-37mm AAA mounted on a Type 69 MBT chassis. The turret is welded and fully enclosed with search radar and fire control equipment on top. The performance of the Type 88 was unsatisfactory, and the system never entered production. Development activity subsequently focused on work on the new Type 90II.

Type 80 Chinese 57mm Self-Propelled Anti-Aircraft Gun

Tiers:

1 2 3 4

System

Alternative Designations: Type 80
Description: Self-propelled anti-aircraft gun (SPAAG), armed with two 57 mm autocannons
Crew: 6
Chassis: Mounted on the chassis of a Chinese Type 69-II MBT

HE-T Fuze Type: (Yugoslavian, impact [super quick] action with pyrotechnical self-destruct)

Self-Destruct Time: sec13-17

Armor Penetration: 130mm at 1,000m, APHE 96 APC-T at 1,000m

Armored Command Vehicle

Description: System will link to an ACV which may have a radar for EW and target acquisition. For example, see Sborka ACV and radar.

Fire Control

Description: Sights with magnification: optical mechanical computing reflex sight (not radar controlled) later variants were fitted with a more sophisticated sighting system, identified by two small ports in forward upper portion of the turret.

Other Fire Control: Absence of a tracking radar, a night vision device, and an enclosed turret makes this a daylight, fair weather weapon system only. Off-carriage radars, such as the Son-9/Son-9a (NATO fire can), RPK- 1/flap wheel, or Type 311 can be used the gun is linked to the battery net which receives analog voice radio alerts for approaching aircraft, including direction, altitude, and direction. Guns and battery/ battalion have air watches and forward observers.

Protection

Armor Type: Welded-Steel

Armor: mm8-15

Notes:

The Type 80 57mm Self-Propelled Anti-Aircraft Gun is a Chinese version of the Russian ZSU-57-2 57mm Self-Propelled Anti-Aircraft Gun. The ZSU-57-2 Ob'yekt 500 is a Soviet self-propelled anti-aircraft gun (SPAAG), armed with two 57 mm autocannons. 'ZSU' stands for Zenitnaya Samokhodnaya Ustanovka, meaning "anti-aircraft self-propelled mount", '57' stands for the bore of the armament in millimetres and '2' stands for the number of gun barrels. It was the first Soviet mass-produced tracked SPAAG. In the USSR it had the unofficial nickname "Sparka", meaning "twin mount", referring to the twin auto-cannon with which the vehicle is armed. Based on past experiences with SPAAG designs, Soviet engineers designed a vehicle that used a modified T-54 chassis, with four twin road wheels per side instead of five, and much thinner armor. The vehicle was armed with twin 57 mm S-68 auto-cannon in a new, large, rotating, open-topped turret. The ZSU-57-2 consists of three compartments: driver's in the front, fighting in the middle and engine-transmission at the rear. The hull is more spacious in comparison with the T-54 because of the thinner armor and has different locations for some equipment. The general layout, with transverse mounting of the engine, is the same The driver's compartment is located on the left hand side of the front of the hull. The driver's seat is moved forward and to the left in comparison with its location in the T-54. The compartment is equipped with a single-piece hatch cover opening to the left and two periscopic vision devices. One of them can be replaced by the TVN-1 infrared vision device which is operated together with the infrared headlamp (active night vision), which is mounted on the right track board. A fire-fighting equipment signal panel and a spare parts case are also located in the driver's compartment. The open-topped box-type welded turret has a ball-bearing race ring 1850 mm in diameter. The turret rear can be removed, which makes replacement of the guns easier. The turret can be covered in the travelling position by a tarpaulin which has 16 Plexiglas windows. To aim the guns, base data such as the target's speed, direction and range must be entered into the sighting system by the sight adjuster, who sits to the left of the guns at the rear of the turret. The target's speed and direction is determined by visual estimation, while range can also be estimated visually or with the rangefinder. The upper front of the turret has two small ports with armored covers meant for collimators of the sight. To fire the guns, the breeches must first be opened. The left and right loaders, located in the forward part of the turret on both sides of the main armament, load clips into the magazines of their respective weapons. The loaders' travel seats should be stowed in clamps on the turret sides before opening fire. The gunner, seated on the left hand side in the middle of the turret, aims ("lays") the gun and opens fire using an electric trigger, which fires both barrels, or two foot pedals, which can fire either barrel independently. If manual mechanical backup gun-laying is used instead of electro-hydraulic drive, three crew members instead of two should work with the sight. The commander, who sits on the right hand side in the middle of the turret, lays the gun in azimuth, the gunner in elevation and the sight adjuster enters data into the sight. The loaders feed clips into the twin auto-cannon manually as needed, similar to the Bofors 40mm. The twin S-68s are recoil-operated and weigh 4,500 kg. Their construction was based on two 57 mm S-60 AA auto-cannons. The guns have a recoil of between 325 and 370 mm. The individual weapons cannot be swapped from one side to the other as they are mirror images. Each air-cooled gun barrel is 4365 mm long (76.6 calibers) and is fitted with a muzzle brake. They can be elevated or depressed between −5° and +85° at a speed of between 0.3° and 20° per second, the turret can traverse 360° at a speed of between 0.2° and 36° per second. Drive is from a direct current electric motor and universal hydraulic speed gears (a manual mechanical drive is also provided in case of electro-hydraulic failure; with the use of mechanical drive, elevation speed is 4.5° per second and the turret traverse speed is 4° per second). The guns firing together are capable of firing up to 210–240 fragmentation and armor-piercing tracer (AP-T) shells per minute, with a practical rate of fire of between 100 and 140 rounds per minute.[3] Muzzle velocity is 1,000 m/s. Each clip has 4 rounds, each of which weighs 6.6 kg; the charge in each round consists of 1.2 kg of 11/7 nitrocellulose powder, a projectile weighs 2.8 kg. Maximum horizontal range is 12 km (with an effective range against ground targets of up to 4 km / 2.5 miles. Maximum vertical range is 8.8 km with a maximum effective vertical range of 4.5 km / 14,750 ft). Fragmentation rounds have a safety-destructor which activates between 12 and 16 seconds after being fired to ensure the shells won't fall back to ground, so the maximum slant range of anti-aircraft fire is 6.5–7 km.[16] BR-281 armor-piercing rounds are able to penetrate 110 mm armor at 500 m or 70 mm armor at 2,000 m (at 90° impact angle). The S-68 auto-cannon was the most powerful AA gun installed on SPAAGs at that time. According to the statistical data of the Air Defense Research Institute No. 2, a direct hit of a single 57 mm shell could destroy a contemporary jet aircraft. In order to shoot down a jet bomber of the Canberra type, an average of 1.7 hits were

deemed necessary. The vehicle carries 300 rounds, and the ammunition is stowed as follows: 176 rounds in clips inside the turret, 72 rounds in clips in the hull front, and 52 separate (unclipped) rounds in special compartments under the turret floor. Armour-piercing rounds in clips are placed in the rear part of the turret to the left and right of the guns. Empty shell cases and clips are removed via a conveyor belt through a special port in the turret rear into an external metal wire basket on the back of the turret.

BOV-3 Slovenian 20mm Self-Propelled Anti-Aircraft Weapon System

Tiers:

Variants:

- **BOV-M (Slovenia):** Some built with 12.7-mm MGs
- **BOV-VP:** Security version with swing out gates to direct crowds
- **BOV-1/Polo M-83:** Sans troop compartment with 2 ATGM launcher pods with 3 AT-3 launchers each with machine gun mounted before the two AT-3s
- **BOV-3:** 3 turret-mounted 20-mm cannons for air defense
- **BOV-30:** 2 turret-mounted 30-mm cannons for air defense
- **LOV (Croatia):** No raised compartment, increased hull protection, but with a 12.7-mm machine gun
- **BOV-SN:** Ambulance
- **Yugo import BOV variants:** Serbia has a variants that include SP AA vehicles with the Igla or Stinger missiles or the ZU-23; AT vehicles with the AT-5 Spandrel; or an armored reconnaissance vehicle with a 20-mm M55 cannon, 7.62-mm PKT machine gun with twin AT-3 Sagger AT launchers or a single Spandrel system

System

Alternative Designations: BOV-3
Description: 4 X 4 APC built originally by Yugoslavia with space for 8 soldiers to exit through side doors: 3 firing ports on each side & an additional one to the right of the commander’s vision block
Manufacturer: TAM Complex Battle System factory in Velika Plana, Serbia
In Service: 1984-Present

Type: Rifle

Caliber: 20mm

Muzzle Velocity, HE/HEI: m/s850

Muzzle Velocity, AP/API: 840

Basic Load: 60 rounds each, 1,500 total

Types of Ammunition: 20 × 110 mm PZ (pancirno zrno) M60 armour-piercing grenade pointer/marker (with and without flow clearing device): Deep black paint with earth-red ring in the upper third of the grenade. The granulated shell consists of hardened steel and absorbs the phosphorus firing in the rear, which ignites when hitting a target. 20 × 110 mm TZO (trenutno zapaljivo obilježavajuće) M57 explosive torch cartridge with illuminator: Chrome-yellow paint with earth-red ring in the upper third of the grenades and a green ring above the guide ring. The grenade is made of steel and has a Trotile explosive filling inside the center, which ignites when a target is hit. The sensitive AZZ UT M57 headlamp screwed onto the grenade is an explosive impact fuse with a self-disengaging device which starts after 4.5 to 9.5 seconds. 20 × 110 mm TZ (trenutno zapaljivo) M57 explosive torch cartridge without illuminator. 20 × 110 mm M79 exercise carousel (with glow track): Dark green paint with light green ring above the guide ring. Steel case with impact lighter, which, when striking a target, ignites a lightning bolt to allow a better observation of the hit image. 20 × 110 mm M77 exercise cartridges: cream white. A plastic floor filled with iron powder and provided with breakpoints, which bursts after exiting the barrel.

NBC Protection System: Available

Smoke Equipment: 2 x 3 smoke dischargers

Survivability Equipment: Grill armor over windows

Central Tire Inflation System: Yes

Notes:

The BOV-3 vehicle was armed with a triple-barreled anti-aircraft gun M55A4B1 20 mm. The BOV has a capacity of 10, including a driver, gunner, and eight infantrymen. The vehicle has a four-wheel drive and is powered by the Deutz type F 6L 413 F six-cylinder diesel engine developing 150 hp (110 kW) at 2650 rpm. The theoretical gun shooting speed is 1950 to 2250 bullets per minute. The allowed burst length is 180 rounds per tube, whereby the tube is heated to 250 ° C, so a break of 5-10 minutes is necessary for cooling.

ZSU-23-4 Shilka Russian 23mm Self-Propelled Anti-Aircraft Weapon System

Tiers:

Variants:

- **ZSU-23-4V "Shilka"(1964):** (1968): modernized variant with enhanced reliability of some details, ventilation system case located on the hull. Commander vision device was added.
- **ZSU-23-4V1 "Shilka"(1970)::** modernized variant with enhanced reliability of some details, ventilation system case located on the hull. Commander vision device was added.
- **ZSU-23-4V1 "Shilka" (1970)::** modernized variant with enhanced reliability of radar system and other details, ventilation system cases located on front bilges of the turret. Guidance-system computer was improved (as well as accuracy and efficiency of anti-aircraft fire on the move at 40 km/h). It is fitted with a slightly improved diesel engine V-6R-1.
- **ZSU-23-4M1 (1973)::** armed with modernized autocannons 2A7M. The pneumatic loading was replaced with pyrotechnic loading (unreliable compressor was removed), welded tubes of coolant outlet were replaced with flexible pipes which increased autocannon barrel life from 3500 rounds to 4500 rounds.
- **ZSU-23-4M3 "Biryusa" (1977)::** equipped with identification friend-or-foe system "Luk". All ZSU-23-4M were upgraded to ZSU-23-4M3 level during scheduled repairs. Army unofficially continued to use the name "Shilka" for all variants of ZSU-23-4.
- **ZSU-23-4M2 (1978)::** so-called "Afghan" variant. Re Equipment performed during the Soviet–Afghan War for mountain combat. The radar system was removed and a night-sight was added. Ammunition increased from 2,000 to 4,000 rounds.
- **ZSU-23-4M4 and ZSU-23-4M5 (1999)::** modernized variants, armed with two additional paired man-portable air-defense systems "Igla" on each side of the turret and equipped with 81mm smoke grenade launchers, laser emission sensors, electro-optical vision devices (including television system for driver) and improved weapon radar system. The mechanical transmission was replaced with hydrostatic transmission, hydraulic boosters were installed. Mobility increased to the level of main battle tanks. This upgrade was first shown during the exhibition MAKS-99 in Zhukovsky and was carried out by the Minotor Service Enterprise and Peleng Joint Stock Company from the Republic of Belarus, and the Ulyanovsk Mechanical Plant of Russia. The Ulyanovsk Mechanical Plant is also offering ZSU-23-4 upgrade packages independently
- **Donets (1999):** This is a Ukrainian modernization developed by Malyshev Tank Factory in Kharkov. It has the modified turret from the ZSU-23-4, armed with two additional paired man-portable air-defense systems "Strela-10" installed on the hull of the T-80UD main battle tank. Ammunition capacity for its 23 mm autocannons is doubled.
- **ZSU-23-4M-A (2017)::** A modernisation package developed by the Arsenal Factory in Kyiv, this system features a new Rokach-AS radar, laser rangefinder, and four automatic Igla missiles.
- **ZSU-23-4MP Biała (2000)::** Polish modernized upgrade with Grom anti-aircraft missiles and fully digital passive aiming devices instead of the radar

Notes:

The Shilka ZSU-23-4 [ZSU = Zenitnaya Samokhodnaya Ustanovka - Anti-aircraft Self-Propelled Gun] is a Self-Propelled Anti-Aircraft Gun (SPAAG) featuring a prominent radar dish that can be folded down mounted on a modified PT-76 chassis. ZSU 23-4 Shilka, is capable of acquiring, tracking and engaging low-flying aircraft (as well as mobile ground targets while either in place or on the move). Employed in pairs 200 meters apart, 400 meters behind battalion leading elements, it is commonly used to suppress ATGM launch sites, such as TOW vehicles. The armament consists of four 23mm cannon with a maximum slant range of 3,000 meters. Ammunition is normally loaded with a ratio of three HE rounds to one AP round. Resupply vehicles carry an estimated additional 3,000 rounds for each of the four ZSUs in a typical battery. Recent (October 1997) information details ZSU-23-4 updates/modernization being offered by the Ukrainians that include: a new radar system replacing the GUN DISH radar, plus a sensor pod believed to include day/night camera, and a laser rangefinder; and mounted above radar/sensor pod is a layer of six fire-and-forget SAMs, believed to be Russian SA-18/GROUSE. The radar-guided ZSU-23-4 "Shilka" SPAAG, with its four 23 mm (0.90") autocannons, was a revolutionary SPAAG, proving to be an extremely effective weapon against enemy attack aircraft and helicopters under every weather and light condition. The ZSU-23-4 has a very high density, rate and accuracy of fire, as well as the capability for each of the four autocannons to fire its own type of projectile from separate belts. While it is technically possible that each cannon shoots different type of ammunition, there were two types commonly used in late 1970s: OFZT incendiary fragmentation and BZT armour-piercing tracer, which were to be loaded in 3:1 ratio—three OFZT, then one BZT, every 10th BZT round equipped with so-called "copper remover" and marked. Operators were strongly discouraged from shooting from a single barrel. The appearance of the "Shilka" caused significant changes in NATO tactics in aircraft use at low altitude over the battlefield. Despite its present obsolescence as a modern short-range anti-aircraft weapon, the ZSU-23-4 is still deadly for enemy light armoured vehicles, infantry and firing points as an infantry-support vehicle. With its high rate of accurate fire, the ZSU-23-4 can even neutralize tanks by destroying their gun sights, radio antennas, or other vulnerable parts.[3] ZSU-23-4s, especially late models, have excellent performance and good systems reliability. Based on the GM-575 tracked vehicle chassis, which used components from the PT-76 light amphibious tank, the ZSU-23-4 mounts an armored turret holding four liquid-cooled 23 mm (0.9") 2A7 autocannons linked to an RPK-2 "Tobol" radar (NATO designator: "Gun Dish"). The vehicle weighs 19 tonnes (late modifications up to 21 tonnes), has a movement range of 450 km (280 mi) and

a top speed of 50 km/h (31 mph). Additional firepower of late modifications can be supplied by a roof-mounted pod of six short-range SA-18 SAMs, or side mounted SA-16s. The crew numbers four: driver, commander, gunner and radar operator. The driver's compartment is located in the nose part of the vehicle. The fighting compartment is in the center, and the engine compartment is in the rear part of the vehicle. The transmission consists of a multi-plate metal-contact main clutch, a manual gearbox with five forward gears, two planetary two-step steering gears with locking frictions and two final drive groups. The vehicle chassis has six single rubber tired road wheels, a rear drive sprocket with detachable sprocket rings (lantern-wheel gear) and one idler wheel per side. The first and fifth left, and sixth right road wheels have hydraulic shock absorbers. The track is 11.904 m long, 382 mm (15") wide and has 93 links. Because of a large number of different pipes and tubes to detach during maintenance, the repair procedure for some of the vehicle's mechanisms is hard (for example, replacement or repair of a starter). The electric drive of an air outlet hatch of a gas turbine engine (part of the vehicle's electric power supply system) has an inconvenient location (at the bottom of the hull) which causes overheating and sometimes, jamming of the electric drive. On the other hand, the construction of the electric power supply system is very reliable. Changing the main engine oil and coolant is easy, as is replacement of fuel and oil filters, and sections of the air filter. The ZSU-23-4 can cross vertical obstacles 0.7 m (2.3') high, trenches 2.5 m (8.2') wide, has a 1.0 m (3.3') fording depth and can climb 30° gradients. The ZSU-23-4 has good maneuverability and cross-country ability, but its diesel engine's power is insufficient for a vehicle of its weight. As a result, off-road acceleration capabilities are sub-par, and the vehicle lags behind MBTs and IFVs on up-hill terrain. The ZSU-23-4 is equipped with an NBC system with an air filtration unit, fire-fighting equipment, TNA-2 navigational system, infrared vision device, R-123 radio set, R-124 intercom and electric power supply system consisting of a DGChM-1 single-shaft gas turbine engine (70 hp at 6,000 rpm) and a direct-current generator (which provides 27 V and 54 V direct current or 220 V 400 Hz alternating current).

→Man-Portable Air-Defense Systems (MANPADS)

9K333 Verba (SA-25) Russian Man-Portable Infrared Homing Surface-to-Air Missile

Tiers:

System

Alternative Designation: 9K333 Verba (SA-25)
Type: Man-Portable Infrared Homing Surface-to-Air Missile
Family: 9K333
Manufacturer: KB Mashinostroyeniya - developer of the system
In Service: 2014-Present
Crew: ea1

Dimensions

Note: See Missile System

Missile System

↳*System*

Name: 9K333 Verba (SA-25)
Type: Man-Portable Air Defense System (MANPADS)
Missile Length: m1.64
Missile Diameter: m0.07
Fin Span: INA
Missile Weight: kg12

Launcher Type: 9P521 launcher

Launcher Weight: kg6

Missile Weight with Launcher: kg18

Engine: Solid fuel rocket motor

Warhead Type: High Explosive Blast Fragmentation

Warhead Weight: kg1.5

Range of Fire: km6

Flight Ceiling: km4.5

Guidance System: Three-channel optical seeker (ultraviolet, near-infrared, mid-infrared)

Fire Control

Name: INA

Computerized FCS: The new MANPADS also includes integrated automated control system. This enables data usage from both ground and early radar warning aircraft. Thus targets can be traced in advance and passed to MANPAD operators for engagement.

Direct Fire: Yes

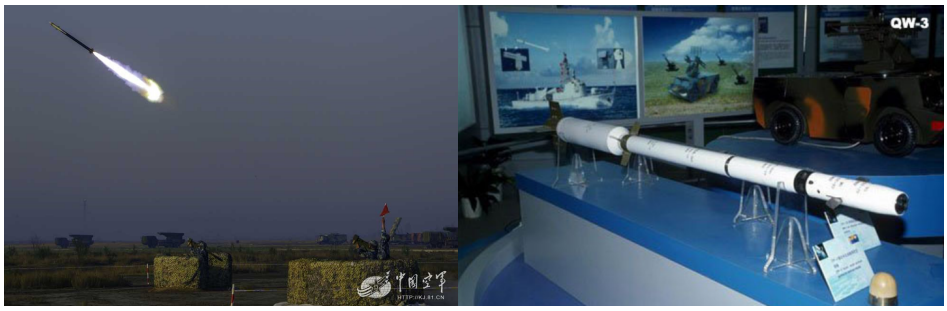
Imaging Sight: Maugli-2M infrared imaging sight

Identification Friend-or-Foe (IFF) Interrogator: Yes

Notes:

The 9K333 Verba Man-Portable Air Defense System (MANPADS) was developed by the Russian Konstruktorskoye Byuro Mashinostroyenia (KBM). It was unveiled in 2015. It was developed as a replacement for the 9K38 Igla system, which is currently used by Russian forces. Igla system is being used by many countries worldwide. The new Verba system uses a surface-to-air missile to engage air targets. It was approved for production in 2011 and adopted by the Russian Armed Forces in 2014. It is also being proposed for export customers. Verba's kill range is similar to the Igla-S (6 Km) and operating altitude is about 4.5 Km. But the engagement envelope has been extended by a factor of 2.5 besides improved protection from countermeasures. General performance factor has been increased by 1.5 to 2.

QW-3 Chinese Man-Portable Laser Guided Surface-to-Air Missile



Tiers:

Variants:

- **QW-1M:** QW-1M is a development of QW-1, and first revealed in Zhuhai Air Show. The missile is considered as a third generation MANPAD by Chinese, and many domestic Chinese media sources claim that it is the Chinese equivalent of Soviet SA-18 Grouse, which it strongly resembles. Like its predecessor QW-1, QW-1M also appeared to incorporate technologies of FIM-92 Stinger. Various western sources have postulated that China had likely obtained FIM-92 Stinger samples from either Afghan guerrilla or Pakistan, or even Iran, but such claims have yet to be confirmed. The missile is slightly heavier than QW-1, weighing at 18 kg for the entire system, and it is claimed to have better ECCM capability and better capability to engage low-flying aircraft in comparison to QW-1.[citation needed] Some have been supplied to Kata'ib Hezbollah.
- **QW-1A:** QW-1A is a derivative of QW-1M, with the adaptation of man-portable radar weighing 30 kg and a range of 15 km, and it is carried by the observer. The associating fire control system enables various QW-1A units to be linked up and thus increasing the effectiveness by forming an air defense network, which in turn, could be integrated into large air defense network. Although the entire QW-1A system including radar / fire control system could be carried by a crew of 2-men team, it is often mounted on vehicles.
- **QW-11 (QW-1G):** QW-11 is a development of QW family that is specifically designed to engage terrain hugging cruise missiles, while retaining the capability of engaging low-flying aircraft. QW-11 was first revealed at Zhuhai Air Show in 2002. A new combined impact and proximity fuze is developed to provide better capability against cruise missiles. Length: 1.477 m Missile weight: 10.69 kg System weight: 16.9 kg Warhead: 1.42 kg Range: 0.5 – 5000 m Altitude: 30 m - 4 km Reaction time: 10 sec
- **QW-18:** QW-18 is the development of the QW-11G with an improved seeker. QW-18 first appeared in Zhuai Air Show with QW-11 and QW-11G in 2002. An enhanced dual band infrared seeker is developed so that the target is not only tracked via the exhaust heat, but also the temperature difference of the skin of the target. These improvements provided better capabilities against terrain-hugging cruise missiles at supersonic speed. Externally, QW-18 is identical to QW-11G / QW-11.
- **QW-2:** QW-2 is a missile with all aspect attack capability and improved ECCM capability. There are two types of seeker for QW-2: the first is the dual band infrared passive seeker first revealed in 1998, and an imaging IR (ImIR) seeker has been designed sometimes later. The fuse is similar to that of QW-18. The minimum altitude is decreased to 10 m, thus further improving the capability against low-flying cruise missile and hovering helicopters that suddenly pop up from hiding.
- **QW-3:** This is the Chinese equivalent of French Mistral missile, with fuse developed from that of QW-2. The missile is unique among Chinese MANPAD in that this is the only surface-to-air missile that adopts the semi-active laser guidance similar to AGM-114 Hellfire. The gyro stabilized seeker provides very high degree of accuracy and is extremely effective against low altitude cruise missiles. The 15 degrees per second tracking rate of the seeker is relatively low in comparison for other MANPAD for supersonic targets in high g maneuver at very high altitudes, but this is by no means handicapping the performance because such targets are not intended to be for QW-3, which is specifically designed to engage terrain hugging helicopters and UAV's and other fast flying targets at extremely low altitudes, including supersonic sea skimming cruise missiles.
- **QW-4:** The newest member of QW series with the fuze similar to that of QW-2, and a new thermal imaging seeker. The new fully electric control surfaces provide smoother flight path curves, thus greatly improved accuracy.
- **Anza Mk 2:** INA
- **Anza Mk 3:** INA
- **TD-2000B:** To increase the capability of TD-2000, China National Precision Machinery Import and Export Corporation (CNPMIEC) also revealed a development of TD-2000, dubbed as TD-2000B at the same Zhuhai Airshow, where TD-2000B was displayed as part of the subsystem of TD-2000B. The primary improvement over the original system is the extra

C4ISR capability added so that in addition to control the QW-4 missiles of TD-2000, TD-2000B can also simultaneously control up to 6 anti-aircraft artillery pieces.

System

↳***QW-3 Man-Portable Laser Guided Surface-to-Air Missile***

Name: QW-3
Type: Laser Guided Surface-to-Air Missile
Manufactured: China Precision Machinery Import-Export Corp. (CPMIEC), Beijing, China China Aerospace Science and Industry Corporation (CASIC), Shenyang, China
Length: 2.10 m
Diameter: 72 mm
Launcher Weight: INA
Missile Weight: 23.0 kg
Propulsion: two-stage solid-propellant rocket
Maximum Speed: 750 m/sec, Mach 2.2
Maximum Engagement Altitude: 5,000 m
Minimum Engagement Altitude: 4 m
Maximum Range: 8,000 m
Minimum Range: 8 m
Guidance System: semi-active laser

Notes:

The QW-3, QianWei-3, is a person-transportable, shoulder-released surface-to-air missile (SAM) derived from the QW-1 missile. The QW-3 missile features a solid rocket booster taking into consideration an extended variety and extended warhead ability. The QW-3 steering device includes a nostril-established semi-active laser seeker. The missile is supplied with a blast-fragmentation warhead. The Q-three is capable of shooting down aerodynamic objectives flying at altitudes between 4 and 5,000 meters and at ranges between 800 and 8,000 meters. The QW-3 missile system become deployed with the aid of the people's Liberation army (PLA) inside the early 2000s.

Blowpipe British Man-Portable Air Defense Missile System (MANPAD)

Tiers:

System

Alternative Designation: Blowpipe
Type: Man-Portable Air Defense Missile System (MANPAD)
Manufacturer: Short Brothers
Number Built: 34,382
Crew: ea1
Effective Firing Range: 0.5 to 3.5 km
Warhead: Shape Charge
Warhead Weight: 2.2 kg
Engine: Solid rocket motor
Speed: Mach 1.5
Guidance System: MCLOS system

Dimensions

Length: m1.35
Width: mm76
Weight, Combat: 14.5 kg (missile in launch tube) 22 kg (complete system) 6.2 kg (launcher)

Notes:

The Shorts Blowpipe is a man-portable surface-to-air missile that was in use with the British Army and Royal Marines from 1975. It was superseded by an interim design, Javelin, and later the greatly improved Starstreak. The missile is supplied as a single round in a storage cylinder/firing tube. The aiming unit is clipped to the launch tube and fired from the operator's

shoulder. To reduce the overall size of the container, the rear fins of the missile are stored in the larger diameter cylinder at the front of the tube (this also contains the Yagi antenna for transmitting guidance signals); during firing, the fins slip onto the rear of the missile as it flies through and are held there by heat-activated adhesive tapes. This gives the launch container a unique shape, seemingly oversized at the front and extremely thin at the rear. The missile is powered by a short duration solid rocket for launch, then by a sustainer motor once it is well clear of the launch tube. The Blowpipe's guidance is initially semi-automatic with the missile gathered to the centre of the sight's crosshairs by the infrared optic atop the aiming unit. Two to three seconds after launch, missile guidance is switched to fully MCLOS mode, and the operator regains full control of the missile. The operator has to steer the missile all the way to its target manually via a small thumb joystick. The operator can opt not to use autogathering when engaging low flying targets such as helicopters, but then has to super-elevate the launcher to ensure that the missile does not hit the ground. Four flares in the tail of the missile make it visible in flight, first to the infrared optic, then to the operator. Detonation is either by proximity or contact fuse. In emergencies, the operator can end an engagement by shutting off the power to the transmitter with the system switch, after which the missile will immediately self-destruct. The aiming unit can then be removed from the empty missile container and fitted to a new round. Blowpipe was developed as a SAM for submarines, fitted as a cluster of four missiles into a mast that could be raised from the submarine's conning tower under the name Submarine Launched Airflight Missile (SLAM) trialled on HMS Aeneas (P427) in 1972. These were for a time installed on Israeli Gal class submarines.

SA-18 Grouse (9K38 Igla) Russian Man-Portable Air-Defense Missile System (MANPADS)

Tiers:

1 2 **3** 4

Variants:

- **Igla-1E:** Export version.
- **Igla-1M:** Improved version of 9K38 Igla. Entered service in Soviet Military during the late 1980s.
- **Igla-1D:** Igla-1D
- **Igla-1V:** Air-launched version, mainly for combat helicopters.
- **Igla-1N:** A version with heavier warhead at the cost of a slight reduction in range and speed.
- **Igla-1A:** Export version
- **Strelets Igla-S / Igla:** The Strelets is designed for remote automated firing of the Igla and Igla-S surface-to-air missile by single shot, ripple or in salvo. In service with Syria
- **3M-47 Gibka:** A turret for ships that is equipped with Igla missiles
- **Komar:** Another turret for ships that is equipped with Igla missiles

System

Alternative Designation: 9K38 Igla; SA18 Grouse

Type of Targets: Tactical aircraft, helicopter, UAV and cruise missile

Family: 9K38 Igla

Crew: ea1

Reaction Time: 5-10 Seconds

Note: The Igla–1M missile consists of a Ground Power Supply Source (GPSS), Launching Tube, Launching Mechanism & Missile (9M 313–1)

Dimensions

Length, Missile: m1.574

Diameter, Missile: mm72

Height: INA

Weight, Combat: See Missile Information

Missile System

↳*Missile Launcher*

Name: 9M 313–1 launching mechanism
Type: Portable Air-Defense Missile System (MANPADS)
Note: There is also a two-barrel 9K38 missile launcher called Djigit

↳*Missile*

Name: 9M39 Missile
Type: Portable Air-Defense Missile System (MANPADS)
Engine: Solid Fuel Rocket Motor
Length: m1.574
Diameter: mm72
Weight, Full System: kg17.9
Weight, Missile: kg10.8
Weight, Warhead: kg1.7
Warhead Type: Directed-energy blast fragmentation
Fuze Type: Delayed impact, magnetic and grazing
Target Engagement: m5,200
Speed: m/s600
Maximum Effective Range: m5,200
Maximum Target Speed, Receding: m/s360
Maximum Target Speed, Approaching: m/s320
Seeker Head Type: Nitrogen-cooled, Indium antimonide (InSb) and uncooled lead sulfide (PbS)
Seeker Scanning: FM-modulated
Maximum Altitude: m3500
Minimum Altitude: m10
Guidance System: Passive IR homing device and night vision (operating in the medium IR range)
NOTE: Missile is pitched by guidance unit over the lead point to avoid premature ground detonation when engaging targets at less than 10m. This slows engagement time.

Notes:

The SA-18 Grouse or Igla or 9K38 is a Russian made man-portable infrared homing surface-to-air missile defence system (SAM/MANPAD). This is a third-generation, man-portable, surface-to-air missile system and it is given the Russian industrial index number 9K38, for the complete system. The SA-18 Grouse with its 9M39 missile was accepted into service in the Soviet Army in 1983. The full-capability 9K38 Igla with its 9M39 missile was finally accepted into service in the Soviet Army in 1983. The main improvements over the Igla-1 included much improved resistance against flares and jamming, a more sensitive seeker, expanding forward-hemisphere engagement capability to include straight-approaching fighters (all-aspect capability) under favourable circumstances, a slightly longer range, a higher-impulse, shorter-burning rocket with higher peak velocity (but

approximately same time of flight to maximum range). The naval variant of 9K38 Igla has the NATO reporting name SA-N-10 Grouse. The Igla–1M missile consists of a Ground Power Supply Source (GPSS), Launching Tube, Launching Mechanism & Missile (9M 313–1). There is also a two-barrel 9K38 missile launcher called Djigit.

Misagh-2 Iranian Man-Portable Surface-to-Air Missile System (MANPADS)

Tiers:

Variants:

- **Misagh-1:** The Misagh 1 (also Mithaq-1, etc.) is an Iranian man-portable surface-to-air missile. It was developed by the Shahid Kazemi Industrial Complex in Tehran. It is a variant or reverse-engineered clone of the Chinese QW-1 Vanguard missile system and is comparable to the Soviet SA-16 Gimlet missile. It is used by Iran and has been exported to Hezbollah in Lebanon and to the Popular Mobilization Forces in Iraq and to Syria as well. The MANPADS was supplemented by the newer Misagh-2 missile system.

Guidance System: Passive IR homing device and night vision (operating in the medium IR range)
Speed: m/s850
Maximum Engagement Altitude: 4,000 m
Minimum Engagement Altitude: 10 m
Maximum Engagement Range: m6,000
Minimum Engagement Range: m500
Warhead Type:
Storage Life: 8 Years
Reaction Time: 5 to 10 sec.
Targets: Tactical aircraft, helicopter, UAV and cruise missile

Dimensions

Length: m1,590 m

Diameter: mINA

Weight: kg11.32

Warhead Weight: kg1.42

Notes:

The Misagh-2 is an Iranian man-portable infrared-guided surface-to-air missile. The Misagh-2 is the successor to the Misagh-1. Like its predecessor, the Misagh-2 is based on Chinese technology.[1] Iran’s defense minister launched the domestic mass production of the Misagh-2 on 5 February 2006. This missile destroys its target within 5 second and has an operation temperature of -40°C to +60°C. Near the target its speed reaches 2.7+ Mach. It is roughly comparable to the Soviet SA-18 Grouse missiles.

Misagh-1 Iranian Man-Portable Surface-to-Air Missile System (MANPADS)

Gunner Acquisition Range: INA

Gunner Night Sight: None standard, but available

Acquisition Range: 6,000

IFF: Yes

Notes:

The 9K34 Strela-3, NATO reporting name: SA-14 Gremlin is a man-portable air defense missile system (MANPADS) developed in the Soviet Union as a response to the poor performance of the earlier 9K32 Strela 2 (SA-7 Grail) system. The missile was largely based on the earlier Strela 2, and thus development proceeded rapidly. The new weapon was accepted into service in the Soviet Army in January 1974. The most significant change over the Strela 2 was the introduction of an all-new infra-red homing seeker head. The new seeker worked on FM modulation (con-scan) principle, which is less vulnerable to jamming and decoy flares than the earlier AM (spin-scan) seekers, which were easily fooled by flares and even the most primitive infrared jammers. The new seeker also introduced detector element cooling in the form of a pressurized nitrogen bottle attached to the launcher. The effect of cooling was to expand the seeker's lead sulphide detector element's sensitivity range to longer wavelengths (slightly over 4 µm as opposed to 2.8 µm of uncooled PbS elements). In practice this made possible the tracking of cooler targets over longer ranges, and enabled forward-hemisphere engagement of jets under favourable circumstances. The seeker also had better tracking rate, enabling the missile to track maneuvering of fast and approaching targets. A negative side effect from the aforementioned improvements was increased missile weight, which caused a slight decrease in the kinematic performance of the original Strela-2 (SA-7). Against relatively slow, low-altitude battlefield air threats the overall effectiveness was much improved. Strela-3 missiles have been exported to over 30 countries. The original Strela-3 missile was the 9M36. The follow-on to the Strela-3 was Igla. The naval version of this missile has the NATO reporting name of SA-N-8.

SAM-14A (SA-16 Gimlet) Iranian Man-Portable Air-Defense Systems (MANPADS)

Tiers:

Variants:

- **Igla-1E:** Export version.
- **Igla-1M:** Improved version of 9K38 Igla. Entered service in Soviet Military during the late 1980s.
- **Igla-1D:** A version for paratroopers and special forces.
- **Igla-1V:** Air-launched version, mainly for combat helicopters.
- **Igla-1N:** A version with heavier warhead at the cost of a slight reduction in range and speed.
- **Igla-1A:** Export version
- **Igla-S (SA-24 Grinch):** Newest variant with improved range, seeker, resistance to countermeasures, and warhead.
- **Strelets Igla-S:** The Strelets is designed for remote automated firing of the Igla and Igla-S surface-to-air missile by single shot, ripple or in salvo. In service with Syria
- **3M-47 Gibka:** A turret for ships that is equipped with Igla missiles.
- **Komar:** Another turret for ships that is equipped with Igla missiles.

System

In Service: 1981-Present

Dimensions

Length: m1,574

Diameter: mm72

Height: INA

Weight, Missile Only: kg10.8
Weight, Full System: kg13.9

Missile System

↳*System*

Name: 9K310 Igla-1 (SA-16 Gimlet)
Type: Russian Man-Portable Infrared Homing Surface-to-Air Missile
Launcher Name: 9P322 fibre glass launch canister
Missile Name: 9M313 missile
Warhead Weight: kg1.17
Explosive Weight: grams390
Detonation Mechanism: contact and grazing fuzes
Engine: solid fuel rocket motor
Operational Range: km5.2
Flight Ceiling: km3.5
Speed: m/s570
Guidance System: dual waveband infra-red (S-version
Taget Engagement Altitude: 100 to 3,500 m
Taget Engagement Range: 500 - 5,000 m
Reaction Time: 5-10 seconds
IFF System: Yes

Notes:

The SAM-14 is a export of the Russian 9K310 Igla-1 (NATO: SA-16 Gimlet) The 9K310 Igla-1 system and its 9M313 missile were accepted into service in the Soviet army on 11 March 1981. The main differences from the Strela-3 included an optional Identification Friend or Foe system to prevent firing on friendly aircraft, an automatic lead and super elevation to simplify shooting and reduce minimum firing range, a slightly larger rocket, reduced drag and better guidance system extend maximum range and improve performance against fast and maneuverable targets, an improved lethality on target achieved by a combination of delayed impact fuzing, terminal maneuver to hit the fuselage rather than jet nozzle, an additional charge to set off the remaining rocket fuel (if any) on impact, an improved resistance to infrared countermeasures (both decoy flares and ALQ-144 series jamming emitters), and slightly improved seeker sensitivity. 9K38 Igla (SA-18) missile and launcher top and 9K310 Igla-1 (SA-16) missile and launcher below. The seeker has two detectors – a cooled MWIR InSb detector for detection of the target and uncooled PbS SWIR detector for detection of IR decoys (flares). The built-in logic determines whether the detected object is a target or a decoy. The latest version (Igla-S) is reported to have additional detectors around the main seeker to provide further resistance against pulsed IRCM devices commonly used on helicopters. The 9M313 missile features an aerospike mounted on a tripod (Igla's 9M39 missile has aerospike attached directly to the seeker dome), which reduces a shock wave, thus providing less dome heating and greater range. The name Igla is derived from these devices. Like many other MANPADS, Igla-1 and Igla feature so-called rolling airframe missiles. These missiles roll in flight (900 – 1200 rpm) so steering the missile requires just a single pair of control surfaces, unlike roll-stabilized missiles, which require separate control surfaces for pitch and yaw. Both 9M313 and 9M39 missiles contain a gas generator, which drives a small gas turbine to provide electrical power, and the pistons, which move the canards used to steer the missile in a bang-bang mode. In addition to that, two exhaust tubes of the gas generator are placed perpendicular to the steering canards to provide maneuverability immediately after launch when the missile airspeed is too low for canards to be effective. Later versions of Igla are reported to use proportional control to drive the canards, which enables greater precision and less oscillation of the flight path. According to the manufacturer, South African tests have shown the Igla's superiority over the contemporary (1982 service entry) but smaller and lighter American FIM-92A Stinger missile. According to Kolomna OKB, the Igla-1 has a Pk (probability of kill) of 0.30 to 0.48

against unprotected targets which is reduced to 0.24 in the presence of decoy flares and jamming. In another report, the manufacturer claimed a Pk of 0.59 against an approaching and 0.44 against receding F-4 Phantom II fighter not employing infrared countermeasures or evasive maneuvers

Mistral Franch Man-Portable Air-Defense System (MANPADS)

Tiers:

Variants:

- **Submarine Air Defence Weapon:** On 26 September 2012 DCNS at the company's Le Mourillon plant announced plans to design and build a submarine canister-based air defence weapon based on the Mistral. The concept is similar to the British Submarine Launched Airflight Missile developed by Vickers in the 1970s and tested on HMS Aeneas and three boats of the Gal-class.
- **SIMBAD-RC:** SIMBAD-RC is a naval remote controlled turret using Mistral missiles developed by MBDA.

System

:
:
:

↳*Mistral MANPADS*

Name: Mistral
Type: Man Portable surface-to-air missile
Manufacturer: MBDA (France)
In Service: 1988-Present
Length: 1.86 m
DIameter: 90 mm
Crew: 1
Effective Firing Range: 6 km
Warhead: High Explosive with high density tungsten balls
Warhead Weight: 2.95 kg
Detonation Mechanism: Laser proximity or impact triggered
Engine: Solid Rocket Motor
Speed: m/s800
Guidance System: Infrared homing
Note: SIMBAD-RC is a naval remote controlled turret using Mistral missiles developed by MBDA

Notes:

Mistral is an infrared homing MANPADS manufactured by the European multinational company MBDA missile systems (formerly by Matra BAe Dynamics). Based on the French SATCP (Sol-Air À Très Courte Portée), the portable missile later to become the Mistral began development in 1974. It was initially deployed in 1988 for the first version (S1), 1997 for the second version (M2), and 2019 for the third version (M3). The basic Mistral missile is used with a man-portable launch unit. There are also launch units that allow the missile to be fired from armoured vehicles, ships or helicopters (such as the Aérospatiale Gazelle, Denel Rooivalk, or Eurocopter Tiger). To reject the flares ejected from the rear of the targeted aircraft, proportional navigation using a gyro as a reference is adopted for Mistral, instead of the pursuit method in earlier IR-guided MANPADS. To further enhance the ECCM capability, the seeker of Mistral has a very narrow field of view to reject decoys and interference, but the seeker can tilt in the range of +/− 38 degrees. On the launcher, the missile runs up the gyro in 2 seconds, and total reaction time is 5 seconds. The all-aspect two-color (2–4 and 3–5 μm) cooled IR-seeker of Mistral is developed by SAT, and the missile adopts both laser proximity and impact fuzes. A close-in weapon system based on Mistral is a six-missile version called Sadral, with a stabilized rapid-reload launcher that is fully automated. A CSEE developed fire control director is integrated to the launcher, consisted of TV camera and FLIR. Image produced by both directors appear on the screen in the operator console below deck, and the missiles are locked onto the target before being launched. A fully loaded Sadral launcher weighs 1080 kg, and the operator console weighs 280 kg. A two-missile unit installed on ships is called Simbad, and a newly launched four-missile version is called Tetral. An evolution of the Simbad is now proposed: Simbad RC. Both Tetral and Simbad RC are remote controlled from the ship's deck while the original Simbad is manually operated with a simple optical sight.

FIM-92 Stinger American Man-Portable Air-Defense System (MANPADS)

Tiers:

Variants:

- **The MANPADS has been adapted for launch from APC or IFV chassis. It has also been adapted for light utility vehicles and combat support vehicles, such as the German Wiesel-based Fliegerfaust-2 (FLF-2). A variety of air defense launcher systems can use Stinger, Mistral, or other MANPADS.:**
- **FIM-92A:** Stinger Basic: The basic model.
- **FIM-92B:** Stinger POST: In this version, the infrared seeker head was replaced by a combined IR/UV seeker that utilized rosette scanning. This resulted in achieving significantly higher resistance to enemy countermeasures (flares) and natural disturbances. Production ran from 1981 to 1987; a total of 600 missiles were produced.[
- **FIM-92C:** Stinger RMP: The resistance to interference was increased again by adding more powerful digital computer components. Moreover, the software of the missile could now be reconfigured in a short time in order to respond quickly and efficiently to new types of countermeasures. Until 1991, some 20,000 units were produced for the U.S. Army alone.
- **FIM-92D:** Various modifications were continued with this version in order to increase the resistance to interference.
- **FIM-92E:** Stinger—RMP Block I: By adding a new rollover sensor and revised control software, the flight behavior was significantly improved. Additionally, the performance against small targets such as drones, cruise missiles and light reconnaissance helicopters was improved. The first deliveries began in 1995. Almost the entire stock of U.S. Stinger missiles was replaced by this version.
- **FIM-92F:** A further improvement of the E version and the current production version.
- **FIM-92G:** An unspecified upgrade for the D variant.[
- **FIM-92H:** Indicates a D variant that has been upgraded to the E standard.
- **Stinger—RMP Block II:** This variant was a planned developed based on the E version. The improvements included an imaging infrared seeker head from the AIM-9X. With this modification, the detection distance and the resistance to jamming was to be greatly increased. Changes to the airframe would furthermore enable a significant increase in range. Although the missile reached the testing phase, the program was dropped in 2002 for budgetary reasons.
- **FIM-92J:** Block 1 missile upgrade to replace aging components to extend service life an additional 10 years. Upgrades include a proximity fuse warhead section, equipped with a target detection device to increase effectiveness against unmanned aerial vehicles.
- **FIM-92K:** variant of FIM-92J designed to use a vehicle datalink rather than the missile's own seeker for targeting.

System

Alternative Designation: FIM-92A Basic Stinger
System: Grip-stock (with battery coolant unit, IFF, impulse generator, and seeker redesign), missile, night sight, radio and

Fuze Type: Contact with time delay

Guidance: Cooled 2nd gen passive IR homing (4.1-4.4 mm)

Length : mm1.52

Name: FIM-92A

Probability of Hit: PCTINA

Propulsion: Solid fuel, dual-thrust (ejector motor and sustainer motor)

Range, Maximum : m4,000+

Range, Minimum : m200.0

Seeker Field of View : degINA

Self-Destruct Time: sec20.0

Speed : m/s745 m/s, Mach 2.2

Target Maneuver Limit: Up to 8 g

Tracking Rate: INA

Type: Frag-HE

Type: Missile

Weight : kg1.0

Weight : kg10.0

Fire Control System

ADAD: British passive thermal IR scanners on remote tripod or vehicle mount with 240 o FOV automatic cueing system.

IFF: AN/PPX-1 trigger-activated on grip-stock, with battery belt-pack

Target Alert Display Set (TADDS): US portable graphic display set w/audio alert, VHF radio, and IFF.

↳*Day Sight*

Acquisition Range : km4000+

Field of View : degINA

Field of View : degINA

Type: Ring and bead, most launchers Optical sight with lead bias available.

↳*Night Sight*

Type: Optional AN/PAS-18, Wide- Angle Stinger Pointer System (WASP) thermal sight.

↳*Night Sights*

Acquisition Range : km20-30 side or tail aspect, 10 head-on aspect

Field of View : deg20o x 12 o

↳*Radar*

Radar Equipment: Providing Omni-directional Reporting of Targets at Extended Ranges (REPORTER), German/Dutch EW system with I/J band radar and IFF. Range: 40 km. Altitude: 15-4000 m.

Radar Other: Several U.S. and foreign radars are available for use with Stinger.

Notes:

The FIM-92 Stinger is a Man-Portable Air-Defense System (MANPADS) that operates as an infrared homing surface-to-air missile (SAM). It can be adapted to fire from a wide variety of ground vehicles and helicopters (as an AAM). Developed in the United States, it entered service in 1981 and is used by the militaries of the United States and 29 other countries. It is principally manufactured by Raytheon Missile Systems and is produced under license by EADS in Germany and by Roketsan in Turkey, with 70,000 missiles produced.

HN-5A Chinese Man Portable Surface-to-Air Missile (MANPAD)

Tiers:

Variants:

- **LHN-5A:** The HN-5A has a greater detection range for the IR seeker and a reduced susceptibility IR background noise.
- **HN-5B:** The HN-5B has an increased maximum altitude of 8,202 ft (2,500 m).
- **HN-5C:** This is a mobile launcher system. There is one four-tube box on either side of unmanned pedestal. A laser rangefinder, thermal imager and TV camera for fire control are in a mount atop the pedestal. Eight reload missiles are in the vehicle body. Total mounted weight is 4,409 lb. (2,000 kg). This version has been displayed on a small flat-bed truck and a scale model of 6 x 6 wheeled armored reconnaissance vehicle. Originally, it was shown on the HRB-230 cross-country vehicle. During the 1997 Paris Air Show, a model of the WZ551 APC was on display with the HN-5C system mounted on the ve hicle's roof. The WZ551 version has a turret elevation limitation of -2/+80 degrees. The HN-5C is operated by a two-man crew and has a maximum effective range of 13,779 ft. (4,200 m) between an altitude limits of 164 ft (50 m) and 7,545 ft (2,300 m). The maximum target speed is 492 ft/s (150 m/s) for head-on intercept and 853 ft/s (260 m/s) for tail-on engagement. It is available f or export; the current production status of this HN-5C is unreported.

System

Alternative Designations: Red Cherry 5, Red Cherry 5A, HN-5A

Target: Rotary wing aircraft

Crew: Can be fired by one however, a second crew member assists with identification of the target

Reaction Time: secs<5

Family: HN-5

Dimensions

Weight: kg16

Length: m1.44

Diameter: mm72

Armament (Missile)

Engine: 1 x 2-stage solid-propellant rocket

Max Speed: Mach 1.5

Maximum Slant Range: km4.4

Minimum Slant Range: m800

Maximum Altitude: m2,300

Minimum Altitude: m80

Maximum Target Speed (Head On): kph550

Maximum Target Speed (Tail Chase): kph950

Warhead: HE / Frag

Counter-Counter Measures: Missile has a filter to reduce chances of missile being diverted by flares

Notes:

The Chinese Hong Nu (Red Cherry) 5 (HN-5) is a man-portable surface-to-air missile (SAM), designed to engage propeller-driven aircraft and helicopters. It began as a copy of the Soviet SA-7 Grail, but has been updated as the HN-5A. The original HN-5 guidance technology was relatively primitive, using an uncooled lead sulfide (PbS) infrared (IR) seeker and following the target's flight path until intercept. The uncooled IR seeker proved very susceptible to homing on the hottest object in its field of view, which was often some thing other than an aircraft. The HN-5A has a cooled seeker with a background noise rejection filter, greater detection range and proportional navigation, which steers the missile on an interception course. It also has a heavier warhead. The HN-5A has replaced the HN-5 in production and has been offered for export. The launch tube has simple sights. The power supply is under the tube. The missile has a long pipe-like body with very small foreplanes and angled steering vanes extending to the rear. The launch procedure for the HN-5 was nearly identical to the SA-7.

FN-6 Chinese Man-Portable Air Defence System (MANPADS)

Tiers:

Variants:

- **FN-6A:** Vehicle mounted version of FN-6 first revealed to public in 2005. The system is based on a Chinese HMMWVS, 4x4 light tactical vehicle.
- **QW-1:** Export version of FN-6
- **FN-16:** FN-16 is an improvement of earlier FN-6, with better all aspect attack capability and better resistance against electronic countermeasures. Another major improvement is in its seeker, which in addition to the original IR guidance, UV guidance is also incorporated, a practice adopted in the later version of FIM-92 Stinger. Like its predecessor FN-6, FN-16 can also be fitted with both IFF systems used on FN-6, and just like FN-6, FN-16 is re-designated as FY-16 (Fei Ying meaning Flying Eagle) when equipped with IFFs.
- **HN-6:** HN-6 is a further development of FN/FY-6/16. HN-6 utilizes fire control systems (FCS) of earlier FN/FY-6/16 MANPADS, but a new FCS sight of unknown designation has also been developed. In addition to improved performance over the original FN/FY-6/16 MANPADS, HN-6 incorporates a protective cap over the seeker of missile, offering better protection against the environmental elements. Based on the photos and video clips of PLA training, this protective cap does not appear to be automatically ejected when the missile is fired, but instead, it is manually removed before firing the missile. Another improvement of HN-6 over the earlier FN/FY-6/16 MANPADS is that it incorporates a fire station similar to that of RBS 70 and Mistral: a seat is attached to the light weight tripod firing stand that can be folded for transportation and storage, and the operator is protected by a bulletproof glass shield.

System

Alternative Designation: FN-6 or Fei Nu-6
Description: Shoulder fired, IR homing, heat seeking, surface to air missile designed to destroy fixed wing aircraft, rotary wing aircraft, and UAVs
Propellant: Solid
Maximum Velocity: m/s600
Maximum Range: m5,500
Maximum Altitude: km3.8
Minimum Range: m500
Minimum Altitude: m15
Attack Characteristics: Missile can attack incoming, outgoing, and crossing aircraft
Proximity fuze: Yes
Crew: 2 (can be fired without second team member)
Guidance System: Infrared Homing
Fire-and-Forget: Yes

Dimensions

Missile Weight: kg10.7

System Weight: kg17

Missile Length: mm1495

Missile Diameter: mm72

Fin Span: m0.18

Additional Options (Not required for missile to fire)

IFF: Yes

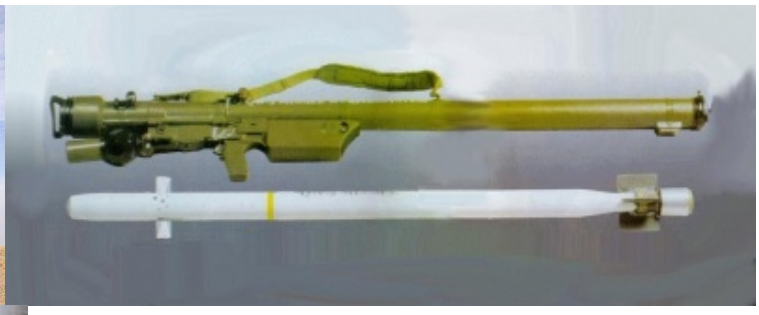
Enhanced Optical Sight: Yes

Night Sight: Yes

Notes:

The FN-6 is a man-portable air defense missile system (MANPADS) designed and manufactured in China by the Defense Company Poly Technologies. it is deployed as a two-man team however, a second soldier is not required to put ready the system to fire or fire the system. It is a third generation passive infrared (IR) man portable air defense system. The FN-6 has the capability of all-direction attack and anti-infrared jamming. The FN-6 is a fire-and-forget system that is easy to transport and use. The FN-6 is especially designed to engage low flying targets flying at or less than 300m/s. The weapon was specifically designed to be used against targets flying at low and very low altitudes. The FN-6 was developed in parallel with the Qian Wei (QW) missile series. FN-6, or FeiNu-6, is the export name given to the export version derived from this system, and it is known as HongYing-6 (Chinese: □□; pinyin: hóng yīng; lit.: 'red tassel') in the PLA. The training simulator of FN-6 is not developed by the contractor of the missile system, but instead, the simulator is developed by PLA itself after the missile was purchased, and the general designer of the training simulator of FN-6 is Mr. Liu Weixing. The training simulator of FN-6 is also used for later versions of MANPADS developed from FN-6. Export sales of the weapon is the responsibility of China National Precision Machinery Import and Export Corporation, a state owned trading company responsible for representing the domestic defense production industry in air defense related products. According to Janes, the FN-6 is a third generation, passive infrared, man portable air defense system (MANPADS). It is equipped with a digital infrared seeker with a strong resistance to flares, solar heat and heat from the ground. The pyramid shaped nose of the missile houses the four unit infrared seeker. The handle of the launcher houses the batteries and cooling system. An IFF antenna and an optional clip-on optical sight are fitted on to the launcher. The missile is capable of all-aspect attack and has a 70% single shot hit probability. It can engage targets maneuvering at up to 4 g. When FN-6 MANPADS can be equipped with night vision equipment, and it can also be equipped with IFF systems, two of which were shown to public, one of which is similar in appearance to AN/PPX-1 IFF of FIM-92 Stinger, while the other IFF system is a fish bone configuration. When equipped with IFF system, the name is changed from FN-6 to FY-6, or short for Fei Ying, meaning Flying Eagle.

QW-2 Chinese Man-Portable Infrared Homing Guided Surface-to-Air Missile



Tiers:

1 **2** 3 4

System

:

:

↳***QW-2 Vanguard 2 Man-Portable Infrared Homing Guided Surface-to-Air Missile***

Name: QW-2
Type: Infrared Homing Guided Surface-to-Air Missile
Manufactured: Shenyang-based CASIC 119 Factory
Length: 1.59 m
Diameter: INA
Weight: 11.32 kg
Detonation Mechanism: Impact & Proximity
Engine: Rocket
Propellant: Solid Rocket
Operational Range: 6 km maximum
Flight Ceiling: 4 km
Flight Altitude: 10 meter minimum
Maximum Speed: > 600 m/s
Guidance System: Infrared Homing

Launch Platform: MANPADS, Type 95 SPAAA

Notes:

The QW-2 is a Chinese all-aspect man-portable infrared homing guided surface-to-air missile. It is not clear when the missile first entered service, but it is likely to have been between 1998 and 2002. The QianWei 2 (or Vanguard 2, its export name) is the third-generation shoulder-launched, all-aspect IR-homing, 'fire-and-forget' surface-to-air missile developed by Shenyang-based CASIC 119 Factory (Shenyang Hangtian Xinle Ltd). The QW-2 was first revealed during the 1998 Farnborough Airshow. The missile and launcher of the QW-2 bear strong resemblance to those of the Russian 9K310 Igla-1, and the two missile systems are believed to be comparable in performance. QW-2 is a development of the QW-1 Vanguard series, and is considered by many domestic Chinese media sources as the Chinese equivalent of FIM-92E Stinger. Compared to the QianWei 1, the minimum operating altitude of the QianWei 2 has been reduced from 30m to 10m; the operating range has been increased from 5 km to 6 km; and the missile’s reaction time has been reduced to below 5 seconds. The QianWei 2 features a newly developed dual-band passive IR seeker with strong resistance to heat flares dispensed by the target and solar/ground heat, thus improving the missile’s performance in day/night, all-weather conditions.

SAM-18 (SA-18 Grouse) Iranian Man-Portable Air-Defense Missile System (MANPADS)

Tiers:

Variants:

- **Igla-1E:** Export version.
- **Igla-1M:** Improved version of 9K38 Igla. Entered service in Soviet Military during the late 1980s.
- **Igla-1D:** Igla-1D
- **Igla-1V:** Air-launched version, mainly for combat helicopters.
- **Igla-1N:** A version with heavier warhead at the cost of a slight reduction in range and speed.
- **Igla-1A:** Export version
- **Strelets Igla-S / Igla:** The Strelets is designed for remote automated firing of the Igla and Igla-S surface-to-air missile by single shot, ripple or in salvo. In service with Syria
- **3M-47 Gibka:** A turret for ships that is equipped with Igla missiles
- **Komar:** Another turret for ships that is equipped with Igla missiles

System

Alternative Designation: 9K38 Igla; SA18 Grouse
Type of Targets: Tactical aircraft, helicopter, UAV and cruise missile
Family: 9K38 Igla
Crew: ea1
Reaction Time: 5-10 Seconds
Note: The Igla–1M missile consists of a Ground Power Supply Source (GPSS), Launching Tube, Launching Mechanism & Missile (9M 313–1)

Dimensions

Length, Missile: m1.574
Diameter, Missile: mm72
Height: INA

Weight, Combat: See Missile Information

Missile System

↳*Missile Launcher*

Name: 9M 313–1 launching mechanism
Type: Portable Air-Defense Missile System (MANPADS)
Note: There is also a two-barrel 9K38 missile launcher called Djigit

↳*Missile*

Name: 9M39 Missile
Type: Portable Air-Defense Missile System (MANPADS)
Engine: Solid Fuel Rocket Motor
Length: m1.574
Diameter: mm72
Weight, Full System: kg17.9
Weight, Missile: kg10.8
Weight, Warhead: kg1.7
Warhead Type: Directed-energy blast fragmentation
Fuze Type: Delayed impact, magnetic and grazing
Target Engagement: m5,200
Speed: m/s600
Maximum Effective Range: m5,200
Maximum Target Speed, Receding: m/s360
Maximum Target Speed, Approaching: m/s320
Seeker Head Type: Nitrogen-cooled, Indium antimonide (InSb) and uncooled lead sulfide (PbS)
Seeker Scanning: FM-modulated
Maximum Altitude: m3500
Minimum Altitude: m10
Guidance System: Passive IR homing device and night vision (operating in the medium IR range)
NOTE: Missile is pitched by guidance unit over the lead point to avoid premature ground detonation when engaging targets at less than 10m. This slows engagement time.

Notes:

The SA-18 Grouse or Igla or 9K38 is a Russian made man-portable infrared homing surface-to-air missile defence system (SAM/MANPAD). This is a third-generation, man-portable, surface-to-air missile system and it is given the Russian industrial index number 9K38, for the complete system. The SA-18 Grouse with its 9M39 missile was accepted into service in the Soviet Army in 1983. The full-capability 9K38 Igla with its 9M39 missile was finally accepted into service in the Soviet Army in 1983. The main improvements over the Igla-1 included much improved resistance against flares and jamming, a more sensitive seeker, expanding forward-hemisphere engagement capability to include straight-approaching fighters (all-aspect capability) under favourable circumstances, a slightly longer range, a higher-impulse, shorter-burning rocket with higher peak velocity (but

approximately same time of flight to maximum range). The naval variant of 9K38 Igla has the NATO reporting name SA-N-10 Grouse. The Igla–1M missile consists of a Ground Power Supply Source (GPSS), Launching Tube, Launching Mechanism & Missile (9M 313–1). There is also a two-barrel 9K38 missile launcher called Djigit.

SAM-14 (SA-14 Gremlin) Iranian Man-Portable Air Defense Missile System (MANPADS)

Tiers:

1 2 3 4

System

Alternative Designations: 9K34 Strela-3 SA-14

Target: Air Defense

Description: The 9K34 Strela-3, NATO reporting name: SA-14 Gremlin) is a man-portable air defense missile system (MANPADS) developed in the Soviet Union as a response to the poor performance of the earlier 9K32 Strela 2 (SA-7 Grail) system.

Crew: 1, Normally 2 with a loader

Armament

Launcher Name: 9K34 Strela-3 (SA-14 Gremlin)

Missile Name: 9M36 or 9M36-1

Length: m1.4

Diameter: mm75

Weight: kg10.3

Reaction Time: sec25

Fire on the Move: Yes, in short halt

Max Range: m6,000

Min Range: m600

Max Altitude: m6,000

Min Altitude: m10; 0 with degraded Ph

Fin Span: INA

Missile Speed: m/s600

Propulsion: 2-stage solid-propellant rocket

Guidance: 1-color passive IR homing

Seeker Field of View: INA

Tracking Rate: INA

Warhead Type: Frag-HE

Warhead Weight: kg1.0

Fuze Type: Contact/grazing

Probability of Hit: Ph%50 FW/50 heli

Fire Control

Sights with magnification: Launch tube has simple sights

Gunner: INA

Gunner Field of View: INA

Gunner Acquisition Range: INA

Gunner Night Sight: None standard, but available

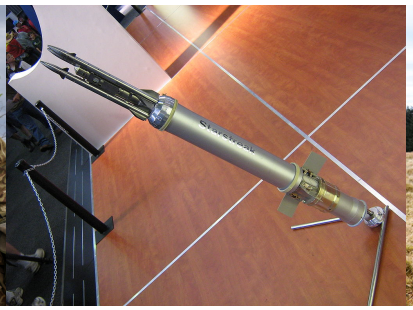
Acquisition Range: 6,000

IFF: Yes

Notes:

The 9K34 Strela-3, NATO reporting name: SA-14 Gremlin is a man-portable air defense missile system (MANPADS) developed in the Soviet Union as a response to the poor performance of the earlier 9K32 Strela 2 (SA-7 Grail) system. The missile was largely based on the earlier Strela 2, and thus development proceeded rapidly. The new weapon was accepted into service in the Soviet Army in January 1974. The most significant change over the Strela 2 was the introduction of an all-new infra-red homing seeker head. The new seeker worked on FM modulation (con-scan) principle, which is less vulnerable to jamming and decoy flares than the earlier AM (spin-scan) seekers, which were easily fooled by flares and even the most primitive infrared jammers. The new seeker also introduced detector element cooling in the form of a pressurized nitrogen bottle attached to the launcher. The effect of cooling was to expand the seeker's lead sulphide detector element's sensitivity range to longer wavelengths (slightly over 4 µm as opposed to 2.8 µm of uncooled PbS elements). In practice this made possible the tracking of cooler targets over longer ranges, and enabled forward-hemisphere engagement of jets under favourable circumstances. The seeker also had better tracking rate, enabling the missile to track maneuvering of fast and approaching targets. A negative side effect from the aforementioned improvements was increased missile weight, which caused a slight decrease in the kinematic performance of the original Strela-2 (SA-7). Against relatively slow, low-altitude battlefield air threats the overall effectiveness was much improved. Strela-3 missiles have been exported to over 30 countries. The original Strela-3 missile was the 9M36. The follow-on to the Strela-3 was Igla. The naval version of this missile has the NATO reporting name of SA-N-8.

Starstreak British Short-Range Man-Portable Air-Defense System (MANPADS)



Tiers:

Variants:

- **Starburst:** Javelin SAM launcher adapted for Starstreak LBR guidance- in production
- **Lightweight Multiple Launcher (LML):** Pedestal launcher for three missiles (above). The launcher can also mount on a light vehicle, e.g., TUV. A demonstrator is LML on a Panhard tactical truck.
- **Starstreak II:** Improved launcher uses Starstreak or Starstreak II missile. It has an auto-tracker for hands-free guidance. It was fielded in 2010.
- **Starstreak Lightweight Vehicle (LWV):** Land Rover truck converted into an SP SAM system with a 6-canister launcher, ADAD auto-tracker, and TV/ thermal FCS. This launcher can be mounted on other vehicles.
- **Armored Starstreak or (SP HVM):** Vehicle is a Stormer tracked APC chassis, with an 8-missile launcher. The passive IR fire control system uses ADAD, an auto-tracker and thermal sight. The launcher can be mounted on other vehicles.
- **Seastreak:** Single-stage missile naval variant in a 12-missile launcher, with mm-wave radar FCS.
- **Thor:** British Multi-Mission Air Defense System is a RWS, with 4 missile launchers, TV, FLIR, and an auto-tracker. Weighing .5 mt, it mounts on trucks, vans, TUVs, APCs, etc., with a remote operator. Designed for Starstreak, launchers, it can also mount other MANPADS, and ATGMs, such as Ingwe, TOW, HELLFIRE, Mokopa, Spike, etc.
- **Lightweight Multi-Role Missile/LMM:** A multi-role missile options with a single 3-kg tandem (HEAT/HE) warhead and proximity fuze. At 13 kg, the lower-cost missile flies 8-km at 1.5 Mach. It was due in 2013 and was successfully launched by a Camcopter S-100 UCAV variant. Other projected upgrades are semi-active laser- homing and/or dual-mode (LBR/SAL-H).
- **Low-cost air defense/anti-armor (multi-role) system.:** Optional use: as a low-cost air defense/anti-armor (multi-role) system, STARSTREAK can be employed against ground targets, such as light armored vehicles, and snipers in bunkers or buildings. The missile and its darts, with a unique combination of penetrator and following frag-he, have been successfully tested against vehicle targets. With a missile cost of 1/2 to 1/3 of competing MANPADS, the system could be used as a fire support asset to complement ATGM launchers and vehicle weapons
- **The most common launcher used is SL. Optional Use: As a low-cost air defense/anti-armor (multi-role) system, Starstreak can be employed against ground targets, such as light armored vehicles, and snipers in bunkers or buildings. The missile and its darts, with a unique combination of penetrator and following Frag- HE, have been successfully tested against vehicle targets. With a missile cost of 1/2 to 1/3 of competing MANPADS, the system could be used as a fire support asset to complement ATGM launchers and vehicle weapons.:**

System

Alternative Designation: Man portable Shoulder- Launched (SL) Starstreak
Country of Origin: Great Britain.
Crew : ea2.0
Reaction Time : secless than 6
Reload Time : secless than 25 est
Time between Launches : minless than 30 sec

↳*Target*

Type: FW, heli, ground vehicles

Launcher

Name: Aiming Unit

Armament

Combat Load : rds5.0

Combat Load, Dismount : rds3.0

Fire on Move: no

↳*Weapon 1*

System Dimensions: See Missile

System Weight: kg24.3 with missile

Fire Control System

Other: ADAD: British passive thermal IR scanners on remote tripod or vehicle mount with 240 degree FOV automatic cueing Missile team employs an azimuth plotting board (e.g. Russian 1L15-1) for direction of approach on aerial targets.

↳*Day Sight*

Acquisition Range : km7000+

Field of View : degINA

Name: Avimo stabilized optical sight with lead bias system

↳*Night Sight*

Acquisition Range : km4 to 5 est

Name: Thales clip-on thermal sight

Ammunition

↳*Ammunition (Option 1)*

Name: Starstreak

Type: Three 25mm darts: Tungsten KE tip and case; HE fill

Altitude : m0-5000

Length : m1.4

Diameter : mm127.0

Weight : kg14.0

Flight Time : sec5 to 7

Fuze Type: Contact wit time delay

Guidance: Laser beam rider SACLOS

Penetration : mm KE120+ all LAVs (equal to 3 x 40- mm APFSD-T rds) HE detonates after for frangible effects

Probability of Hit: PCT60 FW, more than 95 heli (each dart 67% for heli)

Propulsion: Canister launch booster, bus missile, and 3 darts (sub-missiles)

Range, Maximum : m7000 (guided)

Range, Minimum : m300.0

Self-Destruct Range: km5.5

Speed : m/s1364, Mach 4

Other: Starstreak II: Improved missile has 8-km range and better precision. Fielded 2010

Notes:

Starstreak is a British short range man-portable air-defence system (MANPADS) manufactured by Thales Air Defence (formerly Shorts Missile Systems), in Belfast. It is also known as Starstreak HVM (High Velocity Missile). After launch, the missile accelerates to more than Mach 4, making it the fastest short-range surface-to-air missile in the world. It then launches three laser beam riding submunitions, increasing the likelihood of a successful hit on the target. Starstreak has been in service with the British Army since 1997. In 2012 Thales rebranded the system under the ForceSHIELD banner. The Starstreak missile is transported in a sealed launch tube. This tube is attached to an aiming unit for firing. The operator tracks the target using the aiming unit's optically stabilized sight. The process of tracking the target allows the aiming unit to compute the right trajectory to bring the missile together with the target. The operator can indicate wind direction to the unit and, in the case of a long range target, provide superelevation. When the initial tracking is complete, the operator fires the missile by pressing a button. The missile then fires the first-stage rocket motor, which launches the missile from the tube – but burns out before leaving the tube to protect the operator. Four meters away from the operator, when the missile is a safe distance away, the second stage fires, which rapidly accelerates the missile to burn out velocity of more than Mach 4. As the second stage burns out, three dart sub-munitions are released. The dart housing is made from a tungsten alloy. The darts are each 396 millimetres (15.6 in) long with a diameter of 22 millimetres (0.87 in) and weigh about 900 grams (32 oz). Around half the weight of each dart approximately 450 g (16 oz), is its explosive charge, detonated by a delayed-action, impact activated fuze. Each dart consists of a rotating fore-body with two canard fins attached to a non-rotating rear assembly which has four fins. The rear assembly of each dart also houses the electronics that guide the missile, including a rearwards facing sensor. The darts do not home in on laser energy reflected from the target but instead the aiming unit projects two laser beams which paint a two dimensional matrix upon the target. The lasers are modulated and by examining these modulations the sub-munition's sensor can determine the dart's location within the matrix, the dart is then steered to keep it in the centre of the matrix. The sub-munitions steer by briefly decelerating the rotating fore-body with a clutch. The front wings then steer the missile in the appropriate direction. The three sub-munitions fly in a formation about 1.5 meters in radius, and have enough kinetic energy to manoeuvre to meet a target evading at 9 g at 7,000 meters. Earlier laser guidance systems used a single beam that had to be kept on the target at all times, the missile homing in on laser energy reflected off the target, if it moved off the target, the reflection would end and guidance would be lost until the target was regained. The problem could be reduced by making the laser's beam wider, but only at the cost of lowering accuracy and reducing the amount of energy being reflected. Starstreak's system allows for the beam area to be much larger than the target while retaining pinpoint accuracy. On impact with the target, a delayed action fuze is triggered. This gives time for the projectile to penetrate the target before the explosive warhead detonates. The tungsten housing is designed to fragment and produce maximum damage inside the target. A demonstration was conducted in September 1999 that showed the missile being used against an FV432 armoured personnel carrier, showing the missile's effectiveness as a surface-to-surface weapon. Each sub-munition dart travelling at 4,500 km/h (1,250 m/s, 4,100 ft/s, 2,800 mph) has comparable kinetic energy to a shell from a Bofors 40 mm gun and probably has sufficient energy to penetrate the front armour of an infantry fighting vehicle. However, it lacks the armour penetration capabilities of a purpose-built anti-tank guided missile or of a dual purpose missile (such as the Air Defence Anti-Tank System).

9K310 Igla-1 (SA-16 Gimlet) Russian Man-Portable Infrared Homing Surface-to-Air Missile

Tiers:

1 2 3 4

Variants:

- **Igla-1E:** Export version.
- **Igla-1M:** Improved version of 9K38 Igla. Entered service in Soviet Military during the late 1980s.
- **Igla-1D:** A version for paratroopers and special forces.
- **Igla-1V:** Air-launched version, mainly for combat helicopters.
- **Igla-1N:** A version with heavier warhead at the cost of a slight reduction in range and speed.
- **Igla-1A:** Export version
- **Igla-S (SA-24 Grinch):** Newest variant with improved range, seeker, resistance to countermeasures, and warhead.
- **Strelets Igla-S:** The Strelets is designed for remote automated firing of the Igla and Igla-S surface-to-air missile by single shot, ripple or in salvo. In service with Syria
- **3M-47 Gibka:** A turret for ships that is equipped with Igla missiles.
- **Komar:** Another turret for ships that is equipped with Igla missiles.

System

Alternative Designation: 9K310 Igla-1 (SA-16 Gimlet)
Type: Russian Man-Portable Infrared Homing Surface-to-Air Missile
Manufacturer: KB Mashinostroyeniya – developer of the system
Family: Igla

↳ ***System***

Name: 9K310 Igla-1 (SA-16 Gimlet)
Type: Russian Man-Portable Infrared Homing Surface-to-Air Missile
Launcher Name: 9P322 fibre glass launch canister
Missile Name: 9M313 missile
Warhead Weight: kg1.17
Explosive Weight: grams390
Detonation Mechanism: contact and grazing fuzes
Engine: solid fuel rocket motor
Operational Range: km5.2
Flight Ceiling: km3.5
Speed: m/s570
Guidance System: dual waveband infra-red (S-version
Taget Engagement Altitude: 100 to 3,500 m
Taget Engagement Range: 500 - 5,000 m
Reaction Time: 5-10 seconds
IFF System: Yes

Notes:

The 9K310 Igla-1 system and its 9M313 missile were accepted into service in the Soviet army on 11 March 1981. The main differences from the Strela-3 included an optional Identification Friend or Foe system to prevent firing on friendly aircraft, an automatic lead and super elevation to simplify shooting and reduce minimum firing range, a slightly larger rocket, reduced drag and better guidance system extend maximum range and improve performance against fast and maneuverable targets, an improved lethality on target achieved by a combination of delayed impact fuzing, terminal maneuver to hit the fuselage rather than jet nozzle, an additional charge to set off the remaining rocket fuel (if any) on impact, an improved resistance to infrared countermeasures (both decoy flares and ALQ-144 series jamming emitters), and slightly improved seeker sensitivity. 9K38 Igla (SA-18) missile and launcher top and 9K310 Igla-1 (SA-16) missile and launcher below. The seeker has two detectors – a cooled MWIR InSb detector for detection of the target and uncooled PbS SWIR detector for detection of IR decoys (flares). The built-in logic determines whether the detected object is a target or a decoy. The latest version (Igla-S) is reported to have additional detectors around the main seeker to provide further resistance against pulsed IRCM devices commonly used on helicopters. The 9M313 missile features an aerospike mounted on a tripod (Igla's 9M39 missile has aerospike attached directly to the seeker dome), which reduces a shock wave, thus providing less dome heating and greater range. The name Igla is derived from these devices. Like many other MANPADS, Igla-1 and Igla feature so-called rolling airframe missiles. These missiles roll in flight (900 – 1200 rpm) so steering the missile requires just a single pair of control surfaces, unlike roll-stabilized missiles, which require separate control surfaces for pitch and yaw. Both 9M313 and 9M39 missiles contain a gas generator, which drives a small gas turbine to provide electrical power, and the pistons, which move the canards used to steer the missile in a bang-bang mode. In addition to that, two exhaust tubes of the gas generator are placed perpendicular to the steering canards to provide maneuverability immediately after launch when the missile airspeed is too low for canards to be effective. Later versions of Igla are reported to use proportional control to drive the canards, which enables greater precision and less oscillation of the flight path. According to the manufacturer, South African tests have shown the Igla's superiority over the contemporary (1982 service entry) but smaller and lighter American FIM-92A Stinger missile. According to Kolomna OKB, the Igla-1 has a Pk (probability of kill) of 0.30 to 0.48 against unprotected targets which is reduced to 0.24 in the presence of decoy flares and jamming. In another report, the manufacturer claimed a Pk of 0.59 against an approaching and 0.44 against receding F-4 Phantom II fighter not employing infrared countermeasures or evasive maneuvers

9K388 Igla-S (SA-24 Grinch) Russian Man-Portable Air-Defense Missile System (MANPADS)

Notes:

The Igla man-portable air-defense systems (MANPADS) are one of the best-selling arms. This system belongs to the second-generation MANPADS meeting most stringent requirements to combat effectiveness in harsh jamming environment. In 2004 the Russian army adopted the new MANPADS - Igla-S (sometimes called "Igla-Super") which is much more sophisticated and efficient in countering air threats. Serial production of the "Igla-S" ("Needle-S") portable antiaircraft missile complex (PAAMC) is conducted at the Degtyarev factory in the city of Kovrov. This newest PAAMC was awarded the State premium. The "Igla-S" PAAMC by its capabilities is significantly superior to the "Igla" PAAMC, which entered service in 1983. The "Igla-S" tactical and technical characteristics enable it to destroy targets at altitudes up to 5-7 km. The limiting altitude of effective target destruction for the "Igla-S" complex is 3.5 km, according to Deputy Director General of the enterprise Vasily Russu. According to him, foreign customers also display serious interest in the "Igla-S" PAAMC. In 1971 the USSR started development of a new generation man-portable air defence missile system (code-named "Igla"). The Igla MANPADS, as a whole, was to be developed by the Kolomna-based KBM machine-building design bureau headed by S.P.Nepobedimy, and the missile's thermal homing head - by the Leningrad-based LOMO optical-mechanical association headed by O.A. Artamonov. Difficulties connected with the

complexity of creating jam-resistant seeker ruined the timetable of the seeker's development. Therefore it was decided to take an interim decision and make a simplified version of the Igla system equipped with the seeker from the Strela-3 older-generation MANPADS. That Igla entered service on 11 March 1981. The genuine Igla was successfully tested in 1982 and entered service with the Soviet Army on 23 September 1983. The Igla system boasts high jamming immunity attained thanks to excellent target selectivity against the man-made interference background. This advantageous capability was provided by a new dual-channel optical homing head with the logic unit for a true target selection against clutter. The development of the Igla MANPADS was awarded with the State Prize of the USSR. In the 1990s the KBM continued improving the Igla MANPADS. As a result, a new Igla-S system entered service with the Russian Army in 2004. The most recent system is substantially more efficient than the Igla and the US Stinger MANPADS. The Igla-S is armed with the increased-weight warhead and a contact-proximity fuse. Its control algorithm ensures selection of the most optimal moment for the warhead's explosion as far as its effectiveness is concerned, both in the contact and non-contact modes. Besides, the Igla-S control system architecture is based on revolutionary (compared to the Igla) principles providing considerably improved missile accuracy. Designers and other specialists of the KBM and its subcontractors were awarded with the State Prize of Russia for the development and introduction into production of the Igla-S MANPADS. On 13 August 2003 Hemant Lakhani, a British national born in India, was charged by the US Government with attempting to provide material support to terrorists and attempting to sell arms without a license. Lakhani sought to arrange for the sale of at least another 50 anti-aircraft missiles to a cooperating witness, who was posing as a representative of a Somali terror organization. Two other defendants were arrested. Both of them helped in a planned money transfer that was part of the transaction. The complaint states that during a video- and audio-taped meeting at a hotel overlooking Newark Airport in September 2002, Lakhani and the cooperating witness looked out and gestured at departing commercial aircraft. Lakhani allegedly said he understood the purpose of the sale was to shoot down an aircraft and cause economic harm to the United States - to "make one explosion ... to shake the economy." The discussions continued about importation of the missile, and on Aug. 17, 2002, Lakhani said he understood that the buyer of the missile had wanted it for "the anniversary" - a reference to the Sept. 11, 2001, terrorist attacks on America. Three days later, Lakhani allegedly faxed the cooperating witness a document listing the price for an "Igla-S portable anti-aircraft missile complex," including a price breakdown between the missile and its launcher. In more recorded conversations during August 2002, Lakhani allegedly said the supplier was concerned that the deal for just one missile was "too risky," and that he had committed to the supplier that there would be a purchase of at least an additional 20 missiles. The complaint further alleges that on or about July 12, 2003, Lakhani traveled to Moscow to meet with the suppliers and the government's cooperating witness. At a meeting two days later, Lakhani met with the witness and two officers of the Russian Federal Security Service (FSB), posing as the suppliers. The FSB officers showed Lakhani what appeared to be an actual surface-to-air missile, which was actually an unarmed replica. In subsequent meetings, Lakhani allegedly discussed payment arrangements and his desire to arrange a deal for the purchase of an additional 50 surface-to-air missiles. The Igla-S (SA-24) is Russia's most advanced MANPADS and considered one of the most lethal portable air defense systems ever made. Starting in 2005 the US Government raised its concerns with the Government of Russia (GOR) about the Government of Venezuela's (GOV) possible acquisition of MANPADS and other conventional weapons. In particular, the US highlighted the risk these could be diverted to the Revolutionary Armed Forces of Colombia (FARC) or other regional terrorists and non-state actors. Venezuela's tactical air defense inventory consists of 1970s-era Swedish (RBS-70) and 1980s-era French systems (Mistral), which are both crew-served systems. If the SA-24 transfer occurred, it would be Venezuela's first man-portable air defense weapon. The United States and Russia have been very involved in efforts to prevent the proliferation of MANPADS and strengthen controls over their export. Of particular concern is preventing the transfer of such systems into regions known to foster unreliable end-users. The US was concerned with Venezuela's ability to properly secure and safeguard small arms and light weapons (SA/LW). The US saw no indication that Venezuela was prepared to implement adequate physical security and stockpile management practices for such systems consistent with international standards. In 2005, The US reiterated US concerns regarding arms sales to Venezuela during a meeting with Anatoliy Antonov, MFA Director for Disarmament and Security Affairs. Antonov said that he and his Department's experts had carefully considered the points the US had presented and had shared them with Russian services. Antonov stressed that there was no international restriction on selling arms, including MANPADS, to Venezuela. Russia recognized the US as a competitor in the international arms trade, with the motivation of restricting Russia's market access. Antonov said Russia respected the US right to determine US policy on arms sales to Venezuela, but added, "that is your decision, not ours; we have our own policy." The U.S. and Russia have committed to enhancing the control of MANPADS to prevent their acquisition and use by non-state actors and the proliferation to countries that do not have strong export control and stockpile management procedures. During the US-Russia MANPADS Arrangement Expert Meeting in 2006, when the US raised this issue with regard to Venezuela, Russia offered no assurances that it would not sell Igla-S to the GOV. However, it was suggested that, if a transfer occurred, the system would likely be vehicle-mounted. On November 19, 2008 the Russian News & Information Agency Novosti (RIA Novosti) reported that Rosoboronexport signed a major contract for the sale of Igla-S MANPADS to Venezuela. The media report also revealed that a manager of LOMO, a partner company in the production of Igla-S, stated that this implied the contract for the delivery of several hundred Igla-S MANPADS. At the end of January the US received reports that Venezuela had deployed ten Venezuelan specialists to Kolomna, Russia, to begin training on the Igla-S MANPADS. Reporting indicates that five of the ten specialists were to take part in Igla-S equipment acceptance inspections, sometime in the last ten days of February 2009. Russia advised that it had stringent end-use requirements (consistent with the Wassenaar guidelines) for such sales and requested more specific information on why the U.S. views this possible transaction as a risk. Information gleaned from FARC hard-drives obtained by the Colombian government in March 2008 indicated Venezuelan government officials had tried to facilitate black and gray arms market deals for the FARC. This information was widely disseminated in major mainstream international media outlets. More specifically, information on the hard-drives indicated specific discussions between the Government of Venezuela and FARC on the provision of MANPADS. In light of Venezuela's relationship with the FARC, corruption within the Venezuelan military, and the

US assessment that Venezuela's stockpile and security management practices do not meet international standards, the US was concerned there is a significant risk that these weapons could be diverted to the FARC. The US did not rule out the possibility that the transfer of the IGLA-S weapon system could displace and make available existing weapon systems for FARC's use. The US feared that should these sophisticated systems fall into the hands of the FARC, they could possibly be sold or traded to drug organizations, including those in Mexico, which are actively seeking to acquire powerful and highly sophisticated weapons for use against government forces. The U.S. was particularly concerned about this possibility because FARC's acquisition of MANPADS would constitute a new capability for the group to undermine peace and security in the region as well as threaten counter-narcotics operations in Colombia. Given these serious risks, the US had serious concerns about this transaction going forward.

Dual Mount Stinger American Man-Portable Air-Defense System (MANPADS)

Tiers:

Variants:

- **The MANPADS has been adapted for launch from APC or IFV chassis. It has also been adapted for light utility vehicles and combat support vehicles, such as the German Wiesel-based Fliegerfaust-2 (FLF-2). A variety of air defense launcher systems can use Stinger, Mistral, or other MANPADS.:**
- **FIM-92A:** Stinger Basic: The basic model.
- **FIM-92B:** Stinger POST: In this version, the infrared seeker head was replaced by a combined IR/UV seeker that utilized rosette scanning. This resulted in achieving significantly higher resistance to enemy countermeasures (flares) and natural disturbances. Production ran from 1981 to 1987; a total of 600 missiles were produced.[
- **FIM-92C:** Stinger RMP: The resistance to interference was increased again by adding more powerful digital computer components. Moreover, the software of the missile could now be reconfigured in a short time in order to respond quickly and efficiently to new types of countermeasures. Until 1991, some 20,000 units were produced for the U.S. Army alone.
- **FIM-92D:** Various modifications were continued with this version in order to increase the resistance to interference.
- **FIM-92E:** Stinger—RMP Block I: By adding a new rollover sensor and revised control software, the flight behavior was significantly improved. Additionally, the performance against small targets such as drones, cruise missiles and light reconnaissance helicopters was improved. The first deliveries began in 1995. Almost the entire stock of U.S. Stinger missiles was replaced by this version.
- **FIM-92F:** A further improvement of the E version and the current production version.
- **FIM-92G:** An unspecified upgrade for the D variant.[
- **FIM-92H:** Indicates a D variant that has been upgraded to the E standard.
- **Stinger—RMP Block II:** This variant was a planned developed based on the E version. The improvements included an imaging infrared seeker head from the AIM-9X. With this modification, the detection distance and the resistance to jamming was to be greatly increased. Changes to the airframe would furthermore enable a significant increase in range. Although the missile reached the testing phase, the program was dropped in 2002 for budgetary reasons.
- **FIM-92J:** Block 1 missile upgrade to replace aging components to extend service life an additional 10 years. Upgrades include a proximity fuse warhead section, equipped with a target detection device to increase effectiveness against unmanned aerial vehicles.
- **FIM-92K:** variant of FIM-92J designed to use a vehicle datalink rather than the missile's own seeker for targeting.

System

Alternative Designation: Dual Mount Stinger (DMS)
Type: Man-Portable Air-Defense System (MANPADS)
Manufacturer: Prime contractor: Raytheon Missile Systems (formerly Hughes Missile Systems; formerly General Dynamics), Tucson, Ariz. Prime contractor (Europe): Daimler-Benz Aerospace (now DaimlerChrysler) (Dasa), Munich, Germany
Crew : ea1, Normally 2 with a loader
In Service: 1997-Present

Main Weapon System

↳*Launcher*

Note: Two Stinger fire-and-forget missiles mounted on a tripod with an operator's seat and controls. It can be mounted on a light utility truck or on deck of a small patrol boat.
System Weight: 15.2 kg

↳*Missile*

Name: Stinger
Type: Man-Portable Air-Defense System (MANPADS)
Length: 1.52 m
Diameter: 70 mm
Missile Weight: 10.0 kg
Warhead Weight: 3.0 kg
Engine: 1 x Atlantic Research Mk 27 dual-thrust solid-fuel rocket
Maximum Speed: Mach 2.2
Maximum Range: 4.8 km
Maximum Altitude: 3,800 m
Warhead: penetrating high-explosive; impact fuze
Optics: optical sight (some thermal imaging capability) proportional navigation with lead bias and Target Adaptive Guidance (TAG)
Guidance System: all-aspect passive infrared homing

Fire Control System

ADAD: British passive thermal IR scanners on remote tripod or vehicle mount with 240 o FOV automatic cueing system.
IFF: AN/PPX-1 trigger-activated on grip-stock, with battery belt-pack
Target Alert Display Set (TADDS): US portable graphic display set w/audio alert, VHF radio, and IFF.

↳*Day Sight*

Acquisition Range : km4000+
Field of View : degINA
Field of View : degINA
Type: Ring and bead, most launchers Optical sight with lead bias available.

↳*Night Sight*

Type: Optional AN/PAS-18, Wide- Angle Stinger Pointer System (WASP) thermal sight.

↳*Night Sights*

Acquisition Range : km20-30 side or tail aspect, 10 head-on aspect
Field of View : deg20o x 12 o

↳***Radar***

Radar Equipment: Providing Omni-directional Reporting of Targets at Extended Ranges (REPORTER), German/Dutch EW system with I/J band radar and IFF. Range: 40 km. Altitude: 15-4000 m.

Radar Other: Several U.S. and foreign radars are available for use with Stinger.

Notes:

The Dual Mount Stinger (DMS) is a tripod-mounted launch platform for the Stinger Missile developed by Hughes Missile Systems Company (HMSC) for the SHORAD Project Office. (HMSC was later sold to Raytheon Corporation and is currently operating as Raytheon Missile Systems Corporation [RMSC].) Tripod-mounted missile launch devices are not a new concept. Developed for FMS customers, the DMS Weapon System consists of the DMS launcher with two Stinger tactical missiles (Guided Missile, Intercept Aerial). This system provides air defense capability from a fixed ground position. A self-contained system, the DMS includes its own electrical power system, argon coolant, and sighting units. Easily disassembled into portable components that require minimal set-up time, the DMS can be operated autonomously or in conjunction with an external early warning command and cueing/control system. The DMS launcher has provisions to receive Forward Area Air Defense Data Link or Ground Based Data Link cueing data, which can be from either two-dimensional (2D) or three-dimensional(3D) sensors. Cueing data from a 2D system give the approach direction (azimuth) and range of the target aircraft, while cueing data from a 3D system give the approach direction (azimuth), range of the target aircraft, and elevation angle. Since the United States had no requirement for this system in 1997, its development and fielding presented a unique set of challenges. A current FMS customer approached the SHORAD Project Office with the requirement for a tripod launcher, and we immediately started the research necessary to meet the requirement. The sale of this system, even though it technically did not exist at the time, required the same U.S. Department of State approval as any other FMS case. In August 1998 the Taipei Economic and Cultural Representative Office (TECRO) in the United States requested a possible sale of 61 Dual Mount STINGER Missile Systems consisting of: 61 Dual Mount STINGER (DMS) launchers (includes elevation assembly, tripod assembly, and sights) with coolant units, 61 STINGER RMP (-) captive flight trainers, 728 complete STINGER RMP (-) missile rounds (less battery coolant unit), 132 AN/VRC-91 export version Single Channel Ground/Air Radio System (SINCGARS) radios, spare and repair parts, support equipment, Interrogator Friend or Foe interrogator sets, interrogator programmers, utility carrier trucks, aerial flight handling and launcher trainers, coolant units, gas bottles, publications and documentation data, personnel training and training equipment, U.S. Government and contractor engineering and logistics personnel services, U.S. Government Quality Assurance Teams, Mobile Training Teams, and other related elements of logistics support. The estimated cost was $180 million. The Short Range Air Defense (SHORAD) Project Office obtained necessary approvals and built the customer a Stinger Missile Launcher that ultimately met their requirements in a timely and cost-effective manner.

RBS 70 Swedish Man-Portable Air Defense Missile System (MANPADS)

Tiers:

Variants:

- **RBS 70:** Original production model from 1977. It is sometimes referred to as the "Mk.0".
- **RBS 70 Mk.1:** Improved RBS-70 with an increased range, introduced in 1990.
- **RBS.90:** Further development of the Mk.1 introduced in 1991, with improved guidance and optics, to include a wider-angle laser and sight, a passive thermal imaging capability, and a fire control unit that mounts two or three launch tubes instead of one. The RBS.90 model was developed especially for the Swedish armed forces. It is also called the RBS 70 Mk.1+.
- **RBS 70 Mk.2:** Successor to the Mk.1 series, with a further increased range, and increased armor penetration as well. Introduced in 1995.
- **Bolide:** Further development of the Mk.2 first introduced in 2005, with radically improved performance. The name is often capitalized as "BOLIDE". Employs the BORC thermal imaging sight, and has uncooled laser diodes (previous models required Freon coolant).
- **RBS 70 NG:** The latest weapon in the series, the RBS 70 NG ("Next Generation") employs improved sights and optics, and a telemetry system allowing for improved training and after-action analysis. The missile itself is apparently the same as that of the Bolide.
- **Lvrbv 701:** The Lvrbv 701 ("Luftvärnsrobotvagn 701") is an armored, fully-tracked air defense vehicle utilizing the RBS 70. It utilizes a chassis converted from the retired 1950s-era Ikv 103 self-propelled howitzer. Sweden was the sole user of the Lvrbv 701, and retired them all by 2000.
- **ASRAD-R:** The ASRAD-R (Advanced Short Range Air Defense System - RBS) is a turret utilizing a MANPADS missile, Active Electronically Scanned Array (AESA) radar, and an infra-red search and track. First demonstrated on an M113 Gavin chassis, it was adopted by several nations on a variety of platforms. The missiles used in this system vary, and include both the FIM-92 Stinger and the Bolide.
- **ItO 2005:** Mobile air defense system including an ASRAD-R turret and the Bolide missile system, mounted on a Sisu Nasu chassis. Operated by Finland.

System

Alternative Designation: RBS 70
Type: Man-Portable Air Defense Missile System (MANPADS)
Manufacturer: Bofors Defence (1980s–2000) Saab Bofors Dynamics (since 2000)
Family: RBS
Crew: ea1
Layout: The RBS-70 uses a pedetal launcher on which a single operator is seated. The operator identifies targets or receives target information from mobile radar systems such as the Giraffe. The SACLOS guidance requires the operator to keep the target within the crosshairs while the missile uses laser beam riding guidance to reach the target. The laser receiver is in the tail of the missile and is very hard to jam. This required exhaust vents in the middle of the missile. The laser seeker and warhead are in the nose.
Engine: Booster and sustainer with smokeless solid propellant

Warhead: 1.1 kg Combined with 3,000 tungsten spheres and shaped charge

Detonation Mechansim: Adaptive proximity fuze function with 3 selectable modes (Off, Normal, Small target)

Operational Range: 250 m – 8 km

Flight Altitude: 5,000 m

Speed: Mach 1.6 (Mark 0/1) Mach 2 (5 km in 12 seconds) (Mark 2/BOLIDE)

Guidance System: Laser beam riding missile

Mobility: The RBS-70 is man portable by three men, but only over short distances. The launcher is rather heavy, especially with night sight fitted. Usually the launcher is transported in a utility vehicle or truck. The launcher can also be mounted on vehicles.

Users: The RBS-70 was first adopted by the Swedish military to realize their doctrine of mobile warfare with limited maintainance systems. The RBS-70 has been exported to a large number of nations, mainly in Europe and Asia.

Dimensions

Length: m1.32

Width: mm106

Wingspan: 32 cm

Weight, Combat: 87 kg (Stand + Sight + Missile)

Notes:

The RBS-70 is a modern man portable SAM system of Swedish origin. It was developed as a highly mobile system to primarily protect predefined areas, not troops on the move. The manual SACLOS guidance sets this system apart from the more common infrared homing MANPADS designs. The RBS-70 uses a pedetal launcher on which a single operator is seated. The operator identifies targets or receives target information from mobile radar systems such as the Giraffe. The SACLOS guidance requires the operator to keep the target within the crosshairs while the missile uses laser beam riding guidance to reach the target. The laser receiver is in the tail of the missile and is very hard to jam. This required exhaust vents in the middle of the missile. The laser seeker and warhead are in the nose. RBS 70 (Robotsystem 70, "robot" meaning "missile" in this context in Swedish) is a man-portable air-defense system (MANPADS) designed for anti-aircraft warfare in all climate zones and with little to no support from other forces. Originally designed and manufactured by the Swedish defence firm of Bofors Defence (now Saab Bofors Dynamics, since 2000). It uses the RB 70 missile which is also in use in a number of other Swedish missile systems. The RBS 70 was developed to supply the Swedish air defense with a low-cost, easy-to-use and effective short-range SAM system. Before RBS 70 the mainstay of Swedish air defense was American MIM-23 Hawk systems (RBS 77 and RBS 97 "Swedish HAWK"), American Redeye (RBS 69) and the Swedish Bofors m/48 AAA. The Swedish Army has decided to replace the RBS 70 with a ground-launched version of the IRIS-T missile. The RBS 70 is a Short-range Air Defense (SHORAD) laser guided missile system. Mk 1 and Mk 2 followed shortly and are the standard RBS 70 with a range of 5,000–6,000 m and a ceiling of 3,000 m. Currently, RBS 70 is operational in 18 customer countries, on all continents and in arctic, desert, and tropical environments. In 2003 the "BOLIDE" upgrade system was introduced to the RBS 70.[3] The BOLIDE missile is an RBS 70 Mk 2 upgrade that is faster (Mach 2 vs Mach 1.6), with a range up to 8 km (5.0 mi) and can reach an altitude of 6 km. Deliveries were initiated in 2005. In 2011, Saab Bofors Dynamics (successor company of Bofors Defence) announced the introduction of the new RBS 70 New Generation (RBS 70 NG). The upgraded version included an improved sighting system capable of night vision and improved training and after-action review features.

QW-4 Chinese Man-Portable Infrared Guided Surface-to-Air Missile

Tiers:

Variants:

- **QW-1M:** QW-1M is a development of QW-1, and first revealed in Zhuhai Air Show. The missile is considered as a third generation MANPAD by Chinese, and many domestic Chinese media sources claim that it is the Chinese equivalent of Soviet SA-18 Grouse, which it strongly resembles. Like its predecessor QW-1, QW-1M also appeared to incorporate technologies of FIM-92 Stinger. Various western sources have postulated that China had likely obtained FIM-92 Stinger samples from either Afghan guerrilla or Pakistan, or even Iran, but such claims have yet to be confirmed. The missile is slightly heavier than QW-1, weighing at 18 kg for the entire system, and it is claimed to have better ECCM capability and better capability to engage low-flying aircraft in comparison to QW-1.[citation needed] Some have been supplied to Kata'ib Hezbollah.
- **QW-1A:** QW-1A is a derivative of QW-1M, with the adaptation of man-portable radar weighing 30 kg and a range of 15 km, and it is carried by the observer. The associating fire control system enables various QW-1A units to be linked up and thus increasing the effectiveness by forming an air defense network, which in turn, could be integrated into large air defense network. Although the entire QW-1A system including radar / fire control system could be carried by a crew of 2-men team, it is often mounted on vehicles.
- **QW-11 (QW-1G):** QW-11 is a development of QW family that is specifically designed to engage terrain hugging cruise missiles, while retaining the capability of engaging low-flying aircraft. QW-11 was first revealed at Zhuhai Air Show in 2002. A new combined impact and proximity fuze is developed to provide better capability against cruise missiles. Length: 1.477 m Missile weight: 10.69 kg System weight: 16.9 kg Warhead: 1.42 kg Range: 0.5 – 5000 m Altitude: 30 m - 4 km Reaction time: 10 sec
- **QW-18:** QW-18 is the development of the QW-11G with an improved seeker. QW-18 first appeared in Zhuai Air Show with QW-11 and QW-11G in 2002. An enhanced dual band infrared seeker is developed so that the target is not only tracked via the exhaust heat, but also the temperature difference of the skin of the target. These improvements provided better capabilities against terrain-hugging cruise missiles at supersonic speed. Externally, QW-18 is identical to QW-11G / QW-11.
- **QW-2:** QW-2 is a missile with all aspect attack capability and improved ECCM capability. There are two types of seeker for QW-2: the first is the dual band infrared passive seeker first revealed in 1998, and an imaging IR (ImIR) seeker has been designed sometimes later. The fuse is similar to that of QW-18. The minimum altitude is decreased to 10 m, thus further improving the capability against low-flying cruise missile and hovering helicopters that suddenly pop up from hiding.
- **QW-3:** This is the Chinese equivalent of French Mistral missile, with fuse developed from that of QW-2. The missile is unique among Chinese MANPAD in that this is the only surface-to-air missile that adopts the semi-active laser guidance similar to AGM-114 Hellfire. The gyro stabilized seeker provides very high degree of accuracy and is extremely effective against low altitude cruise missiles. The 15 degrees per second tracking rate of the seeker is relatively low in comparison for other MANPAD for supersonic targets in high g maneuver at very high altitudes, but this is by no means handicapping the performance because such targets are not intended to be for QW-3, which is specifically designed to engage terrain hugging helicopters and UAV's and other fast flying targets at extremely low altitudes, including supersonic sea skimming cruise missiles.
- **QW-4:** The newest member of QW series with the fuze similar to that of QW-2, and a new thermal imaging seeker. The new fully electric control surfaces provide smoother flight path curves, thus greatly improved accuracy.
- **Anza Mk 2:** INA
- **Anza Mk 3:** INA
- **TD-2000B:** To increase the capability of TD-2000, China National Precision Machinery Import and Export Corporation (CNPMIEC) also revealed a development of TD-2000, dubbed as TD-2000B at the same Zhuhai Airshow, where TD-2000B was displayed as part of the subsystem of TD-2000B. The primary improvement over the original system is the extra

C4ISR capability added so that in addition to control the QW-4 missiles of TD-2000, TD-2000B can also simultaneously control up to 6 anti-aircraft artillery pieces.

↳ ***QW-4 Man-Portable Infrared Guided Surface-to-Air Missile***

Name: QW-4
Type: Infrared Imaging Guided Surface-to-Air Missile
Manufactured: China Precision Machinery Import-Export Corp. (CPMIEC), Beijing, China China Aerospace Science and Industry Corporation (CASIC), Shenyang, China
Length: 2.10 m
Diameter: 72 mm
Launcher Weight: INA
Missile Weight: 23.0 kg
Propulsion: two-stage solid-propellant rocket
Maximum Speed: 750 m/sec, Mach 2.2
Maximum Engagement Altitude: 4km
Minimum Engagement Altitude: 4 m
Maximum Range: 8,000 m
Minimum Range: 8 m
Guidance System: Infrared Imaging Guidance System

Notes:

The newest member of QW series with the fuze similar to that of QW-2, and a new thermal imaging seeker. The new fully electric control surfaces provide smoother flight path curves, thus greatly improved accuracy.

QW-18 Chinese Man-Portable Infrared Guided Surface-to-Air Missile

Tiers:

Variants:

- **QW-1M:** QW-1M is a development of QW-1, and first revealed in Zhuhai Air Show. The missile is considered as a third generation MANPAD by Chinese, and many domestic Chinese media sources claim that it is the Chinese equivalent of Soviet SA-18 Grouse, which it strongly resembles. These improvements provided better capabilities against terrain-hugging cruise missiles at supersonic speed. Externally, QW-18 is identical to QW-11G / QW-11.
- **QW-2:** QW-2 is a missile with all aspect attack capability and improved ECCM capability. There are two types of seeker for QW-2: the first is the dual band infrared passive seeker first revealed in 1998, and an imaging IR (ImIR) seeker has been designed sometimes later. The fuse is similar to that of QW-18. The minimum altitude is decreased to 10 m, thus further improving the capability against low-flying cruise missile and hovering helicopters that suddenly pop up from hiding.
- **QW-3:** This is the Chinese equivalent of French Mistral missile, with fuse developed from that of QW-2. The missile is unique among Chinese MANPAD in that this is the only surface-to-air missile that adopts the semi-active laser guidance similar to AGM-114 Hellfire. The gyro stabilized seeker provides very high degree of accuracy and is extremely effective against low altitude cruise missiles. The 15 degrees per second tracking rate of the seeker is relatively low in comparison for other MANPAD for supersonic targets in high g maneuver at very high altitudes, but this is by no means

handicapping the performance because such targets are not intended to be for QW-3, which is specifically designed to engage terrain hugging helicopters and UAV's and other fast flying targets at extremely low altitudes, including supersonic sea skimming cruise missiles.
- **QW-4:** The newest member of QW series with the fuze similar to that of QW-2, and a new thermal imaging seeker. The new fully electric control surfaces provide smoother flight path curves, thus greatly improved accuracy.
- **Anza Mk 2:** INA
- **Anza Mk 3:** INA
- **TD-2000B:** To increase the capability of TD-2000, China National Precision Machinery Import and Export Corporation (CNPMIEC) also revealed a development of TD-2000, dubbed as TD-2000B at the same Zhuhai Airshow, where TD-2000B was displayed as part of the subsystem of TD-2000B. The primary improvement over the original system is the extra C4ISR capability added so that in addition to control the QW-4 missiles of TD-2000, TD-2000B can also simultaneously control up to 6 anti-aircraft artillery pieces.

↳ ***QW-18 Man-Portable Infrared Guided Surface-to-Air Missile***

Name: QW-18
Type: Infrared Imaging Guided Surface-to-Air Missile
Manufactured: China Precision Machinery Import-Export Corp. (CPMIEC), Beijing, China China Aerospace Science and Industry Corporation (CASIC), Shenyang, China
Length: 2.10 m
Diameter: 72 mm
Launch Tube Weight: 4 kg
Firing Unit Weight: 1.7 kg
Total System Weight: 18 kg
Launch Mode: Shoulder-Fired
Mode of Attack: Omi-Direction
Guidance System: Infrared Imaging Guidance System
Target Speed: 300 m/s
Missile Speed: 600 m/s
Interception Altitude: 10-4,000 m
Self-Destruction Time: 14-18 seconds
Shelf Life: 10 Years

Notes:

QW-18 is a new all-climate man transportable shoulder-fired anti-aircraft missile system, with outstanding anti-interference function of the infrared, to attack the enemy to all low-altitude, low altitude strikes, and speeds of 300 m / s following a variety of flying target. QW-18 biggest function is the usage of a twin-band passive infrared seeker, the target plume and skinning heat detection, as a way to firmly lock the goal. QW-18 system can combine with other air defense weapons to shape a entire air defense system, together with the combination of anti-aircraft missile and artillery guns systems; can also be converted into air to air missiles and small vessels in the configuration on the ship-air missiles and so on.

9K32 Strela-2 (SA-7 Grail) Russian Man Portable Surface-to-Air Missile (MANPAD)

Tiers:

Variants:

- **Strela 2M/A:** Yugoslav upgraded version with larger warhead
- **CA-94 and CA-94M:** Romanian license-built versions of the SA-7a and SA-7b, respectively
- **HN-5:** Chinese unlicensed copy
- **Anza Mk-I:** Pakistani license-built copy of Chinese HN-5
- **Ayn al Saqr:** Egyptian copy
- **Hwasung-Chong:** North Korean license-built copy of Egyptian Ayn al Saqr system

System

Alternative Designations: 9K32M Strela-2; SA-7 Grail
Target: FW, heli
Crew: 1, Normally 2 with a loader

Armament

Launcher: INA
Name: 9M32M
Length: m1.40
Diameter: mm70
Weight: kg9.97
Reaction Time (acquisition to fire): sec5-10
Time Between Launches: INA
Reload Time: sec6-10
Fire on the Move: Yes, in short halt
Range: m500-5,000
Max Altitude: m4,500
Min Altitude: m18, 0 with degraded Ph
Missile Speed: m/s580
Propulsion: Solid fuel booster and solid fuel sustainer rocket motor. Guidance: Passive 1-color IR homing (operating in the edium IR range)

Guidance: Passive 1-color IR homing (operating in the medium IR range)

Warhead Type: HE

Warhead Weight: kg1.15

Fuze Type: Contact (flush or grazing)

Probability of Hit: Ph%30 FW/40 heli

Self-Destruct: sec15

Countermeasure Resistance: The seeker is fitted with a filter to reduce effectiveness of decoy flares and to block IR emissions.

Weapons and Ammunition Types

Ready Missile: Typical Combat Load 1 Normal Dismount 2 From AD Vehicle 5

Fire Control

Sights with Magnification: Launcher has a sighting device and a target acquisition indicator. The gunner visually identifies and acquires the target.

Field of View (o): INA

Night Sight: None Standard

Acquisition Range (m): INA

IFF: Yes (see NOTES)

Main Armament Ammunition

Type: Frangible APDS (FAPDS) for upgrades. On impact with the target surface, the penetrator breaks into several KE fragments. The round has Frag-HE effects with the higher velocity and flat trajectory of a sabot round.

Tactical AA range: m3,500 (self-destruct)

Tracer Range: INA

Effective Altitude: m3,100

Min Altitude: m0

Self-Destruct: sec6-12

Range: m4,000

Tactical AA Range: m3,500

Effective: m3,500

Self-Destruct Time: sec6-12

Penetration: 115+ at 1,000 m

Type: APDS-T

Other Ammunition Type: HEI

Notes:

The 9K32 Strela-2 (Russian: Стрела, "arrow"; NATO reporting name SA-7 Grail) is a light-weight, shoulder-fired, surface-to-air missile (or MANPAD) system. It is designed to target aircraft at low altitudes, with passive infrared homing guidance and destroy them with a high explosive warhead. Broadly comparable in performance with the US Army FIM-43 Redeye, the Strela-2 was the first Soviet man-portable SAM – it entered use in 1968, and full-scale production began in 1970. The Strela-2 was a

staple of the Cold War and was produced in huge numbers for the Soviet Union and their allies, as well as revolutionary movements.[4] Though since replaced with more modern systems, the Strela and its variants remain in service in many countries, and have seen widespread use in nearly every regional conflict since 1972.

QW Family (QW-1, QW-2, QW-3) of Chinese Man-Portable Infrared Guided Surface-to-Air Missiles

Tiers:

Variants:

- **QW-1M:** QW-1M is a development of QW-1, and first revealed in Zhuhai Air Show. The missile is considered as a third generation MANPAD by Chinese, and many domestic Chinese media sources claim that it is the Chinese equivalent of Soviet SA-18 Grouse, which it strongly resembles. Like its predecessor QW-1, QW-1M also appeared to incorporate technologies of FIM-92 Stinger. Various western sources have postulated that China had likely obtained FIM-92 Stinger samples from either Afghan guerrilla or Pakistan, or even Iran, but such claims have yet to be confirmed. The missile is slightly heavier than QW-1, weighing at 18 kg for the entire system, and it is claimed to have better ECCM capability and better capability to engage low-flying aircraft in comparison to QW-1. Some have been supplied to Kata'ib Hezbollah.
- **QW-1A:** QW-1A is a derivative of QW-1M, with the adaptation of man-portable radar weighing 30 kg and a range of 15 km, and it is carried by the observer. The associating fire control system enables various QW-1A units to be linked up and thus increasing the effectiveness by forming an air defense network, which in turn, could be integrated into large air defense network. Although the entire QW-1A system including radar / fire control system could be carried by a crew of 2-men team, it is often mounted on vehicles.
- **QW-11 (QW-1G):** QW-11 is a development of QW family that is specifically designed to engage terrain hugging cruise missiles, while retaining the capability of engaging low-flying aircraft. QW-11 was first revealed at Zhuhai Air Show in 2002. A new combined impact and proximity fuze is developed to provide better capability against cruise missiles. Length: 1.477 m Missile weight: 10.69 kg System weight: 16.9 kg Warhead: 1.42 kg Range: 0.5 – 5000 m Altitude: 30 m - 4 km Reaction time: 10 sec
- **QW-11G:** Improved version of QW-11 with enhanced ECCM capability was displayed at same Zhuai Air Show with QW-11 in 2002. The suffix G stands for Gaijin or Gailiang in Chinese, meaning improvement. The QW-11G system does not have dimensional changes physically so that QW-11 missile can be directly used for QW-11G.
- **QW-18:** QW-18 is the development of the QW-11G with an improved seeker. QW-18 first appeared in Zhuai Air Show with QW-11 and QW-11G in 2002. An enhanced dual band infrared seeker is developed so that the target is not only tracked via the exhaust heat, but also the temperature difference of the skin of the target. These improvements provided better capabilities against terrain-hugging cruise missiles at supersonic speed. Externally, QW-18 is identical to QW-11G / QW-11.
- **QW-2:** QW-2 is a missile with all aspect attack capability and improved ECCM capability. There are two types of seeker for QW-2: the first is the dual band infrared passive seeker first revealed in 1998, and an imaging IR (ImIR) seeker has been designed sometimes later. The fuse is similar to that of QW-18. The minimum altitude is decreased to 10 m, thus further improving the capability against low-flying cruise missile and hovering helicopters that suddenly pop up from hiding.
- **QW-3:** This is the Chinese equivalent of French Mistral missile, with fuse developed from that of QW-2. The missile is

unique among Chinese MANPAD in that this is the only surface-to-air missile that adopts the semi-active laser guidance similar to AGM-114 Hellfire. The gyro stabilized seeker provides very high degree of accuracy and is extremely effective against low altitude cruise missiles. The 15 degrees per second tracking rate of the seeker is relatively low in comparison for other MANPAD for supersonic targets in high g maneuver at very high altitudes, but this is by no means handicapping the performance because such targets are not intended to be for QW-3, which is specifically designed to engage terrain hugging helicopters and UAV's and other fast flying targets at extremely low altitudes, including supersonic sea skimming cruise missiles.

- **QW-4:** The newest member of QW series with the fuze similar to that of QW-2, and a new thermal imaging seeker. The new fully electric control surfaces provide smoother flight path curves, thus greatly improved accuracy.
- **Anza Mk 2:** This is the Pakistani version of the QW-1. There are no known differences in performance. It entered service in 1994.
- **Anza Mk 3:** This is a Pakistani variant of the QW-2.
- **CQW-2:** Vehicle mounted version of QW-2 mounted on a 4 x 4 high mobility armored vehicle with three crew members: commander, driver and gunner. The fire control systems mainly consisted of radar and electro-optical system. Once the target is acquired by radar, it is passed to the electro-optical system for tracking and engagement. The onboard system allows the gunner to fire either a single missile or two missiles at a time, and there is a total of 8 missiles. Inside the vehicle, there are another additional 8 missiles for reload. The missiles of CQW-2 are interchangeable with that of MANPAD version, but they cannot be directly interchanged in the field. The prefix C standards for Che-zai in Chinese, meaning vehicle mounted.
- **TB-1:** TB-1 is a missile derived from QW series, first revealed at the 8th Zhuhai Airshow held in the 4th Quarter of 2010 by its developer, China Aerospace Science & Industry Corporation. TB-1 utilizes the airframe of QW-1/2 and the seeker of QW-3, and thus has the same diameter of QW-1/2 and the main stage of QW-3, around 70 millimeter. TB-1 is designed to engage both aerial and ground targets by adopting a specially designed shaped charge armor-piercing blast-fragmentation warhead, so that it can successfully destroy armored vehicles and light tanks, in addition to aerial targets QW-1/2/3 could destroy. At its public debut, a twin launcher was shown.
- **FLS-1:** Naval version of QW-3 with launcher looks very similar to that of RIM-116 Rolling Airframe Missile externally. Although many Chinese media sources claim that it is the equivalent of RIM-116 Rolling Airframe Missile, with the total weight less than a ton (a single launcher containing missiles). When QW-3 missiles are used, the FLS-1 system actually lacks the fire-and-forget capability of the RAM. However, the FLS-1 system can also be used to deploy the infrared guided TY-90, and thus becoming a fire-and-forget capable SAM system like American RIM-116 Rolling Airframe Missile. The fire control system includes radar and electro-optics, that can be either dedicated or utilizing the existing systems on board the naval vessel. The FLS-1 system with QW-3 missiles has been retrofitted to fast attack craft of the PLAN, but FLS-1 system with TY-90 has not entered services (as of 2008) despite successfully completing acceptance tests and receiving state certification. Although naval versions of other members of QW family have been successfully developed, they were not accepted into service with the exception of FLS-1. Instead, the Chinese deploy other QW missiles in the similar way United States Navy deploys FIM-92 Stinger missiles on board ships: sailors and marines on board ships were organized into MANPAD Gunnery Detachment to station on board ships, and fire the missile like the way the missiles are shoulder-fired on land.
- **FLV-1:** Vehicle mounted version for all QW series of missiles, development of CQW-2. In addition to QW series of missiles, other Chinese built MANPAD missiles such as HN-5 series and FN-6 series can also be used (though for QW-3, the launcher must be modified to accommodate the larger missile). The missiles are also mounted a high mobility 4 x 4 armored vehicle with same configuration, and the speed of the vehicle is greater than 85 km per hour and range is slightly greater than 600 km. The fire control system also works in the way similar to that of CQW-2, and the radar of FLV-1 has a range of 18+ km. The reaction of the entire system is less than 8 seconds. The missiles of FLV-1 can be directly removed from the vehicle mount and rapidly used by infantry in the field as shoulder fired missiles. Vehicle speed: > 85 km / hour Vehicle range: > 600 km Radar range: > 18 km Missile: Configuration of 2, 4, or 8 (usually 8) Reload: 8 total Reaction time: < 8 seconds
- **FLG-1:** Development of FLV-1 with upgraded C4I system so that in addition to the missiles of FLV-1, up to half a dozen towed anti-aircraft artillery could also be controlled at the same time. Since the towed anti-aircraft artillery lacked fire control system and the FLV-1 system lacks any guns, the combined anti-aircraft artillery and air defense missile system overcomes the disadvantage for both and greatly improved the performance in comparison to separate individual system. The FLG-1 system can be integrated into larger air defense network.
- **FL-2000(V):** FL-2000(V) (short for Flying Leopard 2000 Vehicle mounted) is the latest member which first made its public debut in China at the end of 2004 during the 5th Zhuhai Airshow. FL-2000(V) is a development of FLG-1 which utilizes modular design concept, enabling the system to incorporate a wide range of missiles and systems developed earlier. Laser designator is added the existing fire control system (FCS) so that the semi-active laser guided QW-3 can be directly used in the air defense system, instead of having to modify the earlier FCS first. Another significant improvement over FLG-1 is that FL-2000(V) incorporates the land-based version of FLS-1, and due to the modular design, the land-based version FLS-1 system is interchangeable with other land based system, and thus can be mounted on same chassis. FL-2000(V) system consists of 3 versions, FL-2000A, FL-2000B and FL-2000C. The A version is the basic model, with each vehicle has its own FCS, controlling missiles carried and AAA assigned. The B version incorporates a command vehicle so that several A versions and associating AAA can be integrated as a network to fight together. The C version incorporates TY-90 missile, further expanding capability.
- **TD-2000:** At the 7th Zhuhai Airshow held at the end of 2008, China National Precision Machinery Import and Export

Corporation (CNPMIEC) revealed a new family of mobile SAM system based on QW-4. The new SAM systems in dubbed as TD-2000, which is based on the 4 x 4 ZFB05 armored vehicle manufactured by Shaanxi Baoji Special Vehicles Manufacturing Co. Ltd. A total of 8 QW-4 missiles are mounted atop of the vehicle in two groups of 4, with the electro-optical (optronic) fire control systems (FCS) in the middle. The optronic FCS is the OT-3, derived from OFC-3 optronic FCS used on Type 730 CIWS, and developed by the same manufacturer of OFC-3. The range of the optronic FCS is greater than 15 km, and the reaction time is less than 6 seconds, and it weighs around 110 kg. The reaction time of the missile is less than a second. Missiles of TD-2000 can be fired simultaneously in pairs, either a pair or two pairs, against a single target, or simultaneously against two different targets, and all missiles can be reloaded within 7 minutes. TD-2000 can fire its missiles from traveling state in less than 5 to 10 minutes. TD-2000 features a built-in-test/diagnostic system which greatly improves its reliability and maintainability. Specifications: Operating temperature: −40 to 50 °C Mean time between failure: > 100 hours Mean time between catastrophic failure: > 250 hours Mean time to repair: < 0.5 hour

- **TD-2000B:** To increase the capability of TD-2000, China National Precision Machinery Import and Export Corporation (CNPMIEC) also revealed a development of TD-2000, dubbed as TD-2000B at the same Zhuhai Airshow, where TD-2000B was displayed as part of the subsystem of TD-2000B. The primary improvement over the original system is the extra C4ISR capability added so that in addition to control the QW-4 missiles of TD-2000, TD-2000B can also simultaneously control up to 6 anti-aircraft artillery pieces.
- **FL-9:** FL-9 is another SAM system utilizing QW series MANPADS, and it is not to be confused with the Chinese anti-shipping missile also designated as FL-9, which is a derivative of TL-6. FL-9 SAM system is similar to FL-2000C in that both utilizes QW series MANPAD and TY-90. FL-9 is a highly automated system that the operation of engaging targets can be performed by a single person. The vehicle carries a total of six missiles, three on each side of the FCS arranged in the following way: one TY-90 atop of two QW-18. The FCS included TV, IR and laser. Another improved feature of FL-9 is that in addition to SAMs, surface-to-surface missile can also be deployed on the same platform.

System

Manufactured: China Precision Machinery Import-Export Corp. (CPMIEC), Beijing, China China Aerospace Science and Industry Corporation (CASIC), Shenyang, China

Launch Mode: Shoulder-Fired

Mode of Attack: Omi-Direction

Guidance System: Infrared Imaging Guidance System

Engine: Rocket

Propellant: Solid

Minimum Range: 8m

Maximum Range: 8,000m

Guidance

QW-1 / QW-2: Infrared

QW-3: Semi-active Laser

QW-4: Imaging Laser

Notes:

The QW-1 (Qianwei-Advanced Guard) Vanguard infrared-guided surface-to-air missile (SAM) is similar in appearance to the U.S. FIM-92 Stinger. It was first developed as a replacement for the HN-5 shoulder-launched SAM (the Chinese version of the Russian SA-7 Grail), but is also can be deployed on light helicopters. The missile is similar in appearance to the Stinger, though it has only two forward control fins compared to the Stinger's four. It has four cropped delta wings at the rear. It is carried in a launch canister, the wings kept folded and deploying after launch. The nose is rounded and blunt. There is a slight taper at the tail of the missile where the rear wings are located, just forward of the launch booster. The QW-1 is easily identified by the vertically mounted cylindrical battery/coolant module. The missile can be shoulder-fired, launched from tripod or vehicle- or ship-mounted launcher. The missile reportedly can maneuver at up to 16 Gs. Guidance consists of a cooled, two-color infrared (IR) seeker with IR Counter-Counter Measures. The missile includes a short-lasting boost phase to clear it from the canister, after which the booster is discarded and the sustainer motor activates. The QW-1 is operated by a two-man-team. The gunner carries the missile, while the operator conducts target detection tasks. Once a target is visually detected, a suitable launch location is

selected and the end caps are removed from the launcher. The gunner activates the battery and the coolant, cooling the infrared seeker to the operating temperature. At that point, the gunner tracks the target until the missile locks on, which is indicated by a flashing light and a tone. The missile is fired and then the infrared seeker activates for terminal guidance. Initial operational capability (IOC) was reached in 1992 as a shoulder-launched anti-aircraft missile. It was first displayed and offered for export in 1994. There is no confirmation that the missile is serving as an Air to Air Missile (AAM). A naval SAM version has also been reported. An improved variant, the QW-2 AAM, was first offered for export in 1998 and began production in 1999. The QW-2 entered service in 2000. Bangladesh manufactures the QW-2 under license for its ground and naval forces. The missile is replacing the HN-5A system in Bangladeshi service. In 2008, the Indonesian air force ordered 26 QW-3 man-portable air defense systems and a number of missiles. Indonesian marines also utilize QW-3 missile systems mounted on 4 x 4 vehicles. The air force in 2008 also placed a US$35 million order for two TD-2000B combined gun and missile short-range air defense systems utilizing QW-3 missiles. In September 2009, Indonesia announced that it would acquire QW-3 missiles for the Paskhas special air force unit. QW-2 Vanguards were photographed in South Sudan in service with the Sudanese People’s Liberation Army (SPLA), according to Armament Research Services in mid-January of 2015. (The SPLA, formerly a guerrilla group, kept the same name as the nation's regular army) Ref: Military Periscope, October 2017

→Air Defense Command and Control Systems

Barnaul-T Russian Air Defense Command and Control System

Tiers:

System

Alternative Designation: Barnaul-T
Type: Russian Air Defense Command and Control System
Mission: Designed to detect aerial targets and control air defense systems of the Army, marine units and the Airborne Force.
Crew: It is manned by a driver, commander, and two crew to control the radar and C2 equipment, with the control stations housed in the crew compartment
Chassis: MT-LBU
Interoperability: interoperability with other combatant arms and services of the armed forces
Software: Current hardware/software can be modified to ensure interface with foreign-made radar data sources and SAM systems
Emplacement: Maximum set up time of five minutes from road march to combat readiness configuration
Displacement: min7
Note: The new air defence control system use of automation equipment at tactical level increases the efficiency of short-range SAM systems by up to 20% and reduces the expenditure of missiles per killed target by up to 30%

Dimensions (Chassis: MT-LBU)

Length: m6.45
Width: m2.86
Height: m1.86

Weight, Combat: kg11,000

Ground Pressure: kg/cm20.46 standard track / 0.28 wide track

Automotive (Chassis: MT-LBU)

Engine Name: YaMZ 238 (Newer versions have the KamAZ-740.50 engine / 360 horsepower)

Engine Type: Diesel

Engine Power: hp240

Cruising Range: km500

Speed, Maximum Road: km/h60

Speed, Average Cross: 30

Speed Maximum Swim: km/h5

Fording Depth: mAmphibious

Communications

Tactical Radio: Either the Azart-P (4km), Azart-N (12km), and Azart-BM (40km).

Main Weapon System

↳*System*

Name: PKT

Type: 7.62 mm, Machine-Gun

Caliber: mm7.62

↳*Ammunition*

Type: API, API-T

Caliber: mm7.62

Muzzle Velocity: m/sINA

Basic Load: rounds1,500

Max Effective Range (Day): m1,000

Max Effective Range (On the move): m500

Maximum Aimed Range: m1,500

Min Range: kmINA

Armor Penetration: 8mm of RHA at 500m

Communication Range on the Move: 9S931-1 MP-K, 9S931 MP, 9S932 MRU-B is 10km. 9S933 PMUO is 1 km.

↳*Radar*

Name: 1L122-1E Radar

Type: Radar that locates and tracks low-altitude aerial targets such as unmanned aerial vehicles (UAVs), helicopters, and ground attack aircraft

Maximum Range: km40

Targets: Capable of simultaneously tracking up to 100 different targets

Radar Refresh Rate: Automatic refresh rate of 1-12 seconds

Continuously Operation: 72 hours on internal power source

:

Protection

Hull Armor: mm14

Turret Armor: mm14

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: Optional

NBC Protection: Yes

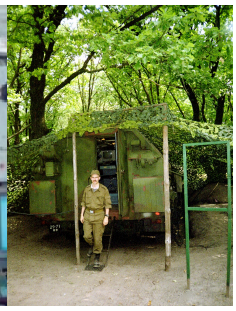
Smoke Equipment: No

Night Vision Device Capable: Yes. Some versions have spot lights.

Notes:

The Barnaul-T air defense control system is designed to detect aerial targets and control air defense systems of the Army, marine units and the Airborne Force. The systems uses the 9S932-1 intelligence and control module with 1L122-1E radar mounted on an MT-LBu tracked chassis. Baseline air defence command & control subsystem of the integrated troop and weapon management system. The Barnaul-T baseline air defence command and control subsystem is designed to fit tactical units' air defence (AD) control posts (CP) with advanced automation, communication, and data exchange equipment in order to effectively control air defence troops and weapons, coordinate their activities, and increase their mobility and survivability under any combat conditions. The Barnaul-T baseline set is used to equip: * AD division/brigade CP (mission planning module (MPM) mounted on the 9S931-1 wheeled chassis); * AD regiment CP (MP-K 9S931-1 and 9S931 MPM); * AD battalion CP (9S931 MPM); * Battery command and control (C2) post (9S932-1 reconnaissance and control vehicle with 1L122-1E radar); * MANPADS platoon C2 post (9S933 portable fire control unit); * SAM squad – 9S935 MANPADS squad automation equipment set. The configuration of the Barnaul-T baseline set depends on the organizational structure of Customer's tactical military units. The baseline set performs the following major tasks in automated mode: * Athering (reception) of air situation data from superior, interacting, and subordinate C2 posts, and a heliborne radar picket system; target tracking, radar data identification and display; reception and display of data on the friendly aircraft patrol area, interception lines, flight corridors, and joint action and cooperation areas; * Reception of alerts and battle commands from the superior C2 post, generation of reports based on them and target tracks with flight parameters; * Control over subordinate C2 posts and radars, transmission of alert information and data on the areas (sectors) of responsibility to such C2 posts and radars; reception, processing, display, and transmission of operational/tactical information on the position, status, and battle readiness of friendly troops; target allocation at each level of command, transmission of target designation and cease-fire commands to subordinate assets, based on the battle readiness, availability of free target channels and missiles; * Equipment test, engagement process recording; * Stand-alone and system-level integrated training of combat crews.

9S52 Polyana-D4 ASU Russian 6x6 Air Defense Command and Control Vehicle



Tiers:

1 2 **3** 4

Variants:

- **9S52M D4M Polyana system:** produced by Belarusian GNPO Agat, also developers of the Buk-MB modernisation of Buk-M1.

System

Alternate Designation: 9S52 Polyana-D4 ASU
In Service: 1986-Present
Type: Air Defense Command and Control System
Chassis: Ural 375
Composition: Combat Control Post; COmmand-Staff Vehicle; Autonomous Automated Workstation; SPTA and Maintenance Trailer; Two ED1x30-T400-1RAM3 Mobile Electric Power Stations

↳*Dimensions (Chassis: Ural 375D)*

Height, Overall : m2.68
Length, Overall : m7.36
Width, Overall : m2.67
Weight, Gross Vehicle: mt13.2

Cargo Space (Chassis: Ural 375D)

↳*Dimensions (Chassis: Ural 375D)*

Cargo Bed Area : m29.5
Height : m0.872
Length : m3.9
Width : m2.43

Automotive (Chassis: Ural 375D)

Engine Name: ZiL-375 Diesel

Engine Type: V8, 180 hp, Gasoline

Engine Power: hp180

Cooling System: Liquid

Fuel Capacity , Aux : liters60.0

Fuel Capacity, Main Tank: liters300.0

Maximum Road Speed: km/h75

Maximum Range: km750

Towing Capability, Off-Highway: kg5000.0

Towing Capability, Off-Highway: kg10000.0

Gradient: %65

Side Slope: %40

Vertical Step: m0.8

Trench: m0.7

Fording: m1.2

Command and Control, Communication Equipment

Number of Interfaces with Superior CPs: ea1

Number of Interfaces with Radar Data Sources: up to 3

Number of Air Targets Tracked Simultaneously: up to 250

Automated Workstation in CCP: ea8

Automated Workstation in CSV: ea3

Data Transfer Channels in CCP: ea16

Data Transfer Channels in CSV: ea4

Continuous Operation Time: not less than 72 hours

Into/Out-of-Action Time: Not more than 35 min

Radar Data Gathering and Processing: Yes

Air Situation Monitoring: Yes

Ground Situation Data: Yes, receiving, gathering, and processing

Automated Data Registration and Recording: Yes

Ciphering Equipment Capable: Yes

Operating Temperature: -40 deg C to +50 deg C

Notes:

9S52 Polyana-D4 ASU is a Soviet/Russian automated command and control system for air defence troops. May act as an upper level command post (CP) of the SAM brigade including S-300V as well as the 9K37 Buk complex. And also other means, including aircraft. Developed by Scientific Research Institute of the automatisation technics of Minradioprom. Chief designer - G.A.Burlakov. Development works started under the Decisions of the Special Commission of the Presidium of the USSR Soviet Ministry on military-industrial questions dated June 29, 1977 and August 27, 1981. Mass production of the system organized at the Minsk Electromechanical Plant (currently GNPO Agat), but later transferred to Penza, former Minradioprom factory. In

service since 1986. Chassis: Ural 375D

PPRU-M1 Russian Air Target Reconnaissance and Control Post

Tiers:

Variants:

- **PPRU-1M-2:** The PPRU-1M-2 replaces the analogue Dog Ear Radar with the VNIIRT 9S80M1-2 X-band radar.

System

Alternative Designation: PPRU-M1
Type: Air Target Reconnaissance and Control Post
Crew: eaINA
Chassis: MT-LBu

Dimensions (MT-LBu)

Length: 7.21 m
Width: 2.85 m
Height: 1.905 m
Weight, Combat: 15,550 kg
Ground Pressure: INA

Automotive (MT-LBu)

Engine Name: YaMZ-238N
Engine Type: V-8 diesel
Engine Power: 300 hp at 2,100 rpm
Cruising Range: km
Speed, Maximum: 61.5 km/h (road) 30 km/h (off-road)
Speed, Average Cross: INA
Speed Maximum Swim: 6 km/h
Fording Depth: INA
Suspension: Torsion bar

Radar System

Radar Name: 9S80 (Dog Ear)

Radar Operating Waveband: cm

Maximum Target Acquisition Range, at over 500 m: 34

Maximum Target Acquisition Range, at 25 m: 22

Automatic Target Tracking Capability: not less than 40 targets

Number of Objects Controlled Simultaneously: up to 6

Continous Operation Time: 24 hours

In/Out-of-Action Time: Not more than 5 minutes

Protection

Hull Armor: Welded aluminum

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The legacy PPRU M/M1 series of command posts were used primarily to support the 9K35/SA-13 Gopher and 2K22/SA-19 Grison point defence SAM system. The design remains in production. Early variants used the X-band 9S80/9S80M/M1 Ovod / Dog Ear as a battery acquisition radar. The most recent variant, displayed at MAKS 2007, includes the new design digital solid state VNIIRT 9S80M1-2 X-band radar, replacing the analogue Dog Ear. The MTLBu chassis is employed. he PPRU-M1 air target reconnaissance and control post is designed to control, both on the move and at halt, combat actions and fire delivery of air defence units armed with close/short-range antiaircraft artillery and missile systems. Composition: *radar *computer control system *multichannel data transceiver *external and internal communication aids *navigation and survey system *training facility *life support system *power supply system *tracked chassis, the MT-LBu multipurpose light armoured extended tractor *single spare parts, tools and accessories kit The PPRU-M1 CP provides full control of combat operations of any AD unit irrespective of its armaments and table of organisation. It exercises combat control of units armed with man portable surface-to-air missile systems via coded datalinks provided that MANPADS operators employ the 1L15/1L110 hand-held electronic data displays. The PPRU-M1 CP can be operated in various climates at ambient temperatures from -20°C to +50°C, relative air humidity of 98%, and wind speed of 30 m/s.

Cruise Missiles

→Short-Range Cruise Missiles (SRCM) (Less than 600 km)

→→Ground-Launched Cruise Missiles (GLCM) (Less than 600 km)

SS-N-27 Sizzler Russian Multi-Purpose Short Range Cruise Missile

Tiers:

Variants:

- **3M14K (SS-N-30A):** An inertial guidance land attack variant deployed by the Russian Navy. The submarine-launched weapon has a basic length of 6.2 m (20 ft), with a 450 kg (990 lb) warhead. Its range is 2,500 km (1,600 mi), allowing the Russian Navy to strike targets throughout central Western Europe (including all of the UK, northern France including Paris, and most of Germany) from beyond the GIUK gap. Its subsonic terminal speed is Mach 0.8.
- **3M14T:** The inertial guidance land attack variant which is deployed by the Russian Navy. A surface ship with VLS launched missile, with thrust vectoring booster, its basic length is 8.9 m (29 ft), its warhead weight and other performance are the same as the 3M14K. Russia fired 26 3M14T cruise missiles from four surface ships in the Caspian Sea against 11 targets in Syria on 7 October 2015.
- **3M-14TE:** An inertially guided, ship launched, land attack variant with VLS and a thrust vectoring booster. Its basic length is 8.9 m (29 ft), its warhead weight and other performances are the same as the 3M-14E. Its subsonic terminal speed is 0.8 mach, with a range of 300 km (190 mi) at supersonic speed.
- **91RE1:** A submarine-launched anti-submarine variant, it consists of two stages, one solid booster with four grid fins and one anti-submarine light torpedo. Its basic length is 7.65 m (25.1 ft), it has a range of 50 km (31 mi). It can reach supersonic speed. The torpedo has a warhead weight of 76 kg (168 lb). It is similar to the American ASROC/SUBROC missile/torpedo system. It follows a ballistic path on the surface, with a speed of Mach 2.5.
- **91RTE2:** Surface ship, VLS launched anti-submarine variant; it consists of three stages, one booster with thrust vector nozzle, one conventional booster, and one anti-submarine light torpedo. Its basic length is 8.9 m (29 ft), with a range of 40 km (25 mi) at supersonic speed. The torpedo has a warhead weight of 76 kg (168 lb). The lightest of all variants, with a launch weight of 1,300 kg (2,900 lb). Speed is Mach 2.
- **Club-M:** Land-based anti-ship missile for coastal defense. Range 300 km, includes supersonic terminal sprint phase.

System

Alternate Designation: SS-N-27, SS-N-27A, SS-N-27B, Sizzler, 3M54, 3M54M, 3M54E, 3M-54E1, 3M54TE, 3M54TE1,

3M54AE, 3M54AE1, 3M54-1, 3M14, Biryuza, 91R1, 91RT2

Class: Anti-Ship and Land Attack

Effective Range: 220 km (3M54), 300 km (3M54M1)

Circular Error Probability: m3

Basing: Submarine, Ship, Aircraft, Ground

Dimensions

Length: 8.22m for 3M54 (6.2 m for 3M54M1)

Missile Weight: 1,920 kg for 3M54 (1,570 kg for 3M54M1)

Diameter: m0.533

Fin Span: INA

Payload

Type: Single warhead

Warhead Type: Conventional or Nuclear

Warhead Weight: 200 kg HE for 3M54 (450kg HE for 3M54M1)

Nuclear Yield: INA

Conventional Warhead Weight: 400-500kg

Conventional Warheads Available: HE

Propulsion Characteristics

Engine: Turbojet (3M54 is three stage, 3M54M1 is two stage)

Propellant: Solid

Speed: Mach 0.8 - Mach 2.9

Flight Ceiling: m1,000

Flight Altitude: 50-150m AGL (20m ASL)

Fire Control

Guidance System: See variant

Notes:

The SS-N-27, Sizzler is a Russian short-range anti ship cruise missile that can be launched from land, sea, and air (in different variants). The Sizzler is the "AK-47" of Russian cruise missiles with almost limitless variants (See "Variants" on this page). The Sizzler is part of the Kalibr family.

Rubezh-ME Russian Coastal Defense Missile System

Tiers:

Variants:

- **Rubezh:** The Rubezh system uses improved P-15M missiles. These missiles are recoilless upon launch. Maximum range of fire is 80 km. This missile travels at a speed of 1 100 km/h (Mach 0.9). The missile travels at an altitude of 25, 50 or 250 m above sea level, depending on the setting which is pre-programmed before launch. Missile attacks its targets from the top.

System

Alternative Designation: Rubezh-ME

Type: Coastal Defense Missile System

Crew: ea2

Chassis: KamAZ-6350

Displacement Time: less than 10 minutes

Emplacement Time: less than 10 minutes

Fire on the Move: INA

Note #1: A typical battery of the Rubezh-ME includes up to 8 launcher vehicles with missiles and a mobile command post, equipped with Monolith-B radar. It is based on the same KamAZ 8x8 military truck chassis. Each launcher vehicle is supported by an associated reloading vehicle, which is fitted with a crane and carries reload missiles.

Note #2: The Rubezh-ME battery can launch up to 32 anti-ship cruise missiles. This is sufficient to disrupt operations of a large hostile battlegroup. Once the missiles are launched it takes 30-40 minutes to reload the launcher vehicles.

Dimensions

Length: 10 m

Width: 2.5 m

Height: 4 m

Weight, Combat: 26 tons

Automotive

Engine Name: KamAZ-740.50-360

Engine Type: Diesel

Engine Power: hp360

Range: up to 1 000 km

Speed, Maximum Road: km/h75

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %40

Vertical Step: 0.6 m

Trench: 0.6 - 1.4 m

Fording Depth: mup to 1.75 m

Missile System

Name: Kh-35UE

Type: Cruise Missile

Manufacturer: 440 cm

Length: 440 cm

Diameter: 42.0 cm

Wingspan: 133 cm

Weight: 610 kg

Warhead: 145 kg High Explosive Fragmentation (HE-FRAG) warhead.

Warhead Weight: 145 kg

Engine: R95TP-300 Turbojet Kh-35 / Turbofan Kh-35U 360 kgf

Propellant: kerosene

Operational Range: 260 km

Flight Altitude: 10-15 m en route and about 4 m at terminal area

Maximum Speed: 980–1,164 km/h

Guidance System: inertial guidance and ARGS-35E X-band terminal active radar homing

Basic Load: The launcher vehicle carries 4 containerized Kh-35UE missiles.

Fire Control

↳*Fire Control System*

Name: INA

Computerized FCS: Yes

Direct Fire: No

Indirect Fire: Yes

↳*Radar*

Name: 1 x Mineral-ME1 active radar

Type: Active Search Radar

Range: 250 km

Number of Targets System can Track: up to 200 targets

Protection

Hull Armor: Protection from small arms and shell splinters

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: INA

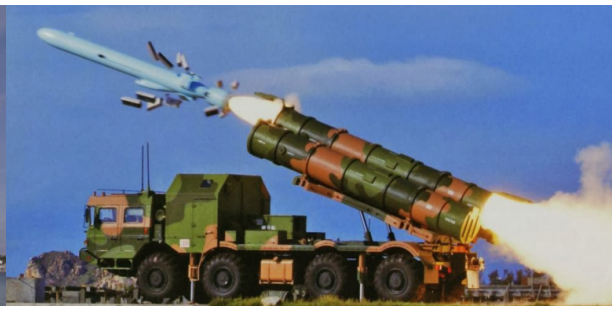
NBC Protection: INA

Smoke Equipment: INA

Notes:

At IMDS 2019, a new version of the Russian Bal-E coastal defence system is presented for the 1st time. The Rubezh-ME, dedicated to the export market, is based on a Kamaz 63501 8x8 chassis which is more compact than the MZKT-7930 of the original Bal-E. The Rubezh-ME still uses the same familly of KH-35 anti-ship missile. The system is paired with its Monolith-B self-propelled commmand vehicle with control and communication unit. The Rubez-ME can be deployed in less than 15 min, be positioned up to 1km above sea level and 10km from the coast line. The Monolith-B radar allows the Rubezh-ME to engage targets up to 250 km in active mode and up to 450km in passive mode, the systems also allows to track 30 targets in active mode, 50 in passive detection mode and 10 in targeting mode. The KH-35E missile has a range of 5 to 130km and the KH-35UE allows the Rubezh-ME to engage from 7 to 260km.

CM-602G Chinese Cruise Missile



Tiers:

1 **2** 3 4

Variants:

- **YJ-62:** The YJ-62 (Chinese: □□-62; pinyin: yingji-62; literally: 'eagle strike 62') is a Chinese subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation Third Academy.
- **C-602:** The C-602 is the export version of the YJ-62, claimed to have a range of 280 km, a 300 kg (660 lb) semi-armour-piercing warhead, and GPS guidance. The reduced range is in accordance with Missile Technology Control Regime restrictions. The C-602 was revealed in September 2005, and displayed outside of China for the first time at the African Aerospace and Defence exhibition in 2006.

System

:
:
:

↳ ***System***

Name: CM-602G Missile
Type: Cruise Missile
Missile Basic Load: INA
Length: INA
Diameter: INA
Weight: INA
Warhead Weight: 480 kg (1,060 lb) penetrating blast/fragmentation warhead
Detonation Mechanism: Semi-armor-piercing
Flight Altitude: 7 – 10 meter terminal

Operational Range: 290 km

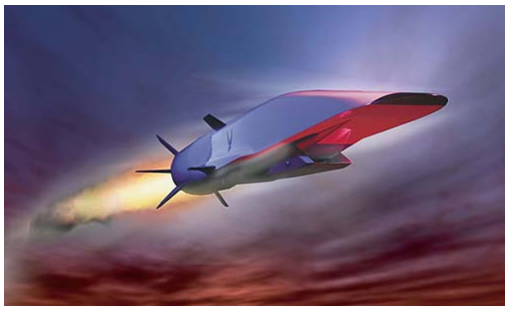
Speed: Mach 0.6-0.8

Guidance System: inertial guidance system using GPS data which may be augmented to provide man-in-the-loop control.

Notes:

The CM-602G is a land-attack version of the C-602. It is advertised as having a range of 290 km (180 mi), a 480 kg (1,060 lb) penetrating blast/fragmentation warhead, and an inertial guidance system using GPS data which may be augmented to provide man-in-the-loop control. The missile was revealed at the China International Aviation & Aerospace Exhibition in 2012. The YJ-62 is a Chinese subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation Third Academy. n a September 2014 article published in Joint Forces Quarterly, the YJ-62 is credited with a 210 kg (460 lb) warhead, a speed of Mach 0.6–Mach 0.8 (735–980 km/h; 457–609 mph), and a sea-skimming terminal attack height of 7–10 metres. The missile has an inertial guidance system using GPS and BeiDou data, and an active terminal sensor. YJ-62A is credited with a range of up to 400 km (250 mi; 220 nmi). In lieu of official data, the United States Navy's Office of Naval Intelligence believes it is likely the YJ-62 has a longer range than the 150 nautical miles (170 mi; 280 km) of the C-602 export version, at least 400 km. The missile is deployed aboard Type 052C destroyers, and by coastal defence units using three-round transporter erector launchers.

BrahMos II Indian/Russian Multi-Role Short Range Cruise Missile



Tiers:

1 2 3 4

System

Alternate Designation: BrahMos 2, BrahMos Mark 2, BrahMos-II(K)

Country of Origin: Russia / India cooperative effort

Basing: Submarine, ship, ground, air

Launch Platform(s): TBD

Effective Range: km~600

Circular Error Probability: m~1

Dimensions

Length: mINA

Missile Weight: kgINA

Diameter: mINA

Fin Span: mINA

Payload

Warhead Type: INA

Warhead Options: INA

Nuclear Yield: mTINA

Conventional Warhead Weight: kgINA

Conventional Warheads Available: INA

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: INA

Chemical Capable: INA

Propulsion Characteristics

Engine: 2 stage, boost and scram jet

Propellant: Russia working on a unique fuel

Speed: ~Mach 7

Flight Ceiling: INA

Attack Altitude: INA

Fire Control

Guidance System: INA

Notes:

BrahMos-II BrahMos Mark II (not to be confused with BrahMos-I, Block-2) is intended to be a hyper-sonic cruise missile currently under joint development by Russia and India, which have together formed BrahMos Aerospace Private Limited. It is the second of the BrahMos series of cruise missiles. The BrahMos-II is expected to have a range of 450 kilometers and a speed of Mach 7. During the cruise stage of flight the missile will be propelled by a scram jet air breathing jet engine. http://defencenews.in/article/Meet-BrahMos-II-The-Super-Hypersonic-Missile-Russia-and-India-May-Never-Build-583398 Russia's military made headlines in 2018 when it announced it had hypersonic missiles that are ready for combat. While many nations are developing these advanced weapons, Russia appears to hold the lead and is not stopping, with Putin announcing that Russia plans to field even more in 2019 . But what about the joint Russian/Indian hypersonic missile project? Following the development of the supersonic BrahMos anti-ship cruise missile during the 2000s, the joint venture, BrahMos Aerospace, announced the development of a hypersonic BrahMos II in 2008 . But ten years later, as Russia fields its first hypersonic missiles, where is the BrahMos II? The short answer is that the BrahMos II is not coming any time soon. While Russian hypersonic missile programs have steadily proceeded, BrahMos II development has intermittently started and stopped multiple times, with deadlines and dates changing almost every year. It's possible that it may never enter service. ...This was not to be. At Aero India 2015, the new CEO of BrahMos Aerospace, Sudhir Mishra said that scientists had quietly begun work on the hypersonic version of the supersonic BrahMos missile. He expressed the view that the India may be the first country in the world to field a hypersonic missile "in the next 7-12 years". This pushed the timeline for the BrahMos II back to 2022-2027. But in 2016, the marketing director of BrahMos Aerospace, Praveen Pathak, suggested that this was not true in an interview with the Russian TASS news service. He said that work on the hypersonic BrahMos would begin in 2022 , and that a prototype would be ready two years later in 2024. At this point, it's likely that earlier work on the hypersonic missile was wiped clean, since Pathak suggested that the missile's shape and design were not known. During the interview, he stated that "the preliminary design is now being developed." In 2018 this was pushed back further. Mishra told the Times of India that "We will require seven to ten years from now to become a hypersonic missile system," suggesting that the hypersonic BrahMos would only reach service between 2025 and 2028. So where does the BrahMos II stand in 2019? In a report about the BrahMos at Aero India 2019, it was simply said that the hypersonic version would exist "in a few years." While this is far more realistic, given that Russia has nearly completed development of its own missiles, time will tell if the BrahMos II is delayed yet again.

Polyphem German and French Multi-Role Short Range Cruise Missile

Tiers:

1 2 3 **4**

Variants:

- **Polyphem-H:** Helicopter launched variant
- **Polyphem-S:** Ship launched variant
- **Triton:** Submarine launched variant

System

Alternate Designation: Trilateral fibre-optic guided missile system (TRIFOM), Polyphem-S, Polyphem-H, Triton

Basing: Submarine, Ship, Truck

Launch Platform(s): Braunschweig class corvette, Mercedes TEL

Effective Range: km60

Circular Error Probability: m1

Dimensions

Length: m2.7

Missile Weight: kg130

Diameter: mINA

Fin Span: mINA

Payload

Warhead Type: Single

Warhead Options: Conventional

Nuclear Yield: mTNA

Conventional Warhead Weight: kg20

Conventional Warheads Available: Hollow charge with a hull of splinters

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: NA

Propulsion Characteristics

Engine: Booster for launch and turbo-jet for flight

Propellant: Solid

Speed: 120—180 m/s (around 430—650 km/h)

Flight Ceiling: m600

Minimum Altitude: m20

Attack Altitude: INA

Fire Control

Guidance System: Primary guidance came from fiber optics to send and receive messages to and from the launch site. The missile was also capable of automatic flight using advanced image processing algorithms, electro-optical converters and radio links. The firing station has a global positioning system (GPS) Navstar navigation reference unit, a north-seeking device and a command, control, communications and information (C3I) system interface.

Notes:

The Polyphem was a proposed light-weight fibre-optic wire-guided surface-to-surface missile with a range of 60 km. It used a solid propellant booster rocket to launch the missile out of its canister to an initial height so that the wings and control surfaces can unfold and a more fuel economic turbojet cruise engine would kick in to propel the missile. The missile could be programmed to follow a preset course, using GPS or inertial guidance. An infrared seeker could be used to automatically pick a target and for the terminal guidance phase, but it was also possible to transfer the thermal images back to the launching platform via a 200 MBit/s data link provided by an optical fibre, and manually select the target. The fibre-optic guided Polyphem missile was intended for two kinds of mission: isolated strikes from light land vehicles against long-range targets or from small ships or helicopters against land-based targets. The Polyphem program was started in 1994 by Germany, France and Italy. Italy later left the project. A naval version, called Polyphem-S, was initially selected for the Braunschweig class corvette as anti-ship and land-attack missile, but that has been cancelled. The Polyphem program as a whole was cancelled in 2003.

SS-N-26 Strobile Russian Anti-Ship Short Range Cruise Missile

Tiers:

Variants:

- **3M55 Oniks:** Base version for Russia.
- **Oniks-M:** Version of Oniks with improved range (up to 800 km), accuracy and ECCM capabilities.
- **P-800 Yakhont:** Export version of Oniks.
- **P-800 Bolid:** Submarine-launched version of Yakhont.
- **Brahmos:** Co-developed by Russia and India, based on Oniks, produced by BrahMos Aerospace Private Limited in India. BrahMos-II, a hypersonic version is also being developed.
- **Bastion-P:** Bastion-P is a coastal defense version of the P-800. It entered Russian service in 2010. The P-800 missile used in the Bastion-P remains essentially unchanged. Its launch platform is based upon a Belarusian MZKT-7930 special wheeled chassis. This gives the Bastion-P excellent mobility, including rough terrain. The Bastion-P launcher vehicle carries two P-800 missiles
- **Kh-61:** Air launched air to surface version.

System

Alternate Designation: Yakhont, 3M55, Ruby, Kh-61, P-800 Oniks, Yakhont-M, Stallion, Bastion-P, Bastion-S,

Class: Anti-Ship, Land Attack

Effective Range: 600km (Export: 300km)

Circular Error Probability: m1.5

Basing: Ground, Ship,Submarine, Aircraft

Transporter-Erector-Launcher: K-340P for ground launch can carry two missiles and each missile can be launched 5 seconds apart

Dimensions

Length: 8.6m (8.3m for air to surface version)

Missile Weight: kg3,000

Diameter: m.7

Fin Span: m1.7

Payload

Type: Single warhead

Warhead Type: Semi-armor piercing and HE (Export version: HE)

Nuclear Warhead Weight: NA

Nuclear Yield: NA

Conventional Warhead Weight: 200kg HE / 250kg Armor Piercing

Conventional Warheads Available: HE sub-munitions, semi-armor piercing

Propulsion Characteristics

Engine: Booster / Ramjet

Propellant: Solid-fuel Booster; Liquid-Fuel Ramjet Sustainer

Speed: 750 m/s (Mach 2.6)

Flight Altitude: 10,000–14,000 m

Minimum Altitude: m10

Surface Speed: Mach 2

Fire Control

Guidance System: GPS, mid-course inertial guidance, active radar homing, passive radar seeker head

Radar homing: All-weather monopulse active-passive with frequency hopping

Countermeasures: Active spoofing, dipole clouds

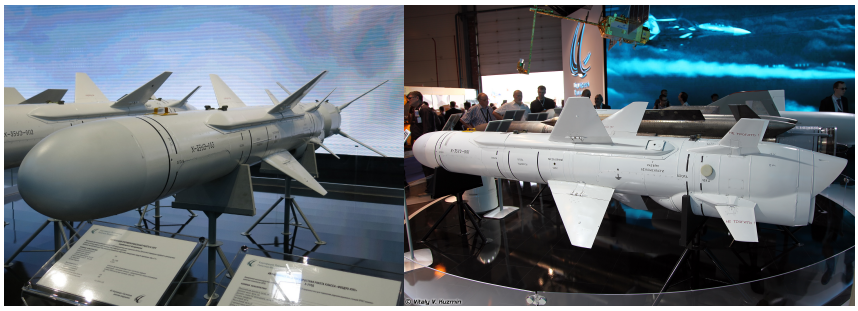
Radar Range: km50

Seeker: Granit-Elektron seeker

Notes:

The SS-N-26 Strobile was first developed in 1993 by NPO Mashinostroyenia. In 1999, they developed the ground-launched export version, the Yakhont, and an air-launched version, the Yakhont-M. A sub-launched version has been developed to be fitted to Yasen-class attack submarines, and the Bastion-P and Bastion-S launch systems have since been developed. The Strobile was first deployed in 2002 on Russia’s Nakat-class missile ship. Though originally designed to be an anti-ship missile, the Bastion missile launch systems were first deployed in 2015 with the Russian Army and the missiles were used in a surface to surface role. In 1988, Russia and India collaborated on a joint venture called Brahmos Aerospace Ltd, which produced the Brahmos missile, a supersonic cruise missile based on the Yakhont.

Kh-35UE Russian Cruise Missile



Tiers:

1 **2** 3 4

Variants:

- **Kh-35 (3M-24):** Base naval version for Russia (2003).
- **Kh-35E (3M-24E):** Export version of Kh-35 (1996).
- **Kh-35U:** Base upgrade unified missile (can be used with any carrier), version for Russia in production (as of July 1, 2015). Capable of striking land targets.
- **Kh-35UE:** Export version of Kh-35U, in production.
- **Kh-35V:** Version for Russia, launched from a helicopter.
- **3M-24EMV:** Export version of Kh-35 missile-target without warhead for Vietnam.
- **Kh-35 Uran/Uran-E:** Shipborne equipment of the control system with a missile Kh-35/Kh-35E
- **Bal/Bal-E:** Coastal (SSC-6 Sennight) missile complex with Kh-35/Kh-35E missiles (2008).
- **KN-09 Kumsong/GeumSeong-3:** (Venus 3 □□3□ □□3□) - KN0v 0x 01, KN19 Reported North Korean copy of the Kh-35U. Kumsong-3 is a North Korean domestic variant/clone of Kh-35 likely based on Kh-35U due to range.Demonstrated range in 2017, June 8 test is 240 km.
- **Kh-37 or Kh-39:** possible name for nuclear-tipped variant.
- **KCT-15:** License-produced Kh-35E by Vietnam
- **Neptune:** Ukrainian derivative
- **VCM-01:** customized version of the Russian-made Kh-35UE produced under license in Vietnam.

System

Name: Kh-35UE
Type: Cruise Missile
Manufacturer: 440 cm
Length: 440 cm
Diameter: 42.0 cm
Wingspan: 133 cm
Weight: 610 kg
Warhead: 145 kg High Explosive Fragmentation (HE-FRAG) warhead.
Warhead Weight: 145 kg
Engine: R95TP-300 Turbojet Kh-35 / Turbofan Kh-35U 360 kgf
Propellant: kerosene
Operational Range: 260 km
Flight Altitude: 10-15 m en route and about 4 m at terminal area

Maximum Speed: 980–1,164 km/h

Guidance System: inertial guidance and ARGS-35E X-band terminal active radar homing

Basic Load: The launcher vehicle carries 4 containerized Kh-35UE missiles.

Notes:

The Kh-35UE air-to-surface/anti-ship missile is a modern variant of the Kh-35E air-launched missile. It is in service with the Russian Navy, Indian Navy, and the Vietnamese People’s Navy. The high-subsonic missile offers improved performance and range than its predecessor. It is guided by inertial and satellite navigation systems, as well as an active-passive radar seeker, which ensure better accuracy, and resistance against jamming. The advanced seeker further offers a 50km lock-on range compared with the 20km range of the Kh-35E. Fitted with a 145 kg high-explosive fragmentation penetrator warhead, the Kh-35UE missile is available in aircraft and helicopter-launched versions, which can strike targets within the range of 260km.

→→Air-Launched Cruise Missiles (ALCM) (Less than 600 km)

C-802 Chinese Anti-Ship Cruise Missile

Tiers:

Variants:

- **YJ-83:** The YJ-83 (Chinese: □□-83; pinyin: yingji-83; literally: 'eagle strike 83'; NATO reporting name: CSS-N-8 Saccade) is a Chinese subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation Third Academy.
- **C-801:** The C-801 is the export version of the YJ-8. The C-801 was not marketed after 2003.
- **C-802:** The C-802 is the export version of the YJ-83; It is powered by the French TRI 60-2 turbojet and has a range of 65 nautical miles (120 km). The C-802A and C-802AK are the export surface- and air-launched variants. The C-802A has a range of 100 nautical miles (190 km).

System

:
:
:

↳***C-802 Anti-Ship Cruise Missile***

Name: C-802
Type: Anti-Ship Cruise Missile
Manufacturer: China Aerospace Science and Industry Corporation
Length: INA
Diameter: INA
Weight: INA
Warhead: 190 kg high-explosive fragmentation
Engine: French TRI 60-2 turbojet
Operational Range: 125 km
Maximum Speed: Mach 0.9
Guidance System: Inertial navigation/active radar homing terminal guidance

Notes:

The C-802 is the export version of the YJ-83; It is powered by the French TRI 60-2 turbojet and has a range of 65 nautical miles (120 km). The C-802A and C-802AK are the export surface- and air-launched variants. The C-802A has a range of 100 nautical miles (190 km). The YJ-83 (Chinese: □□-83; pinyin: yingji-83; literally: 'eagle strike 83'; NATO reporting name: CSS-N-8 Saccade) is a Chinese subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation Third Academy. The US military considers the C-802 and C-802A as parts of the YJ-83 family. The C-802 precedes the closely related YJ-83; strictly speaking, only the C-802A is the export development of the YJ-83. The C-802 is sometimes and erroneously considered the export version of the YJ-82; the two are separate developments. A prospective "C-803" was erroneously promulgated as the export version of the YJ-83 by enthusiasts in the late-1990s. As yet, no such missile exists.

YJ-83 (CSS-N-8 Saccade) Chinese Anti-Ship Cruise Missile

Tiers:

Variants:

- **C-802:** The C-802 is the export version of the YJ-83; It is powered by the French TRI 60-2 turbojet and has a range of 65 nautical miles (120 km). The C-802A and C-802AK are the export surface- and air-launched variants. The C-802A has a range of 100 nautical miles (190 km).

System

:
:

↳***Missile***

Name: YJ-83 (CSS-N-8 Saccade)
Type: Subsonic anti-ship cruise missile
Manufacturer: China Aerospace Science and Industry Corporation
Length: INA
Diameter: INA
Warhead Type: High-explosive fragmentation
Warhead Weight: kg190
Operational Range: km180
Speed: Mach 0.9
Guidance System: Inertial navigation/active radar homing terminal guidance
Basic Load: ea2

Notes:

The YJ-83 (Chinese: □□-83; pinyin: yingji-83; literally: 'eagle strike 83'; NATO reporting name: CSS-N-8 Saccade) is a Chinese subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation Third Academy. The YJ-83 uses microprocessors and a strapdown inertial reference unit (IRU); these are more compact than the equivalent electronics used in the YJ-8 and the export C-802, allowing the YJ-83 to have a 180-km range at Mach 0.9. The missile is powered by the Chinese CTJ-2 turbojet, and carries 190-kg high-explosive fragmentation warhead. Terminal guidance is by an active radar. The YJ-83K, the air-launched variant, has a range of 200 km. This data may be for an improved YJ-83A; the original

YJ-83 may have shorter range, at 120 km and 130 km for the surface- and air-launched versions, respectively. The YJ-83KH has an electro-optical seeker, and may receive course corrections by remote link. The YJ-83 entered service with the People's Liberation Army Navy in 1998-1999 and has equipped a large number of its surface warships. The YJ-83K equips the Xian JH-7 and H-6G.

YJ-12 Chinese Supersonic Anti-Ship Cruise Missile

Tiers:

Variants:

- **YJ-12:** INA
- **YJ-12A:** Naval surface-based variant, launched by rocket booster[
- **YJ-12B:** Land-based variant with 160 nmi (180 mi; 300 km) range
- **CM-400AKG:** The CM-400AKG is an air-launched supersonic surface attack cruise missile, believed to be the export version of the YJ-12. The 910 kg (2,000 lb) missile is 0.4 m (1.3 ft) in diameter and has a range of between 54–130 nmi (62–150 mi; 100–241 km) while carrying either a 150 kg (330 lb) blast or 200 kg (440 lb) penetration warhead. It has three guidance options, including inertial navigation system (INS) coupled with satellite positioning to get within 50 m, an onboard IR/TV seeker for terminal guidance and 5 m accuracy, and passive radar to supplement the seeker, which delivers (strangely worse) 5–10 m accuracy. One unusual characteristic is that it does not fly at low altitude to avoid detection, but rather uses “high altitude launching” to achieve “higher aircraft survivability.” It may have a top speed of Mach 5.
- **CM-302:** In November 2016, CASIC unveiled the CM-302 as the export version of the YJ-12. It is marketed as "the world's best anti-ship missile" that it is supersonic throughout its flight, can be launched from air, land, and naval platforms, can disable a 5,000-tonne warship, and be used in a land attack role. Assuming physical characteristics similar to the YJ-12, the missile is likely 7 m (23 ft) long and 0.6 m (2.0 ft) diameter, with an estimated weight of 2,000–2,500 kg (4,400–5,500 lb). It is stated to have a range of 280 km (170 mi; 150 nmi), a 250 kg (550 lb) warhead, guided by BeiDou which can be updated by data-link with an active radar seeker for terminal homing to achieve a 90% probability of hitting its target, while traveling at a mid-course speed of Mach 1.5-2 and accelerating to Mach 3 or higher during the terminal flight phase.

System

Alternative Designation: YJ-12

Type: Supersonic Anti-Ship Cruise Missile

Type: Supersonic Anti-Ship Cruise Missile

Length: 6.3 m

Diameter: 0.756 m

Weight: 2,500 kg

Warhead Type: HE-FRAG

Engine: integrated ramjet/booster propulsion system

Operational Range: 500 km

Maximum Speed: Mach 3

Guidance System: Inertial with active radar homing

Notes:

The YJ-12 (Chinese: □□-12; pinyin: yīngjī-12; literally: 'Eagle Strike 12') is a Chinese supersonic anti-ship cruise missile. The YJ-12 is an air-launched missile that resembles a lengthened Kh-31 and is close in shape to the GQM-163 Coyote aerial target. A 2011 article in the United States Naval War College Review credited the "YJ-91/YJ-12" with a range of 400 km and a 205 kg high explosive warhead, compared to the 130 km (81 mi; 70 nmi) range of a Harpoon anti-ship missile. Furthermore, an aircraft could launch the "YJ-91/YJ-12" while still 230 km beyond the range of SM-2 and Sparrow anti-air missiles, which have ranges of less than 170 km. According to Chinese sources, the YJ-12 has a speed of around Mach 2 if launched from low altitude and up to Mach 3.2 if launched from high altitude, with a maximum range of around 380 km (240 mi; 210 nmi) depending on launch altitude; terminal attack altitude is 15 meters. In a September 2014 article published in Joint Forces Quarterly, the missile was credited with a range of up to 250 km and a speed of Mach 2.5. In February 2015, military expert Li Li claimed the YJ-12 has a 400–500 kg (880–1,100 lb) warhead and a range of 300 km (190 mi; 160 nmi) when traveling at Mach 3, or 400 km at a speed of Mach 4. Speed and range varies on launch altitude and flight path, achieving maximum performance at an altitude of 40 km (130,000 ft) and degrading as it gets lower. Although actual warhead weight may be roughly 200 kg, its supersonic speed enables lethality equivalent to a subsonic missile equipped with a 400–500 kg warhead. The YJ-12 can also do evasive maneuvers to avoid anti-missile threats. A saturation attack by YJ-12's fired at long range would pose a grave threat to American carrier strike groups; once the wave of sea-skimming missiles appeared over the horizon and was detected by ships' own sensors, they would only have some 45 seconds to engage before impact and if there were enough, short range defenses would be overwhelmed. Given that fighters such as the Su-30MKK and J-11B have a combat radius of about 1,500 km, equipping them with the YJ-12 gives them a potential strike range out to 1,900 km (1,200 mi; 1,000 nmi). The U.S. Navy's counter is to use the Cooperative Engagement Capability to detect and destroy the YJ-12's launch aircraft with SM-6 missiles and fighters at long range before they can be fired. It has been test-launched from Xian H-6 bombers and will be fitted on the JH-7B. Reportedly, they may also be launched from the J-10, Su-30MKK, the J-11, and J-16.

C-801 Chinese Anti-Ship Cruise Missile

Tiers:

Variants:

- **C-801:** The C-801 is the export version of the YJ-8. The C-801 was not marketed after 2003.
- **YJ-8:** Basic version with fixed wings
- **YJ-8A:** Modified YJ-8 with folding wings.
- **YJ-81:** Air-launched version without the booster.
- **YJ-82:** Submarine-launched version.
- **C-801K:** Export version of the YJ-81
- **C-801Q:** Export version of YJ-82.

↳*C-801 Anti-Ship Cruise Missile*

Name: C-801
Type: Anti-Ship Cruise Missile
Length: 5.81 m
Diameter: INA
Weight: 815 kg
Warhead Weight: 165 kg
Engine: Rocket
Propellant: solid rocket
Operational Range: 42 km
Flight Altitude: 5-7 m
Maximum Speed: Mach 0.9
Guidance System: Inertial navigation/active radar homing terminal guidance

Notes:

The C-801 is the export version of the YJ-8.[4][3] The C-801 was not marketed after 2003. The YJ-8 (Chinese: □□-8; pinyin: yingji-8; literally: 'eagle strike 8'; NATO reporting name: CSS-N-4 Sardine) is a Chinese surface-launched subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation (CASIC) Third Academy. The YJ-8 was developed into air-launched (YJ-81) and submarine-launched (YJ-82) variants. The YJ-8 is either based on, or is a heavily modified copy of, the MM38 Exocet; the two missiles share virtually identical operational profiles. The replication of the MM38's "revolutionary flight profile" in less than ten years and with an immature industrial base strongly suggests that China had access to proven technology. The YJ-8 was a "radical departure" from China's first anti-ship missiles derived from the P-15 Termit. The YJ-8 carried a smaller warhead, but had the same range and speed while being significantly smaller and lighter.

Kh-61 Russian Supersonic Cruise Missile

Tiers:

Variants:

- **3M55 Oniks:** Base version for Russia.
- **P-800 Yakhont:** Export version of Oniks.
- **P-800 Bolid:** Submarine-launched version of Yakhont.
- **Brahmos:** Co-developed by Russia and India, based on Oniks, produced by BrahMos Aerospace Private Limited in India. BrahMos-II, a hypersonic version is also being developed.
- **Bastion-P:** Coast mobile missile system. Officially it entered service in 2015.
- **Kh-61:** Air launched air to surface version.
- **Oniks-M:** version of Oniks with improved range (up to 800 km), accuracy and ECCM capabilities

Name: Kh-61
Type: Supersonic Anti-Ship Cruise Missile
Manufacturer: NPO Mashinostroyeniya
Length: 8.9 m
Diameter: 0.7 m
Weight: 3,000 kg
Wingspan: 1.7 m
Warhead: national ver. 300 kg semi-armour piercing HE, thermonuclear; for export 200 kg semi-armour piercing HE
Detonation Mechanism: delay fuze
Engine: Ramjet 4 tons of thrust
Propellant: kerosene liquid fuel
Operational Range: 600 km (370 mi; 320 nmi) (Oniks version for Russia) 120 to 300 km (75 to 186 mi; 65 to 162 nmi) depending on altitude (Yakhont export version)
Flight Ceiling: 14,000 m

Flight Altitude: 10 meters or higher

Speed: Mach 2

Guidance System: midcourse inertial guidance, active radar homing-passive radar seeker head

Accuracy: m1.5

Launch Platform: coastal installations, naval ships, Fixed-wing aircraft

Notes:

Kh-61 - Air launched air to surface version of the P-800 The P-800 Oniks (Russian: П-800 Оникс; English: Onyx), also known in export markets as Yakhont (Russian: Яхонт; English: ruby), is a Soviet / Russian supersonic anti-ship cruise missile developed by NPO Mashinostroyeniya as a ramjet version of P-80 Zubr. Its GRAU designation is 3M55, the air launched Kh-61 variant also exists. The missile has the NATO reporting codename SS-N-26 "Strobile". Development officially started in 1983, and in the 1990s the anti-ship missile was tested on the Project 1234.7 ship. In 2002 the missile passed the whole range of trials and was commissioned. It is reportedly a replacement of the P-270 Moskit, but possibly also of the P-700 Granit. The P-800 was used as the basis for the joint Russian-Indian supersonic missile BrahMos. The missile is carried in flight by aerodynamic lift. The solid-propellant booster is located in the ramjet's combustion chamber and is ejected by the airflow after it has burned out. Advantages *Over-the-horizon firing range *Full autonomy of combat use ("fire and forget") *A set of flexible ("low-profile sea-skimming", "high-low") trajectories *High supersonic speed in all phases of flight *Full harmonization for a wide range of platforms (surface ships, submarines and land-based launchers) * Possible use of the missile in electronic countermeasures environment and under enemy fire

Length: 385 cm

Diameter: 42.0 cm

Weight: 520 kg

Wingspan: 133 cm

Warhead: HE fragmentation shaped charge

Warhead Weight: 145 kg

Engine: R95TP-300 Turbojet Kh-35 / Turbofan Kh-35U 360 kgf

Propellant: kerosene

Operational Range: 130 km

Flight Altitude: 10-15 m en route and about 4 m at terminal area

Speed: Mach 0.8–Mach 0.95 (609–723 mph; 980–1,164 km/h)

Guidance System: inertial guidance and ARGS-35E X-band terminal active radar homing

Launch Platform: Tupolev Tu-142, Su-24, MiG-29M/K, Sukhoi Su-35, Su-27SM, Su-30MKI//SM, Su-34, HAL Tejas, Ka-27, Ka-28, Ka-52, T-50, also ships and boats, coastal, LACM, TEL variants

Notes:

The Zvezda Kh-35 (Russian: X-35 , AS-20 'Kayak') is a Soviet turbojet subsonic cruise[8] anti-ship missile. The same missile can also be launched from helicopters, surface ships and coastal defence batteries with the help of a rocket booster, in which case it is known as Uran ('Uranus', SS-N-25 'Switchblade', GRAU 3M24) or Bal ('Ball', SSC-6 'Sennight', GRAU 3K60). It is designed to attack vessels up to 5,000 tonnes. Zvezda started work on the Kh-35 in 1983 by a decree of the USSR Council of Ministers and the USSR CPSU Central Committee to arm ships of medium tonnage. The Kh-35 missile is a subsonic weapon featuring a normal aerodynamic configuration with cruciform wings and fins and a semi submerged air duct intake. The propulsion unit is a turbofan engine. The missile is guided to its target at the final leg of the trajectory by commands fed from the active radar homing head and the radio altimeter. Target designation data can be introduced into the missile from the launch aircraft or ship or external sources. Flight mission data is inserted into the missile control system after input of target coordinates. An inertial system controls the missile in flight, stabilizes it at an assigned altitude and brings it to a target location area. At a certain target range, the homing head is switched on to search for, lock on and track the target. The inertial control system then turns the missile toward the target and changes its flight altitude to an extremely low one. At this altitude, the missile continues the process of homing by the data fed from the homing head and the inertial control system until a hit is obtained. The Kh-35 can be employed in fair and adverse weather conditions at sea states up to 5-6, by day and night, under enemy fire and electronic countermeasures. Its aerodynamic configuration is optimized for high subsonic-speed sea-skimming flight to ensure stealthy characteristics of the missile. The missile has low signatures thanks to its small dimensions, sea-skimming capability and a special guidance algorithm ensuring highly secure operational modes of the active radar seeker. Its ARGS-35E active radar seeker operates in both single and multiple missile launch modes, acquiring and locking on targets at a maximum range of up to 20 km. A new radar seeker, Gran-KE has been developed by SPE Radar MMS and will be replacing the existing ARGS-35E X band seeker.

C-602 Chinese Anti-Ship Cruise Missile

Tiers:

Variants:

- **YJ-62:** The YJ-62 (Chinese: □□-62; pinyin: yingji-62; literally: 'eagle strike 62') is a Chinese subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation Third Academy.
- **CM-602G:** The CM-602G is a land-attack version of the C-602. It is advertised as having a range of 290 km (180 mi), a 480 kg (1,060 lb) penetrating blast/fragmentation warhead, and an inertial guidance system using GPS data which may be augmented to provide man-in-the-loop control. The missile was revealed at the China International Aviation & Aerospace Exhibition in 2012.

C-602 Anti-Ship Cruise Missile

↳*System*

Name: C-602 Missile
Type: Anti-Ship Cruise Missile
Manufacturer: China Aerospace Science and Industry Corporation
Proliferation: Widely Proliferated
Length: INA
Diameter: INA
Weight: INA
Warhead Weight: 300 kg (660 lb) semi-armour-piercing warhead
Detonation Mechanism: Semi-armor-piercing
Flight Altitude: 7 – 10 meter terminal
Operational Range: 200 km
Speed: Mach 0.6-0.8
Guidance System: GPS guidance
Launch Platform: TEL Type 052C destroyer

Notes:

The C-602 is the export version of the YJ-62, claimed to have a range of 280 km, a 300 kg (660 lb) semi-armour-piercing warhead, and GPS guidance. The reduced range is in accordance with Missile Technology Control Regime restrictions. The C-602 was revealed in September 2005, and displayed outside of China for the first time at the African Aerospace and Defence

exhibition in 2006. The YJ-62 is a Chinese subsonic anti-ship cruise missile. It is manufactured by the China Aerospace Science and Industry Corporation Third Academy. n a September 2014 article published in Joint Forces Quarterly, the YJ-62 is credited with a 210 kg (460 lb) warhead, a speed of Mach 0.6–Mach 0.8 (735–980 km/h; 457–609 mph), and a sea-skimming terminal attack height of 7–10 metres. The missile has an inertial guidance system using GPS and BeiDou data, and an active terminal sensor. YJ-62A is credited with a range of up to 400 km (250 mi; 220 nmi). In lieu of official data, the United States Navy's Office of Naval Intelligence believes it is likely the YJ-62 has a longer range than the 150 nautical miles (170 mi; 280 km) of the C-602 export version, at least 400 km. The missile is deployed aboard Type 052C destroyers, and by coastal defence units using three-round transporter erector launchers.

YJ-62 Chinese Anti-Ship Cruise Missile

Tiers:

1 **2** 3 4

Variants:

- **C-602:** The C-602 is the export version of the YJ-62, claimed to have a range of 280 km, a 300 kg (660 lb) semi-armour-piercing warhead, and GPS guidance. The reduced range is in accordance with Missile Technology Control Regime restrictions. The C-602 was revealed in September 2005, and displayed outside of China for the first time at the African Aerospace and Defence exhibition in 2006.
- **CM-602G:** The CM-602G is a land-attack version of the C-602. It is advertised as having a range of 290 km (180 mi), a 480 kg (1,060 lb) penetrating blast/fragmentation warhead, and an inertial guidance system using GPS data which may be augmented to provide man-in-the-loop control. The missile was revealed at the China International Aviation & Aerospace Exhibition in 2012.

↳***System***

Name: P-800 Bolid
Type: Supersonic Anti-Ship Cruise Missile
Manufacturer: NPO Mashinostroyeniya
Length: 8.9 m
Diameter: 0.7 m
Weight: 3,000 kg
Wingspan: 1.7 m
Warhead: national ver. 300 kg semi-armour piercing HE, thermonuclear; for export 200 kg semi-armour piercing HE
Detonation Mechanism: delay fuze
Engine: Ramjet 4 tons of thrust
Propellant: kerosene liquid fuel
Operational Range: 600 km (370 mi; 320 nmi) (Oniks version for Russia) 120 to 300 km (75 to 186 mi; 65 to 162 nmi)

depending on altitude (Yakhont export version)

Flight Ceiling: 14,000 m

Flight Altitude: 10 meters or higher

Speed: Mach 2

Guidance System: midcourse inertial guidance, active radar homing-passive radar seeker head

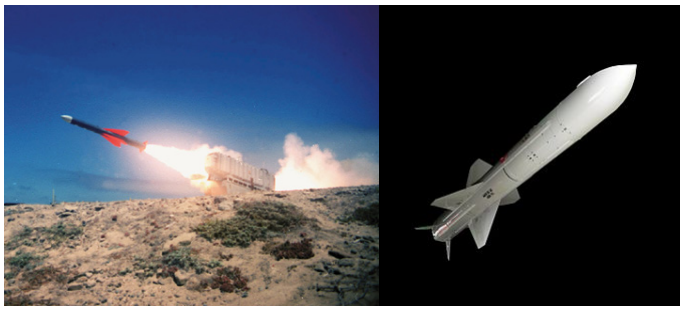
Accuracy: m1.5

Launch Platform: coastal installations, naval ships, Fixed-wing aircraft

Notes:

P-800 Bolid - Submarine-launched Version of theP-800 Oniks The P-800 Oniks (Russian: П-800 Оникс; English: Onyx), also known in export markets as Yakhont (Russian: Яхонт; English: ruby), is a Soviet / Russian supersonic anti-ship cruise missile developed by NPO Mashinostroyeniya as a ramjet version of P-80 Zubr. Its GRAU designation is 3M55, the air launched Kh-61 variant also exists. The missile has the NATO reporting codename SS-N-26 "Strobile". Development officially started in 1983, and in the 1990s the anti-ship missile was tested on the Project 1234.7 ship. In 2002 the missile passed the whole range of trials and was commissioned. It is reportedly a replacement of the P-270 Moskit, but possibly also of the P-700 Granit. The P-800 was used as the basis for the joint Russian-Indian supersonic missile BrahMos. The missile is carried in flight by aerodynamic lift. The solid-propellant booster is located in the ramjet's combustion chamber and is ejected by the airflow after it has burned out. Advantages *Over-the-horizon firing range *Full autonomy of combat use ("fire and forget") *A set of flexible ("low-profile sea-skimming", "high-low") trajectories *High supersonic speed in all phases of flight *Full harmonization for a wide range of platforms (surface ships, submarines and land-based launchers) * Possible use of the missile in electronic countermeasures environment and under enemy fire

SM39 Exocet French Anti-Ship Cruise Missile



Tiers:

Variants:

- **MM38 (surface-launched):** deployed on warships. Range: 42 km. No longer produced (1970). A coast defence version known as "Excalibur" was developed in the United Kingdom and deployed in Gibraltar from 1985–1997.
- **AM38 (helicopter-launched:** tested only
- **AM39 (air-launched):** B2 Mod 2: deployed on 14 types of aircraft (combat jets, maritime patrol aircraft, helicopters). Range between 50 and 70 km, depending on the altitude and the speed of the launch aircraft.
- **SM39 (submarine-launched):** B2 Mod 2: deployed on submarines. The missile is housed inside a watertight launched capsule (VSM or véhicule Sous marin), which is fired by the submarine's torpedo-launch tubes. On leaving the water, the capsule is ejected and the missile's motor is ignited. It then behaves like an MM40. The missile will be fired at depth, which makes it particularly suitable for discreet submarine operations.
- **MM40 (surface-launched):** Block 1, Block 2 and Block 3: deployed on warships and in coastal batteries. Range: 72 km for the Block 2, in excess of 180 km for the Block 3.
- **MM40 Block 3:** In February 2004, the Délégation Générale pour l'Armement (DGA) notified MBDA of a contract for the design and production of a new missile, the MM40 Block 3. It has an improved range, in excess of 180 kilometres (97 nautical miles)—through the use of a turbojet engine, and includes four air intakes to provide continuous airflow to the power plant during high-G manoeuvres. The Block 3 missile accepts GPS guidance system waypoint commands, which allow it to attack naval targets from different angles and to strike land targets, giving it a marginal role as a land-attack missile. The Block 3 Exocet is lighter than the previous MM40 Block 2 Exocet.

Name: SM 39 Exocet
Type: Anti-Ship Cruise Missile
Manufacturer: 1979–1999: Aérospatiale 1999–2001: Aérospatiale-Matra 2001–present: MBDA
Length: 5.80 m
Diameter: 348 mm
Wingspan: 1.14 m
Weight: 666 kg
Configuration: slim, pointed cylinder cruciform cropped and swept delta mainplanes indexed in-line with small

cruciform tail planes
Propulsion: 2 x SNPE double-base Nitramite smokeless solid-propellant rockets. 1 x Epervier booster with 2.4 sec burn. 1 x Eole V sustainer with 200-220 sec burn
Speed: 594 kt (684 mph; 1,100 km/h) or Mach 0.93
Maximum Range: 50 km
Minimum Range: 4 km
Peak Altitude: 50 m
Warhead: 363 lb. (165 kg) Hexolite blast fragmentation
Sensor and Fire Control: TRT AHV-7 radio altimeter inertial navigation during first part of flight Electronique Marcel Dassault ADAC or Super ADAC I/J-band active radar homing in terminal phase that begins search approx 5.4 nm (6.2 mi.; 10 km) from target's estimated position.

Notes:

The Exocet (French pronunciation: [ɛgzɔsɛ]; French for "flying fish") is a French-built anti-ship missile whose various versions can be launched from surface vessels, submarines, helicopters and fixed-wing aircraft. The Exocet is built by MBDA, a European missile company. Development began in 1967 by Nord as a ship-launched weapon named the MM 38. A few years later Aerospatiale and Nord merged. The basic body design was based on the Nord AS30 air-to-ground tactical missile. The air-launched Exocet was developed in 1974 and entered service with the French Navy five years later. The relatively compact missile is designed for attacking small- to medium-size warships (e.g., frigates, corvettes and destroyers), although multiple hits are effective against larger vessels, such as aircraft carriers. It is guided inertially in mid-flight and turns on active radar late in its flight to find and hit its target. As a countermeasure against air defence around the target, it maintains a very low altitude during ingress, staying one to two meters above the sea surface. Due to the effect of the radar horizon, this means that the target may not detect an incoming attack until the missile is only 6,000 m from impact. This leaves little time for reaction and stimulated the design of close-in weapon systems (CIWS). Its rocket motor, which is fuelled by solid propellant, gives the Exocet a maximum range of 70 kilometres (43 mi; 38 nmi). It was replaced on the Block 3 MM40 ship-launched version of the missile with a solid-propellant booster and a turbojet sustainer motor which extends the range of the missile to more than 180 kilometres (110 mi; 97 nmi). The submarine-launched version places the missile inside a launch capsule.

↳***System***

Name: P-800 Yakhont
Type: Supersonic Cruise Missile
Manufacturer: BrahMos Aerospace Limited
Type: The BrahMos (designated PJ-10) is a medium-range ramjet supersonic cruise missile that can be launched from submarine, ships, aircraft, or land. It is the fastest supersonic cruise missile in the world.
Length: 8.4 m
Diameter: 0.6 m
Weight: 3,000 kg (6,600 lb) 2,500 kg (5,500 lb) (air-launched)
Wingspan: 1.7 m

Warhead: 200 kg (440 lb) conventional semi-armour-piercing and nuclear 300 kg (660 lb) (air-launched) Both manufactured indigenously by the Indian Ordnance Factories

Detonation Mechanism: delay fuze

Engine: First stage: Solid rocket booster Second stage: Liquid ramjet Both manufactured by Ordnance Factory Board

Propellant: First stage: Solid fuel, Second stage: Liquid fuel

Operational Range: Surface/Sea Platform - 500 km (310 mi; 270 nmi) (original/export) To be upgraded to 600 km (370 mi; 320 nmi) Air Platform - 400 km (250 mi; 220 nmi)

Flight Ceiling: 15 km

Flight Altitude: Sea skimming, as low as 3–4 meters

Speed: Mach 3

Guidance System: Mid-course: Inertial navigation system Terminal: Active radar homing, GPS/GLONASS/GAGAN satellite guidance

Accuracy: m1

Launch Platform: Ship, submarine, aircraft, and land-based mobile launchers.

Notes:

The BrahMos (designated PJ-10) is a medium-range ramjet supersonic cruise missile that can be launched from submarine, ships, aircraft, or land. It is the fastest supersonic cruise missile in the world. It is a joint venture between the Russian Federation's NPO Mashinostroyeniya and India's Defence Research and Development Organisation (DRDO), who together have formed BrahMos Aerospace. It is based on the Russian P-800 Oniks cruise missile and other similar sea-skimming Russian cruise missile technology. The name BrahMos is a portmanteau formed from the names of two rivers, the Brahmaputra of India and the Moskva of Russia. It is the world's fastest anti-ship cruise missile in operation. The land-launched and ship-launched versions are already in service. An air-launched variant of BrahMos appeared in 2012 and entered service in 2019. A hypersonic version of the missile, BrahMos-II, is also presently under development with a speed of Mach 7-8 to boost aerial fast strike capability. It is expected to be ready for testing by 2020. India wanted the BrahMos to be based on a mid range cruise missile like the P-700 Granit. Its propulsion is based on the Russian missile, and missile guidance has been developed by BrahMos Aerospace. The missile is expected to reach a total order of US$13 billion. In 2016, as India became a member of the Missile Technology Control Regime (MTCR), India and Russia are now planning to jointly develop a new generation of Brahmos missiles with 600 km-plus range and an ability to hit protected targets with pinpoint accuracy. In 2019, India upgraded the missile with a new range of 500 km. Versions: Surface-launched, Block I *Ship-launched, anti-ship variant (operational) *Ship-launched, land-attack variant (operational) *Land-launched, land-attack variant (operational) *Land-launched, anti-ship variant (In induction, tested on 10 December 2010) Surface-launched, upgraded variants *BrahMos Block II land-attack variant (Operational) *BrahMos Block III land-variant (being inducted) *Anti-aircraft carrier variant (tested in March 2012) – the missile gained the capability to attack aircraft carriers using the supersonic vertical dive variant of the missile that could travel up to 290 km. Air-launched *Air-launched, anti-ship variant (In induction) *Air-launched, land-attack variant (In induction) Submarine-launched *Submarine-launched, anti-ship variant – Tested successfully for the first time from a submerged pontoon on 20 March 2013. *Submarine-launched, land-attack variant (under development, expected completion in 2011)

3M22 Tsirkon Russian Multi-Role Long Range Cruise Missile

Tiers:

System

Alternate Designation: 3M22, Zircon, Tsirkon, Cyrkon, SS-N-33

Maximum Effective Range: km1,000

Launch Platform: Submarines, surface ships

Dimensions

Length: m10

Warhead Weight: kg300-400

Propulsion Characteristics

Engine: Two-stage: solid fuel in the first stage, scramjet motor in the second

Propellant: Solid

Speed: Up to Mach 9

Fire Control

Note:: Reports indicate that the 3M22 can be remotely piloted, given a target based upon GPS data and can have that data changed while in flight.

Guidance System: Active and passive radar

Notes:

The 3M22 Zircon, also spelled Tsirkon (Russian: Циркон, NATO reporting name: SS-N-33) is a scramjet powered maneuvering anti-ship hypersonic cruise missile developed by Russia. Zircon is believed to be a maneuvering, winged hypersonic cruise missile with a lift-generating center body. A booster stage with solid-fuel engines accelerates it to supersonic speeds, after which a scramjet motor with liquid-fuel in the second stage accelerates it to hypersonic speeds. The missile represents a further development of the HELA (Hypersonic Experimental Flying Vehicle) developed by NPO Mashinostroyeniya that was on display at the 1995 MAKS air show. Zircon can travel at a speed of Mach 9. Such high speeds would likely create a cloud of plasma around the missile, absorbing any radio waves and making the missile virtually invisible to radars (plasma stealth). This has led to concerns that it could penetrate existing naval defense systems. Zircon exchanges information in flight and can be

controlled by commands if necessary. Zircon will be first deployed with the Kirov-class battlecruisers Admiral Nakhimov and Pyotr Velikiy after 2020. These ships will have their P-700 Granit anti-ship missiles replaced with the 3S-14 universal VLS cells capable of carrying the Oniks, Kalibr and Zircon missiles; each vessel is to be equipped with 72 such missiles. After completion of their refit, the ships could carry 40–80 anti-ship missiles of different types. Another platforms is to likely include Admiral Grigorovich class and Admiral Gorshkov-class frigates, as well as various guided missile corvettes of the Russian Navy, including Buyan class, Karakurt class or Gremyashchiy class, mainly due to the installation of the compatible 3S-14 vertical launchers. In November 2017, Colonel General Viktor Bondarev revealed the Zircon missile was already in service with the Russian Armed Forces. On 20 February 2019, Russian President Vladimir Putin stated the missile is capable to accelerate up to Mach 9 and destroy both sea-going and land targets within 1,000 km (540 nmi; 620 mi) distance. Reports suggest that after the fielding of the 3M22 to naval forces, production of a lighter version of the Tsirkon will be developed to be deployed from strategic bombers. US reports state that the most likely bomber to carry the airborne version of the 3M22 will be the Tupolev Tu-160/M/M2 "Blackjack"

→→Vessel-Launched Cruise Missiles (VLCM) (601 km - 1,000 km)

3M54T (SS-N-27 Sizzler) Russian Anti-Shipping Cruise Missile

Tiers:

Variants:

- **3M54K:** 3M54K: A submarine-launched anti-shipping variant deployed by the Russian Navy. Its length is 8.22 m (27.0 ft), with a 200 kg (440 lb) warhead. Its range is 440–660 km (270–410 mi). It is a Sea-skimmer with a final stage flight altitude of 4.6 metres (15 ft) and a supersonic terminal speed of Mach 2.9 (3,550 km/h; 2,210 mph).
- **3M54T:** 3M54T An anti-shipping variant deployed by the Russian Navy on surface ships. It is launched with a VLS, has a Thrust vectoring booster, and is 8.9 m (29 ft) long. Its warhead weight and other performances are the same as the 3M-54K.
- **3M14K (SS-N-30A):** 3M14K (SS-N-30A) An inertial guidance land attack variant deployed by the Russian Navy. The submarine-launched weapon has a basic length of 6.2 m (20 ft), with a 450 kg (990 lb) warhead. Its range is 2,500 km (1,600 mi), allowing the Russian Navy to strike targets throughout central Western Europe (including all of the UK, northern France including Paris, and most of Germany) from beyond the GIUK gap. Its subsonic terminal speed is Mach 0.8.
- **3M14T:** 3M14T is the inertial guidance land attack variant which is deployed by the Russian Navy. A surface ship with VLS launched missile, with thrust vectoring booster, its basic length is 8.9 m (29 ft), its warhead weight and other performance are the same as the 3M14K. Russia fired 26 3M14T cruise missiles from four surface ships in the Caspian Sea against 11 targets in Syria on 7 October 2015.
- **Kalibr-M:** Kalibr-M is a new version of Kalibr with larger warhead and extended range to 4,500 km. The ship, submarine, air, and land-launched versions are in development.

Accuracy: 3 m (Club-S/Kalibr-PL)

Launch Platforms: naval ships, submarines, containers, airplanes, TEL

Notes:

3M54T An anti-shipping variant deployed by the Russian Navy on surface ships. It is launched with a VLS, has a Thrust vectoring booster, and is 8.9 m (29 ft) long. Its warhead weight and other performances are the same as the 3M-54K. The 3M-54 Kalibr, (Калибр, caliber), also referred to it as 3M54-1 Kalibr, 3M14 Biryuza (Бирюза, turqoise), (NATO codenames SS-N-27 Sizzler and SS-N-30A), 91R1, 91RT2 is a group of Russian surface ship-, submarine-launched and airborne anti-ship and coastal anti ship (AShM), land attack cruise missiles (LACM) and anti-submarine missiles developed by the Novator Design Bureau (OKB-8). Derived export versions are the 3M54E, 3M54E1, 3M14E, 91RE1, 91RTE2. The 3M54T, 3M54K, 3M54A, 3M54E (3M54TE), 3M54KE and 3M54AE have a second stage that performs a supersonic sprint in the terminal approach to the target, reducing the time that target's defense systems have to react. The 3M54T1, 3M54K1, 3M54A1, 3M54E1 (3M54T/K/AE1) only travels at subsonic speeds, although its range is accordingly greater than those of the supersonic versions. Club is the designation used for the export versions. The missile is a modular system with five versions: two anti-shipping types, one for land attack and two anti-submarine types. The missile is designed to share common parts between the surface and submarine-launched variants but each missile consists of different components, for example, the booster. The missile can be launched from a surface ship using a Vertical Launch System (VLS). It has a booster with thrust vectoring capability. The missile launched from a submarine torpedo tube has no need for such an addition but has a conventional booster instead. The air launched version is held in a container that is dropped as the missile launches, detaching from the container. Kalibr land attack versions in use by Russia have various claimed maximum ranges. The U.S. Department of Defense estimates its range at 1,400 km (870 mi), and Russian Defence Minister Sergei Shoigu put its range at "almost 1,500 km (930 mi)." Following its first operational firing in October 2015, Russian Ministry of Defence statements suggested a range of 2,000 km (1,200 mi), while a December 2015 Office of Naval Intelligence report gathered a number of Russian statements projecting ranges between 1,500-2,500 km (1,600 mi). Discrepancies in range values may be attributed to political declarations for strategic effect, or potentially longer 2,500 km-range claims could be associated with a thermonuclear armed variant while shorter 1,500 km-range estimates are for the conventionally armed missile. The Russian domestic variant (3M54T / 3M54K) and export variants (3M54TE/3M54KE) fly at sub-sonic speeds while achieving supersonic speed as they near their target. They are also capable of performing very high angled defensive high speed maneuvers in contrast to the common linear flight path of other anti-ship cruise missiles.

→→Submarine-Launched Cruise Missiles (SLCM) (601 km - 1,000 km)

3M54K (SS-N-27 Sizzler) Russian Land Attack Cruise Missile

Tiers:

Variants:

- **3M54K:** 3M54K: A submarine-launched anti-shipping variant deployed by the Russian Navy. Its length is 8.22 m (27.0 ft), with a 200 kg (440 lb) warhead. Its range is 440–660 km (270–410 mi). It is a Sea-skimmer with a final stage flight altitude of 4.6 metres (15 ft) and a supersonic terminal speed of Mach 2.9 (3,550 km/h; 2,210 mph).
- **3M54T:** 3M54T An anti-shipping variant deployed by the Russian Navy on surface ships. It is launched with a VLS, has a Thrust vectoring booster, and is 8.9 m (29 ft) long. Its warhead weight and other performances are the same as the 3M-54K.
- **3M14K (SS-N-30A):** 3M14K (SS-N-30A) An inertial guidance land attack variant deployed by the Russian Navy. The submarine-launched weapon has a basic length of 6.2 m (20 ft), with a 450 kg (990 lb) warhead. Its range is 2,500 km (1,600 mi), allowing the Russian Navy to strike targets throughout central Western Europe (including all of the UK, northern France including Paris, and most of Germany) from beyond the GIUK gap. Its subsonic terminal speed is Mach 0.8.
- **3M14T:** 3M14T is the inertial guidance land attack variant which is deployed by the Russian Navy. A surface ship with VLS launched missile, with thrust vectoring booster, its basic length is 8.9 m (29 ft), its warhead weight and other performance are the same as the 3M14K. Russia fired 26 3M14T cruise missiles from four surface ships in the Caspian Sea against 11 targets in Syria on 7 October 2015.
- **Kalibr-M:** Kalibr-M is a new version of Kalibr with larger warhead and extended range to 4,500 km. The ship, submarine, air, and land-launched versions are in development.

System

:

:

↳***System***

Name: 3M54K (SS-N-27 Sizzler) Russian Land Attack Cruise Missile
Type: Anti-Ship Cruise Missile
Manufacturer: Novator Design Bureau, KTRV, MKB Fakel, NPO Mash, Raduga, NPO Zvezda Strela (Orenburg)
Length: Varies on variant, from 6.2 m to 8.9 m
Diameter: 0.533 m
Warhead: 400-500 kg HE or thermonuclear
Weight: Varies on variant, from 1,300 kg-1780 kg-2300 kg

Engine: Multi-stage solid-fuel rocket, turbojet engine for 3M-54/E/TE/E1/TE1, -14/E/TE, solid fuel rocket for 91RE1/RTE2
Operational Range: 91RE1: 50 km 3M-54E (export version): 220 km 3M-54E1/3M-14E (export version): 300 km 3M-54/3M-54T: 660 km 3M-14/3M-14T: 1,500-2,500 km Kalibr-M: 4,500 km
Flight Ceiling: 1,000 m
Flight Altitude: 50-150 m AGL 20 m over water
Speed: 0.8-2.5-2.9 Mach
Guidance System: Inertial guidance plus terminal Active radar homing, By satellites, DSMAC
Accuracy: 3 m (Club-S/Kalibr-PL)
Launch Platforms: naval ships, submarines, containers, airplanes, TEL

Notes:

3M54K: A submarine-launched anti-shipping variant deployed by the Russian Navy. Its length is 8.22 m (27.0 ft), with a 200 kg (440 lb) warhead. Its range is 440–660 km (270–410 mi). It is a Sea-skimmer with a final stage flight altitude of 4.6 metres (15 ft) and a supersonic terminal speed of Mach 2.9 (3,550 km/h; 2,210 mph). The 3M-54 Kalibr, (Калибр, caliber), also referred to it as 3M54-1 Kalibr, 3M14 Biryuza (Бирюза, turqoise), (NATO codenames SS-N-27 Sizzler and SS-N-30A), 91R1, 91RT2 is a group of Russian surface ship-, submarine-launched and airborne anti-ship and coastal anti ship (AShM), land attack cruise missiles (LACM) and anti-submarine missiles developed by the Novator Design Bureau (OKB-8). Derived export versions are the 3M54E, 3M54E1, 3M14E, 91RE1, 91RTE2. The 3M54T, 3M54K, 3M54A, 3M54E (3M54TE), 3M54KE and 3M54AE have a second stage that performs a supersonic sprint in the terminal approach to the target, reducing the time that target's defense systems have to react. The 3M54T1, 3M54K1, 3M54A1, 3M54E1 (3M54T/K/AE1) only travels at subsonic speeds, although its range is accordingly greater than those of the supersonic versions. Club is the designation used for the export versions. The missile is a modular system with five versions: two anti-shipping types, one for land attack and two anti-submarine types. The missile is designed to share common parts between the surface and submarine-launched variants but each missile consists of different components, for example, the booster. The missile can be launched from a surface ship using a Vertical Launch System (VLS). It has a booster with thrust vectoring capability. The missile launched from a submarine torpedo tube has no need for such an addition but has a conventional booster instead. The air launched version is held in a container that is dropped as the missile launches, detaching from the container. Kalibr land attack versions in use by Russia have various claimed maximum ranges. The U.S. Department of Defense estimates its range at 1,400 km (870 mi), and Russian Defence Minister Sergei Shoigu put its range at "almost 1,500 km (930 mi)." Following its first operational firing in October 2015, Russian Ministry of Defence statements suggested a range of 2,000 km (1,200 mi), while a December 2015 Office of Naval Intelligence report gathered a number of Russian statements projecting ranges between 1,500-2,500 km (1,600 mi). Discrepancies in range values may be attributed to political declarations for strategic effect, or potentially longer 2,500 km-range claims could be associated with a thermonuclear armed variant while shorter 1,500 km-range estimates are for the conventionally armed missile. The Russian domestic variant (3M54T / 3M54K) and export variants (3M54TE/3M54KE) fly at sub-sonic speeds while achieving supersonic speed as they near their target. They are also capable of performing very high angled defensive high speed maneuvers in contrast to the common linear flight path of other anti-ship cruise missiles.

P-1000 Vulkan Russian Supersonic Cruise Missile

Tiers:

Variants:

- **P-500 Bazalt:** The P-500 Bazalt (Russian: П-500 «Базальт»; English: basalt) is a turbojet-powered, supersonic cruise missile used by the Soviet and Russian navies. Its GRAU designation is 4K80[2] and its NATO reporting name is SS-N-12 Sandbox, modern version is P-1000 Vulkan AShM SLCM.

P-1000 Vulkan Cruise Missile

↳*System*

Name: P-1000 Vulkan
Type: Cruise Missile
Basic Load: 16 x Missiles (8 x 2) P-1000 Vulcan (SS-N-12 Sandbox) anti-ship missiles
Manufactuer: P.A. Strela
Length: 11.7 m
Diameter: 0.88 m
Wingspan: 2.6 meters
Weight: 2 tons
Warhead: High explosive or nuclear
Warhead Weight: 1,000 kg
Blast Yield: 350 kt
Engine: Turbojet
Operational Range: 800 km
Flight Altitude: 50–5,000 m

Speed: Mach 2.5

Guidance System: Semi-active radar homing, terminal active radar homing

Launch Platform: Echo II & Juliett-class submarines Kiev-class aircraft carrier & Slava-class cruiser.

Notes:

An improved version of the P-500 was installed on three Echo II submarines towards the end of the Cold War. The P-1000 Vulkan (GRAU 3M70) presumably has the same firing range and maximum speed with the P-500 Bazalt (range 800 km). The missile weight was increased by 1–2 tons. The missile has a turbojet engine and a starting powder accelerator. High-altitude flight regimes are presumably the same as that of P-500. The P-1000 was ordered on 15 May 1979 from NPO Mashinostroyeniya Chelomey; it first flew in July 1982 and was accepted for service on 18 December 1987. It was installed on three Echo II submarines of the Northern Fleet between 1987 and 1993; the conversion of two units of the Pacific Fleet, the K-10 and K-34, was abandoned due to lack of funds. Of the submarines that did receive the P-1000, the K-1 was decommissioned after a reactor accident in 1989, the K-35 was stricken in 1993 and the K-22 in 1995.The P-1000 has been installed on the Slava class cruiser Varyag, and some sources report P-1000 missiles on her sister ship Moskva. The P-500 Bazalt (Russian: П-500 «Базальт»; English: basalt) is a turbojet-powered, supersonic cruise missile used by the Soviet and Russian navies. Its GRAU designation is 4K80 and its NATO reporting name is SS-N-12 Sandbox, modern version is P-1000 Vulkan AShM SLCM. The P-500 Bazalt has a 550 km range and a payload of 1,000 kg, which allows it to carry a 350 kt nuclear or a 950 kg semi-armor-piercing high-explosive warhead. The P-500 Bazalt uses active radar homing for terminal guidance, and can receive mid-course correction from the Tupolev Tu-95RTs Bear D, the Kamov Ka-25K Hormone B and the Kamov Ka-31. The missiles were intended to be used in salvos; a submarine could launch eight in rapid succession, maintaining control of each through a separate datalink. In flight the group could co-ordinate their actions; one would fly to a higher altitude and use its active radar to search for targets, forwarding this data to the other missiles which remained at low altitude. The missiles were programmed so that half of a salvo would head for a carrier target, with the rest dividing between other ships. If the high-flying missile was shot down, another from the salvo would automatically pop up to take its place. All of the missiles would switch to active radar for the terminal phase of the attack.

→→Multiple-Launch Platform Cruise Missiles (MLPCM) (601 km - 1,000 km)

Oniks-M Russian Supersonic Cruise Missile

Tiers:

Variants:

- **3M55 Oniks:** Base version for Russia.
- **P-800 Yakhont:** Export version of Oniks.
- **P-800 Bolid:** Submarine-launched version of Yakhont.
- **Brahmos:** Co-developed by Russia and India, based on Oniks, produced by BrahMos Aerospace Private Limited in India. BrahMos-II, a hypersonic version is also being developed.
- **Bastion-P:** Coast mobile missile system. Officially it entered service in 2015.
- **Kh-61:** Air launched air to surface version.
- **Oniks-M:** version of Oniks with improved range (up to 800 km), accuracy and ECCM capabilities

System

:
:
:

↳***System***

Name: Oniks-M
Type: Supersonic Anti-Ship Cruise Missile
Manufacturer: NPO Mashinostroyeniya
Length: 8.9 m
Diameter: 0.7 m
Weight: 3,000 kg
Wingspan: 1.7 m
Warhead: national ver. 300 kg semi-armour piercing HE, thermonuclear; for export 200 kg semi-armour piercing HE
Detonation Mechanism: delay fuze
Engine: Ramjet 4 tons of thrust
Propellant: kerosene liquid fuel
Operational Range: km800
Flight Ceiling: 14,000 m
Flight Altitude: 10 meters or higher
Speed: Mach 2
Guidance System: midcourse inertial guidance, active radar homing-passive radar seeker head
Accuracy: m1.5

ECCM Capable: Yes

Launch Platform: coastal installations, naval ships, Fixed-wing aircraft

Notes:

Oniks-M - version of Oniks with improved range (up to 800 km), accuracy and ECCM capabilities. The P-800 Oniks (Russian: П-800 Оникс; English: Onyx), also known in export markets as Yakhont (Russian: Яхонт; English: ruby), is a Soviet / Russian supersonic anti-ship cruise missile developed by NPO Mashinostroyeniya as a ramjet version of P-80 Zubr. Its GRAU designation is 3M55, the air launched Kh-61 variant also exists. The missile has the NATO reporting codename SS-N-26 "Strobile". Development officially started in 1983, and in the 1990s the anti-ship missile was tested on the Project 1234.7 ship. In 2002 the missile passed the whole range of trials and was commissioned. It is reportedly a replacement of the P-270 Moskit, but possibly also of the P-700 Granit. The P-800 was used as the basis for the joint Russian-Indian supersonic missile BrahMos. The missile is carried in flight by aerodynamic lift. The solid-propellant booster is located in the ramjet's combustion chamber and is ejected by the airflow after it has burned out. Advantages *Over-the-horizon firing range *Full autonomy of combat use ("fire and forget") *A set of flexible ("low-profile sea-skimming", "high-low") trajectories *High supersonic speed in all phases of flight *Full harmonization for a wide range of platforms (surface ships, submarines and land-based launchers) * Possible use of the missile in electronic countermeasures environment and under enemy fire

→Long-Range Cruise Missiles (LRCM) (More than 1,000 km)

→→Ground-Launched Cruise Missiles (GLCM) (More than 1,000 km)

9M730 Burevestnik (Storm Petrel) Russian Nuclear Powered Cruise Missile

Tiers:

1 2 3 4

System

Alternate Designation: KY30, SSC-X-9, “Skyfall.”

Maximum Effective Range: Unlimited

Launch Platform: INA

Warhead Type: Nuclear

MIRV: INA

Circular Error Probability: INA

Dimensions

Length: INA

Warhead Weight: INA

Missile Weight: INA

Diameter: INA

Fin Span: INA

Propulsion Characteristics

Engine: Nuclear reactor

Propellant: Nuclear

Speed: INA

Flight Ceiling: INA

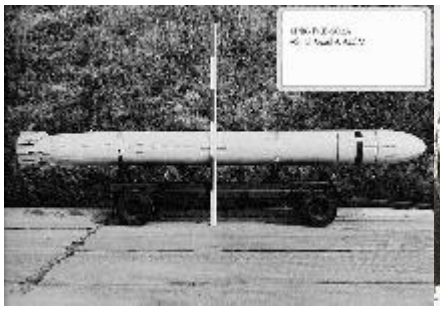
Fire Control

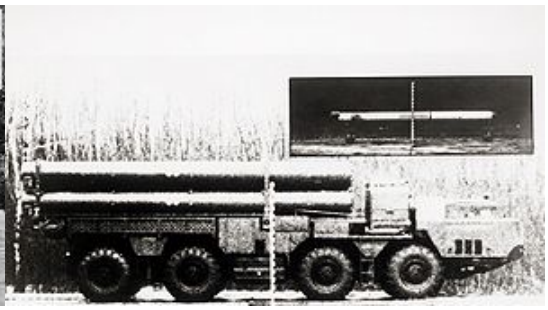
Guidance System: INA

Notes:

The 9M730 Burevestnik (Russian: Буревестник; "Storm Petrel", NATO reporting name: SSC-X-9 Skyfall) is a Russian experimental nuclear-powered, nuclear-armed cruise missile under development for the Russian Armed Forces. The missile is claimed to have virtually unlimited range. This type of weapon flies under the ballistic weapon shield and can stay airborne for days to avoid missile defenses and is part of President Putin's broader program to attempt to re-balance his nuclear strike capability. The Russian defense industry began developing an intercontinental-range nuclear-powered cruise missile capable of penetrating any interceptor-based missile defense system. It is said to have unlimited range and ability to dodge missile defenses. A major stage of trials of the cruise missile of the Burevestnik complex, the tests of the nuclear power unit, were successfully completed in January 2019. Many skeptics say that the technology to produce such a weapon without littering the earth from launch site to impact site with radioactive material is still far away.

SS-N-21 Sampson (RK-55) Russian Multi-Role Long Range Cruise Missile





Tiers:

Variants:

- **Kh-55 (AS-15 'Kent'):** Air launched version
- **Kh-65:** A tactical modification of the strategic Kh-55. According to the first available information (1992 Moscow Air Show), its range was to be 500-600km. According to terms of the SALT-2 Treaty, any aircraft carrying missiles with a range longer than 600 km will be regarded as a strategic one and the number of such aircraft is strictly limited. A full-sized version of the Kh-65SE was displayed for the first time in 1993 (Abu Dabi, then 1993 in Zhukovskiy and Nizhniy Novgorod). The missiles shown at the exhibitions did not differ from the earlier versions except for their range, quoted as 250km when launched from low altitude and 280km when launched from high altitude. The Kh-65 was intended for use against large targets with a larger than 300m2 effective reflecting surface area, particularly warships, under conditions of strong electronic interference. It approaches the target guided by an inertial navigation system while flying at a low altitude. Having reached the region where the target is located, it rises to a higher altitude and its active-radar target seeking system turns on.

System

Alternate Designation: RK-55, 3M10, Granat, SSC-X-4, Slingshot, 3K10, SS-CX-7/SS-CX-8

Launch Platform(s): Submarines: Victor 3 (Project 671RTM), Akula 1/2 (Project 971), Sierra 1/2 (Project 945), Yankee Notch (Project 667AR/AT), and possibly Delta 1/2/3 class submarines; TEL based on the MAZ 543*

Basing: Submarine-launched, Ground launched from a TEL*

Effective Range: 2,400 km (submarine launch), 3,000 (ground launch)*

Circular Error Probability: m150

Class: Subsonic cruise missile

* **Note:** All ground launch versions of the RK-55 were to be destroyed within 3 years of the signing of the INF.

Dimensions

Length: m8.09

Missile Weight: kg1,700

Diameter: m.51

Fin Span: m3.1

Payload

Warhead Type: Single

Warhead Options: Conventional and Nuclear

Nuclear Yield: kT200

Conventional Warhead Weight: kg410

Conventional Warheads Available: HE

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: INA

Propulsion Characteristics

Engine: R95-300 Turbofan

Propellant: Solid

Speed: km/h720

Flight Ceiling: INA

Attack Altitude: INA

Fire Control

Guidance System: Sprut inertial guidance plus TERCOM

Notes:

The RK-55 is the submarine/ground-launched component of the “55” series of cruise missiles which also included the Kh-55 air-launched missile. This family of cruise missiles was the Soviet Union’s response to the U.S. Tomahawk series. The ground-launched variant was dismantled and destroyed due to the signing of the 1987 INF Treaty.

Kh-47M2 Kinzhal (Dagger) Russian Cruise Missile

Tiers:

1 **2** 3 4

System

Alternate Designation: Dagger, Kinzhal

Maximum Effective Range: 2,000km when launched from the MiG-31B; 3,000km when launched from the Tu-22M3)

Launch Platform: MiG-31B aircraft (estimated 10 aircraft are capable of deploying the Kh-47M2); Tu-22M3

Warhead Type: Nuclear (100-500kT) / Conventional (HE-Frag)

MIRV: No

Circular Error Probability: m20

Dimensions

Length: m8

Warhead Weight: kg500

Missile Weight: kg4,400

Diameter: m1

Fin Span: m1.5

Propulsion Characteristics

Engine: INA

Propellant: Solid

Speed: Mach 10

Flight Ceiling: km20

Fire Control

Guidance System: Inertial guidance and satellite navigation with a terminal seeker; remote control and optical homing system

Notes:

The Kh-47M2 Kinzhal (Dagger) entered service in December 2017, is a Russian, nuclear-capable, air-launched, ballistic missile (ALBM). It has a claimed range of more than 2,000 km (1,200 mi), Mach 10 speed, and an ability to perform evasive maneuvers at every stage of its flight. It can carry both conventional and nuclear warheads and can be launched from MiG-31K interceptors

Tu-22M3 bombers. It has been deployed at airbases in Russia's Southern Military District. The missile is designed to target US and NATO warships posing a threat to strategic missile systems in Russia’s European region. It has an additional task of destroying NATO missile defense systems, ballistic missile defense ships, and land objects close to Russia borders. It is allegedly designed to overcome any known or planned US air or missile defense systems including MIM-104 Patriot, Terminal High Altitude Area Defense and Aegis Combat System. The missile first stage is probably shared with 9K720 Iskander and the guidance section is specifically designed for this missile. The missile accelerates to hypersonic speed within seconds of launch and, as mentioned, performs maneuvers at all stages of the flight trajectory to evade enemy missile defenses. Russian media claims the missile's range is 2,000 kilometres (1,200 mi; 1,100 nmi) when carried by the MiG-31K and 3,000 kilometres (1,900 mi; 1,600 nmi) when carried by the Tu-22M3.

SS-N-30A (3M-14 Kalibr) Russian Multi-Role Long Range Cruise Missile

Tiers:

Variants:

- **3M-54T Kalibr-NK:** Export version with a 300km range.
- **3M-14K Kalibr-PL:** The 3M-14K Kalibr-PL is similar to the 3M-14T except that is launched from a submarine. This variant was reported to have been launched from an improved Kilo-class submarine in the Mediterranean to strike targets inside Syria in December 2015.

System

Alternate Designation: 3M-54, Kalibr

Date of Introduction: 2015

Class: Sea-launched Land Attack Cruise Missile

Basing: Ship, Submarine

Launch Platforms: Kalibr-PL (sub-surface ships) – Kilo, Lada, Akula, Yasen, Borei class submarines; Kalibr-NK (surface ships) – Admiral Gorshkov, Admiral Grigorovich, Gepard, Gremyashchy, second batch of Steregushchy, and Buyan-M class ships

Effective Range: km2,500

Circular Error Probability: m3

Transporter-Erector-Launcher: NA

Dimensions

Length: m6.2

Missile Weight: kg1,300

Diameter: m.533

Fin Span: INA

Payload

Warhead Type: Single

Warhead Options: HE, possibly nuclear capable

Nuclear Yield: INA

Conventional Warhead Weight: kg450

Conventional Warheads Available: HE

Multiple Independent Reentry Vehicle (MIRV) Capable: Yes, 1, yield unknown

Propulsion Characteristics

Engine: Turbojet

Stages: 2

Propellant: 1st stage liquid-fuel booster; 2nd stage solid-fuel, turbojet engine

Speed: km/h965

Flight Ceiling: m1,000

Attack Altitude: 20m over sea; 50m over ground

Fire Control

Guidance System: Inertial; TERCOM; GLONASS GPS; Terminal-Phase Active Radar Seeker

Notes:

Kalibr cruise missiles are believed to be the land-attack version the Klub (Club) family. Although commonly referred to as the Kalibr cruise missile in media reports, the SS-N-30A is in fact just one part of the larger Kalibr family of Russian sea-launched missiles, which includes the SS-N-27 (Sizzler) anti-ship cruise missile and the 91R anti-submarine missile. All three Kalibr missiles share common Kalibr vertical launch system (VLS) tubes, which are quickly becoming a mainstay of the Russian Navy’s cruise missile launch capabilities. Russia plans to equip most of its submarines and surface ships with the respective versions of the Klub anti-ship and Kalibr land-attack cruise missiles. Novator Design Bureau, the designers of the Klub launch system, have developed a shipping container version of the launcher, capable of holding up to four missiles. This shipping container version allows the cruise missile to be forward deployed on ships, trucks, and trains without detection.

Kh-101 / Kh-102 Russian Air Launched Cruise Missile

Tiers:

System

Alternate Designation: NA
Class: Air Launched Cruise Missile
Effective Range: 5,000km (a source said that the range could be as high as 10,000km)
Circular Error Probability: m6
Basing: Tu-160 "Blackjack" (12 missiles), Tu-22M3/5 "Backfire" C (4 missiles), Tu-95M16 "Bear-H" (8 missiles), and Su-27IB (INA), Su-34 (2 missiles)

Dimensions

Length: m7.45
Missile Weight: kg2,400
Diameter: m.5
Fin Span: mINA

Payload

Warhead Options: Conventional and Nuclear
Warhead Type: Kh-101 = Conventional; Kh-102 = Nuclear
Warhead Weight: kg450
Nuclear Yield: mT250
Conventional Warhead Weight: kg400
Conventional Warheads Available: HE, Fragmentation, Submunitions

Propulsion Characteristics

Engine: TRDD-50A Turbofan
Propellant: INA
Speed: km/h900
Flight Ceiling: m6,000
Minimum Flight Altitude: m30
Cruise Altitude: 30-70m above the ground
Endurance: hours10

Fire Control

Guidance System: Inertial, Electro-optical correction, GLONASS satellite navigation, and IR TV terminal guidance
Note:: For inflight course correction, the missile uses a pre-loaded map in its onboard computer to perform terrain comparison.

Notes:

The Kh-101 / Kh-102 Raduga is a new line of conventional and nuclear capable air-launched cruise missiles (ALCM) developed and deployed by Russia. A stealthy missile, the Kh-101 / Kh-102 is designed to defeat air defense systems by flying low and hugging the terrain to avoid their radar systems. The Kh-101 is the conventional warhead version while the Kh-102 is the nuclear capable version of the Raduga. The missile also has radar absorbing capabilities which make it difficult to detect. It boasts a radar cross section of .01 square meters. The missile has no booster engine and therefore, relied on the altitude of its launch aircraft to assist it in reaching attack speed. The altitude window is 3,000m to 12,000m flying at a speed of 900km/h.

SSC-8 (9M729) Russian Multi-Role Long Range Cruise Missile

Tiers:

1 2 3 4

System

Alternate Designation: SSC-X-8
Class: Ground Launched Cruise Missile
Effective Range: km50-2,500
Launch Platform: Ground Launched
Circular Error Probability: m5
Basing: Road mobile, likely via YaMZ-846 diesel
Transporter-Erector-Launcher: Likely the 9P701
Note: The launcher vehicle of the SSC-8 can carry at four 9M728 or 9M729 missiles.

Dimensions

Length: m8
Missile Weight: kg2,300
Diameter: m.5
Fin Span: m3

Payload

Missile Name: 9M729 (R-500 and is known in the West as SSC-7).
Warhead Type: Single Warhead
Warhead Options: Conventional and Nuclear

Warhead Weight: 400-500KG

Maximum Range: km480

Conventional Warhead Weight: kg500

Conventional Warheads Available: HE, Cluster munitions, Fuel-air explosive, Bunker buster

MIRV and Yield: No MIRV capability / Low-yield (N/A)

Nuclear Warhead Yield: This missile was designed to carry a low-yield nuclear warhead. It could have a yield of around 10-50 kT.

Guidance System: GLONASS satellite navigation system

Accuracy: m5

Targets: This missile can destroy important enemy targets, such as concentrations of troops and armored vehicles, air defense batteries, supply depots, industrial installations, airfields, command centers and so on.

Note: Some sources report that the 9M729 potentially might have a range of around 2 000-2 500 km. There are even assessments that this missile could actually have a range of up to 5 500 km. Russian officials have long said they could extend the reach of their Iskander systems with little difficulty.

Propulsion Characteristics

Engine: 1 stage

Propellant: Solid

Speed: INA

Flight Ceiling: INA

Fire Control

Guidance System: GLONASS satellite navigation system, produced by GosNIPP

Notes:

The SSC-8 is a Russian ground-launched cruise missile labeled a "missile of concern" by the US after being test launched from a road-mobile launcher in violation of the Intermediate-Range Nuclear Forces (INF) Treaty. Moscow claims the missile is fully compliant with the INF. The missile is likely a ground-launched variant of the Russian Navy's 3M-54 Kalibr missile (NATO: SS-N-27 "Sizzler") or another version of the Iskander-K or Kh-101. It is estimated that the Russians have fielded two battalions of SSC-8s. Each battalion has four launchers and each launcher has six missiles. Experts believe that there are less that 100 missiles that have been produced as of Dec, 2018. The missile is likely a ground-launched variant of the Russian Navy’s 3M-54 Kalibr missile (NATO: SS-N-27 Sizzler). It has also been reported as a modified version of the Iskander-K or Kh-101. It was originally designated in U.S. reports as the SSC-X-8, but officials removed the “X” when it transitioned from an experimental to operational weapon.6 The missile was developed by Russian company NPO Novator.

Kh-55 Russian Multi-Role Long Range Cruise Missile

Tiers:

Variants:

- **Kh-555:** A conventional variant of the Kh-55. The nuclear warhead has been replaced by a 400kg unitary HE, penetration HE, or submunitions warhead. Other notable changes include the following: Larger conformal fuel tanks (compared to the Kh-55SM), reduced radar cross-section, improved accuracy, increased range, 3,500 km.
- **Kh-65SE and Kh-SD:** The Kh-65SE is a conventional version designed for export, although no exports have been documented. It is capable of carrying a 410kg HE warhead 600km. 1995, a similar missile called the Kh-SD was reported. This missile would have fallen within the guidelines of the Missile Technology Control Regime due to its reduced range of 300km. Although, in 1999 the range was reportedly increased to 600km. Its exact status is unknown.
- **Kh-55SM:** An extended range version. To achieve the extra range, conformal fuel tanks are mounted on both sides of the fuselage. It also has a more powerful engine, producing 450 kg of thrust. Other differences include a slightly larger body diameter due to the fuel tanks, 0.77 m, an increased launch weight, 1,500 kg, and increased range, 3,000 km.
- **Kh-55OK:** Version with optical guidance.
- **Kh-BD:** A future cruise missile with a range of 3 000 km, or greater. In 2017 this missile was at the project stage. It is planned with conventional and nuclear warheads. It should be carried by modernized Tu-160M2 bombers.
- **Soumar:** Soumar is an unlicensed Iranian copy of the Kh-55. Unlike the original Kh-55, the Soumar is ground-launched. In 2001 Ukraine sold twelve Kh-55 missiles without nuclear warheads to Iran. Existence of the Soumar missile was revealed in 2015.
- **Meshkat / Hoveizeh:** Meshkat / Hoveizeh is a more recent Iranian missile based on the Kh-55, which is believed to have a range of 1,200km, an increased range over the Soumar. According to one source, the Iranians are having a difficult time developing a warhead for the cruise missile.
- **CJ-10:** CJ-10 is a Chinese land attack cruise missile, which is believed to be based on the Kh-55 technology. In 1995 production unit of the Kh-55 missiles was delivered to Shanghai and appears to have been used to produce similar cruise missiles in China. Other sources suggest that in 2000 Ukraine exported six Kh-55SM missiles to China.

System

Alternate Designation: X-55, RKV-500, AS-15, Kent, X-65C3, Kh-SD

Basing: Aircraft

Launch Platform(s): Tu-95 MS6 ‘Bear H6’ (6 or 16 depending on version), Tu-142M ‘Bear F’, Tu-95 MS16 ‘Bear H16’, Tu-160 ‘Blackjack’ (12 missiles), Su-34 'Fullback' (1 missile)

Effective Range: 3,500km

Circular Error Probability: m25

Class: Subsonic cruise missile

Dimensions

Length: m6.04

Missile Weight: kg1,210

Diameter: m.514

Fin Span: m3.1

Payload

Warhead Type: Single

Warhead Options: Conventional and Nuclear

Nuclear Yield: 200-250kT

Conventional Warhead Weight: kg410

Conventional Warheads Available: HE

Multiple Independently targetable Reentry Vehicle (MIRV) Capable: INA

Propulsion Characteristics

Engine: R95-300 Turbofan

Propellant: Jet fuel

Speed: Mach .75

Flight Ceiling: m12,000

Minimum Altitude: m40

Attack Altitude: 40m - 110m

Fire Control

Guidance System: Inertial guidance with Doppler radar/terrain map updates

Notes:

The Kh-55 (Russian: X-55, also known as RKV-500; NATO reporting name: AS-15 'Kent') is a Soviet/Russian subsonic air-launched cruise missile, designed by MKB Raduga. It has a range of up to 2,500 km (1,350 nmi) and can carry nuclear warheads. Kh-55 is launched exclusively from bomber aircraft

→→Vessel-Launched Cruise Missiles (VLCM) (More than 1,000 km)

→→Submarine-Launched Cruise Missiles (SLCM) (More than 1,000 km)

Missile de Croisière Naval French Long-Range Cruise Missile

Tiers:

Variants:

- **Storm Shadow:** Low-observable air-launched cruise missile

Missile de Croisière Naval Long-Range Cruise Missile

↳***System***

Name: Missile de Croisière Naval
Type: Long-Range Cruise Missile
Manufacturer: MBDA
Length: 6.5 m
Diameter: 500 mm
Wingspan: 2.85 m
Engine: Microturbo
Effective Firing Range: >1,000 km (620 mi; 540 nmi
Speed: 800 km/h (500 mph; 430 kn; Mach 0.65)
Guidance System: inertial guidance, topographic (TERCOM/TERPROM), active radar homing and infrared guidance, GPS
Accuracy: Metric
Launch Platform: FREMM frigates Barracuda submarines Scorpène submarines

Notes:

MBDA developed a longer-range sea-launched variant for the French Navy, called Missile de Croisière Naval (MdCN standing for Naval Cruise Missile), to be deployed on FREMM multipurpose frigates from 2015, and on Barracuda-class submarines from 2018, using the A70 version of the Sylver launcher on the former and the 533 mm torpedo tubes on the latter. As the missile is

not launched from a plane, as is SCALP/Storm Shadow, a booster has been included. The submarine version is encapsulated in an hydrodynamic hard container which is ejected when the missile reaches the surface. To provide a comparable range to the BGM-109 Tomahawk, the range of the MdCN (well over 1000 km) is significantly larger than the SCALP/Storm Shadow. The smaller Scorpène-class submarines can also carry the MdCN missile. France originally ordered 50 MdCN for its FREMM frigates in 2006, delivery was expected in 2012. A further 100 surface-launched missiles were ordered in 2009, along with 50 for the planned Barracuda-class submarines. The €1.2bn (FY2011) project was to deliver 200 missiles at a unit cost of €2.48m, or €6m including development costs. MdCN first flight test from a vertical launcher took place on 28 May 2010 and its first submarine launch test took place on 8 June 2011. MdCN's first complete qualification firing took place on 9 July 2012 at the Biscarosse test range. During its third development firing, MdCN met all its test requirements perfectly including the validation of the terminal autonomously guided phase with IR target scenario reconnaissance, which provides the weapon with its exceptionally high precision. On 24 October 2012, MdCN was tested "end-to-end" in the submarine launch configuration for the first time, adjacent to the Île du Levant test centre. The MdCN entered service with FREMM frigates in February 2017. The MdCN was used in its first operational strike during the April 2018 bombing of Damascus and Homs against alleged Syrian chemical weapons production site, in coordination with the United States and United Kingdom, but without approval from the UN. In addition to nine Scalp EG missiles fired from French aircraft, the FREMM frigates Aquitaine, Provence, and Languedoc launched three MdCN missiles.

→→Multiple-Launch Platform Cruise Missiles (MLPCM) (More than 1,000 km)

Tomahawk American Land Attack Cruise Missile

Tiers:

Variants:

- **BGM-109A:** BGM-109A Tomahawk Land Attack Missile – Nuclear (TLAM-N) with a W80 nuclear warhead. Retired from service sometime between 2010 and 2013. Reports from early 2018 state that the U.S. Navy is considering (re)introducing a (yet unknown type of) nuclear-tipped cruise missile into service.
- **RGM/UGM-109B:** RGM/UGM-109B Tomahawk Anti-Ship Missile (TASM) – active radar homing anti-ship missile variant; withdrawn from service in 1994 and converted to Block IV version.
- **BGM-109C:** BGM-109C Tomahawk Land Attack Missile – Conventional (TLAM-C) with a unitary warhead. This was initially a modified Bullpup warhead.
- **BGM-109D:** BGM-109D Tomahawk Land Attack Missile – Dispenser (TLAM-D) with cluster munitions
- **RGM/UGM-109E:** RGM/UGM-109E Tomahawk Land Attack Missile (TLAM Block IV) – improved version of the TLAM-C.
- **BGM-109G Ground Launched Cruise Missile:** BGM-109G Ground Launched Cruise Missile (GLCM) – with a W84 nuclear warhead; withdrawn from service in 1991 to comply with the INF Treaty.
- **AGM-109H/L:** AGM-109H/L Medium Range Air-to-Surface Missile (MRASM) – a shorter-range, turbojet powered air-launched cruise missile with cluster munitions; never entered service, cost US$569,000 (1999).

System

:

↳***System***

Name: Tomahawk Missile
Type: Long-Range Cruise Missile
Manufacturer: General Dynamics (initially) McDonnell Douglas Hughes Aircraft Corporation Raytheon
Launcher: 8-tubed Lockheed-Martin Mark 41 VLS system

Missile Basic Load: INA
Length: Without booster: 18 ft 3 in (5.56 m) With booster: 20 ft 6 in (6.25 m)
Diameter: 0.52 m
Wingspan: 2.67 m
Weight: 2,900 lb (1,300 kg), 3,500 lb (1,600 kg) with booster
Warhead: Nuclear: W80 warhead (retired) Conventional: 1,000 pounds (450 kg) high explosive or submunition dispenser with BLU-97/B Combined Effects Bomb or PBXN
Detonation Mechanism: FMU-148 since TLAM Block III, others for special applications
Engine: Williams International F107-WR-402 turbofan using TH-dimer fuel and a solid-fuel rocket booster
Operational Range: Block II TLAM-A – 1,350 nmi (1,550 mi; 2,500 km) Block III TLAM-C, Block IV TLAM-E – 900 nmi (1,000 mi; 1,700 km) Block III TLAM-D – 700 nmi (810 mi; 1,300 km)
Flight Altitude: 98–164 ft (30–50 m) AGL
Speed: Subsonic; ~Mach 0.74. about 550 mph (480 kn; 890 km/h)
Guidance System: GPS, INS, TERCOM, DSMAC, active radar homing (RGM/UGM-109B)
Launch Platforms: Vertical Launch System (VLS) and horizontal submarine torpedo tubes (known as TTL (torpedo tube launch))

Notes:

The Tomahawk (/ˈtɒməhɔːk/) Land Attack Missile (TLAM) is a long-range, all-weather, jet-powered, subsonic cruise missile that is primarily used by the United States Navy and Royal Navy in ship- and submarine-based land-attack operations. It was designed and initially produced in the 1970s by General Dynamics as a medium- to long-range, low-altitude missile that could be launched from a surface platform. The missile's modular design accommodates a wide variety of warhead, guidance, and range capabilities. At least six variants and multiple upgraded versions have been introduced since then, including air-, sub-, and ground-launched variants and conventional and nuclear-armed ones. As of 2019, only non-nuclear, sea-launched variants are currently in service. The U.S. Navy launched the BGM-109 Tomahawk project, hiring James H. Walker and a team of scientists at the Applied Physics Laboratory near Laurel, Maryland. Since then, it has been upgraded several times with guidance systems for precision navigation. In 1992–1994, McDonnell Douglas Corporation was the sole supplier of Tomahawk Missiles and produced Block II and Block III Tomahawk missiles and remanufactured many Tomahawks to Block III specifications. In 1994, Hughes outbid McDonnell Douglas Aerospace to become the sole supplier of Tomahawk missiles. It is now manufactured by Raytheon. In 2016, the U.S. Department of Defense purchased 149 Tomahawk Block IV missiles for $202.3 million. Ground-launched cruise missiles (GLCM) and their truck-like launch vehicles were employed at bases in Europe; they were withdrawn from service to comply with the 1987 Intermediate-Range Nuclear Forces Treaty. Many of the anti-ship versions were converted into TLAMs at the end of the Cold War. The Block III TLAMs that entered service in 1993 can fly 3 percent farther using their new turbofan engines and use Global Positioning System (GPS) receivers to strike more precisely. Block III TLAM-Cs retain the Digital Scene Matching Area Correlation (DSMAC) II navigation system, allowing three kinds of navigation: GPS-only, which allow for rapid mission planning, with some reduced accuracy, DSMAC-only, which take longer to plan but terminal accuracy is somewhat better; and GPS-aided missions that combine DSMAC II and GPS navigation for greatest accuracy.Block IV TLAMs have an improved turbofan engine that allows them to launch more quickly, get better fuel economy, and change speeds in flight. The Block IV TLAMs can loiter better and have a real-time targeting system for striking fleeing targets and electro-optical sensors that allow real-time battle damage assessment. The Block IVs can be given a new target in flight and can transmit an image, via satcom, immediately before impact to help determine whether the missile is on target and the likely damage from the attack.

Weight, VUFUS-25 block: kg19
Weight, VUFUS-100 block: kg18

Weight, UM-100 block: kg20
Weight, block of BV-25 fans: kg1

Notes:

Mobile VHF radio station of range R-168-100U-2 Provides a radio communication in radio networks of a tactical control link a regiment - a battalion - a company. Types of work · Phone with frequency modulation. · Phone with cryptographic protection of speech information. · Data transmission. Operating modes Fixed Frequency (FF) (simplex, two-frequency simplex). Pseudorandom Reorganization of Working Frequency (PRWF) (simplex). Adaptive Communication (AC) (simplex, two-frequency simplex). The scanning reception at 8 in advance prepared frequencies. Work with a suppressor of noise. Relaying. The manual and automated record radiodanngkh from the input equipment of radio data with the optical interface (UVRD-O) or from the external COMPUTER (change of frequencies and the address). Emergency deleting of radio data. Transfer and reception of circular, address and voice-frequency calls. Work on 8 in advance prepared channels (APC). Management from the external COMPUTER on RS-232C joint. Voice informant of actions of the operator. Dialogue mode. The automated working capacity control.

MR3000P American VHF Tactical Handheld Radio

Tiers:

System

Alternative Designation: MR3000P

Type: VHF Tactical Handheld Radio

Crew: ea1

Multiband Capability: Multiband capability (25 MHz to 146 MHz)

Embedded EPM: Embedded EPM (ECCM) in line with R&S®SECOM-P

Output power: 5W RF output power

Secure Transmission: Secure transmission of voice, data, and short messages

Selective Calling: Selective calling with sender authentication

MTBF: > 10 000 hours

Maximum Range: INA

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Notes:

The R&S®MR3000P is a small, lightweight, handheld transceiver that perfectly complements the R&S®M3TR family. Though compact, the R&S®MR3000P has all the features required of a tactical transceiver. It provides reliable connections, even in topographically difficult terrain, and is suitable for flexible integration into tactical networks. Since the transceiver can interoperate with the R&S®M3TR, it enables continuous radiocommunications both within and between forces. The expanded frequency range of the handheld transceiver also supports interoperability. It covers tactical VHF as well as parts of the HF and VHF air traffic control bands.

R-168-5UN(1)E Russian VHF Manpack-Vehicular Radio Station

Tiers:

System

↳*VHF Radio*

Name: R-168-5UN-1
Manufacturer: Yaroslavl Radioworks Corp
Quantity: ea1
Type: VHF
Frequency: MHz30-88
Capabilities: FH Voice Data
Maximum Range: km8-12
Mount Type: Manpack
In Service: Possibly Replaced
Battery: Battery 10NKGTs 6-2
Antenna: Rod antenna ASh-1.5
Handset: Handset MTT-1
Types of Operation: FM telephony with and without cyphering, transmission-reception of digital data from external terminal at the rate of 1.2 kb/s to 16 kb/s
Types of Data Transmitted: Analog, clear and secure with the built-in ciphering unit; digital, from an external terminal; tone call at frequency of 1000 Hz

Notes:

The R-168-5U(N)1E VHF manpack-vehicular radio station provides clear and secure radio communications in tactical command level radio networks in harsh ECM environment. The radio station is produced as a manpack, vehicular or fixed version. R-168-5UN(1)E replaces R-159 (16 kg), R-159M (16 kg), R-163-10U (14 kg). The BTR-80 is an 8×8 wheeled amphibious armoured personnel carrier (APC) designed in the USSR. The BTR-80 is a modern, lightly armored vehicle with a diesel power plant. It is manufactured at the Gorkiy Automobile Factory in Nizhniy Novgorod and has been in service since the early 1980s. The BTR-80 is a lightly armored amphibious vehicle with a collective chemical-biological-radiological (CBR) protective system. Operated by a crew of three, the vehicle can carry a squad of seven infantry troops. The BTR-80 8 x 8 armored personnel carrier is intended to carry personnel on the battlefield and provide close fire support. It can also carry out reconnaissance, combat support and patrol missions. It entered service with the Russian army in the late 1980's and has since been used in a number of military conflicts, including UN peacekeeping operations. The vehicle is in production and in service with the Russian

army and with a number of other countries.The BTR-80 is superior to BTR-60/70 with a larger chassis, high-angle-of- fire turret, and single more powerful diesel engine (vs gasoline). Although the armament is same as BTR-60 and BTR-70, except for added smoke grenade dispensers on the back of the turret, the conical turret has been improved and the gun can elevate higher.

Panther V (BCC 67/VRQ 327) British Portable VHF Frequency Hopping Secure EPM Radio

Tiers:

System

Country of Origin: United Kingdom
Description: Hand-held Squad/Platoon
Manufacturer: Thales
In Service: Yes
Frequency Range: MHz30-180
Vehicle Fit: 20 Watts
Applique Amplifier: Yes, a 50 Warr Amplifier is avalable
Integral Vehicle Harness Interface: Yes
Dedicated GPS Interface: Yes
2 and 3 way re-broadcast Facility: Yes
Display: Alphanumeric Display
Note: Smallest 20 Watt EPM manpack/ vehicle transceiver available

BCC 67 PANTHER V-VHF Manpack Radio

Type: VHF
Frequency: MHz30-108
RF Output Power: selectable up to 5 W
Power: 20 W boosted mode at 24 V DC (vehicle configuration)
Weight: 5.9 kg with battery
Battery Life: 32 hr with rechargeable Li-Ion battery pack
Mount Type: Portable or Vehicle

VRQ 327 PANTHER V-VHF Vehicle Station

Type: VHF
Frequency: 30-108

RF Output Power: selectable up to 50 W

Width: mm230

Height: mm160

Depth: mm230

Weight: INA

Mount Type: Vehicle

BCC 69 PANTHER P-VHF Handheld Radio

Type: VHF

Frequency: 30-88

RF Output Power: selectable up to 5 W

Weight: 900 g with battery

Battery Life: 18 hr with rechargeable Li-Ion battery

Notes:

The Panther V manpack transceiver provides 5 and 20 watts of RF power with un-matched co-site capability enabling operation in multiradio locations where the majority of similar manpack radios would fail. The transceiver’s superior co-site performance also enables the manpack to be operated in a vehicle clip-in configuration, with co-located 50 watt VHF radios, delivering up to 20 watts through the vehicle antenna. The Panther V (BCC 67/VRQ 327) British Portable VHF Frequency Hopping Secure EPM Radio consists of the following: 1. BCC 67 PANTHER V-VHF Manpack Radio 2. BCC 69 PANTHER P-VHF Handheld Radio 3. Option - VRQ 327 PANTHER V-VHF Vehicle Station

System

:

↳*VHF Radio*

Name: R-168-25U-2
Quantity: ea2
Type: VHF
Frequency: MHz30-180
Capabilities: FH Voice Data Retrans
Maximum Range: km25-40
Mount Type: Vehicle
In Service: Yes
Length: mm205
Width: mm175
Height: mm95
Weight: kg3
Operation Modes: Fixed Frequency (FF) (simplex, two-frequency simplex). · Pseudorandom Reorganization of Working Frequency (PRWF) (simplex). · Adaptive Communication (AC) (simplex, two-frequency simplex). · The scanning reception at 8 in advance prepared frequencies. · Work with a suppressor of noise · Relaying. · The manual and automated record of the radio data with the optical interface (UVRD-O) which are radio given from the input equipment or from the external COMPUTER. · Emergency deleting of radio data. · Transfer and reception of circular, address and voice-frequency calls. · Management from the external COMPUTER on RS-232C joint. · Voice informant of actions of the operator. · Dialogue mode. · The automated working capacity control. · A simplex or a two-frequency simplex on one of 8 in advance prepared frequencies. · Simultaneous transfer of speech information and data.
Type of Work: - Phone (TLF) with the frequency modulation (FM). - TLF with technical masking of speech information. - Data transmission from the external equipment.

Notes:

Multifunctional R-168-25UE-2 radio stations are designated for open and masked communications on moderately rugged terrain. The digital radio stations operate in frequency retuning regime, are highly protected from jamming and sustainable against radio-electronic warfare. The equipment can uninterruptedly operate in harsh climatic conditions, sustain heavy shocks and vibration and is immune to sand and moisture. Provides a radio communication in radio networks of a tactical control link a regiment - a battalion - a company.

→→Vehicle-Mounted UHF Radios

UM600 Norwegian Vehicle-Mounted UHF IP Broadband Radio

Tiers:

System

Type: UHF IP Broadband Radio
Mount: Vehicle
Height: mm40
Width: mm245
Depth: mm138
Weight: kg1.55
Input Voltage: 9-32 VDC through PMU
Power Consumption: watts35
Frequency Range: 225-400 MHz
RF Bandwidth: up to 5 MHz
Output power: up to 5 W
Military ODU connectors: Yes
Operating temperature: -35oC to +55oC
Environment: MIL-STD 810
EMC: MIL-STD 461
Dual audio channel: Yes
Ad-Hoc: Ad-hoc, fully automatic multi-hop capabilities (MANET)
Encryption: mbedded AES256 encryption, no need for external encryption
Software: Through Software Defined Radio (SDR) the waveform can be optimized to fit the application

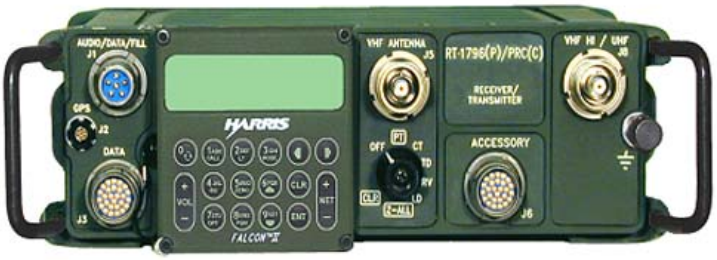
Note: Fully integrated with Kongsberg CMS management system

Notes:

The UM600 high capacity UHF radio supports tactical operations in mobile platforms. High data throughput is ensures with a transmission range suited for vehicles at the tactical edge of an operation. UM600 has full router functionality including multi-hop features ensuring that data is reaching its destination correct and timely. UM600 can support up to 2.5 Mbit/s. For harsh operational environment the radio is optimized at a data rate of 900 kbit/s. UM600 can be configured to operate in a mixed TDMA mode supporting a number of voice channels as well as guaranteed access for time critical data. This mode is the optimum choice for handling all communication needs within e.g. an 8x8 Company.

→Multiband Radios

AN/PRC-117G American Multiband Manpack Radio



Tiers:

Variants:

- **AN/PRC-117 Version F (Foxtrot):** Version F (Foxtrot), namely AN/PRC-117F-MP Falcon II series, covering the 30-512 MHz frequency range, provided without internal GPS (optionally an external commercial GPS can be connected, or a GPS SAASM as a Precision Lightweight GPS Receiver [PLGR] or a Defense Advanced GPS Receiver [DAGR])
- **AN/PRC-117 Version G (Golf):** Version G (Golf), namely AN/PRC-117G-MP Falcon III series, covering the 30-2000 MHz frequency range, and provided with internal SAASM GPS (optionally an external commercial GPS can be connected)

System

Alternative Designation: AN/PRC-117
Type: Multiband Manpack Radio
Crew: ea1
Frequency Range: 30 MHz to 2 GHz
Presets: 100 (110 including DAMA)
Transmission Modes: FM, AM, PSK, CPM
Tuning Resolution: 10 Hz
Model: RT-1796 (P)(C)/U
Transmitter Output Power: 1 W to 20 W (Max)
Transmitter, Harmonic Suppression: –40 dBc
Transmitter, Frequency Stability: +/- 1.0 ppm
Receiver, FM Sensitivity: -118 dBm (10 dB SINAD)
Receiver, Adjacent Channel Rejection: 60 dB

Fill Devices: AN/CYZ-10 DTD, AN/PYQ-10 SKL (Supports DS-101, DS-102 and Mode 2/3)

Crypto Modes: KY-57, ANDVT/KYV-5, KG-84C, FASCINATOR

Radios: AN/PRC-152; AN/PRC-148; AN/PRC-119A/B/G; AN/PRC-113; AN/PRC-77; AN/PSC-5; Other versions of the AN/PRC-117

External Data: RS-232, MIL-STD-188-114A

Remote control: RS-232, RS-422

Antenna Ports: Separate VHF, VHF-HI/UHF

Audio: Six-pin Standard

Power: Two BA-5590, BB-390A/U, BB-2590, or BB-590 batteries

Operating Temperature: -40 °C to 70 °C

Line of Sight: VHF/UHF AM/FM; SINCGARS ECCM; HAVE QUICK II ECCM; ANW2 - Advanced Networking Wideband Waveform (Harris); SRW Soldier Radio Waveform; NATO SATURN waveform, per NATO STANAG 4372 - optional

SATCOM: MIL-STD-188-181-B/C; MIL-STD-188-182-A; MIL-STD-188-183-A/B; High performance waveform (HPW); Mobile User Objective System (MUOS) - optional

Dimensions

Height: 3.7 in (w/o battery case)

Width: 7.4 in (w/o battery case)

Depth: 8.8 in (w/o battery case)

Weight, Combat: 8.2 lbs (without batteries)

Notes:

The AN/PRC-117 Multiband Manpack Radio, or Multiband Multi Mission Radio (MBMMR), is a man-portable, tactical software-defined combat-net radio, manufactured by Harris Corporation, in two different version: Version F (Foxtrot), namely AN/PRC-117F-MP Falcon II series, covering the 30-512 MHz frequency range, provided without internal GPS (optionally an external commercial GPS can be connected, or a GPS SAASM as a Precision Lightweight GPS Receiver [PLGR] or a Defense Advanced GPS Receiver [DAGR]); Version G (Golf), namely AN/PRC-117G-MP Falcon III series, covering the 30-2000 MHz frequency range, and provided with internal SAASM GPS (optionally an external commercial GPS can be connected). Both radios have NSA certification for the transmission of voice and data traffic up to the Top Secret level. The designation AN/PRC translates to "Army Navy / Portable Radio Communications" used for two way Communications, according to Joint Electronics Type Designation System guidelines. The radios are also provided in a vehicular configuration under the AN/VRC-103 nomenclature.

MR300xH/U American Advanced Multiband Tactical Radios

Tiers:

System

Alternative Designation: MR300xH/U
Type: Advanced Multiband Tactical Radios
Manufacturer: Rohde and Schwarz
Crew: ea1
Software: Software-configurable
Multiband Capability: Multiband capability (1.5 MHz to 512 MHz with external devices)
Multiwaveform Capability: Multiwaveform capability (HF House, VHF/UHF tactical and G-A-G waveforms)
Embedded EPM: Embedded EPM (ECCM) in line with R&S®SECOM and R&S®SECOS, HAVE QUICK II
GPS: Integrated GPS, position report
Data Rate: Integrated GPS, position report
IP: IP over air capability (R&S®IPoA)
Voice Operation: SIP based remote voice operation
MTBF: > 7500 hours

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

The |R&S MR300x radios form a family of high-performance digital radios covering the HF, VHF and UHF bands. Thanks to various high-speed data modes and protocols as well as multiple anti-jam modes for HF, VHF and UHF, they perfectly integrate into tactical communications networks. The radios are software-configurable and reprogrammable. Manpacks of the R&S®M3TR family are based on one mechanical platform, with a common logistics concept, identical physical interfaces and one human-machine interface (HMI).

Iridium Extreme PT American Satellite Phone

Tiers:

System

Alternative Designation: Iridium Extreme PT
Type: Satellite Phone
Manufacturer: Iridium
Crew: ea1
Physical Features: • Meets military-grade durability standards • Jet-water, shock and dust resistance (IP65-rated) • Compact, lightweight design for ultimate portability • Diamond treaded, taper grip for in-hand ergonomics • Integrated loudspeaker • Rugged, high-gain antenna • Daylight-readable, glare-resistant display • 2.5mm headset and hands-free capability • Mini-USB data port
Operating Temperature: 10C to +55C operating temperature
Phone Mode Battery Duration: - Standby: Up to 54 hours - Talk time: Up to 6.5 hours
PTT Mode Battery Duration: - Standby: Up to 16.5 hours - Talk time: Up to 5 hours

Dimensions

Length: 140 mm
Width: 60 mm
Depth: 32 mm
Weight, Combat: 268g weight

Notes:

The Iridium Extreme® Push-to-Talk (PTT) is the device for global dependability, adaptability and durability. Only Iridium can deliver the power of fast, simple and secure group communication with the toughest, most feature-rich PTT-enabled satellite phone on the market. Versatile Communications at the Push of a Button Iridium Extreme® PTT takes reliable group communications to the next level with unique features and capabilities, including: *Everything offered within the Iridium Extreme® plus Push-to-Talk functionality *Global PTT capabilities and configurable talkgroups *A reinforced PTT button *A high audio loudspeaker *Enhanced SMS and email messaging capability *GPS-enabled location-based services *SOS access in Phone Mode *Phone Mode battery duration: standby up to (54) hours; talk time up to (6.5) hours *PTT Mode battery duration: standby up to (16.5) hours; Talk time up to (5) hours Ruggedly engineered to support high intensity users in some of the harshest

conditions, Iridium Extreme® PTT features: *Military-grade (MIL-STD 810F) durability *An Ingress Protection (IP) rating of IP65 *Jet-water, shock and dust resistance *Diamond treaded, tapered grip to provide superior in-hand ergonomics

Notes:

HC-2423 was a handheld GSM 1 mobile telephone set with built-in encryption facilities, made by Crypto AG (Hagelin) in Zug (Switzerland) in the early 2000s. The unit could be used on any public GSM 900/1800 network in the world, and was compatible with the HC-2203 PSTN encryption. The GSM system uses TDMA to split a frequency into time slots. Probably the most useful thing to know about the Global System for Mobile communications (GSM) is that it is an international standard. If you travel in Europe and many other parts of the world, GSM is the only type of cellular service available. GSM cell phone with integrated Endto-End Encryption (hardware module) for secure phone communication in GSM 900/1800 networks.

IsatPhone 2 American Inmarsat Satellite Phone

Tiers:

System

Alternative Designation: IsatPhone 2
Type: Inmarsat Satellite Phone
Manufacturer: Inmarsat
Crew: ea1
Display: High-contrast colour screen
Interfaces: Micro USB Audio socket Antenna port Bluetooth 2.0
Durability: IP65 IK04
Operating Range: -20°C to +55°C (-4°F to +131°F)
Storage Range: -20ºC to +70ºC (-4ºF to +158ºF) (with battery)
Charging Range: 0°C to +45°C (+32°F to +113°F)
Battery: Type: Lithium-ion, 3.7 volts Talk time: Up to 8 hours Standby time: Up to 160 hours
Satellite Telephony: 2.4kbps voice codec
Voicemail: Speed dial 1
Supplementary Voice Services: Call history Caller ID Call waiting Call divert Call holding Conferencing Call barring Speed dialling Fixed number dialling
Text-to-Text: 160 Latin / ~74 non-Latin characters Up to 10 concatenations Standard and predictive text
Text-to-Email: 160 Latin / ~74 non-Latin characters Up to 10 concatenations Incoming email – 160 Latin characters / ~74 non-Latin characters
GPS Locattion Data: View position Send as text or email
Reliable Network: Operates over our global I-4 satellite network, ensuring reliable call stability and seamless roaming worldwide.
Global Coverage: IsatPhone 2 coverage is worldwide, apart from the Poles. Calls are made via a single, global network so there are no roaming charges.

Dimensions

Length: 169mm

Width, without Antenna: 52mm
Width, with Antenna: 75mm
Depth, in Hand: 29mm
Depth, at Deepest Point: 36mm
Weight: 318g (11.2oz) – including battery

Notes:

IsatPhone 2 is the latest addition to our handheld satellite phone portfolio, offering a range of new features to ensure you stay connected in even the most extreme and remote locations. IsatPhone 2 is a tough phone for a tough world. The robust handset has been engineered to cope with anything that nature can throw at it – from searing heat to icy blasts, desert sandstorms or monsoon rain. And with fast network registration, an unrivalled battery life offering 8 hours' talk time and up to 160 hours on standby, you know you can always depend on IsatPhone 2. What’s more, IsatPhone 2 gives you the excellent voice clarity and call stability you expect from the world-leading Inmarsat network.

R-438M Belozer Russian Mobile Satellite Communication Station

Tiers:

System

:

↳***Radio #6***

Name: R-438M Belozer
Quantity: ea1
Type: Portable SATCOM System
Frequency: INA
Capabilities: Voice Data
Maximum Range: km5,000
Mount Type: Manpack
In Service: Yes
Transfer Rates: bps1,200
Two Channel Receiving Mode: Yes
Note: There is very little information about the R-438M Belozer

Notes:

The station is designed to provide satellite radio communications for units operating detached from the main forces, as well as for use as a commander’s personal station. It provides a full autonomy of operation transmitting voice, digital, and text messages, automated functional testing, and interface with a wide range of peripheral devices through ports RS-232C, C1-FL-BI. The radio station can be carried by one person. Mode of work: Duplex telecommunication; Simplex data communication; Formalized service communication mode; Transfer rates of 1200 bps; Two channel receiving mode. As compared to the stations of the previous generation, the data speed has increased by several times. On the move, the station is the size of a school backpack and can be carried by one person; it weighs 16 kg. Set up time is about 30 sec. The station provides formalized service communication and a secure telephone mode. The station operates in the range of 4 GHz to 6 GHz. Data transfer rate is 1200 bps. The advantages of satellite communication are a large range of reliable signals, especially in areas with difficult terrain, regardless of the weather conditions and time of day and year, and a highly secure protection. Yaroslavl Radio

Manufacturing Plant started production of the portable satellite radio station R-438 Barrier-T in 1998-2000 and the R-438M Belozer in 2002-2003.

→Tactical Broadband Wireless Modules

UM620 Norwgian Tactical Broadband Wireless Module

Tiers:

System

Alternative Designation: UM620
Type: Tactical Broadband Wireless Module
Crew: ea1
Radio Features: The UM620 operates from 225 to 400 MH z to provide a good balance bet ween range in non-LOS terrain, data rate and RF power output. The radio has proven multipath capabilities and selec table RF output from 100mW to 20W. The radio can provide different net work capacities based on selec ted RF bandwidth and coding. The radio may operate in a pure data radio mode or in combined voice and data modes. Dynamic configuration of wave-form is possible.
Software: Depending on chosen net work operation, the radio can handle a number of parallel voice net works and IP multi hop data net works in one RF network.
Mounting: The UM620s small size and weight allows for flexible mounting in the Power Mounting Unit (PMU) or in a combined Dual Channel Radio mount.
MIL-STD: The UM620 complies with MIL-STD 810G requirements to tac tical equipment.
Protocols: IP versions IPv4 / IPv6 LAN protocols Ethernet
Services: Network Service DHCP External networks OSPF/RIP/Static routing Multi hop capability Voice and data Multicast Unicast
Mangement: Web (https) SNMPv3
RF Characteristics: Frequency Range 225-400 MHz Power 100mW to 20 W
Network Capacity: Voice: up to 5 voice nets Data rates: up to 2500 kbps RF bandwidth: up to 5 MHz
LAN: IEEE 802.3 10/100 Base-T/TX
Audio: Dual channel
GPS: External Internal
Power Supply: Input Voltage 11-32 V DC
Operating Temperature: -35ºC to +55ºC

Dimensions

Height: 55 mm

Width: 245 mm

Depth: 156 mm

Weight, Combat: 2.2 kg

Notes:

UM620 – TACTICAL BROADBAND WIRELESS MODULE Robust broadband wireless connec tion for mobile combat zone users UM620 operates without any Master in the network. UM620 provides ad-hoc functionality for fast and easy establishment of networks. Voice connection to intercom systems is utilized through digital or analogue interface. UM620 provides DHCP services and routing for connected LAN subscribers. Multi hop capability ensures the user to reach intended destination for both voice and data. The software defined solution of UM620 and the radio’s flexible software facilitates new services to be implemented in support of customer specific applications. The UM620 is easy to use, and managed using the integrated web-based management system or by using the SNMP interface. DISMOUNTED CAPABILITY The UM620 is fully compatible with the soldier radio SR600, and enables integration between vehicles and dismounted troops. NETWORK SERVICES The UM620 provides an Ethernet interface with DHCP server capability to the local LAN of the vehicle. Various IP routing services are provided within the radio network as well as towards external networks. Multicast and Unicast services are supported.

→Tactical Routers

IPX600 Norwegian Tactical Router

Tiers:

System

Alternative Designation: IPX600
Type: Tactical Router
Crew: ea1
Port Connections: 5 x WAN 2 x LAN 1 x Fibre 1 x Operation and Maintenance
Subscribers: 15 x Legacy Telephones 100 x VoIP Telephones
Protocols: SIP Q.931/QSIG RIPv2 and RIPng STANAG 4206 OSPFv2 and OSPFv3 STANAG 4578 Ed.1 BGP CPX Trunk Group PIM-SM PIM-SSM RTP NTP
Services: IPv4 and IPv6 DHCP Server /Client Call Handling NTP Server SIP Telephones Remote Management From CMS
Interfaces: Ethernet: 10/100BASE-T/TX ITU-T: V.11 256, 512, 1024, 2048, 4096, 8192, 8448 kbit/s ITU-T: G.703 256, 512, 1024, 1544, 2048, 4096, 8192, 8448 kbit/s EUROCOM D/1: 256, 512, 1024, 2048, 4096, 8192, 8448 kbit/s STANAG 4206: 256, 512 kbit/s STANAG 4578 Ed. 1: 2048 kbit/s Fibre: 1 Gbit/s
Power Supply: Input Voltage: 19-32 VDC Power consumption: 100 W
Operating Temperature: -40ºC to +55ºC
MIL-STD: Environment: MIL-STD 810 EMC: MIL-STD 461
Features: •Integrated Call Control, supports up to 100 VoIP telephones • Voice, data and management service integration with legacy EriTac (circuit switched) and TacLAN (Combat level IP system) • Supports traditional EriTac/EUROCOM terminals • Media Gateway supporting SIP , STANAG, ISDN and EUROCOM GWs, enabling for example calls between Eurocom and Voice over IP subscribers • Multimedia access unit via Optical Fibre or Radio Lin

Dimensions

Height: 177 mm
Width: 483 mm
Depth: 350 mm
Weight, Combat: 19 kg

Notes:

TACTICAL ROUTER/MEDIA GATEWAY The Link Between EriTac and IP Networks IPX600 is a high capacity Router and TDM switch

with a range of functions. IPX600 is the main networking component of K-TaCS, Tactical Communication System from KONGSBERG. IPX600 integrates IP networks and legacy tactical networks and Provides IP networks with Military Gateways. IPX600 is a configurable media gateway and router, supporting a range of different interfaces. IPX600 provides a wide range of IP and circuit switched network services. Its small size and low weight together with its inherent properties for communication readiness, makes IPX600 particularly suitable for communicationn between tactical units frequently on the move. Management is performed through the Communication Management System CMS. CMS is an intuitive, easy to use menu based system. Predefined configurations may be used. IPX600 is fully ruggedised, designed for harsh environments.

→Tactical Amplifiers

VK3150 American 150 W HF Power Amplifier

Tiers:

System

Alternative Designation: VK3150

Type: 50 W HF Power Amplifier

Crew: ea1

Operation: The R&S®VK3150 provides medium-power/medium-range communications links. Typical applications include mobile or base station installations for general-purpose HF SSB voice and data communications.

Frequency Range: Supports continuous operation across the 1.5 MHz to 30 MHz band with 150 W transmit power

Frequency Hopping: The power amplifier section is of broadband design and fully supports frequency-agile operating modes (automatic link establishment, slow frequency hopping).

Mounting: The HF power amplifier is mounted separately on an independent shockmount with room for proper air flow. This provides additional flexibility when installing tactical radio systems into vehicles.

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Notes:

The R&S VK3150 150 W HF power amplifier increases the HF output power of the R&S MR300xH/U manpack radios to 150 W PEP or 100 W average. The R&S®VK3150 provides medium-power/medium-range communications links. Typical applications include mobile or base station installations for general-purpose HF SSB voice and data communications. Continuous coverage is provided over the 1.5 MHz to 30 MHz frequency range. The power amplifier section is of broadband design and fully supports frequency-agile operating modes (automatic link establishment, slow frequency hopping). When used with the automatic R&S®FK3150 HF antenna tuning unit, the output of the R&S®VK3150 is automatically matched to most rod and whip antennas. Built-in self-test features permit operators or maintenance personnel to fully check the transceiver and the power amplifier down to the module level. Fault conditions are displayed on the transceiver‘s front-panel display. The R&S®MR300xH/U manpack acts as an exciter for the power amplifier, avoiding the disadvantages of transceiver/ booster solutions with respect to unwanted emissions. The HF power amplifier is mounted separately on an independent shockmount with room for proper air flow. This provides additional flexibility when installing tactical radio systems into vehicles. The R&S®VK3150 uses rugged tactical packaging and meets the same environmental specifications for temperature, shock, vibration, and submersibility as the rest of the R&S®M3TR family.

VT3050 American 50 W VHF/UHF Power Amplifier

Tiers:

1 2 3 4

System

Alternative Designation: VT3050

Type: 50 W VHF/UHF Power Amplifier

Manufacturer: Rhode and Schwarz

Crew: ea1

Operation: The R&S®VT3050 50 W VHF/UHF power amplifier supports continuous operation across the 30 MHz to 512 MHz band with 50 W transmit power.

Family: The R&S®VT3050 is a member of the R&S®M3TR family of multiband tactical radio systems.

Voice and Data: This power amplifier meets the need for military voice and data communications in all analog and digital fixed frequency and frequency hopping modes supported by the R&S®MR300xH/R&S®MR300xU tactical radio.

High-Speed Radio Modem: The amplifier is especially designed for high linearity to satisfy the requirements of the R&S®M3TR family's high-speed radio modem for 72 000 bit/s.

Collocation Option: A collocation option is available for the VHF low band (30 MHz to 88 MHz). The co-site filter is factory-installed. Fully automatic operation (controlled from the transceiver) and rapid tuning capability are provided

Multiband Operation: An R&S®M3TR VHF/UHF system can be easily upgraded to multiband operation. The serial control bus of the R&S®M3TR allows combinations of radios with up to two external amplifiers

Frequency Range: 1.5 MHz to 512 MHz

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Notes:

The R&S VT3050 50 W VHF/UHF power amplifier supports continuous operation across the 30 MHz to 512 MHz band with 50 W transmit power. The R&S®VT3050 is a member of the R&S®M3TR family of multiband tactical radio systems. This power amplifier meets the need for military voice and data communications in all analog and digital fixed frequency and frequency hopping modes supported by the R&S®MR300xH/R&S®MR300xU tactical radio. The amplifier is especially designed for high linearity to satisfy the requirements of the R&S®M3TR family's high-speed radio modem for 72 000 bit/s. It supports medium to fast frequency hopping. A collocation option is available for the VHF low band (30 MHz to 88 MHz). The co-site filter is factory-

installed. Fully automatic operation (controlled from the transceiver) and rapid tuning capability are provided. An R&S®M3TR VHF/UHF system can be easily upgraded to multiband operation. The serial control bus of the R&S®M3TR allows combinations of radios with up to two external amplifiers. By adding an R&S®VK3150 HF amplifier and an R&S®FK3150 antenna tuning unit, the system can be expanded to a frequency range of 1.5 MHz to 512 MHz.

→Antennas

GATR 1.2M American Inflatable Antenna

Tiers:

System

Alternative Designation: GATR 1.2m
Type: Inflatable Antenna
Crew: ea2
Band: Ku-Band; X-Band
Emplacement Time: Under 20 minutes on satellite
Displacement Time: Under 20 minutes on satellite
Optics: Prime focus
Reflector Construction: Flexible parabolic fabric
Az/El/Pol: Manual point and align
Modem: Works with all standard SATCOM modems
Satellite Location Controller: iDirect SNR tuning. Satellite acquisition, peaking, and cross pol adjustment using GPS or compass, and level inputs
Interface: CAT-5 cable for IP applications
Elevation: 5 to 90 deg
Azimuth: +/-10 deg of hold-downs
Polarization, Ku-Band: Linear
Polarization, X-Band: Circular
Transmit Gain (Mid-band), Ku-Band: 43.0 dBi
Transmit Gain (Mid-band), X-Band: 37.0 dBi
Receive Gain (Mid-band), Ku-Band: 41.5 dBi
Receive Gain (Mid-band), X-Band: 36.1 dBi
Satellite System Compliance, Ku-Band: Intelsat
Satellite System Compliance, X-Band: Skynet and XTAR

Operating Temperature: Operational: -32 to +55°C Storage: -40 to +60°C
Wind Load: Operational: 40 mph (64 kph) Survivable: 60 mph (97 kph) with anchor spikes
Power: 100-277V AC

Dimensions

Length, Standard Case: 79 cm
Width, Standard Case: 51 cm
Height, Standard Case: 30.5 cm
Weight: 34 kg

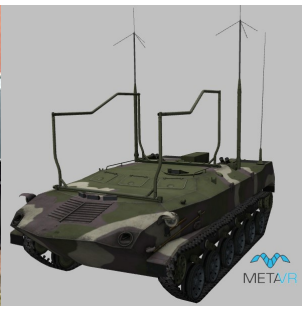
Notes:

From an innovative, ultra-portable design, the GATR 1.2m Antenna System provides high-bandwidth communications for transmission of secure and non-secure data, voice and video transmissions. Incorporating an inflatable radome and flexible parabolic reflector mounted at its equator, GATR 1.2M features a single Ku-band 1.2-meter satellite terminal, all in a compact system that fits comfortably into one airline-checkable case weighing less than 75 pounds (34 kg). A 50-percent reduction in pack-out weight and volume compared to deployable rigid antennas of similar size, making it ideal for first-in deployments, remote applications and contingency scenarios where transportation and space are limited. Plus, set up takes less than 20 minutes.

Command and Control (C2) Systems

→Command and Control (C2) Vehicles

BMD-KShM Russian Command Post Vehicle



Tiers:

Variants:

- **BMD:** First production model.
- **BMD-1K:** (K stands for komandirskaya – command) – Command variant fitted with R-126 and R-107 transceivers, two Clothes Rail antennas and a generator box. It's sometimes called BMD-K
- **BMD-1P:** BMD-1 modernization with its 9S428 ATGM launcher replaced by pintle-mounted 9P135M-1 ATGM launcher capable of firing 9M113 "Konkurs" (AT-5 Spandrel), 9M113M "Konkurs-M" (AT-5B Spandrel B), 9M111 "Fagot" (AT-4 Spigot) and 9M111-2 "Fagot" (AT-4B Spigot B) ATGMs. Entered service in 1977.
- **2S9 NONA Russian 120mm Self-Propelled Mortar (SPM):** The 120 mm SO-120 2S9 Anona (Anemone) self-propelled gun/mortar (SPG/M) was first seen in public in May 1985 and is an airborne artillery assault vehicle that was developed to carry out two tactical functions.
- **2S9-1 Russian 120mm Self-Propelled Mortar (SPM):**
- **2S9-1M:** The 2S9-1M is an upgraded variant of the baseline SO-120 2S9 Anona-S. The upgraded vehicle is designed to maintain the battlefield viability of the original SO-120 until a replacement - likely to be the Lotus fire support vehicle based on the BMD-4M - can be developed and introduced into service.
- **BMD-1PK:** (K stands for komandirskaya – command) – Command variant of BMD-1P. It is fitted with an additional R-123M radio set, a generator, the GPK-59 gyroscopic compass, the PRKhR radiation and chemical reconnaissance unit and two attachable tables. The machine gun mounted in the left corner of the bow of the hull has been eliminated as well as one of the seats. The crew consists of 6 men. The ammo load was reduced by one 9M113 "Konkurs" (AT-5 Spandrel) ATGM and 250 7.62 mm machine gun rounds
- **BMD-1M:** BMD-1 with smoke grenade launchers on the rear of the turret, improved ventilation and road wheels
- **BMD-2 (Ob'yekt 916):** BMD-1 variant with a new one-man turret armed with stabilized 30 mm 2A42 multi-purpose autocannon and 7.62 mm PKT coaxial tank machine gun (mounted on the right hand side of the main gun). The vehicle carries 300 rounds for the main gun (180 AP and 120 HE) and 2,940 rounds for the machine gun. The gun has a maximum elevation of 75° and can be used to fire at air targets. The turret is also armed with pintle-mounted 9P135M launcher, on the right hand side of the roof of the turret, with semi-automatic control capable of firing SACLOS guided 9M113 "Konkurs" (AT-5 Spandrel) and 9M113M "Konkurs-M" (AT-5B Spandrel B) ATGMs. The new turret seats the gunner on the left hand side of the main gun. On top of the turret there's one single piece circular hatch opening to the front. Located in front of the said hatch is the gunner's sight which is the same one as the one used in BMP-2. Another gunner's sight is located on the left hand side of the main gun and moves in vertical planes along with it. It is a high angle of fire sight used when the gunner is aiming at air targets. The vehicle also has additional periscopes that provide it with vision on the sides. A white searchlight is mounted in front of the turret. The amount of bow mounted tank machine guns decreased from two to one. The right hand side bow mounted machine gun was preserved. NATO gave it the designation BMD M1981/1
- **BTR-D (Ob'yekt 925):** Lengthened variant (with 6 rather than 5 road wheels), slightly up-armoured at the front. The BTR-D has no turret, but is armed with two bow-mounted machine guns PKB and can be fitted with pintle-mounted automatic grenade launchers (AGS-17, AGS-30 or AGS-57) and/or machine guns (PKM, 6P41, "Utyos" or "Kord"). Entered service in 1974 and can carry 10 passengers. Combat weight: 8.5 tons.

System

Alternative Designation: BMD-KShM

In Service: 1969-Present

Manufacturer: Volgograd Tractor Plant

Type: Command Post Vehicle; Airborne Amphibious Infantry Fighting Vehicle (IFV)

Family: 2S923

Crew: ea2 (driver, gunner)

Passengers: 6 troopers (including commander and machine gunner seated next to the driver and 3 men in the troop compartment)

Chassis: S-120 and based on the aluminium hull of the BTR-D airborne multi-purpose tracked armoured personnel carrier

Displacement Time: min30

Emplacement Time: min30

Airborne Capable: Yes

Parachute System: PRSM-916 parachute system, or the PRSM-925 for combat deployments

Airdrop Height: m500-1,500

Note: The BMD-1 can be distinguished from all other BMD variants firstly by the large gun that is its main armament, and secondly by its road wheels that have a star-shaped centre and dual rims.

Dimensions

Length: m5.1

Communications

Type: R-173

Note: There is no information available that outlines what type of Command and Control Equipment is installed in the BMD-KShM.

Main Gun

↳*System*

Name: 2A28 Grom 73mm smooth bore semi-automatic gun

Type: mm73

Manufacturer: KBP

Length, Barrel: mm1,195

Height: mm322

Weight: kg115

Width: mm218

Electric Motor: Yes, with a manual mechanical backup

Magazine Type: forty-round mechanized conveyor double-row magazine

Max Rate of Fire: rds/min8-10

Loader Type: M3 electromechanical autoloader with ammunition conveyor

Max Elevation: deg+33

Min Elevation: deg-4

Traverse Range: deg360

Traverse Left: deg180

Traverse Right: deg180

Note: The BMD-1 can also fire ATGM launcher (three 9M14M or 9M113 or 9M111M ATGMs)[4][9]

↳*Ammunition (Option 1)*

Type: OG-15V HE-Frag

Caliber: mm73

Muzzle Velocity: m/s290

Basic Load: 16 Total OG-15V HE-Frag Projectiles

Weight: kg4.57

Shell: kgOG-9 shell with a 0.73 kg (1 lb 10 oz) TNT bursting charge

↳*Ammunition (Option 2)*

Type: PG-15V (HEAT)

Caliber: mm73

Muzzle Velocity: m/s400

Stabilizer Type: fixed fin-stabilized rocket-assisted round.

Basic Load: 24 Total PG-15V Projectiles

Weight: kg3.47

Shell: kg2.6

Explosive Type: mmRDX explosive charge in the warhead

Explosive Weight: kg0.322

Penetration: mm280-350

Note: Once the projectile has travelled 10–20 m (33–66 ft), the rocket motor starts and accelerates it to 700 m/s (2,300 ft/s).

Anti-Tank Guided Weapons (ATGW)

Name: Kolomna Malyutka (Baby) 9M14

Type: wire-guided ATGW

Minimum Range: m500

Maximum Range: m3,000

Maximum Speed (throughout the Flight): m/s130

Flight Time: sec25

Warhead Type: HEAT Warhead

Penetration: mm400

Coaxial Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Type: mm7.62

Max Rate of Fire: rds/min650

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces

In Service: 1961-present

Manufacturer: Degtyaryov plant

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length (Overall): mm1,203

Length (Barrel): mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Note: The 7.62 PKT can be controlled remotely

↳*Ammunition*

Type: Rifle
Caliber: mm7.62
Muzzle Velocity: m/s825
Basic Load: ea1,500
Maximum Effective Range (With Sight Adjustments): m100-1,500

Fire Control

Name: INA
Computerized FCS: Yes
Thermal Sight Vehicle Commander: Yes, with three day vision devices
Thermal Sight Gunner: Yes, dual-mode 1PN22M1 monocular periscopic sight mounted on the left side of the turret roof.
Driver Sight: TNPO-170 periscope
Main Gun Stabilization: INA
Indirect Fire: Yes
Direct Fire: INA
Land Navigation: Yes
Searchlight: IR searchlight

Protection

Armor Type: Welded aluminium alloy
Gun Mantlet: mm33
Turret Armor: 23 mm at 42° turret front 19 mm at 36° turret side 13 mm at 30° turret rear 6 mm turret top
Hull Armor: 15 mm at 50° lower hull front, 10 mm rest of the hull
Applique Armor: INA
Explosive Reactive Armor: No
Active Protection System: INA
Mine Clearing: No
Self-Entrenching Blade: Available
NBC Protection: PAZ NBC system
Smoke Equipment: INA
Fire-Extinguishing System.: PPO centralised ethylene-bromide fire-extinguishing system

Notes:

The BMD-KShM: command post vehicle is a variant of the BMD-1. The BMD-1 is an airborne infantry tracked armoured vehicle, which entered in the service to the Russian army airborne units in 1969 and was first show to the public during a parade held in Moscow in November 1973. The vehicle was called the M1970 before its Russian designation became known. Development started in 1965 and limited production began in 1968 and ended in 1969. After operational trials it was deployed in limited numbers by 1969 and the serial production started in 1970, although the vehicle weight 500 kg more than what the

requirements stated (7.5 tonnes and 13.3 tonnes when loaded with equipment). In late 1970s a new modernized vehicle received a designation BMD-1P following adoption of the new 9P135M-1 ATGM launcher instead of 9S428 ATGM launcher, firing the 9M113 "Konkurs" (AT-5 Spandrel). In 1983, based on the combat experience in Afghanistan a decision was made to produce a new variant of the BMD with a weapon capable of engaging targets such as those faced by the airborne troops in that conflict. This resulted in "Ob'yekt 916" which later became BMD-2. A lengthened chassis of BMD-1 served as a basis for the BTR-D airborne multi-purpose tracked APC which itself served as a basis for many specialized airborne vehicles. The BMD-1 is always currently used by the Russian airborne troops. BMD-1 and BMD-1PK IFVs are used by Russian airborne units of KFOR. BMD-1 IFVs were used by Russian airborne units of SFOR.

9S737 Ranzhir Russian 6x6 Mobile Command Center

Tiers:

1 2 **3** 4

Variants:

- **9S737M Ranzhir-M:** INA

System

Alternative Designation: 9S737 Ranzhir
Type: Russian 6x6 Mobile Command Center
Manufacturer: AGAT–Control Systems
Family: Ranzhir
In Service: 1989-Present
Chassis: Tata LPK 2518
Crew: INA
Passenger Capacity: INA
Note #1: There is very little unclassified information about the 9S737 Ranzhir
Note #2: The Ranzhir E/M is also available in a lower cost truck variant, intended for applications where high road mobility is important. For instance a wheeled Tor M2E or Pantsir S1 battery would used the wheeled variant to match the high road speed of the TELARs.

Dimensions

Length: 7.18 m
Width: 3.35 m

Time for mission setting, in Manual Mode: sec5

Protection

Armor: Protection from small arms fire and shell splinters

Applique Armor: INA

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Ranzhir series of mobile command posts was originally developed for the PVO-SV to provide a tracked and hardened ADCP for batteries of point defence weapons, such as SPAAGs and SAM systems. 9S737 vehicle was designed by Belarusian scientific and research institute of automatization technologies (NIISA), currently "AGAT–Control Systems". A. V. Shershnev was appointed chief designer of 9S737 vehicle. State trials of the system were held from August 1987 till June 1988 at Embi testing range (nowadays at Kazakhstan). In 1989 it was approved for military. Mass production was started at Minsk NPO Agat, but later transferred to Radiozavod (Penza) Early variants were deployed to provide battery C3 for the SA-15, SA-17, SA-19 systems. More recent variants are used with the SA-13, replacing legacy ADCPs, and the new wheeled SA-15 and SA-22, in a wheeled configuration. A single Ranzhir usually supports 4 to 6 TELARs, SPAAGMs or SPAAGs.

1V110 Russian Artillery Command and Reconnaissance Vehicle

Tiers:

1 2 3 4

System

Alternative Designation : M1979-1

Chassis: AZ-66B, 4x4 wheeled, Box Body Van

Crew : ea5

Dimensions

Height, Overall: m2.44

Width, Overall: m2.34

Weight, Combat: mT3.6

Automotive

Engine Name: ZMZ-66

Engine Power : hp115

Engine Type: Water-cooled, gasoline

Range, Cruising : km875

Speed, Average Cross-Country: INA

Speed, Maximum Off-Road: km/h35

Speed, Maximum Road : km/h87

Maximum Fording Depth: m1

Communications

Radios: R-123M radio (3 each)

Fire Control System

Fire direction: Automated fire direction: 1V520. Manual fire direction: PUO-7. The vehicle is equipped with the APK automated firing data receiver.

Other: DSP-30 laser rangefinder, K-1 collimator

Notes:

In 1979, the Soviet Union introduced a similar wheeled ACRV set for multiple rocket launcher and towed cannon units. The eight-vehicle set consists of three 1V110 battery senior officer's vehicles, three 1V18 battery commander's vehicles, one 1V19 battalion commander's vehicle, and one 1V111 battalion chief of staff's vehicle. Early versions of the 1V17 ACRV set included a 1V111 equipped with a modified ZIL-130-mounted 9S77M instead of the ZIL-131. There have been no upgrades to the 1V17 like that of the 1V12 to 1V12M. The ACRV 1V110 battery FDC serves the same function as the ACRV 1V13 (1V12 ACRV Complex) and is similarly equipped. However, the land navigation system is a different model.

R-149BMR Russian 8x8 Amphibious Armored Command and Signal Vehicle

Tiers:

Variants:

- **BTR-80 (GAZ-5903):** Original w/ 3 firing ports on each side & smoke grenade launchers.
- **BTR-80A (GAZ-59034:** Stabilized turret w/ 2A72 gun, 7.62-mm coax MG, & new right side firing port.
- **BTR-80AK:** BTR-80A CP variant with 1 firing port on right side and 2 whip antennas at rear corners
- **BTR-80K (GAZ-59031):** Command Post for 6; different turret w/ MGs & 3 radios (R-173, R-173P & R-159)
- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment
- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle
- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun
- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control

- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RPM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle
- **R-439-BK (Legenda 2BK):** Satellite communications vehicle
- **R-165B:** Short-wave signal/ communications vehicle
- **R-149BM4A:** Command and Signal Vehicle
- **R-149BMR:** Signal/Communications vehicle
- **PU-12M7 (9S482MU):** Improved PU-12M6 FA battery command vehicle
- **PU-12M6 (9S482M6):** Field Artillery (FA) battery command vehicle
- **P-240BTZ:** Switchboard platform
- **K1Sh1 (GAZ-59032) (UNSH):** Command Post with enlarged hull w/o turret armament
- **E-351BrM:** Mobile power station with diesel/electric generator
- **BREM-K (GAZ-59033) ARV:** Armored recovery vehicle with A-frame, tow bars, & stabilizers
- **BMM-80 (GAZ-59039 or Simfoniya):** Battlefield ambulance for 9 sitting or 2 litter patients
- **BMM-3:** Battlefield ambulance used as a mobile field hospital
- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)
- **2S23 (Nona-SVK) SP GunMortar System (Fire Support Vehicle):** Breach-loaded 2A60 120-mm rifled mortar/gun system similar to the 2S9
- **BTR-80 R-975:** Forward air control vehicle
- **BTR-80 1V152:** Artillery C2 & forward observation vehicle w/ range finding, navigation & new optics

System

Alternative Designation: R-149BMR

Description: 8 X 8 wheeled APC as an upgrade to the BTR-70; 7 soldiers exit through 2 side doors; 4 firing ports on the right & 3 firing ports on the left

In addition, they ensure accurate navigation and automatically display the vehicle's coordinates on the electronic map

↳*Radio #1*

Name: R-168-0.1UM

Quantity: ea3

Type: VHF

Frequency: MHz45-56

Capabilities: Voice Data

Maximum Range: km1.2

Mount Type: Portable

In Service: Yes

Power Supply: 6NKGTs-0.94

Antenna: antenna-feeder device with wide-band matching unit

Telephony: 16 kb/s secure voice telephony

Data Transmission Rate: data transmission at the rate of 1.2 to 16 kb/s via interfaces RS-232 or S1FL

Data Recording: automated radio data recording

Types of Data Transmitted: analog clear, non-protected with built-in cyphering unit; analog secure, protected with built-in cyphering unit; digital, from external terminal; tone call at frequency of 1000 Hz

Note #1: VHF handheld radio set R-168-0,1U (M)1E is intended for radio communication of platoon- squad – soldier level

Note #2: The R-168-0.1U(M)E, R-168-0.1U(M)1E VHF handheld radio stations ensure clear and secure radio communications in tactical command level radio networks in harsh ECM environment

Note #3: By their tactical and technical characteristics, the R-168-0.1(U)ME and R-168-0.1(U)M1E radios are recommended to be used instead of analogues: R-147, R-158, R-162-0.1, R-163-0.5R, R-163-1U, R-168-0.1UE, R-168-0.5UE and «Barmitsa-RS»

↳*Radio #2*

Name: R-168-5UN-1

Manufacturer: Yaroslavl Radioworks Corp

Quantity: ea1

Type: VHF

Frequency: MHz30-88

Capabilities: FH Voice Data

Maximum Range: km8-12

Mount Type: Manpack

In Service: Possibly Replaced

Battery: Battery 10NKGTs 6-2

Antenna: Rod antenna ASh-1.5

Handset: Handset MTT-1

Types of Operation: FM telephony with and without cyphering, transmission-reception of digital data from external terminal at the rate of 1.2 kb/s to 16 kb/s

Types of Data Transmitted: Analog, clear and secure with the built-in ciphering unit; digital, from an external terminal; tone call at frequency of 1000 Hz

Note #1: The R-168-5U(N)1E VHF manpack-vehicular radio station provides clear and secure radio communications in tactical command level radio networks in harsh ECM environment. The radio station is produced as a manpack, vehicular or fixed version

Note #2: R-168-5UN(1)E replaces R-159 (16 kg), R-159M (16 kg), R-163-10U (14 kg)

↳***Radio #3***

Name: R-168-25U-2

Quantity: ea2

Type: VHF

Frequency: MHz30-180

Capabilities: FH Voice Data Retrans

Maximum Range: km25-40

Mount Type: Vehicle

In Service: Yes

Length: mm205

Width: mm175

Height: mm95

Weight: kg3

Operation Modes: Fixed Frequency (FF) (simplex, two-frequency simplex). · Pseudorandom Reorganization of Working Frequency (PRWF) (simplex). · Adaptive Communication (AC) (simplex, two-frequency simplex). · The scanning reception at 8 in advance prepared frequencies. · Work with a suppressor of noise · Relaying. · The manual and automated record of the radio data with the optical interface (UVRD-O) which are radio given from the input equipment or from the external COMPUTER. · Emergency deleting of radio data. · Transfer and reception of circular, address and voice-frequency calls. · Management from the external COMPUTER on RS-232C joint. · Voice informant of actions of the operator. · Dialogue mode. · The automated working capacity control. · A simplex or a two-frequency simplex on one of 8 in advance prepared frequencies. · Simultaneous transfer of speech information and data.

Type of Work: - Phone (TLF) with the frequency modulation (FM). - TLF with technical masking of speech information. - Data transmission from the external equipment.

Note #1: Provides a radio communication in radio networks of a tactical control link a regiment - a battalion - a company.

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, Collective

Smoke Equipment: 6 x 81-mm smoke grenade launchers

Notes:

The R-149BMR is a Command and Signal variant of the BTR-80. The R-149BMR is typically used at the Russian equivalent to the United States Army's Brigade and Battalion Level. The BTR-80 is an 8×8 wheeled amphibious armoured personnel carrier (APC) designed in the USSR. The BTR-80 is a modern, lightly armored vehicle with a diesel power plant. It is manufactured at the Gorkiy Automobile Factory in Nizhniy Novgorod and has been in service since the early 1980s. The BTR-80 is a lightly armored amphibious vehicle with a collective chemical-biological-radiological (CBR) protective system. Operated by a crew of three, the

vehicle can carry a squad of seven infantry troops. The BTR-80 8 x 8 armored personnel carrier is intended to carry personnel on the battlefield and provide close fire support. It can also carry out reconnaissance, combat support and patrol missions. It entered service with the Russian army in the late 1980's and has since been used in a number of military conflicts, including UN peacekeeping operations. The vehicle is in production and in service with the Russian army and with a number of other countries.The BTR-80 is superior to BTR-60/70 with a larger chassis, high-angle-of- fire turret, and single more powerful diesel engine (vs gasoline). Although the armament is same as BTR-60 and BTR-70, except for added smoke grenade dispensers on the back of the turret, the conical turret has been improved and the gun can elevate higher.

ASLAV-C Australian 8x8 Amphibious Armored Command and Control Vehicle

Tiers:

Variants:

- **ASLAV Type I:** The ASLAV Type I is the most numerous type; it is a turreted vehicle derived from the LAV-25 and comes in only one variant.[
- **ASLAV-25 (Reconnaissance):** ASLAV-25 (Reconnaissance) – is an Armoured Car with a crew of three (commander, gunner & driver). The two man turret has day, thermal and infrared imaging weapon systems, a stabilised M242 25mm dual-feed chain gun and two FN MAG 58 7.62 mm machine guns. The ASLAV-25 conducts troop-level tactical reconnaissance and can carry up to six dismounts in the rear.
- **ASLAV Type II:** The ASLAV Type II has no turret and greater internal capacity and is derived from the Canadian Bison Armoured Personnel Carrier. The ASLAV Type II has a crew of two (commander and driver) and is armed with a pintle mounted M2 12.7 mm machine gun. In a number of vehicles, the standard machine gun pintle mount was replaced by a Kongsberg Protector remote weapon station (RWS), which can accommodate either a 12.7 mm machine gun or a Mk 19 40mm automatic grenade launcher. Using a common hull design installed with interchangeable Mission Role Installation Kits (MRIKs), it can be converted into any one of four variants.
- **ASLAV-PC (Personnel Carrier):** is an Armoured Personnel Carrier capable of carrying seven fully equipped troops in support of troop level tactical reconnaissance
- **ASLAV-C (Command):** is an Armoured Command Vehicle, it is equipped with an enhanced radio installation and radio masts, map boards, stowage compartments, specialised seating and an stowable annex. In addition to the crew, the ASLAV-C can accommodate three staff officers and provides command and control at the Squadron and Regimental Headquarter level.
- **ASLAV-S (Surveillance):** is a specialised surveillance vehicle equipped with a hydraulically raised mast mounted thermal imager, laser range finder, day television camera and battlefield surveillance radar RASIT or AMSTAR. The ASLAV-S supports tactical reconnaissance with ground surveillance and observation and can carry four crew and two occasional troops.
- **ASLAV-A (Ambulance):** is an Armoured Ambulance and is fitted with specialist medical equipment and in addition to the crew can accommodate a medic and three lying patients or six sitting patients.
- **ASLAV Type III:** The ASLAV Type III has no turret and is used by members of the Royal Australian Electrical and Mechanical Engineers for repair and recovery. The ASLAV Type III has a crew of two (commander and driver) and usually carries a third mechanic, it is armed with a pintle mounted FN MAG 58 7.62 mm machine gun, although some have been fitted with the Kongsberg Protector RWS. The ASLAV Type III comes in two variants utilising two specialist MRIKs.
- **ASLAV-F (Fitter):** is a maintenance support vehicle that provides a protected mobile workshop for field repair personnel, including vehicle parts and tools, and is fitted with a HIAB 650 crane.
- **ASLAV-R (Recovery):** is an Armoured Recovery Vehicle that is equipped with a heavy winch to recover disabled vehicles to a more accessible location or tow them to a repair facility

System

Alternative Designation: ASLAV-C
Type: Armored Command and Control Vehicle
Family: ASLAV
In Service: In the Australian Army, the ASLAV equips the Cavalry Squadrons of the Royal Australian Armoured Corps. A Cavalry Squadron comprises a headquarters element, an echelon and three sabre troops of six ASLAVs, each troop is further

broken down into two patrols each comprising two ASLAV-25s and one ASLAV-PC. The ASLAV equips two squadrons from each of the Australian Army's Armoured Cavalry Regiments, the 1st Armoured Regiment in Adelaide, the 2nd Cavalry Regiment in Townsville, and the 2nd/14th Light Horse Regiment (Queensland Mounted Infantry) in Brisbane, as well as the School of Armour at Puckapunyal.

Crew: ea3

Passenger Capacity: In addition to the crew, the ASLAV-C can accommodate three staff officers and provides command and control at the Squadron and Regimental Headquarter level.

Notes:

ASLAV-C (Command) – is an Armoured Command Vehicle, it is equipped with an enhanced radio installation and radio masts, map boards, stowage compartments, specialised seating and an stowable annex. In addition to the crew, the ASLAV-C can accommodate three staff officers and provides command and control at the Squadron and Regimental Headquarter level. The Australian Light Armoured Vehicle (ASLAV) is an eight-wheeled amphibious armoured reconnaissance vehicle used by the Australian Army. It was built by General Dynamics Land Systems Canada, and developed from the Canadian Army's LAV-25 and Bison armoured fighting vehicles. The ASLAV is a highly mobile, eight-wheel drive, amphibious armoured fighting vehicle that can be deployed by land, sea or air (in Royal Australian Air Force C-130s or C-17s). It is fitted with GPS, an intra-vehicular navigation system and a radio harness capable of supporting HF, VHF, UHF and digital radios. The ASLAV is capable of speeds of 100 km/h (62 mph) and has a maximum range in excess of 660 km (410 mi). The eight-wheel drive provides excellent cross-country mobility and redundancy, the vehicle is capable of operation with only four working wheels, and can continue to operate with eight punctured tyres through the use of solid-core run-flat tyres. It is fully amphibious and is driven in the water by permanent shrouded propellers located at the rear of the hull at speeds of up to 10 km/h (6.2 mph)

"Kushetka-B" offers continuous 48 - hours operation under the following conditions: - operating temperature 223 K - 323 K (-50°C to +50°C); - air humidity not more 98%, when temperature is not more 298 K (25°C); - low atmospheric pressure not less 6x104 Pa (450 mm of mercury); - vibration up to 300 Hz. "Kushetka-B" is furnished with equipment of the third and fourth generation. Field of application- tactical link of non-automated and automated control systems. We are ready to work out and produce command-staff vehicles with any other communication facilities and equipment on the transport base to the Buyer's option.

FV 511 Warrior British Infantry Command Vehicle

Tiers:

Variants:

- **FV510 Infantry Section Vehicle:** This is the principal version operated by the British Army, as described above. 489 were produced (including 105 as platforms for the mobility of ATGW teams, originally equipped with MILAN and later with Javelin).
- **FV511 Infantry Command Vehicle:** 84 of these were produced.
- **FV512 Mechanised Combat Repair Vehicle.:** Operated by REME detachments in Armoured Infantry battalions. It is equipped with a 6.5 tonne crane plus power tools and is able to tow a trailer carrying two Warrior power packs or one Challenger power pack. 105 of these were produced.
- **FV513 Mechanised Recovery Vehicle (Repair):** Also operated by REME detachments in Armoured Infantry battalions. It is equipped with a 20 tonne winch and 6.5 tonne crane plus power tools and (like the FV512) is able to tow a trailer carrying two Warrior power packs or one Challenger power pack. 39 of these were produced.
- **FV514 Mechanised Artillery Observation Vehicle:** This is operated by the Royal Artillery as an Artillery Observation Post Vehicle (OPV) and is fitted with mast-mounted Man-packable Surveillance and Target Acquisition Radar (MSTAR) and Position and Azimuth Determining System (PADS), with Image Intensifying and Infra Red equipment. The only armament is the 7.62 mm machine gun, as the 30 mm Rarden cannon is replaced by a dummy weapon. This allows space for the targeting and surveillance equipment while still keeping largely the same outward appearance of a standard Warrior in order to avoid becoming a priority target. 52 of these were produced.
- **FV515 Battery Command Vehicle:** This is operated by the Royal Artillery. 19 of these were produced. Desert Warrior. This was an export version adapted for operations in hostile desert conditions. It was fitted with the Delco turret as used on the LAV-25 wheeled IFV, mounting a stabilised M242 Bushmaster 25 mm chain gun with coaxial 7.62 mm chain gun and 2 x Hughes TOW ATGM launchers (one mounted on each side). In 1993, Kuwait purchased 254 Desert Warrior vehicles.
- **Warrior 2000.:** This was a new version developed for the Swiss Army. It did not enter production. It featured an all-welded aluminium hull, increased armour, digital fire control system and more powerful engine. It was fitted with the Delco turret, or a Land Systems Hagglunds E30 turret with Alliant Techsystems Bushmaster II Mk 44 30 mm cannon.

NBC Protection: Yes

Smoke Equipment: Yes, two banks of four 66 mm smoke grenade

Firing Ports: No, to aid in protecting the vehicle

Engine Fire Protection System: Yes

Joint Combat Identification Marking System: Yes

Note: Around 70 vehicles, upgraded to Theatre Entry Standard Herrick (TES (H)) protection kit

Notes:

Command Vehicle This variant comes in three configurations: battalion, company and platoon command vehicles, all-purpose outfitted by the British army. Command vehicles are outfitted with different types of radios, map boards and other staff support equipment, depending on the command level of the vehicle. It is also fitted with the Vickers Defense Turret mounting the 30-mm Rarden cannon. The Warrior tracked vehicle family is a series of British armored vehicles, originally developed to replace the older FV430 series of armored vehicles. The Warrior started life as the MCV-80, "Mechanised Combat Vehicle for the 1980s". One of the requirements of the new vehicle was a top speed able to keep up with the projected new MBT, the MBT-80 - later canceled and replaced by what became the Challenger 1 - which the then-current FV432 could not. The project was begun in the 1970s. GKN Defence won the production contract in 1980. A total of 789 FV510 and variants were manufactured for the British Army, and 254 of a modified version (Desert Warrior) was produced for the Kuwaiti Army. The Warrior incorporates

several design features in keeping with the UK's battlefield experience. In particular, there are no firing ports in the hull, in line with British thinking that the role of the armored personnel carrier/infantry fighting vehicle (APC/IFV) is to carry troops under protection to the objective and then give firepower support when they have disembarked. The absence of firing ports also allows additional appliqué armor to be fitted to the sides of the vehicle, which is invariably applied to Warriors involved in active operations. The cage armor used at one stage was replaced in 2007 by "Wrap Two" appliqué armor. The basic armor provides all-around protection against small arms ball ammunition. The crew of a Warrior comprises the driver, seated in the front hull, and the gunner and commander, who are both seated in the turret. The embarked infantry section can number up to seven soldiers, who are seated facing each other in the rear hull compartment. Passenger access is through a single electric ram powered door at the rear of the hull, rather than a drop-down ramp as in the US M113 APC and M2 Bradley IFV. Warrior Section Vehicles are able to carry and support seven fully equipped soldiers together with supplies and weapons, including a number of anti-tank weapons, for a 48-hour battlefield day in nuclear/biological/chemical conditions. The Warrior is driven by a Perkins-Rolls-Royce V8 Condor engine through a four-speed automatic gearbox. It is capable of a road speed of 46 miles per hour (74 km/h). The Warrior has the speed and performance to keep up with a Challenger 2 main battle tank over the most difficult terrain. The vehicle is fitted with a two-man GKN Sankey turret, armed with a non-stabilized L21A1 30 mm RARDEN cannon capable of destroying some APCs at a maximum range of 1,500 meters (1,600 yd), and an L94A1 EX-34 7.62 mm Hughes Helicopters coaxial chain gun. It is fitted with two clusters of four defensive grenade launchers (usually used with Visual and Infrared Screening Smoke – VIRSS). All Warrior Infantry Section Vehicles are now equipped with Bowman radios, which replaced the earlier Clansman radios, for enhanced communications, command and control. When first introduced, the vehicles were fitted with passive Image intensifier night vision sights. These have since been progressively replaced with Thales Optronics Battle Group Thermal Imaging (BGTI) sights to upgrade night fighting capabilities, with 8x magnification. As of 2007, 350 vehicles were fitted with BGTI.

R-149MA3 Russian 8x8 Amphibious Command and Signal Armored Personnel Carrier (APC)

Tiers:

Variants:

- **BTR-80 (GAZ-5903):** Original w/ 3 firing ports on each side & smoke grenade launchers.
- **BTR-80A (GAZ-59034:** Stabilized turret w/ 2A72 gun, 7.62-mm coax MG, & new right side firing port.
- **BTR-80AK:** BTR-80A CP variant with 1 firing port on right side and 2 whip antennas at rear corners
- **BTR-80K (GAZ-59031):** Command Post for 6; different turret w/ MGs & 3 radios (R-173, R-173P & R-159)
- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment
- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle
- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun
- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control

- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RPM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle
- **R-439-BK (Legenda 2BK):** Satellite communications vehicle
- **R-165B:** Short-wave signal/ communications vehicle
- **R-149BM4A:** Command and Signal Vehicle
- **R-149BMR:** Signal/Communications vehicle
- **PU-12M7 (9S482MU):** Improved PU-12M6 FA battery command vehicle
- **PU-12M6 (9S482M6):** Field Artillery (FA) battery command vehicle
- **P-240BTZ:** Switchboard platform
- **K1Sh1 (GAZ-59032) (UNSH):** Command Post with enlarged hull w/o turret armament
- **E-351BrM:** Mobile power station with diesel/electric generator
- **BREM-K (GAZ-59033) ARV:** Armored recovery vehicle with A-frame, tow bars, & stabilizers
- **BMM-80 (GAZ-59039 or Simfoniya):** Battlefield ambulance for 9 sitting or 2 litter patients
- **BMM-3:** Battlefield ambulance used as a mobile field hospital
- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)
- **2S23 (Nona-SVK) SP GunMortar System (Fire Support Vehicle):** Breach-loaded 2A60 120-mm rifled mortar/gun system similar to the 2S9
- **BTR-80 R-975:** Forward air control vehicle
- **BTR-80 1V152:** Artillery C2 & forward observation vehicle w/ range finding, navigation & new optics

System

Alternative Designation:
Description: Command and Control Tactical 8 X 8 wheeled APC.
Crew: ea3

Weight: kg49

Length, Total: mm1.980

Barrel Length: mm1,346

Width: mm162

Height: mm225

Rate of Fire: rds/min600

Maximum Firing Range: m4,000

Effective Firing Range: m3,000

Feed System: 40-round belt

Sights: iron or optical

Maximum Elevation: deg+60

Minimum Elevation: deg-4

Fire on the Move: Yes

↳*Ammunition*

Name: INA

Type: API-T

Caliber: mm14.5

Cartridge: 14.5×114 mm

Muzzle Velocity: m/s1,005

Basic Load: ea500

Effective Range (Day): m2,000

Effective Range (Night): INA

Tactical Range: m1,500-2,000

Armor Penetration: 20 at 1,000 m/ 30 at 500 m

Note: Additional Ammo includes: API, I-T

Auxiliary Weapon System

↳*System*

Name: 7.62mm PKT (Kalashnikov's Machine Gun)

Caliber: mm7.62

Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.

In Service: 1961-present

Manufacturer: Degtyaryov plant

Proliferation: 1 Million +

Max Rate of Fire: rds/min650

Effective Rate of Fire: rds.min250-300

Weight (Gun Only): kg9

Weight (Tripod Only): kg7.7

Length, Total: mm1,203

Length, Barrel: mm605

Action: Gas-operated, open bolt

Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes

Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights

Effective Firing Range (With Sight Adjustments): m100-1,500

↳*Ammunition*

Name: 57-N-323S

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

Fire Control

Name: INA

Computerized FCS: INA

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Gunner Day Sights: 1P3-6, 1.2x/4x

Main Gun Stabilization: No

Infrared Searchlight: OU-3GA2M

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Turret Armor: Protection against 12.7mm and shrapnel

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, Collective

Smoke Equipment: 6 x 81-mm smoke grenade launchers

Notes:

R-149MA3 unified command vehicle based on BTR-80 APC. Unified command vehicle R-149MA3 is designated for providing command management and communications for the units and servicemen of company-platoon-squad levels. See Communication Equipment. The BTR-80 is an 8×8 wheeled amphibious armoured personnel carrier (APC) designed in the USSR. The BTR-80 is a modern, lightly armored vehicle with a diesel power plant. It is manufactured at the Gorkiy Automobile Factory in Nizhniy Novgorod and has been in service since the early 1980s. The BTR-80 is a lightly armored amphibious vehicle with a collective chemical-biological-radiological (CBR) protective system. Operated by a crew of three, the vehicle can carry a squad of seven infantry troops. The BTR-80 8 x 8 armored personnel carrier is intended to carry personnel on the battlefield and provide close fire support. It can also carry out reconnaissance, combat support and patrol missions. It entered service with the Russian army in the late 1980's and has since been used in a number of military conflicts, including UN peacekeeping operations. The vehicle is in production and in service with the Russian army and with a number of other countries.The BTR-80 is superior to BTR-60/70 with a larger chassis, high-angle-of- fire turret, and single more powerful diesel engine (vs gasoline). Although the armament is same as BTR-60 and BTR-70, except for added smoke grenade dispensers on the back of the turret, the conical turret has been improved and the gun can elevate higher.

FV105 Sultan British Amphibious Command and Control Vehicle

Tiers:

1 2 3 4

Variants:

- **Scorpion (FV101):** Original variant with 3-man crew
- **Spartan (FV103):** Artillery & engineer vehicle with 3-man crew & 4 dismountable troops; 80 k/hr; 483 km range; 1 7.62-mm MG
- **Striker (FV102):** AT vehicle with 5 Swingfire CLOS ATGMS (5 reloads) & 1 7.62-mm L37A1 MG
- **Scorpion 90:** 3-man crew; 73 k/hr; Cockerill Mk IIIK 90-mm gun & 1 7.62-mm MG
- **Samaritan (FV104):** Ambulance for 4 litter patients, 5 seated patients, or 2 litter/3 seated patients; 2-man crew; 483 km range
- **Sultan (FV105):** Command vehicle with at least 2 radios; total 5-6 personnel; 483 km range
- **Samson (FV106):** 483 km range, ARV with internal main winch, tow bars, & tow cables
- **Scimitar (FV107):** Scorpion with 1 30-mm Rarden L21 rifled gun (165 rounds) & 1 7.62-mm coax MG; 80 k/hr; 644 km range;
- **Scorpion 2:** Description of late production Scorpions with Perkins engine & other upgrades with 2-man turret with 30-mm, 76-mm, or 90-mm main armament options
- **Saber:** Reconditioned recon vehicle with 30-mm Rarden cannon & Hughes 7.62-mm coaxial chain gun
- **Scorpion (Jordan):** Upgraded original Scorpion with Perkins engine & other upgrades
- **Spartan with MILAN ATGM:** 2-round turret must be reloaded from outside the vehicle (11 reloads)
- **Scorpion 90 (Venzeula):** Scorpion 90 with Belgain CMI Defence 90-mm Mk II gun & Perkins engine
- **Sturgeon:** OPFOR vehicle used in Suffield, Canada based on the Spartan
- **Salamander:** OPFOR vehicle used in Suffield, Canada based on the 76-mm Scorpion
- **Scorpion (Malaysia):** Scorpion 90 with 76-mm AGL & Perkins engine
- **Omani Scorpion:** Increased protection package & some received a Cummins diesel engine
- **Scorpion vehicle-mounted automatic mortar FCS:** Fires Denel's 60-mm or BAE Systems' 81-mm L16 mortars
- **CVR(T) Life-Extension Program (LEP):** LEP with diesel engine, better optics & communication

System

Alternative Designations: FV105 Sultan
Type: Command and Control Vehicle
Manufacturer: Alvis Vehicles, Coventry, England
Family: e Combat Vehicle Reconnaissance (Tracked), CVR(T), family
In Service: 1979-? (Great Britain) 1979-Present (see proliferation)
Crew: eaThe FV105 Sultan accommodates a crew of 5-6, including commander, driver, radio operator and watchkeepers.
Note #1: The rear of the FV105 Sultan is designed to be extended by an attached tent.
Note #2: Airportable

Armor (turret front): mmAgainst 14.5-mm rounds (remainder of the vehicle against 7.62-mm rounds)

Applique armor: mmINA

Explosive reactive armor: mmINA

Active Protection System: INA

Self-entrenching blade: No

NBC Protection System: Yes

Smoke Equipment: 8 Smoke dischargers

Survivability Equipment: Enhanced mine protection available

Notes:

The FV105 Sultan is a British Army command and control vehicle based on the CVR(T) platform. It has a higher roof than the APC variants, providing a more comfortable "office space" inside. This contains a large vertical map board and desk along one side, with a bench seat for three people facing it. Forward of this are positions for the radio operator, with provision for four radios, and vehicle commander, whose seat can be raised to give him access to the pintle-mounted G.P.M.G. The driver sits forward of this in a small compartment beside the engine space, on a chair with a spring-loaded seat that allows him to recline inside the vehicle or sit upright with his head out of the hatch.

Fire on Move: Yes

Protection

Armor, Hull: mm15

Armor, Turret Front: mm20

NBC Protection: Yes

Smoke Equipment: No

Notes:

The ACRV 1V15 is the battalion commander's vehicle of the 1V12 ACRV complex. The 1V15 can be distinguished from the 1V14 by the external antenna bracket on the rear of the vehicle. The ACRV is equipped with the 1T121 land navigation system, a 1D15 laser rangefinder, and the 1PN44 day/night sight mounted in a basket turret. The observer uses an analog coordinate converter to translate the polar location data when determining rectangular target coordinates. The 1V520 fire direction computer may be transported internally and dismounted at a command observation post. The artillery commander, assisted by target acquisition, fire direction, and communications personnel mans the vehicle. The artillery commander decides how to attack targets of opportunity and targets relayed to him be the supported maneuver unit.

PU-12M6 Russian 8x8 Mobile Command and Control Vehicle

Tiers:

1 2 3 4

Variants:

- **PU12M7 Battery Command Post:**

System

Alternative Designation: PU-12M6
Type: Battery Command Post Vehicle
Manufacturer: INA
Family: PU-12M Series
In Service: Late 1980s - Present
Crew: INA
Chassis: BTR-80
Passenger Capacity: INA
Note: There is very little unclassified information available online about the PU-12M6

Dimensions (Chassis: BTR:80)

Length: m7.7
Width: m2.9
Height: m2.41
Weight, Combat: tons13.6

Automotive (Chassis: BTR:80)

Speed Maximum Swim: km/h10

Gradient: %60

Side Slope: %40

Vertical Step: m0.5

Trench: m2.0

Fording Depth: Amphibious

Communications

Note: The R-161 Poisk family was widely fielded in the 1980-1990s, and has since been replaced by the R-166 Artek family which was developed in the late 1990s. The R-176 Antey family is the next generation of the Russian Ground Forces' long range, over-the-horizon radios for operational and strategic level control. Among other technological innovations, the R-176 Antey family, is reportedly a Software Defined Radio (SDR), meaning a radio that is primarily manipulated through software instead of hardware such as mixers, filters, modulators/demodulators, etc. These types of radios are capable of receiving and transmitting different waveforms based solely on the software used, instead of requiring physical modifications of hardware.

Command and Control System

Onboard Power Supply System: Yes

Navigation System: Yes, using GLONASS

Survey System: Yes

Data Transmission and Reception Equipment: Yes

Control of Short-Range Air Defence Missile Batteries: Via Coded Datalink: up to 6

Control of Short-Range Air Defence Missile Batteries: Via Telephone Link: up to 4

Control of Short-Range Air Defence Missile Batteries: Igla MANPADS (via coded datalink): up to 6

Number of Received Targets: up to 99

Coordinates Measurement Envelope: up to 100 km

Coordinates Measurement Envelope Maximum Altitude: up to 25 km

Data Transmission Range via field Telephone Wire: up to 15 km

Fire Control

Laser Target Desinator: No

Night Vision Devices: Yes

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Applique Armor: Available

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: 6 x 81-mm smoke grenade launchers

Life Support System: Yes

Notes:

The PU-12M6 mobile control post is designed to automate combat control of weapons employment by AD units on the move and at halt under air attack. It is a battery CP intended to operate as part of special purpose automated control systems. The PU-12M6 mobile CP is mounted on the BTR-80 wheeled armoured personnel carrier fitted with: • life support system; • power supply system; • navigation and survey system ; • radiation and chemical agent sensors; • night vision devices; • data transmission and reception equipment; • com munications aids; • spare parts, tools and accessories kit.

Transmission Range: km5000

Notes:

R-142 was a complete mobile HF and VHF radio system, developed in the USSR and used in the Warsaw Pact countries during the Cold War, consisting of a fairly large metal rack with a number of radio transceivers, intercoms, interfaces, control units and encryption devices. The radio station was generally housed inside a communications shelter mounted on a GAZ-66 truck. The van body is divided into a forward and rear section. The forward section houses most of the radios and has 2 radio operator stations. The rear section has a table with cushioned bench seats capable of seating 3 on each side. The Erika UHF and the ICOM VHF aviation band radio are located in the rear along with 2 intercom/switching units allowing the use of the R-168 series radios.

Notes:

The set provides the command and control vehicles for the self propelled cannon battalions. The eight-vehicle set consists of three 1V13 battery senior officers' vehicles, three 1V14 battery commander's vehicles, one 1V15 battalion commander's vehicle, and one 1V16 battalion FDC/chief of staff's vehicle. The 1V12M Faltset ACRV set is a modernized version of the system. The installation of an upgraded electronics package in the vehicles created the requirement for an external-mounted power generator. In addition to freeing a small amount of space inside the vehicle, the external mounting reduces the internal noise level. The ACRV 1V13 is the battery FDC of the 1V12 ACRV complex. The battery senior officer, assisted by fire direction and communication personnel, mans the vehicle. It has direct radio communications with the battery COP, the battalion COP, and the battalion FDC. The vehicle is equipped with a land navigation system and has a roof mounted periscopic aiming circle. The roof mounted periscopic aiming circle allows the battery senior officer to ability to lay the howitzers for direction from within his vehicle. There is no battlefield observation equipment present on the 1V13.

Fording Depths: mAmphibious

Communication

Radio: R-123M (3 each), R-107M (1 each)

Sensors/Components

Navigation: 1T121-M Navigation System

Automatic Fire direction: 1V520

Manual Fire direction: PUO-7

Other equipment: 1D15 laser rangefinder, DSP-30 rangefinder, 1PN44 day/night sight, PAB-2AM aiming circle, DS-1 stereoscopic rangefinder, VOP-7 vision blocks and driver’s periscopes

Protection

Armor Turret Front: INA

Armor Turret Top: INA

Armor Hull: mm15

NBC Protection System: Yes

Smoke Equipment: No

Notes:

The ACRV 1V119 is associated with the deployment of the 2S9 Nona-S 120mm combination gun and can be parachute landed with airborne troops. The 1V119’s sensor and fire direction package is similar to the ACRV 1V14.

BTR-60-R-145BM Russian 8x8 Command Post and Communication Center Vehicle

Tiers:

Parent:

BTR-60 Russian Armored Personnel Carrier (APC)

Variants:

- **BTR-60P:** Initial model with open top, pintle-mounted 7.62-mm machine gun
- **BTR-60PA/BTR-60PK (12 passengers only):** Covered top, NBC protection, pintle-mounted 7.62-mm MG, still exit over top
- **BTR-60PB (space for 8 soldiers for dismounted operations):** Most common variant with BRDM-2 MG turret with a 14.5-mm MG & coaxial 7.62-mm; troops exit over top
- **Modernized BTR-60PB:** BM2 Turret with 30-mm 2A42 Cannon & 7.62-mm PKTM MG; 30-mm AGS-17 AGL on left side
- **BTR-60U:** Command vehicle with additional radios
- **BTR-60 PU-12/12M:** Anti-Aircraft units' command vehicle
- **BTR-60 MS:** Radio vehicle with High Ball antenna
- **BTR-60 VVS:** Sans turret with additional radios
- **BTR-60 PBK:** BTR-60PB with 3 radios
- **BTR-60 1V18:** Artillery observation vehicle
- **BTR-60 1V19:** BTR-60 1V18 for FDC operations
- **BTR-60 R-145BM:** Communications vehicle with 5 radios
- **BTR-60 R-975:** Forward air-control vehicle with turret
- **BTR-60-Z-351BR:** Power production vehicle with generator
- **BTR-60-P-238BT:** Switchboard vehicle for communications
- **BTR-60-P-240BT:** Integrates radio & wire communications- R-123M radio & R-241 switchboard
- **BTR-60-P241BT:** Equipped with P-241 telephone system
- **BTR-60-R-137B:** Communications vehicle with turret
- **BTR-60 ACRV:** Artillery Battery C2 & recon vehicle
- **BTR-60-R-145:** Additional radio, but no turret
- **BTR-60-R-156BTR:** C2 vehicle with additional radios
- **BTR-60-R-409BM:** Relay vehicle-R-409 & R-123M radios
- **BTR-60PAU (Bulgaria):** Artillery command vehicle
- **BTR-60PB-MD (Bulgaria):** Upgraded engine, radios, & NBC equipment
- **BTR-60P Maintenance Assistance (MTR-2):** Maintenance vehicle with tarp over troop compartment
- **BTR-60 SPAAG (Cuba):** Twin 30-mm anti-aircraft cannons
- **BTR-60 Djibouti (Djibouti):** AML-90 turret on BTR-60
- **BTR-60BD:** Speed increased to 100 km/h & range to 800 km
- **MTP-2:** Armored Recovery Vehicle
- **BTR-60PZ:** Final production model with 1PZ-2 roof-mounted periscope
- **BTR-60-R-140BM:** C2 vehicle with turret
- **MEP:** Infantry command post
- **BTR-60PB FAC:** Turreted FAC vehicle without the gun

System

Alternative Designations: BTR-60-R-145BM

Manufacturer: Gorkovsky Avtomobilny Zavod (Soviet Union) Ratmil Regie Autonoma (Romania, TAB-71)

Description: 8 X 8 wheeled APC designed to replace the BTR-152; original design (BTR-60) had an open top & 14 soldiers had to exit over the sides; 3 firing ports on each side of vehicle

Notes:

The ACRV 1V14 is the battery commander's vehicle of the 1V12 ACRV complex. The ACRV is equipped with the 1T121 land navigation system, a 1D15 laser rangefinder, and the 1PN44 day/night sight mounted in a basket turret. The observer uses an analog coordinate converter to translate the polar location data when determining rectangular target coordinates. The 1V14 has an internal power generator. The 1V520 fire direction computer may be transported internally and dismounted at a command observation post. The artillery commander, assisted by target acquisition, fire direction, and communication personnel mans the vehicle. The artillery commander decides how to attack targets of opportunity and targets relayed to him by the supported maneuver unit.

BTR-80K Russian 8x8 Amphibious Armored Command Vehicle

Tiers:

Variants:

- **BTR-80 (GAZ-5903):** Original w/ 3 firing ports on each side & smoke grenade launchers.
- **BTR-80A (GAZ-59034:** Stabilized turret w/ 2A72 gun, 7.62-mm coax MG, & new right side firing port.
- **BTR-80AK:** BTR-80A CP variant with 1 firing port on right side and 2 whip antennas at rear corners
- **BTR-80K (GAZ-59031):** Command Post for 6; different turret w/ MGs & 3 radios (R-173, R-173P & R-159)
- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment
- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle
- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun
- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control

- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RPM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle
- **R-439-BK (Legenda 2BK):** Satellite communications vehicle
- **R-165B:** Short-wave signal/ communications vehicle
- **R-149BM4A:** Command and Signal Vehicle
- **R-149BMR:** Signal/Communications vehicle
- **PU-12M7 (9S482MU):** Improved PU-12M6 FA battery command vehicle
- **PU-12M6 (9S482M6):** Field Artillery (FA) battery command vehicle
- **P-240BTZ:** Switchboard platform
- **K1Sh1 (GAZ-59032) (UNSH):** Command Post with enlarged hull w/o turret armament
- **E-351BrM:** Mobile power station with diesel/electric generator
- **BREM-K (GAZ-59033) ARV:** Armored recovery vehicle with A-frame, tow bars, & stabilizers
- **BMM-80 (GAZ-59039 or Simfoniya):** Battlefield ambulance for 9 sitting or 2 litter patients
- **BMM-3:** Battlefield ambulance used as a mobile field hospital
- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)
- **2S23 (Nona-SVK) SP GunMortar System (Fire Support Vehicle):** Breach-loaded 2A60 120-mm rifled mortar/gun system similar to the 2S9
- **BTR-80 R-975:** Forward air control vehicle
- **BTR-80 1V152:** Artillery C2 & forward observation vehicle w/ range finding, navigation & new optics

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Turret Armor: Protection against 12.7mm and shrapnel

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, Collective

Smoke Equipment: 6 x 81-mm smoke grenade launchers

Notes:

BTR-80K (GAZ-59031) (kommandnyj) – command vehicle APC with telescopic antenna mast, TNA-4 navigation device and R-163-50У series of radio equipment. The BTR-80K is intended to enable the infantry battalion commander to command sub-units and maintain communications with headquarters. It is based on the BTR-80, with the same 14.5mm and 7.62mm machine guns, but has a number of extra systems necessary for this mission. These include: two VHF-173 radio sets, antenna device set for UHF antenna, IFF automatic interrogator, TNA-4 navigational aid, PAB- 2M artillery periscope aiming ring, TNP-165A night vision sight and TSh-4 interphone headsets with GVSh-T-13 head and chest set. The BTR-80 is an 8×8 wheeled amphibious armoured personnel carrier (APC) designed in the USSR. The BTR-80 is a modern, lightly armored vehicle with a diesel power plant. It is manufactured at the Gorkiy Automobile Factory in Nizhniy Novgorod and has been in service since the early 1980s.

The BTR-80 is a lightly armored amphibious vehicle with a collective chemical-biological-radiological (CBR) protective system. Operated by a crew of three, the vehicle can carry a squad of seven infantry troops. The BTR-80 8 x 8 armored personnel carrier is intended to carry personnel on the battlefield and provide close fire support. It can also carry out reconnaissance, combat support and patrol missions. It entered service with the Russian army in the late 1980's and has since been used in a number of military conflicts, including UN peacekeeping operations. The vehicle is in production and in service with the Russian army and with a number of other countries.The BTR-80 is superior to BTR-60/70 with a larger chassis, high-angle-of- fire turret, and single more powerful diesel engine (vs gasoline). Although the armament is same as BTR-60 and BTR-70, except for added smoke grenade dispensers on the back of the turret, the conical turret has been improved and the gun can elevate higher. The Soviets-based the BTR-80 on the BTR-70 APC. It has a single 260-hp, V-8 turbocharged, water-cooled, diesel engine, an improvement over the twin gasoline engines installed in the BTR-60 and BTR-70 vehicles. The reconfigured rear portion of the hull accommodates the new, single engine. The Soviets removed the roof chamfers of the modified BTR-70, raised the rear, and squared off the rearward-sloping engine compartment. Standard equipment includes TNPO vision blocks, TNP-B and TKN-3 optical devices for the driver and commander, an OU-3GA2M infrared search light, six 81 mm smoke grenade launchers 902V "Tucha", a radioset (R-173 or R-163-50U), an intercom, and hydrojets for amphibious propulsion. The Soviets modified the truncated cone turret used on the BTR-70 for the BTR-80 by redesigning the mantlet. This allows the 14.5 mm (0.57 in) KPVT and coaxial 7.62 mm (0.3 in) PKT machine guns to be elevated to a maximum of 60 degrees. This high angle of fire is useful in engaging targets on steep slopes, in urban fighting, and for engaging low slow flying air targets.[5] The Soviets had also modified the design and positioning of the firing ports; the ports are now round, rather than tear-shaped, and have ball mounts similar to those used on the BMP-1. The forward firing ports now sit in angled recesses, which allows infantry to fire to the front of the vehicle. The redesigned side doors are split horizontally. The upper portion opens forward; this gives dismounting troops some protection against small arms fire from the front of the vehicle. The lower portion opens down, forming a step. Six smoke grenade projectors are mounted on the rear of the turret. The BTR-80 can climb a slope with up to 60% gradient and climb a vertical step of 0.5 m.

R-149AKSh-1 Russian 6x6 Command and Signal Vehicle

Notes:

The R-149AKSH is a Command and Signal Vehicle adopted from a KamAZ-530 General Utility Truck. The Truck is divided into an electronics compartment with 3 crew workstations and a work area for the driver/electrician, and an officer compartment with 5 crew workstations. Chassis: The KamAZ-5350 general utility truck is a member of Mustang family. This family of military trucks includes the KamAZ-4350 (4x4) and KamAZ-6350 (8x8) with numerous variants. This general utility truck is a further development of the KamAZ-4310, which was launched in the early 1980s. It was officially accepted to service with the Russian Army in 2002 and a small-scale production commenced in 2003.

1V152 FIST Kapustnik-B Russian 8x8 Amphibious Command and Forward Observer Vehicle

Tiers:

Variants:

- **BTR-80 (GAZ-5903):** Original w/ 3 firing ports on each side & smoke grenade launchers.
- **BTR-80A (GAZ-59034:** Stabilized turret w/ 2A72 gun, 7.62-mm coax MG, & new right side firing port.
- **BTR-80AK:** BTR-80A CP variant with 1 firing port on right side and 2 whip antennas at rear corners
- **BTR-80K (GAZ-59031):** Command Post for 6; different turret w/ MGs & 3 radios (R-173, R-173P & R-159)
- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment
- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle
- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun
- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control

- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RPM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle
- **R-439-BK (Legenda 2BK):** Satellite communications vehicle
- **R-165B:** Short-wave signal/ communications vehicle
- **R-149BM4A:** Command and Signal Vehicle
- **R-149BMR:** Signal/Communications vehicle
- **PU-12M7 (9S482MU):** Improved PU-12M6 FA battery command vehicle
- **PU-12M6 (9S482M6):** Field Artillery (FA) battery command vehicle
- **P-240BTZ:** Switchboard platform
- **K1Sh1 (GAZ-59032) (UNSH):** Command Post with enlarged hull w/o turret armament
- **E-351BrM:** Mobile power station with diesel/electric generator
- **BREM-K (GAZ-59033) ARV:** Armored recovery vehicle with A-frame, tow bars, & stabilizers
- **BMM-80 (GAZ-59039 or Simfoniya):** Battlefield ambulance for 9 sitting or 2 litter patients
- **BMM-3:** Battlefield ambulance used as a mobile field hospital
- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)
- **2S23 (Nona-SVK) SP GunMortar System (Fire Support Vehicle):** Breach-loaded 2A60 120-mm rifled mortar/gun system similar to the 2S9
- **BTR-80 R-975:** Forward air control vehicle
- **BTR-80 1V152:** Artillery C2 & forward observation vehicle w/ range finding, navigation & new optics

System

Alternative Designation: 1V152 FIST

Description: 8 X 8 wheeled APC as an upgrade to the BTR-70; 7 soldiers exit through 2 side doors; 4 firing ports on the right & 3 firing ports on the left

Manufacturer: Arzamas

In Service: 1986-Present

Chassis: BTR-80

Crew: ea3

Personnel: ea7

Note #1: The crew enter and exit through enlarged side hatches, which are clamshell hatches opening upwards and downwards

Note #2: The 1V152 also carries an assortment of maps and map markers, manual plotting devices, and hand-held calculators as a backup for the computers

Dimensions (Chassis: BTR-80)

Length: m7.7

Width: m2.9

Height: m2.41

Weight, Combat: tons13.6

Automotive (Chassis: BTR-80)

Engine Name: KamAZ-7403

Engine Type: Water-cooled, V8 Diesel

Automotive Performance: hp260

Range, Cruising: km600

Speed, Maximum Road: km/h80

Speed, Maximum Off-Road: km/h60

Speed, Maximum Swim: km/h10

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.5

Trench: m2.0

Fording Depth: mAmphibious

Winch: Yes, The 1V152s have a winch in the front with a capacity of 4.5 tons and 60 meters of cable

Internal Generator: Yes, The 1V152 has an internal 4kW generator to power electronics and sensors when the vehicle's engine is off

Communications

Antenna Placement: There are special, folding or retractable antennas on the front left of the passenger compartment, on the right rear of the same compartment, and on the front left of the bow roof

Antenna: The 1V152 has a 10-meter extendible antenna for extended-range communications and more advanced whip antennas

Note: There is very little information about the radios equipped on the 1V152 FIST

Weight: kg49

Length, Total: mm1.980

Barrel Length: mm1,346

Width: mm162

Height: mm225

Rate of Fire: rds/min600

Maximum Firing Range: m4,000

Effective Firing Range: m3,000

Feed System: 40-round belt

Sights: iron or optical

Maximum Elevation: deg+60

Minimum Elevation: deg-4

Fire on the Move: Yes

↳***Ammunition***

Name: INA
Type: API-T
Caliber: mm14.5
Cartridge: 14.5×114 mm
Muzzle Velocity: m/s1,005
Basic Load: ea500
Effective Range (Day): m2,000
Effective Range (Night): INA
Tactical Range: m1,500-2,000
Armor Penetration: 20 at 1,000 m/ 30 at 500 m
Note: Additional Ammo includes: API, I-T

Auxiliary Weapon System

↳***System***

Name: 7.62mm PKT (Kalashnikov's Machine Gun)
Caliber: mm7.62
Function: In use as a front-line infantry and vehicle-mounted weapon with Russia's armed forces.
In Service: 1961-present
Manufacturer: Degtyaryov plant
Proliferation: 1 Million +
Max Rate of Fire: rds/min650
Effective Rate of Fire: rds.min250-300
Weight (Gun Only): kg9
Weight (Tripod Only): kg7.7
Length, Total: mm1,203
Length, Barrel: mm605
Action: Gas-operated, open bolt
Feed System: Non-disintegrating metal 50 round belts in 100 and 200/250 round ammunition boxes
Sights: Tangent iron sights (default); Optical, Night-vision, Thermal and Radar sights
Effective Firing Range (With Sight Adjustments): m100-1,500

↳***Ammunition***

Name: 57-N-323S
Type: Rifle
Caliber: mm7.62

Cartridge: 7.62×54mmR km

Muzzle Velocity: m/s855

Basic Load: ea2,500

Accuracy of fire at 300 m: mm90

Fire Control

Name: INA

Computerized FCS: Yes; however the computer does not compute fire solutions, though it can calculate corrections to observed fire

Computerized FCS Upgrade: Later versions increase the capabilities and reliability of the main computer to allow it to tie into the new GLONASS system or the inertial navigation system, and give recommendations on what round might be the most effective. The improved version has an advanced active/passive IR viewer with a range of 1500 meters in the passive mode and 3000 meters in the active mode.

Gunner Day Sights: 1P3-6, 1.2x/4x

Main Gun Stabilization: No

Infrared Searchlight: OU-3GA2M

Night Vision: Name: INA; extensive night vision equipment. Passive IR (D, C), Advanced Active/Passive IR (Turret), Image Intensification (C, Turret), Thermal Imaging (Turret)

Day Vision: Name: INA; extensive Day vision equipment

Laser Rangefinder: Yes

Vision Blocks: The commander and driver have vision blocks to the front and to their respective sides to supplement this, and each have a night vision block

Turret Elevation: The turret has electric traverse and elevation

Inertial Navigation System and Sensors: Yes

Targeting Information: The 1V152 FIST provides targeting information to artillery, mortar, or MRL batteries

Hand-Held Laser Rangefinder: Yes, this laser rangefinder can be connected by a cable to the vehicle’s artillery fire control computer to feed information directly to it

Hand-Held Image Intensifier: YEs, along with several pairs of binoculars

Laser Designator: Yes

Thermal Imager: Yes

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Turret Armor: Protection against 12.7mm and shrapnel

Bullet-Resistant Windows: Yes

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, Collective

Radiological Shielding: Yes

Smoke Equipment: The turret has a cluster of four smoke grenade launchers on either side of the turret

Notes:

The 1V152 is called a “unified command vehicle;” of somewhat modular interior design, there are two versions of the 1V152, a FIST vehicle and an FDC vehicle. Both carry the same designation, but have different equipment and different capabilities. The BTR-80 1V152 version is used by battalion commanders and forward observers in field artillery units. This variant contains special navigation, range finding, and vision equipment The 1V152 FIST version uses a wider and somewhat taller turret which not only houses the gunner/observer, but a large array of vision equipment, including extensive night vision equipment and day vision equipment along with a laser rangefinder. The original 1V152 had a relatively simple control computer to tie together the inertial navigation system and the sensors and provide targeting information to artillery, mortar, or MRL batteries. This computer does not compute fire solutions, though it can calculate corrections to observed fire. The 1V152 FIST has three long-range radios (two of them data capable), one medium-range radio, and one short-range radio. The 1V152 has an internal 4kW generator to power electronics and sensors when the vehicle’s engine is off. The 1V152 has a 10-meter extendable antenna for extended-range communications and more advanced whip antennas. The 1V152 also carries an assortment of maps and map markers, manual plotting devices, and hand-held calculators as a backup for the computers. The 1V152 carries not only a turret-mounted laser rangefinder, but also a hand-held laser rangefinder for use away from the vehicle; this laser rangefinder can be connected by a cable to the vehicle’s artillery fire control computer to feed information directly to it. The vehicle also carries a hand-held image intensifier and several pairs of binoculars. Later versions increase the capabilities and reliability of the main computer to allow it to tie into the new GLONASS system or the inertial navigation system, and give recommendations on what round might be the most effective. This computer can produce limited fire solutions, though they will not be as accurate as those produced by a dedicated FDC. The improved version has an advanced active/passive IR viewer with a range of 1500 meters in the passive mode and 3000 meters in the active mode; the 1V152 FIST has a small IR searchlight for use when the IR is in the active mode. The improved version adds a thermal imager and a laser designator.

1V18/1V19 Russian Artillery Command and Reconnaissance Vehicle

Tiers:

1 2 3 4

System

Alternative Designations: M1979-2A (1V17), M1979-2B (1V18)

Sensors/Components

Navigation: 1T121-M Navigation System

Automated Fire direction: 1V520

Manual Fire direction: PUO-7

Other equipment: 1D15 laser rangefinder, 1PN44 day/night sight, PAB-2AM aiming circle, DS-1 stereoscopic rangefinder

Protection

Armor Turret Front: Protected against 12.7mm
Armor Turret Top: Protected against 7.62mm
Armor Hull: Protected against 7.62mm
NBC Protection System: Yes
Smoke Equipment: No

Notes:

In 1979, the Soviet Union introduced a similar wheeled ACRV set for multiple rocket launcher and towed cannon units. The eight-vehicle set consists of three 1V110 battery senior officer’s vehicles, three 1V18 battery commander’s vehicles, one 1V19 battalion commander’s vehicle, and one 1V111 battalion chief of staff’s vehicle. Early versions of the 1V17 acrv set included a 1V111 equipped with a modified ZIL-130-mounted 9S77M instead of the ZIL-131. There have been no upgrades to the 1V17 like that of the 1V12 to 1V12m. The acrv 1V18 and 1V19 are the battery and battalion commander’s vehicles of the 1V17 ACRV complex. Both vehicles are equipped with the 1T121 land navigation system, a 1D15 laser rangefinder, and the 1PN44 day/night sight. The observer uses an analog coordinate converter to translate the polar location data when determining rectangular target coordinates. The 1V520 fire direction computer may be transported internally and dismounted at a command observation post.

1L122-1E Baurnal-T Russian Mobile Air Defence Command and Control System

Tiers:

System

Alternative Designation: 1L122-1E Baurnal-T

Type: Mobile Air Defence Command and Control System

Crew: INA

Mission: The Barnaul-T air defense control system is designed to detect aerial targets and control air defense systems of the Army, marine units and the Airborne Force. The systems uses the 9S932-1 intelligence and control module with 1L122-1E radar.

Chassis: BTR-MD Rakushka

Passenger Capacity: 13

Payload Capacity: 2,000 kg

Paradropped: The 1L122-1E Baurnal-T can be carried by and paradropped from most medium cargo aircraft with the crew of three inside. The Il-76 can carry two of these airborne APCs. A single vehicle can be carried underslung by the Mi-26 heavy cargo helicopter.

Radar Detection Range: 1-40 km

Traget Tracking Speed: The 1L122-1E (1L122-2E) radar makes it possible to detect the indicated types of air targets flying at a speed of up to 700 m / s

Detection Zone Azimuth: 360 deg

Detection Zone Elevation: -5 (0) - +45 (60) degrees

Effective Dispersion Area (EPR): the mean square errors of determining the coordinates of a single target with an effective dispersion area (EPR) of 1 square m.

Data Update Rate: 2 (4) or 4 (10) s

Displacement Time: INA

Emplacement Time: INA

Dimensions

Length: 6.1 m

Width: 3.1 m

Height: 2.5 m

Weight, Combat: 13.2 t

Antenna Length: 1,200 mm

Antenna Weight: 800 mm

Automotive

Engine Name: 2V-06-2

Engine Type: Diesel

Engine Power: hp450

Cruising Range: km500

Speed, Maximum Road: km/h70

Protection
↳

Hull Armor: Protection of this vehicle is very light due to weight limitations. Hull of the BTR-MD is welded from aluminum

armor. It provides protection only from small arms fire and artillery shell splinters. Vehicle is fitted with NBC protection and automatic fire suppression systems.

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: INA

NBC Protection: INA

Smoke Equipment: INA

Notes:

Barnaul-T is baseline air defence command & control subsystem of the integrated troop and weapon management system designed to detect aerial targets and control air defense systems of the Army, marine units and the Airborne Force. The Barnaul-T baseline air defence command and control subsystem is designed to fit tactical units' air defence (AD) control posts (CP) with advanced automation, communication, and data exchange equipment in order to effectively control air defence troops and weapons, coordinate their activities, and increase their mobility and survivability under any combat conditions. The systems use the 9S932-1 intelligence and control module with 1L122-1E radar mounted on a BTR-MD Rakushka amphibious tracked chassis or MT-LBU. The new air defence control system use of automation equipment at tactical level increases the efficiency of short-range SAM systems by up to 20% and reduces the expenditure of missiles per killed target by up to 30%. The Barnaul-T baseline air defence command and control subsystem is designed to fit tactical units' air defence (AD) control posts (CP) with advanced automation, communication, and data exchange equipment in order to effectively control air defence troops and weapons, coordinate their activities, and increase their mobility and survivability under any combat conditions. The Barnaul-T baseline set is used to equip *AD division/brigade CP (mission planning module (MPM) mounted on the 9S931-1 wheeled chassis); *AD regiment CP (MP-K 9S931-1 and 9S931 MPM); *AD battalion CP (9S931 MPM); *Battery command and control (C2) post (9S932-1 reconnaissance and control vehicle with 1L122-1E radar); *MANPADS platoon C2 post (9S933 portable fire control unit); *SAM squad – 9S935 MANPADS squad automation equipment set. The configuration of the Barnaul-T baseline set depends on the organizational structure of Customer's tactical military units.

XA-202 Finish 6x6 Armored Command Vehicle

Tiers:

Variants:

- **XA-202/XA-202S:** This is a command vehicle based on the XA-200 chassis. The hull is divided into four sections: auxiliary power unit (APU) room, engine room, driver/commander compartment and operator room. A ring mount for a 12.7-mm machine gun is fitted above the commander.
- **XA-203/XA-203S:** This is an armored personnel carrier variant with a combat weight of 23 tons, including a payload of 7 tons.
- **XA-220:** This is the latest variant, which was revealed by Patria in mid-2016. The vehicle offers more comfort, mine protection, armor protection, speed, all-terrain mobility and internal space compared to similar platforms, according to the manufacturer.

System

Alternative Designation: XA-202

Type: 6x6 Armored Command Vehicle

Manufacturer: Patria Vehicles, Hameenlinna, Finland

Family: XA Series

Crew: ea3

Passenger Capacity: ea8

Note: The vehicle can be fitted with a 78-ft 9-in (24-m) hydraulic mast, powered by the main engine's hydraulic pump. It has an automatic, hydraulically tightening guy rope system with a radius of 17 ft (5.2 m) and hydraulically powered support legs.

Dimensions

Length: 7.45 m

Width: 2.95 m

Height: 2.60 m

Ground Clearance: 0.40 m

Weight, Combat: 22,500 kg

Weight, Unloaded: 14,500 kg

Payload Weight: 8,000 kg

Automotive

Engine Name: Valmet 612DWIBIC (Euro 2)

Engine Type: turbocharged intercooled six-cylinder inline Diesel

Engine Power: 295 hp at 2,000 rpm

Power-to-Weight Ratio: 13.4 hp/ton

Fuel Capacity: 300 liters

Transmission: Allison MD 3560PR automatic w/torque converter(6 forward gears, 1 reverse in high range)

Axles: Sisu

Steering: hydraulic, power steering, first two axles

Brakes: dual circuit pneumatic

Suspensions: parabolic leaf springs with hydraulic shock absorbers

Maximum Speed on Road: 95 kph

Range: 600 km

Gradient: 60 percent

Side Slope: 60 percent

Fording: 1.5 m

Main Gun

Note: A ring mount for a 12.7-mm machine gun is fitted above the commander.

Protection

Hull Armor: High hardness welded armored steel

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Notes:

XA-202/XA-202S This is a command vehicle based on the XA-200 chassis. The hull is divided into four sections: auxiliary power unit (APU) room, engine room, driver/commander compartment and operator room. A ring mount for a 12.7-mm machine gun is fitted above the commander. The XA-200 series armoured 6×6 wheeled vehicle is an updated production version of the XA series, of which over 700 vehicles have been produced. The series is manufactured by Patria Vehicles of Hameenlinna, Finland, formerly Sisu Vehicles. The vehicle is in service with the Finnish Army (104 XA-200 armoured personnel carriers), the Swedish

Army (86 XA-203S basic vehicles and 18 XA-202S command vehicles) and the Norwegian Army (32 XA-200 armoured personnel carriers). The AMOS advanced mortar system has been integrated on the XA-200 chassis and trialled and evaluated by the Finnish Army. 24 AMOS systems (developed by Patria Hagglunds) were ordered by Finland for integration on the Patria 8×8 armoured modular vehicle.

Communications

Note: The R-161 Poisk family was widely fielded in the 1980-1990s, and has since been replaced by the R-166 Artek family which was developed in the late 1990s. The R-176 Antey family is the next generation of the Russian Ground Forces' long range, over-the-horizon radios for operational and strategic level control. Among other technological innovations, the R-176 Antey family, is reportedly a Software Defined Radio (SDR), meaning a radio that is primarily manipulated through software instead of hardware such as mixers, filters, modulators/demodulators, etc. These types of radios are capable of receiving and transmitting different waveforms based solely on the software used, instead of requiring physical modifications of hardware.

Command and Control System

Onboard Power Supply System: Yes

Navigation System: Yes, using GLONASS

Survey System: Yes

Data Transmission and Reception Equipment: Yes

Control of Short-Range Air Defence Missile Batteries: Via Coded Datalink: up to 6

Control of Short-Range Air Defence Missile Batteries: Via Telephone Link: up to 4

Control of Short-Range Air Defence Missile Batteries: Tor-M1 launchers (via coded datalink): up to 4

Control of Short-Range Air Defence Missile Batteries: Igla MANPADS (via coded datalink): up to 6

Primary (Radar with Analogue output signal): ea1

Radars with Coded Output Signal: ea3

Number of Received Targets: up to 99

Coordinates Measurement Envelope: up to 100 km

Coordinates Measurement Envelope Maximum Altitude: up to 25 km

Data Transmission Range via field Telephone Wire: up to 15 km

Fire Control

Laser Target Desinator: No

Night Vision Devices: Yes

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Applique Armor: Available

Active Protection System: INA

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: 6 x 81-mm smoke grenade launchers

Life Support System: Yes

Notes:

The PU-12M7 mo bile control post is designed to automate combat control of weapons employment by AD units on the move and at halt under air attack. It is a battery CP intended to operate as part of special purpose automated control systems. Composition The PU-12M7 mobile CP is mounted on the BTR-80 wheeled armoured personnel carrier fitted with: • life support system; • self-contained po wer supply system ; • navigation and survey system ; • radiation and chemical agent sensors; • night vision devices; • data transmission and reception equipment; • com munications aids; • spare parts, tools and accessories kit.

Deimos-NSA Russian 6x6 Command and Control Vehicle

Tiers:

Variants:

- **R-142-R:** 2015 variant on a KamAZ-5350 chassis. Has video surveillance systems, GPS, replaces the single R-168-100U with two R-168-100U-2. Upgrades encryption with two T-231-2A and a T-236-V.

Range, Maximum Effective, Night: m1500
Rate of Fire: rd/min80-100
Fire on Move: Yes

Sensors / Components

Fire Direction (Automated): 9V59
Fire Direction (Manual): PUO-7

Notes:

The 1V16 is the simplest of the vehicles in the 1V12 ACRV complex and serves as the battalion FDC / Chief of Staff's vehicle. Normally, the battalion chief of staff, assisted by fire direction and communication personnel mans the vehicle. It has neither battlefield observation optics nor a navigation system. However, the vehicle is equipped with the standard VOP-7 vision blocks and driver's periscopes. It is equipped with extra radios and has an extendable antenna mast mounted on the vehicle rear. The 9V59 fire direction computer is mounted in the vehicle. The 9V59 fire control computer comes in several different models believed to be designated a 9V59-1, -2, and -3. For example, the 9V59-2 is associated with 152mm artillery units. The 9V59 fire control computer is probably a 4-bit computer and, although quite rugged, is assessed to have a low mean time between failures because of a larger number of discrete components. The 1V510 is assessed to be a replacement for the 9V59 fire control computer. The 1V510 is capable of performing survey calculations and technical firing data. The system is assessed to be 33% faster than the 9V59.

1V152 FDC Kapustnik-B Russian 8x8 Amphibious Command and Fire Control Vehicle

Tiers:

Variants:

- **BTR-80 (GAZ-5903):** Original w/ 3 firing ports on each side & smoke grenade launchers.
- **BTR-80A (GAZ-59034:** Stabilized turret w/ 2A72 gun, 7.62-mm coax MG, & new right side firing port.
- **BTR-80AK:** BTR-80A CP variant with 1 firing port on right side and 2 whip antennas at rear corners
- **BTR-80K (GAZ-59031):** Command Post for 6; different turret w/ MGs & 3 radios (R-173, R-173P & R-159)
- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment
- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle
- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun
- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control

- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RPM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle
- **R-439-BK (Legenda 2BK):** Satellite communications vehicle
- **R-165B:** Short-wave signal/ communications vehicle
- **R-149BM4A:** Command and Signal Vehicle
- **R-149BMR:** Signal/Communications vehicle
- **PU-12M7 (9S482MU):** Improved PU-12M6 FA battery command vehicle
- **PU-12M6 (9S482M6):** Field Artillery (FA) battery command vehicle
- **P-240BTZ:** Switchboard platform
- **K1Sh1 (GAZ-59032) (UNSH):** Command Post with enlarged hull w/o turret armament
- **E-351BrM:** Mobile power station with diesel/electric generator
- **BREM-K (GAZ-59033) ARV:** Armored recovery vehicle with A-frame, tow bars, & stabilizers
- **BMM-80 (GAZ-59039 or Simfoniya):** Battlefield ambulance for 9 sitting or 2 litter patients
- **BMM-3:** Battlefield ambulance used as a mobile field hospital
- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)
- **2S23 (Nona-SVK) SP GunMortar System (Fire Support Vehicle):** Breach-loaded 2A60 120-mm rifled mortar/gun system similar to the 2S9
- **BTR-80 R-975:** Forward air control vehicle
- **BTR-80 1V152:** Artillery C2 & forward observation vehicle w/ range finding, navigation & new optics

System

Alternative Designation: 1V152 FDC
Description: 8 X 8 wheeled APC as an upgrade to the BTR-70; 7 soldiers exit through 2 side doors; 4 firing ports on the right & 3 firing ports on the left
Manufacturer: Arzamas
In Service: 1986-Present
Chassis: BTR-80
Crew: ea3
Personnel: ea7
Inertial Navigation: Yes
Gyroscopic Backup: Yes
Note: The crew enter and exit through enlarged side hatches, which are clamshell hatches opening upwards and downwards

Dimensions (Chassis: BTR-80)

Rate of Fire: rds/min600

Maximum Firing Range: m4,000

Effective Firing Range: m3,000

Feed System: 40-round belt

Sights: iron or optical

Maximum Elevation: deg+60

Minimum Elevation: deg-4

Fire on the Move: Yes

↳*Ammunition*

Name: INA

Type: API-T

Caliber: mm14.5

Cartridge: 14.5×114 mm

Muzzle Velocity: m/s1,005

Basic Load: ea500

Effective Range (Day): m2,000

Effective Range (Night): INA

Tactical Range: m1,500-2,000

Armor Penetration: 20 at 1,000 m/ 30 at 500 m

Note: Additional Ammo includes: API, I-T

Auxiliary Weapon System

Note: The 1V152 FDC uses the same turret as the BTR-80 from which it derived, but that turret does not have the PKT coaxial machine gun

Fire Control

Name: INA

Computerized FCS: Yes. The 1V152 FDC has a limited computer able to compute fire solutions (though only two at a time), and use the data transmitted by FIST vehicles (manual input must be used)

Computerized FCS Upgrade: Newer 1V152 FDCs add a more capable computer able to calculate multiple fire solutions at once as well as fully and semi-automatically integrate information from FIST vehicles with much reduced user input

Gunner Day Sights: 1P3-6, 1.2x/4x

Main Gun Stabilization: No

Infrared Searchlight: OU-3GA2M

Night Vision: Name: INA; extensive night vision equipment. Passive IR (D, C), Advanced Active/Passive IR (Turret), Image Intensification (C, Turret), Thermal Imaging (Turret)

Day Vision: Name: INA; extensive Day vision equipment

Laser Rangefinder: Yes

Vision Blocks: The commander and driver have vision blocks to the front and to their respective sides to supplement this, and each have a night vision block

Turret Elevation: The turret has electric traverse and elevation

Survey System: a survey system to help lay out firing positions for the guns, mortars, or MRLs

GLONASS System: Yes

Hand-Held Laser Rangefinder: Yes, to help determine proper firing positions for its guns, mortars, or MRLs; this laser rangefinder can be connected to the computer by a cable, and directly input its information

Note: The 1V152 also carries an assortment of manual aids to producing fire positions and determining firing positions, in case of equipment failure

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Turret Armor: Protection against 12.7mm and shrapnel

Bullet-Resistant Windows: Yes

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, Collective

Radiological Shielding: Yes

Smoke Equipment: The turret has a cluster of four smoke grenade launchers on either side of the turret

Notes:

The 1V152 is called a “unified command vehicle;” of somewhat modular interior design, there are two versions of the 1V152, a FIST vehicle and an FDC vehicle. Both carry the same designation, but have different equipment and different capabilities. The BTR-80 1V152 version is used by battalion commanders and forward observers in field artillery units. This variant contains special navigation, range finding, and vision equipment. The 1V152 FDC is the fire control component of the 1V152 system. In its original iteration, the 1V152 FDC carries two data-capable long-range radios, a medium-range radio, and a short-range radio. The 1V152 FDC has a limited computer able to compute fire solutions (though only two at a time), and use the data transmitted by FIST vehicles (manual input must be used). The 1V152 FDC uses the same turret as the BTR-80 from which it derived, but that turret does not have the PKT coaxial machinegun. On the roof is a 10-meter collapsible antenna, and several advanced whip antennas which are longer than normal whip antennas. The original 1V152 FDC is equipped with an inertial navigation system with gyroscopic backup. It has a survey system to help lay out firing positions for the guns, mortars, or MRLs. Newer 1V152 FDCs add a third long-range radio, a more capable computer able to calculate multiple fire solutions at once as well as fully and semi-automatically integrate information from FIST vehicles with much reduced user input. The newer 1V152 FDC also adds a GLONASS system and a hand-held laser rangefinder to help determine proper firing positions for its guns, mortars, or MRLs; this laser rangefinder can be connected to the computer by a cable, and directly input its information. The 1V152 also carries an assortment of manual aids to producing fire positions and determining firing positions, in case of equipment failure. The 1V152 FDC carries an internal 4kW generator to power its electronics while the engine is turned off.

BRDM-2M-98 & BRDM-2M-97 Polish Armored Staff Car

Tiers:

1 **2** 3 4

Variants:

- **BRDM-2-M98/Zbik-A/BRDM-2A:** Upgraded turret, 12.7mm machine gun, and battlefield surveillance system.
- **BRDM-2-M97/Zbik-A/BRDM-2B:** 20 upgrades including larger turret, 12.7mm machine gun, ATGM, night sensors, radar, and improved space design.
- **BRDM-2A (Russia):** Better engine and other upgrades.
- **BRDM-2SMD/BRDM-2D (Russia):** 145hp engine and other improvements.
- **BRDM-B (Czech Republic):** Overhead turret, 12.7mm machine gun, TV/thermal sight, new engine, and space for 6 soldiers.

System

Alternative Designation: BRDM-2A, BRDM-2B M97, Zbik-A, Zbik-B

Crew: ea4

Smoke Equipment: INA

Survivability Equipment: Internal fire suppression system

Notes:

The wheeled armored vehicle "model 98" is a new variant of the BRDM-2. This model is very different from the basic model of the original Russian vehicle BRDM-2. The vehicle has a wide variety of improvements including a new engine, a new access hatch on each side of the sides of the hull, a spare wheel placed at the rear of the hull, a more spacious crew compartment and better suited to current combat situations. This vehicle is currently used by the Polish army. A special effort has been made regarding the communication and navigation system. Thanks to all these improvements, the BRDM-2 has found a second youth, which still allows it a very long life in many army of the old Warsaw Pact. Indeed, these countries do not have a significant defense budget, they are forced to find compromises to keep their armies at an operational level worthy of armies like France or the United States. There are two other variants, the "Model 97", whose turret has been completely modified. They are wider and have smoke grenade launchers on the front left and right, and also a large net holder at the rear. One can also find on the roof of the turret, an anti-tank firing post. The "Model 98" has a 12.7 mm machine gun and a 7.62 mm machine gun, a passive night vision system for the vehicle manager and the driver and an optoelectronic recognition system. On all these vehicle models, we only find the four additional retractable wheels as on the original model. The vehicle is fully amphibious, it can move in the water at a speed of 9 to 10 km / hr.

BRDM 2U Russian 4x4 Command and Control Vehicle

Configuration 2: One R-105M, one R-108M and one R-130M

Protection

Frontal Armor: mm10
Applique Armor: NA
Active Protection System: NA
NBC Protection: Collective
Smoke Equipment: NA

Notes:

The BRDM-2U command vehicle has no turret but carries a generator and extra radios. The increased number of antennas marks this version as a command and control vehicle. It is found in battalion and regimental headquarters of maneuver units and also is used extensively by artillery units. The BRDM-2U (BRDM-2UM) carries a 1 kW generator and extra radios (two R-123 and an R-107, or according to other sources one R-105M, one R-108M and one R-130M). On either side of the upper hull there is a big antenna base.

Chassis Length Overall: m6.90

Height Overall: m2.48

Width Overall: m2.50

Automotive

Vehicle: ZIL 131 6x6 box body van

Engine Type: V8 gasoline

Cruising Range (km): km850 km

Max Road Speed (km/h): km/h80

Max Off-Road Speed (km/h): km/h35

Cross-Country Speed (km/h): INA

Fording Depth: m1.4

Communication

Radios: R-111M (1 each), R-123M (2 each) radios; R-130M short-wave radio (1 each), and R-326 receiver (1 each)

Sensors/Components

Fire direction: 9V59 fire-control computer

Protection

Note: The ZiL-131 is a light skinned vehicle and provides no protection to the crew

NBC: The staff van may have an overpressure system to provide protection against an NBC attack

Notes:

In 1979, the Soviet Union introduced a wheeled ACRV set for multiple rocket launcher and towed cannon units. The eight-vehicle set consists of three 1V110 battery senior officer's vehicles, three 1V18 battery commander's vehicles, one 1V19 battalion commander's vehicle, and one 1V111 battalion chief of staff's vehicle. Early versions of the 1V17 ACRV set included a 1V111 equipped with a modified ZIL-130-mounted 9S77M instead of the ZIL-131. There have been no upgrades to the 1V17 like that of the 1V12 to 1V12m. The ACRV 1V111 battalion FDC/Chief of staff's vehicle serves the same function as the ACRV 1V16 (1V12 ACRV complex) and houses the fire-direction computer. Like the 1V16, it is the simplest of the vehicles in the 1V17 ACRV complex and lacks a land navigation system.

→Command and Control Information Systems (C2IS)

Akatsiya-M ASU Russian Automated Command and Control System

Tiers:

System

Alternative Designation: Akatsiya-M
Type: Automated Command and Control System (ASU)
Manufacturer: INA
In Service: Yes
Fielded: fielded in Russia's operational-level Ground Forces' commands (12 Combined Arms Armies and 4 Army Corps)
Capabilities: The system will not only provide C2 and situational awareness for the operational commander regarding his own directly subordinate units, but will also allow for liaising with, or command and control of, attached subordinate units of the Navy, Aerospace Forces, and Airborne Troops. In addition, the Akatsiya-M will be integrated with the Russian National Defense Control Center.
Note: There is very little unclassified information about the Akatsiya-M

Dimensions

Length: mINA
Width: mINA
Height: mINA
Weight, Combat: INA

Notes:

The system provides the army commander and his staff with online information about the combat situation, including the status of our own troops and actions by the enemy. Based on these data, the commander will be able to give orders directly via Akatsiya to subordinate troops. According to experts, the new system will significantly outpace an enemy in decision-making and implementation on the battlefield. The Akatsiya-M technically consists of staff cars with special equipment based on KamAZ all-terrain four-axle trucks. This provides the system with high mobility. It can be deployed in minutes in any direction. Manufacture of the Akatsiya-M will begin this year and will go on until 2019. The Akatsiya-M will be in each combined-arms army and army corps. In total, more than 21 billion rubles have already been allocated for the creation of the system…The Akatsiya system was already deployed in the field in 2011. It supports the daily life of the military in peacetime. For example, through this system, the rear services keep records of stocks and the issuance of food, fuel and lubricants, and clothing. But the Akatsiya-M is a combat system. It is designed for combat, peacekeeping and special operations. The automated command and control system uses closed radio and satellite communication channels to create a single information field that ensures continuous exchange of information between command posts and headquarters. The automated command and control system also has integrated reconnaissance devices, including satellites and UAVs. The Akatsiya-M continuously receives and analyzes

data on the ongoing situation in real time: information on enemy actions and the aerial,ground, interference, radiation, chemical, and bacteriological environment. Also, data is disseminated on the combat readiness of our own troops' equipment, the availability of ammunition, fuel and lubricants, and even information about the moral and psychological state of personnel…The processed data is displayed in real time on an electronic chart. In that way, the commander can assess the situation in real time and make a decision in a few minutes. If there is a need, the commander can even give orders to a detachment of soldiers. The Akatsiya-M interacts with automated command and control systems of other military arms and branches. Thanks to this, the commander and army headquarters will be able to easily manage groups of troops which include Navy units and formations, Aerospace Forces, and Airborne Troops. The Akatsiya-M also exchanges information with the National Defense Control Center in real time. Automated Command and Control System (ASU) ACUs are seen as essential elements of reconnaissance-strike loops, as they facilitate rapid reconnaissance, planning, and most importantly, action.

Bittium Tough SDR Finish Tactical handheld Radio

Tiers:

System

Alternative Designation: Bittium Tough SDR

Type: Tactical handheld Radio

Crew: ea1

Frequency: The Tough SDR radios provide a uniquely wide frequency range, 30-2500 MHz, across several frequency bands.

Frequency Agility: Uniquely wide frequency range providing frequency agility and less interference

Several Routing Networks: Support for several routing networks and even thousands of radios in one network

Support for Different Waveforms: Support for several different waveforms with seamless porting also for legacy and national proprietary waveforms

Flexible Integration of Applications: Application sandbox for flexible integration of C2 applications, such as BMS and blue force tracking

Easy Operation: Best-in-class user interface and usability for easy operation

Secure: Access to information security implementation and certification both nationally and internationally

Dimensions

Length: INA

Width: INA

Height: INA

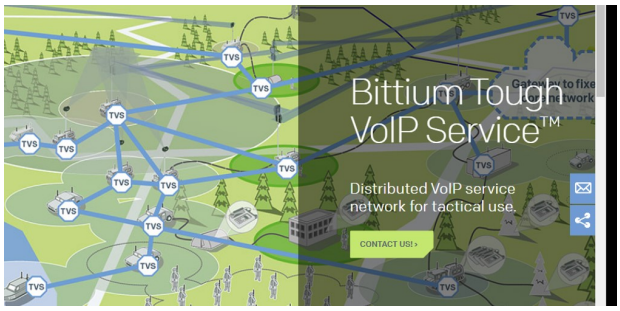
Weight, Combat: INA

Notes:

Bittium Tough SDR Handheld™ is the next generation software defined tactical radio for dismounted soldiers, such as squad or platoon leader. With the radio it is possible to bring broadband data transfer and voice to mobile troops across the battlefield. This improves the performance and the effectiveness of the tactical troops, and leading the troops is easier based on the up-to-date situational awareness and more reliable connections. With Bittium Tough SDR Handheld troops can communicate securely over narrowband and wideband waveforms. The radio can flexibly use the best performing waveform considering the conditions and the mission. The uniquely wide range of frequency bands in the radios improves combat survivability. Using several waveforms improves compatibility and enables operations on different levels and missions. Also legacy and national proprietary waveforms can be seamlessly ported to the radio with national COMSEC and TRANSEC. The Tough SDR radios provide a uniquely wide frequency range, 30-2500 MHz, across several frequency bands. Together with flexible configuration options and routing networks, even thousands of radios in one network are supported. Connectivity Across the Battlefield The Handheld radio is compatible with Bittium Tough SDR Vehicular™, which belongs to the same product family, and Bittium Tactical

Wireless IP Network™ (TAC WIN) system. With the Tough SDR radios, the TAC WIN system and the related waveforms, it is possible to bring broadband data and voice to all mobile troops starting from brigade level and all the way across the battlefield.

Bittium Tough VoIP Finish Distributed VoIP Service Network



Tiers:

1 2 3 4

System

Alternative Designation: Bittium Tough VoIP
Type: Distributed VoIP Service Network
Crew: INA
Designed for MANET Networks: Tough VoIP Service is designed to be operational in Mobile Ad Hoc Networks.
Easy Configuration: Requires only global parameters, no need to define network configuration for Tough VoIP Service nodes.
Seamless Connectivity: Connects users seamlessly across tactical and fixed networks.
Easy System Integration: Interoperability with 3rd party SIP VoIP services and VoIP clients.
Optimized for Tactical Networks: Optimized call features such as managed group calls, PTT calls, call prioritization (MLPP) and user mobility.
Bridging CNR to VoIP Networks: Enables voice communication between VoIP and CNR networks.

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

Bittium Tough VoIP Service creates a highly resilient, distributed digital voice service in a tactical network. Tough VoIP Service can rapidly adapt to changes in the network, and the network can be split or merged while maintaining the service available for all clients that are accessible. When network islands merge with the network, the clients will have core network connection automatically.

Andromeda-D Russian Automated Command and Control (C2) System

Tiers:

System

Alternative Designation: Andromeda-D

Type: Automated Command and Control (C2) System

Purpose: Andromeda-D as a division-to-soldier system, with stationary points for commanders down to battalion, and vehicle-mounted systems for tactical units

Manufacturer: Scientific-Research Institute of Communications and Command and Control Systems

In Service: 2017-Present

Crew: eaRussian Airborne Troops

Polet-K System Enabled: Yes

GLONASS Receivers: Yes

Software Package: The Andromeda-D Software package includes digital maps for each of the users to be able to update the information about enemy positions, weapons and vehicles online. In most cases, the positions of the friendly forces are downloaded to the computers automatically using the GLONASS/GPS positioning of the switched-on computers

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Note: Airborne's Andromeda-D automated C2 system from the Sozvezdiye Corporation is a network of ES-1866 laptop computers enabling their users at all levels - from the branch's commander down to a squad leader - to swap real-time information

Automotive

Chassis: The Andromeda-D can be mounted on a variety of vehciles ranging from: biaxial Kamaz trucks; BTR-D Armored Personnel Carriers; and BMD-2 or BMD-4 Amphibious Infantry Fighting Vehicles

Operate on the Move: Yes

Note: mAndromeda-D is developed specifically for airborne troops and is adapted to loading onto a plane, flying and landing

Communications

Facsimile Communications: Yes
Video Conferencing: Yes
Data Transmission: Yes
Special Purpose Telephone Communication: Yes
Radio Channels: Available
Radio Relay Channels: Available
Satellite Communication Channels: Available

Notes:

The Andromeda-D ACS is a complex of automatic devices for equipping stationary and mobile troop command posts. The Andromeda-D is an automatic control system developed by Sozvezdie to meet the Russian Armed Forces requirement for network centric operations in real time. The Andromeda-D will make possible cooperation between ground and airborne forces installed on Armata, Kurganets and Boomerang armored vehicle families. The system provides real time information about the technical and tactical status of a given armored vehicle including speed, route, fuel and ammo reserves. The first stage of development of the new system will be completed by the end of 2017 with it going operational in 2018 or later. Andromeda-D affects the communications hardware supplied to the armored vehicles and above all software which is the key component of the new system. Actually, Andromeda-D was already being used by the Russian Airborne units within 2016.

Bittium Tough Comnode Finish Versatile Tactical IP Communication Device

Tiers:

System

Alternative Designation: Bittium Tough Comnode
Type: Versatile Tactical IP Communication Device
Crew: ea1
Versatile: The same device acts as a terminal, IP router, SHDSL repeater, CNR GW and SIP server.
Portable and Easy to Install: Small size and rugged form factor makes it easy to install anywhere and it is portable on the field.
Extensive Connectivity: Extensive connectivity with e.g. CNR interface, SHDSL, ETH, USB, WLAN, BT, SERIAL/AUDIO and GPS.
Military Grade IP Communications: Together with distributed VoIP service, Bittium Tough VoIP Service, and wide range of codecs.
Network Reliability: Dynamic routing capabilities improve network reliability.
Standard: MIL-STD-810G, MIL-STD-461G and MIL-STD-1275E standards compliant
Connectivity: Connectivity to 3rd party SIP servers and VoIP clients
IP address configuration: Automatic IP address configuration
Tactical IP Network: Fully independent tactical IP network using SHDSL and Ethernet connections

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

Bittium Tough Comnode is a versatile and rugged terminal and IP communication device for tactical networks. The device fulfils the data transfer needs for mobile troops for example as SIP phone, router and SHDSL modem. Bittium Tough VoIP Service™ can be run on the device to provide telephony and SIP server functionalities to other VoIP devices for accessing the VoIP network. Bittium Tough Comnode also provides wireless access point for mobile clients and enables using legacy Combat Net Radios (CNR) as part of the IP-based tactical communication system (Radio over IP, RoIP). Bittium Tough Comnode is also compatible with *Bittium Tactical Wireles IP Network™ (TAC WIN) system *Bittium Tough SDR™ products *Bittium Tough VoIP™

products

→Battlefield Management Systems (BMS)

Pak-IBMS (Rehbar) Pakistani Integrated Battlefield Management System

Tiers:

1 **2** 3 4

System

Alternative Designations: Pak-IBMS (Rehbar)
Description: IBMS provides near real time battlefield situational awareness (SA) data through an integrated network of both mobile and fixed nodes.
VHF: Digital signal multiband interoperability
UHF: Fiber optic backbone for transport to higher echelons
Features: Displays vehicles; Includes real time status and decision point warnings.
Vehicle Management: Records routes of registered vehicles
Command and Control: Adds and deletes vehicles for specific tasks. Associates vehicle echelon with assigned domains. Provides situational alerts.
Geographic Information System: Static and mobile management centers include routers and radio access points (RAP) to backbone. Tracking devices are installed in weapons platforms (including MBTs).

↳*Communications*

Frequency Band Types: HF / VHF / UHF / SHF
Communications Transmission Platforms: CNR / HCLOS / WLAN / SATCOM / Fiber Optics

Operational Features

Information Sharing: Safe and Secure Information Sharing through adhoc networking of radios
AAMG: Remote Operation of 12.7mm AAMG from inside the tank
Route Driving: Driver panel to facilitate driver to follow the correct route with the help of directional bars
Target Tracking: Auto Target Tracking for Arial and Ground Targets
Laser Target Indication: Laser Target Indication to indicate location of the hostile elements and its engagement
Hardware: Ruggedized hardware to work in harsh environmental conditions based on Military specifications

Notes:

Integrated Battlefield Management System (IBMS) is designed for the operations of amour units in the field to meet the requirements of future battlefield. The user-friendly system provides battlefield awareness through comprehensive land navigation system based on GPS and digitized maps. It enables commanders in mission planning, modification and dissemination of plans, monitoring of battlefield at tactical and operational level, through safe and secure radio network. Pak-IBMS(Rehbar) also facilitates commanders in remote firing of AAMG by auto tracking the aerial and ground targets from inside the tank. Major Modules Situational Awareness Module enables war-fighters to see integrated battlefield picture through displays of terrain information in the form of different types of stitched maps with zooming, panning and browsing capability. Tank commander can determine and display his own position with the help of integrated GPS and broadcast it to friendly elements in the communication range and similarly see other friendly elements in the vicinity. Combat Messaging System Module enables commanders to exchange critical information/ orders in near real time and save history of messages. It has capability to either select predefined messages or write free-form text messages and transmit it to any individual/group or all participants. Tactical Mission Planning Module helps commanders to prepare plans, overlays and mark no go areas on digital maps. The plans made during peace time can also be loaded, edited and modified based on intelligent information. The option of automatic saving of plans has also been incorporated to avoid any accidental loss of data. The provision to mark military symbols and add attributes to all types of entities has also been provided.

Radar Systems

→Ground Radars

→→Battlefield Surveillance and Reconnaissance Radars

P-35/P-37 (Bar Lock) Russian towed Two-Dimensional Target Acquisition and Ground Control Intercept (GCI) Radar

Tiers:

Variants:

- **ELSYS P-37 upgrade:** This variant, developed by ELSYS in Ukraine, replaces the existing traveling wave tube components with the MSHB 37R1 low-noise microwave amplifier and the SG-01-01 and VSS-1 units with the ELP-2 microwave receiver module.
- **JSC Lemz P-37 upgrade:** This modernization includes replacement of the magnetron and thyratron in the transmitting system, improving frequency stability and extending service life; replacing the vacuum-based traveling wave tube with a solid-state low-noise amplifier and other receiving system components; addition of bearings and separators in the antenna turntable to increase shelf-life by more than 50,000 hours; and installing digital processing equipment, including VP-118 systems designed to extract radar data from IFF, ADF for tracking processing and for information transmission in code that can be used by air traffic controllers.
- **RETIA P-37 upgrade:** Developed by Czech firm RETIA, this upgrade includes a new transmitter chain; new radio frequency block; new extractor; new display and communications unit; and built-in test equipment. It is designed to improve the radar's overall performance; ability to disseminate digital data; counter-countermeasures performance; and reliability and service life.
- **HM Arzenal upgrade:** Hungarian firm HM Arzenal developed this modernization for Hungary's P-37 radars. The first upgraded radar was delivered in 1999. Transmitter upgrades replaced the magnetron and thyratron blocks with improved versions. Transmitter protection systems and internal cabling was modified for various subsystems.
- **LOBB Banksa Bystrica upgrade:** This modernization was developed by Slovak firm LOBB Banksa Bystrica in cooperation with Lemz. It primarily focused on converting the radar to 3D and integrating the MSR 2000 IFF. The transmitting and receiving cabin, indication cabin, source trailer and transportation trailer were also updated.

System

Alternative Designation: P-35/P-37; NATO: Bar Lock
Type: Towed Two-Dimensional Target Acquisition and Ground Control Intercept (GCI) Radar
Crew: INA
Band: E-F (2-4 GHz)
Frequency: stacked beams 2,695-2,715 MHz 2,715-2,750 MHz 2,815-2,835 MHz 2,900-2,990 MHz 2,990-3,025 MHz 3,080-3,125 MHz

Maximum Range: 390 km

Accuracy Angular: 0.5 deg

Accuracy Range: 900 m

Power: 650 kW each beam

Beamwidth Transmit: 0.7 deg

Pulse Repetition Frequency: 375 Hz

Pulse Width: 1.83-3.1 microseconds

Azimuth Scanning Rate: 3 or 6 rpm

Dimensions

Antenna Length: INA

Antenna Height: 11 m

Antenna Width: 3 m

Weight: INA

Notes:

P-35/37 / BAR LOCK Radar Station or Radio-location Station (RLS) P-35 has a large tactical radius. It insures a circular scanning of the air space, detects the planes which are located in its operational zone and calculates their coordinates. The station P-35 has the following basic tactical and technical characteristics: Maximum range, depending on the type of plane and height of the flight-from 150 to 350 km. For example, the plane TU-104 which flies at an altitude of from 8,000 to 10,000 meters is detected at a distance of 350 km; the scanning zone: in altitude-up to 25,000m, in angle of location-up to 30 degrees; errors while determining the coordinates: in distance plus of minus 500m, in azimuth plus of minus 0.5 degrees; partitioning ability: in distance-500m, in azimuth-1.5 degrees; time for one circular scanning of the space is 20 or ten seconds, in accordance with a speed of rotation of the antenna-3 or 6 turns per minute. RLS P-35 has 6 channels. The 6 channels have frequencies in the the centimeter range. At the end of the 1950s, a circular review station (range finder) was developed and put into service - P-35 radar with enhanced power characteristics, with a smaller number of failures in the detection zone, with increased accuracy in determining the elevation angle (height) of the target. Just like the P-30 radar, the station was used in the country's Air Defense Forces, in the Air Force, in the air defense units of the Navy and in the radio engineering formations of the air defense forces of the Air Force. The station was developed at the plant number 37 GKRE. In contrast to the P-30 radar, in the P-35 station, the upper antenna mirror was installed horizontally with a certain inclination in the elevation plane, the available decimeter channel was replaced by a centimeter channel. The first serious Western attempt to measure the radiated power of a radar for intelligence purposes was made by CIA in 1958 on the Soviet early-warning radar known as BAR LOCK. The BAR LOCK was a new version of the Soviet multi-beam S-band family of radars which had undergone a rapid and widespread deployment in East Germany and other areas peripheral to the USSR. Intelligence indicated this new radar was deployed to detect and track the U-2 aircraft which were just beginning to make deep penetrations over the Soviet Union. Estimates of the BAR LOCK's radiated power output, based largely upon photographic evidence, ranged as high as 5 megawatts peak pulse power from each of its 5 transmitters. With 5 megawatts in each beam the BAR LOCK would have had ten times the power of previous similar radars and would have significantly improved the detection and tracking capabilities of the Soviet air defense system. To meet this threat to the U-2, those responsible for the reconnaissance program demanded firmer information on the BAR LOCK's power output and radiation pattern coverage. A laboratory that provided scientific back-up to the U-2 program assembled power-measurement equipment, crude by present-day standards, and installed it in a C-119 aircraft. With little advance testing, a series of flights was made through the air corridors to Berlin, where BAR LOCK signals were easily intercepted. The resulting power measurements at various vertical angles in the antenna pattern were not of high accuracy because of uncontrolled errors in the equipment. The data did indicate, however, somewhat less than one megawatt of peak power for each BAR LOCK transmitter, and this was later confirmed by other sources. Although not entirely successful in power measurement, this project suggested solutions to many technical problems and opened the way for follow-on developments. BAR LOCK, first sighted in late 1958, represented a major modification in Soviet early warning/GCI radar. The early multi-frequency, multi-beam Token was the forerunner for Big Bar in 1959. BAR LOCK was found to have evolved away from these radars. BAR LOCK is similar to Cross Out and Strike Out in that it has two horizontal reflectors, but the structural details were found to be entirely different. The power is believed to have been much higher than that for previously developed Soviet radars and it apparently had better capabilities for aircraft detection and tracking than previous Soviet EW/GCI radars. The introduction of BAR LOCK again evidenced that the Soviets were continuously increasing their ECCM capability with each new member of the GCI family. BAR LOCK provided the capability to shut off individual beams in order to overcome the effects of spot jamming and retained all

ECCM circuitry incorporated in Big Mesh. BAR LOCK proved to be the primary, long range, high performance radar in use by the Soviets at GCI sites. BAR LOCK's van mounted antennas were comprised of truncated parabolic mesh reflectors with clipped corners measuring 10 x 32 feet. These reflectors were also used in configuring the Big Bar radar system in 1959. Four beams emanated from the lower reflector and two from the upper. BAR LOCK was one of the more capable EW radars in the Soviet inventory and when collocated with height finders such as Side Net it was highly functional in a GCI role. It was put to wide spread use and was most likely the primary EW component at EW/GCI sites.

P-40 (Long Track) Russian Mobile 3-D UHF Radar System

Tiers:

System

Alternative Designations: P -40. The name LONG TRACK is actually the radar.
Chassis: A modified version of the AT-T heavy tracked transporter vehicle (426 U).
Engine: 465-hp diesel
Weight (mt): 35
Max Road Speed (km/h): 55

Radar

Antenna: Elliptical parabolic
Auxiliary Power Unit: 400 Hz gen and gasoline engine.
Frequency Band: E-band (UHF)
Frequency: 2.6 GHz
Sweep Rate (rpm): 12-15
Display range (nm): 200
Effective range (km): 167
Tracking range (km): 150
Effective altitude (km): 30
Track targets on Move: No
Emplacement time (min): INA
Displacement time (min): INA
Dead time (min): 0
Max targets displayed: >8
Associated SAMs: SA-4/GANEF, SA-6/GAINFUL, SA-8/GECKO
ADA Unit Level:: Employed at division and echelons above division The system is used in Tier 3 and 4 units.
Other Radars: The radar system links to the IADS to provide analog warning and to pass analog data.

Notes:

The P-40 was the first high-mobility radar to enter into service with the then new tactical anti-aircraft forces of the Soviet armed forces. The P-40 used the AT-T artillery tractor with tracked chassis, fitted with a 12-cylinder 4-stroke diesel engine with an output of 342 kW (465 hp) and producing a top speed of 55 km/h. The P-40 had a crew of 6 and a total weight of 35 tons, the radar being powered by a gas turbine running 400 Hz generator. The radar uses an open frame truncated parabolic antenna with a stacked antenna feed. The radar antenna is mounted on the truck used to transport it giving excellent mobility, the radar capable of being folded for stowage during transit. Azimuth was determined by mechanical scanning while the angle of the target is determined from within which beam of the antenna stack the target is detected, the radar does not carry a secondary antenna for IFF.

P-12 (Spoon Rest A) Russian Mobile Early Warning Radar

Tiers:

Variants:

- **Spoon Rest B (P-12):** Mast-mounted variant that operates at a lower VHF frequency than Spoon Rest A.
- **Spoon Rest D (P-18):** Mast-mounted variant with eight dipoles; operates in the VHF frequency range (150-170 MHz). Based on the Spoon Rest B. Characteristics include:

System

Alternative Designation: P-12; Spoon Rest A
Type: Mobile Early Warning Radar
Manufacturer: INA
Chassis: ZIL Trucks
Crew: INA
Band: 147-161 MHz
Maximum Range: 275 km
Vertical Beamwidth: 2.5 deg
Horizontal Beamwidth: 7-9 deg
Peak Power: 180-350 kW
Pulse Width: 4-6 microseconds
Pulse Repetition Frequency (PRF): 310-400 Hz

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

Spoon Rest is a Russian ground-based, early warning radar that later evolved into the Knife Rest** series. The very high frequency (VHF) radar is widely used with the Fan Song radar associated with the SA-2 Guideline surface-to-air missile (SAM) system. Spoon Rest A is the original version of the system and is mounted in two trailers. The system's generator is carried in

one of the trucks while the radar array and electronics cabinets are in the other. The large antenna is a six-dipole horizontal Yagi array mounted on top of a truck. The P-12 Yenisei was a development of the earlier P-10 radar, the P-12 being developed between 1954 and 1956. The P-12 was developed by the SKB Design Bureau, a division of State Plant No.197 named after V. I. Lenin who developed the previous P-10, the predecessor of the current Nizhny Novgorod Research Institute of Radio Engineering (NNIIRT). The Yenisei radar was accepted into service in 1956 following the successful completion of the radars test program. In 1958 a modernised variant of the P-12 passed the testing process and entered into service as the P-12M, the modernised radar featured the ability to shift the radar frequency within a range of 10 MHz. A further modernisation came in 1962 in the form of the P-12MP which featured improved reliability, reduced side lobe radiation and the ability to be paired with a centimeter band search radar, in 1970 the radar was provided with flicker equipment to improve immunity to anti-radiation missiles. The final variant of the P-12 was the P-12NP which was also produced as the P-12NA with a different transport chassis. The P-12NP compared with the previous P-12MP featured improved detection ranges and reliability as well as the ability to locate the control cabin up to 500 meters from the antenna to improve crew survivability as a result of attack on the radar. he main differences between the earlier P-10 and the P-12 included a new antenna feed system with lower side lobes, reduced to 4% of the main lobe. The P-12 also offered a greater frequency range and greater frequency agility, being able to retune to four pre-set frequencies automatically as well as automatic frequency fine tuning. Finally Yenisei had greater accuracy with improved detection range (250 km) and better protection against passive and active interference. In addition to frequency agility the P-12 was the first Russian radar system to use the coherent cancellation moving target indicator (MTI) method to eliminate ground clutter. The P-12 "Spoon Rest A" was mounted on two Zil trucks, though later with the P-12NP "Spoon Rest B" the radar antenna mast was mounted on a separate trailer cabin to allow for location away from the other components of the radar site, the P-12NA returned to a track based platform. The P-12 used a single antenna accomplishing both transmission and reception, the antenna was composed of twelve Yagi antenna mounted in sets of six with one set above the other. Azimuth was scanned mechanically by the antenna with a rotation of 10 r.p.m, elevation was determined using a Goniometer by comparing the phase comparison between the upper and lower antenna sets, in similar fashion to the original P-3 but since this reduced range it was rarely used. The P-12 used two indicators, a plan position indicator in addition to an E-scope to indicate height, the P-12 could integrate track information from an additional radar with both sets of information appearing on the plan position indicator A secondary radar for IFF was generally used in conjunction with the P-12 such as the NRZ-12 (NATO "Score Board")

HF 200 British Height Finding Radar

Tiers:

1 2 **3** 4

System

Alternative Designation: HF 200

Type: Height Finder Radar

Crew: INA

Frequency: A frequency in the range 2,800 - 3,010 MHz (E/F band).

Class of Equipment: Long range, medium power, fixed, nodding height finder operating in the E/F band.

Purpose of Equipment: a. Main Role. Height finding on aircraft at long, medium or short range in the UK and overseas. b. Subsidiary Role. Provision of limited volumetric cover in place of an inoperative main search radar.

Coverage: a. Azimuth. 0o to 360o by slewing at a maximum rate of 6 rev/min. b. Elevation. (1) -3o to +33o at 20 scans/minute to a range of 50 nm. (2) -3o to +18o at about 44 scans/minute from 50 to 100 nm range. (3) -3o to +9o at about 50 scans/minute from 100 to 150 nm range. (4) -3o to +6o at 56 scans/minute at a range of over 160 nm.

Coverage in Volumetric Role: a. Azimuth. Equivalent to 1.5 rev/mm over sector up to 45o b. Elevation. -3o to +6o.

Range Performance: About 120 nm on a 2 square metre target, 180 nm on a 10 square metre target and 210 nm on a 15 square metre target with 90% probability of paint, at 40,000 feet.

Discrimination: 1 nm at 150 nm in range, 12,000 ft at 150 nm in elevation.

Aerial Characteristics: a. Polarization. Vertical or circular. b. Beam Shape. (1) Horizontal beam width 3o at 3 dB points. (2) Vertical beam width 0.75o at 3 dB points.

Aerial Reflector: Double curvature, 35 ft high by 8 ft wide.

Aerial Feed: Horn wave guide.

Transmitter: a. Type. Magnetron. b. Pulse Width. 5 uS c. PRF. 200-250 pps. d. Peak Power Output. 2.5 MW.

Receiver: Two output channels: linear and logarithmic.

Signal Processing: Vertical or circular polarization, fast time constant (FTC) and swept gain. Instantaneous automatic gain control (IAGC) on logarithmic channel.

Accuracy: ± 1,000 ft at 150 nm, but about ±500 ft for relative heights at the same range.

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Notes:

A Decca HF 200 height finder at RAF Boulmer with the RX12874 Passive Detection aerial and the redundant Type 80 modulator building in the background on the extreme left. The height finding element of the Linesman system, the HF 200 succeeded the American AN/FPS-6 height finder radars used in the Rotor system. The HF 200's (along with the AN/FPS-6) were also known as "Nodding Horrors" and they spewed hydraulic oil everywhere. HF 200 Mk3's were located at the three main linesman sites at R.A.F. Boulmer, R.A.F. Staxton Wold and R.A.F. Neatishead. A Mk4 was commisioned at R.A.F Saxa Vord in the Shetland Islands in 1979 and there was a Mk2 at R.A.F. Troodos, Cyprus. Dave Quantrill tells me that the Troodos Mk2 featured a valve console among other things and that it was a horrible thing! Note the barbed wire in the picture; for many years Linesman sites were protected only by a wire mesh perimeter fence but in the mid '70's the Ministry of Defence must have bought a job lot of barbed wire cheap from someone because they put it up everywhere! Interestingly enough no one seems to have considered what could be done about air strikes, mortars and rocket propelled grenades - the site was totally undefended from aerial attack and the perimeter fences were not patrolled! Once upon a time all of the antennas at R.A.F. Boulmer were painted in a pale blue shade, quite pretty really, and it has been suggested that this was to satisfy the whims of the then Duke of Northumberland who happened to own the land on which the operations site stood, or so the story went. Eventually though someone thought they really should be camouflaged so they were painted in a shade that in Scotland might be called "Sharnie Green"!

SBR-3 (IRL 136) Russian Man-Portable Short-Range Ground-Surveillance Radar

Tiers:

Variants:

- **IRL-136/SBR-3 Fara:** Russian-built version.
- **SSBR-3 Fara:** Version built by Kintex of Bulgaria.

System

Alternative Designation: SBR-3 Fara; IRL 136

Type: Man-Portable Short-Range Ground-Surveillance Radar

Crew: ea1

Manufacturer: Strela Research Institute, Russia (design) Rosvoorouzhenie (IRL-136) (Russian state export company), Russia Kintex, Bulgaria (under license as the Kintex Fara SSBR-3)

Band: J (10-20 GHz)

Emitted Power: 5 W

Power Consumption: 50 W

Coverage Area: 6 sq km

Detection Range, Personnel: 2 km

Detection Range, Vehicles: 4 km

Moving Target Velocity Range: 0.55 to 13.9 m/sec

Resolution Azimuth: 00-67 mils

Resolution Range: 100 m

Mean Time Between Failure (MTBF): 1,000 hours

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: kg18.3 kg

Note: can be packaged in a backpack, and is capable of being carried by one soldier.

Notes:

The IRL 136, also known as the SBR-3, is a short-range, ground-surveillance, man portable-Doppler radar used to track moving targets including vehicles and personnel. The system consists of a power and control unit; flat-array antenna/transmitter, which can be remoted from the former during operations; battery pack; a scanning device; headphones; support cabling; and associated mounting frames and devices. The total system, which weighs about 40 lbs (18.3 kg), can be packaged in a backpack, and is capable of being carried by one soldier.

SNAR10 Russian Battlefield Surveillance Radar

Tiers:

Variants:

- **SNAR-10M:** This updated vehicle replaces the BIG FRED radar with a Kredo-1E radar, for a ground vehicle detection range of 40 km. It also has digital display and communications.
- **SNAR-10M1:** Designed for reconnaissance of moving ground, air and surface targets. The radar can detect vehicles, soldiers, and exploding shells at a range of 200m – 40km.

System

Alternative Designations: Big Fred, 1RL232, 1RL232-1, Leopard
Crew: ea5
Platform: MT-LBu

Dimensions

Combat Weight: mT12.6
Chassis Length Overall: m7.62
Height Overall: m2.72
Width Overall: m2.85

Automotive Performance

Engine Type: YaMZ-238, 240 hp diesel
Cruising Range: km500
Max Road Speed: km/h60
Max Off-Road Speed: km/h26

Cross-Country Speed: INA

Max Swim Speed: Cannot swim due to the weight of the antenna

Fording Depths: INA

Sensors/Components

Antenna Type: Parabolic

Operating Band: K (34.55 to 35.25 GHz)

Detection Range Against Moving Vehicles, Without MTI (km): 16.0

Detection Range Against Moving Ships, Without MTI (km): 30.0

Detection Range Against Moving Shell Impact, Without MTI (km): 10.0

Detection Range Against Moving Vehicles, With MTI (km):: 10.0

Emplacement Time (minutes): 5.0

Displacement Time (minutes): 5.0

Armament

↳***PKT***

Caliber/Length: 7.62-mm

Type: Machine gun

Mount Type: Coaxial

Direct Fire Range: m1300

Max Effective Range Day: 1000m / 400-500m on the move

Max Effective Range Night: m800

Fire on Move: Yes

Rate of Fire: 600rpm cyclic in 2-10 round bursts

Protection

Armor Turret Front (mm): 20

Armor Turret Top (mm): INA

Armor Hull (mm): 15

NBC Protection System: Yes

Smoke Equipment: No

Notes:

The primary mission of the Big Fred radar is to detect and track both moving ground and water surface targets. Additionally, the radar can be used to provide friendly fire correction data to artillery units. The Snar 10 is not capable of amphibious operations (unlike other members of the MT-LBu family) due to the heavy turret. The vehicles are also equipped with a NBC filtration and over-pressure system.

PSNR-8 Kredo-M1 Russian Portable Ground Surveillance Radar System

Tiers:

System

Alternative Designation: PSNR-8 Kredo-M1
Type: Portable Ground Surveillance Radar System
In Service: 2002-Present
Family: INA
Crew: ea2-3
Operating Frequency Range: 2 cm (J)
Range, Scan Zone: 200 meters to 32 km
Azimuth, Scan Zone: from 12° to 180° with an adjustment discrete of 12°
Maximum Elevation, Scan Zone: deg+18
Minimum Elevation, Scan Zone: deg-18
Detection Range, Person: km7-8
Detection Range, Tank: km16
Detection Range, Truck: km32
Detection Range, 155mm Shell Explosion: km5
Power Consumption: w110
Continuous Operating Time: hours24
Median Errors in Determining the Coordinates for Range: m25
Median Errors in Determining the coordinates for Direction: 00–05 m (0.3°)

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: kg51

Notes:

The PSNR-8 Kredo-M1 portable ground surveillance radar system was adopted by the Russian Armed Forces only in 2002. The PSNR-8 Kredo-M1 portable ground surveillance radar system is designed to detect moving targets on the ground or water and to support artillery fire at any time of the day regardless of the season, and also in conditions of low visibility (fog, rain, snow, dust, or smoke)

702D Chinese Artillery Meteorological Radar Vehicle

Tiers:

System

Alternative Designation: 702D

Type: Artillery Meteorological Radar Vehicle

Crew: INA

Chassis: The shelter of the 702D Meteorological Radar can be mounted on a 4X4 North-Benz 2629 truck chassis.

702D Package Includes: Antenna assembly - Elevating ball guide screw mechanism - Main control console - Terminal computer system - Communication system - Power distribution box - Air conditioning unit

Detection Range: 200 km

Altitude Range: 25 km

Tracking Accuracy Angle: 0.1 deg

Tracking Accuracy Range: 15 m

Onboard Equipment: Circular antenna, Elevating ball guide screw mechanism, Main control console, Terminal computer system, Communication system, Power distribution box, Air conditioning unit

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Automotive

Engine Name: Deutz 1013/1015

Engineer Type: Diesel

Engine Power: 220~480hp

Maximum Speed: 85 km/h

Maximum Range: 800 km

Fuel Capacity: INA

Protection

Hull Armor: INA
Applique Armor: INA
Explosive Reactive Armor: No
Active Protection System: No
Mine Clearing: No
NBC Protection: INA
Smoke Equipment: No

Notes:

The 702D meteorological radar station consists of two truck shelters, the meteorological radar shelter and the meteorological support shelter. These two shelters are mounted on a 4x4 truck chassis. The systems is used by the Type 90B 122mm MLRS but can be also used by other artillery weapons.

RAC 3D (Flamingo) Danish Mobile 3D Short-Range Radar

Tiers:

System

Alternative Designation: RAC 3D Radar

Type: Mobile 3D Short-Range Radar

Manufacturer: Thales Raytheon Systems

Crew: INA

Coordination: The defense of strategic sites, as well as the protection troops on the move requires a multi-layered air defense. Associated with its integrated Command and Control (C2), the RAC 3D operates as a multi-mission system fully interoperable with higher levels of command such as national air defense or allied networks. The RAC 3D system activates weapon control orders and provides target-weapon pairing to co-ordinate any mix of MSAM, SHORADS and VSHORADS. The RAC 3D is also used as a gap-filler system for low altitude air defense.

Efficiency: Currently in production, the RAC 3D equips Armies and Air Forces in a number of European countries. More than 50 systems are already fielded, and the RAC 3D has successfully participated in extensive NATO trials.

Details: The RAC-3D is intended as a gap-filling and warning radar for air defense units. It is optimized for detecting low observable targets. To maximize low altitude capabilities, the radar is attached to a 13 m hydraulic mast, giving it a good capability against medium to very low-altitude targets. It can be unattended, as well as operated as either a stand-alone or networked with other radars.

Frequency: 4-8 GHz (G/H Band (NATO), C Band (IEEE))

Power Output: INA

PRF: Hz

Range Accuracy: 20 m (range), 0.4 degrees azimuth

Emplacement Time: 15 minutes

Displacement Time: 15 minutes

Instrumental Range: 100 km

Ceiling: 30,000 feet

Elevation Coverage: > 45°

Accuracy on Combat Aircraft, Range: 20 m/150m

Accuracy on Combat Aircraft, Azimuth: 0.4°/4°

Accuracy on Combat Aircraft, Elevation: 0.5°

IFF: Yes

Dimensions

Length: m6

Width: m6

Mast Height: m13

Weight, Combat: INA

Automotive

Note: There is no available information on what type of chassis the RAC 3D radar is stationed on.

Notes:

The RAC 3D is a three dimensional, multi-mode, radar for the co-ordination of medium-range, short-range and very-short range air defense weapon systems. It provides a 3D air picture up to 100 km. Highly mobile and optimized for detecting low observable targets, the RAC 3D is capable of operating under the most severe weather, jamming and propagation conditions. The RAC 3D detects and classifies modern threats, including medium to very low-altitude hovering helicopters. The RAC alert and co-ordination 3-D radar operates in the G/H-Band which offers, within a 100 km range envelope, the best trade-off between atmospheric attenuation, transmitting power resolution and antenna size versus detection of small targets, such as those flying at very low Altitude in heavy clutter. RAC 3D employs a state-of-the-art planar phased-array and a digital pulse compression. Tree types of the RAC radar station are in service: *A two-shelter radar station in order to separate the radar from the combat control system for alerting the surface-to-air missiles “Stinger”, in service with the Danish Army. *A compact radar station named “Flamingo” with the radar itself and the combat control system housed on a single shelter, is being supplied to the Austrian Army for surface-to-air missile “Mistral” alerting. *The Austrian Air Force has acquired RAC 3D compact radars as gap fillers. The RAC 3D alert and co-ordinating radar accomplishes the following tasks: *warning and control for anti-aircraft guns and missiles over a range of 80 km *detection and target identification *air situation analysis *Alerting of up to 12 “Mistral” or AAA units The RAC 3D gap filler radars accomplishes the following tasks: *Warning and control over a range of 100 km *Detection and target identification *Equipped with a computer and communications links two workstations interfaces with the country's air defence systems.

MSTAR (AN/PPS-5C) British Man-portable Surveillance and Target Acquisition Radar

Tiers:

System

Alternate Designation(s): MSTAR is used by the US Army as AN/PPS-5C and by the Australian Army as AMSTAR.

Type: Man-portable Surveillance and Target Acquisition Radar (MSTAR) is a lightweight all-weather battlefield Doppler radar

Manufacturer: MSTAR was developed and produced in UK in the mid 1980s by Thorn EMI Electronics (now part of Thales) and selected by competitive tender. MSTAR is now licensed and manufactured by DRS Technologies.

Purpose: It is usually used by artillery observers to acquire and engage targets in bad visibility or at night. It is capable of detecting, recognizing and tracking helicopters, slow moving fixed-wing aircraft, tracked and wheeled vehicles and troops, as well as observing and adjusting the fall of shot.

Frequency: J Band

Display: The radar display is an electro-luminescent screen that can be overlaid with a map grid. It also shows the areas of ground visible to the radar and those that are masked by terrain.

Target Location: arget location can be presented as either map coordinates or bearing and distance (polar coordinates) from the radar.

Target Detection Range: It can detect targets out to 30 kilometres (19 mi), with a maximum range of 42 kilometres (26 mi).

Emplacement: under three minutes.

Displacement: under three minutes.

Target Location Accuracy, Tange: ±10 m

Target Location Accuracy, Azimuth: ± 5 mils

Radar Controls and Interface: 12.1 inch SVGA flat-panel display, 800 x 600 pixel resolution, PentiumTMclass processor, 20 GB mass storage, 256 MB RAM, AGP high speed video graphics, MIL connector panel, full QWERTY keyboard, internal 3.5 inch FDD, internal PCMCIA interface, communication ports include parallel, RS-422, RS-232, Ethernet and USB, XML 2.0 ICD compliant/ USAF certified.

Note: The radar head (antenna and electronics) are connected by remoting cable to the display. The rotating head can be mounted on either a tripod on the ground or an elevated mast, the latter fitted to the Warrior Artillery Observation Post vehicle (FV514), or the Coyote Reconnaissance Vehicle. When fitted to the mast power is taken from the vehicle supply and the display is inside the vehicle.

Dimensions

Length: INA

Width: INA

Height: INA
Aerial head Assembly Weight: 9.6 kg
Main Electronics Assembly Weight: 13.0 kg
Radar Control and Display Unit Weight: 7.4 kg
Tripod Kit Weight: 4.8 kg
Ancillary Equipment Weight: 3.9 kg
Total Weight: 30 kg

Notes:

Man-portable Surveillance and Target Acquisition Radar (MSTAR) is a lightweight all-weather battlefield Doppler radar operating in the J band. It is usually used by artillery observers to acquire and engage targets in bad visibility or at night. It is capable of detecting, recognizing and tracking helicopters, slow moving fixed-wing aircraft, tracked and wheeled vehicles and troops, as well as observing and adjusting the fall of shot. The radar display is an electro-luminescent screen that can be overlaid with a map grid. It also shows the areas of ground visible to the radar and those that are masked by terrain. Target location can be presented as either map coordinates or bearing and distance (polar coordinates) from the radar. The complete radar weighs 30 kilograms (66 lb) It can detect targets out to 30 kilometres (19 mi), with a maximum range of 42 kilometres (26 mi). The radar head (antenna and electronics) are connected by remoting cable to the display. The rotating head can be mounted on either a tripod on the ground or an elevated mast, the latter fitted to the Warrior Artillery Observation Post vehicle (FV514), or the Coyote Reconnaissance Vehicle. When fitted to the mast power is taken from the vehicle supply and the display is inside the vehicle. For dismounted use the radar uses standard military rechargeable dry batteries and is man-carried in three loads. The radar can be set up in under three minutes. The requirement for MSTAR was developed in the early 1980s by the UK Ministry of Defence as a replacement for Radar GS No 14 (ZB298) that had entered service some 10 years earlier. The primary users of MSTAR, like its predecessor, were and are artillery observation parties, although it may be used by other reconnaissance and surveillance elements as required. MSTAR was developed and produced in UK in the mid 1980s by Thorn EMI Electronics (now part of Thales) and selected by competitive tender. MSTAR entered UK service in early 1991, slightly accelerated for use in the Gulf War. Its official UK designation is Radar, GS, No 22. In about 2005 MSTAR underwent an upgrading programme. MSTAR is used by the US Army as AN/PPS-5C and by the Australian Army as AMSTAR.[1] It is also used for border patrols, airports, coastal patrols, and high security areas. The Canadian Forces use the MSTAR on their Coyote Reconnaissance Vehicles. MSTAR is now licensed and manufactured by DRS Technologies.

9S15 Billboard (9S15M Obzor 3) Russian 3D Surveillance Radar System

Tiers:

9S15 BILL BOARD Surveillance Radar system

↳Radar

Name: 9S15 BILL BOARD Surveillance Radar system
Type: Phased-Array Surveillance Radar system
Traverse Range: deg360
Traverse Left: deg360
Traverse Right: deg360
Crew: ea4
Detection Range: km330
Aircraft Detection: At a range of 240 km aircraft are detected with a chance of 50%
Ballistic Missile Detection: It detects ballistic missiles at a range of about 150 km
Antenna Rotating Speed: sec6-12
Target Detection: up to 200 targets
Target Coverage Elevation: 0-55º in Elevation
Target Coverage Range: 10-250 km
Target Coverage Accuracy: 30-35 min of arc in azimuth and 250 m in range
Waveband: Centimetric
Scan Cycle: 6-8 seconds depending on operational mode
Reciever Sensitivity: 10-13 Watts
Note: This radar provides a highly mobile 3D search and acquisition capability, but is limited in low level coverage footprint by its antenna elevation. Its limited scan rate makes it unusable for high performance IRBM acquisition and tracking, which is the primary role of the 9S19 High Screen radar

Notes:

The fully mobile 9S15/9S15M Obzor 3 / Bill Board acquisition radar is a mechanically rotated 3D radar system, with electronic beam steering in elevation and an IFF array. It provides long range early warning of aerial threats and low end TBMs such as the Scud A and Lance for the S-300V/VM / SA-12/23 Giant/Gladiator SAM systems. There are a number of configurations,

associated with specific block upgrades to the S-300V / SA-12 series system, including a variant specific to the S-300VM / SA-23 system, the 9S15MV/MVZ The 9S15 has two basic modes of operation. The first is optimised for a 12 second sweep and is claimed to provide a 50% probability of detecting a fighter sized target at 130 nautical miles. The second mode employs a faster 6 second sweep period, and is used to detect inbound TBMs and aircraft, with a reduced detection range of about 80 nautical miles for fighters, and 50 to 60 nautical miles for TBMs like the Scud A or Lance. Cited range against aerial targets for the improved Bill Board B is in excess of 170 nautical miles for fighters.

Kasta 2E2 Russian 6x6 Low-Altitude All-Around 3-D Surveillance Radar System

Tiers:

System

Alternate Designation: Flat Face, 39N6E,
Waveband: Decimetric
Range: 5km to 150km
Azimuth: 360 degrees
Altitude: Up to 6km
Elevation: 25 degrees
Number of targets system can track: At least 50
Data update rate: 5 and 10 seconds
Clutter rejection factor: 54 dB
MTBF (Mean Time Between Failures): At lease 700 hours
Mean recovery time: Up to 0.3 hours
Time of continuous operation: At least 20 days
Emplacement / deplacement time: Up to 20 minutes
Power consumption: up to 23 kW
Crew: 2
System Composition: 3 trucks: Antenna truck, compost truck, and power plant truck

↳Measurement Accuracy

Range: 100m
Azimuth: 40 degree minimum arc
Altitude: 900m
Speed: 20m/s

↳Resolution

Range: 300m

Azimuth: 5.5 degrees

Dimensions (Chassis: KamAZ 5350)

Length: 7.85

Width: 2.5

Height: 3.29

Weight, Combat: tons9.2

Maximum Load: tons6

Automotive Dimensions (Chassis: KamAZ 5350)

Engine Name: KamAZ-740.13-260 Diesel

Engine Type: Diesel

Engine Power: hp260

Cruising Range: km1,000

Speed, Maximum Road: km/h100

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %40

Vertical Step: m0.6

Trench: m0.6

Fording Depth: m1.75

Notes:

The Kasta-2E2 3D surveillance radar is designed to conduct air surveillance, find range, azimuth, altitude, and track air targets like airplanes, helicopters, unmanned aerial vehicles, and cruise missiles, including low- and extremely low-level and stealthy air targets, in a heavy clutter environment. The Kasta-2E2 low-altitude 3D all-round surveillance radar is designed to control airspace and to perform automatic detection, range/azimuth/altitude measurements and flight path characteristics of fixed-wing and rotary-wing aircraft, unmanned aerial vehicles and cruise missiles, including low-flying, terrain-hugging and stealth ones, in conditions of intensive clutter reflections from a background surface, local objects and weather formations. The Kasta-2E2 mobile automated solid-state low-altitude radar can be integrated into various military and civil-purpose systems used for air defence, coast and border control, air traffic control and air operations control in aerodrome zones. The radar features modular design with a solid-state emitter, digital data processing and automated operation, built-in functional testing system, a 14-m antenna tower to detect very low-flying air targets, high degree of immunity to interference from neighboring electronic assets when operating in close formations (protection rate – up to 50 dB). The Kasta-2E2 radar comprises a hardware vehicle, an antenna vehicle, a diesel-electric power plant mounted on all-terrain wheeled chassis; two single-axle trailers carrying auxiliary equipment; a remote workstation enabling radar control from a distance of up to 300 m. The radar can detect small-size targets, including low-speed ones, at great distances. It is a jam-immune, reliable, easy and safe to operate and maintain asset that can be shipped by various transportation means. At customer request, a containerized radar variant can be supplied to operate with its antenna mounted on an Unzha-type mast.The radar features long detection ranges for small-sized low-level targets, including low-speed ones, and good jamming immunity. It is economic, reliable, operationally safe, and easy in maintenance. It can be carried by various means of transportation. Ref: http://defensetechs.com/wp-

P-15 Tropa (FLAT FACE) Russian 2D UHF Radar System

Tiers:

FLAT FACE (P-15) Radar

↳*System*

Name: FLAT FACE (P-15) Radar
Alternative Designation: The P-15 "Tropa" (Russian: "Тропа"; English: "trail") or 1RL13 (also referred to by the NATO reporting name "Flat Face A" i
Function: Surveillance/Target Acquisition
Proliferation: The P-15 was operated by the Soviet Union from 1955. It has since become obsolete, but it was passed down to successor states after the fall of the Soviet Union. It has been largely superseded by its successor the P-19. North Korea may still have some of these in their inventory.
Vehicle Mount: Long-range surveillance and target acquisition is handled by the van-mounted P-15 FLAT FACE) radar.
Range: 200-250 km
Frequency: UHF, C band (UHF)
Associated Weapon System: SA_3 GOA possibly SA-8 GECKO SAM, LOW BLOW missile control radar
Number of Missiles: Can guide three missiles simultaneosly
Power: 380kw
PRF: 200-700pps
Parabolic Reflectors: Two eliptical parabolic reflectors measuring 11x5.5 m. Reflectors arranged one above the other on van roof.
Precision: 0.3 km range
Note #1: The P-15 radar has been replaced in many S-125 units by the P-15M SQUAT EYE radar.
Note #2: Target data generated by these tracking radars is passed to the battalion's LOW BLOW trailer-mounted fire control radar.

Notes:

The P-15 is a high mobility radar. With the antenna mounted directly on the single truck (Zil-157) used for transport, the system could be deployed and taken down in no more than 10 minutes. The P-15 uses two open frame elliptical parabolic antenna accomplishing both transmission and reception, each antenna being fed by a single antenna feed. The radar can rapidly shift its frequency to one of four preset frequencies to avoid active interference, with passive interference being removed by a coherent doppler filter. Azimuth was determined by mechanical scanning with an associated accompanying PRV-11 (NATO reporting

name "Side Net") used to determine elevation. A secondary radar for IFF is generally used in conjunction with the P-15, generally the 1L22 "Parol".

RASIT French 6x6 Ground-Surveillance Pulse Doppler Radar Vehicle

Tiers:

1 2 **3** 4

System

Alternative Designation : RASIT 3190B; RACIT E; DRPT-5; Basir 110D (Iran)

Description: Ground Surveillance Radar (GSR) can be operated by a crew of 1 or 2; entire system breaks down to 3 90-kg sections; vehicle or tripod- mounted

Crew : ea2 (operator & assistant operator); more for vehicle

↳*Dimensions*

Remote Operation: Console 300 m from dish

Remote user transmission: Standard interface; RASIT E can be integrated with battle management system using TCP/IP interface

Target acquisition: Automatically detects, tracks, & identifies all targets

Tone Signal: Yes

TV Monitor: Polar & Universal Transverse Mercator (UTM) coordinates

Performance

Countermeasure Resistance: ECCM & LPI capable

Resolution: +/- 10 m range; +/- 0.6 in azimuth

Surveillance Range (Personnel): km22.0

Surveillance Range (Vehicles): km35.0

Surveillance Range (Aircraft): km34.0

Tracking Speed: 103 km/hr

Transceiver

Accuracy: 90% probability of detection

Compatibility: With IFF systems & ECCM capabilities

Name: Transceiver

Polarization: Linear & circular

Power : W3000 (consumption); 150 (Output)

Signal: I-Band (8.00 10.00 GHz)

Width of radiation pattern lobe : deg-11 to 240

Notes:

RASIT (RAdar de Surveillance des InTervalles) is a ground-surveillance pulse doppler radar developed by Thomson-CSF (now Thales),[1] and fielded by several militaries. The original version of RASIT had a range of 20 kilometers and allowed a skilled operator to distinguish between personnel, vehicles, and aircraft.[2] RASIT operates in the I band and has a peak power of two kilowatts. The system is deployed on vehicles (although it can be removed from its mount and emplaced on the ground) and has been used by at least 32 nations.[3] The latest version of RASIT, the RASIT-E, has a range of 40 kilometers. RASIT was developed in the mid-1970s and over 700 units had been sold by 1996. The latest RASIT customer is Estonia, where the radar is used for border surveillance.

Watchman British Mobile Medium-Range Surveillance Radar

Tiers:

1 2 **3** 4

System

Alternative Designation: Watchman
Type: Mobile Medium-Range Surveillance Radar
Crew: INA
Band: S-Band
Frequency: 2,750 … 3,050 MHz
Pulse Repetition Frequency (PRF): ≈ 1,100 Hz (9-fold staggered)
Pulse Width: 0.4 and 20 µs
Peak Power: 58 kW
Average Power: 1.3 kW
Instrumental Range: 80 NM
Range Resolution: 60 m (190 ft)
Accuracy: INA
Antenna Rotation: 4 Seconds (15 rpm)

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA
Antenna Mast: INA

Notes:

The Watchman family of S-Band medium-range radars is designed to provide terminal area/approach surveillance and ground controlled approach surveillance developed by Plessey Radar Ltd during the 1970s. The radar can be configured from a number of modules which enables users to match precisely equipments to operational needs. Options include transportable or static aluminium or carbon-fibre antennas; adaptive or eight-filter Moving Target Detector (MTD) signal processing and plot or track outputs. The Traveling-wave tube- based transmitter provides frequency diversity and frequency agility and enables a single radar to provide a variety of detection ranges out to a maximum of 222 km. The transmitter is available in a single tube format

or with multi-tubes which accommodates the “graceful degradation” often required by the operator. A dual pulse train is used; it has a very short pulse (0.4 microseconds) for high discrimination at short ranges and a much longer pulse (20 microseconds) for long-range detection of aircraft with small radar cross-sections. The long pulse is compressed in the receiver using a surface acoustic wave equalizer. The basic compressed pulse length is 0.4 μs, giving a 60 m range cell too. The signal separation is achieved by using different radio frequencies for the long and short pulses. Target detection is further enhanced by interchanging frequencies at nine pulse repetition intervals. A recent variant of Watchman (S) uses Solid-state transmitter. There are any upgrades to a new digital receiver design with intelligent tracking routines. CFAR circuit and high definition clutter map clutter map using a process of alpha smoothing (1/8 of current clutter amplitude plus 7/8 of previous sweep clutter amplitude) compensate the influence of noise and clutter by raising the detection thresholds. The Watchman surveillance radar system provides Air Traffic Services for the vast majority of the UK Ministry of Defence operational stations in the UK and worldwide. There are currently 40 systems in service worldwide. The Tactical variant (mobile equipment) of the Watchman system allows the rapid deployment and installation of Air Traffic Services in locations where British forces are on operational duty.

59N6E Protivnik-GE Russian Towed 3D Mobile Surveillance Radar

Tiers:

System

Alternative Designation: 59N6E Protivnik-GE
Type: 3D Mobile Surveillance Radar
Crew: INA
Frequency: D-Band (former L-Band)
Pulse Width: ca. 64 µs (Pulse compression)
Detection Range: The 59N6E Protivnik-GE is a 3D mobile surveillance radar developed by Almaz Antey Concern to detect a wide array of airborne targets at a distance between 10 kilometers and 400 kilometers flying at altitudes of up to 200 kilometers.
Digital Phased Array Antenna: Yes
Digital Signal Processing System: Yes
Detection Speed: The Protivnik-GE radar can detect targets flying at speeds between 60 and 8,000 kilometers per hour
Number of Targets: up to 150 airborne targets simultaneously.
Hits Per Scan: 1 to 3
Antenna Rotation: 5 and 10 seconds

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

The 59N6E Protivnik-GE is a 3D mobile surveillance radar developed by Almaz Antey Concern to detect a wide array of airborne targets at a distance between 10 kilometers and 400 kilometers flying at altitudes of up to 200 kilometers. The radar system features a digital phased array antenna and digital signal processing system with the ability to perform target identification while providing the critical information to air defense systems as well as automated command and control (C2). The Protivnik-GE radar can detect targets flying at speeds between 60 and 8,000 kilometers per hour while tracking up to 150 airborne targets simultaneously. This radar system has been deployed within the Russian Armed Forces and was supplied to Egypt in 2017.

48Ya6-K1 Podlet K1 Russian Mobile Long-Range High-Altitude Surveillance Radar

Tiers:

System

Alternative Designation: 48Ya6-K1 Podlet K1
Type: Mobile Long-Range High-Altitude Surveillance Radar
Mission: The Podlet K1 was designed to detect hostile targets flying at low-altitude, provide early warning and support Russian advanced air-defense systems, such as the S-400.
Crew: INA
Chassis: INA
Frequency: S-Band
Maximum Range: 200-300 km depending on the operation mode
Passive Electronically Steered Array (PESA) Antenna: Yes

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

The Radar 48Ya6-K1 “Podlet K1” (Cyrillic: 48Я6-К1 «Подлет-К1»; translated: “Approach”) is a mobile three-coordinate S-Band radar of low-altitude, a circular scan of a combat mode and inter-service application. It uses a phased-array antenna (the upper big array) for detecting and tracking of low-altitude aims. The lower two back-to-back arrays are secondary radar, the thinner array for international standard (SIF Mark XII), the larger for the national Russian IFF. The narrow antenna next to the big array is a compensation antenna for protection against jamming.

Credo-1E Russian Unified Moving Target Locating Radar

Tiers:

Variants:

- **Kredo-1S:** Ground recon vehicle with Kredo-1E radar/EO sensor pod on telescoping arm on amphibious BAZ-5921 chassis
- **TBD:** Same telescoping arm as the Kredo-1S, but on the BTR-based UNSh/K1Sh1 chassis
- **SNAR-10M:** Russian upgrade for the SNAR-10 artillery battlefield surveillance radar vehicle (replaces BIG FRED radar with the Kredo-1E)

System

Alternative designations: RP-200, IRL-133-3, Kredo-1, Credo-1, Credo-1E, & PSNR-8
Description: Ground Surveillance Radar (GSR) can be operated by a crew of 2 or 3; vehicle pintle or mast-mounted or tripodmounted
Crew: ea2/3 (operator; assistants); more for vehicle
Combat weight: kg48 (up to 97 with battery & display)
Radio: INA
Protection: N/A

Equipment

Name: Kredo-1E
Console: INA
Radar: Motor-driven for azimuth adjustment
Azimuth coverage (°): 360; 180 in scan sector; 18 in elevation
Antenna type: Slotted wave guide

Performance

Surveillance range: km40 (detection); 30 (tracking); 40 (tanks); 20-40 (light vehicles & trucks); 35 (helicopters); 30 (large aircraft); 12 (ships); 15 (personnel); 15 (shell burst-155-mm); 0.2 (minimum)
Tracking speed: 3-72 km/h4
Resolution: 50 m range; 1.8° in azimuth
Countermeasure resistance: INA

Transceiver specifications: Multi-mode master oscillator & klystron
Signal: Coherent pulse Doppler J-band (10.00 -19.00 GHz, US Ku band)
Power: w250 (Consumption)
Mode: Mono-pulse digital processing
Width of radiation pattern lobe: INA
Accuracy: 10 m in range); 0.12° in azimuth)
Emplacement time: 5 minutes
Polarization: INA
Compatibility: Can be used as the base for an integrated digital sensor suite or fused to process data from other sensors
Remote Operation: 25-200 m away from dish
Target acquisition: Automatically detects, tracks, & identifies targets & reads coordinates
TV Monitor: INA
Display: Displays acquisitions on digital map display with various display colors
Tone Signal: INA
Remote user transmission: Transmit data digitally over network via standard interface

Notes:

The Credo-1E unified moving ground target locating radar is designed to detect moving ground, surface and low-flying targets (man, group of people, vehicles) and to support artillery fire round-the-clock, in any season, and under zero visibility conditions (fog, smoke, and dust). It can be used as a standalone surveillance asset (with its transceiver and antenna control unit mounted on a tripod) or as part of a variety of artillery reconnaissance and mobile observation posts (on telescopic masts). The radar has standard interfaces allowing real-time transmission of target coordinates to the user, as well as remote radar control via communication links.

P-14 (Tall King A) Russian Mobile 2D VHF Early Warning Radar

Tiers:

Variants:

- **P-14MA/5H84AMA:** ground-based long-range VHF surveillance radar P-180U is offered as the modernized follow-on to its prototype, the analogue P-14. Produced in LiTak-Tak

System

Alternate Designation: P-14; NATO: Tall King
Type: Mobile 2D VHF Early Warning Radar
Chassis: Ural 375D
Crew: INA
Frequency: VHF
RPM: 2-6 rpm
Maximum Range: 400 km
Maximum Altitude: 30,000 meters ; 65,000 meters high beam (98,000 feet; 200,000 feet)
Azimuth: 360 degrees
Elevation: 12/17 degrees
Precision: 1.2 km range, 1.2 degrees azimuth
Power: 900 kW

↳*Dimensions (Chassis: Ural 375D)*

Height, Overall : m2.68
Length, Overall : m7.36
Width, Overall : m2.67
Weight, Gross Vehicle: mt13.2
Antenna Diameter: 33 meters
Antenna Mast: INA

Automotive (Chassis: Ural 375D)

Engine Name: ZiL-375 Diesel

Engine Type: V8, 180 hp, Gasoline

Engine Power: hp180

Cooling System: Liquid

Fuel Capacity , Aux : liters60.0

Fuel Capacity, Main Tank: liters300.0

Maximum Road Speed: km/h75

Maximum Range: km750

Towing Capability, Off-Highway: kg5000.0

Towing Capability, Off-Highway: kg10000.0

Gradient: %65

Side Slope: %40

Vertical Step: m0.8

Trench: m0.7

Fording: m1.2

Notes:

The P-14 (also referred to by the NATO reporting name "Tall King") is a 2D VHF radar that was developed and operated by the Soviet Union. The design of the P-14 2D early warning radar started in 1955 by decree of the CPSU Central Committee. The P-14 being the first high power VHF radar to be developed by the Soviet Union, the radar was accepted into service in 1959 following the successful completion of the radars test program.[2] The P-14 was developed under the direction of V.I. Ovsyannikov by the SKB Design Bureau, a division of State Plant No.197 named after V.I.Lenin, the predecessor of the current Nizhny Novgorod Research Institute of Radio Engineering (NNIIRT). The development team was awarded the Lenin prize by the Soviet Union in 1960 for the development of the P-14 radar. The P-14 was exported and is occasionally still found in service, several companies have offered upgrade options for the system, including replacement of outdated components with modern systems, such as digital MTI, modern PC based signal processing/display and solid state components. The P-14 was superseded by the 55G6 "Nebo" VHF surveillance radar in 1982. The P-14 was produced in three variants: the 1RL113 "Lena" (Tall King A) and 44Zh6 "Furgon" (Tall King B) static versions and the 5N84A "Oborona-14" (Tall King C). A total of 731 1RL113 "Lena" were manufactured between 1959 and 1976, 24 of which were for export. The 1RL113 static site was contained in two building (radar and generator) with the control cabin (operated by a crew of five) situated up to one kilometer away, the 44ZH6 operated in a similar fashion but could be relocated more easily. The 5H84A mobile version featured a folding antenna and transported on six trailers taking over 24 hours to assemble, the radar's control trailer had a crew of six and could be located up to one kilometer from the radar. A secondary radar for IFF is generally used in conjunction with the P-14, either the NRS-12 or the later 1L22 "Parol". All of the P-14 variants were developed for the long-range detection and tracking of aerial targets and had similar performance characteristics between them.[4] All used a single antenna accomplishing both transmission and reception; the antenna was a large open-frame truncated parabolic antenna, the antenna included a heated de-icing system for extreme conditions. The radars ware capable of modulating their frequency around four preset frequencies to counteract active interference and used automatic coherent-compensation for passive interference; both systems able to suppress interference by up to 20 dB. In addition to jammer suppression the P-14 can use five auxiliary antennae for direction finding to locate the jammer. The P-14 can operate in four different modes: high beam with increased upper detection limit, low beam with increased range at low to medium altitudes and scan which alternates between high and low beam modes.

P-12 NP (Spoon Rest B) Russian Mobile Early Warning Radar

Tiers:

Variants:

- **Spoon Rest A (P-12):** The P-12 "Yenisei" (also referred to by the NATO reporting name "Spoon Rest A" in the west) was an early VHF developed and operated by the former Soviet Union.
- **Spoon Rest B (P-12):** Mast-mounted variant that operates at a lower VHF frequency than Spoon Rest A.
- **Spoon Rest D (P-18):** Mast-mounted variant with eight dipoles; operates in the VHF frequency range (150-170 MHz). Based on the Spoon Rest B. Characteristics include:

System

Alternative Designation: P-12 NP; Spoon Rest B
Type: Mobile Early Warning Radar
Manufacturer: INA
Chassis: ZIL Trucks
Crew: INA
Band: 150 - 170 MHz (lower VHF-Band)
Maximum Range: 275 km
Vertical Beamwidth: 2.5 deg
Horizontal Beamwidth: 7-9 deg
Peak Power: 160 to 250 kW
Pulse Width: 4-6 microseconds
Pulse Repetition Frequency (PRF): 310-400 Hz
Antenna Rotation: 6 ... 30 seconds (0 ... 10 rpm.)
Dead Time: 377 µs
Receive Time: 2.4 milliseconds

Dimensions

Length: INA
Width: INA
Height: INA

Weight, Combat: INA

Notes:

The former Soviet Union had considerable successes in the development of VHF- radar units. The assortment of VHF- radar units in the army and the air force sufficed of the P 8 over the P 12 up to the P 18 radar sets. One of them is the mobile variant NP, a version of the P 12 installed into two caravans. The radar unit also has an E-scope next to the plan position indicator (PPI). The elevation angle measures the goniometer (the green luminescent scale between the maintenance panels) by a phase comparison between the two echo signals received by the both antenna planes. The Goniometer produced a standing wave of the received RF impulses on two slip rings fed by the two antenna groups. An electrical engine alternately moves a measuring contact on the slip rings and simultaneous a variable resistor delivers the vertical deflecting voltage to the RHI-scope. The voltage difference of the slip rings reaches the value zero in a certain position. The mechanical angle of this position corresponds to the elevation angle of the target. With a nomogram on the screen the shown elevation angle could be converted to a height. But the method reduces, however, the maximum range of the radar unit. Therefore the crew usually switched off the Goniometer. The radar unit P 12 can be synchronized with other radar units and then the PPI-scope shows both received echos. If two stations working by the same frequency are in a favorable distance to each other, her maximum obtainable range can be increased by interference. The Goniometer produced a standing wave of the received RF impulses on two slip rings fed by the two antenna groups. An electrical engine alternately moves a measuring contact on the slip rings and simultaneous a variable resistor delivers the vertical deflecting voltage to the RHI-scope. The voltage difference of the slip rings reaches the value zero in a certain position. The mechanical angle of this position corresponds to the elevation angle of the target. With a nomogram on the screen the shown elevation angle could be converted to a height. But the method reduces, however, the maximum range of the radar unit. Therefore the crew usually switched off the Goniometer. The radar unit P 12 can be synchronized with other radar units and then the PPI-scope shows both received echos. If two stations working by the same frequency are in a favorable distance to each other, her maximum obtainable range can be increased by interference. The trailer-mounted P-12 NP (1RL 14 PIR) “Spoon Rest B” is a derivative of the truck-mounted P-12 MA “Spoon Rest A”. The later version P-12 NA is a truck-mounted version again.

P-15 (Flat Face A) Russian Mobile 2D UHF Radar

Tiers:

Variants:

- **Flat Face A (Russian P-15):** INA
- **Flat Face B (Russian P-19):** INA

System

Alternative Designation: P-15; NATO: Flat Face
Type: 2D UHF Radar
Manufacturer: INA
Chassis: ZIL-157
Crew: INA

Dimensions (Chassis: ZIL-157)

Length: 6.93 m
Width: 2.32 m
Height: 2.74 m
Weight, Empty: 5,540 kg
Antenna Width: 6.00 m
Antenna Height: 2.15 m

Radar System

Band: C (810-850 or 880-905 MHz)
Maximum Range: 250 km
Peak Power: 900 kW
Beam WIdth Azimuth: 10 deg
Beam Width Elevation: 5 deg
Accuracy Angular: 5 deg
Accuracy Range: 90 m

Pulse Width: 2-3 microseconds

Pulse Repetition Frequency: 200-800 Hz; 600-880 Hz

Automotive (Chassis: ZIL-157)

Engine Name: ZIL-157

Engine Type: Diesel

Engine Power: hp1041

Transmission: 5 speed X 2 range transfer case

Cruising Range: INA

Speed, Maximum Road: km/h40

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: INA

Side Slope: INA

Vertical Step: INA

Trench: INA

Fording Depth: INA

Protection

Armor: INA

Applique Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The P-15 "Tropa" (Russian: "Тропа"; English: "trail") or 1RL13 (also referred to by the NATO reporting name "Flat Face A" in the west) is a 2D UHF radar developed and operated by the former Soviet Union. In 1952 SRI-244 started development of what become the P-15 early warning radar; by 1955, the radar had passed state trials and was accepted into service with the anti-aircraft troops of the Soviet armed forces. The P-15 was designed to detect aircraft flying at low altitude and came to be associated with the S-125 "Neva" anti-aircraft system (NATO reporting name SA-3 "Goa"), though it was later replaced by the P-15M2 "Squat Eye" radar which mounted a single radar antenna on a 20-30 meter mast to improve coverage. In 1959, the modernised P-15M "trail" radar passed through the state test program, the modernisation replacing outdated mercury-based electronics. In 1962, another modernisation of the P-15 passed through trials as the P-15N, the radar being developed and produced by the Ulyanovsk Mechanical Plant. The P-15N introduced a more sensitive receiver, which improved the detection range and a new amplifier for the transmitter. Further improvements were made in 1970 when the P-15MN passed trials. The P-15MN included a pulse coherent Doppler filter (moving target indicator) to remove passive clutter (by up to 50 dB), the first such radar in the Soviet Union. Finally by 1974, the modernisation of the P-15 was so extensive that it resulted in a new designation, the P-19 "Danube", also known as the 1RL134. The P-19 is known in the west as the Flat Face B. The P-15 is a high mobility radar. With the antenna mounted directly on the single truck (Zil-157) used for transport, the system could be deployed and taken down in no more than 10 minutes. The P-15 uses two open frame elliptical parabolic antenna accomplishing both transmission and reception, each antenna being fed by a single antenna feed. The radar can rapidly shift its frequency to one of four preset frequencies to avoid active interference, with passive interference being removed by a coherent doppler filter. Azimuth was determined by mechanical scanning with an associated accompanying PRV-11 (NATO reporting name "Side Net") used to determine elevation. A secondary radar for IFF is generally used in conjunction with the P-15,

generally the 1L22 "Parol".

30N6E2 (Tombstone) Russian 3-D Long-Range Surveillance Radar

Tiers:

30N6E2 Tombstone Radar

↳Radar

Name: 30N6E2 Tombstone Radar
Type: Illumination and Guidance Radar
Mission: primarily designed to be used as an engagement radar and to track targets and guide missiles to impact using a command link channel
NATO Reporting Name: FLAP LID B
NATO Frequency Band: I-J
Target Detection Range: km300
Azimuth Detection: deg360
Number of Tragets Detection: ea100
Simultaneously Engaged Targets: ea6
Maximum Target Speed: 30 - 2,800 m/s
Antenna: Antenna RPN 30N6E2 may rise to a special mobile tower 40V6M.
Chassis: The 30N6E2 Tomb stone radar is mounted on the high mobility truck chassis 8x8 MAZ-7910 vehicle derived from the MAZ-543
Missile Control: km72
Time Ready to Work: min5
Maximum Elevation: deg+60
Minimum Elevation: deg-3

Dimensions (MAZ-543 Special Wheeled Chassis)

Length: m11.7
Width: m3.07
Height: m2.92

Maximum Load: tons15

Ground Pressure: INA

Automotive (MAZ-543 Special Wheeled Chassis)

Engine Name: D12A-525 38.9-liter Diesel

Engine Type: Diesel

Engine Power: hp525

Cruising Range: km650

Speed, Maximum Road: km/h65

Speed, Average Cross: km/hINA

Speed Maximum Swim: km/hNot Amphibious

Configuration: 8x8

Gradient: deg60

Side Slope: deg40

Vertical Step: m0.6

Trench: m2

Fording Depth: m1.3

Protection

Hull Armor: INA

Turret Armor: INA

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Camouflage Nets: Yes, Standard

Notes:

The 64N6 (NATO codename 'Tombstone') 3-D long-range surveillance radar comprises a hydraulically raised antenna assembly and radar shelter mounted on a common semi-trailer. The phased-array antenna set has a double-sided antenna aperture. Its 3-D performance is obtained by rotation of the antenna once every 12 seconds and electronically scanning the antenna beam, in both azimuth and elevation. Scan sector capability for detecting tactical ballistic missiles is also provided. This can detect aircraft and cruise missile type targets at a range of up to 300 km and ballistic missiles with launching ranges of up to 1,000 km using the sector scan facility. An IFF transponder subsystem is fitted. The radar is used for target detection and tracking in normal, clutter and severe ECM environments. The data obtained are relayed to the command post for processing and assessment. The radar can detect targets with speeds of up to 2,788 m/s (10,000 km/h). The export designation of the system is 83M6E. The S-300PMU-2 system designation is 83M6E2.

YLC-8B Chinese 3D Long-Range Anti-Stealth Surveillance Radar

Tiers:

1 **2** 3 4

System

Alternative Designation: YLC-8B
Type: 3D Long-Range Anti-Stealth Surveillance Radar
Crew: INA
Chassis: 6x6 or 8x8 Truck
Frequency: UHF-Band
Detect and Track Aircraft Range: over 500 km
Detect and Track Missiles: over 700 km
Maximum Altitude: INA
Displacement Time: INA
Emplacement Time: INA
Note: The antenna fold-able array is designed for automatic, rapid deployment and recovery.

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

YLC-8B is operating in UHF-Band 3D long-range anti-stealth surveillance radar utilizing full coherent digital pulse compression and moving target detection technology. The radar can detect and track aircraft that are over 500 km away as well as missile threats out to ranges of over 700 km. The antenna fold-able array is designed for automatic, rapid deployment and recovery.

P-18 (Spoon Rest D) Russian Mobile 2D VHF Radar

Tiers:

Variants:

- **P-18ML:** ground-based long-range VHF surveillance radar P-18ML is offered as the modernized follow-on to its prototype, the analogue P-18. Produced in LiTak-Tak

System

Alternative Designation: P-18; Spoon Rest D; 1Rl131 Terek
Type: Mobile 2D VHF Radar
Chassis: ZIL-157
Crew: INA
Frequency: VHF
Maximum Range: 250 km
Maximum Altitude: 35 km
Azimuth: 360 degrees
Elevation: -5-15 degrees
Precision: 1 km range
Power: 260 kW

Dimensions (Chassis: ZIL-157)

Length: 6.93 m
Width: 2.32 m
Height: 2.74 m
Weight, Empty: 5,540 kg

Automotive (Chassis: ZIL-157)

Engine Name: ZIL-157
Engine Type: Diesel
Engine Power: hp1041

Transmission: 5 speed X 2 range transfer case

Cruising Range: INA

Speed, Maximum Road: km/h40

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: INA

Side Slope: INA

Vertical Step: INA

Trench: INA

Fording Depth: INA

Protection

Armor: INA

Applique Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The P-18 or 1RL131 Terek (also referred to by the NATO reporting name "Spoon Rest D" in the west) is a 2D VHF radar developed and operated by the former Soviet Union. The P-18 early warning radar is a development of the earlier P-12 radar, the P-18 radar being accepted into service in 1970 following the successful completion of the program. The P-18 was developed by the SKB Design Bureau, a division of State Plant No.197 named after V. I. Lenin who developed the previous P-12, the predecessor of the current Nizhny Novgorod Research Institute of Radio Engineering (NNIIRT). In 1979 a new secondary IFF radar the 1L22 "Parol" entered into service to complement the P-18, unlike the previous secondary radar NRS-12 (NATO "Score Board") the new interrogator was carried on a separate truck. The P-18 is still in service today and was widely exported, many companies offer upgrade options to improve the performance and reliability of the radar and to replace out-dated components. NNIIRT offers an upgrade package for the P-18 which includes the installation of a solid state transmitter and receiver, automatic jammer suppression equipment as well as PC based signal processing, test and interface equipment. These upgraded variants of the P-18 can be referred to as the P-18M, P-18-1 or P-18-2 depending on the manufacturer, modification and radar nationality. The P-18 was superseded by the 1L13 "Nebo" VHF surveillance radar in 1984. Currently, the Russian-Belarusian company Defense Systems provides upgrades for P-18 radars. Also Retia, a Czech civil and military electronics company, developed its own, fundamental modernisation of the P-18 under the name ReVEAL. It is now solid state, digitized and fitted with upgraded IFF system, while allowing to utilise also the legacy IFF. The whole equipment is repackaged into a standard container and already sold in several dozen units. The P-18 shares many similarities with the earlier P-12NA and like the P-12 it is mounted on two Ural-4320 truck chassis. The P-18 features many improvements over the P-12 including increased performance, precision and reliability. The radar was developed to work independently or as part of a C3 system directing SAM and aircraft to hostile targets, the truck mounted design provided the radar with high mobility. The P-18 uses a single antenna accomplishing both transmission and reception. The antenna is composed of sixteen Yagi antennas mounted in sets of eight with one set above the other. The radar antenna is mounted on the truck used to transport it improving mobility and the radar also features a mechanism which allows the antenna height and elevation to be altered during operation. Azimuth is scanned mechanically by the antenna with a rotation of 10 r.p.m, the original P-18 used three indicators, including two plan position indicators in addition to a back-up A-scope. Like the P-12 the radar features automatic frequency control with four pre-set operating frequencies, moving target indicator to eliminate passive clutter and active jamming, the radar could also display tracks from another radar it was paired with. The original P-18 used a coaxial cavity resonator transmitter, vacuum tube receiver with transistor based preamplifier and a vacuum tube/pin diode based duplexer. A secondary radar for IFF is generally used in conjunction with the P-18, either the NRS-12 or the later 1L22 "Parol".

AN/TPQ-49 American Multi-Mission Radar System

Tiers:

System

Alternative Designation: AN/TPQ

Type: Multi-Mission Radar

Mission: Performs multiple missions simultaneously including early warning, counterfire and air surveillance

Crew: ea1

Multi-Mission: The AN/TPQ-49 radar is multi-mission capable, allowing the operator to configure the radar to support a variety of missions simultaneously, including: early warning for indirect fire, CTA, air surveillance and counterUAS missions. In multi-mission mode, the radar can perform the tasks of two or more radars and can be configured to prioritize specific capabilities to fit mission needs.

Weapon Location: SRC's AN/TPQ-49 radar system is a trusted U.S. Marine Corps program of record. Combined with SRC's LCMR software, the system is designed to detect, track, classify and warn of incoming RAM threats while determining point of origin and point of impact locations. The system can track multiple weapons simultaneously and has a detection range of greater than 10 kilometers, and a point of origin accuracy of 75 meters at 5 kilometers.

Detection Range: The system can track multiple weapons simultaneously and has a detection range of greater than 10 kilometers, and a point of origin accuracy of 75 meters at 5 kilometers.

Air Surveillance: With SRC's LSTAR software, the radar can detect and track a wide range of traditional and non-traditional aircraft, with an instrumented range of 30 kilometers. The LSTAR software extends the radar coverage volume by employing air surveillance specific waveforms tailored to airspace monitoring. This capability makes the radar an ideal solution for general air surveillance for VSHORAD, wind farm gap filling, and small UAS detection and tracking.

Applications: Air surveillance • Counterfire target acquisition • Counter-UAS • Critical infrastructure protection • Force protection • Ground based sense and avoid • VSHORAD

Benefits: • Transports easily and installs rapidly (< 20 minutes) in challenging terrain • Low lifecycle cost • Unattended remote operation • Few false alarms in challenging clutter • Ideal for integrated solutions - EO/IR camera or counterfire response - ADS-B or secondary surveillance radar

Operating frequenc: L-Band

Azimuth coverage: 360°

Elevation coverage: 0 - 30°

Power: 1,200 W, 110/240 VAC 50/60 Hz, 24 VDC

Dimensions

Diameter: 102 cm

Height: 216 cm
Weight: 68 kg

Notes:

The AN/TPQ-49 multi-mission radar leverages SRC’s LCMR and LSTAR® software to provide the warfighter with a versatile, powerful, all-in one multi-mission radar capable of supporting early warning weapon location for indirect fire, counterfire target acquisition (CTA) and air surveillance missions. The radar provides continuous 360-degree surveillance and 3-D target location using a non-rotating, electronically steered antenna. It’s small footprint and lightweight design make the radar ideal for fixed site emplacement in hard to reach areas where typical radars are impractical. The system can simultaneously detect and track multiple targets from separate points of origin within a 315 square kilometer surveillance area. The radar is designed to support a variety of missions including: air surveillance, force protection, CTA, very short range air defense (VSHORAD), small UAS detection and tracking, and critical infrastructure protection.

PSNR-5 Russian Ground Surveillance Radar

Tiers:

1 2 **3** 4

Variants:

- **PSNR-5:** Tripod mounted
- **PSNR-5K:** Mount mast for vehicles (i.e. Russian BRM-1K)
- **PSNR-5M/Kredo-M:** Updated PSNR-5K on vehicles with a notebook computer to display, process, transmit; with GPS
- **Monitor-M:** Links up to 4 PSNR-5M radars to provide 360 deg view
- **Kredo-M1/PSNR-5M Modernized:** PSNR-5M with additional upgrades with range of 5 km 8.5 km (personnel); 20 km (tanks); 32 km (trucks); with 12 km (tracking)
- **Strazh-ST:** Vehicle sensor pod with Kredo-M1 & EO cameras (PRP-4M uses the PSNR-5M system; the PRP-4MU has an option for the Kredo-M1)

System

Alternative Designation : TALL MIKE (NATO); PSNR- 5/IRL133 (Ground); PSNR- 5K/1RL133-1 (Vehicle); IRL 133M (Kredo M-1 ground); 1RL 133M1 (PSNR-8 vehicle)
Description: Ground Surveillance Radar (GSR) can be operated by 1 or 2 soldiers; 3 soldiers required for dismounted carry
Ground Pressure : kg/cm2Varies by vehicle
Crew : ea1 (Vehicle); 2 (Dismounted)
Notes: Sources: 2014 WEG. With the pintle mount, this radar can be mounted on almost any vehicle to modify It into a reconnaissance vehicle. (photos from 2014 WEG)

Notes:

Radar PSNR-5 Devices 1-RL-133 Russian designation: ПСНР-5 (Подвижная Станция Наземной Разведки) Určení: Radar PSNR-5 is used to search the fixed and moving ground targets and to monitor their movement in the event that the use of other technical means of the survey (from the toolbox of a vehicle) is not possible or is not appropriate. Allows you to identify the character and the polar coordinates of the goals/objectives, in the present case, the distance and the side angle (azimuth). the Basic TTD: The survey of tanks, OT, cars: - rate target in the range of 2-60 km/h..... sound indication - rate target in the range of 4-60 km/h..... from the screen Detecting moving people: - rate target of around 2 km/h..... sound indication - rate target of approximately 4 km/h..... from the screen Dosah⋆: - vehicles, tanks, individually or in the column..... 8 – 10 km - a person individually or in a group..... 3 – 4 km - the minimum distance of the detection target..... 0,2 km - the width of the propátrávaného sector..... 04-00 up to 20-00 dc - power supply..... 20-29V, direct current ⋆ at a wind speed ≥ 5 m/sec and the rains of greater than 4 mm/hr to reach reduced to ½ Zdroje: - rechargeable battery pack summer P-81 ..... 2 ks - battery winter P-81A..... 1 ks (myself basking) - nepřetržitýn operation..... 20 pm the detection Accuracy goals: - sound indication – length..... ± 25 m - sound indication – delivery..... 00 – 05 dc - from the screen – length..... ± 50 m - from the screen – length..... 00 – 10 dc the Composition and the determination of the sets in the BPzV(composition is different from the portable variants): - receiver-transmitter (Block P-01) is designed to emit high-frequency radiation into the space and the income from the goals/objectives of the reflected signal, to control the direction of the radiation in the azimuth and in the polohovém angle - the management and the indicating counter (Block P-02-1) is designed for remote control block P-01, and for processing the received signal, and searching for information on the identified/pursued objectives - voltage stabilizer (Block P-87) is designed for power supply of individual equipment sets of radar from the onboard network of the vehicle, at the same time changes the value of the voltage on the value of the operating - set with stand (Block P-03) in the composition: on the stand (Block P-03A) is designed for the operation of the block P-01 out of the vehicle on a tripod (the same for the observation device NNP-21) the sighting telescope is designed to control the identity of the electronic and the optical axis of the receiver-transmitter, to orientování antenna block P-01 off-road objects (for good visibility, if I know their azimuth) and, where appropriate, to the visual observation of the observed/objective pursued the indicative igo is designed to orientování antenna block P-01 in a magnetic azimuth when the establishment of the stand about the connecting cable is designed to interconnect the blocks of the P-01 and P-02 - battery pack summer (Block P-81) ...2 pc is designed to supply a radar in operation outside the vehicle without connection to its on-board network - accumulator winter (Block P-81A) ...1pc is designed to supply a radar in operation outside the vehicle without connection to its on-board network - device-172R - device Mu-351A - koutový reflector - insert between the rack and trojnožku - the bracket between the rack and trojnožku - the cable connecting 25 m (in the bag) is intended to link the blocks of the P-01 and P-02 in the operation of block P-01 on the rack outside the vehicle, and a block of P-02-1 inside the vehicle or outside of it (in secret) - cabinet with aftermarket parts (č.19) - box with accessories (č.20).

Giraffe 1X Swedish Lightweight Multi-Mission Surveillance Radar

Tiers:

System

Alternative Designation: Giraffe 1X
Type: Lightweight Multi-Mission Surveillance Radar
Manufacturer: SAAB
Family: Giraffe Radar
In Service: INA
Crew: ea1
Fixed, Mobile or Deployable: Giraffe 1X is a mobile, deployable or fixed asset for short-range surveillance and Ground Based Air Defence (GBAD) that provides forces with early warning and the ability to detect and classify more than 100 different targets – simultaneously. Even in high-clutter environments. The system can be delivered with surface surveillance as well as sense & warn add-ons and can be operated remotely or locally. Giraffe 1X is very lightweight with an exceptional small integration footprint. In fact, the complete radar can be transported on a pickup truck-sized vehicle, by helicopter or towed on a trailer. It can be permanently installed on a building or a mast, or integrated into a suitable vehicle. The system can be operated remotely or locally.
Multi-Role for Multipurpose: Giraffe 1X provides simultaneous air surveillance, GBAD target acquisition and RAM sense and warn capabilities without performance degradation. It can detect fixed and rotary wing targets, fast missiles and RAM targets as well as small UAVs in high-clutter environments. It also offers flexible integration of weapon systems and tactical data links, and can be configured fully self-contained with C3 capabilities.
Superior Detection: Giraffe 1X covers the entire search volume every second and will detect any air threat, including small, slow, high and low targets. The system provides exceptional air picture awareness with all-weather performance and accurate 3D data for all targets in the search volume. Automatic weapon location and impact location can be provided as an option. The system offers 360˚ detection and tracking of RAM threats even in severe clutter. This means it can provide your forces with automatic warning of incoming threats, giving them the time needed to prepare and respond.
Networking Possibilities: In the design of Giraffe 1X much emphasis has been put on networking performance. Giraffe 1X allows for standard or Customised data link integration.
Gifraffe 1X Key Advantages: *Highly capable radar with a small footprint *Covers the entire search volume every second

*Full mission flexibility through unparalleled support services *Full interoperability

Integrated Logistics Support (ILS): ILS is an important part of the system delivery and will form the basis for future maintenance. Saab ILS experts have solid experience in tailoring ILS deliveries together with customers worldwide

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Automotive

Note: Giraffe 1X is a small and lightweight yet highperforming 3D radar that is easily integrated in almost any type of mobile platform, fixed structure or C2 system.

Radar System

Name: Giraffe 1X

Type: Stacked beam 3D radar

Antenna Type: AESA, digital beam forming

Frequency: X (I) band

Elevation Coverage: > 70 degrees

Rotation Rate: 60 RPM

Search Volume: 360° or in a sector

Instrumented Range: 75 km

Notes:

The Saab (formerly Ericsson Microwave Systems AB) Giraffe Radar is a family of land and naval two- or three-dimensional G/H-band (4 to 8 GHz) passive electronically scanned array radar-based surveillance and air defense command and control systems tailored for operations with medium- and Short Range Air Defense (SHORAD) missile or gun systems or for use as gap-fillers in a larger air defense system. The radar gets its name from the distinctive folding mast which when deployed allows the radar to see over nearby terrain features such as trees, extending its effective range against low-level air targets. The first systems were produced in 1977. By 2007, some 450 units of all types are reported as having been delivered. When agility and presence close to the combat area are essential, the Giraffe 1X short-range 3D radar surveillance system is there to protect mobile forces and assets against airborne threats. The Giraffe 1X is an ideal air surveillance component in the VSHORAD domain and can be used as a gap-filler that provides airspace commanders with the capabilities needed for maintaining continuous and accurate air situational awareness. Highly capable with small footprint Giraffe 1X is a small and lightweight yet high performing 3D radar that is easily integrated in almost any type of mobile platform, fixed structure or C2 system. The system is designed to deliver key capabilities as part of short-range surveillance and Ground Based Air Defence (GBAD). Accessing the bigger picture The compact concept makes Giraffe 1X the perfect choice when continuous air surveillance is desired. It provides swift understanding of the air situation, enabling immediate and effective response to changing threats, new tactics and shifting operational conditions. The system monitors the air volume 360 degrees for air targets and simultaneously locates and warns against incoming rocket, artillery and mortar rounds. Counter-UAV function Features include Saab’s unique function for enhanced low, slow and small (ELSS) target detection, which provides a dedicated counter-unmanned aerial vehicle (UAV) capability.

9S19 High Screen (9S19M Imbir) Russian Long-Range Sector Surveillance Radar System

Tiers:

System

↳*System*

Name: 9S19 HIGH SCREEN Sector Radar system
Type: Sector Surveillance Radar
Purpose: The HIGH SCREEN sector radar supporst the ATBM role, providing surveillance of anticipated azimuths of threat missiles
Crew: ea4
Mission: t is used to detect high speed targets, such as ballistic missile warheads
Detection Range: km175
Maximum Targets, Simultaneous: maximum being 16 simultaneous targets
Waveband: Centimetric
Maximum Elevation in Anti-Missile Mode: deg+73
Minumum Elevation in Anti-Missile Mode: deg+30
Maximum Elevation in Anti-Aircraft Mode: deg+50
Minimum Elevation in Anti-Aircraft Mode: deg0
Scan Cycle: 12.5-14 seconds
Number of Ballistic Targets tracked Simultaneously: up to 16
Rate of Target Updates fed into the CP: 1-2 seconds
Note: The radar is switches to a tracking mode when high speed targets are detected, automatically transmiting the trajectory parameters to the Command Post Vehicle

Notes:

The specialised 9S19 Imbir is a high power-aperture, coherent, X-band phased array designed for the rapid acquisition and initial tracking of inbound ballistic missiles within a 90 degree sector. To that effect it uses a large passive phase technology transmissive array, using a conceptually similar space feed technique to the MPQ-53 and 30N6 series radars, producing a narrow 0.5º pencil beam mainlobe. The primary search waveform is chirped to provide a very high pulse compression ratio intended to provide very high range resolution of small targets. The design uses a 16 kiloWatt ave Travelling Wave Tube (TWT) source, very low sidelobes and frequency hopping techniques to provide good resistance to jamming. Three primary operating

modes are used. In the first the 9S19 scans a 90º sector in azimuth, between 26º and 75º in elevation, to detect inbound Pershing class IRBMs within a 40 to 95 nautical mile range box, feeding position and kinematic data for up to 16 targets to the 9S457 command post. In this mode the transmissive array is tilted back to 35º. The second mode is intended to detect and track supersonic missiles such as the AGM-69 SRAM, and sweeps a narrower 60º sector in azimuth, between 9º and 50º in elevation, within a range box between 10 and 90 nautical miles, generating target position and velocity updates at 2 second intervals. The third mode is intended to acquire aircraft in severe jamming environments, with similar angular and range parameters to the second mode. In this mode the transmissive array is tilted back to 15º.

Kasta 2E1 Russian 6x6 Low-Altitude All-Around 3-D Surveillance Radar System

Tiers:

1 2 3 4

System

Alternative Designation: Kasta 2E1
Type: Low-Altitude All-Around 3-D Surveillance Radar System
Manufacturer: INA
Family: Kasta
In Service: INA
Vehicle Package: The Kasta 2E1 system uses two antennas and consists of two vehicles: one truck carries the antenna and its peripheral equipment and another truck operates as command post vehicle and on a trailer unit, the external power supply is installed

Dimensions (Chassis: KamAZ-5350)

Length: m7.85
Width: m2.5
Height: m3.29
Weight, Combat: tons9.2
Maximum Load: tons6

Automotive (Chassis: KamAZ-5350)

Engine Name: KamAZ-740.13-260 Diesel
Engine Type: Diesel
Engine Power: hp260

Cruising Range: km1,000

Speed, Maximum Road: km/h100

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %40

Vertical Step: m0.6

Trench: m0.6

Fording Depth: m1.75

Maximum Load: tons6

Note #1: Engine is also equipped with cold weather starting device and can be started at temperatures down to -50°C

Note #2: Vehicle has a full-time all-wheel drive and is fitted with a central tyre inflation system

Radar System

Waveband: Decimetric

Target detection (height 100 m) with Antenna 5.4 / 14 m: km32

Target detection (height 100 m) with Antenna 50 m: km58

Effective Range: km5-150

Accuracy Distance: m540

Altitude: km6

Azimuth: deg360

Height: INA

Moving target indication (MTI): 53 DB

Mean time between failure (MTBF): 300 hours

Setup Time: min20

Power Up: min3.3

Teardown: min20

Operating crew: ea2

Power consumption: kw16

Transport units: ea2

Communications

Radio: R-168-5UN(1)E Russian VHF Manpack-Vehicular Radio Station

Protection

Armor: INA, It is also proposed with concealed built-in internal armor

Applique Armor: Available

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: No

Notes:

The Kasta 2E1 system uses two antennas and consists of two vehicles: one truck carries the antenna and its peripheral equipment another truck operates as command post vehicle and on a trailer unit, the external power supply is installed The Kasta 2E1 and 2E2 are the latest incarnations of the well established Flat Face and Squat Eye family of semimobile UHF band tactical acquisition radars. The initial P-15 Flat Face A introduced the now characteristic double stacked array of elliptical paraboloid section antennas. This radar was widely exported by the Soviets to Warsaw Pact nations and Soviet Third World allies and clients. The radar has been used to support interceptors, as well as SA-3, SA-4, SA-6 and SA-8 missile batteries as an acquisition radar. The P-15M Squat Eye is a derivative of the baseline design with a single antenna on a tethered latticework mast. It was employed to improve low altitude coverage, but also to permit use of the radar in heavily forested terrain where the height of the foliage canopy exceeded the height of the antenna phase centre in the P-15. The P-19 Flat Face B is the improved follow-on to the P-15 with a range of improvements. Since the 1990s a number of manufacturers are now offering comprehensive digital upgrades for the P-15 and P-19 inventory. Kasta 2E1 and 2E2 are heavily redesigned derivatives using a new KAMAZ 6 x 6 chassis and mostly digital hardware. The redesign of the Squat Eye antenna is the most visually prominent change with the increased aperture improving range performance. Due to their low power-aperture ratings this family of radars is generally not regarded to be particularly effective against LO and VLO aircraft.

PRV-16 (Thin Skin B) Russian Height-Finder Radar

Tiers:

System

Alternative Designation: PRV-16; Thin Skin B
Type: Height-Finder Radar
In Service: In service with nations that still operate the SA-4 Ganef**, SA-6 Gainful** and SA-8 Gecko**.
Crew: INA
Chassis: The vertical, orange-peel parabolic section antenna has been seen in both truck-and trailer-mounted versions.
Band: G-H (5-9 GHz)
Maximum Range: 200 km
Pulse Repetition Frequency (PRF): 400/800 Hz
Pulse Repetition Time (PRT): 1.6 and 2.5 milliseconds
Average Power: 470 W
Peak Power: 700 kW

Dimensions

Length (Truck-Mounted): INA
Width (Truck-Mounted): 6.9 m
Height (Truck-Mounted): 3.1 m
Length (Trailer-Mounted): INA
Width (Trailer-Mounted): 3.9 m
Height (Trailer-Mounted): 8.5 m
Weight: INA

Notes:

PRW-16 is a height-finder radar used in the former Warshaw Pact. It is the successor of PRV-9. It was developed in the mid 60s, and from about 1970th it was used in the Soviet army. Characteristic features of: tunable magnetron; depending on the interference environment and after automatic analysis of the disturbances, it seeks the best transmitting frequency for the next pulse; time required for the re-tuning over the entire frequency range: <1s; Interfering protection systems SBZ+UNS using 2 potentialoscopes of type LN 12; Swivel cycle of the antenna: 3.2 s (= nods 18 times per minute); time required for raising or folding down the antenna 4.5 min.

YLC-20 Chinese Emitter Locating System

Tiers:

System

Alternative Designation: YLC-20
Type: Emitter Locating System
Crew: INA
Chassis: 8x8 or 6x6 trucks
Mission: The only open source material at this time states the YLC-20 is intended to detect, locate and identify: 1. aerial emitting targets using active radar, including fighters, AEW&C aircraft and UAVs. 2. surface targets including early warning radars, acquisition radars and fire control radars. 3. emitting communications equipment.
Band Coverage: 380 MHz to 12 GHz
Maximum Range: INA
Maximum Altitude: INA
DIsplacement Time: Less than 1 hour
Emplacement Time: Less than 1 hour

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

The Chinese YLC-20 is conceptually based on the KRTP-91 Tamara, but incorporates both precision DF and DTOA capabilities to locate airborne and surface based emitters. The only open source material at this time states the YLC-20 is intended to detect, locate and identify: 1. aerial emitting targets using active radar, including fighters, AEW&C aircraft and UAVs. 2. surface targets including early warning radars, acquisition radars and fire control radars. 3. emitting communications equipment. Stated band coverage is 380 MHz to 12 GHz. Deployment time is claimed to be 1 hr, with all system components on 8x8 or 6x6 trucks. At the time of writing no good quality imagery of production equipment was available through open sources. This limits current assessments of the system's capabilities. It is likely that DTOA techniques are used for target acquisition and coarse tracking, and DF techniques used for precision tracking, using DTOA derived coordinates to cue an interferometric DF antenna. Avaliable material does not state whether a heightfinding capability is provided, if so this would likely be performed using interferometric techniques with the DF subsystem. Once better quality imagery of the antenna arrangement becomes available, a more precise definition of capabilities and limitations will be possible. It is likely that much of the YLC-20 design is based on documentation

acquired during the abortive attempt to procure six Czech Vera E DTOA ELS systems. The YLC-20 was first disclosed in 2006.

HN-503 Chinese 2D Long-Range Radar

Tiers:

System

Alternative Designation: HN-503

Type: 2D Long-Range, Air Search Radar

Crew: eaINA

Maximum Range: 722.3 km

Minimum Range: 0.4 km

Maximum Altitude: 30480 m

Minimum ALtitude: 0 m

Properties: Moving Target Indicator (MTI), Pulse-only Radar

SQUIRE French Man-Portable Medium-Range Ground Surveillance Radar

Tiers:

System

Alternative Designation: SQUIRE

Type: Man-Portable Medium-Range Ground Surveillance Radar

Crew: ea2

Band: X-Band

Mobility: The SQUIRE consists of compact components to be carried in two backpacks. Each weighs less than 23 kgs., including batteries, and can therefore be easily carried by two persons.

Low Level Air Surveillance: Low level air surveillance for detection of slow moving aircraft/UAV (< 300 km/h)

Average Power: 1 W max.

Instrumented Range: 48 km

Range Resolution: 5 m

Accuracy: ≤ 5 m ; ≤ 5 mils

Maximum Range, Pedestrain: km9

Maximum Range, Vehicles: km19

Maximum Range, Tanks: km23

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: The SQUIRE consists of compact components to be carried in two backpacks. Each weighs less than 23 kgs., including batteries, and can therefore be easily carried by two persons.

Notes:

SQUIRE is a man-portable medium-range ground surveillance radar that can detect and classify moving targets on, or close to, the ground at ranges up to 48 km. Deployed worldwide for force protection, reconnaissance and compound protection, it is equally suited for border, coastal and site surveillance, counter-drug, smuggling operations and drone detection. It consists of compact components to be carried in two backpacks. Each weighs less than 23 kgs., including batteries, and can therefore be easily carried by two persons. SQUIRE is light, compact, and has a very low output power thanks to the application of FMCW

technology. SQUIRE is ideally suitable for use by the Army and Marines, e.g. air mobile and amphibious units, but also by United Nations units or Border Guard units. Squire is an X-Band man-portable medium-range ground surveillance radar that can detect and classify moving targets on, or close to, the ground at ranges up to 48 km. Deployed worldwide for force protection, reconnaissance and compound protection, it is equally suited for border, coastal and site surveillance, counter-drug, smuggling operations and drone detection. Squire is light, compact, and has a very low output power thanks to the application of FMCW technology. Squire is ideally suitable for use by the Army and Marines, e.g. air mobile and amphibious units, but also by United Nations units or Border Guard units. It consists of compact components to be carried in two backpacks. Each weighs less than 23 kgs, including batteries, and can therefore be easily carried by two persons. Because of its low maximum power output (1W max) the Squire is a very safe radar concerning the effects of RF radiation energy. There is no radiation danger for persons, even in the direct vicinity of the system. KEY BENEFITS • SQUIRE is a man-portable ground surveillance radar for detection/tracking and classification of moving ground targets. It can assist artillery and mortar firing units by giving feedback on shell impacts. • Deployment of troops under all circumstances demands a system that is easily transportable, not only by vehicles, but also by man. SQUIRE is a lightweight radar being man-portable and easy to install on a vehicle. • The FMCW radar techniques applied in SQUIRE allow very low transmit power which makes the system virtually undetectable. Even sophisticated devices will not detect SQUIRE. This gives a clear tactical advantage. • Low level air surveillance for detection of slow moving aircraft/UAV (< 300 km/h) • Advanced doppler processing • The use of reliable components like the solid state transceiver, results in an extremely high Mean Time Between Failure [MTBF > 20.000 hr]. • This, combined with extensive use of "Commercial of the Shelf“ components, ensures that the Life Cycle Cost of SQUIRE are extremely low. FEATURES • Very Low Probability of Intercept (LPI) • Instrumented range selection: 3 km, 6 km,12 km, 24 km and 48 km • Track While Scan (option) • Automatic and manual target classification • Artillery fire deviation measurement • Threat warning via alarm zones • Day and night, all weather capability • Very safe due to low output power • Ease of operation (one man operation) with user friendly man-machine interface • Extremely low weight (man portable) • Fast deployment and march-order • Separation of radar unit and operator unit up to 100 m with cable TCP/IP network operation • High operational availability • Very low life cycle costs • Suitable for mounting on a vehicle or a mast • Sea mode (sea clutter filtering)

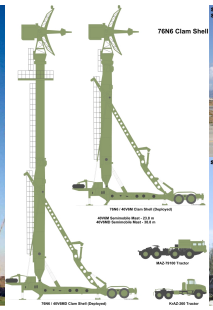
76N6 Clam Shell Russian Low Altitude Acquisition Radar



Tiers:

Variants:

- **91N6E:** This is an upgraded derivative of the 64N6 Big Bird radar system developed for the S-400 surface-to-air missile system. It has a fully digital design with a higher peak power rating than its predecessor to accommodate longer-range 48N6E3 and 40N6E missiles. The 91N6E is mounted on the new MZKT-7930 tractor.

76N6 Clam Shell

↳*System*

Alternative Designations: 76N6 Clam Shell
Name: 76N6 Clam Shell
Type: Acquisition Radar
Band: I (8-10 GHz)
Power: 1.4 kW continuous wave
Turn-on Time: 3 min
Setup Time (40V6M mast): 1 hour
Detection Range, Target Flying at 500 meters: km90
Detection Range, Target Flying at 1,000 meters: km120
Target Tracking: up to 180
Target Resolution Azimuth: deg1
Target Resolution Range: 1.9 km
Target Resolution Velocity: 8.7 kmh
Minimum detectable Radar Cross-Section (RCS): 0.02 sq m
Maximum Target Speed: Mach 2.1
Average Power: 1.4 kW
Peak Power: 55.0 kW
Mean Time Between Failures: 100 hours

Mount: he 76N6 CLAM SHELL (5N66M etc.) is mounted on a large trailer with a mast which is between 24 and 39 m (79 and 128 ft) tall. Usually is used with a mast.

Automotive

Mount: Trailer

Primary Mover: MAZ-537 tractor

Communications

VHF Radio: R-168 Akveduk

HF Radio: R-161 Poisk

Notes:

The 76N6 Clam Shell** is a ground-based three-dimensional radar that uses frequency-modulated continuous-wave transmission for target acquisition in dense electronic countermeasures (ECM) environments. It is designed to detect and track approaching and receding low radar cross-section targets, such as cruise missiles, at very low altitudes.The fully automatic system provides target track data for the fire-control system of static SA-10a or mobile SA-10b air defense systems. Approaching and receding target velocity, range and bearing are provided, with selectable 1- or 6-degree vertical beamwidths and selectable beam polarization. The FA-51MU antenna head subsystem combines a transmit and receive antenna, separated by a shielding structure, which prevents spillover from the transmitter into the receiver. The design includes sidelobe suppression features. The doubly curved transmit and receive reflectors measure about 9 ft 6 in (2.9 m) in each dimension. The manufacturer claims world-class resolution, high rejection of clutter (100 dB) and very accurate pointing. The antenna head is mounted on a hydraulically elevated mast, which is available in two versions: the 40V6M, which is 77 ft 5 in (23.8 m) tall; or the 40V6M2/40V6MD, which is 127 ft 3 in (38.6 m) tall. The mast and antenna head are mated before elevation on a semi-trailer that is towed by a MAZ-537 tractor. A conventional rotational coupler allows the antenna head to rotate through 360 degrees. The Clam Shell transmitter, fitted in the FA-52MU transmit/receive module, produces a high-purity continuous wave signal for search operations, with imposed low frequency modulation for ranging to targets. Signal-processing enables the rejection of clutter, terrain, precipitation, high-density chaff and jamming.

96L6E (Cheese Board) Russian Early-Warning and Acquisition Radar

Tiers:

System

Name: 96L6E, NATO: Cheese Board

Type: 3D early-warning and acquisition radar

Target Detection Range: 300 km

Simultaneously Tracked Targets: 100 ea

Works in Conjunction with: the 83M6E2 control post and S-300MPU2 launchers

Chassis: MAZ-7930 (8x8) truck chassis and is intended for use with the S-300PMU and S-300PMU1 air defence systems as an upgrade to replace several existing radar's with a single more capable system

Band: C-Band

Crew: Three operators are needed to run the set. Up to five operator consoles are provided

Antenna: The phased-array antenna with 96 radiating rows employs mechanical beam steering in azimuth and electronic beam steering in elevation

Antenna Rotation: 5-10 rpm

Mean Time Betweeen Critical Failure: 10,000 hours

High Jam Resistance: Yes

Frequency Hopping: Yes

High Clutter Rejection: Yes

Operation Modes: There are two operation modes implemented: Low altitude targets can be acquired by constraining the mainlobe elevation angle between -3° and +1.5° using an antenna rotation of 5 rpm

Note: The 96L6E “Cheese Board” is designed to replace the 36D6 “Tin Shield B” and 76N6 “Clam Shell”.

Dimensions (MAZ-543 Special Wheeled Chassis)

Length: m11.7

Turret Armor: INA
Applique Armor: INA
Explosive Reactive Armor: No
Active Protection System: No
Mine Clearing: No
Self-Entrenching Blade: No
NBC Protection: Yes
Smoke Equipment: INA
Camouflage Nets: Yes, Standard
Note: Protection. Additional elements of protection are the placement of components of C-300 in the trenches (practiced as placing on the hills for a better view and more rapid care of the horizon, and in the trenches for stealth and protection against fragments of explosions).

Notes:

96L6E “Cheese Board” is a 3D early-warning and acquisition radar operating in C-Band designed to replace the 36D6 “Tin Shield B” and 76N6 “Clam Shell”. It is used in conjunction with the SA-10 “Grumble” (S-300) and SA-21 “Growler” (S-400) theatre defence missile systems. Three operators are needed to run the set. Up to five operator consoles are provided. The phased-array antenna with 96 radiating rows employs mechanical beam steering in azimuth and electronic beam steering in elevation. The radar is a frequency hopping design intended to provide high jam resistance and high clutter rejection. There are two operation modes implemented: Low altitude targets can be acquired by constraining the mainlobe elevation angle between -3° and +1.5° using an antenna rotation of 5 rpm. This slow rotation allows a better clutter rejection with a subclutter visibility up to 70 dB. All altitude targets can be acquired by constraining the mainlobe elevation angle between -1.5° and +20° using an antenna rotation of 10 rpm. As a third mode the radar can operate in a sector search. The 96L6E measures range, azimuth and elevation and performs up to 100 local tracks automatically. It classifies four different target types: aircrafts, helicopters, UAVs, and missiles. After relocation the 96L6E can be set up by three operators in less than 5 minutes.

YLC-2 (LLQ303) Chinese 3D Air Surveillance and Acquisition Radar

Tiers:

Variants:

- **YLC-2A:** Upgraded version
- **YLC-2V:** Self-Propelled Version

System

Alternative Designation: YLC-2
Type: 3D Air Surveillance and Acquisition Radar
Crew: INA
Chassis: INA
Band: L - band
Power Output: 5.5 KW
Peak Power: 85 KW
Detection Range: >500km
Accuracy Range: 200m
Azimuth: 3600
Resolution Range: <100m
Elevation: 0.50 - +200
MTI Improvement Factor: 44dB
Antenna Sidelobe Level: -35dB
Additional Features: *Phased array system and pencil beam scan technology *Wide band low sidelobe planar array antenna *Monopulse angle measurement *Frequency diversity *Distributed high power solid-state transmitter *Advanced programmable digital signal processing

Dimensions

Length: 9 m
Width: 7 M
Height: INA

Weight, Combat: INA

Notes:

The YLC-2 radar (domestic designation: LLQ303, formerly known as 385) is a three-dimensional main guidance and surveillance radar developed by the Nanjing Research Institute of Electronics Technology. In the mid-2000s, an improved version labeled YLC-2A was deployed to the PLA. Equipped with a new Giga-flops digital signal processor, it is capable of Digital Moving Target Indication (DMTI) and Constant false alarm rate (CFAR) processing. An S-band variation called YLC-2U with similar capabilities was also developed for SAM guidance. Both of these advanced YLC-2 radars have been specifically designed to counter stealth fighters such as F-22, with a claimed range of up to 200km even in heavy ECM environment.

Giraffe 8A Swedish AESA 3D Long-Range Radar

Tiers:

Variants:

- **Giraffe 40:** This is a short-range (40 kilometres (25 mi) instrumented) air defense radar with command and control capability. It employs a folding antenna mast that extends to a height of 13 metres (43 ft) when deployed and can be integrated with an Interrogation Friend or Foe (IFF) capability. Coverage is stated to be from ground level to 10,000 metres (33,000 ft) in altitude. In Swedish service the radar is designated PS-70 and PS-701 and provides target data to RBS-70 SHORADS missiles and 40mm Bofors guns. A more powerful version with a 60 kW transmitter is known commercially as Super Giraffe and in Swedish service as PS-707. These radars are no longer marketed.
- **Giraffe 50AT:** This is the model used in the Norwegian NALLADS air defense system which combines the radar and RBS-70 missiles with 20 mm anti-aircraft guns to provide low-level air defense for the combat brigades of the Norwegian army. Mounted on a BV-206 all-terrain tracked vehicle this version has an instrumented range of 50 km (31 mi). The antenna extends to a height of 7 metres (23 ft) and the system can control up to 20 firing units of guns or missiles or a combination of both. The Command and Control system features fully automatic track initiation, target tracking, target identification (IFF), target classification and designation, hovering helicopter detection threat evaluation and handling of "pop-up" targets. It can also exchange data with Giraffe 75 or AMB systems as part of a larger network
- **Giraffe 75:** This features a 13 metres (43 ft) antenna mast and is normally carried on a 6x6 5-ton cross-country truck which carries the radar and command and control shelter. Instrumented range is 75 km (47 mi) and altitude coverage extends from ground-level to 10,000 metres (33,000 ft). An optional add-on unit extends the radars coastal defense capabilities. In Swedish service the radar is designated PS-90.[3] In the Greek Air Force Giraffe 75 is used in combination with Contraves (now Rheinmetall defense) Skyguard/Sparrow fire control systems. 1 Giraffe typically controls 2 Skyguard systems each with 2 twin 35 mm GDF-005 guns and 2 Sparrow surface-to-air missile launchers.
- **Giraffe S:** Optimized as a mobile radar for un-manned remote-controlled applications as a "gap-filler" in air defense early warning systems concentrating on small, low-flying targets over a long distance. It can also be employed as a coastal surveillance radar where targets are small surface vessels and sea-skimming missiles or aircraft. A new antenna extends range coverage to 180 km (110 mi) with altitude coverage from ground level to 6,000 metres (20,000 ft). The antenna mast extends to 8 metres (26 ft).
- **Giraffe AMB:** Giraffe Agile Multi Beam is a passive electronically scanned array radar, providing multi-beam 3-Dimensional air coverage at 5.4 to 5.9 GHz with instrumented ranges of 30 km (19 mi), 60 km (37 mi) and 100 km (62 mi), the altitude coverage is extended from ground-level to 20,000 metres (66,000 ft) with 70-degree elevation coverage. Data rate is 1-scan per-second. Its maintained pulse density suppresses high cluttering in adverse weather conditions. Ultra-low antenna side-lobes combined with pulse-to-pulse and burst-to-burst frequency agility provides some resistance to jamming. As in previous Giraffe radars automatic hovering helicopter detection is provided as is a rocket, artillery and mortar locating function, allowing the radar to detect incoming rounds and give 20 seconds or more of warning before impact. Giraffe AMB is the principal sensor of the Swedish RBS 23 BAMSE air defense missile system but is available for many other applications. The Giraffe AMB can be delivered with ground surveillance options fitted. A skilled crew can deploy the radar in around 10 minutes and recover it in around 6 minutes.
- **ARTE 740:** This is a coastal defense radar based on the Giraffe 75 antenna and Giraffe AMB processing system optimized for surface and low-altitude coverage for the Swedish Amphibious Forces (formerly the Coastal Artillery). It is mounted on a MOWAG Piranha 10x10 armored vehicle. 6 systems are in service.
- **Sea Giraffe AMB:** Saab's Sea Giraffe AMB is the naval variant of their Giraffe radar with 3D AMB technology. It can detect air and surface targets from the horizon up to a height of 20,000 metres (66,000 ft) at elevations up to 70°, and can simultaneously handle multiple threats approaching from different directions and altitudes, including diving anti-ship missiles. Also, it is specialized for rapidly detecting small, fast moving targets at all altitudes and small surface targets in severe clutter. Sea Giraffe AMB is installed on the Republic of Singapore Navy's upgraded Victory-class corvette and US Navy's Independence class of Littoral Combat Ships, and has the designation AN/SPS 77 V for LCS 2

and 4, and AN/SPS 77 V for LCS 6 and higher. It has also been chosen for the Royal Canadian Navy's new Protecteur-class Joint Support Ships. The radar has an instrumented range of 180 kilometres. Its roles include: *Air surveillance and tracking *Surface surveillance and tracking *Target identification for weapon systems *High-resolution splash spotting

- **AESA:** Saab Electronic Defence Systems (EDS) in May 2014 unveiled two new classes of active electronically scanned array (AESA) radar—three land-based systems (Giraffe 1X, Giraffe 4A and Giraffe 8A) and two naval variants (Sea Giraffe 1X and Sea Giraffe 4A).
- **Giraffe 8A:** At the top end of the range is the Giraffe 8A, a long-range IEEE S-band (NATO E/F) 3D sensor that can be produced in fixed, transportable and fully mobile configurations. Intended primarily for remote operation as part of an integrated air defence network, Giraffe 8A can also be operated locally. It has an instrumented range of 470 km and an altitude capability of more than 40,000m, bringing true long-range air defence capability to the Saab radar family for the first time. Giraffe 8A produces 15 stacked beams to provide elevation coverage from ground level to more than 65°. It can operate in a continuous 360° scan mode, rotating mechanically at 24rpm, or can be steered electronically across an operator-specified sector of 40° to 100°. More than 1,000 air defence tracks can be maintained, and the system also has anti-ballistic missile capability, in which case more than 100 tracks can be followed. Saab has paid special attention to Giraffe 8A's electronic counter-countermeasures properties. The radar generates very low sidelobes and incorporates sophisticated frequency agility in pulse-to-pulse, burst-to-burst and scan-to-scan regimes. It also switches and staggers pulse repetition frequency and transmits random jitter to further confuse countermeasures. It automatically selects the least jammed frequencies and can transmit intermittently or randomly. The radar offers a passive detection and tracking capability against jammers.
- **Giraffe 4A:** While the Giraffe 8A occupies the high end of the family, Saab has introduced new radars in the medium-range category in the form of Giraffe 4A and Sea Giraffe 4A for naval use. Employing similar S-band technology to the larger radar, Giraffe 4A offers true 3D multirole capability, combining the air defence and weapon locating tasks in a single unit. Able to be airlifted in a single C-130 load, Giraffe 4A can be deployed by two people in less than 10 minutes. It can operate as a standalone.
- **GIRAFFE 1X:** To complete its new line-up, Saab has introduced two short-range radars, Giraffe 1X and Sea Giraffe 1X. Working in the IEEE X-band (NATO I-band), Giraffe 1X is intended primarily as a highly mobile radar that can work with very short-range air defence systems in the battlefield or at sea. Weighing less than 300 kg, Giraffe 1X can be mounted on a small vehicle or vessel or in fixed installations such as on a building or a mast. The radar has a sense-and-warn function and can be optionally configured for weapon location.

System

Alternative Designation: Giraffe 8A Radar

Type: Multi-Mission Surveillance

Manufacturer: SAAB

Family: Giraffe Radar

In Service: INA

Crew: 2

Emplacement Time: 10 min

Displacement Time: 5 min

Multi-Role Capability: With Giraffe 8A the integrated Air Defence System will be enhanced with a sensor suite to allow constant 24/7 air surveillance over the assigned area of responsibility. The Giraffe 8A will simultaneously search for, detect, track and report short to medium range ballistic missiles.

Operational Flexibility: f the situation dictates, the commanding officer can choose between search in the entire 360° volume or an optimised search in a sector (40°-100°). Both with coverage up to 65° of elevation. *Extended range *Fast update *Low observable targets

Identification: Giraffe 8A can be offered with a set of integrated Electronic Identification capabilities: *IFF Mode 5 & S *Target Classification *Integrated Electronic Support Measures (ESM) *Passive tracking if in network

Survivability: Much emphasis has been put on ECCM performance in the design of Giraffe 8A. This includes: *Ultra-low side-lobes *Frequency agility; pulse to pulse, burst to burst, and scan to scan frequency agility *PRF switching and PRF stagger with random jitters *Intermittent (or random) transmission, to confuse hostile ESMs and Anti-Radiation Missiles *Automatic selection of least jammed frequency *Automatic jammer detection and tracking in both azimuth and elevation

Operated Locally or Remotely: Giraffe 8A is designed to be operated by remote control (primary method of operation). For local maintenance the system can be operated by a ruggedised PC in close connection to the system. The Remote

Control System is designed to give the operators full operational control of the sensor system. Although the radar system normally will operate unattended, all modes and functions can be remotely adjusted and controlled. The remote control functionality also includes system monitoring and system diagnostics.

Integrated Logistics Support (ILS): ILS is an important part of the system delivery and will form the basis for future maintenance. Saab ILS experts have solid experience in tailoring ILS deliveries together with customers worldwide.

Small Target Detection: New AESA technology allows new functionality to detect and track small targets also at longer ranges.

Dimensions

Length: INA

Note: INA

Radar System

Name: Giraffe 8A

Type: Stacked beam 3D radar

Antenna Type: AESA, digital beam forming

Frequency: S (E/F) band

Elevation Coverage: > 65 degrees

Rotation Rate: 24 RPM

Search Volume: 360° or in a sector

Air Surveillance: 470 km

Notes:

The Saab (formerly Ericsson Microwave Systems AB) Giraffe Radar is a family of land and naval two- or three-dimensional G/H-band (4 to 8 GHz) passive electronically scanned array radar-based surveillance and air defense command and control systems tailored for operations with medium- and Short Range Air Defense (SHORAD) missile or gun systems or for use as gap-fillers in a larger air defense system. The radar gets its name from the distinctive folding mast which when deployed allows the radar to see over nearby terrain features such as trees, extending its effective range against low-level air targets. The first systems were produced in 1977. By 2007, some 450 units of all types are reported as having been delivered. *Utilising identical antenna in fixed, transportable and mobile versions of the radar system *Unmatched operational performance against small targets and tactical ballistic missiles with its non-rotating mode *Offers enhanced real time identification and passive tracking functionality The Giraffe 8A is a 3D Long-Range AESA radar system on the S-band, designed for the highest level of situational awareness and ballistic missile defence. It is offered in versions for fixed, transportable and mobile applications, all providing exceptional range, search volume and multi-role capabilities, combined with outstanding operational flexibility. Today and in the future. Long-range air surveillance / early warning identification The capability to rapidly detect, track and report all air-breathing targets within the sensor coverage. Ballistic missile defence operations Detects, tracks and reports short/medium range ballistic missiles. Provides simultaneous weapons queuing and C2 reporting in order to significantly reduce time from warning to engagement. Operational in all climate zones Giraffe 8A is specified for operation in extreme climates, ranging from inland, coastal and hot desert to Arctic environments. Reliability Giraffe 8A is very reliable and easy to operate. Redundant design and the AESA concept makes the time between critical failure extremely long.

HT-233 Chinese 8x8 Self-Propelled Engagement Radar System

Tiers:

System

Alternative Designation: HT-233

Type: Engagement Radar

Manufacturer: INA

Family: INA

In Service: 2008-Present

Crew: INA

Chassis: Taian TAS-5380 series chassis

Dimensions (Chassis: TAS-5380)

Length: m11

Width: m3

Height: m3

Weight, Empty: tons18

Payload Capacity: tons20

Automotive (Chassis: TAS-5380)

Engine Name: Deutz Diesel

Engine Type: Diesel

Engine Power: hp517

Maximum Cruising Range: km800

Speed, Maximum Road: km/h80

Speed, Average Cross: km/h45

Speed Maximum Swim: Not Amphibious

Gradient: deg45

Side Slope: deg30

Vertical Step: m0.5

Trench: m1.8

Fording Depth: m1.1

Radar

Name: HT-233

Type: Engagement Radar

Phase Shifter Elements: claimed to employ 4,000 phase shifter elements.

IFF Antenna: Yes

SSR Antenna: Yes

Bandwidth: 300 MHz instantaneous bandwidth in the lower X-Band or C-Band

Detection Maximum Range: km150

Tracking Maximum Range: km100

Azimuth: deg360

Elevation Beamsteering: 0° to 65°

Number of Targets it can Track: More than 50

Active Thermal Homing: Yes

Frequency Hopping: An interesting claim by Sengupta is that the HT-233 employs “randomness in frequency, space and time”; if this claim is correct then the HT-233 would be a frequency hopper, employing pseudo-random angular scan algorithms.

Note: The radar provides target acquisition and tracking within its coverage sector, post launch missile capture, midcourse missile tracking and command link guidance.

Communications

Tactical Radio: TBR-121

Protection (Chassis: TAS-5380)

Armor: INA

Applique Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: No

Notes:

Designated as HT-233, this radar is the most advanced FCRs HQ-9 could employ, and it has greater similarities to the MIM-104 Patriot's MPQ-53 than the S-300's 30N6 (Flap-Lid) series, working in the NATO G-band (4–6 GHz) also as a search and targeting radar. This could be due to an alleged transfer of a Patriot missile to China from Israel.[12][13] The radar can search a 120 degree arc in azimuth and 0-90 degrees in elevation out to 300 km, with a peak power output on 1MW (average 60 kW). The radar is credited as being able to track 100 targets and guides up to 6 missiles to 6 targets, or alternatively, to 3 targets with a pair of missile for each target. HT-233 is the FCR used by HQ-9 that is closest to AN/MPQ-53: In comparison to earlier H-200

radar used by early models of KS-1 SAM which uses a simple horn instead of lens arrangement, HT-233 radar adopts lens arrangement of AN/MPQ-53. In comparison to SJ-231 radar used by the latest model of KS-1, HT-233 has a thousand more phase shifter on its antenna array, totaling four thousand, as opposed to the three thousand of SJ-231. In contrast, both AN/MPQ-53 & 30N6E radars have ten thousand phase shifters on their antenna arrays respectively. HT-233 radar is mounted on Tai'an TAS5501 10 x 10 high mobility cross country truck, and operates in C-band at 300 MHz. When deployed as a search radar TH-233 is fielded at brigade level, while FCR radars deployed would be SJ-212, H-200 or SJ-231.[3] HT-233 is credited with a detection range of 120 km,[14] scanning 360 degrees in azimuth and 0-65 degrees in elevation. It can track 100 targets and designate 50 for engagements.

Giraffe 75 Swedish Mobile Air Surveillance Radar

Tiers:

Variants:

- **Giraffe 40:** This is a short-range (40 kilometres (25 mi) instrumented) air defense radar with command and control capability. It employs a folding antenna mast that extends to a height of 13 metres (43 ft) when deployed and can be integrated with an Interrogation Friend or Foe (IFF) capability. Coverage is stated to be from ground level to 10,000 metres (33,000 ft) in altitude. In Swedish service the radar is designated PS-70 and PS-701 and provides target data to RBS-70 SHORADS missiles and 40mm Bofors guns. A more powerful version with a 60 kW transmitter is known commercially as Super Giraffe and in Swedish service as PS-707. These radars are no longer marketed.
- **Giraffe 50AT:** This is the model used in the Norwegian NALLADS air defense system which combines the radar and RBS-70 missiles with 20 mm anti-aircraft guns to provide low-level air defense for the combat brigades of the Norwegian army. Mounted on a BV-206 all-terrain tracked vehicle this version has an instrumented range of 50 km (31 mi). The antenna extends to a height of 7 metres (23 ft) and the system can control up to 20 firing units of guns or missiles or a combination of both. The Command and Control system features fully automatic track initiation, target tracking, target identification (IFF), target classification and designation, hovering helicopter detection threat evaluation and handling of "pop-up" targets. It can also exchange data with Giraffe 75 or AMB systems as part of a larger network.
- **Giraffe 75:** This features a 13 metres (43 ft) antenna mast and is normally carried on a 6x6 5-ton cross-country truck which carries the radar and command and control shelter. Instrumented range is 75 km (47 mi) and altitude coverage extends from ground-level to 10,000 metres (33,000 ft). An optional add-on unit extends the radars coastal defense capabilities. In Swedish service the radar is designated PS-90.[3] In the Greek Air Force Giraffe 75 is used in combination with Contraves (now Rheinmetall defense) Skyguard/Sparrow fire control systems. 1 Giraffe typically controls 2 Skyguard systems each with 2 twin 35 mm GDF-005 guns and 2 Sparrow surface-to-air missile launchers.
- **Giraffe S:** Optimized as a mobile radar for un-manned remote-controlled applications as a "gap-filler" in air defense early warning systems concentrating on small, low-flying targets over a long distance. It can also be employed as a coastal surveillance radar where targets are small surface vessels and sea-skimming missiles or aircraft. A new antenna extends range coverage to 180 km (110 mi) with altitude coverage from ground level to 6,000 metres (20,000 ft). The antenna mast extends to 8 metres (26 ft).
- **Giraffe AMB:** Giraffe Agile Multi Beam is a passive electronically scanned array radar, providing multi-beam 3-Dimensional air coverage at 5.4 to 5.9 GHz with instrumented ranges of 30 km (19 mi), 60 km (37 mi) and 100 km (62 mi), the altitude coverage is extended from ground-level to 20,000 metres (66,000 ft) with 70-degree elevation coverage. Data rate is 1-scan per-second. Its maintained pulse density suppresses high cluttering in adverse weather conditions. Ultra-low antenna side-lobes combined with pulse-to-pulse and burst-to-burst frequency agility provides some resistance to jamming. As in previous Giraffe radars automatic hovering helicopter detection is provided as is a rocket, artillery and mortar locating function, allowing the radar to detect incoming rounds and give 20 seconds or more of warning before impact. Giraffe AMB is the principal sensor of the Swedish RBS 23 BAMSE air defense missile system but is available for many other applications. The Giraffe AMB can be delivered with ground surveillance options fitted.
- **ARTE 740:** This is a coastal defense radar based on the Giraffe 75 antenna and Giraffe AMB processing system optimized for surface and low-altitude coverage for the Swedish Amphibious Forces (formerly the Coastal Artillery). It is mounted on a MOWAG Piranha 10x10 armored vehicle. 6 systems are in service.
- **Sea Giraffe AMB:** Saab's Sea Giraffe AMB is the naval variant of their Giraffe radar with 3D AMB technology. It can detect air and surface targets from the horizon up to a height of 20,000 metres (66,000 ft) at elevations up to 70°, and can simultaneously handle multiple threats approaching from different directions and altitudes, including diving anti-ship missiles. Also, it is specialized for rapidly detecting small, fast moving targets at all altitudes and small surface targets in severe clutter. Sea Giraffe AMB is installed on the Republic of Singapore Navy's upgraded Victory-class corvette and US Navy's Independence class of Littoral Combat Ships, and has the designation AN/SPS 77 V(1) for LCS 2 and 4, and AN/SPS 77 V(2) for LCS 6 and higher.

- **AESA:** Saab Electronic Defence Systems (EDS) in May 2014 unveiled two new classes of active electronically scanned array (AESA) radar—three land-based systems (Giraffe 1X, Giraffe 4A and Giraffe 8A) and two naval variants (Sea Giraffe 1X and Sea Giraffe 4A).
- **Giraffe 8A:** At the top end of the range is the Giraffe 8A, a long-range IEEE S-band (NATO E/F) 3D sensor that can be produced in fixed, transportable and fully mobile configurations. Intended primarily for remote operation as part of an integrated air defence network, Giraffe 8A can also be operated locally. It has an instrumented range of 470 km and an altitude capability of more than 40,000m, bringing true long-range air defence capability to the Saab radar family for the first time. Giraffe 8A produces 15 stacked beams to provide elevation coverage from ground level to more than 65°. It can operate in a continuous 360° scan mode, rotating mechanically at 24rpm, or can be steered electronically across an operator-specified sector of 40° to 100°. More than 1,000 air defence tracks can be maintained, and the system also has anti-ballistic missile capability, in which case more than 100 tracks can be followed. Saab has paid special attention to Giraffe 8A's electronic counter-countermeasures properties. The radar generates very low sidelobes and incorporates sophisticated frequency agility in pulse-to-pulse, burst-to-burst and scan-to-scan regimes. It also switches and staggers pulse repetition frequency and transmits random jitter to further confuse countermeasures. It automatically selects the least jammed frequencies and can transmit intermittently or randomly. The radar offers a passive detection and tracking capability against jammers.
- **Giraffe 4A:** While the Giraffe 8A occupies the high end of the family, Saab has introduced new radars in the medium-range category in the form of Giraffe 4A and Sea Giraffe 4A for naval use. Employing similar S-band technology to the larger radar, Giraffe 4A offers true 3D multirole capability, combining the air defence and weapon locating tasks in a single unit. Able to be airlifted in a single C-130 load, Giraffe 4A can be deployed by two people in less than 10 minutes. It can operate as a standalone.
- **Giraffe 1X:** To complete its new line-up, Saab has introduced two short-range radars, Giraffe 1X and Sea Giraffe 1X. Working in the IEEE X-band (NATO I-band), Giraffe 1X is intended primarily as a highly mobile radar that can work with very short-range air defence systems in the battlefield or at sea. Weighing less than 300 kg, Giraffe 1X can be mounted on a small vehicle or vessel or in fixed installations such as on a building or a mast. The radar has a sense-and-warn function and can be optionally configured for weapon location.

System

Alternative Designation: Giraffe 75; PS-90

Chassis: BV-206

Crew: ea2

Mission: The main tasks of the Giraffe 75 system can be summarised as keeping a threat adapted alert status, increasing reaction time by providing early target information and designation and making the combat of all air targets possible with air defence firing units, gun and missile. In addition, the system also co-ordinates the air defence firing units with own air movements.

Band: 5.4 GHz5.9 GHz (C-band)

Firing Posts: The truck-mounted Giraffe 75 mobile radar, also known as the PS-90 can be linked to nine RBS 70 firing posts.

Beamwidth: 8.2°vertical, 1.8°horizontal

Turning Radius: m8

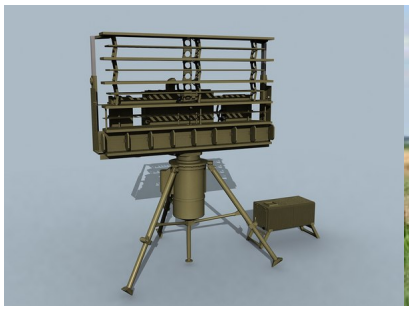
Protection

Armor: Depends on Variant. Armored variant of the Bv 206 is the Bv 206S. It has modified cabs and armor plating on all its bodywork. Recent member of the Bv 206 family is the BvS 10 improved armored version. It is new larger vehicle, with improved load capacity. The BvS 10 has the same superior mobility in difficult terrain, combined with the same speed on road.
Armor, Applique: Available
Armor, Explosive Reactive: No
Active Protection System: No
NBC Protection: Yes
Smoke Equipment: Yes

Notes:

This features a 13 metres (43 ft) antenna mast and is normally carried on a 6x6 5-ton cross-country truck which carries the radar and command and control shelter. Instrumented range is 75 km (47 mi) and altitude coverage extends from ground-level to 10,000 metres (33,000 ft). An optional add-on unit extends the radars coastal defense capabilities. In Swedish service the radar is designated PS-90. In the Greek Air Force Giraffe 75 is used in combination with Contraves (now Rheinmetall defense) Skyguard/Sparrow fire control systems. 1 Giraffe typically controls 2 Skyguard systems each with 2 twin 35 mm GDF-005 guns and 2 Sparrow surface-to-air missile launchers.

1L122-1E Russian Man-Portable Air Defense Radar



Tiers:

Variants:

- **1L122–2E:** The larger one, 1L122–2E is a compact mobile solid-state 3D radar which is designed to perform necessary “information support function” for short- and medium-range air defense weapon systems, as well as for controlling and directing aerial traffic at make-shift airfields. These functions can be executed at short notice, in complacent to military’s force mobilization plans. The radar’s detection envelope (range) is between 1–80 km. The 1L122–2E is a vehicular variant that features a mast, which is extended when the vehicle is not moving and, when retracted, allows the radar to operate on the move. 1L122–2E is recommended to replace currently available target acquisition radars such as P-15, P-18, P-19, and others used to provide information support for the Pechora, Kvadrat, and Osa surface-to-air missile (SAM) systems.

System

Alternative Designation: 1L122–1E
Type: Man-Portable Air Defense Radar
Crew: ea2
Targets: v1L122–1E’s main task is to detect, position, and track aircraft, cruise missiles, and unmanned aerial vehicles, conduct friend-or-foe identification and automatically transmit tracking data to the automated control system.
Installation: Other provisions made in the design include installation on any mobile chassis and deployment of the radar head to a distance of up to 300 m from the carrier to be controlled remotely.
Radar Detection Range: 1-40 km
Target Tracking Speed: The 1L122-1E (1L122-2E) radar makes it possible to detect the indicated types of air targets flying at a speed of up to 700 m / s
Detection Zone Azimuth: 360 deg
Detection Zone Elevation: -5 (0) - +45 (60) degrees
Effective Dispersion Area (EPR): the mean square errors of determining the coordinates of a single target with an effective dispersion area (EPR) of 1 square m.
Displacement Time: INA
Emplacement Time: INA
Data Update Rate: 2 (4) or 4 (10) s

Dimensions

Antenna Length: 1200 mm

Antenna Width: 800 mm

Weight, Combat: kg30

Notes:

On July 3, 2018, Russia unveiled two air-defense radars of 1L122 series which able to detect a variety of targets including aircraft, helicopters, cruise missiles, and unmanned aerial vehicles (UAVs). Russia is developing these small radar hardware for a decade to supports its man-portable air defense systems and to create a robust command station with automation at field-level. The introduction of such hardware allows the troops to receive more precise target data. The radars are developed by Nizhny Novgorod Research Institute of Radio Engineering (NNIIRT). The series mainly consists of two variants — 1L122–1E (1Л122–1E) operating at L band frequency and 1L122–2E (1Л122–2E) operating at UHF frequency. 1L122–1E The smaller one, 1L122–1E's main task is to detect, position, and track aircraft, cruise missiles, and unmanned aerial vehicles, conduct friend-or-foe identification and automatically transmit tracking data to the automated control system. In its portable configuration (1L122–1E), the radar can be rapidly delivered to an assigned point, even in a hard-to-reach location. The set is broken down into several units, each weighing not more than 30 kg, which permits delivery by airdrop as well as any other mode of transportation. Other provisions made in the design include installation on any mobile chassis and deployment of the radar head to a distance of up to 300 m from the carrier to be controlled remotely. The radar's detection envelope (range) is between 1–40 km. In 2014, GAZ Tigr chassis-mounted anti-aircraft command module with 1L122E radar was unveiled at Oboronexpo 2014, a defense exhibition in Moscow.

1L119 Nebo-SVU Russian Early Warning / Target Acquisition Anti-Stealth Radar

Tiers:

System

Manufacturer: Nizhny Novgorod Research Institute of Radio Engineering (Russian acronym: NNIIRT)

Mission: Detecting and tracking Very Low Observable (VLO) and Low Observable (LO) aircraft designs

Crew: 4

Vehicles: 2

Detection Range: km500

Band: VHF

Deployment Time: min20

Tracking Range: km200

Tracking accuracy: 0.5 degrees in azimuth, and 1.5 in elevation, making it suitable as an acquisition radar for the S-300PMU1/2 and S-400 systems

Characteristics: Solid state phased array with electronic beam-steering in azimuth and elevation, it is considerably more accurate than its predecessor, it has much better mobility, and incorporates a wide range of improvements. It retains the VHF element design, but uses vertical polarization.

Detection range for aircraft and ballistic targets with RCS of 1 m2, km:: At 0.5 km altitude, km 65. At 10 km altitude, km 270. At 20 km altitude, km 380.

Measurement Accuracy:: Range, 200m. Azimuth, 30 arc minimum. Elevation angle, 1.5 (within 3 to 45 deg elevation angle range).

Maximum number of tracks: 100

Mean Time Between Failure: hours500

Mean Time to Repair Mean: hour.5

Power Consumption: kPH30

Dimensions

Height of Radar: m6

Length of Radar: m60

Notes:

The Nebo-SVU is part of the Nebo family of Very High Frequency (VHF) 2D and 3D mobile surveillance radars which also includes the 55G6-1 Nebo 3D radar and 1L13-3 Nebo-SV 2D radar both deployed in the 1990s. The Nebo-SVU phased array radar is designed to automatically detect, determine the coordinates and track airborne targets such as rotary- and fixed-wing aircraft, ballistic missiles, stealth aircraft, unmanned aerial vehicles and hypersonic cruise missiles. Besides, the radar system also provides Identification Friend or Foe (IFF) and detection of active electronic countermeasures (ECM) capabilities. Advanced digital signal techniques allow to suppress natural clutter and active jammers. The Nebo-SVU is capable of relying target information and air surveillance data to air defense systems and command centers. It entered service with the Russian Air Force in 2004 and has been exported at least to one undisclosed customer. The Nebo-SVU radar comprises antennas and electronic equipment, mounted on a semi-trailer; and the autonomous electric power plant, based on the ED-2x30-T400-1RA1M4 diesel-engine power plant, carried by the Kamaz truck. The radar system can operate in various climates with temperatures ranging from +50 Celsius to -50 Celsius, air humidity of 98%. It can detect a fighter aircraft with a radar cross section (RCS) of 2.5 square meters at 50 kilometers flying at 500 meters of altitude, at 250 kilometers flying at 10,000 meters or at 350 kilometers flying at 20,000 meters. It can detect ballistic targets at altitudes of up to 180 kilometers. Overall, the Nebo-SVU radar can track in excess of 100 airborne targets simultaneously.

64N6E (Big Bird) Russian Ballistic Missile Intercept Radar

Tiers:

1 **2** 3 4

System

Alternate Designations: NATO designation: Tombstone

Design: Radar is mounted on the cabin of the trailer and a turntable, allowing 360 degree rotation.

↳*Radar*

Radar Type: S-Band phased array search and acquisition

Target Detecting Capability: Can detect up to 200 targets simultaneously

Target Tracking Ability: Either 6 or 12 targets maximum depending on the number of antennas being used.

Band of Operation: 2 GHz

Azimuth of Operation: 360 with both antennas

Detection Range: 140-150 nautical miles

Time required to be ready to track from the march: 5 minutes

Notes:

Used for the detection of aerial targets and ballistic missiles and works in conjunction with the SA-10A Grumble or the SA-20 Gargoyle surface to air missile systems. 30% larger aperture than the U.S. Navy's SPY-1 Aegis radar. Unlike Western phased arrays in this class, the 64N6 uses a reflective phased array with a front face horn feed, the horn placed at the end of the long boom which protects the waveguides to the transmitters and receivers in the cabin. The beam steering electronics are embedded inside the antenna array, which has around 2700 phase elements on either face. This Janus faced arrangement permits the Big Bird to concurrently search two 90 degree sectors, in opposite directions, using mechanical rotation to position the antenna and electronic beam steering in azimuth and elevation. This design technique permits incremental growth in output power as the only components of the system which have to handle high microwave power levels are the waveguide and feed horn. The 64N6E is a frequency hopper, and incorporates additional auxiliary antenna/receiver channels for suppression of sidelobe jammers - NIIP claim the ability to measure accurate bearing to jamming sources. The back end processing is Moving Target Indicator (MTI), and like the Aegis the system software can partition the instantaneous sector being covered into smaller zones for specific searches. To enhance MTI performance the system can make use of stored clutter returns from multiple preceding sweeps. Detection ranges for small fighter targets are of the order of 140 to 150 nautical miles for early variants. Per 12 second sweep 200 targets can be detected, and either six or twelve can be individually tracked for engagements. While the Big Bird provides an excellent acquisition capability against aerial and ballistic missile targets, the 5V55 missile was inadequate. The S-300PM/PMU1 introduced the 48N6 which has much better kinematics - cited range against aerial targets is 81 nautical miles, ballistic missile targets 21.5 nautical miles, with a minimum engagement range of 1.6 to 2.7 nautical miles. Low altitude engagement capabilities were improved - down to 20 - 30 ft AGL. The missile speed peaks at 2,100 metres/sec or cca Mach 6. The missiles can be fired at 3 second intervals, and Russian sources claim a single shot kill probability of 80% to 93% for aerial targets, 40% to 85% for cruise missiles and 50% to 77% for TBMs.

64N6 (Big Bird) Russian Surveillance and Target Acquisition Radar

Tiers:

Variants:

- **91N6E:** This is an upgraded derivative of the 64N6 Big Bird radar system developed for the S-400 surface-to-air missile system. It has a fully digital design with a higher peak power rating than its predecessor to accommodate longer-range 48N6E3 and 40N6E missiles.

64N6 (Big Bird) Surveillance Radar

↳System

Alternative Designations: 64N6 (NATO designation Big Bird)
Name: 64N6 (Big Bird) Surveillance Radar
Type: Designation Radar
Crew: ea6
Weight: 60,000 kg
Band: 2 GHz
Coverage Azimuth: 360 deg or 180 deg
Elevation Detection Mode: deg13.4
Elevation Tracking Mode: deg28
Ballistic Target Detection Sector Azimuth: deg60
Ballistic Target Detection Sector Elevation: 0-55 deg; or 20-75 deg
64N6E2: 0-75 deg
Detection Range (Mig-21 Type Target): km260
Detection Range, Ballistic Target: km127

Accuracy Range: m150

Accuracy Azimuth: deg0.5

Accuracy Elevation: deg0.5

Tracking: 200 targets simultaneously

Scan Rate: sec12

Emplacement Time: 5 min

Displacement Time: INA

Mount: The 64N6 BIG BIRD is mounted on a large trailer along with a generator and typically towed with the now familiar 8-wheeled truck

Automotive

Mount: Trailer

Prime Mover: Both elements are mounted on a 60-ton truck consisting of the Type 74106 tractor and the Type 9988 semi-trailer

Communications

VHF Radio: R-168 Akveduk

HF Radio: R-161 Poisk

Notes:

The 64N6 (NATO codename 'Tombstone') 3-D long-range surveillance radar comprises a hydraulically raised antenna assembly and radar shelter mounted on a common semi-trailer. The phased-array antenna set has a double-sided antenna aperture. Its 3-D performance is obtained by rotation of the antenna once every 12 seconds and electronically scanning the antenna beam, in both azimuth and elevation. Scan sector capability for detecting tactical ballistic missiles is also provided. This can detect aircraft and cruise missile type targets at a range of up to 300 km and ballistic missiles with launching ranges of up to 1,000 km using the sector scan facility. An IFF transponder subsystem is fitted. The radar is used for target detection and tracking in normal, clutter and severe ECM environments. The data obtained are relayed to the command post for processing and assessment. The radar can detect targets with speeds of up to 2,788 m/s (10,000 km/h). The export designation of the system is 83M6E. The S-300PMU-2 system designation is 83M6E2. The Air Defense 64N6 (NATO code designation of Big Bird or Tombstone) is a mobile radar detection station with bilateral antenna, automatic control of modes and data, working in a centimetric range of frequencies. It is intended for maintenance with 54N6 radar-tracking information system and 83N6 control facilities for the S-300PM. The 64N6 provides detection of the air targets with resolution, accuracy of definition of coordinates and rate of updating of the data, allowing tracking of targets, follow the trajectory without difficulty, and overcome active and passive countermeasures, definition of the state accessory(belonging) of the found out purposes, and also directions of active countermeasures. Electronic scanning by a beam of illuminators in azimuthal and elevation planes in a combination to fast switching the sides of radiation of illuminators and uniform electromechanical rotation of illuminators on an azimuth allows redistribution of radiated energy in separate directions and sectors of a zone of the review due to temporary expenses for the review of various sites of space depending on radar-tracking conditions, to divide(undresse) visibility range into a zone of the regular review and a zone of support, to optimize time allocation for air defense due to use of procedures of detection in a combination with a mode of selection of the moving target. Borders of action are established for height and range by operators or automatically. Protection against active countermeasures is provided with automatic reorganization of carrying frequency by results of the analysis of tracking conditions. For protection against the active countermeasures operating on lateral petals of the diagram of an orientation of antennae, the three-channel self-balancing potentiometer connected to compensatory aerials is used. Protection against passive countermeasures is made due to use of equipment SDTS. Temporary automatic adjustment of amplification is applied to reduce the quantity of false tracks in a near zone (up to 65 km) in the channel of detection, in a distant zone - the scheme of stabilization of a level of false alarms. To reduce the quantity of false returns from subjects on district and the inactive purposes it is applied intersurvey the signals received from same sites of space during several periods of the review. Management of air defense work and devices entering into it, processing of the radar-tracking information and definition of coordinates of the purposes is carried out by a computer constructed on the basis of two specialized computers. The built in monitoring system checks functioning the equipment and defines malfunctions. The structure of the command post includes means of speech communication, and also the broadband communication line 5?312 for transfer of the information on a radio channel or on a cable. It is completed by means of independent electrosupply into which structure enters the unit

producing the electric power of a three-phase alternating current by frequency of 400 Hz by a voltage of 220 Volts given means of external power supplies can be used the converting device and diesel power station. Equipment is placed in two containers F6 (the illuminators, transmitting and reception devices and devices for processings of information and management), installed on the lorry convoy tractor MAZ-74106. The system is served by fighting calculation from 4 person. Its weight is 60 tons

Type 305A (LLQ305A) Chinese Self-Propelled 3D Acquisition Radar

Tiers:

1 **2** 3 4

System

Alternative Designation: Type 305A; LLQ305A
Type: Self-Propelled 3D Acquisition Radar
Crew: INA
Chassis: Mercedes-Benz NG 80
Mssion: Chinese sources have identified the radar as a long range 3D high altitude acquisition and search design, intended to support missile guidance applications.
Maximum Range: INA
Minimum Range: INA
Maximum Altitude: INA
Minimum Altitude: INA
Note: Very little info is released about this radar other than it can also act as Fire-control radar.

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

The new Type 305A 3D acquisition radar is unique and does not resemble any known Chinese radar designs. It is carried on the same Mercedes-Benz NG 80 derived chassis as the Type 120 and Type 305B radars. The antenna design physically resembles existing Western S-band AESAs such as the Thales Ground Master series, or the very much larger Israeli IAI/Elta EL/M-2080 Green Pine ABM radar series. The depth of the primary antenna and its structural frame is typical for AESA designs in this category, using a stacked modular feed network arrangement; this is well documented in a number of Russian AESA designs. The rear face of the antenna frame is largely occupied with voluminous equipment housings, of similar depth to the antenna frame itself, and of equal height. These would be consistent with the installation of low voltage AESA power supplies, cooling equipment, receiver, and exciter hardware. China's industry has previously designed and built large AESAs, specifically for the KJ-200 and KJ-2000 AWACS projects, operating either in the L-Band or S-Band, so the basic technology is available to construct a ground based radar in this category. Chinese sources have identified the radar as a long range 3D high altitude acquisition and search design, intended to support missile guidance applications. This type of functionality is consistent with a number of extant dual role acquisition radars, built to support long range acquisition of aerial targets at medium to high altitudes, and

acquisition of Tactical Ballistic Missile (TBM) category targets. In recent years claims have emerged of an intended ABM or ATBM role for the HQ-9, but no evidence of a suitable acquisition radar for this purpose was ever provided. If the Type 305A is what it appears to be, then it would be the kind of radar required for a ATBM acquisition capability. Until further disclosures are made, deeper analysis of the Type 305A would be largely speculative.

9S80 (Dog Ear) Russian Target Acquisition Radar System

Tiers:

1 2 **3** 4

System

:
:
:

↳*9S80 Dog Ear Radar System*

Name: 9S80 Dog Ear Radar System
Type: Acquisition Radar
Chassis: MT-LB
Function: The radar supplies target alerting information to the SA-13 Gopher (Russian 9K35 Strela-10) surface-to-air missile (SAM) system.
Antenna Type: open-mesh, rounded-rectangle parabolic antenna.
Vehicle Mount: The Dog Ear (with the Russian designation of 9S80) is a Russian ground-based, target-acquisition radar mounted on an MT-LB multi-purpose tracked vehicle or MT-LBu armored command and reconnaissance vehicle (ACRV).
Band: F-G (3-6 GHz)
Maximum Range, Acquisition: km80
Maximum Range, Tracking: km35
Note #1: Target acquisition requires a separate vehicle mounting a Dog Ear** forward alerting radar.
Note #2: Deployment usually involves one system for each air defense battery/battalion.

Dimensions (MT-LB)

Length: 6.45 m
Width: 2.85 m
Height: 1.87 m
Ground Clearance: 400 mm
Length of Track on Ground: 3.80 m

Track Width: 350 mm

Automotive (MT-LB)

Engine Name: 1 x YaMZ 238V

Engine Type: V-8 diesel engine

Engine Power: 240 hp at 2,100 rpm

Transmission: manual w/1 reverse gear and 6 forward gears

Fuel: 450 liters

Suspension: torsion bar, 6 road wheels, front drive, rear idler, 2 shock absorbers, no return rollers

Maximum Speed, Road: 62 km/h

Maximum Speed, Water: 6 km/h

Range: 500 km

Gradient: %60

Side Slope: %30

Vertical Obstacle: 0.70 m

Trench: 2.70 m

Fording: Amphibious

Protection

Armor: 7-14 mm maximum

Applique Armor: INA

Active Protection System: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

The Dog Ear (with the Russian designation of 9S80) is a Russian ground-based, target-acquisition radar mounted on an MT-LB multi-purpose tracked vehicle or MT-LBu armored command and reconnaissance vehicle (ACRV). It uses an open-mesh, rounded-rectangle parabolic antenna. The radar supplies target alerting information to the SA-13 Gopher (Russian 9K35 Strela-10) surface-to-air missile (SAM) system. Deployment usually involves one system for each air defense battery/battalion.

PRV-11 (Side Net) Russian Height-Finder Radar System

Tiers:

System

:
:
:

↳*PRV-11 (SIDE NET) Radar System*

Name: PRV-11 (SIDE NET) Radar
Function: Height Radar
Frequency: E band, 2.7 GHz
Length: m4
Width: m6
Crew: INA
Pulse Repetition Time (PRT): 3 and 1,3 ms
Pulsewidth: 3 and 1.5 µs
Pulse Repetition Frequency (PRF): 330 and 730 Hz
Peak Power: 1.2 MW
Average Power: 1.3 kW
Maximum Range: km28
Maximum Altitude: km32
Associated Weeapon System: SA-2/3/5
Displacement Time: INA
Emplacement Time: INA

Notes:

The PRV-11 radar (NATO name: SIDE NET) is a mobile, nodding height-finding radar operating in the E Band. The PRV-11 is a mobile, van-mounted mobile radar. It features clutter and asynchronous jamming protection. Weapons systems associated with the P-37 include the SA-2 GUIDELINE, SA-3 GOA and SA-5 GAMMON.

Giraffe AMB Swedish Air Surveillance and Ground Based Air Defence

Tiers:

Variants:

- **Giraffe 40:** This is a short-range (40 kilometres (25 mi) instrumented) air defense radar with command and control capability. It employs a folding antenna mast that extends to a height of 13 metres (43 ft) when deployed and can be integrated with an Interrogation Friend or Foe (IFF) capability. Coverage is stated to be from ground level to 10,000 metres (33,000 ft) in altitude. In Swedish service the radar is designated PS-70 and PS-701 and provides target data to RBS-70 SHORADS missiles and 40mm Bofors guns. A more powerful version with a 60 kW transmitter is known commercially as Super Giraffe and in Swedish service as PS-707. These radars are no longer marketed.
- **Giraffe 50AT:** This is the model used in the Norwegian NALLADS air defense system which combines the radar and RBS-70 missiles with 20 mm anti-aircraft guns to provide low-level air defense for the combat brigades of the Norwegian army. Mounted on a BV-206 all-terrain tracked vehicle this version has an instrumented range of 50 km (31 mi). The antenna extends to a height of 7 metres (23 ft) and the system can control up to 20 firing units of guns or missiles or a combination of both. The Command and Control system features fully automatic track initiation, target tracking, target identification (IFF), target classification and designation, hovering helicopter detection threat evaluation and handling of "pop-up" targets. It can also exchange data with Giraffe 75 or AMB systems as part of a larger network
- **Giraffe 75:** This features a 13 metres (43 ft) antenna mast and is normally carried on a 6x6 5-ton cross-country truck which carries the radar and command and control shelter. Instrumented range is 75 km (47 mi) and altitude coverage extends from ground-level to 10,000 metres (33,000 ft). An optional add-on unit extends the radars coastal defense capabilities. In Swedish service the radar is designated PS-90.[3] In the Greek Air Force Giraffe 75 is used in combination with Contraves (now Rheinmetall defense) Skyguard/Sparrow fire control systems. 1 Giraffe typically controls 2 Skyguard systems each with 2 twin 35 mm GDF-005 guns and 2 Sparrow surface-to-air missile launchers.
- **Giraffe S:** Optimized as a mobile radar for un-manned remote-controlled applications as a "gap-filler" in air defense early warning systems concentrating on small, low-flying targets over a long distance. It can also be employed as a coastal surveillance radar where targets are small surface vessels and sea-skimming missiles or aircraft. A new antenna extends range coverage to 180 km (110 mi) with altitude coverage from ground level to 6,000 metres (20,000 ft). The antenna mast extends to 8 metres (26 ft).
- **Giraffe AMB:** Giraffe Agile Multi Beam is a passive electronically scanned array radar, providing multi-beam 3-Dimensional air coverage at 5.4 to 5.9 GHz with instrumented ranges of 30 km (19 mi), 60 km (37 mi) and 100 km (62 mi), the altitude coverage is extended from ground-level to 20,000 metres (66,000 ft) with 70-degree elevation coverage. Data rate is 1-scan per-second. Its maintained pulse density suppresses high cluttering in adverse weather conditions. Ultra-low antenna side-lobes combined with pulse-to-pulse and burst-to-burst frequency agility provides some resistance to jamming. As in previous Giraffe radars automatic hovering helicopter detection is provided as is a rocket, artillery and mortar locating function, allowing the radar to detect incoming rounds and give 20 seconds or more of warning before impact. Giraffe AMB is the principal sensor of the Swedish RBS 23 BAMSE air defense missile system but is available for many other applications. The Giraffe AMB can be delivered with ground surveillance options fitted. A

skilled crew can deploy the radar in around 10 minutes and recover it in around 6 minutes.

- **ARTE 740:** This is a coastal defense radar based on the Giraffe 75 antenna and Giraffe AMB processing system optimized for surface and low-altitude coverage for the Swedish Amphibious Forces (formerly the Coastal Artillery). It is mounted on a MOWAG Piranha 10x10 armored vehicle. 6 systems are in service.
- **Sea Giraffe AMB:** Saab's Sea Giraffe AMB is the naval variant of their Giraffe radar with 3D AMB technology. It can detect air and surface targets from the horizon up to a height of 20,000 metres (66,000 ft) at elevations up to 70°, and can simultaneously handle multiple threats approaching from different directions and altitudes, including diving anti-ship missiles. Also, it is specialized for rapidly detecting small, fast moving targets at all altitudes and small surface targets in severe clutter. Sea Giraffe AMB is installed on the Republic of Singapore Navy's upgraded Victory-class corvette and US Navy's Independence class of Littoral Combat Ships, and has the designation AN/SPS 77 V for LCS 2 and 4, and AN/SPS 77 V for LCS 6 and higher. It has also been chosen for the Royal Canadian Navy's new Protecteur-class Joint Support Ships. The radar has an instrumented range of 180 kilometres. Its roles include: *Air surveillance and tracking *Surface surveillance and tracking *Target identification for weapon systems *High-resolution splash spotting
- **AESA:** Saab Electronic Defence Systems (EDS) in May 2014 unveiled two new classes of active electronically scanned array (AESA) radar—three land-based systems (Giraffe 1X, Giraffe 4A and Giraffe 8A) and two naval variants (Sea Giraffe 1X and Sea Giraffe 4A).
- **Giraffe 8A:** At the top end of the range is the Giraffe 8A, a long-range IEEE S-band (NATO E/F) 3D sensor that can be produced in fixed, transportable and fully mobile configurations. Intended primarily for remote operation as part of an integrated air defence network, Giraffe 8A can also be operated locally. It has an instrumented range of 470 km and an altitude capability of more than 40,000m, bringing true long-range air defence capability to the Saab radar family for the first time. Giraffe 8A produces 15 stacked beams to provide elevation coverage from ground level to more than 65°. It can operate in a continuous 360° scan mode, rotating mechanically at 24rpm, or can be steered electronically across an operator-specified sector of 40° to 100°. More than 1,000 air defence tracks can be maintained, and the system also has anti-ballistic missile capability, in which case more than 100 tracks can be followed. Saab has paid special attention to Giraffe 8A's electronic counter-countermeasures properties. The radar generates very low sidelobes and incorporates sophisticated frequency agility in pulse-to-pulse, burst-to-burst and scan-to-scan regimes. It also switches and staggers pulse repetition frequency and transmits random jitter to further confuse countermeasures. It automatically selects the least jammed frequencies and can transmit intermittently or randomly. The radar offers a passive detection and tracking capability against jammers.
- **Giraffe 4A:** While the Giraffe 8A occupies the high end of the family, Saab has introduced new radars in the medium-range category in the form of Giraffe 4A and Sea Giraffe 4A for naval use. Employing similar S-band technology to the larger radar, Giraffe 4A offers true 3D multirole capability, combining the air defence and weapon locating tasks in a single unit. Able to be airlifted in a single C-130 load, Giraffe 4A can be deployed by two people in less than 10 minutes. It can operate as a standalone.
- **GIRAFFE 1X:** To complete its new line-up, Saab has introduced two short-range radars, Giraffe 1X and Sea Giraffe 1X. Working in the IEEE X-band (NATO I-band), Giraffe 1X is intended primarily as a highly mobile radar that can work with very short-range air defence systems in the battlefield or at sea. Weighing less than 300 kg, Giraffe 1X can be mounted on a small vehicle or vessel or in fixed installations such as on a building or a mast. The radar has a sense-and-warn function and can be optionally configured for weapon location.

System

Alternative Designation: Giraffe AMB
Date of Introduction: INA
Proliferation: INA
Type: Air Surveillance and Ground Based Air Defence
Manufacturer: SAAB
Family: Giraffe Radar
In Service: INA
Crew: INA
Emplacement Time: 10 min
Displacement Time: 5 min
Maintaining Air Situational Awareness: Maintaining air situational awareness Integrated medium- and short-range GBAD systems are supported in multiple simultaneous engagements. The Giraffe AMB can classify and track fixed wing, helicopter, surface, jammer and ballistic targets. The Giraffe AMB medium-range 3D radar surveillance system is an ideal gap filler that provides airspace commanders with the capabilities needed for maintaining continuous and accurate air situational

awareness. It is a mobile deployable or fixed asset for air surveillance that can be operated remotely or locally with the ability to provide a networked air picture. Giraffe AMB allows for standard or customised data link integration.

Assuring Ground-Based Air Defence Capabilities: By combining a true multi-mission radar system and powerful C3 system Giraffe AMB delivers an accurate air picture with high update rate and highly automated functions for planning, threat evaluation, weapon assignment and target distribution. Everything the commander responsible for GBAD needs for safeguarding people and assets. Giraffe AMB can detect fast missiles and small UAVs even in high-clutter environments and offers flexible integration of weapon systems and tactical data links. The system is fully self-contained with all support systems and C3, highly mobile and deploys in less than 10 minutes.

Proven Multi-Mission Capability: *Provides simultaneous air surveillance, GBAD target acquisition and sense & warn capabilities without performance degradation *Combat-proven over more than 150,000 h in full operation *Is a mobile deployable or fixed asset for air surveillance *Can be delivered with surface surveillance add-ons

Detection Capability: *Covers the entire search volume every second *Superior small, slow and low target detection capability *Accurate 3D data for all targets in the search volume *All-weather performance with maintained range coverage *Detection of very low- and high-altitude targets

Force and Asset Protection: *360˚ detection and tracking of small ballistic objects (shells and rockets) even in severe ground clutter *Prediction of impact location *Automatic warning generated before impact in protected area

C3: *Provides engagement-quality Recognized Air Picture (RAP) target data *Integrated air picture with Link 11B and Link 16 *Automatic threat evaluation and weapon assignment *Able to handle multiple defended assets and various types of firing units *Can be delivered with military Air Traffic Control

Flexibility and Mobility: *Deployment in less than 10 minutes and teardown in less than 5 minutes 12 m antenna height offers freedom of deployment. *Operated remotely or locally *Fully self-contained single vehicle configuration *20ft ISO container cabin, C-130 transportable *Offers full mission flexibility through unparalleled *Support services with low and predictable cost of ownership

Integrated Logistics Support (ILS): ILS is an important part of the system delivery and will form the basis for future maintenance. Saab ILS experts have solid experience in tailoring ILS deliveries together with customers worldwide.

Radar System

Name: Giraffe AMB

Type: Stacked beam 3D radar

Antenna Type: 3D phased array, digital beam forming

Frequency: C (G/H)-band

Elevation Coverage: > 70 degrees

Rotation Rate: 60 RPM

Search Volume: 360° or in a sector

Instrumented Range: 120 km

Notes:

The Saab (formerly Ericsson Microwave Systems AB) Giraffe Radar is a family of land and naval two- or three-dimensional G/H-band (4 to 8 GHz) passive electronically scanned array radar-based surveillance and air defense command and control systems tailored for operations with medium- and Short Range Air Defense (SHORAD) missile or gun systems or for use as gap-fillers in a larger air defense system. The radar gets its name from the distinctive folding mast which when deployed allows the radar to see over nearby terrain features such as trees, extending its effective range against low-level air targets. The first systems were produced in 1977. By 2007, some 450 units of all types are reported as having been delivered. In combat situations, event protection operations or other tense situations, real-time information is critical for protecting forces against threats from the air. When every second counts, the Giraffe AMB surface radar provides the information and time needed for protecting both people and assets. *Covers the entire search volume every second *Provides engagement-quality Recognized Air Picture (RAP) target data *Combat-proven 24/7 capability with more than 150,000 h in full operation *Full mission flexibility through unparalleled support services *High degree of interoperability and is designed for low and predictable cost of ownership Giraffe AMB delivers key capabilities as part of short- and medium-range surveillance and Ground Based Air Defence (GBAD). It integrates powerful 3D surveillance radar and C3 functionality in one and the same system and provides forces with swift understanding of the air situation, enabling immediate and effective response to changing threats, new tactics, and shifting operational conditions. The system monitors the air volume 360 degrees for air targets and simultaneously locates and warns against incoming rocket, artillery and mortar rounds, and at the same time able to provide coastal surveillance. Large volume C-UAS surveillance Features include Saab’s unique function for enhanced low, slow and small (ELSS) target detection, which provides a dedicated counter-unmanned aerial vehicle (UAV) capability.

Kabina 66/5n87 (Back Trap) 3D Long-Range Radar System

Tiers:

System

Alternative Designation: Kabina 66/5n87; NATO: Back Trap
Type: 3D Long-Range Radar System
Crew: INA
Chassis: The BACK TRAP is a van-mounted mobile radar.
Weapon System Associated with the Back Trap Radar: Weapons systems associated with the BACK TRAP include the SA-5 GAMMON.
Band: "E/F" Band
Frequency: 1.98-2.45 GHz
Power Output: 32 kW (average), 1.5 MW (peak) (some sources report up to 2.4 MW peak power)
PRF: 60-1460 Hz
Range Resolution: 1.7 km (range)/1 degree (azimuth)
On/Off time: INA
Detection Ranges, 1 m2 RCS target at 200 m Altitude: 50 km
Detection Ranges, 1 m2 RCS target at 400 m Altitude: 200 km
Detection Ranges, 1 m2 RCS target at 600 m Altitude: 310 km
Detection Ranges, 1 m2 RCS target at Maximum Range: 450 km (380 km for fighter sized target)

Dimensions

Length: INA

Width: INA

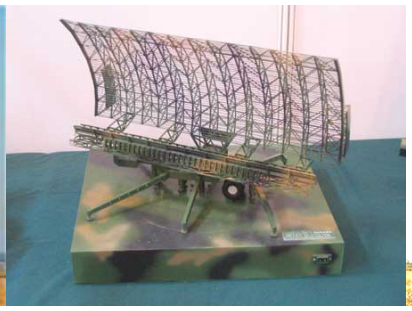
Height: INA

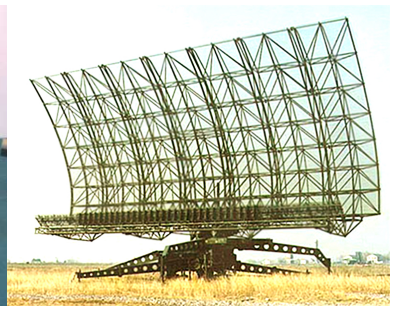
Weight, Combat: INA

Notes:

Air defense radar unit of the former Soviet Union Interesting at this radar unit is the diametral attachment of 2 antenna systems. Every antenna is meant for another elevation angle. Since two equal radar units always turned a location synchronously, four height ranges were felt therefore (like a Stacked- Beam- Antenna). The Kabina 66 was coupled with several height-finders (2 - 4 height-finders PRV-13 or PRV-17). The frequency is processed with four impulses but only two of these are transmitted. Two radar units work synchronously as a couple but also separate operation is possible. The rotary drive is hydraulically carried out. The power supply (300 kW / 400 Hz) is carried out of convertor or with diesel engines. A transfer needs 19 railroad plate freight cars.

YLC-4 Chinese 2D Long-Range Surveillance Radar





Tiers:

System

Alternative Designation: YLC-4
Type: 2D Long-Range Surveillance Radar
Crew: INA
Frequency Range: 216~220 MHz
RMAX: 380 km
Coverage Azimuth: 0° < 360°
Coverage Elevation: 0° < 25°
Reliability MTBFC: => 500 hours
Reliability MTTR: <= 0.5 hours
Aperture: 16.5 x 7.12 m Super cosecant square beam in elevation
Peak Power: ~50 kW
Pulse Width/Duty Cycle: 2 usec / 13%
Sweep Rate: ~10 sec
Sideslobes: < -30dB
Processing/MTI Improvement Factor: Digital AMTI / 41 dB
Clutter Rejection: ~45 dB
Power Requirements: 2 x 120 kW diesel generators

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

YLC-4 is a Chinese UHF solid-state, fully coherent 2D long range surveillance radar, which is mainly used for long range surveillance. The radar has the ability to synthesize data from up to four other radars with a large data capacity, and to communicate and display the data and state of the system through the net to realize remote control and detection. When equipped with height-finding radar, it can perform the function of guidance and providing target data for an air traffic control system. With long range detection range, high reliability and easy maintenance, YLC-4 radar is a main radar in air defense network. The manufacturer of the system is Nanjing Research Institute of Electronics Technology (NRIET)/Nanjing Institute No. 1.

Giraffe 4A Swedish Multi-Mission Surveillance Radar

Tiers:

Variants:

- **Giraffe 40:** This is a short-range (40 kilometres (25 mi) instrumented) air defense radar with command and control capability. It employs a folding antenna mast that extends to a height of 13 metres (43 ft) when deployed and can be integrated with an Interrogation Friend or Foe (IFF) capability. Coverage is stated to be from ground level to 10,000 metres (33,000 ft) in altitude. In Swedish service the radar is designated PS-70 and PS-701 and provides target data to RBS-70 SHORADS missiles and 40mm Bofors guns. A more powerful version with a 60 kW transmitter is known commercially as Super Giraffe and in Swedish service as PS-707. These radars are no longer marketed.
- **Giraffe 50AT:** This is the model used in the Norwegian NALLADS air defense system which combines the radar and RBS-70 missiles with 20 mm anti-aircraft guns to provide low-level air defense for the combat brigades of the Norwegian army. Mounted on a BV-206 all-terrain tracked vehicle this version has an instrumented range of 50 km (31 mi). The antenna extends to a height of 7 metres (23 ft) and the system can control up to 20 firing units of guns or missiles or a combination of both. The Command and Control system features fully automatic track initiation, target tracking, target identification (IFF), target classification and designation, hovering helicopter detection threat evaluation and handling of "pop-up" targets. It can also exchange data with Giraffe 75 or AMB systems as part of a larger network
- **Giraffe 75:** This features a 13 metres (43 ft) antenna mast and is normally carried on a 6x6 5-ton cross-country truck which carries the radar and command and control shelter. Instrumented range is 75 km (47 mi) and altitude coverage extends from ground-level to 10,000 metres (33,000 ft). An optional add-on unit extends the radars coastal defense capabilities. In Swedish service the radar is designated PS-90.[3] In the Greek Air Force Giraffe 75 is used in combination with Contraves (now Rheinmetall defense) Skyguard/Sparrow fire control systems. 1 Giraffe typically controls 2 Skyguard systems each with 2 twin 35 mm GDF-005 guns and 2 Sparrow surface-to-air missile launchers.
- **Giraffe S:** Optimized as a mobile radar for un-manned remote-controlled applications as a "gap-filler" in air defense early warning systems concentrating on small, low-flying targets over a long distance. It can also be employed as a coastal surveillance radar where targets are small surface vessels and sea-skimming missiles or aircraft. A new antenna extends range coverage to 180 km (110 mi) with altitude coverage from ground level to 6,000 metres (20,000 ft). The antenna mast extends to 8 metres (26 ft).
- **Giraffe AMB:** Giraffe Agile Multi Beam is a passive electronically scanned array radar, providing multi-beam 3-Dimensional air coverage at 5.4 to 5.9 GHz with instrumented ranges of 30 km (19 mi), 60 km (37 mi) and 100 km (62 mi), the altitude coverage is extended from ground-level to 20,000 metres (66,000 ft) with 70-degree elevation coverage. Data rate is 1-scan per-second. Its maintained pulse density suppresses high cluttering in adverse weather conditions. Ultra-low antenna side-lobes combined with pulse-to-pulse and burst-to-burst frequency agility provides some resistance to jamming. As in previous Giraffe radars automatic hovering helicopter detection is provided as is a rocket, artillery and mortar locating function, allowing the radar to detect incoming rounds and give 20 seconds or more of warning before impact. Giraffe AMB is the principal sensor of the Swedish RBS 23 BAMSE air defense missile system but is available for many other applications. The Giraffe AMB can be delivered with ground surveillance options fitted. A

skilled crew can deploy the radar in around 10 minutes and recover it in around 6 minutes.

- **ARTE 740:** This is a coastal defense radar based on the Giraffe 75 antenna and Giraffe AMB processing system optimized for surface and low-altitude coverage for the Swedish Amphibious Forces (formerly the Coastal Artillery). It is mounted on a MOWAG Piranha 10x10 armored vehicle. 6 systems are in service.
- **Sea Giraffe AMB:** Saab's Sea Giraffe AMB is the naval variant of their Giraffe radar with 3D AMB technology. It can detect air and surface targets from the horizon up to a height of 20,000 metres (66,000 ft) at elevations up to 70°, and can simultaneously handle multiple threats approaching from different directions and altitudes, including diving anti-ship missiles. Also, it is specialized for rapidly detecting small, fast moving targets at all altitudes and small surface targets in severe clutter. Sea Giraffe AMB is installed on the Republic of Singapore Navy's upgraded Victory-class corvette and US Navy's Independence class of Littoral Combat Ships, and has the designation AN/SPS 77 V for LCS 2 and 4, and AN/SPS 77 V for LCS 6 and higher. It has also been chosen for the Royal Canadian Navy's new Protecteur-class Joint Support Ships. The radar has an instrumented range of 180 kilometres. Its roles include: *Air surveillance and tracking *Surface surveillance and tracking *Target identification for weapon systems *High-resolution splash spotting
- **AESA:** Saab Electronic Defence Systems (EDS) in May 2014 unveiled two new classes of active electronically scanned array (AESA) radar—three land-based systems (Giraffe 1X, Giraffe 4A and Giraffe 8A) and two naval variants (Sea Giraffe 1X and Sea Giraffe 4A).
- **Giraffe 8A:** At the top end of the range is the Giraffe 8A, a long-range IEEE S-band (NATO E/F) 3D sensor that can be produced in fixed, transportable and fully mobile configurations. Intended primarily for remote operation as part of an integrated air defence network, Giraffe 8A can also be operated locally. It has an instrumented range of 470 km and an altitude capability of more than 40,000m, bringing true long-range air defence capability to the Saab radar family for the first time. Giraffe 8A produces 15 stacked beams to provide elevation coverage from ground level to more than 65°. It can operate in a continuous 360° scan mode, rotating mechanically at 24rpm, or can be steered electronically across an operator-specified sector of 40° to 100°. More than 1,000 air defence tracks can be maintained, and the system also has anti-ballistic missile capability, in which case more than 100 tracks can be followed. Saab has paid special attention to Giraffe 8A's electronic counter-countermeasures properties. The radar generates very low sidelobes and incorporates sophisticated frequency agility in pulse-to-pulse, burst-to-burst and scan-to-scan regimes. It also switches and staggers pulse repetition frequency and transmits random jitter to further confuse countermeasures. It automatically selects the least jammed frequencies and can transmit intermittently or randomly. The radar offers a passive detection and tracking capability against jammers.
- **Giraffe 4A:** While the Giraffe 8A occupies the high end of the family, Saab has introduced new radars in the medium-range category in the form of Giraffe 4A and Sea Giraffe 4A for naval use. Employing similar S-band technology to the larger radar, Giraffe 4A offers true 3D multirole capability, combining the air defence and weapon locating tasks in a single unit. Able to be airlifted in a single C-130 load, Giraffe 4A can be deployed by two people in less than 10 minutes. It can operate as a standalone.
- **GIRAFFE 1X:** To complete its new line-up, Saab has introduced two short-range radars, Giraffe 1X and Sea Giraffe 1X. Working in the IEEE X-band (NATO I-band), Giraffe 1X is intended primarily as a highly mobile radar that can work with very short-range air defence systems in the battlefield or at sea. Weighing less than 300 kg, Giraffe 1X can be mounted on a small vehicle or vessel or in fixed installations such as on a building or a mast. The radar has a sense-and-warn function and can be optionally configured for weapon location.

System

Alternative Designation: Giraffe 4A Radar
Type: Multi-Mission Surveillance
Manufacturer: SAAB
Family: Giraffe Radar
In Service: INA
Crew: 2
Emplacement Time: 10 min
Displacement Time: 5 min
Multi-Mission Capability: With Giraffe 4A the commanding officer will access very high situation awareness through simultaneous air surveillance and GBAD target acquisition together with weapon locating capacity without performance degradation. If the situation dictates, the commanding officer can choose between search in the entire 360° volume or an optimised search in a sector (45°-120°).Both with coverage up to 70° of elevation.
Weapon Location Mode: Giraffe 4A also offers an optimised mode for weapon locating where the radar continuously searches the horizon and immediately tracks incoming projectiles.The point of origin and point of impact are calculated and

serve as input for counter-battery fire, adjustment of own fire or warning of incoming fire.

Surviability: Much emphasis has been put on ECCM performance in the design of Giraffe 4A. This includes: *Ultra-low side lobes *Frequency agility; pulse to pulse, burst to burst, and scan to scan frequency agility *PRF switching and PRF stagger with random jitters *Intermittent (or random) transmission, to confuse hostile ESMs and anti-radiation missiles *Sector transmission, which can be independently defined by the operator *Automatic selection of least jammed frequency *Automatic jammer detection and tracking in both azimuth and elevation

Operated Locally or Remotely: Giraffe 4A is designed to be operated locally or by remote control. Local operation is executed with a ruggedised PC in close connection to the system. The system also includes an operator module with two operator places in an NBC protected and armoured shelter.

Flexibility and Mobility: Giraffe 4A can be deployed by two persons in less than 10 min and teardown takes less than 5 min. It can also be airlifted by a single C-130 using standard equipment for container handling. With larger aircraft, such as the IL-76, C-17 or A400M the system can be transported as drive-on/drive-off cargo.

Integrated Logtistics Support (ILS): ILS is an important part of the system delivery and will form the basis for future maintenance. Saab ILS experts have solid experience in tailoring ILS deliveries together with customers worldwide.

Search Volume: 360° or in a sector

Air Surveillance: 120 km

Weapon Locating: 100 km

Notes:

The Saab (formerly Ericsson Microwave Systems AB) Giraffe Radar is a family of land and naval two- or three-dimensional G/H-band (4 to 8 GHz) passive electronically scanned array radar-based surveillance and air defense command and control systems tailored for operations with medium- and Short Range Air Defense (SHORAD) missile or gun systems or for use as gap-fillers in a larger air defense system. The radar gets its name from the distinctive folding mast which when deployed allows the radar to see over nearby terrain features such as trees, extending its effective range against low-level air targets. The first systems were produced in 1977. By 2007, some 450 units of all types are reported as having been delivered. Multimission flexibility - Giraffe 4A combines the battle-proven designs from the Arthur and Giraffe AMB product families with an all-new radar sensor, based on AESA (Active Electronically Scanned Array) technology. This new radar offers exceptional range, performance and multi-function operational flexibility in a single solution. Air surveillance The ability to identify and track a high number of objects simultaneously makes the system suitable for air and sea surveillance as well as military ATC. Ground-based air defence Tracks air targets together with identification capability to to support multiple simultaneous engagements. Weapon

locating Tracks ballistic projectiles and calculates point of origin and point of impact for counter-battery fire or adjustment of own fire. Sense and warn The ability to detect and warn for small incoming ballistic objects offers valuable protection of own forces or civilian protection objects. Operational in all climate zones Giraffe 4A is specified for operation in extreme climates, ranging from inland, coastal and hot desert to Arctic environments. Giraffe 4A is reliable and easy to operate. Redundant design such as the AESA concept makes the time between critical failure extremely long; >2,500 h while typical repair time is less than 45 min. Large volume C-UAS surveillance Features include Saab’s unique function for enhanced low, slow and small (ELSS) target detection, which provides a dedicated counter-unmanned aerial vehicle (UAV) capability.

9S32 Grill Pan Russian Fire Control Radar System

Tiers:

1 2 **3** 4

System

↳*Radar*

Name: 9S32 GRILL PAN Guidance Radar system
Type: Parabolic dish target-illumination radar on telescoping mast on missile launch vehicle
Purpose: The GRILL PAN radar system controls the battery's launcher vehicles (TELARs and LLVs)
Sector Scan: 90-deg sector scan through 50 deg elevation on separate vehicle
Guidance System: inertial guidance with semi-active terminal homing
Band: X-Band
Multichannel: Yes
Peak Power: kW150
Maximum Range: km250
Beamwidth: deg0.5
Antenna: ransmission type of space fed phased-array antenna
Maximum Targets, Simultaneous: It can simultaneously track up to 12 targets and control up to six missiles against these targets
Radar Cross-Section: Radar cross-section of 2m2 at a range of 150 km in manual mode and 140 km in automatic mode
IFF Planara Array: Yes
Note: The GRILL PAN tracks targets assigned to it by the CP while simultaneously maintaining a horizon search for new targets

Protection

Hull Armor: INA
Applique Armor: No
Explosive Reactive Armor: No
Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: No

Note: The S-300V is considered as a survivable system. Once all the missiles are launched the launcher vehicles can briefly redeploy. It uses shoot, scoot and hide tactics in order to avoid being destroyed.

Notes:

The 9S32 Grill Pan Fire Control Radar System is a multiple-target X-band tracking and guidance radar using a 10,000-element space fed transmission lens. Above the radar array is an IFF planara array, and below it are three sidelobe canceller antennas, which are mechanically steered to cover the main array sidelobe structure on up to three selected targets. There are two monopulse feeds on the top of the rotating radar turret. The upper feed is covered by a white, Teflon-like shell and is used when the array is set to 30° tilt for aircraft targets. The lower feed is further forward on the roof of the turret and is in line with the center axis of the array when it is tilted to approximately 45° for TBM intercepts. The emphasized features of the SA-12 system, including the Grill Pan array, are low RF loss and low cost. The phase shifters are Faraday rotators, having two sections in series, controlled by separate coils, with a total phase of 720°. In each phase shifter, the first coil is connected in series with coils of other phase shifters in that row and driven by the row command. The second coil is connected in series with coils of the other phase shifters in that column and drlven by the corresponding column command. Thus, a 10,000-element array, 100x 100 elements, requires only 100 row drivers and 100 column drivers. There are no electronic components on the phase shifter. The radar transmits right circular polarization and receives left circular (the predominant target echo polarization), and hence the Faraday rotator uses the same control field for reception as for transmission. The control field is changed only when the beam position is changed. During a dwell of several milliseconds, several hundred pulses are transmitted and received.

9S18M1 Snow Drift Russian Mobile 3D Coherent-Pulse Target Acquisition Radar

Tiers:

Variants:

- **9S18M1-1:** This variant offers increased detection range of 86 nm (99 mi, 160 km) and has a scan rate of 4.5 and 6 s.

System

Alternative Designation: 9S18M1 Snow Drift
Type: Mobile 3D Coherent-Pulse Target Acquisition Radar
Manufacturer: NIIP (Measuring Instruments Research Bureau), Novosibirsk, Russia Rosoboronexport, Moscow, Russia (export)
Chassis: The radar is vehicle-mounted and can become operational, once positioned, in less than 5 minutes.
Crew: INA
Detection Range High-Altitude Target: 85 km
Detection Range 100 meter Altitude Target: 35 km
Detection Range Nap-of-Earth (NOE) Target: 23 km
Tracking Range High-Altitude Target: 70 km
Tracking Range Nap-of-Earth (NOE) Target: 20 km
Emplacement Time: Less than 5 min
Displacement Time: Less than 5 min
Coverage Azimuth Ballistic Missile Targets: 120 deg
Coverage Azimuth Aircraft Targets: 360 deg
Coverage Elevation Aircraft Targets: 40 deg
Coverage Elevation Ballistic Missile Targets: 55 deg
Accuracy: 150 m
Scan Rate: 6-18 sec (deployment on operating mode)
Targets Located per Scan: 100

Notes:

The 9S18M1 radar (NATO name: SNOW DRIFT) is a 3-D acquisition radar operating in the centimetric Band. The 9S18M1 SNOW DRIFT is a mobile 3-D radar that uses an electronically steered pencil beam. The system incorporates frequency agility, giving it enhanced resistance to ECM. The SNOW DRIFT generally receives early warning from brigade-level surveillance radars such as the SPOON REST before acquiring the target. The radar can track up to 50 targets at a time, and provide target designation on six targets. Weapon systems associated with the 9S18M1 SNOW DRIFT include the SA-11 GADFLY and the SA-17 GRIZZLY.

VARIANT Danish 2D Surveillance and Target Indication Radar

Tiers:

1 2 3 4

System

Alternative Designation: VARIANT

Type: 2D Surveillance and Target Indication Radar

Manufacturer: Thales Group

Crew: INA

Military Features: VARIANT has typical military features including excellent surface gun fire support, hovering helicopter detection and protection against jamming. Its tracking is optimised for low false alarm rate and high track continuity. Rigorous testing to military standards ensures robust operation under the most demanding circumstances.

Dual Band Operation: Dual band (X-band and C-band) operation is jammer resistant. It always offers the best band to achieve robust performance under varying environmental conditions such as multipath, ducting and weather.

Low Probability of Intercept (LPI): Emissions from the integrated SCOUT antenna are difficult to detect. The applied Frequency Modulated Continuous Wave (FMCW) technique uses extremely low power. Unlike pulse radars with quasi LPI modes, detection performance is not sacrificed. This feature is called 'True LPI' (Low Probability of Intercept). It allows VARIANT to operate covertly in in a hostile environment while providing a very high resolution.

Features: • Fully automatic detection and tracking of air and surface targets • Surface Gun Fire support • Helicopter detection and classification, based on Spread Spectrum Indication (SSI) • Extensive ECCM facilities including dual band operation • Low Probability of Intercept (LPI) using the integrated FMCW radar SCOUT • Integral IFF antenna with monopulse capability (Mode 5/S) • Mechanical two axes stabilisation

Update Rate: 4.4 & 2.2 sec

Elevation Coverage: Up to 35°

Frequency Bands: G-band & I-band

Beamwidth Main Radar: 1.8° (G-band); 1.2° (I-band)

Beamwidth FMCW Radar: 1.5°

Peak Power: 2 kW (main radar); 3W (FMCW radar)

IFF Antenna: Integrated

MTBCF & MTBF: >1560 & >1270

Processing (Main Channel): Digital pulse compression and FFT based pulse Doppler processing

Air Targets Maximum Range: 120 km instrumented

Surface Targets Maximum Range: 70 km instrumented

Minimum Range: <25m

Tracking Capacity: 200 air tracks 200 surface tracks

Dimensions

Length: m1.16

Width: m2.35

Height: m2

Weight, Combat: kg450

Notes:

Variant is Thales Naval Nederland's latest 2D surveillance and target indication radar. Its principal role is as an automatic, fast reaction time radar sensor supplying targeting data to weapon systems. Targeting data is supplied for both air and surface targets simultaneously. Variant is a dual-band radar, utilising both the I- and G-Bands. Fully coherent, Variant provides pulse doppler operation for optimal clutter suppression and air target detection. Automatic “Hands off” target detection and tracking is provided by Thales Naval Nederland's modular digital processing. Outstanding ECM facilities are provided by the ability to operate over two frequency bands, an octave apart, and an integral Low Probability of Intercept (LPI) radar sensor. This LPI sensor can be used alone, thus providing Variant the unusual ability to operate in a mode that is almost undetectable to external ESM. Variant's low power consumption, lightweight construction and compact design, make the system well suited for use in fast patrol boats and other small ships. Variant is based on a double pill-box antenna, having a horizontal beamwidth of 1.8° and a vertical beamwidth of 14°. The transmitter is a Traveling Wave Tube with an average power of 200 W. Processing is based on digital pulse compression, Fast Fourier Transform processing, plot processing and automatic tracking. Detection range against a typical air target is given as about 30 km in G-Band and 28 km in I-Band. The Variant radar system supplies the following principal functions: *Surface target detection *Surface target tracking *Air target detection *Air target tracking *Gun-fire targeting support These functions are supported by the following features: *Automatic air target track initiation and maintenance *Manual surface track initiation *Automatic surface track maintenance *Splash-spotting gunfire support for pre-action calibration *Extensive ECM facilities including integral LPI radar *Integral IFF antenna

JY-27 Wide Mat Chinese Long-Range Early Warning Radar

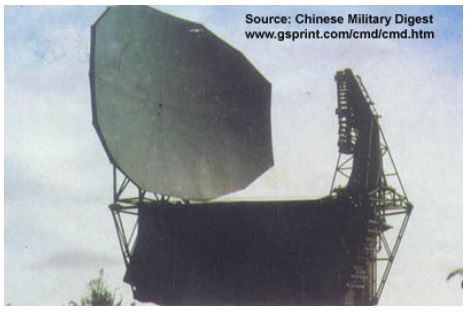
Weight, Combat: INA

Notes:

JY-27 radar of the Chinese manufacturer CETC is a fully solid-state and fully coherent long-range early warning system. It is designed and developed to provide early warning information and detect low-observable air targets in so-called “Stealth Technology”. Besides, it provides the early warning information for weapons system as well. The newer one antenna design is clearly influenced by the 1L13 Nebo SV “Box Spring” and 1L119 Nebo SVU. The radiating elements are horizontally polarized.

JY-8 Chinese Mobile 3D Air Surveillance, Target Acquisition and Interception Control Radar



Tiers:

Variants:

- **JY-8A:** This is a stripped-down variant of the baseline system. It uses only a single transmitter, eliminating the frequency diversity capability. Accordingly, maximum range is significantly reduced and height measurements are less accurate. Its stacked beam antenna forms 16 transmitting beams and 12 independent receiving beams to compensate for the loss in accuracy.

System

Alternative Designation: JY-8
Type: Mobile 3D Air Surveillance, Target Acquisition and Interception Control Radar
Crew: INA
Components: The system has four major components: the main antenna/transmitter/receiver shelter, operations shelter, maintenance shelter and tow truck. The complete system is air/sea transportable and can be assembled within one hour.
Band: G-H (4-6 GHz)
Antenna Scan Azimuth: 360 deg
Antenna Scan Elevation: 20 deg
Antenna Scan Altitude Range: 25 km
Antenna Scan Maximum Range: 350 km
Antenna Horizontal Beamwidth: 0.55 deg
Antenna Vertical Beamwidth: 0.90 deg
Antenna Rotation Rate: 3 rpm or 6 rpm
Pulse Width: 3-3.3 micro sec
Pulse Repetition Frequency: 365,500 Hz
Displacement: INA
Emplacement: Less than 1 Hour
Accuracy 100 nm Range Azimuth: 0.3 deg
Accuracy 100 nm Range: 500 m
Accuracy 100 nm Range RMS: 600 m

Target Resolution Range: 1 km

Target Resolution Azimuth: 0.6 deg

Target Capacity: 36 tracks

Peak Power: 800 kW per transmitter

Dimensions

Length: 12 m

Width: 12 m

Height: INA

Weight, Combat: INA

Notes:

The JY-8 is a mobile 3D air surveillance, target acquisition and interception control radar system operating in the C-band. It can be employed as the main radar sensor for an automated tactical defence system, or can be used as an independent radar. The system uses advanced signal/data processor techniques and is fully solid state with the exception of the magnetrons and thyratrons of the transmitters. The general designer of JY-9 is the head of 38th Research Institute, academician of Chinese Academy of Sciences Mr. Wu Manqing (□□□, Aug 1965 -), who is also the general designer of JY-9 and the general designer of the radar systems for KJ-2000 and KJ-200. The system has four major components: the main antenna/transmitter/receiver shelter, operations shelter, maintenance shelter and tow truck. The complete system is air/sea transportable and can be assembled within one hour. The system is designed to make use of amplitude comparison for height finding. With the aid of two computers, it is able to provide automatically accurate real-time 3D information on targets. Frequency diversity is used to increased detection probability. Other features include digital MTI, clutter map, automatic residue map and CFAR. A multibeam antenna assembly, mounted on the transmitter/receiver shelter and rotating at 3/6 rpm, is employed to form a group of stacked beams. RF power is generated by two transmitters and is fed to a power dividing network and then illuminated to the reflector via a waveguide assembly and feed array, creating a group of individual beams stacked vertically to form a wide cosecant squared pattern. In reception, both individual and combined beams are employed, 11 beams are formed by a receive network connected with an 11 channel diversity receiver. The received signals are sequentially mixed, amplified, detected and finally sent for data processing.

JY-9 Wall Eye Chinese Mobile Low-Altitude Search Radar

Tiers:

System

Alternative Designation: Jy-9 Wall Eye

Type: Mobile Low-Altitude Search Radar

Manufacturer: The system is manufactured by the East China Research Institute of Electronic Engineering(ECRIEE)/No.38 Research Institute.

Crew: ea4

Band: S (2-4 GHz)

Vertical Beamwidth: 40.0 deg

Horizontal Beamwidth: 1.3 deg

Dynamic Range: 120 dB

Maximum Range: 150 km

Altitude: 10,000 m

Scan Rate: 6 rpm or 12 rpm

Peak Power Output: 200.0 kW

Average Power OUtput: 3.4 kW

Emplacement: Less than 20 min

Displacement: Less than 20 min

Coverage, Azimuth: 360 deg

Coverage, Elevation: 0 deg to 40 deg

Maximum Resolution Range: 240 m

Minimum Resolution Range: 120 m

Azimuth: 1.3 deg

Antenna Gain: 34.4 dB

Detection Accuracy, Range: 80 m

Detection Accuracy, Azimuth: 0.4 deg

Detection Accuracy, Sensitivity: 55 dBm

Detection Accuracy, Noise Figure: 3.0 dB

Detection Accuracy, Clutter Rejection: 50.0 dB

Tracking: 1,000 plots; 72 tracks

Pulsewidth: 20 microsec

Pulse Repetition Frequency: 790 Hz

Mean Time Before Failure: >400 hours

Mean Time to Repair: <30 min

Dimensions

Length: m12

Width: m12

Antenna Height: m12

Weight, Combat: INA

Notes:

The JY-9 Radar is a mobile S-band low altitude search radar intended for use in air defense, gap filling, airport surveillance and coastal defense. It is designed for effective detection of targets at low altitude in both ECM and natural clutter environments. The general designer of JY-9 is the head of 38th Research Institute, academician of Chinese Academy of Sciences Mr. Wu Manqing (□□□, Aug 1965 -), who is also the general designer of JY-8 and the general designer of the radar systems for KJ-2000 and KJ-200. It consist of a radar/operations shelter, an antenna pallet and a power station shelter and is transportable by air, rail, and sea. It has a setup and dismantle time of 90 minutes by a team of 8 men. The JY-9 employs a dual-beam antenna assembly consisting of a deformed parabolic reflector, two horns and two feed channels. One channel is used for transmit, but both are used for receive. The antenna rotates at 6 or 12 rpm to provide all round coverage and can be mounted on a shelter or on the ground. The JY-9 has high anti-jamming and anti-clutter capability due to the use of advanced techniques, including pulse to pulse frequency agility, dual channel, JATS, wide operating band, low sidelobes, MTD automatic spectrum processing, automatic clutter map and automatic residue map. The mean time between failures is better than 900 hours with Built-in test equipment (BITE). The JY-9F three-dimensional low-altitude surveillance radar, is a new derivation of the JY-9 low-altitude radar. It is a fully coherent pulse-compression radar with a high reliability and mobility and can provide low-flying target information for national air defence information networks or for AAA or air traffic control systems. The JY-9F consists of an antenna assembly, an operations shelter, a trailer-installed shelter housing two diesel generators and an optional trailer-installed shelter. The antenna can be folded down or erected by a motor-driven mechanism and the assembling and disassembling of the system can be accomplished by a crew of eight men within one hour. This advanced radar incorporates the state-of-the-art techniques. The excellent low sidelobe antenna employed in the system has greatly enhanced the radar's anti-clutter capability and ECCM performance, giving improved low-altitude detection performance. Three AMTI processing channels are used, each equipped to handle a particular environmental condition, thereby providing maximum low-altitude target detection. The wideband and highly stable TWT+CFA transmitter guarantees a super-clutter visibility in excess of 40 dB in the presence of ground clutter. The quadriphase Taylor code ensures a desirable consistency, high reliability and high stability. Meanwhile, the waveform agility can be realised. The JY-9F radar is characterised by high reliability and maintainability with an MTBF of more than 400 hours and MTTR of less than 30 minutes. Due to extensive BITE adopted in the system, troubleshooting probability reaches 95 per cent while 85 per cent of faults can be isolated to PCB level and all faults can be isolated to the replaceable unit level. The system is manufactured by the East China Research Institute of Electronic Engineering(ECRIEE)/No.38 Research Institute.

67N6E Gamma-D Russian Towed Long-Range 3D Acquisition and Air Surveillance Radar

Tiers:

System

Alternative Designation: 67N6E Gamma-D
Type: Towed Long-Range 3D Acquisition and Air Surveillance Radar
Crew: INA
Frequency: D-Band
Average Power: 12.5 kW
Instrumental Range: 400 km
Range Resolution: 300 m
Accuracy: 100 m; 0.2°
Beamwidth: 1.35°
Antenna Rotation: 6 min-1
MTBCF: 1 000 hrs
Note: 67N6E «Gamma-D» is a mobile, operating in D-Band solid-state, long-range 3D acquisition and air surveillance radar, designed for use as part of automated and non-automated air defense and air force control systems. The radar can also be used for air traffic control and is with its export version probably an S-400 (Nato-Designator: S-21 “Growler”) battery component option.

Dimensions

Length: INA
Width: INA
Height: INA

Weight, Combat: INA

Notes:

67N6E «Gamma-D» (Cyrillic: 67Н6Е «Гамма-Д») is a mobile, operating in D-Band solid-state, long-range 3D acquisition and air surveillance radar, designed for use as part of automated and non-automated air defense and air force control systems. The radar can also be used for air traffic control and is with its export version probably an S-400 (Nato-Designator: S-21 “Growler”) battery component option. The radar comprises an active phased-array antenna with the turntable, an operator’s cabin housing electronic equipment and spare parts, tools and accessories set, a diesel power plant with two diesel-generators, and a self-contained power source for the operator’s cabin. The radar’s antenna and the turntable may be mounted on a semi-mobile tower (radar deployment platform 40V6M) with a height of 23.8 m. A remote control equipment kit can be provided for setting up at command posts to ensure radar operation at a distance of up to 15 km away with data link coupling. The kit also allows the crew to operate from the cabin moved 1 000 m away from the rotating antenna. The radar is fitted with a built-in automatic test and monitoring equipment, automatic fire-alarm and fire-extinguishing systems, air conditioning, and other technical support assets.

PRV-13 (Odd Pair) Russian Height Finding Radar

Tiers:

System

Alternative Designation: PRV-13; NATO: Odd Pair
Type: Height Finding Radar
Crew: INA
Chassis: Van-mounted
Associated with: Odd Pair** is a van-mounted, height-finding radar associated with the SA-5 Gammon** surface-to-air missile (SAM) system.
Frequency: 2500 to 2700 mhz
Peak Power: 1.6 mw
Average Power: 1 kW
Maximum Detection Range: 310 km
Pulse Repetition Frequency (PRF): 400 Hz
Hit Per Scan: > 15

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

RV-13 “Odd Pair” was a fully remote controlled height-finder in the former Warshaw Pact. It was used for heights up to 85 km. This height-finder was on duty as a transitional solution for the new states in the German Air Force up to 1998. A special feature is its compensation antenna (the so-called “baby-antenna”) used for sidelobe suppression. The transmitter stage of the PRV-13 uses a magnetron at a fixed frequency, with a second transmitter tuned on another frequency on standby. There where four reserve frequencies that could never be used before for reasons of confidentiality. Changing this frequency means, changing the magnetron. The PRV-13 was a patchwork of from proven electron tube assemblies used in its predecessors too, and solid-state assemblies and modules using integrated CMOS circuits. Very interesting was the kind of generation of the elevation angle marks: a cathode ray tube was deflected in scale to the elevation angle. In this tube was clamped a precise grid of wires. When the synchronously electron beam into this tube hit one of these wires, then it created an output pulse (standing for an electronic range mark).

Kolchuga-M Ukrainian Passive Early Warning Radar System

Tiers:

System

Alternative Designations: Kolchuga-M
Mission: he Kolchuga-M passive detection system is truck-mounted and detects aircraft electromagnetic emissions in the VHF, UHF, and SHF wavebands. It identifies and tracks incoming aircraft at long range for acquisition by separate air defense systems.
In Service: 2000-Present
Components for Complex: 2-3 vehicles plus control post
Crew: 2 at the receiving station, 3or 4 at control post
Platform: 6x6 van
Antenna Type: 4 in VHF, UHF, and SHF
Frequency Range: 0.13-18 GHz (to include X and Ku bands
Azimuth Coverage: deg360
Surveillance range: 450-620 km depending on target altitude and frequencies. The latter figure is for targets at 18.5 km altitude. Manufacturer claims 800 km (may be valid - some frequencies).
Effectiveness Against Stealth: Reported but not likely
Maximum Number of Targets Tracked: 32
Range for a Complex: 1,000 km frontage or 450-600 radius
Operation Duration Time: hours24
Operation Radius: 600 km (air targets at the 10 km altitude - up to 800 km), which makes an effective early warning air defense system
Range Aerials: The Kolchuga station is equipped with five meter-, decimeter-, and centimeter-range aerials, which provide for high radio sensitivity within a 110dB/W - 155 dB/W swath, depending on the frequency
Mode of Operation: Kolchuga is an electronic support measures system that employs two or more sites to locate emitters by triangulation. The system is vehicle mounted and comprises a large vertical meshed reflector, with two smaller circular parabolic dishes beneath and a pair of VHF-to-microwave log periodic antennas above. The dishes may exploit amplitude monopulse techniques for improved direction finding, whilst the angled spacing of the log-periodic antenna suggests that they may use phase interferometry to improve angle measurements. Various smaller antennas, presumably for inter-site communications are to the side and rear of the dish. The detection range is one of the best in its class, but it is highly dependent on the emitted power of the transmitter being tracked, and requires satisfaction of the line of sight condition to at least two receiving sites for triangulation (compared with three sites for a multilateration system such as the VERA passive sensor). A Kolchuga complex can detect and locate air and surface targets and trace their movement to a range generally

limited only by the common line-of-sight of the stations

System Parameters: According to the manufacturer's brochure (from AIDEX 1997), the upgraded Kolchuga-M is equipped: With four antennas in the VHF, UHF and SHF radio bands with narrow and wide beams. With parallel receivers allowing the instant discovery and analysis of signals of radio technical equipment (RTE) in the range 100 MHz -18 GHz and continual tracking across the entire band. [Other sources claim from 130MHz to 18GHz, and a 36 channel preset receiver]. With sensitivity of approximately -145 dBW With equipment for the analysis, processing and continual calculation and tracking of coordinates by triangulation and chronometrical-hyperbolic method. With equipment for the identification, operative displaying of information, long term memory and recording of the results of processing.

Target Identification: Kolchuga is able to detect and identify many types of radio devices mounted on ground, airborne, or marine objects. Target detection relies only on an emitter having sufficient power and being within Kolchuga's frequency range. Target identification, however, is more complex and is based on the measurement of different parameters of the transmitted signal—such as its frequency, bandwidth, pulse width, pulse repetition interval, etc. Kolchuga has been reported to use around forty different parameters when identifying a target. These parameters are compared to a database in order to identify both the type of emitter and, in some cases, even the specific piece of equipment (by identifying the unique signature or "fingerprint" that most transmitters have, due to the variations and tolerances in individual components). The database within Kolchuga is said to have the capacity to store around three hundred different types of emitter and up to five hundred specific signatures for each type.

Dimensions (Ural 375)

Length: 7,350 mm

Width: 2,960 mm

Height: 2,980 mm

Curb Weight: 8,400 kg

Automotive

Engine Name: 7.0L ZIL-375YA

Engine Type: V-8 Diesel

Engine Power: INA

Transmission: 5-speed manual + 2-speed transfer case

Maximum Speed: 76 km/h

Fuel Capacity: 79+16 gal. Fuel economy: 4.9 mpg (at 19-25 mph), 2.94 mpg (city cycle).

Protection

Armor: INA

Applique Armor: INA

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Kolchuga-M passive detection system is truck-mounted and detects aircraft electromagnetic emissions in the VHF, UHF, and SHF wavebands. It identifies and tracks incoming aircraft at long range for acquisition by separate air defense systems. The team of designers with the Topaz state holding, who developed the sophisticated hi-tech [kol-CHOO-gah, Russian for "hauberk"] passive early warning radarequipment, was nominated for the State Science and Engineering Prize. A hauberk is a short tunic made of a mesh of interlinked metal rings. The new-generation strategic long-range passive radar complex "Kolchuga" meets the most stringent moral-ethical and environmental standards as absolutely harmless to people or the environment. It is unique

because, firstly, all research, development, pre-process, and serial production works were performed by the Topaz holding, and funded through Ukrspetsexport investment and Prominvestbank credits; secondly, the high technological level of the Ukrainian radar was asserted de facto by the most developed and powerful country, the trendsetter in the military sphere. A complex consisting of three Kolchuga radar stations makes it possible to spot ground and surface targets and trace their movement within a radius of 600 km (air targets at the 10 km altitude - up to 800 km), which makes an effective early warning air defense system. The Kolchuga station is equipped with five meter-, decimeter-, and centimeter-range aerials, which provide for high radio sensitivity within a 110dB/W - 155 dB/W swath, depending on the frequency. The 800-km detection range has been achieved only by the Ukrainian Kolchuga. The best the U.S. AWACS can do is 600 km, while the ground-based complexes Vera (Czech Republic) and Vega (Russia) can reach out up to 400 km - half what the Ukrainian complex can reach. The Kolchuga's lower limit of the working frequency range is 130MHz and is the lowest of all analogs. For the AWACS it is 2,000 MHz, for the Vera it is 850MHz, for the Vega it is 200MHz. This was developed by the Special Radio Device Design Bureau public holding, the Topaz holding, the Donetsk National Technical University, the Ukrspetsexport state company, and the Investment and Technologies Company. It took them eight years (1993 - 2000) to conduct research, develop algorithms, test solutions on experimental specimens, and launch serial production. The new product dramatically changed the balance in the constant competition between offensive and defensive means. The relatively cheap Ukrainian Kolchuga radar station, which is able to detect and identify practically all known active radio devices mounted on ground, airborne, or marine objects, actually cancels out all those billions of dollars spent on stealth-based armaments. On 15 September 2002 the US State Department made its first public accusations that President Leonid Kuchma personally approved the Kolchuga sale to Iraq via a Jordanian intermediary. The State Department said it had based its accusations on secret tape recordings made by Mykola Melnychenko, a former presidential bodyguard now in exile in the United States. The change in U.S.-Ukraine relations was triggered by authentication of a 90-second audio recording from July 10, 2000. The excerpt contained a conversation between Kuchma and Ukrspetsexport chief Valery Malev, in which Kuchma approves a sale of Kolchuga systems to Iraq. In a transcribed nine-minute conversation Kuchma discusses not only the Kolchuga sale to Iraq, but also a deal to repair Libya's MIG-25 fighter jets. In the conversation, Kuchma gives Malev permission to bypass the State Service for Export Control for the deal. The US concluded that the recording of the Ukrainian president is authentic. Sales of such radar systems would be a clear violation of United Nations Security Council Resolution 661, which prohibits any sale or supply of "weapons or any other military equipment" to Iraq. Equipment like the Kolchuga system could pose a threat to aircraft of the U.S.-led coalition patrolling the no-fly zones over northern and southern Iraq. The government of Ukraine denied selling Iraq the radar systems and invited international experts to Ukraine to investigate the charges. But as State Department spokesman Boucher said, the government of Ukraine has not been candid on this issue. And US Ambassador to Ukraine Carlos Pascual suggested Ukrainian officials may have destroyed or manipulated evidence of the radar sales. The U.S. Government and its NATO allies responded by downgrading Ukraine's participation in the NATO-Ukraine Commission meeting at the November NATO Summit in Prague from a summit to a ministerial. Nevertheless, concurrently, Ukraine developed with NATO a detailed and forward-leaning Action Plan to accelerate Ukraine's integration with NATO. The United States "initiated a temporary pause in new obligations of Freedom Support Act assistance that goes to the central government in Ukraine" and is reexamining its policy towards Ukrainian President Leonid Kuchma after determining that a tape recording of Kuchma approving the sale of an early warning system to Iraq is authentic, State Department Spokesman Richard Boucher told journalists in Washington 24 September 2002. "We've recently concluded an analysis of a July 2000 recording that was provided by the former Ukrainian presidential bodyguard, Mykola Melnychenko. On one of the tapes, Ukrainian President Leonid Kuchma is heard approving the clandestine sale of 'Kolchuga' early warning systems to Iraq, and we believe this recording to be authentic," Boucher said. "Our ongoing policy review reflects our serious concern that illicit transfers to Iraq were approved by President Kuchma, as well as our determination to discourage further transfers by Ukraine or by any other country that violates UN sanctions on Iraq," he continued. While the United States was not certain that the Kolchuga system has arrived in Iraq and been deployed, "there are some indications that suggest it may be there," Boucher said, adding, "It is a very serious matter to have a national leader approving a sale in violation of UN resolutions." Asked whether the United States will take action against Ukraine at the United Nations for its violations of UN resolutions, Boucher replied: "I don't know. We'll have to see." These programs had a budget of approximately $54 million in fiscal year 2002 and they represent about 35 percent of our total Freedom Support Act assistance to Ukraine. Programs that are funded under this budget included work with the Ukrainian Government on reforms in fiscal and commercial law, pensions and government regulations. It was impossible to track the matter down by a joint American-British commission sent to Ukraine in 2002 to investigate this purported sale. As of mid-2004 the US had not located Kolchuga systems in Iraq, and the transfer might not have taken place. Jane's Defense Weekly, dated September 27, 2006, carried a story, strangely datelined Bangkok, reporting that Ukraine had recently delivered or was imminently preparing to deliver an unknown number of Kolchuga systems to Iran for an estimated price of USD25 million per system. Information for the news story originated from Vietnamese arms traders working in Central Europe. Both the Ukrainian Security Service (SBU) and the State Service for Export Controls had responded September 25 to MFA's written inquiries to report that they had uncovered no evidence of such sales. The interagency Presidential Committee on Military Technical Cooperation and Export Controls had met September 27 and discussed the issue. They had decided that the Ukrainian government would not stoke the controversy by denying the claim; on an if-asked basis, however, Ukrainian government officials would deny that any such sale had taken place.

1L13-3 Nebo SV (Box Spring) Russian Mobile 2D Early Warning Radar

Tiers:

System

Alternative Designation: 1L13-3 Nebo SV; NATO: Box Spring
Type: Mobile 2D Early Warning Radar
Chassis: Ural 4320
Crew: INA
Truck-Mounted Antenna Rotating Device: Antenna lifting device from horizontal to vertical position Phased array tilting device
Cabin Equipment: Transmitter Device: Mounted in equipment cabin; Two power output amplifiers based on high power; output devices - endotrones (main and back-up); Broad band power pre-amplifier; Exciter Modulator
Receiver Device, Data Processors and Displays: Mounted in equipment cabin; Cabinets with receiver units, interference rejection system, radar environmental simulator; Displays Data processing equipment; IFF transceiver; Digital data processing units
Transmitter Characteristics: Metric (VHF) band of radiated frequencies, Adaptive programmable and manual frequency agility, Sector radiation mode in azimuth, Shaping of RF pulse by a complex signal, Shaping of RF pulse by complex signal,Crystal stabilisation of RF oscillator, Output device of power amplifier : endotron (high power output device)with liquid cooling.
Frequency: 30-300 MHz (approx)(NATO A/B Band)(IEEE: VHF Band)
Power output: 120-140 kW (peak)
PRF: 300 Hz
Accuracy: 400 m/ 0.67 degrees azimuth
Runup Time: INA
Setup/Stow Time: 45 minutes / 45 minutes
Detection Range (Aircraft) at 500 m Altitude: 60 km
Detection Range (Aircraft) at 10,000 m Altitude: 250 km
Detection Range (Aircraft) at 27,000 m Alititude: 350 km

Dimensions (Chassis: Ural 4320)

Length: m7.37
Width: m2.5

Height: m4.5

Weight, Empty: tons8

Antenna Length: m6

Antenna Width: m60

Antenna Weight: INA

Automotive (Chassis: Ural 4320)

Engine Name: YaMZ-740

Engine Type: Diesel

Engine Power: hp210

Cruising Range: km1,000

Speed, Maximum Road: km/h85

Speed, Average Cross: km/h50

Speed Maximum Swim: km/hNot Amphibious

Gradient: deg62

Side Slope: deg40

Vertical Step: m0.55

Trench: m1.2

Fording Depth: m1.75

Protection

Armor: INA

Applique Armor: Available to protection against small arms fire and artillery shell splinters

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Personal CBRN equipment

Smoke Equipment: No

IR Signature: No

Notes:

The 1L13-3 Nebo radar (NATO name: BOX SPRING) is a mobile, 2-D early warning radar operating in the A/B Band. The 1L13-3 Nebo radar ECCM features include pulse to pulse frequency agility. It is designed to reject chaff automatically. The 1L13-3 Nebo radar ECCM features include pulse to pulse frequency agility. It is designed to reject chaff automatically. Capable of being used as part of a radar system to provide a valuable early warning capability against low observable aircraft. As part of an IADS system, the 1L13 Nebo would be used to cue the high power aperture X-band systems to a small acquisition box in which the VLO aircraft can be found.

JY-50 Chinese 2D Air Defense Radar

Tiers:

1 **2** 3 4

System

Alternative Designation: JY-50
Type: 2D Air Defense Radar
Crew: INA
Chassis: 6x6 or 8x8 Truck
Frequency: VHF-Band
Maximum Altitude: INA
Maximum Range: 250 km

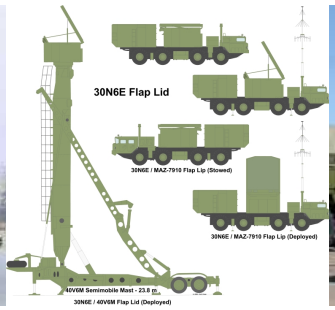
Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

JY-50 is a passive 2-D radar that uses the electromagnetic signals transmitted by distributed radio frequency stations around itself, including civilian mobile phone, radio, and television broadcasts, to perform the detection, location, and tracking of airborne targets including electromagnetic silence targets (so-called Stealth aircraft). JY-50 radar mainly accomplishes air defense warning mission to important direction and sensitive areas. The antenna is an array of two rows of 12 inverted Vee elements backed by a reflective grating.

30N6 Flap Lid Russian Ground-Based Target Acquisition and Tracking Radar



Tiers:

Variants:

- **30N6E:** Export variant for the S-300PMU1 , SA-20A Gargoyle and SA-10D systems.
- **30N6E-1 Flap Lid D/Tomb Stone:** Export variant for the S-300PMU2 system
- **30N6E2:** export variant for the S-300PMU2 /SA-20B Gargoyle /Favorit systems uses the Tomb Stone 30N6-E2 radar, but features new missiles and other radars as well as an Elbrus -90 microcomputer with greater capacity and speed.
- **30N6 Flap Lid B:** This is an upgraded variant. It features include the ability to engage simultaneously six targets, with two missiles against each target. Its phased-array beam-steering angular range is extended for instantaneous coverage of a 90-degree sector, comparable to the SPY-1 Aegis radar.

30N6 Flap Lid FLAP Lid

↳*System*

Name: 30N6 Flap Lid FLAP Lid
Type: Engagement Radar
Antenna: 2.75 sq m
Band: I-J (8-20 GHz)
Interception Range: km90
Minimum Interception Altitude: m25
Maximum Target Velocity: 4,200 kmh
Target Elevation Coverage: 0-50 degrees
Screening angle: 100 degrees
Mount: The 30N6 FLAP LID A is mounted on a small trailer
Note: The 36D6 TIN SHIELD radar can also be used to augment the S-300 system to provide earlier target detection than the FLAP LID radar allows. It can detect a missile-sized target flying at an altitude of 60 metres (200 ft) at least 20 km (12 mi) away, at an altitude of 100 m (330 ft) at least 30 km (19 mi) away, and at high altitude up to 175 km (109 mi) away. In addition a 64N6 BIG BIRD E/F band target acquisition radar can be used which has a maximum detection range of 300 km (190 mi).

Dimensions (Chassis: MAZ-7910 8 x 8 Truck)

Length: m9.40

Width: m3.10

Height: m3.70

Weight: kg20,000

Automotive (Chassis: MAZ-7910 8 x 8 Truck)

Engine Name: D12A-525

Engine Type: V-12 water-cooled diesel

Engine Power: 525 hp at 2,100 rpm

Power-to-Weight Ratio: 26.25 hp/metric ton

Maximum Speed, Road: km/h60

Maximum Speed, Off-Road: km/h30

Maximum Range: km800

Communications

VHF Radio: R-168 Akveduk

HF Radio: R-161 Poisk

Protection

Armor: INA

Notes:

The Flap Lid is a Russian ground-based target acquisition and tracking radar associated with the SA-10 Grumble ** surface-to-air missile (SAM) system. It uses a phased-array antenna and a track-via-missile (TVM) tracking and guidance system similar to that of the MIM-104 Patriot /MPQ-53 system. Flap Lid can reportedly track six targets and guide two missiles per target simultaneously. The launch rate is claimed to be three missiles per second. Target elevation coverage may have been increased from 50 degrees to a maximum of 75 degrees to provide a measure of ballistic missile defense capa bility. The SA-10B system takes approximately five minutes to deploy. The trailer-mounted Flap Lid A radar is associated with the SA-10A, while the truck-mounted (MAZ-7910) Flap Lid B is associated with the SA-10B (S-300P) system. Although the radar has few changes, its mounting on a truck allows for rapid deployment and disengagement. Both options provide 360-degree coverage in azimuth. The S-400 reportedly uses a new tracking and missile guidance radar that is based on the Flap Lid sensor, but with a larger antenna assembly along with a secondary array.

S-125 Newa (LOW BLOW) Russian Tracking and Missile Control Radar System

Tiers:

S-125 “Newa” (LOW BLOW) Radar System

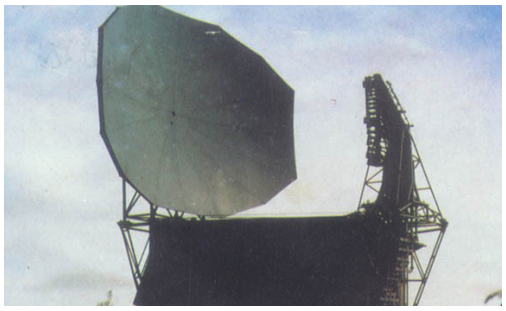
↳*System*

Name: S-125 “Newa” (LOW BLOW) Radar System
Function: A Fire Control, Trk/FC, and Missile Guidance Radar
Mount: Four-wheeled trailer-mounted
Crew: INA
Frequency, Fire Control: I band
Range, Fire Control: km40
Scan, Fire Control: Scan (trough) 16HZ
Frequency, Trk/FC: I band
Range, Trk/FC: km40-85
Scan, Trk/FC: Scan (Para) 25HZ
Frequency, Missile Guidance: D band
Range, Missile Guidance: km29
Parabolic Dishes: Two scanning parabolic dishes one above the other
Associated Weapon System: SA-3 GOA SAM, FLAT FACE, SQUAT EYE acquisition radar.

Notes:

Russian designator: S-125 “Newa” (Kabina UNW) Low Blow is the NATO reporting name given to a family of I-Band radars used with land-based SA-3 “Goa” surface-to-air missiles. The name Low Blow reflects the ability of the radar to guide the missile towards low-flying targets through heavy clutter. It use pairs of electromechanically scanning (so-called Lewis scanner) antennas mounted orthogonally, but to improve low-angle performance the antennas are mounted at 45 degrees from the horizontal. Both antennas are mounted at a 45 degrees angle in an upside down “V” shape. This change was introduced to reduce ground clutter. The antennas generate sawtooth fan beams like Fan Song. Between these two antennas is a Lobe-On-Receive-Only (LORO) mode antenna. When these antennas acquire a target the system can be switched to the LORO mode, receiving from this central parabolic dish antenna. The target in Low Blow tracking antennas scan in 6 degrees swathes, the beams are about 6 degrees wide in the fan and 1 degree in the scanning direction. Inserted into the top of the inverted “V” is the square parabolic guidance command antenna with a beam with of 12 degrees. The system is equipped with a high-resolution television camera by default with an 144 mm lens. Its infrared sensitivity allows working at night and at low-light conditions.

JY-8A Chinese Mobile 3D Air Surveillance, Target Acquisition and Interception Control Radar



Tiers:

Variants:

- **JY-8:** The JY-8 is a mobile 3D air surveillance, target acquisition and interception control radar system operating in the C-band. It can be employed as the main radar sensor for an automated tactical defence system, or can be used as an independent radar. The system uses advanced signal/data processor techniques and is fully solid state with the exception of the magnetrons and thyratrons of the transmitters. The general designer of JY-9 is the head of 38th Research Institute, academician of Chinese Academy of Sciences Mr. Wu Manqing (□□□, Aug 1965 -), who is also the general designer of JY-9 and the general designer of the radar systems for KJ-2000 and KJ-200.

System

Alternative Designation: JY-8A
Type: Mobile 3D Air Surveillance, Target Acquisition and Interception Control Radar
Crew: INA
Components: The system has four major components: the main antenna/transmitter/receiver shelter, operations shelter, maintenance shelter and tow truck. The complete system is air/sea transportable and can be assembled within one hour.
Band: G-H (4-6 GHz)
Antenna Scan Azimuth: 360 deg
Antenna Scan Elevation: 0.5 degrees to 30 degrees
Antenna Scan Altitude Range: 12,000 m
Antenna Scan Maximum Range: 150 km
Antenna Horizontal Beamwidth: 0.55 deg
Antenna Vertical Beamwidth: 0.90 deg
Antenna Rotation Rate: 3 rpm or 6 rpm
Pulse Width: 3-3.3 micro sec
Pulse Repetition Frequency: 365,500 Hz
Displacement: INA
Emplacement: Less than 1 Hour
Accuracy 100 nm Range Azimuth: 0.3 deg
Accuracy 100 nm Range: 500 m

Accuracy 100 nm Range RMS: 500 m

Accuracy Altitude: 700 m

Target Resolution Range: 1 km

Target Resolution Azimuth: 0.6 deg

Target Capacity: 36 tracks

Peak Power: 800 kW per transmitter

Time to Repair: Less than 30 Min

Note: The JY-8A has the same physical dimensions, and operates on similar principles, as the JY-8. It was marketed by China National Electronics Import and Export Corp., Beijing.

Dimensions

Length: 12 m

Width: 12 m

Height: INA

Weight, Combat: INA

Notes:

JY-8A This is a stripped-down variant of the baseline system. It uses only a single transmitter, eliminating the frequency diversity capability. Accordingly, maximum range is significantly reduced and height measurements are less accurate. Its stacked beam antenna forms 16 transmitting beams and 12 independent receiving beams to compensate for the loss in accuracy. The JY-8A has an elevation range of 0.5 degrees to 30 degrees and a lighter, more mobile antenna/transceiver shelter. Mean time before failure is more than 150 hours, while mean time to repair is less than 30 minutes. Otherwise, the JY-8A has the same physical dimensions, and operates on similar principles, as the JY-8. It was marketed by China National Electronics Import and Export Corp., Beijing. The JY-8A is used as the prime surveillance sensor for air defense battalions equipped with 57-mm guns. The radar is mounted on a trailer and towed by a truck. The radar has a maximum range of 95 mi (150 km) and a maximum altitude of 39,750 ft (12,000 m). Range accuracy is 550 yd (500 m), while altitude accuracy is 840 yd (700 m).

P-15M (Squat Eye) Russian Mobile Ground-Based Air Surveillance and Target Acquisition Radar

Tiers:

System

Alternative Designation: P-15M; Squat Eye
Type: Mobile Ground-Based Air Surveillance and Target Acquisition Radar
In Service: 1989-Present
Chassis: ZIL-131
Crew: INA
Band: C (500-1,000 MHz)
Peak Power: 500 kW
Maximum Range: 200 km

Dimensions (Chassis: ZIL-131)

Length: m7.04
Width: m2.49
Height, Cab: m2.49
Height, Transport Body: m2.97
Curb Weight: kg6,700
Wheelbase: 10 ft 10 in (3.30 m)+4 ft 7 in (1.40 m)
Antenna Length: 4 m
Antenna Width: 6 m
Antenna Mast Height: 30 m

Automotive (Chassis: ZIL-131)

Engine Name: INA
Engine Type: V8 gasoline (carburetor) ZIL-130
Engine Power: INA

Cruising Range: INA

Speed, Maximum Road: km/h80

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: INA

Side Slope: INA

Vertical Step: INA

Trench: INA

Fording Depth: mINA

Suspension: solid axles with leaf springs.

Transmission: 5 m, 2-speed transfer case

Fuel Economy: 5.9 mpg-US (40 L/100 km; 7.1 mpg-imp) (city), 50 to 100 liters/100 km (cross-country).

Fuel Tanks: 2x45 gal.

Maneuverability: turning circle 33'5.6", approach angle 36°, departure angle 40°, max. ascent angle 31° (with 3,750 kg (8,267 lb) load), ground clearance 13 in (330 mm), overcome ford 4 ft 7 in (1.40 m)

Stopping Distance at 35 km/h: 12 m

Protection

Armor: INA

Applique Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

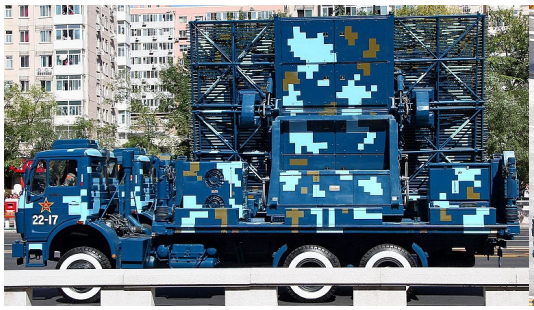
NBC Protection: INA

Smoke Equipment: No

Notes:

Squat Eye** is a ground-based air surveillance and target acquisition radar associated with the SA-3 Goa** surface-to-air missile (SAM) system. Squat Eye works in conjunction with the Low Blow ** missile fire control radar to supply an air-defense site's coverage of low-altitude targets. The radar is distinguished by its open-work elliptical parabolic antenna usually mounted on a 30-m (98-ft) mast. The reflector is fed by an underslung feed horn, which further emphasizes its low-altitude orientation.

Type 306B (LLQ305B) Chinese Self-Propelled 3D Acquisition Radar



Tiers:

System

Alternative Designation: Type 305B; LLQ305B
Type: Self-Propelled 3D Acquisition Radar
Crew: INA
Chassis: Mercedes-Benz NG 80
Mssion: Chinese sources have identified the radar as a long range 3D high altitude acquisition and search design, intended to support missile guidance applications.
Maximum Range: 333.4 km
Minimum Range: INA
Maximum Altitude: INA
Minimum Altitude: INA
Band: S-band at a wavelength of 11.67 cm
Waveguide Feeds: employs sixty 350 mm waveguide feeds
Note: Very little info is released about this radar other than it can also act as Fire-control radar.

Dimensions

Length: 12 m
Width: 12 m
Height: INA
Weight, Combat: INA
Antenna Height: 3.5 m

Notes:

The Type 305B 3D acquisition radar appears to be a variant of the existing NRIET / CEIEC / CETC YLC-2V, which has been photographed as part of a HQ-9 battery, and has been reported as employed to support up to four HT-233 engagement radars, each with four TELs. Chinese sources describe this radar as optimised for search and acquisition of aerial targets. The principal distinction between the established YLC-2V and the Type 305B would appear to be the absence of the IFF/SSR array mounted across the top of the antenna. A Chinese language PRC publication has described the Type 305B as a " three dimensional radar which has an antenna height of 3.5 metres, and employs sixty 350 mm waveguide feeds. It operates in the S-band at a

wavelength of 11.67 cm.”3 The YLC-2V employs a single 6 x 6 truck carrying the antenna head and turntable, which is hydraulically deployed, and three additional 6 x 6 trucks carrying cabins for electronics and operator stations. None of the latter were displayed with the Type 305B antenna systems. The hydraulically folded antenna used with the Type 305B has 58 element rows and will employ frequency scanning like other radars in this family of designs. Row spacing suggests S-band operation, like the YLC-2V.

JYL-1 Chinese Long-Range 3D Surveillance Radar

Tiers:

System

Alternative Designation: JYL-1

Type: Long-Range 3D Surveillance Radar

Crew: ea8

Chassis: INA

Band: It functions in the E/F-band region and might be used as either a military or commercial asset for air traffic control and management purposes.

Azimuth Coverage: 0º ~ 360º

Elevation Coverage: 0º ~ 25º

Search Range: 320km

Coverage Height: 25,000m

Measurement Accuracy Range: 100m

Measurement Accuracy Azimuth: 0.3º

Measurement Accuracy Height: 600m @ 200km

Resolution Range: 200m

Resolution Azimuth: 1.5º

Reliability MTBF: ≥ 800hrs

Reliability MTTR: ≤ 0.5 hrs

Displacement: Under 1 hour

Emplacement: Under 1 hour

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Notes:

The JYL-1 radar is carried in the 2004 CRIA listing of Chinese indigenous products. The JYL-1 is a long-range 3D surveillance radar typical of those assets that might be found in a modern air defence network. It functions in the E/F-band region and might be used as either a military or commercial asset for air traffic control and management purposes.

JY-14 (LLQ302) Chinese Long-Range Air Defense Radar

Tiers:

System

Alternative Designation: JY-14; LLQ302

Type: Long-Range Air Defense Radar

Manufacturer: The system is manufactured by the East China Research Institute of Electronic Engineering(ECRIEE), No.38 Research Institute (□□□□□□□□□□□□□□□□□□□□□□□□□□□□□□□□) in Chinese)).

Crew: ea

Band: E-F (2-4 GHz)

Maximum Range: 450 km

Standard Range: 320 km

Antenna Rotation: 6 rpm

Altitude: 22,860 m

Accuracy Range: 90 m

Accuracy Azimuth: 0.2 deg

Accuracy Height: 400 m

Resolution Range: 240 m

Resolution Azimuth: 0.9 deg

Resolution Elevation: 1.0 deg

Sidelobes: -35 dB

Mean Time Between Failutes: >4,150 hours

Mean Time to Repair: <30 min

Average Power Output: 10 kW

Transmit Power Output: 1 MW

Automatic Tracking: Yes, It can operate in high clutter and jamming environments without range reductions. It also has automatic tracking and reporting of up to 100 targets.

Moving Target Indicator (MIT): The system uses an adaptive Doppler moving target indicator (MTI) to produce an improvement factor of more than 40 dB for ground clutter and of over 30 dB for chaff clutter.

Pulse-to-Pulse Agility: Yes

Antenna Type: The JY-14 has a multibeam "Peacock" antenna designed in a near circular configuration with eight horn feeds: six in the E/F band and two in D band. The latter provide good height cover, while the lowest can also be used for identification-friend-or-foe (IFF).

Operating in Wind Conditions: The JY-14 can maintain operations in winds of up to 56 mph (90 kph); operate with degraded performance in winds from 56 mph to 78 mph (126 kph); and cease operations without damage at winds greater than 78 mph.

Dimensions

Length: INA

Width: INA

Height: INA

Weight, Combat: INA

Notes:

The JY-14 (domestic designation: LLQ302, formerly known as:384) is a medium to long range air defense radar produced and used by the People's Republic of China. It is capable of detecting multiple targets within its range and determine their parameters, tracking them even through surface clutter and ECM jamming. It utilizes a frequency-agile mode with 31 different frequencies, has a large band of ECCM operating parameter frequencies, and uses linear FM compression. This system can simultaneously track up to 100 targets and can feed the data to missile-interceptor batteries. It can track targets flying as high as 75,000 feet (22,900 m) and 186 miles (299 km) in distance. The system is notable for having wideband frequency diversity and adaptive pulse-to-pulse agility, enabling it to track even the most morphic radar signatures. It is the most common ground radar in China, and is rapidly being exported to other countries. The radar features excellent anti clutter and anti jamming ability, as well as very good adaptability and automatization. Incorporated techniques include dual pulse frequency diversity, pulse-to-pulse frequency agility over a wide frequency band, adaptive MTI and CFAR techniques, and an advanced computerized BITE technique. The JY-14 can be upgraded to a more powerful power supply, giving it a wider range. This has been seen only in China so far, where multiple stations are tied together with the air defense system.

Giraffe 50AT Norwegian Mobile Air Defense Radar System

Tiers:

Variants:

- **Giraffe 40:** This is a short-range (40 kilometres (25 mi) instrumented) air defense radar with command and control capability. It employs a folding antenna mast that extends to a height of 13 metres (43 ft) when deployed and can be integrated with an Interrogation Friend or Foe (IFF) capability. Coverage is stated to be from ground level to 10,000 metres (33,000 ft) in altitude. In Swedish service the radar is designated PS-70 and PS-701 and provides target data to RBS-70 SHORADS missiles and 40mm Bofors guns. A more powerful version with a 60 kW transmitter is known commercially as Super Giraffe and in Swedish service as PS-707. These radars are no longer marketed.
- **Giraffe 50AT:** This is the model used in the Norwegian NALLADS air defense system which combines the radar and RBS-70 missiles with 20 mm anti-aircraft guns to provide low-level air defense for the combat brigades of the Norwegian army. Mounted on a BV-206 all-terrain tracked vehicle this version has an instrumented range of 50 km (31 mi). The antenna extends to a height of 7 metres (23 ft) and the system can control up to 20 firing units of guns or missiles or a combination of both. The Command and Control system features fully automatic track initiation, target tracking, target identification (IFF), target classification and designation, hovering helicopter detection threat evaluation and handling of "pop-up" targets. It can also exchange data with Giraffe 75 or AMB systems as part of a larger network.
- **Giraffe 75:** This features a 13 metres (43 ft) antenna mast and is normally carried on a 6x6 5-ton cross-country truck which carries the radar and command and control shelter. Instrumented range is 75 km (47 mi) and altitude coverage extends from ground-level to 10,000 metres (33,000 ft). An optional add-on unit extends the radars coastal defense capabilities. In Swedish service the radar is designated PS-90. In the Greek Air Force Giraffe 75 is used in combination with Contraves (now Rheinmetall defense) Skyguard/Sparrow fire control systems. 1 Giraffe typically controls 2 Skyguard systems each with 2 twin 35 mm GDF-005 guns and 2 Sparrow surface-to-air missile launchers.
- **Giraffe S:** Optimized as a mobile radar for un-manned remote-controlled applications as a "gap-filler" in air defense early warning systems concentrating on small, low-flying targets over a long distance. It can also be employed as a coastal surveillance radar where targets are small surface vessels and sea-skimming missiles or aircraft. A new antenna extends range coverage to 180 km (110 mi) with altitude coverage from ground level to 6,000 metres (20,000 ft). The antenna mast extends to 8 metres (26 ft).
- **Giraffe AMB:** Giraffe Agile Multi Beam is a passive electronically scanned array radar, providing multi-beam 3-Dimensional air coverage at 5.4 to 5.9 GHz with instrumented ranges of 30 km (19 mi), 60 km (37 mi) and 100 km (62 mi), the altitude coverage is extended from ground-level to 20,000 metres (66,000 ft) with 70-degree elevation coverage. Data rate is 1-scan per-second. Its maintained pulse density suppresses high cluttering in adverse weather conditions. Ultra-low antenna side-lobes combined with pulse-to-pulse and burst-to-burst frequency agility provides some resistance to jamming. As in previous Giraffe radars automatic hovering helicopter detection is provided as is a rocket, artillery and mortar locating function, allowing the radar to detect incoming rounds and give 20 seconds or more of warning before impact. Giraffe AMB is the principal sensor of the Swedish RBS 23 BAMSE air defense missile system but is available for many other applications. The Giraffe AMB can be delivered with ground surveillance options fitted.
- **ARTE 740:** This is a coastal defense radar based on the Giraffe 75 antenna and Giraffe AMB processing system optimized for surface and low-altitude coverage for the Swedish Amphibious Forces (formerly the Coastal Artillery). It is mounted on a MOWAG Piranha 10x10 armored vehicle. 6 systems are in service.
- **Sea Giraffe AMB:** Saab's Sea Giraffe AMB is the naval variant of their Giraffe radar with 3D AMB technology. It can detect air and surface targets from the horizon up to a height of 20,000 metres (66,000 ft) at elevations up to 70°, and can simultaneously handle multiple threats approaching from different directions and altitudes, including diving anti-ship missiles. Also, it is specialized for rapidly detecting small, fast moving targets at all altitudes and small surface targets in severe clutter. Sea Giraffe AMB is installed on the Republic of Singapore Navy's upgraded Victory-class corvette and US Navy's Independence class of Littoral Combat Ships, and has the designation AN/SPS 77 V(1) for LCS 2 and 4, and AN/SPS 77 V(2) for LCS 6 and higher.

- **AESA:** Saab Electronic Defence Systems (EDS) in May 2014 unveiled two new classes of active electronically scanned array (AESA) radar—three land-based systems (Giraffe 1X, Giraffe 4A and Giraffe 8A) and two naval variants (Sea Giraffe 1X and Sea Giraffe 4A).
- **Giraffe 8A:** At the top end of the range is the Giraffe 8A, a long-range IEEE S-band (NATO E/F) 3D sensor that can be produced in fixed, transportable and fully mobile configurations. Intended primarily for remote operation as part of an integrated air defence network, Giraffe 8A can also be operated locally. It has an instrumented range of 470 km and an altitude capability of more than 40,000m, bringing true long-range air defence capability to the Saab radar family for the first time. Giraffe 8A produces 15 stacked beams to provide elevation coverage from ground level to more than 65°. It can operate in a continuous 360° scan mode, rotating mechanically at 24rpm, or can be steered electronically across an operator-specified sector of 40° to 100°. More than 1,000 air defence tracks can be maintained, and the system also has anti-ballistic missile capability, in which case more than 100 tracks can be followed. Saab has paid special attention to Giraffe 8A's electronic counter-countermeasures properties. The radar generates very low sidelobes and incorporates sophisticated frequency agility in pulse-to-pulse, burst-to-burst and scan-to-scan regimes. It also switches and staggers pulse repetition frequency and transmits random jitter to further confuse countermeasures. It automatically selects the least jammed frequencies and can transmit intermittently or randomly. The radar offers a passive detection and tracking capability against jammers.
- **Giraffe 4A:** While the Giraffe 8A occupies the high end of the family, Saab has introduced new radars in the medium-range category in the form of Giraffe 4A and Sea Giraffe 4A for naval use. Employing similar S-band technology to the larger radar, Giraffe 4A offers true 3D multirole capability, combining the air defence and weapon locating tasks in a single unit. Able to be airlifted in a single C-130 load, Giraffe 4A can be deployed by two people in less than 10 minutes. It can operate as a standalone.
- **Giraffe 1X:** To complete its new line-up, Saab has introduced two short-range radars, Giraffe 1X and Sea Giraffe 1X. Working in the IEEE X-band (NATO I-band), Giraffe 1X is intended primarily as a highly mobile radar that can work with very short-range air defence systems in the battlefield or at sea. Weighing less than 300 kg, Giraffe 1X can be mounted on a small vehicle or vessel or in fixed installations such as on a building or a mast. The radar has a sense-and-warn function and can be optionally configured for weapon location.

System

Alternative Designation: Giraffe 50AT

Chassis: BV-206

Crew: ea2

Type: Air Defense Radar

Total Built: 11,000

Band: C-Band

IFF: Yes

Number of Targets: The frequency-agile radar provides automatic location, pop-up handling, identification and evaluation of threats and can handle up to 20 targets simultaneously, with automatic track initiation on its two operator stations, each of which is equipped with a 19 inch full-colour raster scan display.

Advanced Moving Target Indicator (MTI): Yes

Wind Compensation: The system also has advanced Moving Target Indicator (MTI) filter with automatic wind compensation and automatic detection of hovering helicopters.

Data Communications: Data communications consist of narrow band data channels for plot and track transmission.

Graphics Generators: The graphics generators are based on three Motorola 68020 32-bit microprocessors, and the complete Giraffe 50AT system has a total of seven CPUs – implemented as gate-array single-chip processors – with a combined power of some 10 MIPS (million instructions per second).

Software: Software is written in a real-time variant of the Pascal high-order language, and comprises 50,000 to 200,000 lines of source code, depending on the application.

Note #1: Up to three NALLADS can be linked together to defend an extremely large area. The then Ericsson Microwave Systems in conjunction with Ericsson Radar Norge developed the software for the system while the weapon-control terminals came from Siemens (Norway).

Note #2: The Giraffe 50AT has the ability to exchange data with GIRAFFE 75 and AMB systems to facilitate radar co-operation and the compilation of a local air picture. The system can also be integrated with an IFF subsystem (including Mk

XII).

The Command and Control system features fully automatic track initiation, target tracking, target identification (IFF), target classification and designation, hovering helicopter detection threat evaluation and handling of "pop-up" targets. It can also exchange data with Giraffe 75 or AMB systems as part of a larger network. OVERVIEW: The Giraffe is a mobile, medium range air identification and surveillance radar. Giraffe is a powerful 3D surveillance radar system and Command and Control system intended for short and medium-range surveillance and ground based air defence. In addition it can also warn of incoming rocket, artillery and mortar rounds, as well as provide coastal surveillance. DETAILS: The Giraffe is a frequency agile, low to medium altitude pulse doppler air search radar and combat control center which can be used in mobile or static short to medium range air defense applications. Giraffe is designed to detect low-altitude, low cross-section aircraft targets in conditions of severe clutter and electronic countermeasures. When equipped as an air-defense command center Giraffe provides an air picture to each firing battery using manpack radio communication. It is normally housed in a single 6m long shelter mounted on an all-terrain vehicle for high mobility. NOTES: Several variants available. The first systems were produced in 1977. By 2007, some 450 units of all types are reported as having been delivered. User countries include: Brazil, Croatia, Estonia, Finland, France, Indonesian Army, Ireland Irish Army, Latvia, Lithuania, Greece, Norway, Pakistan, Serbia, Singapore, Sweden, Thailand Navy and United States.

Notes:

The SLC-2 Radar is a Chinese active electronically scanned array counter-battery radar designed to locate hostile artillery, rocket and ground-to-ground missile launchers immediately after firing, and to support friendly artillery by guiding counter-battery fire. SLC-2 radar can also be applied in adjusting firing of friendly weapons or rockets. With slight modification to software parameters the radar can also be used to detect and track low flying targets such as light aircraft, helicopters and RPVs. SLC-2 systems have sometimes been mounted on a Dongfang EQ2102 3.5 ton truck. Four AN/TPQ-37 Firefinder radar were sold to China, and these became the foundation of SLC-2 radar development. Aside from political reasons, the US$10 million plus unit price tag of TPQ-37 (including after sale logistic support) was simply too costly for Chinese. The decision was made to develop a domestic equivalent after mastering the technologies of TPQ-37. After the initial test of TPQ-37 in Tangshan (□□) Range near Nanjing in 1988, and in Xuanhua District in October of the same year, several shortcomings of TPQ-37 were discovered and further intensive tests were conducted and completed in 1994. The requirement of the Chinese domestic equivalent was subsequently modified to address these issues revealed in trials. Due to the limitation of the Chinese industrial capability at the time, decision was made to develop the Chinese domestic equivalent in several steps. The first step was to

develop a smaller one, which would result in the Chinese equivalent of AN/TPQ-36 Firefinder radar, and based on the experience gained from this program, a more capable larger version in the same class of AN/TPQ-37 Firefinder radar would be developed, which eventually resulted in SLC-2 series. As Chinese capability in microelectronics matured, an updated version of passive phased array Type 373 radar is developed, designated as SLC-2. This is a fully solid-state, highly digitized version that adopts planar active phased array antenna. One of the shortcomings of TPQ-37 revealed in tests was in its multi-targeting capability. When enemy artillery batteries located more than two hundred meters apart fires simultaneously, TPQ-37 could provide accurate coordinate for distance, but coordinates for positions were less accurate. This would not be a problem for most users because TPQ-37 can be used in pairs in conjunction, provide accurate coordinates for locations. However, these costly radars could not be purchased in large numbers and China thus developed the capability for SLC-2 to provide accurate coordinates for both distance and position. Bangladesh Bought two in 2012. Pakistan also operates significant number of SLC-2 Radar.

1L219 Zoopark-1 Russian Mobile Counter-Battery Radar

Tiers:

Variants:

- **Zoopark-1M:** The variant entered service in January 2017, according to Russia's Sputnik (March 28, 2017). No details have been revealed. It does include a 1L216 missile and artillery ground reconnaissance system, a 1I38 maintenance vehicle and a ED60 mobile power plant. The system is service with artillery unit s in Russia's Eastern Military District.

System

Alternative Designation: Zoopark-1 1L219
Type: Mobile Counter-Battery Radar
Crew: INA
Chassis: MTLB
Designed: It has been designed to automatically determine the coordinates of enemy artillery positions such as mortars, howitzers, rocket launchers and tactical missile systems.
Band: G-H (4-8 GHz)
Scan Sector: 90 degrees
Range, Tactical Missile: 35 km
Range, Multiple Rocket Systems: 12-20 km
Range, Mortars: 12-15 km
Range, Artillery Rounds: 8-10 km
Displacement Time: Less than 5 Minutes
Emplacement Time: Less than 5 Minutes
Service Life: 8 years guaranteed by manufacturer

Dimensions (Chassis: MTLB)

Length: m6.45
Width: m2.86
Height: m1.86
Weight, Combat: kg11,000

Ground Pressure: kg/cm20.46 standard track / 0.28 wide track

Antenna Length: INA

Antenna Height: INA

Mast Height: INA

Automotive (Chassis: MTLB)

Engine Name: YaMZ 238 (Newer versions have the KamAZ-740.50 engine / 360 horsepower)

Engine Type: Diesel

Engine Power: hp240

Cruising Range: km500

Speed, Maximum Road: km/h60

Speed, Average Cross: 30

Speed Maximum Swim: km/h5

Fording Depth: mAmphibious

Primary Weapon System on Most Variants

↳*System*

Name: PKT

Type: 7.62 mm, machine-gun

↳*Ammunition*

Type: API, API-T

Caliber: mm7.62

Muzzle Velocity: m/sINA

Basic Load: rounds1,500

Max Effective Range (Day): m1,000

Max Effective Range (On the move): m500

Maximum Aimed Range: m1,500

Min Range: kmINA

Armor Penetration: 8mm of RHA at 500m

Hull Armor: mm14

Turret Armor: mm14

Applique Armor: No

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: Optional

NBC Protection: Yes

Smoke Equipment: No

Night Vision Device Capable: Yes. Some versions have spot lights.

Notes:

The Zoopark-1 missile and artillery round reconnaissance radar system, referred in the West as a counter battery radar, was developed by the former Soviet Union in the 1980s as the replacement for the APK-1 Ris radar system. The Zoopark-1 is mounted on a MTLB tracked chassis. It has been designed to automatically determine the coordinates of enemy artillery positions such as mortars, howitzers, rocket launchers and tactical missile systems. The Zoopark-1 radar system can also serve to monitor firing results of its own artillery systems. The Zoopark-1 radar system was deployed to Syria in early 2016. The Zoopark-1 intelligence radar system is completely autonomous and needs five minutes to get set up. The radar can track artillery shells of 82 to 120mm (typically mortar ammunition) at distances of up to 17 kilometers. It can detect 105 to 155mm projectiles at distances of 12 kilometers, multiple launch rocket systems at distances of 22 kilometers and tactical missiles at ranges of up to 45 kilometers. The radar can track up 12 targets simultaneously detecting up to 70 firing positions in a minute.

1L220-U (Zoopark-2) Ukrainian Artillery Locating Radar

Tiers:

System

Alternative Designation: Zoopark 2

Crew: 5

Chassis: Multiple Options (See Images)

Time Between Failures: hours>400

Dimensions

Height, Overall: m3.8

Length, Chassis Overall: m11.5

Width, Overall: m3.2

Weight, Combat: mt23.5 (varies with chassis)

Single Pulse Processing: Coherent
Multiple Pulse Processing: MTI and Doppler Filters

↳*Antenna*

Type: Phased Array
Polarization: Vertical
Mode: Track
Scan Method: Electronic
Scan Type: Monopulse
Scan Width: Deg60
Notes: Scan Width is 10% of the full azimuth sector is assumed for a crossing trajectory

Notes:

A Ukrainian export company reported the Ukrainian army would begin receiving the 1L220-U (NATO: Zoopark 2) in 1999. The Artillery Locating Radar (ALR) has the capability of detecting mortars, cannon artillery, rocket, and tactical missile batteries. It can estimate the impact points of hostile fires as well as register friendly artillery. The ALR has an internal navigation and orientation system to enable autonomous operations and is equipped with a communications suite for command and control. It is capable of friendly fire adjustment ranges as follows: 20-25 km for 152-mm artillery guns, 25-30 km for 82-mm/120-mm mortars; 21-40 km for BM-21-type MLRS; 80 km for rockets.

Horizontal Range of Detection: degrees180

Protection

Armor: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The BL-904 is the artillery locating radar developed by China North Industries Group Corporation (NORINCO). The radar system is based on the phased-array radar technology and was developed as a part of the Plz-45 155mm self-propelled howitzer system. Operating in the C-band, the radar can detect the trajectory of enemy mortar rounds, howitzer projectiles, and rockets and can also be used to adjust friendly artillery. The radar has a response time of 5 seconds, and its performance is said to be comparable to the U.S. TPQ-36. A complete BL-904 radar system consists of two 6X6 trucks, one carrying the phased-array radar antenna and the other carrying the operation center. The system takes 10 minutes to be ready for operation. The radar's vertical range of detection is –5 to +12 degrees and the azimuth range of detection is 180 degrees. The system has a maximum detection range of 15km (for mortars) and 18km (for 122/152/155mm howitzer projectiles and 122mm rockets), and can track eight targets simultaneously. It is also equipped with the GPS and can transmit the target information to the battery command post in real-time.

Soras 6 Swedish Sound Ranging System

Tiers:

System

Alternative Designation: SORAS-6
Crew: ea2
Weight, Combat: mt2.8
Height: mm52
Sound Frequency: hz2-150
Microphone Cable Length: km1-8
Meteorological Unit, Mast Height: m15
Meteorological Unit, Mast Weight: kg40
Maximum Detection Range: km30
Precision Under 10km: 0.5% of the measured distance
Precision Under 30km: 2% of the measured distance
Maximum Number of Targets: targets200
Response Time: seconds2 to 45
Emplacement Time: Varies
Displacement Time: Varies
Number of Microphones: 9

Automotive: Mercedes Benz Unimog U1350L 4x4 (if used)

Engine Name: OM-352
Engine Type: 6 Cylinder Diesel
Speed, Maximum Road: km/h80
Speed, Maximum Swim: NA
Speed, Cross: INA
Speed, Maximum Off: INA
Fording Depth: m1.2

Vehicle Length: m5.5
Vehicle Height: m2.5
Vehicle Width: m2.3
Combat Weight: mt7.5

Notes:

This system is not a radar but is a sound ranging system with the same purpose as counter-battery radar. Sound ranging system (Soras) 6 is a fully automated, EMP-protected, completely passive sound ranging system capable of accurately locating enemy gun positions. The system is not susceptible to jamming. The system is comprised of a computer terminal, nine microphones, and a meteorological unit. Each microphone is surveyed into position and acoustically designates an azimuth to each firer. The computer terminal then calculates intersection points with the azimuths for target locations. The system operates in temperatures ranging from -40° to +55° c. Normally, it takes between 2 and 45 seconds for the computer terminal to calculate target coordinates. But, the target coordinate calculation time depends on the number of sound sources within the same interval of time. Nine microphones are deployed in an area 8 km wide and 1-2 km deep. The microphone positions are determined by conventional surveying methods or by special equipment. An alarm on the calculator is automatically triggered if contact is broken with any of the microphones. The meteorological unit provides air temperature, wind speed, and wind direction. Two people can connect the meteorological unit and raise the mast in 15 to 20 minutes. The system possess the ability to detect firing systems by itself and/or act as a passive cueing system when used in conjunction with an artillery location radar. There are no associated vehicles for the Soras 6 however, the Mercedes Benz Unimog U1350L truck (described within the table) provides a representative worldwide transportation capability for the system.

SNAR-2 (Pork Trough) Russian Mobile Counter-Battery Radar

Tiers:

Variants:

- **Pork Trough-2 (SNAR-6):** Operates in the J band.
- **Cheetah:** This is a mobile Chinese version of the SNAR-2. It operates in the Ku-band. See separate database entry.

System

Alternative Designation: SNAR-2; NATO: Pork Trough
Type: Mobile Counter-Battery Radar
Crew: INA
Chassis: AT-LM
Band: I (8-10 GHz)
Range, Surveillance: 40 km
Range, Arillery Detection: 9 km
Note: There is very little unclassified information available about the SNAR-2

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA
Antenna Length: INA
Antenna Width: INA
Mast Height: INA

Notes:

Pork Trough** (SNAR-2) is a Russian counter-battery radar used to locate enemy artillery and provide position information. It employs a rotating horizontal parabolic cylinder antenna mounted on a fully tracked AT-LM artillery tractor.

AN/TPQ-36(V) American Towed Firefinder Radar

Tiers:

Variants:

- **AN/TPQ-46:** Alongside the baseline AN/TPQ-36(V), the US Marine Corps (USMC) operates a service specific variant that is designated as the AN/TPQ-46. Here, the US Army's two element configuration is replaced by a four HMMWV/trailer application. Subsequent to its initial fielding, the service has commissioned the AN/TPQ-46A and -46B upgrades. Here, AN/TPQ-46A is understood to have been based on the AN/TPQ-36(V)8 configuration and is believed to have updated the architecture's operating shelter and electronics, enhanced its target detection, survivability and interoperability capabilities and reduced its maintenance and logistics requirements. For its part, AN/TPQ-46B mirrors the AN/TPQ-36(V)10 radar and feature that sensor's upgraded processor. Here, the update reduced the circuit board count from nine to three and is claimed to have provided 'unlimited future growth potential'.

System

Alternative Designation: AN/TPQ-36; AN/TPQ-36(V)
Type: Towed Firefinder Radar
Manufacturers: Northrop Grumman manufactures the AN/TPQ-36(V)8 Firefinder radar. Before acquisition by Raytheon, the Hughes Aircraft Co. developed the AN/TPQ-36 Firefinder radar at its Fullerton, California facility, and manufactured it at its Forest, Mississippi plant.
Crew: INA
Upgarde: Firefinder (V)7 adds a modular azimuth position system (MAPS). MAPS has a north seeking laser gyrocompass and a microprocessor controlled Honeywell H-726 inertial navigation system. Prior Firefinders used a survey team to find site latitude, longitude, and direction to North. With MAPS, reaction time was limited only by site set-up, since system geo-position was pre-loaded before sortie deployment. Crew was reduced from 8 to 6. Firefinder (V)8 extends system performance, improves operator survivability and lowers life cycle cost. Greater processing power and the addition of a low noise amplifier to the radar antenna improves detection range (by up to 50%) and performance accuracy against certain threats.
Frequency: 8 GHz to 12.5 GHz (32 sub-frequencies)
Coverage, Range: 8 n miles (14.5 km; 9 miles) (artillery, effective range); 10 n miles (18 km; 11 miles) (mortar, effective range); 13 n miles (24 km; 15 miles) (rockets, effective range)
Coverage, Azimuth: 90° (sector) 360°
Coverage, Target Capacity: 10
Coverage, Track Capacity: 99
Displacement Time: 5 min
Power, Volt: 115 V (400 Hz, AC, three phase, supply);120 V (400 Hz, AC, three phase, supply)
Emplacement Time: 15 min

Power, Watt: 23 kW (transmit, peak); 10 kW (AN/MJQ-25 generator, nominal, supply)

Antenna Type: Phased Array

Transmitter: TWT

Note: The AN/TPQ-36(V) consists of the following: *a trailer-mounted antenna-transceiver assembly; *a power generator, and ; *an operator shelter that houses the necessary processing equipment.

System Dimensions

Length: 4,600 mm

Width: 2,100 mm

Height, in Operation: 3,700 mm

Height, in Transit: 2,100 mm

Weight, Combat: 1,451 kg

Operations Shelter

Length: 2,692 mm

Width: 2,100 mm

Height: 1,800 mm

Weight: 1,089 kg

AN/MJQ-25 Generator with Trailer

Length: 4,350 mm

Width: 2,080 mm

Height: 2,490 mm

Weight: INA

Notes:

Hughes AN/TPQ-36 Firefinder weapon locating system is a mobile radar system developed in the mid-late 1970s by Hughes Aircraft Company and manufactured by Northrop Grumman and ThalesRaytheonSystems, achieving initial operational capability in May, 1982. The system is a "weapon-locating radar", designed to detect and track incoming mortar, artillery and rocket fire to determine the point of origin for counter battery fire. It is currently in service at battalion and higher levels in the United States Army, United States Marine Corps and Australian Army. Also Turkish Army , Portugal and Ukrainian Army are among the users. The radar is typically trailer-mounted and towed by a Humvee. The AN/TPQ-36 Firefinder Radar is a lightweight, small, highly mobile radar set capable of detecting weapon projectiles launched at any angle within selected 90-degree azimuth sectors over 360 degrees of coverage. The AN/TPQ-36 can locate simultaneous and volley-fire weapons. It can also be used to register and adjust friendly fire. Upon projectile detection, the weapon location is computed and is used to direct counter-battery fires. The system consists of an operational control group, OK-398/TPQ-36, and an antenna transceiver group, OY-71/TPQ-36. It is used by the artillery battalions to provide an effective capability to locate hostile weapons, both mortars and short- to medium-range weapons. The Marine Corps will be receiving a Version 8 configuration, currently involving Toby Hanna Army Depot & Grumman Electronics Programs. This new configuration consists of a new Operations Control Group (OCG) using the Army Lightweight Multipurpose Shelter (LMS) mounted on a M1097 HMMWV. This HMMWV tows the Antenna Transceiver Group (ATG) with the integrated Modular Azimuth Positioning System (MAPS) mounted on the M116A2E1 trailer. The OCG is controlled by an operator either located within the shelter or remotely located. The second M1097 HMMWV will carry the MEP112A generator mounted on an M116A2E1 trailer. An additional reconnaissance vehicle/crew carrier, a fourth HMMWV, will be added to the Marine Corps Table of Equipment.

Notes:

The Zoopark-1 automated multifunctional reconnaissance and control complex consists of the 1L259 radar mounted on a MT-LBU chassis, 1IZ0 maintenance van on an Ural-43203 truck, and the trailer-mounted ED30-T230P-1RPM power station. The MT-LBU engine-driven generator allows for autonomous operation. The ED30-T230P-1RPM power station provides power during vehicle and radar maintenance. The system is capable of transmitting information of a detected enemy firing unit position to an artillery unit within 20 seconds of detection. The Zoopark-1 is capable of tracking friendly artillery fire. The system calculates the impact error of friendly artillery rounds and provides automatic correction parameters for increased accuracy. Additionally, the system is also capable of controlling (simultaneously) several remote piloted vehicles (RPVS) using an automatic screen indication with a topographic mapping of calculated and real RPV flight routes. The radar is capable of conducting air traffic control around an airfield or operating area. The radar tracks and establishes the current position of aircraft in the operating area of responsibility and provides real-time data transmission of data received to the air control center. The antenna beam is electronically phase-steered in azimuth and elevation. The reflect-array is composed of 3328 phase shifters, space-fed by a mono-pulse horn located on the front side of the array and electronics enclosure. After coming into position, and after the array is raised from the travel position, it is rotated so that its bore sight is centered in the assigned coverage sector. The search scan elevation angle is probably fixed, nominally at a low angle in the range of 30 to 50 mils. The search mode will be interrupted by verification and track mode scans during periods when targets are detected. Verification is most likely a non-scanning mode, with the beam pointed at the same elevation angle as the search scan. Also, verification may be repeated for some targets. During the track mode, the radar tracks the target by scanning in both azimuth and elevation.

Type 704 Chinese Counter-Battery Radar System

Tiers:

Variants:

- **Type 704 radar:** Type 704 is the first of the Type 704 series of counter-battery radars. Developmental work of Type 704 begun in parallel with the introduction of AN/TPQ-37 radar into Chinese service, and the reported experience gained on the Chinese reverse engineering of TPQ-37 has influenced Type 704 radar. One problem revealed in the tests was that the reliability of TPQ-37 is much lower than what was claimed. The reason was that when TPQ-37 was deployed in environments with high humidity and high level of rainfall (southern China), high salinity (coastal regions), high altitude (southwestern China), and subjected to daily high temperature differences (northwestern China), malfunctions occurs more frequently. Type 704 radar was designed specifically to improve the reliability against these harsh environmental factors.
- **Type 704A radar:** Type 704 is followed by its successor, Type 704A, which is fully solid state, fully digitized version, which further improved reliability and simplified logistics, and thus reduced the operational cost. One of the limitations of TPQ-37 revealed in tests was that the it was less effective against projectiles with flat trajectory, so it is much more effective against howitzer and mortar rounds than rounds from 130 mm towed field gun M1954 (M-46) and its Chinese derivative Type 59-1. Type 704A radar is designed to overcome this shortcoming by improving the capability against rounds with flat trajectory.
- **BL904 radar:** A further improved variant based on Type 704A designated as BL904 has also been introduced. This latest version of Type 704 radar family reportedly utilizes the more advanced lens arrangement for its planar passive phased array antenna, instead of earlier simple horn arranged used in earlier versions. Unconfirmed Chinese claims also concludes that the BL904 radar also incorporate former-USSR counter-battery radar Zoopark-1 radar, two of which was purchased by China from Ukraine, but such claim has yet to be verified by official sources and sources outside China.
- **CS/RB1 radar:** At the 9th Zhuhai Airshow held in November 2012, a new, lightweight, counter battery radar designated as CS/RB1 made its public debut.[1] Like Type 704 and BL904 radars, CS/RB1 is also designed primarily for detecting incoming projectiles down to the size of mortar round, though larger objects can be tracked as well. CS/RB1 is designed to be a lightweight version of Type 704/BL904 to be carried by individual soldiers (when systems are breaking down into portions). CS/RB1 radar operates is a passive phased radar operates in L-band, and it is fully solid state, highly digitized, conformal array in cylindrical shape., and it can be airdropped.

System

Alternative Designation: Type 704
Type: Counter-Battery Radar System
Crew: ea3 (driver, radar operator, power supply operator)
Chassis: INA
Package: The system consists of an antenna-transceiver vehicle and a command-operations vehicle.
Band: I-J (8-20 GHz)
Range, 81mm Mortar: 12.00 km
Range, 120mm Mortar: 15.00 km

Range, 155mm Howitzer: 16.00 km

Accuracy, Flat Trajectory Gun: 40 m

Accuracy, Mortar: 30 m

Accuracy, Registration Fire: 40 m

Accuracy, Rocket Launcher: 60 m

Power Supply: 60 kW est (AN/TPQ-37)

Scan Sector, Beam Width: 6 deg (107 mils)

Scan Sector, Rotation: -0.5 to +90 deg (-9 to +1,600 mils)

Scan Sector, Tilt Angle: -0.5 to +27 deg (-9 to +480 mils)

Stored Targets: 99 est (AN/TPQ-37)

Simultaneous Tracks: 8

Dimensions

Length: INA

Width: INA

Height: INA

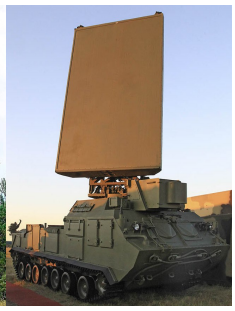
Weight, Antenna-Transceiver Vehicle: 3,820 kg

Weight, Command-Operations Vehicle: 3,920 kg

Notes:

The Type 704 is a counter-battery radar designed to accurately locate the hostile artillery, rocket and ground-to-ground missile launcher immediately after the firing of enemy, and support friendly artillery by providing guidance of counter fire. Built by NORINCO, it was first displayed publicly in 1988's ASIADEX defence show. Type 704 radar shares the same root as its larger cousin, the SLC-2 Radar: four AN/TPQ-37 Firefinder radar have been sold to China and this had become the foundation of SLC-2 radar development. Aside from political reasons, the US$10 million plus unit price tag of TPQ-37 (including after sale logistic support) was simply too costly for Chinese. Decision was made to develop a domestic equivalent after mastering the technologies of TPQ-37. After the initial test of TPQ-37 in Tangshan (□□) Range near Nanjing in 1988, and in Xuanhua District in October of the same year, several shortcomings of TPQ-37 were discovered and further intensive tests were conducted and completed in 1994. The requirement of the Chinese domestic equivalent was subsequently modified to address these issues revealed in trials. Due to the limitation of the Chinese industrial capability at the time, decision was made to develop the Chinese domestic equivalent in several steps. The first step was to develop a smaller one, which would result in the Chinese equivalent of AN/TPQ-36 Firefinder radar, Type 704 series radar, and based on the experience gained from this program, a more capable larger version in the same class of AN/TPQ-37 Firefinder radar would be developed, which eventually resulted in SLC-2 series. Type 704 is the first of the Type 704 series of counter-battery radars. Developmental work of Type 704 begun in parallel with the introduction of AN/TPQ-37 radar into Chinese service, and the reported experience gained on the Chinese reverse engineering of TPQ-37 has influenced Type 704 radar. One problem revealed in the tests was that the reliability of TPQ-37 is much lower than what was claimed. The reason was that when TPQ-37 was deployed in environments with high humidity and high level of rainfall (southern China), high salinity (coastal regions), high altitude (southwestern China), and subjected to daily high temperature differences (northwestern China), malfunctions occurs more frequently. Type 704 radar was designed specifically to improve the reliability against these harsh environmental factors.

1L260 Zoopark-1M Russian Mobile Counter-Battery Radar



Tiers:

Variants:

- **1L259 Zoopark-1:** Zoopark-1 is a three-dimensional (3-D) multifunction phased-array artillery location radar for use on the battlefield. The system tracks projectiles, calculates their trajectory, pinpoints the position of enemy artillery and transfers the information to associated fire-control systems for counter-b attery fire.

System

Alternative Designation: 1L260 Zoopark-1M
Type: Mobile Counter-Battery Radar
Crew: INA
Chassis: MTLB
Designed: The 1L260 Zoopark-1M is a mobile artillery locating radar system designed to detect artillery rocket positions even in heavy electronic countermeasures (ECM) environments. Besides, the 1L260 can detect mortar and howitzer gunfire source as well as tactical ballistic missiles launch pads.
Band: G-H (4-8 GHz)
Range, 155mm Artillery Shell: 23 kilometers
Range, 203mm Artillery Shell: 27 kilometers
Range, Artillery Rockets: between 32 and 45 kilometers
Range, Ballistic Missiles: 65 kilometers
Operating Time: 8 hours
Number of Targets: up to 12 targets simultaneously
Azimuth: In azimuth it covers a sector of 2.5 to 90-degree
Displacement Time: Less than 5 Minutes
Emplacement Time: Less than 5 Minutes

Dimensions (Chassis: MTLB)

Length: m6.45
Width: m2.86
Height: m1.86

Weight, Combat: kg11,000

Ground Pressure: kg/cm20.46 standard track / 0.28 wide track

Notes:

The 1L260 Zoopark-1M is a mobile artillery locating radar system designed to detect artillery rocket positions even in heavy electronic countermeasures (ECM) environments. Besides, the 1L260 can detect mortar and howitzer gunfire source as well as tactical ballistic missiles launch pads. The radar system is mounted on a tracked armored chassis and includes a maintenance vehicle. Besides, the system can provide assistance for friendly artillery systems helping them to adjust their gunfire to effective hit their designated target. The 1L260 radar system can detect a 155mm artillery shell at a range of 23 kilometers or 27 kilometers for 203mm shells. It can detect artillery rockets at ranges between 32 and 45 kilometers. An ATACMS-sized tactical ballistic missile can be detected at a range of 65 kilometers. The 1L260 can be ready for deployment or evacuation in five minutes while operating for over eight hours tracking up to 12 targets simultaneously. In azimuth it covers a sector of 2.5 to 90-degree.

ARTHUR Norwegian Counter-Battery Radar

Active Protection System: No

NBC: INA

Note: The ARTHUR radar is unprotected. The prime mover will have the protection characteristics inherent to the system

Notes:

ARTHUR is an acronym for "ARTillery HUnting Radar", and is a counter-battery radar system originally developed jointly for and in close co-operation with the Norwegian and Swedish armed forces by Ericsson Microwave Systems in both Sweden and Norway. The system is partly based on the same technology as Saab’s Giraffe radar, and simultaneously scans 100 targets per minute, while tracking own shells and calculating impact points during registration. It is also used by the British Army, under the name Mobile Artillery Monitoring Battlefield Radar, or Mobile Artillery Monitoring Battlefield Asset (MAMBA). The ARTHUR detects hostile artillery by tracking projectiles in flight. The original ARTHUR Mod A can locate guns at 15 - 20km and 120mm mortars at 30 - 35km with a circular error probable of 0.45% of range. This is accurate enough for effective counter-battery fire by friendly artillery batteries. ARTHUR can operate as a stand-alone, medium-range weapons locating radar or a long-range weapon locating system, consisting of two to four radars working in coordination. This flexibility enables the system to maintain a constant surveillance of an area of interest. The upgraded ARTHUR Mod B meets the British Army's MAMBA requirement for

locating guns, mortars, and rockets. It can locate guns at 20 - 25km and 120mm mortars at 35 - 40km with a circular error probable of 0.35% of range. MAMBA was successfully used by the British Army in Iraq and Afghanistan. ARTHUR Mod C has a larger antenna and can detect guns at 31km, mortars at 55km and rockets at 50 - 60km depending on their size, and locate targets at a rate of 100 per minute with CEP 0.2% of range for guns and rockets and 0.1% for mortars. ARTHUR can be operated in two main modes: Weapon locating and Fire direction. Weapon locating is used to determine the location of the guns, mortars or rocket launchers that fired and their target area. Fire direction is used to adjust the fire of own artillery onto target coordinates. It can be carried by a C-130 or slung under a heavy lift helicopter such as a Chinook. Its air mobility allows it for use by light and rapid reaction forces such as airborne and marine units. It is a mobile, passive electronically scanned array C-Band radar for the purpose of enemy field artillery acquisition and was developed for the primary role as the core element of a brigade or division level counter battery sensor system. The vehicle carrying the radar was originally a Bandvagn 206 developed and produced by Hägglunds, but is now more often delivered on trucks with ISO fasteners. The radar is now developed by SAAB Electronic Defense Systems (after EMW was sold to SAAB in June 2006) and Saab Technologies Norway AS.

AN/TPQ-50 American Counterfire Radar System

Tiers:

System

Alternative Designation: AN/TPQ-50
Type: Multi-Mission Radar
Mission: Early warning, counterfire target acquisition and air surveillance
Crew: ea1
Performance: The AN/TPQ-50 counterfire radar is an official U.S. Army Program of Record, a distinction of its effectiveness at filling a critical need for America's warfighters. The radar has been designed and tested against strict U.S. military standards, including: • MIL-STD-461E, Requirements for the Control of Electromagnetic Interference, Characteristics of Subsystems and Equipment • MIL-STD-464A, Electromagnetic Environmental Effects Requirements for Systems • MIL-STD-810G, Test Method Standard for Environmental Engineering Considerations & Laboratory Tests The predecessor of AN/TPQ-50 received the Top 10 Army Greatest Invention award in 2004. This award recognizes the best technological solutions for soldiers, and how these new technologies increase competence for the U.S. Army.
Benefits: Saves lives by providing early warning of incoming fire • Quickly locates enemy RAM launchers • Cues a counterfire response from any integrated system • Transports easily in challenging terrain • Low lifecycle cost • Unattended remote operation
Operating Frequency: L-Band
Detection Range: 15 km, depending on weapon type and trajectory
Point of Origin Accuracy: 50 m at 10 km
Azimuth Coverage: 360°
Elevation Coverage: 0 - 30°
Power Requirements: 1,200 W, 110/240 VAC 50/60 Hz, 24 VDC

Dimensions

Diameter: 102 cm
Height: 216 cm
Weight: < 227 kg

Notes:

The AN/TPQ-50 Lightweight Counter Mortar Radar (LCMR) is a highly mobile counterfire target acquisition radar organic to Brigade Combat Teams, field artillery brigades and division artilleries. The system provides 360 azimuth coverage between the ranges of .5 to 10 km while automatically detecting, classifying, tracking and locating points of origin of projectiles fired from

mortar, artillery and rocket systems. The system is fielded in the vehicle-mounted configuration but can be operated in the tripod-mounted configuration. The Q-50 can quickly detect, track, classify and accurately determine the point of origin of enemy indirect fires and provide projectile impact locations with sufficient accuracy to warn Soldiers and provide point of origin information for engagement. The Q-50 is networked with existing counterfire systems to provide the maneuver commander increased counterfire radar flexibility. It can be assembled and disassembled quickly by two Soldiers.

SNAR-10M1 (Big Fred) Russian Mobile Counter-Battery Radar

Tiers:

Variants:

- **Small Fred:** This variant operates in J band (10-20 GHz). It has a detection range of 24 mi (39 km) and a tracking range of 4 mi (7 km). The radar is fitted to a BMP MICV.

System

Alternative Designation: SNAR-10M1; 1RL232-2M; NATO: Big Fred
Crew: INA
Chassis: MTLB
Band: K (34.55-35.25 GHz)
Radar Beam: 0.36 deg x 1.3 deg
Range, Battlefield Surveillance: 12-15 km
Range, Maximum Against Moving Vehicles: 16 km
Range, Maximum Against Moving Ships: 30 km
Range, Maximum Against Moving Shell Impacts: 10 km
Output Power: 14-70 KW
Pulse Repetition Frequency: 4,410 Hz up to 16 miles (26 km)
Target Discrimination Traverse: 6 deg
Target Discrimination Range: 50 m
Grid Radial Error: 30 m
Search Sector: 26 deg
Time for Traget Location: 20 seconds
Precision Locating Coordinates Polar Traverse: <2 mils
Precision Locating Coordinates Polar Range: <66 ft (20 m)
Circular Error Probable for Mortar: 45 m

Notes:

The SNAR-10 M1 self-propelled radar, capable of detecting tanks at a distance of up to 40 km, arrived at the Central Military District under a state defense order. The new station strengthens the combat capabilities of the artillery units of the tank formation stationed in the South Urals. The SNAR-10 M1 radar is designed for reconnaissance of moving ground, air and surface targets. The modern radar can detect vehicles, manpower, exploding shells at a range of 200m - 40km. The station is equipped with an internal and external communication system with automated data transmission, and satellite navigation. Autonomous operation of the complex is at least three days. The crew is four people strong. The radar can be deployed into combat position in max 5 minutes.

SLC-2E Chinese Artillery Locating Radar

Tiers:

System

Alternative Designation: NA

Crew: INA

Chassis: 6×6 Beiben truck chassis / Dongfeng EQ2102 3.5 ton truck

Dimensions

Height: m3.2 in travel mode

Length: m7.5

Width: m2.5

Weight: INA

CEP for Targets Within 10km: 35m

Clutter Improvement Factor: 55 dB

Noise: 3 dB

Other Features: Active phased array antenna with electronic scanning both in azimuth and elevation. Sophisticated computer-controlled digital signal processing. Comprehensive online or offline BITE. Automatic/manual height correction with digital/video map. Various effective ECCM. Tracking while scanning.

Communications

↳*Radio*

Name: INA

Protection

Note: The SLC-2E offers no protection to the crew or system

Notes:

The SLC-2 Radar is a Chinese active electronically scanned array counter-battery radar designed to locate hostile artillery, rocket and ground-to-ground missile launchers immediately after firing, and to support friendly artillery by guiding counter-battery fire. As Chinese capability in microelectronics matured, an updated version of passive phased array Type 373 radar is developed, designated as SLC-2. This is a fully solid-state, highly digitized version that adopts planar active phased array antenna. In addition it is equipped with optical infrared system and sound measuring systems that enable to discover enemy’s stealth attack. In contrast to the original model, the 2E variant is not only designed to support counter-battery missions against hostile artillery, rockets, and surface-to-surface missile systems, but also detect airborne threats with a dedicated air defense mode. A complete SLC-2E system comprises a control cabin with associated processing equipment, on-board power supply, and the radar transmitter. Bangladesh Bought two in 2012. Pakistan also operates significant number of SLC-2 Radar.

MR-104 Rys (Drum Tilt) Russian Naval Fire-Control Radar

Tiers:

System

Alternative Designation: MR-104 Rys (Drum Tilt)
Type: Naval Fire-Control Radar
Band: I (8-10 GHz)
Maximum Range: 22.2 km
Minimum Range: 0.2 km
Maximum Altitude: 9.144 km
Minimum Altitude: 0 m

Dimensions

Length: 1.50 m
Width: 1.35 m
Height: INA
Weight, Combat: INA

Notes:

The Drum Tilt** is a naval fire-control radar associated with the AK-230 30-mm anti-aircraft (AA) twin guns. The drum-shaped plastic radome is tilted about 25 degrees above the horizontal and houses a circular parabolic dish.

P-10 (Knife Rest B) Russian Early Warning Radar

Tiers:

1 2 3 4

System

Alternative Designation: P-10; Knife Rest B
Type: Early Warning Radar
Crew: INA
Frequency: VHF-Band
Pulse Repetition Frequency (PRF): 100 Hz
Peak Power: 55 ... 75 kW
Instrumental Range: 110 NM
Beam Width: 21 degrees
Antena Rotation: 0 ... 6 rpm
Resolution: 2.5 km
Accuracy: 3.7 km

Dimensions

Length: INA
Width: INA
Height: INA
Weight, Combat: INA

Notes:

The Knife Rest (Russian: P-8) series of radars were used for early warning in conjunction with the SA-2 Guideline surface-to-air missile (SAM) system. The antenna consists of a twin Yagi array. Knife Rest-A is ground-mounted; the Knife Rest-B/C (Russian: P-10) models are truck-mounted. A navy variant was fitted in some SVERDLOV-class cruisers and T-43-class minesweepers.

Obstacle Gap : m20.0

Type: SP Ferry

Variants: Amphibious Bridging System- Wheeled (ABS-W)

Communications

↳*Radio*

Name: R-173 and R-134

Notes:

The PMM-2 replaces the GSP and has one main advantage as a ferry over the GSP: whereas two GSP half-ferries must be joined together to produce one ferry with a capacity of 50 metric tons, one PMM-2 can handle approximately the same capacity eight PMM-2 vehicles can form eight separate ferries or four large ferries (85- ton capacity). The PMM-2 bears great similarity to the PTS-2 tracked amphibian, with its cab and boat-like bow. The chassis is similar to that of the MT-T artillery prime mover, with seven road wheels and four return rollers. When unfolded the PMM-2 creates a raft that can carry a main battle tank without further assistance or construction. While two systems can be combined to form an 85-ton capable ferry, the PMM-2 does not form float bridges. On top of the hull, the system has two large box pontoons carried one atop the other. They are hinged to hydraulically unfold to either side of the hull for water operations. Small tread way ramps are folded on the pontoons. The unfolded pontoons have wave deflectors, as well as ramps to expedite the loading and unloading of vehicles. Airdrop/air transportable: No. Minimum operating depth (m): 1.3. Ground clearance (m): .4. Approach angle: 25. Departure angle: 25

M1074 American 10x10 Joint Assault Bridge System (JABS)

Maximum Speed, Off-Road: 48 km/h

Operational Range: 418.2 km

Fuel Capacity: 1,900 liters

Suspension: High-hardness-steel torsion bars with rotary shock absorbers

Ground Clearance: 0.48 m

Protection

Hull Armor: Burlington composite armor

Applique Armor: INA

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1074 Joint Assault Bridge System (JABS) is an armored military engineering vehicle based on the Abrams M1A1 main battle tank. The M1074 was designed by Leonardo DRS Technologies to provide deployable bridge capability for units engaged in military operations. The M1074 Truck, Palletized Loading, 10x10 is one of the US Military family of Palletized Load System (PLS) vehicles. General information about the PLS series is found on the linked page. The M1074 is equipped with a hydraulic Load Handling System (LHS) capable of self-loading and unloading. It is also equipped with a variable reach Grove PLS Material Handling Crane (MHC) to support forward-deployed artillery units or similar missions. It is equipped with a 20K capacity self-recovery side-mounted winch kit that can be deployed for forward or rearward towing. The bridge is an Armored vehicle-launched bridge (AVLB) Military Load Class 95 Scissor Bridge (MLC95). After the M1074 has deployed the bridge, assault force vehicles can cross over the bridge. The M1074 can cross over, pick up the bridge on the far bank and continue along in support of assault forces. The JABS was conceived as a compromise between the M104 Wolverine that was deemed too expensive to operate and the aging M60 AVLB which could not adequately support the Abrams and Bradley vehicles. The vehicle provides the Army Mobility Augmentation Companies supporting Armored Brigade Combat Teams with a survivable, deployable and sustainable heavy-assault-bridging capability. Prototype development began in May 2012 when the U.S. Army Contracting Command awarded General Dynamics Land Systems and Leonardo DRS a $26 million contract to build two Joint Assault Bridge System (JABS) prototypes. The contract supported the engineering and manufacturing development phase, with the GDLS prototype being built in Sterling Heights, Michigan and the Leonardo prototype built in West Plains, Missouri. The Army wanted the winner of the contract to include Anniston Army Depot's organic industrial base experience in the JAB's production. The XM1074 JABS prototypes were ready in 2014. They were delivered to Anniston Army Depot (ANAD) where they underwent testing and evaluation through 2016 with the Leonardo prototype being accepted as the M1074 in August. Leonardo DRS has a public-private partnership with Anniston Army Depot in Alabama to manage the M1 chassis assembly and worked with Israeli Military Industries (IMI) on the design and engineering of the bridge system, according to a DRS statement. On August 23, 2016, DRS Technologies, Inc., announced that the U.S. Army had awarded it an indefinite quantity contract worth up to $400 million to build the new Joint Assault Bridge System (JABS). The Army has placed an initial order for 168 vehicles and the Marines for 29. The JABS completed its low-rate production phase from 2016 to 2018 with a total of 51 vehicles. ANAD produced 10 in fiscal year 2016, 14 in 2017 and an additional 27 in 2018. These first JABSs underwent exploitation and fire survivability testing at the Aberdeen Test Center. These tests finalized the current configuration for full-rate production and evaluated some configuration changes in the design for crew protection. United States Army Operational Test Command, Fort Hood began conducting operational testing in April 2019, with the 40th Brigade Engineer Battalion, 2nd Armored Brigade Combat team, 1st Armored Division. Full-rate production is scheduled to start in 2019 and expected to be completed by May 2024. The M1074 JABS will replace the M60 AVLB and M104 Wolverine on a one-for-one basis in the US Army, Army National Guard and the US Marines Corps. The M1074 Joint Assault Bridge System (JABS) is based on the hull of the M1A1 version of the M1 Abrams main battle tank using the suspension system from the M1A2 and upgraded with the Total InterGrated Engine Revitalization (TIGER). This is projected to lower maintenance costs as well as increased availability and unit readiness with commonality of parts with the Abrams chassis. The unit has a new hydraulic bridge launcher system as well as Embedded Diagnostics (ED). Survivability is enhanced with components of the Tank Urban Survivability Kit (TUSK) including Abrams Reactive Armor Tile (ARAT1), Rear

Viewer Sensor System (RVSS) and Tank-Infantry Phone (TIP). Additionally it can employ the AUTOFLUG Driver's Seat and Abrams Lightweight Underbody Kit for situational use. The Bridge Launcher Mechanism (BLM) was designed by Israel Military Industries in conjunction with Leonardo DRS. The bridging controls are a basic push-button system, similar to the M104 Wolverine, while the computer assembles the bridge and deploys it. The bridge extends its span vertically instead of horizontally as the M104 Wolverine. It can deploy an MLC95 bridge with a gap crossing of 11 meters in approximately 3 minutes.

Notes:

The MTU-72 armored bridgelayer is a combat engineering vehicle, designed to launch an assault bridge for tanks and other military vehicles across trenches and water obstacles. It entered service with the Soviet Army in 1974. It replaced or supplemented the previous MTU-20 and MT-55 bridgelayers, based on the T-55 medium tank. Production of the MTU-72 ceased in 1990. Its replacement - the MTU-90 was ready for production in the late 1990s. However due to funding problems it received no production orders. It appears that the Russian Army was never keen on investing in armored bridgelayers. The MTU-72 bridgelayer is based on a modified T-72 main battle tank chassis. A number of the Soviet T-72B or T-72M1 tanks were converted to armored bridge layer by removing the turret and replacing it with a bridge-launching system. Some sources mention, that some bridgelayers were produced utilizing newly-built T-72 chassis.

TMM Russian Truck-Mounted Scissors Bridge

Tiers:

1 2 3 4

Variants:

- **TMM-1:** 50 ton scissor bridge on ZIL-157 chassis. Also known as TMM without suffix.
- **TMM-2:** 50 ton scissor bridge on KrAZ-214 chassis. Also known as TMM without suffix.
- **TMM-3:** 50 ton scissor bridge on KrAZ-255B chassis. Can be identified by steel frame with spare wheel above cab.
- **TMM-4:** 60 ton scissor bridge with stronger jacks on KrAZ-255B or KrAZ-260 chassis. In KrAZ-260 version spare wheel is located behind cab.
- **TMM-6:** The TMM-6 is a vehicle launched bridge system of Russian origin. It was developed in the 1990's to replace older bridge launching systems with a more capable bridge system. The name TMM-6 stands for Tyazhelo Mekhniznrovanny Most 6, which is Russian for heavy mechanized bridge 6. It is also known as the Gusenitsa-2 with the Gusenitsa-1 being the MTU-90 bridgelayer based on the T-90 chassis.

System

Alternative Designation: Mechanized Bridge, Scissors Bridge

Type: Vehicle launched bridge

Chassis: Modified KrAZ-214 (6 × 6), 7,000 kg, or KrAZ-255B (6 × 6), 7,500 kg, and KrAZ-260 trucks.

Vertical Step : mINA

Fording Depth : m1.0

Fuel Capacity: 450 liters

Bridge System

Type: Single scissor bridge

Length: m10.5

Weight Capacity: tons50

Depth of Water: 1.7 and 3.2 meters deep.

Operation: Normally four TMM vehicles form a unit and together are able span a 40 meter gap.

Note #1: An infinite number of bridges can be connected

Note #2: The bridge has a 50 t weight capacity and the roadway allows for vehicles ranging from small cars to tanks.

Protection

Armor: No

NBC: No

Night Visition: No

Smoke Equipment: No

Notes:

The TMM is a Cold War era vehicle launched bridge of Soviet origin. It was developed to allow Soviet forces to traverse small gaps and water and gaps that are wider than a single bridge but do not require a pontoon. The name TMM stands for Tyazhelo Mekhniznrovanny Most , which is Russian for heavy mechanized bridge. The TMM remains in use, but has been replaced in production by the larger and more capable TMM-6. The TMM is a bridge system that is based on the KrAZ-214 6x6 7t truck. The improved TMM-3 uses the later KrAZ-255B 7.5t truck chassis and launches the same bridge. A 10.5 m folded scissor bridge is carried at the rear of a vehicle. The bridge is launched rearwards using a pivoting metal frame and a series of steel wire and winches connected to the engine. The bridge rests on the river floor by means of two variable length struts. A single bridge section has a length of 10.5 meters and an infinite number can be connected. Normally four TMM vehicles form a unit and together are able span a 40 meter gap. The bridge sections can be laid in gaps and water between 1.7 and 3.2 meters deep. The bridge has a 50 t weight capacity and the roadway allows for vehicles ranging from small cars to tanks. The TMM-4 variant uses a 60 t weight capacity bridge. The TMM was produced in large quantities and was acquired by the USSR, most Warsaw Pact nations and many nations receiving Soviet aid. Despite its age the TMM remains in service although it is no longer produced.

Notes:

The complete PMP ribbon bridge set consists of 32 center pontoons and 4 ramp pontoons, the normal bridge unit consists of a half-set (one complete bridge) made up of 16 center and 2 ramp pontoons. Each 4-section is launched from the KRAZ-255B. It automatically unfolds upon entering the water. The sections then lock in place to form a bridge unit 6.75 meters long and 8 meters wide. Normally, all the units are launched simultaneously. They join together parallel to the near shore to form a continuous roadway. The roadway then swings across the water obstacle; powerboats (6 per half-set) hold it in place on the designated center-line. Engineers can use the full 36- pontoon set to construct 227 meters of bridge. They may also configure it as 40- to 170-ton rafts. A half-set gives the capability to construct 119 meters of 60-ton bridge, 191 meters of 20-ton bridge, or rafts. Under ideal conditions assembly speeds of 7 meters of bridge per minute can result. This bridge can be built in streams with a velocity of up to 2 meters a second (approx. 7 km/h). Bridge pontoons: Weight (kg): 6,790. Length (m): unfolded: 6.75. Folded: 6.75. Width (m): unfolded: 8. Folded: 5. Depth unfolded (m): bow section: 9. Center section: 7. Folded: 2. Ramp pontoons. Weight (kg): 7,252. Length (m): unfolded: 5.6. Folded: 5.6. Width unfolded (m): river end: 7.3. Shore end: 7. Folded: 3.1. Raft assembly data. 40-ton raft-bridge pontoons: 2 Overall deck length (m): 13.5. Assembly time (min): 8* Working party (est.): 6. *Real world evidence indicates that the bridge can be assembled as fast as 30m/minute. 60-ton raft-bridge pontoons: 3 Overall deck length (m): 20.3. Assembly time (min): 10*. Working party (est.): 9. *Real world evidence indicates that the bridge can be assembled as fast as 30m/minute. 80-ton raft-bridge pontoons: 4. Overall deck length (m): 27. Assembly time (min): 12*. Working party (est): 12. *Real world evidence indicates that the bridge can be assembled as fast as 30m/minute. 110-ton raft-bridge ramp pontoon: 1 Bridge pontoons: 5 Overall deck length (m): 39.3. Assembly time (min): 15*. Working party (est.): 18. *Real world evidence indicates that the bridge can be assembled as fast as 30m/minute. 170-ton raft-bridge ramp pontoon: 1. Bridge pontoons: 8. Overall deck length (m): 59.6. Assembly time (min): 15*. Working party (est.): INA. *Real world evidence indicates that the bridge can be assembled as fast as 30m/minute. Auxiliary equipment powerboats or tracked amphibians: 12. Launch sequence. 1. The travel locks are disengaged, the pontoon carrier backs to the edge of the water, brakes sharply, and then the pontoon slides over the carrier roller system into the water where it unfolds almost immediately. 2. The pontoon is then stiffened by activating six locking devices. 3. Once the pontoons have been launched and stiffened they are interconnected parallel to the near shore to form a continuous strip of roadway. 4. This roadway is then swung across the water obstacle and held in place by powerboats. Whenever possible the launching operations are done along a continuous shoreline permitting all pontoons to be launched at the same time. If necessary, the bridge can be built on a small frontage using the successive raft system. This slows construction time. Retrieval. For retrieval the launch operation is reversed. The pontoon carrier backs to the water’s edge, an integral jib is unfolded from the truck bed, and two cables are strung from the winch (located behind the driver’s cab) through the jib pulleys, around the pontoon retrieving guides, and secured to the pontoon retrieval studs. The winch simultaneously folds and lifts the pontoon to the truck bed. The jib is then folded back into the truck bed, and the pontoon is winched over the roller system and secured. The whole procedure takes a few minutes.

BLG-60 German Armored Vehicle-Launched Bridge (AVLB)

Tiers:

Mine Clearing: Roller-plow available, In 1959, some tanks received mountings for the PT-55 mine clearing system or the BTU/BTU-55 plough.

Self-Entrenching Blade: No

NBC Protection: Yes, PAZ (Protivoatomnaya Zashchita) NBC protection system

Smoke Equipment: grenlaunch/eng smk sys

Notes:

This system is mounted ont he adapted chassis of a T55, where a launching unit replaces a combat turret. The BLG- 60 armored bridge-layer was a joint development between the former East Germany and Poland. The bridge is launched in a similar fashion to the Csechoslovakia MT-55. The BLG 60 and BLG 67 armored bridge-layers were used by the East German Army and other countries. The bridge initiating equipment is controlled by a system of hydraulic cylinders; the allocation of hydraulic oil can be controlled both manually by mechanical levers and automatically. The pressure of the liquid is provided by high-pressure piston pumps motorized by the tank engine. All mechanisms of the MT-55A used for laying and recovering of the bridge can be controlled by the crew from the inside of the tank, with hatch covers closed. To begin the launching process, the vehicle stops short of the gap; then, the bridge swings ahead and down while its two sections open like scissors. The MT-55A span is 18 meters long and can hold up loads up to 50 tons. Later the MT-55A was modified with gap measuring mechanism and infrared equipment for bridge laying at darkness. The MT-55A was designed and produced by TS Martin from 1962 (the former Czechoslovakia was one of the countries that build the T-54/55 series under licence). The development phase ended in 1967 after which 5 pre-series vehicles were built. Series production started in 1969. The transformed T-55A chassis differs only by the arrangement of the compartments in the hull. The bridge tank is proposed for an easy and swift crossing of antitank barriers (trenches) and other obstacles with the purpose of facilitating the passage of mechanized and tank units. The bridge initiating equipment is controlled by a system of hydraulic cylinders; the allocation of hydraulic oil can be controlled both manually by mechanical levers and automatically. The pressure of the liquid is provided by high-pressure piston pumps motorized by the tank engine. All mechanisms of the MT-55A used for laying and recovering of the bridge can be controlled by the crew from the inside of the tank, with hatch covers closed. To begin the launching process, the vehicle stops short of the gap; then, the bridge swings ahead and down while its two sections open like scissors. The MT-55A span is 18 meters long and can hold up loads up to 50 tons. Later the MT-55A was modified with gap measuring mechanism and infrared equipment for bridge laying at darkness. Of the MT-55A, a total of 1,762 were produced between 1969 and 1983, including 183 export versions MT-55KS (from 1971) and 301 hulls for East Germany's BLG-60 programme.

MTU-90 Russian Armored Bridge Layer

Tiers:

Variants:

- **MTU-90M:** This is an improved variant with a shorter bridge rather than the MTU-90. The bridge can span 19 m; payload capacity is 60 tons. Initial operational capability (IOC) was attained in Russia in 2013. This version was ordered by Azerbaijan, with deliveries scheduled for August 2014, according to an Azerbaijan Press Agency (APA) report dated June 26, 2014. Ref: Military Periscope, May 2016

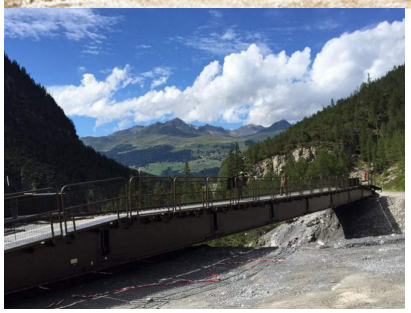
Smoke Equipment: Yes

Notes:

The MTU-90 armored bridge layer is designed to carry and lay a one-span bridge over narrow gaps (ditches, canals and rivers) on the battlefield. The vehicle is mounted on a T-90S chassis supporting the single span and supports the TMM-6 Heavy Bridge Building System. The MTU-90 is capable of basic water-crossing operations as well as self-entrenchment. It is equipped with NBC protection systems, fire extinguishers and a smoke-screen system. The vehicle also has a night-vision device, as well as protection against armor-piercing, incendiary and hollow-charge projectiles. The bridge has a length of 25m, a width of 3.52 m and is capable of supporting 50,000 kg. The vehicle is capable of deploying its single span within 2.5 minutes. The crew can deploy the bridge without leaving the cabin. This vehicle can also work in support of the TMM-6 Heavy Bridge Building System. It is capable of laying multi-span bridges for passage of tanks and wheeled vehicles. The vehicle’s capabilities are similar to those of the U.S. Wolverine, indicating the MTU-90 may be a derivative design.

Dry Support Bridge (DSB) British Tactical Military Bridging System



Tiers:

System

Alternative Designation: Dry Support Bridge (DSB)
Type: Tactical Military Bridging System
Manufacturer: WFEL
Crew: 8
Military Load Classification (MLC): Normal 100 (T) / 96 (W) at 46m Maximum 120 (W) / (T) at 46m
Launch Time: Less than 90 minutes
Operating conditions (air temperature): Minus 46 to plus 49 °C
Normal launcher environment operating conditions (air temperature): Minus 29 to plus 49 °C

Dimensions

Maximum clear span: 46m
Span Range and Increments: 22m to 46m in 6m increments
Road Width: 4.3m
Bank Heights: Up to +/- 3m
Longitudinal Bank Slope: 1 in 20 (reduced capability at 1 in 10)
Lateral Bank Slope: 1 in 20
Parallel Module: Stowed LWH 5.95 x 2.44 x 1.1m Deployed LWH 5.95 x 4.3 x 1.19m Weight 4,417kg
Ramp Module: Stowed LWH 5.95 x 2.44 x 1.1m Deployed LWH 5.96 x 4.3 x 1.19m Weight 4,080kg
End Beam: LWH 2.5 x 0.375 x 0.56m Weight 357kg

Approach Ramp: LWH 4.09 x 0.42 x 0.19m Weight 86kg

Decking & Kerbs: Integral — does not require dressing after bridge setdown

Automotive

Launch Vehicle Chassis: The launching system is designed to be adaptable to a range of vehicle chassis. This has been achieved through the adoption of a chassis interface sub-frame, which allows the crane and launching equipment to be easily adapted to a range of chassis with little modification. This design approach ensures that a very high level of commonality exists across all vehicle configurations and ensures greater spares availability and - most importantly - specification compliance against original test data. In general, chassis have been 5-axle vehicles which have included Oshkosh, IVECO and Rheinmetall MAN.

Notes:

The DSB Bridging System consists of four primary elements: (1) the bridge, (2) the launching system, (3) the launch vehicle chassis and (4) the vehicles used to transport the bridge elements. BRIDGE The DSB bridge is modular in design and consists of only 5 key elements:- the approach ramps which lead onto the bridge, an end beam which supports the approach ramps, two bridging modules, a 6m ramp module and a 6m parallel module and a walkway. Once constructed, the bridge is 4.3m wide and is capable of carrying loads of up to MLC 120W across gaps up to 46m wide. Once built, a 46m bridge weighs approximately 37.5 tonnes, excluding walkways. The bridge modules have been designed to be compact while being transported, yet easily deployable to their full width during bridge construction. This is achieved through a patented folding design, which allows the bridge to unfold to its full width simply by lifting it. The result is a folding bridge module which has integral deck units from which the two main bridge girders pivot. The girders are folded underneath when in transport mode and swing outwards once deployed, to form a fully-decked 4.3m wide bridge surface. The folded dimensions of a bridge module are such that, when two modules are stacked, they are equivalent in size to a 1C ISO container. The folded module is deployed by simply lifting the module via its opening slings, the action of which rotates the girders gently outwards under the control of hydraulic dampers. The modules are similarly folded by lifting the module by its closing slings. The bridge may also be supplied with additional ramp modules, to allow two shorter bridges to be built, if required. Once constructed, the bridge can be fitted with an appliqué walkway, which is carried on an additional flatrack and which, when built, cantilevers off the side of the bridge. Health Usage Monitoring Systems All the parallel bridge modules in the DSB system are fitted with a 'crack first' fatigue monitor. This type of gauge allows the individual life of a bridge panel to be ascertained. Walkways The walkway is deployed in sections, attaches to the existing kerbs and forms a continuous walkway adjacent to the bridge. The design of the walkway is such that its top surface is above the roadway surface, helping to protect foot traffic. It is also possible to fit a walkway to each side of the bridge. LAUNCHING SYSTEM As with the bridge, the launcher has been designed to be compact for transportation purposes, yet quickly deployable to its operational size within minutes. This has been achieved via a ‘fold and rotate’ system which is unique to the Dry Support Bridge system. The launcher vehicle weighs approximately 40–45 tonnes, depending on the chosen chassis and level of armour. THE LAUNCH VEHICLE CHASSIS The launching system is designed to be adaptable to a range of vehicle chassis. This has been achieved through the adoption of a chassis interface sub-frame, which allows the crane and launching equipment to be easily adapted to a range of chassis with little modification. This design approach ensures that a very high level of commonality exists across all vehicle configurations and ensures greater spares availability and - most importantly - specification compliance against original test data. In general, chassis have been 5-axle vehicles which have included Oshkosh, IVECO and Rheinmetall MAN. BRIDGE TRANSPORTATION VEHICLES The size and shape of two DSB bridge modules, when stacked, approximates to the same size as an ISO container. The common method of transportation for the bridge sections is therefore on an ISO Flatrack, which is included in the system. This allows bridging to be treated as a commodity and shipped by a multitude of vehicles, including Oshkosh, IVECO and MAN.

Type 84A Chinese Heavy Mechanized Bridge

Tiers:

1 2 3 4

Variants:

- **Modified Heavy Mechanized Bridge:** This is an upgraded version of the Type 84A developed by NORINCO. It can support armored vehicles weighing up to 60 metric tons and wheeled vehicles with an axle rating of 13 metric tons. Each span has a length of 15m when opened and a roadway width of 3.5m. Five of these spans can be used to cross a 75m gap. The bridge is transported and launched from a domestically manufactured Mercedes-Benz 8 x 8 cross-country truck. The chassis features power-steering on the front four wheels and a central-tire inflation system. In a standard laying operations, the truck backs up to the gap and the bridge is opened out. Once fully open, hydraulically operated outriggers are opened out and extend vertically until they reach the ground. The outriggers are reportedly fully automatic with double-acting cylinders. Each is fitted with a large shoe. A single span takes about 12 min to position, according to NORINCO. The bridge can be deployed in rivers with a maximum flow speed of 7 ft/sec (2 m/sec) and a maximum depth of 5.5m. A typical Modified HMB package includes five trucks, each transporting and launching a single bridge unit, and a crew of 12. Seven personnel are needed to position each span. Notes:

The Type 84A heavy mechanized bridge (HMB) is a Chinese wheeled bridge-laying vehicle. The bridge can hold tracked armored vehicles weighing up to 50 metric tons on five modular spans. It can handle wheeled vehicles with a maximum axle load of 13 metric tons. The bridge can span a gap up to 50m. When the bridge is being deployed, the truck backs up to the gap, drops hydraulic stabilizers on either side of the rear and opens the bridge over the obstacle to be crossed. Outriggers are then opened and extended below the bridge. The bridge sections are carried and placed into position by an 8 x 8 or 6 x 6 wheeled vehicle. Each span is 10.5m long. Up to five can be coupled together. The system can be used in water as deep as 3.5 m. The bridge can also be connected with various types of pontoon bridges. Ref: Military Periscope October 2016

Note #1: One set of TMM-6 consists of two Unlike the older Soviet bridge laying system TMM-3 , in which four identical vehicles belonged to a complete bridge, one set of TMM-6 consists of two bridge laying vehicles and four transport vehicles with a total of six bridges.

Protection

Armor: No

NBC: Yes

Night Visition: No

Smoke Equipment: No

Notes:

The TMM-6 is a vehicle launched bridge system of Russian origin. It was developed in the 1990's to replace older bridge launching systems with a more capable bridge system. The name TMM-6 stands for Tyazhelo Mekhniznrovanny Most 6, which is Russian for heavy mechanized bridge 6. It is also known as the Gusenitsa-2 with the Gusenitsa-1 being the MTU-90 bridgelayer based on the T-90 chassis. The TMM-6 functions in a similar way as the older TMM system but is a much larger and heavier system. A MZKT-7930 8x8 truck chassis is used as the launch vehicle. A 17 m folded scissor bridge is carried at the rear of a vehicle. The bridge is launched rearwards using a hydraulic arm and rests on the river floor by means of two variable length struts. Normally six TMM-6 would form a unit and together are able to create a 102 meter bridge. The TMM-6 is an unarmed vehicle and has no armor but does feature an NBC system. A single bridge section has a length of 17 meters and an infinite number can be connected and a single MTU-90 section can be fitted on one end. Six vehicles would make up a single unit and result in a 102 meter bridge. The bridge sections can be laid in gaps and water between 2 and 5 meters deep. Creating a 102 meter bridge requires 50 minutes. The bridge has a 60 t weight capacity and may carry up to 400 vehicles per hour that may move at speeds up to 30 km/h. The TMM-6 is used in small quantities with the Russian army and is available for export.

MT-55A Czechoslovakian Self-Propelled Armoured Bridgelayer

Tiers:

Variants:

- **MT-55:** Pre-series model, equipped with the bridge of the MT-34 bridge-layer. In Western sources, this model is

Notes:

The MT-55A (Slovak: Mostný tank) is an armoured vehicle-launched bridge (AVLB) tank, manufactured by ZTS Martin in Slovakia. The AVLB is based on a T-55A medium tank chassis, with the turret detached and replaced by a special bridge launching equipment. The MT-55A was produced for the armies of the Warsaw Pact (including the Soviet Army), as well as for export clients. The MT-55, Base T-55, was designed and produced by ZTS Martin from 1962 (the former Czechoslovakia was one of the countries that build the T-54/55 series under licence). The development phase ended in 1967 after which five pre-series vehicles were built. The MT-55A, Base T-55A, series production started in 1969. The transformed T-55A chassis differs by the arrangement of the compartments in the hull. The bridge tank is proposed for an easy and swift crossing of antitank barriers (trenches) and other obstacles with the purpose of facilitating the passage of mechanised and tank units. The bridge initiating equipment is controlled by a system of hydraulic cylinders; the allocation of hydraulic oil can be controlled both manually by mechanical levers and automatically. The pressure of the liquid is provided by high-pressure piston pumps motorized by the tank engine. All mechanisms of the MT-55A used for laying and recovering the bridge can be controlled by the crew from inside the tank with the hatch covers closed. To begin the launching process, the vehicle stops short of the gap; then, the bridge swings ahead and down while its two sections open like scissors.[1] The MT-55A span is 20 meters long and can support loads of up to 50 tons. Later, the MT-55A was modified with a gap measuring mechanism and infrared equipment for bridge laying in darkness. Total production of the MT-55A between 1969 and 1983 amounted to 1,762 vehicles, including 183 export versions MT-55KS (from 1971) and 301 hulls for East Germany's BLG-60 programme.

M104 Wolverine American Armored Bridgelayer

Tiers:

System

Alternative Designation: M104 Wolverine
Type: Armored Bridgelayer
Manufacturer: General Dynamics Land Systems
In Status: 2003-Present
Crew: ea2
Chassis: Based on the M1A2 Abrams tank chassis
Bridge Launch Time: < 5 minutes
Bridge Recovery Time: <10 minutes

Dimensions

Vehicle Length, Overall: 13.40 m
Vehicle Length, Hull: 7.64 m
Width, Overall: 4.00 m
Width, Hull: 3.48 m

Height, Overall: 3.95 m

Height, Hull: 2.91 m

Length of Track on the Ground: 4.65 m

Track Width: 635 mm

Ground Clearance,Center: 483 mm

Ground Clearance, Sides: 432 mm

Bridge Length: 26.00 m

Bridge Width: 4.00 m

Weight, Empty: 7,010 kg

Weight, Combat: 62,325 kg

Maximum Bridging Gap: 24.0 m

Automotive

Engine Name: 1 x Avco-Lycoming AGT-1500

Engine Type: multi fuel turbine

Engine Power: 1,500 hp at 3,000 rpm

Power-to-Weight Ratio: 24.1 hp/metric ton

Speed, Road: 72 kph

Speed, Cross-Country: 48 kph

Speed, up 10 deg slope: 32 kph

Speed, up 60 deg slope: 7 kph

Vertical Obstacle: 0.94 m

Trench: 2.69 m

Fording, without Preparation: 1.22 m

Fording, with Preparation: 1.98 m

Fuel Capacity: 1,885 liters

Suspension: torsion bar

Road Wheels: 7 w/15-in (381-mm) travel, rear drive, front idler, 3 internal shock absorbers, 2 return rollers

Protection

Hull Armor: Chobham-type

Applique Armor: INA

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: Engine exhaust smoke generation

BattleManagement System: The M104 is fitted with a digital battlefield management system, which is designed to increase awareness on the battlefield and keeps the vehicle in contact with local field commanders.

Notes:

The M104 Wolverine Heavy Assault Bridge is an armored military engineering vehicle created by General Dynamics Land Systems, designed to provide deployable bridge capability for units engaged in military operations. Since the 1960s the United States Army has made use of armored bridge-laying vehicles based on the M48 Patton/M60 series of tanks. In recent years, however, the Army discovered that the aging M60 AVLB (Armored Vehicle Launched Bridge) was too slow to keep up with the M1 Abrams' top speed of roughly 70 km/h during field maneuvers. Additionally, the Abrams was so heavy that it could safely cross the AVLB's bridge only at a very slow speed. Program development for a new armored bridge-laying vehicle began in 1983, and by 1994 General Dynamics Land Systems and the German MAN Mobile Bridges GmbH (since 2005 Krauss-Maffei Wegmann) had been awarded a contract. The first prototype vehicles were being tested by 1996, and the first production models were delivered by 2003. It is unclear why the vehicle was subject to such a long development time. Because the Wolverine is essentially an M1A2 SEP tank with Leguan bridge-laying gear instead of a turret, it shares virtually all of the parent vehicle's speed, mobility, survivability, and automotive components. This commonality was a key design factor in the Wolverine's development. The Wolverine also features an advanced communications package designed to keep it in contact with local field commanders. However, the vehicle itself is unarmed. The Wolverine is operated by two crewmen who sit within the hull. Both crewmen have access to the bridging controls, while the bridge is carried in two sections, stacked above the hull. Once a bridging site is chosen the vehicle securely anchors itself in place with a spade. The two sections of the bridge are joined together, and then the entire bridge is extended across the obstacle and dropped into place. The crewmen have the ability to make minor corrections during launch, if needed. Once operations are complete, the Wolverine drives across the bridge and retrieves it from the other side simply by reversing the process. The bridge can be launched in under five minutes or retrieved in less than ten minutes, all without the crewmen ever leaving the safety of their vehicle. Once launched, the 26-meter Leguan bridge can support a 70-ton vehicle moving at 16 km/h, or 10 miles per hour. The Wolverine thus allows the heaviest of vehicles to cross craters, ditches, and damaged bridges at combat speed. This mobility is a decisive advantage for armored units. To date the United States Army has received 44 Wolverines, which have been distributed to a few select engineer units. The Army had originally intended to purchase 465 vehicles; however, budget cuts and a shift in philosophy toward a lighter fighting force meant that the Army no longer needed hundreds of bridgelaying vehicles. While the Army did not plan to purchase any more Wolverines, it had, at the time, reserved the right to restart production if necessary. However, as of 2016 the Wolverine is being replaced by the Leonardo DRS Joint Assault Bridge (JAB), thus effectively ending the Wolverine program. The M1074 Joint Assault Bridge also has an Abrams tank chassis, but is combined with an 18.3-metre (60 ft) scissor bridge. While the M104 was intended to replace the AVLB, it was found to be too expensive and complicated to maintain and operate. While the JAB's bridge is shorter, it has a faster deployment time of three minutes, compared to the Wolverine's 3-5 minute set-up time. On August 23, 2016, DRS Technologies, Inc., announced that the U.S. Army had awarded it an indefinite quantity contract worth up to $400 million to build the new Joint Assault Bridge (JAB) system to carry, deploy and recover a heavy “scissor” bridge. First deliveries are planned in mid-2017, with low-rate initial production expected to be reached in 2019.

M1977 HEMTT American 8x8 Heavy Expanded Mobility Tactical Truck (HEMTT) Common Bridge Transporter (CMT)

Tiers:

Variants:

- **M977:** The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis.
- **M978:** The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant.
- **M983 Tractor:** The M983 is a tractor unit for use with the trailer-mounted MIM-104 Patriot missile system. It can also be used with the Interim Stryker Recovery System, or other trailers. An earlier variant fitted with a 30 kW generator and crane mounted behind the cab was used to tow the Pershing II Erector Launcher in CONUS (a M1001 MAN tractor was used in West Germany). The M983A2/A4 Light Equipment Transporter (LET) tractor is mainly used to transport construction and engineer equipment. It has a 45,000 lb (20,000 kg)) 2 speed hydraulic winch mounted behind the cab used to load the trailer. It does not have a self-recovery winch.
- **M984A1 Wrecker:** The M984 wrecker is the only HEMTT variant to have been produced in the A1 configuration, and this resulting in the change of recovery crane and retrieval system between A0 and A1 configurations. The current model is the M984A4. Standard equipment includes a 27,240 kg (60,050 lb) capacity two-speed recovery winch, a rear-mounted 11,340 kg capacity vehicle retrieval system, and a 6,350 kg (14,000 lb) at 2.74 m (9.0 ft) capacity Grove materials handling crane. A 9,072 kg (20,000 lb) bare drum capacity self-recovery winch is fitted as standard on the M984.
- **M985 Cargo:** The M985 is available in two variants. The current models are A4; there were no A1 models. The M985 cargo variant is similar to the M977 cargo truck but was developed to support the M270 Multiple Launch Rocket System (MLRS) with a M989A1 HEMAT trailer. It may also used to transport Patriot missiles. The M985 Guided Missile Transporter (GMT) was developed specifically for use with the Patriot system and it can be distinguished easily from other cargo models by its rear-mounted Hiab 8108/2 materials handling crane
- **Taiwanese RT-2000 Multiple Rocket Launcher:** The RT-2000 [Lit; Ray-Ting-2000 or Thunder -2000] rocket launcher mounted on an M977 chassis. In service about 1997. Can mount any one of three launchers: Mk 15 117-mm, 60 rounds; Mk 30, 30 rounds with HE; AP/AM cluster warhead - >18-mile range; Mk 45 12 rounds, > 27-mile range, GPS targeting. See separate record for details.
- **M1120 HEMTT Load Handling System (LHS):** The M1120 Load Handling System (LHS) variant was initially introduced as part of the HEMTT overhaul/rebuild program, during which returned M977 cargo trucks have their cargo

bodies and materials handling cranes removed, to be replaced by a Multilift Mark 5 (now designated MPH165-LHS) LHS, as fitted to the Oshkosh PLS truck.

- **M1977 HEMTT Common Bridge Transporter (CBT):** The M1977 HEMTT Common Bridge Transporter (CBT) is a further development of the M1120 LHS, and in common with the M1120 LHS was initially introduced as part of the HEMTT overhaul/rebuild program. It is used for loading, transporting, and unloading Ribbon Bridge components and bridge erection boats.
- **M1142:** The M1142 is a Tactical Fire Fighting Truck (TFFT) capable of extinguishing aircraft, petroleum, brush, and structural fires at isolated military installations. The TFFT is based on a HEMTT M977A2 chassis with the heavier duty M1120 LHS HEMTT variant rear suspension. The TFFT contract was awarded to Pierce Manufacturing with Oshkosh Corporation as a subcontractor to Pierce.
- **M977 A2 Cargo Truck:** Basic version.
- **M977 A2 EPP:** Electrical power plant.
- **M977 A2 LRPT:** Large repair parts transporter.
- **M978 A2:** Fuel servicing transporter truck tanker.
- **HEMTT M983 A2 LET:** Light equipment transporter.
- **HEMTT M983 A2:** Patriot missile tractor.
- **M984 A2:** Recovery truck.
- **M985 A2:** Cargo and MRLS resupply.
- **M985 A2 GMT:** Guided missile transporter.
- **M1120 A2 HEMTT-LHS:** Heavy expanded mobility tactical truck.
- **M1977 A2 CBT:** Common bridge transporter.

System

Alternative Designation: M1977 HEMTT

Type: Heavy Expanded Mobility Tactical Truck (HEMTT) Common Bridge Transporter (CBT)

Manufacturer: Oshkosh Corporation

Configuration: 8x8

Family: Heavy Expanded Mobility Tactical Truck (HEMTT)

Crew: ea2

Mission: The M1977 Common Bridge Transporter (CBT) is a modified M977 HEMTT Cargo truck equipped with a Load Handling System (LHS). The M1977 CBT was designed to support the Engineer Corps in transporting all bridging assets. The M1977 CBT loads, launches and retrieves the Ribbon Bridge, Improved Ribbon Bridge and Heavy Dry Support Bridge utilizing the Bridge Adapter Pallet, (BAP) and associated bridge erection boats utilizing the Improved Boat Cradle (IBC).

Payload Capacity: 9,979 kg

Winch: The CBT is equipped with a winch to assist in retrieving the deployed equipment.

XM15 Bridge Adapter Pallet (BAP): The XM15 Bridge Adapter Pallet (BAP) is used to adapt the CBT for transport of Combat Engineer bridge equipment as mentioned above. When loaded, the BAP provides the necessary locks, rollers and guides to launch, retrieve and transport the bridge equipment. The BAP consists of the main frame and winch frame assemblies. The BAP is PLS compatible and is transloadable to/from the PLS trailer. The winch frame detaches from the BAP main frame and attaches to the CBT LHS. The winch frame utilizes the truck hydraulic power to winch the bridges during retrieval operations.

XM14 Improved Boat Cradle (IBC): The XM14 Improved Boat Cradle (IBC) is used to adapt the CBT for transport of the Combat Engineer Bridge Erection Boat (BEB). When loaded, the IBC provides the necessary locks, rollers and guides to launch, retrieve and transport the BEB. The IBC is PLS compatible, similar to the flatrack in design and is transloadable to/from the PLS Trailer.

Communications

Primary Radio: INA

Radio Jammer: Yes, which prevents detonation of radio-controlled explosives

Main Gun

Note: The 12.7mm NSV is remotely-operated and can be used to destruct visible mines laying on the surface or in soil

↳*System*

Name: NSV (Russian НСВ Никитина-Соколова-Волкова)

Type: Anti-Aircraft Machine Gun

Caliber: mm12.7

Manufacturer: "Metallist", Uralsk, Kazakh SSR, Crvena ZastavaSerbia

Max Rate of Fire: rds/min700-800

Length (Total): mm1,560

Weight (Gun Only): kg25

Weight (On Tripod): kg41

Weight (50-Round Belt): kg11

Action: Gas Operated

Feed System: 50-Round Belt

Sights: Iron Sights

↳***Ammunition***

Type: Rifle

Caliber: mm12.7

Cartridge: 12.7×108mm

Muzzle Velocity: m/s845

Basic Load: ea500

Effective Firing Range (vs. Air Targets): m1,500

Effective Firing Range (vs. Ground Targets): m2,000

Fire Control

Laser Target Desinator: INA

Protection

Armor, Hull: New all-welded superstructure as well as ERA Blocks. The superstructure provides protection against small arms fire, artillery shell splinters and mine fragment debris

Armor, Belly: Composite construction, the belly of the BMR-3M can withstand anti-tank mine blast anywhere under the hull

Applique Armor: Avaialble

Active Protection System: Yes

Mine Clearing: Yes

Explosive Reactive Armor (ERA): Yes

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Blast-Suppressing Seats: Yes, for the Commander and Driver

Life Support System: Yes. It is reported that the crew along with 3 passengers can stay inside the BMR-3M for 2 days

Note: The BMR-3M is based on the T-90 main battle tank chassis. The turret has been removed and new all-welded superstructure has been fitted. This mine clearing vehicle is fitted with Explosive Reactive Armor (ERA) blocks.

Notes:

The Russian BMR-3M is a T-90 hull with the turret replaced with a superstructure housing the crew and other mine clearing equipment. Attached to the front of the vehicle are two arms each with solid steel wheels that whilst driving over mines, their weight detonates them and thanks to their thickness are not damaged, allowing the vehicle to continue along its path with

other tanks such as the T-90 following it. The new mine clearing vehicle is mainly intended for road mine clearing, while escorting convoys.

M1150 American Assault Breacher Vehicle

Tiers:

1 **2** 3 4

System

Alternative Designation: M1150
Type: Assault Breacher Vehicle
Manufacturer: US Army Anniston Depot
Crew: ea2
Chassis: The ABV is builded on the same chassis as the General Dynamics-built M1A1 Abrams main battle tank.
Accessories: Major components of the ABV include a Full-Width Mine Plow (FWMP), two linear demolition charges (LDC), a lane-marking system, a remote control system, and weapon station integration on a modified M1A1 tank chassis. ABV will fill the requirement to clear a lane of sufficient width and depth for the assault forces and will be operated by a two-man crew with an option for remote control. The ABV is equipped with a variety of specialised equipment supplied by Pearson Engineering of the UK can be fitted. The HLA (High Life Adaptors), whilst providing an increased approach angle to the ABV, allows the rapid fitting and removal of the full suite of ABV front end equipment and sub-systems. For clearing minefields, the FWMP (Full Width Mine Ploughs) can be swiftly installed at the front of the vehicle which can be rapidly replaced by the CDBB (Combat Dozer Blades) that, in addition to clearing battlefield obstacles, can also be used to prepare firing positions. Another alternative installation at the front of the vehicle is the Pearson Engineering ROBS (Rapid Ordnance Removal Systems) or an SMP (Lane Marking Systems). The plow mounted on the front of the ABV lets it construct hasty earthworks for cover and to barrel through enemy obstacles. Mounted on the rear of the ABV turret structure is the Linear Demolition Charge System containing two launchers with an updated firing system. Each of these launchers is fitted with a MK 2 solid propellant rocket attached to a M58 linear charge. The ABV included the same communications system and a deep fording capability as the M1A1 Abrams MBT.

Dimensions

Length: 7.9 m
Width: 3.6 m
Height: 2.4 m
Weight: 50,000 kg

Automotive

Engine Name: Honeywell AGT 1500

Engine Type: Gas Turbine

Engine Power: 1,500 hp

Transmission: Allison X-1100-3B Hydro-Kinetic automatic transmission

Maximum Speed, Road: 72 km/h

Maximum Speed, Cross-Country: 48 km/h

Range: INA

Suspension: The suspension of the ABV is composed on each side with 7 road wheels and 2 track-return rollers, on each side of the chassis.

Main Weapon System

Name: M58 MICLIC

Type: Mine Clearing Line Charge (MICLIC)

Note: The M58 Mine Clearing Line Charge (MICLIC) is a rocket-projected explosive line charge which provides a "close-in" demining capability for maneuver forces of the United States Army and Marine Corps. It is effective against conventionally fuzed land mines and, when detonated, it provides a lane 8 meters by 100 meters. The MICLIC system consists of an M353 3½ ton[3] or M200A1 2½ ton trailer (or M200 tracked trailer) chassis, a launcher assembly, an M147 firing kit, an M58A3 line charge and a 5-inch MK22 Mod 4 rocket. The line charge is 350 feet long and contains 5 pounds per linear foot of C-4 explosive. In the event a MICLIC fails to detonate normally, it can be manually activated by time-delay fuses every few feet along the length of it. The M147 Firing Kit can also be employed from other combat engineer vehicles, namely the M60AVLB and the M1150 Assault Breacher Vehicle.

Auxiliary Weapon System

↳*System*

Name: M2 Browning

Type: Heavy Machine Gun

Caliber: 12.7 mm

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

↳*Ammunition*

Type: Rifle

Caliber: 12.7 mm

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 1,200 Rounds

Protection

Hull Armor: The ABV is builded on the same chassis as the General Dynamics-built M1A1 Abrams main battle tank. The ABV will provide crew protection and vehicle survivability while having the speed and mobility to keep pace with the manoeuvre force. For the ABV role, the turret of the M1A1 Abrams MBT has been removed and replaced by a new all-welded steel structure to which has been added the latest explosive reactive armour (ERA) package. This provides a higher level of protection against anti-tank weapons fitted with a High Explosive Anti-Tank (HEAT) warhead fitted to weapons such as the RPG-7 (Rocket Propelled Grenade).

Applique Armor: INA

Mine Clearing: Yes

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1150 Assault Breacher Vehicle (ABV) is a U.S. military mine- and explosives-clearing vehicle, based on the M1 Abrams-chassis, equipped with a mine-plough and line charges. Its first large scale use by the US Marines was in the joint ISAF-Afghan Operation Moshtarak in Southern Afghanistan during the War in Afghanistan in 2010 against the Taliban insurgency. These tracked combat vehicles were especially designed to clear pathways for troops and other vehicles through minefields and along roadside bombs and improvised explosive devices. The 72-ton, 40 foot (15 m) long vehicles are based on the M1 Abrams with a 1,500 horsepower engine, but fitted with a .50 cal machine gun and a front-mounted 15-foot (4.5 m) wide plow, supported by metallic skis that glide on the dirt and armed with nearly 7,000 lb (3,175 kg) of explosives. The Breachers are equipped with Linear Demolition Charge System (LDCS): rockets carrying C-4 explosives up to 100–150 yards forward, detonating hidden bombs at a safe distance, so that troops and vehicles can pass through safely. In the 1990s, the U.S. Army decided it could not afford to continue developing complicated, maintenance-heavy vehicles for this purpose. The Grizzly program was canceled in 2001, and the prototype developed never made it to the production lines. The Marine Corps however persisted and funded its own development and testing. The main body of the final model of the ABV is built on the General Dynamics chassis that is used for the M1A1 Abrams main battle tank. Pearson Engineering of the UK provided the specially designed plow and the other mine-clearing accessories. In the morning of December 3, 2009, for the first time breachers were used in combat, when Marines pushed into the Taliban stronghold Now Zad during Operation Cobra's Anger in Helmand province, on their way to another Taliban stronghold Marjah, 380 miles (610 kilometers) southwest of Kabul, that was to be assaulted in February 2010. On February 11, 2010, two breachers fired explosive line charges in the desert outside Sistani, to test Taliban defenses on the eve of Operation Moshtarak when closing off the enemy's escape route. On February 13, 2010, on the first day of the operation, breachers of the US Marines 2nd Combat Engineer Battalion succeeded in digging and blasting "safety lanes" through the numerous minefields laid by the Taliban around Marjah. According to a report in December 2009, there were then five ABVs in Afghanistan, and the U.S. Marines were said to have plans to field a total of 52 by 2012, of which about 34 have already had been produced. The U.S. Army was said to have ordered 187. By August 2013, six Assault Breacher Vehicles were brought to the Korean Peninsula. They are used by the 2nd Infantry Division to provide the capability for deliberate and in-stride breaching of mine fields and complex obstacles. The ABVs would allow the 2ID to clear the heavily mined Korean Demilitarized Zone, believed to contain tens of thousands to millions of mines. A previous deployment of MRAP mine-resistant vehicles to Korea caused North Korea to accuse their presence as vehicles that would cross the DMZ for an attack of the country; the MRAPs were later withdrawn due to their unsuitability for the terrain. North Korea has not publicly responded to the ABVs’ arrival on the peninsula.

Listva Russian 6x6 Remote Controlled Mine Clearance Vehicle

Tiers:

System

Alternative Designation: SBA-60K2 Bulat
Type: Remote-Controlled Mine Clearance Vehicle
Chassis: SBA-60K2 Bulat
Crew: ea2
Passenger Capacity: ea8
Compartments: The vehicle has three combat compartments: the first houses the commander and driver; the second conceals the radio operator, who searches for mines and scans the surrounding terrain; the third is for a team of sappers, in case a mine needs to be finished off manually.
Mine Detection: The Listva vehicle’s electronics can detect mines and IEDs at a distance of 100 meters within a 30° sector.
Sensors: This includes 16 externally mounted sensors for locating objects at a range of one hundred meters and transmitting the information in real time to the operator at the control panel.

Dimensions

Length: 8 m
Width: 2.5 m
Height: 2.6 m
Weight, Combat: 15.9–19.5 t
Ground Pressure: INA

Automotive

Engine Name: KamAZ-740.31-240

Engine Type: Diesel

Engine Power: hp240

Range: km800

Speed, Maximum Road: km/h90

Speed, Mine Detection: 15 kph

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Fording Depth: INA

Main Weapon System

Note: The Listva can be equipped with either 1 × 7.62-mm or 12.7-mm Machine Guns.

Fire Control

Name: INA

Computerized FCS: No

Protection

Hull Armor: The armour on the Listva can withstand direct hits from 7.62 mm calibre weapons. The vehicle features prominent, high-angled plated armour meant to deflect small-arms' rounds and artillery shell shrapnel, and features a V-shaped hull to increase protection against mine and IED blasts, with the bottom of the hull being resistant to explosions equivalent to 1 kg of TNT. The Bulat is also fitted with mine-resistant seats.

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

Russia’s Strategic Missile Force unveiled the Listva remote-controlled mine-clearance vehicle to the public at the Army 2018 international military and technical forum. "The remote-controlled mine-clearance vehicle was developed to increase the survivability and protection level of ground-mobile missile systems on combat patrol routes and in the field, breach minefields and remove remote-controlled explosive devices," the press office said. The combat effectiveness of the Listva system was checked. During the check, systems of the type deactivated explosive devices and then they were delivered to missile large units. The vehicle was developed specifically for the Strategic Missile Force and proved its effectiveness during a command post exercise involving the Novosibirsk-based missile large unit. The Listva vehicle’s electronics can detect mines and IEDs at a distance of 100 meters within a 30° sector. Strategic Missile Force engineering units are planning to receive more than 300 items of engineering equipment before 2020, including obstacle-clearing vehicles, heavy mechanized bridges, excavators, truck cranes and some other vehicles. Wheeled road-building vehicles developed specifically for the Strategic Missile Force will make up more than 50 percent of the engineering materiel to be delivered.

Trojan British Combat Engineering Vehicle

Tiers:

1 **2** 3 4

System

Alternative Designation: Trojan
Type: Combat Engineering Vehicle
Manufacturer: BAE Systems Land Systems
Chassis: The Trojan is based on a modified Challenger 2 main battle tank chassis. The turret has been removed and replaced by a new superstructure with special equipment.
Crew: 3 (commander, operator, driver)
Mine Plough: Yes, The Trojan is fitted with a full-length mine plough, that pushes mines out of the way to clear a safe path for following vehicles
Dozer Blade: Yes
Large Excavator Arm: Yes, The excavator arm is used for earth works, grabbing and moving obstacles, placing fascines. The standard bucket has a 1 m^3 capacity. Bucket can be replaced with other attachments. The arm lift capacity is 6.5 tonnes.
Minefield Breaching System: This vehicle can carry fascines and drop into ditches. Also it can tow a trailer carrying Python rocket-propelled minefield breaching system.
:

Dimensions

Length: 8.3 m
Width: 3.5 m, 4.2 m with Applique Armor
Height: 2.5 m
Weight, Combat: 62.5 tons

Automotive

Engine Name: Perkins CV12-8A

Engine Type: Diesel

Engine Power: hp1,200

Power to Weight Ration: 19.2 hp/t

Transmission: David Brown TN54 epicyclic transmission (6 fwd, 2 rev.)

Suspension: Hydropneumatic

Range: 450 km

Speed: 59 km/h (37 mph) 40 km/h (25 mph) off road

Gradient: %60

Side Slope: %30

Vertical Step: m0.9

Trench: m2.3

Fording: m1

Main Weapon System

Note: The Main Weapon System is controlled via remote control.

↳*System*

Name: L94A1 Chain Gun

Type: Chain Gun

Caliber: mm7.62

Length: 1.25 m

Barrel Length: 703 mm

Weight: 17.86 kg

Action: Electrically driven

Rate of Fire: 520 to 550 rounds per minute

Muzzle Velocity: 862 m/s

Feed System: disintegrating link belt

↳*Ammunition*

Type: Rifle

Caliber: mm7.62

Cartridge: 7.62×51mm NATO (linked)

Basic Load: INA

Protection

Hull Armor: The Trojan combat engineering vehicle has the same level of armor protection as the Challenger 2 MBT. It

provides a very high level of protection against direct fire weapons.

Applique Armor: If required additional armor can be added. Vehicle also has enhanced protection against landmines.

Mine Clearing: This vehicle can carry fascines and drop into ditches. Also it can tow a trailer carrying Python rocket-propelled minefield breaching system.

NBC Protection: There is an NBC protection system for the crew, so this engineering vehicle can operate in hazardous environments.

Smoke Equipment: INA

Notes:

The Trojan Armoured Vehicle Royal Engineers (AVRE) is a combat engineering vehicle of the British Army. It is used to breach minefields and for many other tasks. It is currently in use with the Royal Engineers. The Trojan Armoured Vehicle Royal Engineers is based on a Challenger 2 tank chassis, but lacks the main armament. In place of the turret, it has a large hydraulic excavator arm, which can be used to excavate areas, move obstacles, and deposit the fascine that the Trojan carries at its rear. The Trojan is usually also fitted with a plough on the front, which enables it to clear mines, either detonating them on contact, or pushing them out of the way to clear a safe channel for following vehicles. For self-defence only, it carries a 7.62mm machine gun. For rapid mine-clearing purposes, the Trojan can also tow a trailer carrying the Python, a rocket-propelled hose similar to the Giant Viper. This allows for a much quicker way of clearing a path for ground forces. The hose, packed with explosive, is launched across a minefield, and detonates after it hits the ground, clearing a 7-metre wide path for 230 metres. The vehicles were built at BAE Systems Land Systems plant in Newcastle upon Tyne. The contract was awarded in 2001 to Vickers Defence Systems, who were bought by BAE Systems in 2004. The project was known as the Future Engineer Tank. 33 have been built. It was first used on exercise in May 2007 with the 1st Battalion (Mechanised) of the Duke of Lancaster's Regiment. A number of Trojans are permanently based in Canada at British Army Training Unit Suffield in order to allow the Royal Engineers to support Armoured Battle Groups on major exercises. Trojans were first deployed operationally by the British Army to Afghanistan in 2009 engaging in their first advance under contact in 2010. During Operation Moshtarak 28 Engineer Regiment operated the Trojan attempting to use its traditional mine clearance equipment in the Counter-IED role in support of a major British Army advance. Its companion vehicle, developed at the same time, is another variant of the Challenger 2, the Titan armoured bridge layer, of which 33 have also been built.

PNMIRL Danish Armored Mine Clearing Vehicle

Tiers:

System

Alternative Designation: Wisent 1; Bergepanzer Wisent

Type: Armored Recovery Vehicle

Manufacturer: German FFG company as a private venture

Crew: ea3

Bucket Capacity: 1.3 m³

Dig Depth: 4.4 m

Lifting Capacity: 30 t

Winch Capacity: 35 t

Towed Load: 50 t

Earth Working Capacity (Dozer): 300 m³/h

Earth Working Capacity (Excavator Arm): 300 m³/h

Front Mounted Dozer Blade: It can be used to clear obstacles and for earthmowing operations. It is also used as an earth anchor to stabilize the vehicle during craning, winching and excavating operations.

ARV: In the ARV role the Wisent 1 can recover damaged, stuck, swamped or overturned combat vehicles on the battlefield. It also tows them to the nearest shelter, or maintenance unit. Vehicle can also provide maintenance service in the field. Crew of the Wisent 1 operate from under armor protection.

The Full Width Mine Plough (FWMP)

Description: This produces a safe and mine free cleared lane for following vehicles. This product is battle proven and is in service with, amongst others, the British Army, the U.S. Army, the U.S. Marine Corps and the Finnish, Danish, Dutch and Swedish Armed Forces. The blast resistant system comprises three main parts; two 9-tine track width blades to protect vehicle tracks and a central 5-tine vee blade to provide full width clearance. Fold out blade extensions to each side of the

system ensure that mines are pushed well beyond the width of the cleared lane. Ploughing depth is controlled by plough skids which remain in contact with the ground at all times. The system works well in a wide range of soil conditions and ground undulations. The FWMP can be fitted using a common interface kit which allows the task equipment to be quickly and easily interchanged and jettisoned increasing the operational capability of the host vehicle.

Key Features: *Rapidly clears mines and IEDs from the full width of the host vehicle *Blast resistant and can remain fully operational after a mine detonation *Designed to minimize the tractive effort required *Capable of operating in a wide range of soil conditions *Low maintenance *Can be fitted with a MSD to counter magnetic influence fused mines

Operation and Control: *The FWMP(H) has two operating positions; stowed for cross-country travel and deployed for breaching operations. Two hydraulic lift cylinders stow and deploy the plough blades. *Hydraulic power is provided by an in-built electrohydraulic power system if the FWMP is directly fitted to the vehicle. If the FWMP(H) is fitted using a Pearson Engineering common interface kit (HLA), an on-board hydraulic system is supplied. *The FWMP(H) is controlled from a Multipurpose Control Unit (MCU) mounted within easy reach of the vehicle driver.

Modular: *The FWMP(H) can be rapidly attached to, or detached from, the vehicle and interchanged with other Special to Role equipment using a (HLA) *An optional Hard Surface Device (HSD) can be fitted to the FWMP(H) to clear mines and munitions laid on the surface of roads and hard flat terrain. *An optional Magnetic System Duplicator (MSD) can be fitted to help protect the equipment from the effect of magnetically fused mines. *A purpose built Transportation Pallet facilitates both storage and transport and is capable of fitting into either an ISO container or onto a DROPS pallet.

Dimensions

Length: 8.2 m

Width: 3.5 m

Height: 3 m

Weight: 47 t

Automotive

Engine Name: MTU MB 838 Ca M500

Engine Type: Diesel

Engine Power: 960

Transmission: INA

Maximum Speed: 65 km/h

Range: 600 km

Gradient: 60%

Side Slope: 30%

Vertical Step: 0.7 m

Trench: 2.5 m

Fording: 1.2 m

Main Weapon System

Note: 1 x 12.7 mm (optional)

Protection

Hull Armor: This multi-purpose combat vehicle has a level of protection, similar to that of the Leopard 1 main battle tank. Vehicle withstands blasts equivalent to 8 kg of TNT anywhere under the hull or under any track location. Interior is lined with a spall liner.

Applique Armor: Available

Mine Clearing: Yes, The Wisent 1 can be also reconfigured for mine clearing role. It can clear pathways through minefields, allowing assault units to pass, before enemy establishes defenses. For this role it can be fitted with a full-width mine plough and a safe lane marking system.

NBC Protection: Yes

Smoke Equipment: No

Notes:

PNMIRK is the Danish abbreviation for Pansret Minerydningskøretøj, Armoured Mine clearing Vehicle – a unique Danish combInation of the Wisent ARV and the Full Width Pearson Mine Clearing Plough. It is used to clear a path of mines or IEDs for all kind of vehicles and personnel. Besides the full width plough the PNMIRK also has MSD Signature Duplicator (this creates a magnetic field in front of the vehicle to set off magnetic mines), and at the back a Lane Marking System (LMS) that by air pressure shoots markers along the cleared path.

Grizzley American Minefield Breaching Vehicle

Tiers:

System

Alternative Designation: Grizzly

Type: Minefield Breaching Vehicle

Manufacturer: INA

Crew: ea2

Dozer Blade: The Grizzly is equipped with a huge dozer blade, which is 4.5 m wide. It is able to dig one meter into the ground at a swipe and excavate 300 m³ per hour. The dozer blade is heavily armored and can withstand mine damage.

Telescopic Arm: Its telescopic arm with bucket for obstacle removal and digging. It is able to reach 10 meters and can excavate 80 m³ per hour. The bucket can lift about 6.3 tonnes.

Breaching: The Grizzly could breach an 600 meter obstacle with mines, berms, wire, rubble within 21 minutes, creating a lane for vehicles to follow. It could also breach an anti-tank trench in 5 minutes. This Combat engineer vehicle could breach natural obstacles as well.

Dimensions

Length: 10.62 m

Width: 3.66 m

Width, With Dozer Blade: 5.55 m

Height: 3.6 m

Weight: 50 Tons

Automotive

Engine Name: Honeywell AGT1500

Engine Type: Gas Turbine

Engine Power: 1,500 hp

Transmission: INA

Maximum Speed: 66 km/h

Range: 420 km

Gradient: %60

Side Slope: %30

Vertical Step: 1 m

Trench: 2.7 m

Fording: 1.2 m

Fording with deep Fording Kit: 2.28 m

Main Weapon System

Note: The Grizzly was fitted with a remotely controlled weapon station, armed with 12.7 mm machine gun or 40 mm automatic grenade launcher.

Protection

Hull Armor: Protection of the Grizzly is comparable to that of the main battle tanks. It can withstand mine damage.

Applique Armor: Available

Mine Clearing: Yes

NBC Protection: Yes

Smoke Equipment: No

Notes:

The Fiscal Year 2001 Army budget request included decisions to restructure or "divest" a number of programs in order to provide some of the resources to support its transformation to achieve the ambitious deployment goals outlined in the October 1999 Army Vision. The restructured programs are the Crusader and the Future Scout and Cavalry System. The "divestitures" include Heliborne Prophet (Air), MLRS Smart Tactical Rocket (MSTAR), Stinger Block II, Command and Control Vehicle (C2V), Grizzly, Wolverine, and the Army Tactical Missile System Block IIA. Funding for these programs was reallocated to fund the Army Vision transformation strategy. The GRIZZLY [initially designated the Breacher] is an armored vehicle designed to breach complex obstacles including mines, berms, wire, rubble, and tank-ditches. The GRIZZLY will breach obstacles with minimal preparation creating safe lanes for other vehicles in the dominant maneuver force with little or no loss in momentum. The GRIZZLY's obstacle clearing features include a full-width mine-clearing blade and a powered, extensible excavating arm. GRIZZLY is a Military Load Class 70 complex obstacle breaching vehicle which will integrate advanced countermine and counter-obstacle capabilities into a single survivable system. GRIZZLY will incorporate a full width Mine Clearing Blade (MCB), Power Driven Arm (PDA) for obstacle reduction and digging and a commander's control station (CCS) (crew compartment). It will have a remote fired 50-caliber machine gun and grenade launched screening smoke for self-defense. GRIZZLY will breach an 600 meter complex obstacle in 21 minutes and breach an antitank ditch in 5 minutes. GRIZZLY will be capable of breaching other types of natural and man made, simple and complex obstacles, creating a lane for vehicles to follow. It will integrate the technologies incorporated in the M1 & M2A3 chassis with the GRIZZLY mission modules. GRIZZLY is designed to provide the Digital Division with mobility support (i.e. counter-obstacle breaching) for Decisive Operations. Based on a modified and refurbished M1 Abrams tank chassis, the GRIZZLY will employ armors and many components derived from various members of the Abrams family of tanks. The system employs a two man crew. Its mobility will be comparable to the Abrams Main Battle Tank and the Bradley Fighting Vehicle. The dominant maneuver force will support the GRIZZLY with ongoing direct and indirect fire and air support. The GRIZZLY will be deployed with selected engineer companies in mechanized battalions, armored cavalry regiments, and heavy brigades. GRIZZLY is employed as an integral part of the M1A2 SEP/M2A3 equipped digital maneuver battalion task force. GRIZZLY as part of the Breach Force and supported by friendly direct and indirect fires, will reduce threat obstacles and create a safe one way passage lane for an M1/M2 equipped force to follow. A GRIZZLY equipped task force can execute breaching operations with minimal preparation and with little or no loss of task force momentum or need for lane proofing. GRIZZLY must provide an integrated, survivable breach system. GRIZZLY must provide breach lanes through simple and complex obstacles that allow the supported maneuver force to pass through and accomplish the force's mission. The required probabilities of two GRIZZLYs to successfully breach a lane is 0.95 (threshold) and 0.99 (objective), inclusive of blade and system losses due to mines, but exclusive of losses due to direct and indirect fires. GRIZZLY must breach lanes through simple and complex obstacles to allow the heavy maneuver force to conduct Decisive Operations. The probabilities of the GRIZZLY in providing breached lanes are a function of the GRIZZLY’s breach capabilities and GRIZZLY survivability to direct and indirect fires, but also the success of the maneuver force at suppressing the enemy (threat) force, obscuring the breach site, and securing the breach site. Nearly all obstacles include mines, so survivability of the system and the blade to mines must be considered. Doctrine calls for two lanes per task force with a recommended allocation of two assets to achieve one lane. The GRIZZLY equipped force must provide the task force a near certainty (a 99% probability) of achieving

one lane and a high probability (approximately 90%) of achieving two lanes. Assuming that two GRIZZLYs are allocated to each of two lanes, the threshold value of 0.95 results in a 0.90 probability of successfully breaching both lanes and a 0.9975% probability of successfully breaching at least one of the lanes. GRIZZLY will provide a lane allowing 95% of the maneuver task force (threshold) and 99% of the task force (objective) to safely pass, excluding losses due to direct and indirect fires. GRIZZLY will operate as part of a combined arms task force. The maneuver commander sets the conditions for breaching success through the execution of the Suppress, Obscure, and Secure fundamentals of breaching. Ideally, direct and observed indirect fires on the breach site are eliminated before the GRIZZLY is committed to execute the Reduce fundamental of breaching operations. Force on force combat simulation and threat assessments predict that the most likely direct fire threat faced by the GRIZZLY will come from dismounted teams providing fires on the obstacle and employing handheld anti-tank weapons (RPG type weapons). GRIZZLY is also exposed to indirect fires while conducting the breach. The specified conditions are representative of the type of fire mission expected against the GRIZZLY in the breach. These conditions equate to 60 rounds aimed/targeted at a box approximately 250 meters by 50 meters deep. These parameters will provide the inputs to existing models for development of the specific test parameters to measure compliance with this requirement. It is not intended that testing include the firing of 60 shells. GRIZZLY will provide resistance to perforation of the CCS against a 6-gun artillery battery, firing a variable time fuze, 10 round artillery salvo of 155 mm M107 high explosive with proximity fuze comparable to the M728 from 7,000 meters (threshold). The objective requirement is to provide resistance to top attack munitions. Grizzly [Breacher] The Fiscal Year 2001 Army budget request included decisions to restructure or "divest" a number of programs in order to provide some of the resources to support its transformation to achieve the ambitious deployment goals outlined in the October 1999 Army Vision. The restructured programs are the Crusader and the Future Scout and Cavalry System. The "divestitures" include Heliborne Prophet (Air), MLRS Smart Tactical Rocket (MSTAR), Stinger Block II, Command and Control Vehicle (C2V), Grizzly, Wolverine, and the Army Tactical Missile System Block IIA. Funding for these programs was reallocated to fund the Army Vision transformation strategy. The GRIZZLY [initially designated the Breacher] is an armored vehicle designed to breach complex obstacles including mines, berms, wire, rubble, and tank-ditches. The maneuver commander sets the conditions for breaching success through the execution of the Suppress, Obscure, and Secure fundamentals of breaching. Ideally, direct and observed indirect fires on the breach site are eliminated before the GRIZZLY is committed to execute the Reduce fundamental of breaching operations. Force on force combat simulation and threat assessments predict that the most likely direct fire threat faced by the GRIZZLY will come from dismounted teams providing fires on the obstacle and employing handheld anti-tank weapons (RPG type weapons). GRIZZLY is also exposed to indirect fires while conducting the breach. The specified conditions are representative of the type of fire mission expected against the GRIZZLY in the breach. These conditions equate to 60 rounds aimed/targeted at a box approximately 250 meters by 50 meters deep. These parameters will provide the inputs to existing models for development of the specific test parameters to measure compliance with this requirement. It is not intended that

testing include the firing of 60 shells. GRIZZLY will provide resistance to perforation of the CCS against a 6-gun artillery battery, firing a variable time fuze, 10 round artillery salvo of 155 mm M107 high explosive with proximity fuze comparable to the M728 from 7,000 meters (threshold). The objective requirement is to provide resistance to top attack munitions. The Breacher program was initiated in FY92 as a result of lessons reinforced during Operation Desert Storm and as a consequence of the deferral of the Combat Mobility Vehicle (CMV) during the Armored Systems Modernization (ASM) restructure. The Army has leveraged the work conducted under the ASM-CMV Advanced Technology Transition Demonstrator (ATTD) program to accelerate the development cycle. A sole-source contract was awarded to United Defense, LP (formerly BMY) in September 1992 for Demonstration and Validation prototypes to be delivered in 4QFY95. Following a significant increase in the GRIZZLY program's procurement objective to the currently planned 366 units, the Army's Acquisition Executive notified OSD that the Army designated the GRIZZLY program an ACAT II program and a covered system for LFT&E in June 1996. The GRIZZLY was added to the FY97 Annual T&E Oversight List for LFT&E only. This program is not an operational test and evaluation oversight program. The Army briefed a draft LFT&E strategy to DOT&E in April 1996 and received DOT&E approval of a revised strategy in December 1996. Dedicated LFT&E events begin in FY98 and extend through FY01. There was one GRIZZLY test event supporting the LFT&E program during FY97. Testing conducted prior to this most recent effort consisted of developmental and demonstration/validation testing only. That testing, although generating valuable information for the product manager, did not provide relevant data for the LFT&E. A full-up, system-level test employing a prototype chassis was subjected to a mine detonation during FY97. This test challenged a mine clearing blade system that had been redesigned based on FY96 developmental test results. The redesigned mine clearing blade system survived the mine detonation and did perform in accordance with engineering expectations. The program is in Engineering and Manufacturing Development (EMD) Phase and funded for First Unit Equipped (FUE) in 3QFY04 to 1 CD. Initial Operational Capability (IOC) is 4QFY04. United Defense (UD) finalized their EMD vehicle design 30 Jul 98 and will fabricate two prototypes for delivery to the government in 2QFY00.

Husky 2G South African 4x4 Vehicle-Mounted Mine Detection (VMMD)

Tiers:

Variants:

- **Husky Mk I:** The Husky Mk I was developed in the 1970s, for land mine detection.
- **Husky Mk II:** DCD introduced Husky Mk II and Husky Mk III as upgraded versions of the basic variant.
- **Husky Mk III:** The current Program of Record (M1231) for the U.S. Army. The Mk III is the modern single-occupant Husky model. The platform is integrated with pulse induction metal detector panels and overpass tires that enable operators to regulate tire air pressure in order to reduce the risk of initiating victim-operated, pressure-fused, anti-vehicle landmines without causing detonation. As with all Husky platforms, the Mk III has been engineered in a unique modular, frangible configuration. In the event of a mine or improvised explosive device detonation, vehicle components break apart in a predictable fashion, reducing damage to the platform and occupants, as well as facilitating fast in-field repairs using the system's RedPack, a towable asset comprising front and rear modules as well as a battle damage repair tool kit.
- **Husky 2G:** A two-occupant version of the Husky MK III vehicle. Development of the Husky 2G was prompted by the need to effectively conduct longer missions and employ multiple advanced detection systems. The Husky 2G was designed with the same protection, survivability, and mobility characteristics as the original Husky MK III, but integration of more sophisticated high sensitivity detectors, ground-penetrating radar, and video optics suites, and remote weapon stations created the need for a second operator to manage the additional workload.

System

Alternative Designation: Husky 2G

Type: Vehicle-Mounted Mine Detection (VMMD)

Family: Husky

Manufacturer: VMMD vehicle is marketed in the US by Critical Solutions International (CSI), who are also responsible for the international marketing and field support of the vehicle.

Crew: 2

Hull: The Husky VMMD incorporates a V-shaped hull offering optimum protection against blasts.

Cabin: The cabin is fitted with a bullet-proof glass window and a single hatch is provided on the top.

Mission: The vehicle is designed to detect landmines and improvised explosive devices (IEDs) with high probability of detection (Pd) and low false alarm rate (FAR). The height of the sensor installed on the Husky can be controlled automatically to adjust in various terrains. The Husky is also attached with the Mine Detonation Trailer (MDT) set to detonate any left out mines.

Backup Camera: Yes

Endurance: 6 hours

Radar

Radar Name: The Husky vehicle is equipped with NIITEK's VISOR™ 2500 Ground Penetrating Radar (GPR), with four panelled 3.2m array at the front.

Detection: The Husky is most commonly configured with payloads that enable operators to identify threats through visual scans and the focused application of optics and sensors.

Pulse Induction Metal Detectors: Yes

Non-Linear Junction Detectors: Yes

Gunshot Detection: Yes

Interrogation

Attachments: Husky vehicles are frequently integrated with attachments that enhance clearance units' ability to confirm and classify a detected threat using remote, mechanical, or explosive means.

Interrogation Arm: Yes

Blowers: Yes

Water Diggers: Yes

Thermal Cameras: Yes

Optics Suite: Yes

Disruption: The Husky can be equipped with payloads to deliberately initiate or interrupt a suspected threat systems' ability to function as intended by mechanical, electrical, or explosive means. Launched line charges Mine-clearing line charge

Mitgation: The Husky are often equipped with payloads designed to limit the severity of damage caused by undetected threats on friendly follow on elements through standoff subsystems and disruptive proofing *Mine Roller Mine rollers *Passive Infrared Disruption Rhino *Passive Infrared Defeat System *Rake *Proofing Roller *Electrostatic Discharge

Interrogation Arm: The Husky 2G features the FASCAN interrogation arm, which is used to investigate suspected mines and roadside bombs.

Situational Camera: TORC Robotics 360 situational awareness camera system and the QinetiQ North America QNET system, which provides lightweight protection against rocket-propelled grenades.

Protection

Hull Armor: The v-shaped hull of Husky VMMD can protect the vehicle and crew from blasts.It can withstand up to STANAG 4569 level 4a & 4b blasts on field and is also capable of withstanding STANAG 4569 level 3 (standard) ballistic explosion. The vehicle is designed to withstand high detonation and can be brought to operating conditions within two hours after an explosion.

Cabin Armor: The cabin is fitted with a bullet-proof glass window and a single hatch is provided on the top.

Applique Armor: INA

EFP Armor: Yes, Explosively Formed Penetrator

RPG Netting: Rocket-propelled grenade

RPG Bare Armor: Yes

Smoke Launchers: Yes

NBC Protection: Yes

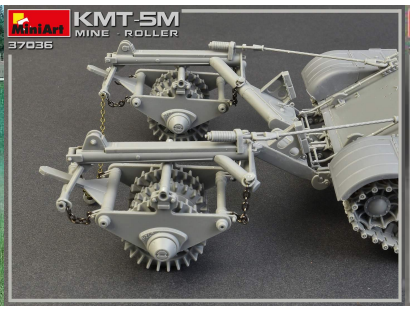
Electronic Countermeasures: Yes

Notes:

This variant has an enlarged driver's cab that can accommodate two people. The driver focuses on maneuvering the vehicle and spotting IEDs visually, while the commander handles the sensors. The driver's workload is reduced two ways. First, several functions are transferred to the commander, who oversees both the ground-penetrating radar as well as the sensor systems. In addition to vision system upgrades, the driver can use a back-up camera. The Husky 2G features the FASCAN interrogation arm, which is used to investigate suspected mines and roadside bombs. The upgraded system has additional power to operate additional sensors and enhancements, such as the NIITEK ground-penetrating radar. It is also equipped with the TORC Robotics 360 situational awareness camera system and the QinetiQ North America QNET system, which provides lightweight protection against rocket-propelled grenades. Active self-defense is available from the Common Remotely Operated Weapon Station (CROWS), which is handled by the commander from within the cab. In addition to the machine gun, the CROWS includes a large 15-inch (381-mm) color monitor that shows live video from the turret's cameras in the daytime and a second-generation forward-looking infrared (FLIR) camera at night. The commander can operate the cameras and a built-in laser rangefinder without having to use the gun. The Husky VMMD (vehicle-mounted mine detection) family of vehicles are blast-survivable, mission-configurable wheeled platforms employed around the world by specialized route clearance teams operating in high-explosive threat areas. Defined by their unique design characteristics of survivability, frangibility, and reparability, Husky

vehicles enable personnel and payloads to safely operate in close proximity to sub-surface explosive hazards. The Husky is manufactured in South Africa by DCD Protected Mobility and then integrated with clearance payloads, provided, and supported by U.S.-based C-IED solutions company, Critical Solutions International. The current iteration of the Husky is part of a class of MRAP vehicles developed from a South African blast protection design. The basic v-hull concept of modern MRAP vehicles, and the Husky, was an architectural innovation that fundamentally recast the nature of the vehicle's resistance to explosive threats. As clearance techniques matured along with emerging technologies in order to respond to evolving threats, the unique tenants of the Husky design have endured. Survivability: The sharp V-hull of the Husky dramatically reduces blast effect by increasing ground clearance and standoff from the blast, increasing structural hull rigidity, and diverting blast energy and fragmentation away from the platform and its occupants. Frangibility: With three main components (a center cab with front and rear wheel modules) connected by sheering pins, the Husky is designed to break apart in a blast event, allowing energy to transfer to the detachable front and rear modules rather than transferring stress to the critical components of the vehicle or the occupants located in the cab. Repairability: Critical components have been engineered to break apart in a predictable fashion, preventing catastrophic damage and enabling users to quickly replace modules on site. This approach increases the lifespan of the vehicle, maintains mission readiness, and limits the need for recovery teams to evacuate the vehicle to intermediate- or depot-level maintenance facilities. The Husky VMMD Mk III and 2G are powered by a Mercedes Benz OM 906 LA 6.4L six-cylinder turbo diesel engine coupled with an Allison 2500 SP 5-speed automatic transmission. The operating weight of vehicle is 8,350kg, and the Husky can reach a maximum speed of 72km/h and has a range of 400km or 200km when equipped with mine-detonation trailer (MDT). The cabin of the Husky is fitted with bullet-proof glass windows and an entry hatch on the roof. The Husky's versatility for application in dynamic clearance missions comes from both the vehicle design and the modularity provided by easy integration of tailored payloads.

KMT-5M Russian Tank Mounted Mechanical Mine Clearing Device



Tiers:

System

Alternative Designation: None
Type: Roller and Plow
Chassis: Can be mounted on the T-54, T-55, T-62, and other medium tanks.
Crew: ea2
Installation Time: min30-45
Lane Clearing Rate: km8-12
Number of Rollers per set: 2
Total Number of Rollers: 2 sets of three roller disks per system
Weight, Combat: mt7.5
Cleared lane width, each: mm2 x 810mm lanes behind each roller / plow

↳*Dimensions*

Height, Overall: mINA
Length, Overall: m3.2
Width, Overall: m4

Notes:

The KMT-5M mine roller-plow is very flexible, since it allows for either the plows or the rollers to be used. The rollers function satisfactorily against mines equipped with simple pressure fuses, but other mines will defeat this equipment. However, the roller-plow combination also allows the tank to counter more sophisticated fuses with plows designed to uncover or push mines aside. The plows and rollers cannot work simultaneously. The KMT-5M also includes a luminous lane-marking device for night operations. Because plows and rollers do not clear the area between them a “dog bone” or light chain with rollers is stretched between the roller sections to defeat tilt-rod mines. Quick disconnects allow the operator to drop either plows or rollers or both; otherwise, the crew can remove the system in 8 to 13 minutes. All current medium tanks have fittings for attaching mine clearing equipment. There is one plow per tank platoon and one roller per company. For tanks newer than the T-55/62 the plows are no longer carried in the engineer company, but are permanently mounted on the tank. Therefore the engineers need only to transport the rollers. One Kraz-255B truck (with KM-61 crane) or two ZIL-131 trucks can carry one KMT-5M.

Uran-6 Russian Multi-functional Robotic Mine-Clearing System

Tiers:

System

Alternative Designation: URAN-6

Type: Uran-6 is a multi-functional, mine-clearing robotic system manufactured by JSC 766 UPTK for the Armed Forces of the Russian Federation.

Crew: eaRobotic, unmanned

Note: Four video cameras, fitted atop the robot, provide operator with 360° field-of-view of the operating area in the front and rear. The real-time imagery is transmitted to its remote control system.

Notes:

The Uran-6 is a multi-functional, mine-clearing robot that can be deployed in mine reconnaissance and area clearance operations to detect and remove explosive ordnance as well as anti-personnel and anti-tank mines.The Uran-6 (MRTK-R) is a an unmanned multifunctional demining system designed and manufactured by the Russian Defense Industry. The Uran-6 is a Russian version of the Croatian MV-4 Dok-Ing mine-clearing robot. The Uran-6 can do the work of 20 engineer troops. The demining robot can be deployed in mine reconnaissance and area clearance operations to detect and remove explosive ordnance and anti-personnel / anti-tank mines. It also minimises risks caused by unexploded ordnance and other dangerous objects. The robot recently took part in the International Military Technical Forum (Army-2016) held in Russia in September 2016.

Heidar-5 Russian 8x8 Armored Minelayer Vehicle

Tiers:

Variants:

- **BTR-60P:** Initial model with open top, pintle-mounted 7.62-mm machine gun
- **BTR-60PA/BTR-60PK (12 passengers only):** Covered top, NBC protection, pintle-mounted 7.62-mm MG, still exit over top
- **BTR-60PB (space for 8 soldiers for dismounted operations).:** Most common variant with BRDM-2 MG turret with a 14.5-mm MG & coaxial 7.62-mm; troops exit over top
- **Modernized BTR-60PB:** BM2 Turret with 30-mm 2A42 Cannon & 7.62-mm PKTM MG; 30-mm AGS-17 AGL on left side
- **BTR-60U:** Command vehicle with additional radios
- **BTR-60 PU-12/12M:** Anti-Aircraft units' command vehicle
- **BTR-60 MS:** Radio vehicle with High Ball antenna
- **BTR-60 VVS:** Sans turret with additional radios
- **BTR-60 PBK:** BTR-60PB with 3 radios
- **BTR-60 1V18:** Artillery observation vehicle
- **BTR-60 1V19:** BTR-60 1V18 for FDC operations
- **BTR-60 R-145BM:** Communications vehicle with 5 radios
- **BTR-60 R-975:** Forward air-control vehicle with turret
- **BTR-60-Z-351BR:** Power production vehicle with generator
- **BTR-60-P-238BT:** Switchboard vehicle for communications
- **BTR-60-P-240BT:** Integrates radio & wire communications- R-123M radio & R-241 switchboard
- **BTR-60-P241BT:** Equipped with P-241 telephone system
- **BTR-60-R-137B:** Communications vehicle with turret
- **BTR-60 ACRV:** Artillery Battery C2 & recon vehicle
- **BTR-60-R-145:** Additional radio, but no turret
- **BTR-60-R-156BTR:** C2 vehicle with additional radios
- **BTR-60-R-409BM:** Relay vehicle-R-409 & R-123M radios
- **BTR-60PAU (Bulgaria):** Artillery command vehicle
- **BTR-60PB-MD (Bulgaria):** Upgraded engine, radios, & NBC equipment
- **BTR-60P Maintenance Assistance (MTR-2):** Maintenance vehicle with tarp over troop compartment
- **BTR-60 SPAAG (Cuba):** Twin 30-mm anti-aircraft cannons
- **BTR-60 Djibouti (Djibouti):** AML-90 turret on BTR-60
- **BTR-60BD:** Speed increased to 100 km/h & range to 800 km
- **MTP-2:** Armored Recovery Vehicle
- **BTR-60PZ:** Final production model with 1PZ-2 roof-mounted periscope
- **BTR-60-R-140BM:** C2 vehicle with turret
- **MEP:** Infantry command post
- **BTR-60PB FAC:** Turreted FAC vehicle without the gun

System

Alternative Designations: Heidar-5

Manufacturer: INA

In Service: 2018-Present

Description: 8x8 Armored Minelayer Vehicle

Crew: ea3

Passengers: ea14

Mine Launching Unit: 18 mine launcher units mounted on each side of the hull.

Types of Mines: According to our first analysis, each mine launcher unit has two preloaded magazines, each of which holds two anti-tank or anti-personnel mines. The vehicle seems to equipped with an automatic firing system that can be used to preselect the resultant mine barrier data and can be placed into several laying modes that can be changed while the vehicle is moving.

NBC Protection System: Collective (closed vehicles)

Smoke Equipment: No

Survivability Equipment: No

Notes:

During the Iranian Army Day, local defense industry has presented the Heidar-5, a new minelayer wheeled vehicle able to launch anti-tank mines to create mine barrier based on Soviet-made BTR-60 8x8 APC (Armoured Personnel Carrier). The vehicle is equipped with an automatic firing unit located inside the vehicle. The Heidar-5 minelayer is based on a modified Soviet-made BTR-60PB 8x8 armoured personnel carrier. The original turret is removed and the troops compartment is used to put a mine launching assembly mounted at the rear vehicle, with 18 mine launcher units mounted on each side of the hull. According to our first analysis, each mine launcher unit has two preloaded magazines, each of which holds two anti-tank or anti-personnel mines. The vehicle seems to equipped with an automatic firing system that can be used to preselect the resultant mine barrier data and can be placed into several laying modes that can be changed while the vehicle is moving. The Heidar-5 could also create mine barrier on the move. Mines are ejected on each side of the vehicle. In road position, the mine laying system is covered by armour plates. The front of the Heidar-5 is fitted a remotely-operated weapon station armed with a Soviet-made DShK 12.7mm heavy machine gun. The hull of the BTR-60PB is of all-welded steel armour with the driver and commander seated at the front of the hull. Both have a windscreen in front of them which, when in action, is covered by a flap hinged at the top. The BTR-60PB enters in service with the Russian army in 1966. The vehicle is an eight-wheel-drive vehicle motorized with a 2 GAZ-49B 6-cylinder in-line water-cooled petrol engines developing 90 hp at 3,400 rpm each coupled to manual transmission with 4 forward and 1 reverse gears. It can run at a maximum road speed of 80 km/h with a maximum cruising range of 500 km.

Husky MkIII (M1231) South African 4x4 Vehicle-Mounted Mine Detection (VMMD)

Tiers:

Variants:

- **Husky Mk I:** The Husky Mk I was developed in the 1970s, for land mine detection.
- **Husky Mk II:** DCD introduced Husky Mk II and Husky Mk III as upgraded versions of the basic variant.
- **Husky Mk III:** The current Program of Record (M1231) for the U.S. Army. The Mk III is the modern single-occupant Husky model. The platform is integrated with pulse induction metal detector panels and overpass tires that enable operators to regulate tire air pressure in order to reduce the risk of initiating victim-operated, pressure-fused, anti-vehicle landmines without causing detonation. As with all Husky platforms, the Mk III has been engineered in a unique modular, frangible configuration. In the event of a mine or improvised explosive device detonation, vehicle components break apart in a predictable fashion, reducing damage to the platform and occupants, as well as facilitating fast in-field repairs using the system's RedPack, a towable asset comprising front and rear modules as well as a battle damage repair tool kit.
- **Husky 2G:** A two-occupant version of the Husky MK III vehicle. Development of the Husky 2G was prompted by the need to effectively conduct longer missions and employ multiple advanced detection systems. The Husky 2G was designed with the same protection, survivability, and mobility characteristics as the original Husky MK III, but integration of more sophisticated high sensitivity detectors, ground-penetrating radar, and video optics suites, and remote weapon stations created the need for a second operator to manage the additional workload.

System

Alternative Designation: Husky Mk III; The current Program of Record (M1231) for the U.S. Army.

Type: Vehicle-Mounted Mine Detection (VMMD)

Family: Husky

Manufacturer: VMMD vehicle is marketed in the US by Critical Solutions International (CSI), who are also responsible for the international marketing and field support of the vehicle.

Crew: 1

Hull: The Husky VMMD incorporates a V-shaped hull offering optimum protection against blasts.

Cabin: The cabin is fitted with a bullet-proof glass window and a single hatch is provided on the top.

Mission: The vehicle is designed to detect landmines and improvised explosive devices (IEDs) with high probability of detection (Pd) and low false alarm rate (FAR). The height of the sensor installed on the Husky can be controlled automatically to adjust in various terrains. The Husky is also attached with the Mine Detonation Trailer (MDT) set to detonate any left out mines.

Notes:

The UR-77 Meteorit (Russian: УР-77 Метеорит, lit. 'Meteorite') is a Soviet mine clearing vehicle, based on a variant of the 2S1 Gvozdika chassis. The vehicle is armed with a launcher and two mine-clearing line charges. When launched, a charge causes a shock wave that destroys or disables all the shells or mines along the area of the line charge. (with a width of 6 metres and length up to 90 metres). The vehicle has also been used offensively, where its line charge has been used to destroy entire streets in urban combat.

Armor, Hull Floor: mm20

Armor, Top: mm33

Smoke Equipment: 8 x 81-mm smoke grenade launchers. Vehicle engine exhaust smoke system.

Notes:

The PLA also operates the GSL130 Tracked Comprehensive Mine-Clearing Vehicle (TCMCV), which is based on the older Type 59/Type 69 MBT hull. This system is also referred to as the WZ763. The turret has been removed and replaced by an armoured superstructure for the crew of three and mounted at the front is a hydraulically operated full-width mine plough clearing system, which includes a depth-sensing device that is lifted while travelling.

Armor, Applique: mmINA

Armor, Explosive Reactive: mmINA

Armor, Turret Front: mmINA

NBC Protection: Collective protection system

Self entrenching blade: No

Smoke Equipment: Vehicle engine exhaust smoke system (VEESS)

Notes:

The IRM engineer reconnaissance vehicle conducts reconnaissance of routes, fords, water barriers (velocity, depth, underwater obstacles, and bottom profile and density), ice, mapping, and overall terrain trafficability. Its chassis employs components of the BMP-1 IFV. It has two propellers on the rear of the hull for propulsion in the water. A wave deflector covers the front of the hull. The IRM has an emergency extraction/self-recovery system available which allows the vehicle to quickly extract itself when stuck in mud, etc. without having the crew exit the vehicle. The system consists of two racks of 12 rockets each mounted on the rear deck between the propellers. This rocket propulsion system is especially valuable if the vehicle is stuck when under enemy fire. Gradient: 36 Side Slope: 17 Mine detecting capability: two extendable arms for mine detecting. The mine detector arms are hydraulically articulated to their operating position in three minutes. The detector will bring the vehicle to a halt upon encountering an obstacle or detecting a metallic object. Handheld mine detectors AT mine detection zone (m) width: 3.6 depth: .3. River-type wide-span mine detector: RSHM-2 (detects mines planted depth of .3m with current velocity of 3-5 km/h). Mechanical Penetrometer (to analyze soil for trafficability). Sonar (echo sounder with an auto recorder and three hydro-acoustic

transducers) .5 to 20 m (for water bottom profiles, mine and obstacle detection). Gyrocompass and Gyro Stabilized Artificial Horizon: AGI-1S Surveillance and Night Observation Equipment: TNPO-160, TNP-370, TVN-2BM. Navigation: inertial with constant coordinate and direction readout: TNA-3. IR searchlight is mounted to the right of the PKT MG. Equipment for Dismounted Engineer: Digital Camera Portable Periscope: PIR-T. The 15x periscope is used primarily for detailed studies of enemy structures and obstacle soil. Penetrometer. Portable ice drill. Laser Rangefinder. Thermal Viewer. Handheld GPS Receiver. Handheld Mine Detectors. Portable: RVM-2M and IMP-2. Radios, Handheld: R-147, 2 each.

IMR-2M Russian Heavy Combat Engineering Vehicle

Tiers:

Variants:

- **IMR:** First version of combat engineering vehicle built on T-54/55 medium battle tank chassis, powered by a V-55 diesel engine developing 520 hp.
- **IMR-2M1:** Simplified model without the mine-clearing system. Entered service in 1982. Based on T-72A tank hull.
- **IMR-2M2:** Improved version that is better suited for operations in dangerous situations, for example in contaminated areas. It entered service in 1990 and has a modified crane arm with bucket instead off the pincers.
- **IMR-2MA:** Latest version with bigger operator's cabin armed with a 12.7 mm machine gun NSV.
- **Klin-1:** Remote controlled IMR-2.
- **IMR-3M:** Combat engineering vehicle built on the T-90 main battle tank chassis. The vehicle is 9,320 mm long, 3,500 mm wide and 3,430 mm high and weighs 49.5 t with the KMT-RZ minesweeping device. The IMR-3M is powered by an 840-hp V-84MS multifuel diesel engine, producing a maximum speed of 60 km/h and a range of 500 km. The baseline AEV is fitted with a U-type dozer blade, jib-type crane with an excavator bucket, and minesweeping plow. A chemical, biological, radiological and nuclear [CBRN] reconnaissance device, smokescreen generator, advanced signal suite and automatic fire extinguisher are fitted. The IMR-3M is armed with an NSVT 12.7 mm heavy machine gun [HMG] in a remotely controlled station. Production started in 2016 and is currently ongoing.

Notes:

IMR-2MA: Latest version with bigger operator's cabin armed with a 12.7 mm machine gun NSV. The IMR-2 is a combat engineering vehicle built on T-72 main battle tank basis. Development of the IMR-2 begun in 1970s and completed in 1980, while commercial production commenced in 1982. IMR-2 developed to replace aging IMR which built on the basis of T-54/55 tank. The IMR-2 combat engineering vehicle is in service with Russian Army and some foreign militaries. It took part in Soviet–Afghan War, First Chechen War, Second Chechen War and in addition used in relief operations after Chernobyl disaster. IMR-2 was derived from the T-72 tank. The turret of the T-72 was replaced with a new rotating multipurpose telescopic crane.

The IMR-2 has a bulldozer blade fitted on the front of the hull, which has a V shape and a straight shape and a 200 – 250 m3/h capacity. When not required, the blade is folded upwards. Stone barriers can be cleared at the rate of 280 to 350 meter an hour while trenches and tree barriers can be filled in at the rate of 350 to 400 m3/h. A 12.7 mm NSVT machine gun is mounted on the crew operator/commander cabin, for the self-protection of the vehicle. The IMR-2 is powered by a multi-fuel water-cooled diesel engine V-84Ms developing 840 hp, the same engine used in the T-72. The IMR-2 can run at a maximum road speed of 50 km/h with a maximum range of 500 km. The IMR-2 uses the same torsion bar suspension as the main battle tank T-72, which consists of six road wheels on each side. This combat engineering vehicle is operated by a 2-man crew.[

BAT-M Russian Tracked Route-Clearing Vehicle

Tiers:

Fording Depths: m0.7

↳*Features*

Radios, Frequency, and Range: INA
Vertical Step: m1
Trench Crossing: m1.57
Time from Travel to Operating Position: min5 to 7

Notes:

In the late 40’s the Soviet troops required a heavy artillery tractor to tow their super heavy guns and the upcoming nuclear missiles. One of them was the legendary AT-T based on the very early chassis and lower hull of the T-44 and later T-54 tank with 500mm wide tracks and a 13 teeth sprocket wheel. On the basis of this very strong artillery tractor several other heavy engineer vehicles were also derived. One of them, the BAT-M (also known as a “Way Builder”), featured a huge blade that was pivoted back when marching or being transported and a 2-ton crane installed at the rear part of the vehicle. My model represents an NVA version used by the former Eastern German Army until its end in 1990, at which time they still had 158 BAT / BAT-M in service. This vehicle had a V12 Diesel Engine with a cylinder capacity of 38.800 cm3, was water cooled, with a 415 hp rating.

Notes:

Engineer Troops of the Armed Forces of the Russian Federation have received modern IMR-3M mine-obstacle vehicles. In the framework of the contract signed in 2016, the manufacturer handed over 13 vehicles to the Russian Defence Ministry. The IMR-3M was created on the basis of the T-90A tank and is equipped with a KMT-R3 track width mine plough with an EMT electromagnetic detachable device for trawling mines with rod-type and non-contact magnetic fuses. The vehicle is capable of lifting loads up to 2 tons. The IMR-3M is armed with the 12.7mm remote-controlled machine-gun mount. It can fire at ground, low-speed air targets, as well as explosive objects openly lying on the ground. The IMR-3M is also designed to make passes in moderately rugged terrain, in stone and forest rubble and in snow. It can remove minefields or perform work in contaminated area. The vehicle is equipped with radiation, chemical reconnaissance and contamination control and has a high level of protection against radiation and toxic substances. IMR-3M is capable of forcing water barriers up to 5 m deep along the bottom.

DIM Russian Vehicle Mounted Mine Detector

Tiers:

1 2 **3** 4

System

Alternative Designation: None
Chassis: Used on a UAZ-469 or other light 4x4 vehicle
Crew: ea2
Depth: m25cm; 70cm while fording
Detection Ability: Can detect metallic mines in roadways, airfields, and other flat terrain.
Mounting/dismounting Time: minUp to 7
Operating Speed: km/h10

Notes:

Components: detection system, pneumatic system, electronic system. The DIM is a large pulse-induction mine-detection device mounted to a light 4x4 truck. The detection element fastens to a frame on the front of the vehicle. When a mine is detected, the vehicle breaking system is engaged and the clutch is disengaged. The full-width detection head, located 2.6 meters from the vehicle's front wheels to provide stopping distance, is divided into six components to pinpoint mine location. The electronic system also displays which component of the mine-detector head the mine is under. It also has attached rollers so that the head does not come in contact with ground objects. Cross-country capability is very limited; therefore the DIM is generally used for clearing prepared surfaces. The detection equipment swings upward to ride on the top of the vehicle cab for traveling. When needed it is swung forward to rest on two wheels.

Caterpiller 120M American 6x6 Motor Grader

Tiers:

1 **2** 3 4

System

Alternative Designation: Caterpillar 120M Grader

Type: Motor Grader

Crew: ea1

In-Dash Instrument Cluster: The instrument panel, with easy-to-read, high-visibility gauges and warning lamps, keeps the operator aware of critical system information.

Dimensions

Blade Base: 8.3 ft (2.53 m)

Front Ground Clearance: 1.9 ft (0.58 m)

Ground Clearance - Rear Axle: 13.6 in (34.54 cm)

Height - Exhaust Stack: 112.4 in (285.5 cm)

Height - Front Axle Center: 22.5 in (57.15 cm)

Height - Top of Cab: 10.8 ft (3.29 m)

Height - Top of Cylinders: 113.7 in (288.8 cm)

Height to Top of Isomount Cab: 10.8 ft (3.29 m)

Length - Between Tandem Axles: 59.5 in (151.13 cm)

Length - Counterweight to Ripper: 389.3 in (988.82 cm)

Length - Front Axle to Mid Tandem: 232.8 in (591.31 cm)

Length - Front Axle to Moldboard: 98.9 in (251.21 cm)

Length - Front Tire to Rear of Machine: 334.1 in (848.61 cm)

Overall Length: 27.9 ft (8.5 m)

Rear Ground Clearance: 1.2 ft (0.37 m)

Wheelbase: 19.4 ft (5.91 m)

Width Over Tires: 8.2 ft (2.5 m)

Automotive

Engine Name: Caterpillar C6.6 diesel
Engine Power: 138 - 173 hp
Max Road Speed: 45 km/h
Range: INA
All Wheel Drive (AWD) System.: The optional AWD system utilizes dedicated left and right pumps for precise hydraulic control. The infinitely variable pumps and motors maximize torque in each gear delivering the most power to the ground in the industry and increasing productivity in the most demanding applications.
:
:

Controls

Advanced Joystick Controls: Two electro-hydraulic joysticks reduce hand and wrist movement as much as 78% compared to conventional lever controls for greatly enhanced operator efficiency. The intuitive pattern is easy to learn and provides the precise implement control you expect from Caterpillar.
Auxiliary Pod and Ripper Control: The optional ripper control and auxiliary control pod are ergonomically positioned to allow simple, comfortable operation for the multiple hydraulic options.
Controls and Switches: Reliable, longlife rocker switches are located on the right side cab post and front instrument cluster, within easy reach for the operator.
Intuitive Steering Control: The 120M introduces a breakthrough in joystick steering control. This technology creates a direct relationship between the lean angle of the joystick and the turning angle of the steer tires.
Electronic Throttle Control: Electronic Throttle Control (ETC) provides the operator with easy, precise, and consistent throttle operation. An automatic and manual mode on a single switch offers flexibility for different applications and operator preferences.
Left Joystick Functions: The left joystick primarily controls the machine direction and speed. 1 – Steering: Lean joystick left and right 2 – Articulation: Twist joystick left and right 3 – Articulation Return to Center: Yellow thumb button 4 – Wheel Lean: Two black thumb buttons 5 – Direction: Index trigger shifts transmission to forward, neutral or reverse 6 – Gear Selection: Two yellow thumb buttons upshift and downshift 7 – Left moldboard lift cylinder: Push joystick to lower, pull joystick to raise 7 – Left moldboard lift cylinder float: Pushing joystick through detent engages float
Right Joystick Functions: The right joystick primarily controls the Drawbar, Circle and Moldboard functions. 1 – Right moldboard lift cylinder: Push joystick to lower, pull joystick to raise 7 – Right moldboard lift cylinder float: Pushing joystick through detent engages float 2 – Moldboard slide: Lean joystick left and right 3 – Circle turn: Twist joystick left and right 4 – Moldboard tip: Thumb switch fore and aft 5 – Drawbar center shift: Thumb switch left and right 6 – Electronic Throttle Control: Trigger switch is resume and decrement 7 – Differential Lock/Unlock: Yellow button
Ripper Control Pod: Infinitely variable roller switches control the rear ripper and/or front lift group (when equipped), for easy and comfortable control.
Programmable Auxiliary Hydraulic Pod.: Four fingertip controls and a mini joystick maximize hydraulic control flexibility, accommodating up to six hydraulic circuits. Individual functions are easily programmable through Cat ET to meet the configuration you need. The optional auxiliary hydraulic pod is provided in addition to the ripper control pod when the machine is configured with three or more auxiliary functions.
Smooth Shifting Transmission: The 120M combines several key innovations to ensure smooth, powerful shifts throughout the gear range.
Electronically Controlled Shifting: The full Electronic Clutch Pressure Control (ECPC) system optimizes inching modulation and smooths shifting between all gears and directional changes. This provides outstanding control and also extends the life of the transmission by reducing stress on gears.
Controlled Throttle Shifting: This standard feature helps to smooth directional and gear changes without use of the inching pedal.

Structure

Front Frame Structure: The 120M front frame is a formed structural carbon steel tube. Advanced fabrication technology significantly reduces the number of weld joints, which more evenly distributes stress loads. The result is a robust machine that delivers the durability you expect from Caterpillar.

Rear Frame Structure.: The box-sectioned hitch design helps resist torsion loads and ensure structural durability. The integrated bumper ties the rear frame together as a single, solid unit, so the frame can withstand heavy-duty applications such as ripping and winging snow.

Articulation Hitch: A large tapered roller bearing at the lower pivot carries loads evenly and smoothly. This joint is sealed to prevent contamination in this critical area. A mechanical locking pin prevents frame articulation to help ensure safety when servicing or transporting the machine.

Circle Construction: Our one-piece forged steel circle is built to stand up to high stress loads and provide structural durability. The front 240° of circle teeth are hardened to reduce wear and ensure component reliability.

Drawbar Construction: The A-frame drawbar features a tubular design for high strength and optimum durability.

Aggressive Blade Angle: With a long wheelbase the operator can obtain aggressive moldboard angles, so material rolls more freely along the length of the blade. This is particularly helpful when handling very dry materials or cohesive soils. Better material control gets the job done faster, requires less power and saves fuel.

Hydraulics

Advanced Electro-Hydraulic System.: The 120M incorporates a state-of-the-art electro-hydraulic system. This technology is the foundation for revolutionary changes of the machine and implement controls. Advanced joystick controls provide unmatched controllability with precise, predictable hydraulic movements and the reliability you expect from Caterpillar.

Blade Float: Blade float is built into the blade lift control valves and is optional for some auxiliary hydraulic functions. The blade float feature allows the blade to move freely under its own weight. By floating both cylinders, the blade can follow the contours of the road when removing snow. Floating only one cylinder permits the toe of the blade to follow a hard surface while the operator controls the slope with the other lift cylinder.

Independent Oil Supply: Large, separate hydraulic oil supply prevents crosscontamination and provides proper oil cooling, which reduces heat build-up and extends component life.

Load Sensing Hydraulics (PPPC: The time proven load-sensing system and the advanced Proportional Priority Pressure-Compensating (PPPC, or “triple-PC”) electro-hydraulic valves on the 120M are designed to provide superior implement control and enhanced machine performance in all applications. Continuous matching of hydraulic flow and pressure to power demands creates less heat and reduces power consumption.

Cat® XT™ Hose: Caterpillar hose technology allows high pressures for maximum power and reduced downtime. Intelligent routing minimizes exposure to damage. Hose clips prevent hose rubbing and excessive vibration for lower owning and operating costs.

Balanced Flow: Hydraulic flow is proportioned to ensure all implements operate simultaneously with little effect on the engine or implement speeds. If demand exceeds pump capacity, all cylinder velocities are reduced by the same ratio. The result is improved productivity in all applications.

Consistent and Predictable Movement: PPPC valves have different flow rates for the head (red) and rod ends (blue) of the cylinder. This ensures consistent extension and retraction speeds for each cylinder, and gives the operator a consistent and predictable response every time an implement control is moved.

Notes:

The Caterpillar 120M is a motor grader, used by the US military. The Caterpillar company does not manufacture any special military version of the 120M grader. However after some modifications, such as flat military paint, blackout lights, transport provisions, keyless ignition, and other, this road grading machine can be used for military roles. Though it is claimed that the militarized 120M grader has more reliable performance in extreme weather, mainly due to optional equipment. In 2011 it was announced that more than 1 000 of these motor graders will be delivered to the US Army, Navy and Marine Corps. Deliveries commenced in 2012. It replaced in service the old Caterpillar 130G grader, which has been in service for more than 30 years. The Caterpillar 120M grader has 3 axles. Graders delivered to the US military have an all-wheel drive system for improved mobility. Engine and cab are situated above the rear axles. There is a wide blade in between the 1st and 2nd axles. Actually the Caterpillar 120M grader has rather humble performance comparing with many other commercial graders. Still though it

significantly outperforms the old Caterpillar 130G military grader. There is a 30 years difference in technology between these two machines. The 120M is fitted with modern grade control technologies for precise grading. It is also fitted with diagnostics equipment and is easier to maintain. The Caterpillar 120M is used to create a flat surface during the grading process. Graders create fine "finish grade", while the "rough grading" is performed by bulldozers, scrappers, or other engineering vehicles. The Caterpillar 120M is used for construction and maintenance of dirt and gravel roads. This machine is also used to prepare the base course to create a wide flat surface for paved roads. It can also produce inclined surface to give cant to roads, or produce drainage ditches. Additional front blade and rear ripper can be attached. This militarized grader can be used for construction of airfields, landing zones, defensive berms, anti-tank ditches and for other military earthmoving tasks. The operator has good visibility. Overall working environment of the operator is significantly better than on the previous 130G model. The new grader has joystick controls, air conditioned cab. Furthermore vibration levels inside the cab are much lower. An armored cab can be installed for operation in various hotspots. It provides protection for the operator against small arms fire, artillery shell splinters and various blasts. This grader carries no defensive armament, as it typically operates in rear areas. This construction machine is powered by a Caterpillar C6.6 diesel engine, developing 138-, 153- and 173 hp depending on optional equipment and grading mode. Number in the designation actually denotes a 6.6-liter displacement of the engine. There are 8 forward and 6 reverse gears. This machine has a 6x6 configuration with an all-wheel drive. The older Caterpillar 130G had 6x4 configuration. Unusual feature of this new machine is that it can make a faster turn by adjusting the outside front tire speed up to twice faster than the inside tire. This significantly reduces turning radius. Another unusual feature of the Caterpillar 120M is that this machine can disengage transmission form the rear axles. This feature was originally designed for precise grading. However this feature also allows the machine to return to base on its front wheels with various transmission problems. A number of options are available for these militarized graders. These include a cold starting kit (which allows to start the machine at -40°C), deep fording kit and some other. Optional equipment installed on these graders differs depending on the US military branch. For example US Navy machines have some optional equipment, that is not present on US Army machines. The Caterpillar C120M grader can be airlifted by a C-130 Hercules tactical transport aircraft with minimum of preparation.

Caterpillar 130G American 6x6 Motor Grader

Tiers:

System

Alternative Designation: Caterpillar 130G

Type: Motor Grader

Manufacturer: Caterpillar

Crew: ea1

Note: The Caterpillar 130G was designed to create a flat surface during the grading process. Graders create fine "finish grade", while the "rough grading" is performed by bulldozers, scrappers, or other military engineer vehicles. The Caterpillar 130G was designed for construction and maintenance of dirt and gravel roads. This machine can prepare the base course to create a wide flat surface for paved roads. It can also produce inclined surface to give cant to roads, or produce drainage ditches. Additional front blade and rear ripper can be attached.

Kobelco CKE800 American 80 Ton Hydraulic Crawler Crane

Tiers:

System

Alternative Designation: CKE800
Type: Hydraulic Crawler Crane
Manufacturer: Kobelco
Crew: ea1
Main Boom, Maximum Lifting Capacity: 80 t/3.0 m
Main Boom, Maximum Length: 54.9 m
Fixed Jib Maximum Lifting Capacity: 6.6 t
Fixed Jib, Maximum Combination: 42.7 m + 18.3 m, 45.7m + 12.2m

Dimensions

Length, Base Machine + Boom Base + Crawler: 11,640 mm
Width, Base Machine + Boom Base + Crawler: 3,390 mm widtd
Height, Base Machine + Boom Base + Crawler: 3,300 mm height
Weight, Base Machine + Boom Base + Crawler: 40,770 kg
Length, Upper Boom: 1,510 mm
Width, Upper Boom: 4,545 mm
Length, Lower Boom: 5,350 mm
Width, Lower Boom: 1,510 mm
Basic Bloom Length: 9.1 m
Operating Weight: Approx. 73.8 t
Counter Weight: 25.8 t (upper) + 6.8 t (lower)
Transport Weight: 39.9 t (Main machine with crawler and lower boom)
Ground Pressure: 88 kPa (0.9 kgf/cm2)

Automotive

Engine Name: Mitsubishi 6D16-TLU2K
Engine Type: Diesel
Engine Power: 159 kW/2,000 min-1 (rpm)
Fuel Tank Capacity: 400 liters
Swing Speed: 4.0 min-1 (rpm)
Travel Speed: 1.2 km/h

Hydraulic System

Main Pumps: 3 variable displacement
Maximum Pressure: 32 MPa (325 kgf/cm2)
Hydraulic Tank Capacity: 450 liters
Self-Erection Device: Standard counterweight removal

Main and Auxiliary Winch

Maximum Line Speed: 120 m/min (1st layer)
Rated Line Pull: 78.5 kN (8 tf
Maximum Line Pull: 150 kN (15.3 tf)
Wire Rope: 22 mm
Length, Wire Rope: 215 m (Main) 125 m (Aux.)
Brake Type: Wet-type multiple disc brake

Protection

Hull Armor: INA
Applique Armor: No
Mine Clearing: No
NBC Protection: INA
Smoke Equipment: INA

Notes:

The CKE800 crawler crane from KOBELCO takes advantage of new technologies to raise performance to new heights. Winches with extremely powerful line-pull handle the toughest jobs, while the innovative “wettype” multi-disc braking system provides safe and sure control with minimal maintenance. A large winch capacity promotes ultra-smooth operation and enhanced component service life. An optional full-sized third winch enables the use of an impressive selection of attachments. Add these new features to the renowned power and reliability of KOBELCO cranes, and you have the ideal combination of lifting performance, economical operation and durability. For more information go the the following website: http://www.kobelco-cranes.com/en/wp-content/themes/kobelco/pdf/hydraulic/CKE800_SPEC.pdf

FAUN BKF 35-4 German 35 Ton Mobile Recovery Crane

Tiers:

System

Alternative Designation: FAUN BKF 35-4
Type: 35 ton Mobile Recovery Crane
Manufacturer: Faun
Crew: ea2
Lift Capacity: 35 Tons
Boom Capacity: 22.5 m
Towed Load: 42 Tons
Winch Capacity: 20 Tons

Dimensions

Length: 11.85 m
Width: 2.75 m

Trench: 1.8 ~ 2 m

Fording with deep Fording Kit: 0.75 m

Protection

Hull Armor: INA

Applique Armor: INA

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The FAUN BKF 35-4 is an unusual German military machine. It is referred in German as Bergekranfahrzeug or recovery crane. It is fitted with specialized equipment for craning, winching, towing and recovery operations. This concept of a highly mobile recovery crane is specific to the German army, as other countries do not use such vehicles and rely either on mobile cranes or recovery vehicles. The FAUN BKF 35-4 was produced in the early 2000s. Deliveries commenced between 2002-2004, depending on the source. Some sources report that only 2 of these recovery cranes were ordered. At the time these were the biggest recovery vehicles in German army service.

Liebherr FKL German All-Terrain Crane

Tiers:

Variants:

- **Liebherr FKM:** Liebherr FKM (Fahrzeugkran Mittel or Medium Mobile Crane), is a larger and more capable machine with 6x6 configuration. It has a lifting capacity of 20 t. Its rear cargo platform has a 16 t capacity. This mobile crane was also adopted by the German military. A total of 208 units were delivered. This crane has been exported to the Netherlands (27 units). Some of these cranes are fitted with armored cabs.

System

Alternative Designation: Liebherr FKL
Type: All-Terrain Crane
Crew: ea2
Bulldozer Blade: No
Crane: Yes
Ground Penetrating Radar: No
Bucket Loader: No
Back-hoe Excavator: No
Ditch Trencher: Noi
Recovery Winch: 85 m of cable.
Winch Capacity: 20 tons
Maximum Lifting Capacity: 10 tons
Towed Load: 6.5 tons
Note: At its maximum reach the crane can lift loads with a maximum weight of 2.4 t. This crane does not requires any counterweight.

Dimensions

Length: m9.22
Width: m2.5
Height: m3.2
Weight: 16.1 tons

NBC Protection: INA

Smoke Equipment: No

Notes:

The Liebherr Fahrzeugkran Leicht (FKL), or Light Mobile Crane was specially designed to meet requirements of the Bundeswehr (German military). Sometimes it is referred as the FKL 10 due to its lifting capacity of 10 t. Production order was awarded to Liebherr in 1990 after severe competition. A total of 251 units were delivered to the German military alongside 208 larger and more powerful Liebherr FKM cranes with lifting capacity of 20 t. Deliveries of the FKL began in 1991 and were completed in 1994. This crane is used by all branches of the German military, including army, navy and air force.

Liebherr G-BKF German 20 Ton Armored Recovery Crane

Tiers:

1 2 3 4

System

Alternative Designation: Liebherr G-BKF
Type: Armored Mobile Crane
Manufacturer: Liebherr
Crew: ea2
Lift Capacity: 22.8 t
Boom Length: 20.9 m
Winch Capacity: at least 20 t
Towed Load: 40 t

Dimensions

Length: 11.79 m

Applique Armor: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Liebherr G-BKF is a high mobility, protected recovery crane developed by Liebherr-Werk Ehingen GmbH for the Bundeswehr. The G-BKF is integrated onto a 8×8 MAN truck system supplied by Rheinmetall. Both armored/protected compartments for the driver and cab operator were supplied by Rheinmetall as well. The G-BKF can rescue and tow the new generation of armoured control and command vehicles, armoured transport vehicles, MULTI FSA (swap body vehicles) and wheeled vehicles. It is also capable of providing tactical infantry cover over long distances, providing repair and handling support as well as deployment for rescue, recovery and emergency aid tasks. A key focus of the crane is to protect its occupants. Liebherr worked with leading European military technology company Rheinmetall Defence to produce the armoured driver's and crane cabs. The special driver's cab was extended by 250mm to provide storage space for the extensive personal protective equipment for the crew and integrate the military communication equipment. The cab features a double-thickness steel bulkhead and special glass offering ballistic protection yet meets all road traffic requirements. The protection has been verified to STANAG 4569/ AEP 55. The crane cab is also armoured with composite panels bolted to a steel bearing structure to reduce weight. The four axle carrier is based on a standard All Terrain crane chassis, with all wheel steer and drive . Despite its weight and size it is said to have excellent off-road properties and manoeuvrability. In towing mode, vehicles weighing up to 16 tonnes can be mounted on the lift cradle at the rear. An extensive range of accessories allows it to tow almost all German Army wheeled vehicles. Two Rotzler Treibmatik winches are mounted on the rear of the vehicle, and the smaller winch can be moved to the front for self-rescue purposes. The chassis is also equipped with rescue jacks for recovering a damaged vehicle from difficult terrain. Synchronised winching allows a damaged vehicle to be raised slightly whilst being pulled by the other. The G-BKF is fitted with a 20.9 metre main boom which can handle loads of up to 20 tonnes. All the crane's control functions, the towing device, the two rescue winches and the jacks can be operated either from a protected position in the crane's cab using the standard controls or from the ground using a standard Liebherr remote controller. Liebherr uses all its vast experience for designing special cranes for military purposes. Liebherr military cranes are in demand with the army, air force and navy; they have proven themselves all over the world with repair, resupply and engineering units. Liebherr has manufactured more then 800 military cranes with lifting capacities from 10 to 500 tonnes since 1977. The product range extends from standard cranes with additional options to specially developed vehicles for military purposes. Mobile cranes from Liebherr are suitable for both on-road and off-road use. They feature great economy and are very flexible in use. To satisfy special technical requirements and special solutions, Liebherr uses time-tested components which have been used many times on standard cranes.

Terex-Demag MAC-50 American 50 Ton All-Terrain Mobile Crane

Liebherr G-LTM 1090-4.2 German 35 Ton All-Terrain Crane

Tiers:

1 2 3 4

System

Alternative Designation: Liebherr G-LTM 1090-4.2

Type: 35 Tons All-Terrain Crane

Manufacturer: Liebherr

Crew: ea2

Lifting Capacity: 36.6 tons

Boom: This crane has a powerful telescopic boom which extends to 35.7 m. It can lift loads with a maximum weight of 36.6 t. It can be used for medium and heavy crane work. All functions of crane can be controlled from the crane cab or using a remote control unit.

Recovery Winch: This mobile crane is fitted with a single recovery winch with 49 m of cable. The winch is mounted at the rear and can be used for recovery of stuck, swamped or damaged vehicles, as well as for self-recovery. If required the winch can be moved to the front.

Dimensions

Length: 13.29 m

Width: 2.58 m

Height: 4 m

Weight: 48 tons

Automotive

Engine Name: Liebherr, Model: INA

Trench: m2

Fording: m0.5

Protection

Hull Armor: This crane has an armored driver's cab as well as the crane cab. Liebherr teamed with Rheinmetall Defence in order to develop and produce these cabs. The forward control cab is made of steel armor. The crane cab has a steel frame and ceramic armor in order for reduced overall weight. These cabs provide protection against small arms fire, artillery shell splinters and blasts. There is also an NBC protection system. The forward control cab has a roof hatch and can mount a machine gun for self-defense.

Applique Armor: INA

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

LTM 1090-4.2 Mobile crane The mobile crane LTM 1090-4.2 combines mobility, performance and economy at the highest level. It is worldwide economically mobile, because it can be driven with 10 tons, 12 tons and 16 tons axle load. With its ECOdrive and ECOmode the LTM 1090-4.2 is operated extremely environmental friendly, low on consumption and with low noise. The Liebherr innovations VarioBallast and VarioBase® cater for more performance, flexibility and safety.

→→Forklifts

Atlas II American All-Terrain Forklift

Tiers:

System

Alternative Designation: Atlas II

Type: All-Terrian Forklift

Mission: This material handling machine is used to loading and unloading vehicles and containers. It can transport palletized loads or boxes. It can also stack them on on top of another and unstack. It can handle supplies such as ammunition and missiles. It can also handle MLRS and HIMARS pods with rockets. It can be also used in constructions and rebuild operations.

Crew: ea1

Automatic Fork Leveling System: Yes

Telescopic Boom: 3-stage telescopic boom, that can reach into trucks and shipping containers.

Maximum Lift Capacity: Maximum lift capacity is 2.7 t, or 4.5 t, depending on the carriage.

Airlift Capacity: This military machine can be airlifted by the C-130 Hercules tactical cargo aircraft. It is prepared for flight within 15 minutes.

Dimensions

Length: 9 m

Width: 2.4 m

Height: 2.6 m

Weight, Combat: INA

Automotive

Engine Name: John Deere PE4045 HF 485
Engine Type: Diesel
Engine Power: hp173
Maximum Speed: 37 km/h
Range: 400 km
Gradient: %45
Side Slope: INA
Vertical Step: 0.5 m
Trench: 0.5 m
Fording: 0.9 m

Protection

Hull Armor: This machine has an enclosed cab. It provides protection for the operator against rollover and falling objects.
Applique Armor: Yes, Add-on armor kit is available for the cab for operation in hotspot areas, such as Afghanistan and Iraq.
Mine Clearing: No
Self-Entrenching Blade: No
NBC Protection: INA
Smoke Equipment: No

Notes:

The new ATLAS II is a rough terrain forklift with a load capacity of 10,000 lb with a 48" load center with the primary mission to lift and load/unload pallets from ISO 20' containers. The target price for the production contract is not to exceed $135,000 per vehicle (in FY03 dollars). The intent is to improve the vehicles capabilities as much as possible while maintaining the current program's vehicle cost. The All-Terrain Lifter, Army System (ATLAS II) is to receive and issue supplies, move stock to and from storage; load and unload ammunition, supplies, and equipment on unit vehicles for deployment; stuffing and unstuffing pallets from containers; transloading landing craft cargo between vehicles and aircraft; moving items into stock; and off-loading breakbulk cargo from vehicles and aircraft. The forklift truck (hereinafter called "truck" or "forklift") shall be a four-wheel drive, diesel-engine-driven, variable reach boom type truck (see ASME B56.6). The truck shall not be equipped with stabilizers or outriggers. The truck shall be rated at 6,000 pounds at 24-inch load center with the 6,000-pound capacity carriage mounted and shall be rated at 10,000 pounds at 48-inch load center with the 10,000-pound capacity carriage mounted. The production contract will be a five-year, firm fixed price requirements type contract. The current program estimate includes $135M for approximately 1,000 vehicles. The production contract will require the contractor to deliver up to six vehicles in production configuration about seven months after the production contract award for the Production Verification Testing. The Government reserves the right to purchase the successful offeror's Demonstration Test vehicle to perform additional testing after the award of the production contract and prior to delivery of the production configuration vehicles. This program is based on the belief that industry has existing commercial vehicles, or vehicles capable of being modified, that can meet the requirements of this program. The Demonstration Test (in conjunction with the written proposal and evaluation) is a means of mitigating the risk to the Government in order to select the ATLAS II that has the highest probability of meeting all requirements as well as distinguishing differences between offerors providing vehicles that range in performance due to achieving required and desired objectives outlined in the ORD. The Demonstration Test vehicle, commercial component manuals, and the Demonstration Test vehicle support will be at no cost to the Government. The production contract will also include contract provisions providing for the transfer of the data package and rights to the government in the event that the original manufacturer goes out of business or drops the parts or vehicles from production.

→→Container Handlers

Kalmar RT240 Finish Rough Terrain Container Handler

Tiers:

System

Alternative Designation: Kalmar RT240

Type: Rough Terrain Container Handler

Mission: The container handlers are used to handle standard shipping containers, that are the backbone of military logistics. The Kalmar RTCH lifts, moves, stacks and unstacks standard 20 ft and 40 ft ISO containers.

Crew: ea1

Maximum Lift Capability: This machine can move containers with a maximum weight of 24 t. It can stack containers three high and is capable of picking up a container in the second row. Container handler of the RT240 is capable of side shifting, rotation, tilting forward/rear or left/right

Note: The RT240 is capable of operating in up to 1.5 m of sea water.

Dimensions

Length: 14.55 m

Width: 3.66 m

Height: 3 m

Weight, Combat: 53.75 t

Engine Name: Cummins QSM 11

Engine Type: Diesel

Engine Power: hp400

Maximum Speed: 37 km/h

Range: INA

Gradient: %27

Side Slope: INA

Vertical Step: INA

Trench: INA

Fording: 1.5 m

Note: This machine uses two wheel steering for traveling on highway and four wheel steering for loading duties and operation in confined sites.

Protection

Hull Armor: INA

Applique Armor: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The Kalmar RT240 Rough Terrain Container Handler (RTCH) is a militarized model of commercial design. It was adopted by the US military. It is a successor to the Caterpillar RTCH, which entered service with the US military back in 1981. This machine operates on rough terrain, beaches and other unimproved surfaces. The US Army awarded production contract for new rough terrain container handler in 2000. This machine was first fielded in 2001. By 2004 the US Army operated 346 Kalmar RT240 container handlers. At that time the US Marine Corps ordered 25 RTCH systems with a possible order for another 80 systems. It is also in service with Australia and United Kingdom. The container handlers are used to handle standard shipping containers, that are the backbone of military logistics. The Kalmar RTCH lifts, moves, stacks and unstacks standard 20 ft and 40 ft ISO containers. This machine can move containers with a maximum weight of 24 t. It can stack containers three high and is capable of picking up a container in the second row. Container handler of the RT240 is capable of side shifting, rotation, tilting forward/rear or left/right. This machine can move containers on sites where there is minimal or often destroyed infrastructure. It can operate on various terrain, including sand, mud and even water. This military machine is powered by Cummins QSM 11 turbocharged multi-fuel diesel engine, developing 400 hp. Vehicle has all-wheel drive. This machine uses two wheel steering for traveling on highway and four wheel steering for loading duties and operation in confined sites. Also it has a crab steer for parallel drive when operating close to walls or other obstacles. The RT240 is capable of operating in up to 1.5 m of sea water. This container handler can be airlifted after short preparation by the C-17 or C-5 military cargo aircraft. During preparation transport height of this machine is reduced. However no disassembly is required. The Kalmar RTCH can operate in temperatures from -40°C to +50°C.

→→Smooth Drum Rollers and Vibratory Compactors

Caterpillar CB10 American Split Drum Vibratory Smooth Drum Roller

Tiers:

System

Alternative Designation: Caterpillar CB10
Type: Split Drum Vibratory Smooth Drum Roller
Manufacturer: Caterpillar
Crew: ea1

Dimensions

Length, Overall: 4495.8mm
Width, Overall: 1854.2mm
Wheel Base: 0.28m
Height - With Rops/Fops: 2971.8mm
Drum Diameter: 47in
Standard Compaction Width: 1701.8mm
Static Linear Load: 79.84kg
Travel Speed - Maximum: 12.08km/h
Maximum Compaction Width: 1854.2mm
Maximum Operating Weight With Cab: 12070.1kg
Standard Operating Weight With Rops: 10410kg
Maximum Operating Weight With Rops: 11791.2kg
Standard Operating Weight With Cab: 10670.8kg

Automotive

Time Required to Load Minelayer with One Basic Mine Load : min60-90

Time Required to Load Minelayer with Crew only : mINA

Type: AP, PFM-1S; AP, POM-2; AT, PTM-3

Payload Weight : kg15000.0

Protection

NBC Protection: INA

Smoke Screening System: No

Notes:

The UMZ has been disclosed as the likely replacement for the GMZ-series. The UMZ consists of three launchers mounted on each side of the vehicle for a total of six mine launchers per vehicle. each full turn launcher is hexagonally shaped and contains 30 launch tubes totaling 180. It can fire the mines to one or both sides, or to the rear. Both AP and AT mines are launched from the 140-mm launch tubes. The UMZ uses the same mine canisters as the PKM system. Depending on the position of the launch tubes, one-, two-, or three-lane mine fields can be laid. Minefield (m): length: 1,000 to 1,200. Depth (m): 30 to 120. Max length of minefield with one basic load (m): AP, PFM-1s: 3,200. AP, POM-2: 5,000. AT, PTM-3: 600. Mine capacity: from 180 to 11,520 depending on the type of mine number of mines in one basic load: AP PFM-1s: 11,520. AP POM-2: 720. AT PTM-3: 180. Variants: although primarily mounted on the ZIL-131B, the UMZ minelaying system has been observed mounted on several different carriers such as a modified MT-Blue chassis or on a PT-S tracked amphibious personnel carrier and most recently on the KamAZ-63501 in the UMZ-K Variant.

GMZ-3 Russian Tracked Minelaying Vehicle

Tiers:

1 2 3 4

System

Alternative Designation: GMZ-3; Gusenichniy Minniy Zagraditel

Type: Minelaying Vehicle

Family: GMZ-3

Manufacturer: Ural Transport Engineering Plant, Yekaterinburg, Russia

In Service: 1968-Present

Chassis: based on the chassis of the SA-4 Ganef

Crew: ea3 (commander, driver/mechanic, laying operator)

Passenger Capacity: INA

Note #1: here are three GMZ-3s in the engineering battalion of a typical tank division or motorized rifle division. It can be fully loaded by a squad of seven engineers in 15 to 20 minutes.

Note #2: The driver is also the mechanic.

Notes:

The tracked mine-laying vehicle is designed to lay antitank mines in the progress of action in the soil (snow) with their concealment and on the surface of the soil (snow) without concealment. Mines are laid by being automatically delivered from the cluster to the dispersing mechanism and then through ports in the rear plate of the vehicle hull to the conveyer, which is

provided with a mechanism that arms the moving mines. When mines are laid on the ground (snow) surface, they are dispersed directly from the conveyer. When mines are laid with concealment, they are dispersed through the plow assembly and laid in a furrow made by the plow; after a delay they are finally armed. Mines laid in loose soils (snow) are concealed by back dumps

Smoke Screening System: No

Notes:

Originally designated the PMR-3 “Pricepnoi Minnyi Raskladchik” meaning “towed mine layer (surface)”, this apparatus was the first Soviet minelayer capable of burying mines as well as laying them on top of the ground. It consists of a single chute and a plow attachment. The attachment provides the option of burying the mines or depositing them on the surface of the ground. The PMR-3 equipment designation was later changed to PMZ-4 “Pricepnoi Minnyi Zagraditel” meaning “towed mine layer (buried)” as this designation was more accurate in describing the task carried out by this piece of equipment. The type of mines laid by this apparatus were the Soviet TM-44, TM-46, TM-57 or TM-62 series anti-tank mines. The mines could be spaced 4 to 5,5m apart depending on the control setting. If buried, the mines are placed at a depth between 6-12 cm while the vehicle traveled along at a speed of 5km/h. The trailer on its own weighed 1.8 metric tons. The towing vehicle could carry 120 to 300 mines depending on the capacity and type of vehicle. The SADF captured one of these trailers in Southern Angola during Ops Protea in 1981. The captured PMZ-4 minelayer trailer is seen pictured here while on display to the public at Oshakati. Prime equipment mover: 6x6 ZIL-131 truck (200 mines) or 4x4 Ural-375D (350 mines) or BTR-152 (120 mines). Max burial depth (cm): 20. PMR-3, (and the similar PMZ-4) consists of a single chute and a plow attachment. Differences: PMZ-4 (pic left) has a cable layer used for laying controlled minefields and does not have a conveyer-belt chain drive on the wheels. PMZ-4 hand loaded

only. Towed-minelayers are used in sections of three or four and operate 20 to 40 meters apart with each minelayer laying a straight-line row. Mines in different rows are staggered with the distance between mines depending on whether the mines are pressure-initiated or full-width attack (influenced or tilt-rod fuzed).

UMZ-K Russian 8x8 Multipurpose Minelaying Vehicle

Tiers:

1 2 3 4

Variants:

- **KamAZ-4350:**
- **KamAZ-5350:**

System

Alternative Designation: UMZ-K
Type: Multipurpose Minelaying Vehicle
Manufacturer: INA
Family: UMZ Series
In Service: 2015-Present
Crew: 1 + 2 men
Payload Capacity: 15,000 kg.
Towing Capacity: kg12,000
Launcher: The platform of the truck sits six multiple payload rotary launchers with fixed elevation mechanisms.
Tilt Angle: The tilt angle is 50 degrees, while its horizontal coverage is 90 degrees.
Basic Mine Load: 180 clusters
Types of Mines: antipersonnel (PFM, POM), anti-paratrooper (PDM) or antitank mines (PTM).
Maximum Length of Minefield: antipersonnel mines (PFM) – 3,200 meters; antipersonnel mines (POM) – 5,000 meters; antitank mines (PTM) – 600 meters.
Minefield Dimensions: The minefields it creates are 15 meters deep and 240 meters wide. Its mine-laying speed is up to 40 km per hour.

Dimensions

Length: m9.3
Width: m2.5
Height: m3.25
Weight, Combat: tons11.4

Automotive

Engine Name: KamAZ-740.50.360

BTM-3 Russian Trenching Machine

Tiers:

System

Alternative Designation: BTM-3

Type: Trenching machine

Family: BTM

Crew: ea2

Troop Compartment Capacity: INA

Chassis: Russian T-54 medium tank, however their ends were swapped in order to make an engine compartment at the front. So the AT-T and BTM-3 are essentially driving backwards comparing with the T-54 tank.

Bulldozer Blade: Available

Crane: No

Ground Penetrating Radar: No

Mine Clearing: No

Minelaying Plow: Types, work rate?

Proofing Roller: No

Bucket Loader: No

Back-hoe Excavator: No

Scatterable Mine Dispenser: No

Ditch Trencher: Yes

Note: The BTM-3 could dig straight, zigzag, or curved trenches. The rotor unloads the soil next to the trench, creating front and rear parapet of the trench which is around 0.5 m tall and provides additional protection.

Dimensions

Length: m7

Width: m3.17

Height: m4.32

Weight, Combat: tons27.5 - 27.7 t

Automotive

Engine Name: A-401

Engine Type: Diesel

Engine Power: hp305

Maximum Range: km450-500

Speed, Maximum Road: km/h36

Speed, Average Cross: INA

Speed Maximum Swim: km/hNot Amphibious

Fording Depth: m1.1

Trench: up to 1.8 m

Communications

Tactical Radio: R-113 standard tank radio.

Trenching System

↳***System***

Type: "High-Speed Trenching Machine"

Dig Depth: up to 1.5 m

Earth working capacity (trench depth 0.4 - 0.5 m): 1 200 - 1 400 m/h

Earth working capacity (trench depth 1.1 m): 270 - 810 m/h

Earth working capacity (trench depth 1.5 m): 270 - 560 m/h

Emplacement: min5-7

Displacement: INA

Basic Trench: 1.1 m deep and 0.9 m wide

Full-Size Trench: 0.5 m deep and 1.1 m wide

Note #1: This machine was used by motorized and mechanized infantry units. Each Soviet motorized or mechanized division (10 000~13 000 soldiers) had 3 of these trenching machines.

Note #2: This trench-digging machine has a large rotor with buckets at the rear. There are a total of 8 buckets, with 160 l capacity each. The rotor is lowered behind the vehicle and digs trenches.

Protection

Hull Armor: Protection from small arms fire and projectile Splinters

Applique Armor: Available

Mine Clearing: Yes

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The fast trench-digging vehicle BTM-3 is designed to dig defensive and communication trenches in soils of up to IV type. The BTM consists of the basis vehicle and digging equipment. A heavy artillery prime-mover was used as the vehicle basis. When the vehicle is moving in transport mode, the gear box provides five gears for forward movement and one for backward. As soon as the vehicle starts digging trenches speed is decreased. The BTM can dig trenches in curves with a minimum radius of 25 m. The vehicle can switch from transport mode to operating (digging) mode in 10 minutes. When digging at 3rd gear, the BTM can approximately dig an 800 meter long man-sized trench in one hour.

Notes:

Caterpillar is an American international company that specializes in industrial and farming equipment, including tractors, bulldozers and wheel loaders. The company started in 1925, and it is headquartered in Peoria, Illinois. One of its products is the Caterpillar D5 Crawler Tractor, which is a type of bulldozer. A bulldozer comes with a wide metal plate that you can use to push material around. Buy Caterpillar equipment from authorized dealers, or rent one for a period time.

→→Front-End and Backhoe Loaders

HMEE British 4x4 Backhoe Loader

Tiers:

System

Alternative Designation: HMEE

Type: Backhoe Loader

Manufacturer: JCB

Mission: The HMEE is used for a wide range of mobility, counter-mobility, survivability and general engineering missions. It can perform excavation tasks and then quickly self-deploy to the next mission site.

Crew: ea2

Attachments: The HMEE has a wide array of attachments. These include a range of shovels, wide range of excavator buckets, excavator mounted hydraulic hammer, fork frame, sand bagger, snow plough and other attachments. It is capable of lifting more than 2 t and can dig to a depth of nearly 4 m.

Note: The JCB HMEE is a unique high-mobility excavation system. It can self-deploy and support fast moving forces on long range operations without the need of a trailer.

Dimensions

Length: 8.54 m

Width: 2.49 m

Height: 3.48 m

Applique Armor: Armor protection can be added to the cab for protection against small arms fire, artillery shell splinters and IED blasts.

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The HMEV (High Mobility Engineering Vehicle) is a wheeled engineering vehicle capable of traveling at high speed on/off road. The HMEV was selected by the Australian Army and 27 HMEVs were delivered. In December 2001 the US Army selected the HMEV vehicle for its IHMEE (Interim High Mobility Engineering Excavator) program ordering up to 62 HMEV vehicles. Canada, the United Arab Emirates and some NATO countries are evaluating the HMEV vehicle. The HMEV features self-deployment, cross-country, capability, highway speed of 100 km/h, diesel engine rated at 185-hp, earth moving functions, trailer towing of up to 8,000 kg, air-conditioning, lightweight armor, air transportable capability (C-130 and CH-47) and stores for an optional operator. The vehicle was selected by the US Army under the designation Interim High Mobility Engineering Excavators or IHMEE. Up to 40 IHMEEs will be procured by the US Army with final deliveries scheduled in 2004. ADI hopes that this purchase boosts international orders.

NBC Protection: No

Smoke Equipment: No

Notes:

The Bobcat® S650 skid-steer loader is a vertical lift path model in the 600 frame size. It offers increased lifting capacity and provides greater forward reach at full lift height for loading trucks. The Tier 4 diesel engine delivers power and performance. The new Bobcat® S650 skid steer loader is part of the M-Series. With its vertical lift path, the S650 gives you increase lifting capacity and provides greater forward reach at full lift height for loading over dump trucks. Like all M-Series models, the S650 has an industry-leading cab design that offers improved visibility and operator-friendly features such as cab forward design with the optional pressurized cab, air ride seats and seat-mounted joysticks. The S650 has powerful hydraulics, top digging and pushing power, and increased fuel capacity. Stay productive with simple maintenance checks and simple design. To help you become even more productive, Bobcat offers more attachments for more carriers than anyone in the industry. Bobcat is the only major compact equipment company that manufactures a majority of its attachments. 12-Volt Power Accessory: Your cab is your office. That’s why Bobcat installed a 12-volt power accessory for charging your mobile phone, MP3 player or other accessories. Air-Ride Seats: Achieve optimum suspension comfort with the optional air-ride seat. Air suspension adjusts to your weight, helping you smooth out the bumps on your jobsite and increasing your comfort. Better Visibility: Visibility has been significantly increased in all directions. The rear window is 14% larger and the size of the top window is now 43% larger, providing a big advantage when loading a truck or using attachments with raised lift arms. Cab-Forward Design: The new design moves the operator area closer to the attachment and gives you a better vantage point for your work area. Convenient Engine Speed Controls: The engine speed control has been moved out in front of the operator, on the right-hand corner post of the cab. Convenient Storage: New storage bins are located throughout the machine. Store items wherever it’s convenient! Cup Holders: The cup holders hold 20oz. soda bottles all the way up to super-sized cups and coffee mugs. Deluxe Instrumentation Panel: This intelligent Bobcat option helps you prevent theft with keyless start and enables better operation by closely monitoring and interacting with your machine. A new 4.5-inch LED screen with full-color capability offers increased readability and interaction. Easy-to-read virtual sweep gauges allow you to quickly read and understand operation levels. Easy-Pull, Easy-Secure Side Window: Simply pull the new window knob to slide the side window to five lockable positions. The window stays exactly where you want it to get consistent air flow. Extra Elbow Room, Easier Cleaning: Windows are mounted on the outside of the Roll-Over Protection System (ROPS) – which provides extra elbow room in the cab, and makes window cleaning much faster. Fingertip Controls: Attachments are more comfortable to operate, controlled easily and adjusted simply from the fingertip controls. Flexible Joystick Positioning / Seat-Mounted Joystick Control: Joystick mounts on our SJC- equipped (Selectable Joystick Controls) machines slide forward and backward independent of the seat, adjusting to the individual comfort positions of different-sized operators. The seat-mounted joystick control provides flexible control through seat-mounted joysticks on models with optional SJC; as the suspension seat shifts up and down, the joysticks move with the seat. Foot Well Cleaning Access: Two cleanout holes in the foot well allow for easier removal of mud and debris that enter the cab. Heat and Air Conditioning: Because our optional AC units are integrated into the machine, there is no bulky add-on unit to obstruct your visibility. Automotive-style vents allow you to point the air where you need it for greater comfort in all weather conditions. Large Entry/Exit: On machines with enclosed cabs, Bobcat provides a large swing open door to make it easier to enter and exit the cab. A lowered door threshold gives you increased visibility to your attachment and the surrounding work area – making it easier to see and do your work. More Room: Our stronger, narrower loader arms make a wider cab possible, with up to 20% more interior space than competitors, keeping you comfortable. Operator Switches:Puts important controls in front of you on the cab corner posts. Pressurized Cab: Bobcat loaders with enclosed cabs have a best-in-class, pressurized interior space that

helps keep dust to a minimum. A new, one-piece pressure seat engages the entire door on the front and sides, compressing the door seal into a specialized curved door pocket keeping dust and debris out of the cab. Radio Capable: Order your loader with a stereo to increase your comfort. The radio features an auxiliary audio input jack that is ready for an MP3 player or other audio device. Rear Defrost:Defrosts the new, larger rear window with new rear air ducts. Suspension Seat: Other comfort items include an optional fully adjustable suspension seat, adjusting easily to the operator’s weight. Features S650: Joystick Control Air Conditioning Adjustable Seat Backup Alarm BICS System (Interlock) Cab Enclosure Sound Option Cab Heater Operating Lights Parking Brake Radio Rear Window Top Window Lift-Arm Support Seat Belt Suspension Seat Two Speed Travel Deluxe Instrumentation Engine Shutdown Hydraulic Bucket Positioning High Flow Option Auxiliary Hydraulics Spark Arrestor Muffler Bob-Tach Attachment System Power Bob-Tach ACS (Switchable Controls) Ride Control Rear Hydraulics

WA600-8 Japanese Large Size Front-End Loader

Notes:

Machine Performance Redesigned Komatsu bucket with liner and bolt- on ground engagement tooling (GET) fills more easily and retains material better for up to 7% increased productivity. Powerful Komatsu SAA6D170E-7 Tier4 Final engine with advanced engine timing optimizes performance and reduces emissions. Variable traction control and modulated clutch systems provide optimal tractive effort for all ground conditions. Large Capacity Lock-up Torque Converter provides quick acceleration and automatically engages in 2nd, 3rd, and 4th gear, requiring no action from the operator. Ultimate Efficiency Automatic Digging System performs bucket curl and boom lift during digging to reduce operator fatigue and help optimize bucket fill factors. Komatsu SmartLoader Logic helps reduce fuel consumption without decreasing production. Fuel Consumption Decreased up to 13% in E mode. Dual work modes allow the operator to select between Power and Economy modes to optimize the machine efficiency and performance to match the application. Komatsu Quality All major hydraulic and power train components (engine, transmission, pumps, cylinders, etc) are designed and manufactured by Komatsu which helps increase efficiency and performance by working together in harmony. Castings are used in high stress areas such as the bell-crank to increase durability and visibility. Standard RH full fender with steps and handrail provides improved access to engine compartment for daily checks. Operator Environment The pillar-less operator's cabin provides the operator with a large, quiet and pressurized work environment while providing excellent visibility during operation. New high capacity air suspension operator's seat with heat and dampener is now standard. New 7'' LCD high resolution monitor with key pad allows the operator fast, accurate viewing of operational information. New rear view monitor system with separate monitor is standard. Standard Advanced Joystick Steering System (AJSS) helps optimize steering control while reducing operator fatigue. Maintenance KOMTRAX Komatsu CARE complimentary factory scheduled engine maintenance for 3 years or 2,000 hrs, and up to 2 complimentary KDPF exchange assemblies within the first 5 years. Battery disconnect switch is located at ground level and can be locked with a standard padlock. Reversible cooling fan swings out for ease of cleaning. Convenient Diesel Exhaust Fluid (DEF) fill access with sight gauge. Standard onboard diagnostics with KOMTRAX, monitor machine utilization, maintenance reminders, fuel consumption, working modes, KDPF regeneration, DEF level, payload data, and receive e-mail notifications of important events.

Blade Height: 355mm

Notes:

The Komatsu PC 35 MR 3 is a 3.29t machine with Komatsu engine which powers this model with up to 21.6kW or 28 horse power. The PC 35 MR 3 is categorised in the medium sized machine segment in the mini excavators category. The PC 35 MR 3's size is 2.52m x 4.8m x 1.7m. The bucket of PC 35 MR 3 has a capacity of 0.12m³ which is average for this type of machine. The PC 35 MR 3 is manufactured and distributed with Blade and Rubber track. It does not include Track adaption, Quick hitch hydr. And Quick hitch mech.. There are more detailed specifications and machine descriptions available in the original Komatsu PC 35 MR 3 specs data sheet. Available in Romanian, Portuguese, German, Russian, Dutch, Czech, English, Italian, Finnish, Spanish and French, LECTURA Specs offers a free download of highly detailed specifications and machine descriptions of this model. The production is still going in 2017, where this PC 35 MR 3 is available at a new list price between €56000 and €72000. For more detailed information about pricing and current residual values, check out the LECTURA Valuation system. At present, 15 other mini excavators, which range from 0.9t up to 5.3t are produced by Komatsu. Of these, PC 26 MR 3, PC 30 MR 3 and also PC 16 R 3 HS are the most frequently visited on LECTURA Specs. Ranked in the LECTURA index at #5, this PC 35 MR 3 mini excavator has models that date from 2008 to 2017. Currently, 15 models of the PC 35 MR 3 mini excavator exist, at an average sale value of €16500 at 8 years of age.

PC130-8 Japanese Medium Size Hydraulic Excavator

Tiers:

1 2 3 4

Notes:

PC360LC -11 Power and Performance Powered by a Komatsu SAA6D114E-6 Tier 4 Final certified engine, featuring an integrated diesel particulate filter, hydraulically actuated Komatsu Variable Geometry Turbocharger, and Selective Catalytic Reduction system. Large counterweight and robust undercarriage provide solid over the side stability while lifting. Reduced cooled exhaust gas recirculation rate and advanced engine timing improve combustion efficiency and engine response. High performance final drive assemblies provide high drawbar pull for improved steering performance and maneuverability. Advanced Hydraulic System New hydraulic pump control logic provides up to 4% increased performance compared to the PC360LC-10. High displacement hydraulic pumps provide high flow rates at reduced engine RPM for improved fuel efficiency. A Closed Center Load Sensing hydraulic system ensures smooth operation, quick cycle times, and great multi-function while lowering fuel consumption. Efficiency is further improved with a quick arm return valve and by reducing hydraulic loss within the control valve and hydraulic circuit. Enhanced Cab and Monitor Panel The large quiet reinforced cab has an integrated ROPS design. A high capacity operator seat comes standard with an air suspension and is heated for improved comfort. The LCD color monitor panel has an updated screen that combines a rear view camera display together with key gauges and information. Attachment control stores up to 10 work tools and the machine can run attachments while operating in Economy mode to save fuel. A rear view monitoring system with one camera is standard and allows the operator to view directly behind the machine. Simple and Convenient Maintenance Serviceability is enhanced for simplicity and convenience to make sure it gets done. Left and right guardrails on the upper structure to provide a convenient work area in front of the engine. A battery disconnect switch cuts power to the machine during service or electrical work. Service points are grouped for convenience and filters are accessible from ground level. Maintenance intervals are monitored and stored in the large monitor panel. Reliable Machine Design All major components are designed and manufactured by Komatsu which allows the engine and hydraulic systems to be optimized to maximize efficiency. A high efficiency dual element fuel filter and pre-filter with water separator provides engine protection from fuel contaminants. Triple labyrinth final drive seal shields provide improved durability and floating seal protection. The work equipment features large and durable one piece steel castings in the boom foot, boom tip, and arm tip.

Armor, Hull Rear: mm46

Armor, Hull Top: 33

Armor, Glacis: mm97

Mine Clearing: Limited with blade

Self-Entrenching Blade: Yes

NBC Protection: Yes

Smoke Equipment: Yes, engine exhaust (Not on Thai version)

Notes:

The Type 85 is a tracked armored fighting vehicle produced by Chinese company Norinco. Designed after the chassis of a Type 69 II to recover Type 69s and other similar or lighter vehicles. Thanks to its hydraulic crane, the Type 85 can also be used to assist with maintenance or repair while conducting tasks such as removing engines and / or transmissions. The main winch can be used for multiple tasks but, is primarily used for recovery of vehicles or self recovery. The winch has a 70 metric ton capacity. Using its front mounted hydraulic dozer blade, the Type 85 can also be used in a mobility role as it can remove obstacles and a defensive role as it assists in building fighting positions. The improved version of the Type 85, also known at the W653A or Type W653-I, has a crane with a telescoping jib and a max capacity of 20 metric tons. The Type 85 has also be produced under license by Pakistan.

Type 84 Chinese Armored Recovery Vehicle

Tiers:

Variants:

- **W653A or Type W653-I:** Features a crane with a telescopic jib with a maximum lifting capacity of 20 metric tons.

Notes:

The Type 84 is an armored recovery vehicle based on the Type 69 tank and used by the PLA Army. The Type 84 was designed to change power packs, clear obstacles and prepare firing positions. The Type 84 features a powered structure controlling a dozer blade at the front of the hull and a hydraulically powered crane. The crane is capable of lifting up to 70 tons. Originally designated as Type 653, later versions by Norinco were re-classified as Type 84.

GCZ-112 Chinese Tracked Multi-Purpose Engineer Vehicle (TMPEV)

Power Source: Hydraulic

Shape: Adjustable to straight or V-shaped

Maximum Cutting Depth: m.40

Notes:

The main roles of the GCZ-112 tracked multi-purpose engineer vehicle (TMPEV) are to provide combat engineer support while accompanying armored / mechanized troops, which includes road repair, emergency military road construction, non-explosive obstacle clearing, and towing and recovery operations. The GCZ112 can also be used to construct technical weapons emplacements and flat-bottomed pits. The vehicle is mainly composed of a modified Type 79 tank chassis, and combined dozer blade, crane and winch.

BREM-D Russian Armored Maintenance-Recovery Vehicle

Tiers:

Variants:

- **BTR-DG (Ob'yekt 925G):** Cargo variant without bow machine guns, firing ports and periscopes. The troop compartment was modified to serve as a cargo compartment.
- **BTR-DG:** converted into an airborne SPAAG fitted with a specially built three-legged ZU-23-2 twin anti-aircraft autocannon mount over the roof of the cargo compartment.
- **BTR-D San:** BTR-D converted into an airborne armoured ambulance.
- **BREM-D:** (BREM-D stands for bronirovannaya remonto-evakuatsionnaya mashina desanta – armoured maintenance-recovery vehicle of the airborne) (Ob'yekt 932) – BTR-D converted into an airborne ARV. It carries specialized equipment for the repair and recovery of BMD-1 type vehicles. This equipment includes a light collapsible crane stored on the roof of the personnel compartment, which can be traversed through 180°, a recovery winch, a combination spade and dozer blade, a generator, towing equipment, electric welding system, tools and ready use spares. One of the 7.62 mm bow PKT tank machine guns was eliminated. This entered service in 1989 in very small numbers
- **BTR-RD "Robot":** BTR-D converted into an airborne ATGM team carrier with two 9P135M-1 ATGM launchers capable of firing 9M113 "Konkurs" (AT-5 Spandrel), 9M113M "Konkurs-M" (AT-5B Spandrel B), 9M111 "Fagot" (AT-4 Spigot) and 9M111-2 "Fagot" (AT-4B Spigot B) ATGMs. They can be used by the dismounted ATGM squad or fitted on a pintle mount on the right side of the hull. This is basically a BTR-D with a pintle mount added and with missile racks inside the troop compartment
- **BTR-ZD "Skrezhet":** (ZD stands for zenitnaya ustanovka) – BTR-D converted into an airborne air defense vehicle for carrying two MANPAD teams. The vehicle is fitted with racks for spare MANPAD missiles. It also is fitted with external stowage rails for a MANPAD on the right hand side of the roof of the troop compartment. It can also carry a complete ZU-23-2 twin anti-aircraft autocannon mount on the roof of the troop compartment.
- **NPDU "Sterkh":** (NPDU stands for nazemnyj punkt distantsionnogo upravleniya) – BTR-D converted into an airborne unmanned aerial vehicle carrier and launch vehicle of the "Stroy-P" set. It is used to launch Yak-061 "Pchela-1T" UAV for reconnaissance or jamming at ranges up to 60 km. The single-rail launcher is mounted on left hand side of the roof of the hull. It has large three-piece tube on forward right hand side of the roof of the hull. It entered service in 1990
- **BMD-1KSh "Soroka" (Ob'yekt 926):** (KSh stands for komandno-shtabnaya – command and staff) – airborne command post equipped with the R-123M, R-111 and R-130M or R-134 radio sets, as well as an AB1 portable 1 kW generator, the TNA-3 navigation system, folding CLOTHES HORSE type antennae around the superstructure and two slim antenna masts. Bow mounted machine guns and firing ports were removed. The commander's hatch is offset to the left and does not project forward. It's sometimes called BMD-KSh or KShM-D
- **BMD-1R "Sinitsa":** (R stands for radiostantsiya – signals vehicle) – Division-level command and signals vehicle equipped with R-161A2M radio set, one heavy telescopic antenna mast stowed along the left hand side of the roof of the hull and one slim elevatable antenna mast on the rear right hand side of the roof of the personnel compartment. Only a small number was delivered.
- **R-440-ODB "Kristall-BDS":** BTR-D converted into an airborne satellite communications vehicle with R-440 system with a range of 15,000 km. The vehicle has a roof-mounted satellite dish AK-12 that is covered with a cage-like structure during transport.
- **R-440-ODB "Kristall-BDS":** BTR-D converted into an airborne satellite communications vehicle with R-440 system with a range of 15,000 km. The vehicle has a roof-mounted satellite dish AK-12 that is covered with a cage-like structure during transport.
- **1V119 "Reostat":** BTR-D converted into an airborne artillery battalion fire direction vehicle. The vehicle is fitted with a turret equipped with NNP-21 and V-7 observation devices, three R-173 and R-159 radiosets, PAB-2AM aiming circle, three antennae mounts, DSP-30 and DAK-2 rangefinders. The turret was also equipped with PSNR-5K (1RL-133-1) "Tall Mike" ground surveillance radar mounted on the roof of the turret. Located over the turret front sights were the visors

hinged in the center
- **2S9 Nona-S (Ob'yekt 925S) –:** Airborne self-propelled mortar, armed with a 120 mm 2A60 mortar. Entered service 1981.

System

Alternative Designation: BREM-D

Type: Armored Maintenance-Recovery Vehicle

Family: BTR

Manufacturer: Volgograd Tractor Factory

In Service: 1989-Present

Crew: ea1

Passenger Capacity: ea12

Note: This equipment includes a light collapsible crane stored on the roof of the personnel compartment, which can be traversed through 180°, a recovery winch, a combination spade and dozer blade, a generator, towing equipment, electric welding system, tools and ready use spares.

Fire Control

Name: INA

Computerized FCS: No

Thermal Sight Vehicle Commander: Yes

Thermal Sight Gunner: Yes

Main Gun Stabilization: INA

Protection

Hull Armor: Protection of this vehicle is very light. Hull of the BTR-D is welded from aluminum armor in attempt to save

weight, however it protects the occupants only from small arms fire and artillery shell splinter

Turret Armor: INA

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

IR Signature: INA

Firing Ports: all-round firing ports

Notes:

The BREM-D is a variant of the BTR-D. BREM-D (BREM-D stands for bronirovannaya remonto-evakuatsionnaya mashina desanta – armoured maintenance-recovery vehicle of the airborne) (Ob'yekt 932) – BTR-D converted into an airborne ARV. It carries specialized equipment for the repair and recovery of BMD-1 type vehicles. This equipment includes a light collapsible crane stored on the roof of the personnel compartment, which can be traversed through 180°, a recovery winch, a combination spade and dozer blade, a generator, towing equipment, electric welding system, tools and ready use spares. One of the 7.62 mm bow PKT tank machine guns was eliminated. This entered service in 1989 in very small numbers. The BTR-D is a amphibious and airborne APC. The BTR-D is a Soviet airborne multi-purpose tracked armoured personnel carrier which was introduced in 1974 and first seen by the West in 1979 during the Soviet–Afghan War. BTR-D stands for Bronetransportyor Desanta (БТР, Бронетранспортер Десанта, literally "armoured transporter of the Airborne"). It is based on the BMD-1 airborne IFV. NATO gave it the designation BMD M1979. While the BTR-D is based on the BMD-1, it is 60 mm longer and lacks a turret; instead, it has a small flat superstructure with a hatch on top. Crew The crew consists of the driver, the commander and the left bow mounted machine gun gunner, all of whom are in the same positions and have the same equipment as in the BMD-1. Armament Although the turret with all of the main armament was removed, the two bow mounted machine guns have been retained. However, the original PKT tank machine guns have been replaced by PKB general purpose machine guns. The vehicle can also be fitted with pintle-mounted automatic grenade launchers (AGS-17, AGS-30 or AGS-57) and/or machine guns (PKM, 6P41, "Utyos" or "Kord"). Maneuverability The BTR-D is powered by the same engine as the BMD-1, however, its suspension is longer because the entire vehicle has been lengthened by 60 mm. Because of this, the vehicle has six road wheels on each side instead of five. It also has five return rollers on each side unlike the BMD-1, which has four. Armour protection The armour protection is slightly better on the BTR-D than on the BMD-1. That's because the upper front armour has a dual slanted angle. Troop compartment Because the turret has been removed, the troop compartment has been enlarged and can carry up to ten fully equipped soldiers. It's also linked with the crew compartment in the front. Also, there are two firing ports in the sides and one in the rear, two of which are for RPK-74 light machine guns. Equipment The BTR-D has all the same equipment as the BMD-1, but also has towing equipment for ZU-23-2 twin AA autocannon.

Notes:

he BREM-1 armored repair and recovery vehicle was developed to support a fleet of T-72 main battle tanks and its derivatives. Officially it entered service with the Soviet Army in 1975. Other sources report that production commenced in 1984. Until 1990 a total of 342 BREM-1 armored recovery vehicle have been delivered. The Russian Army had no dedicated recovery vehicle for its T-64 and T-80 series tanks. So the BREM-1 was used to support these tanks as well. So 342 units was not much considering that Soviets were churning out their tanks in tens of thousands. A lack of recovery vehicles was always felt in the Soviet, and later Russian army. Russian Army is still using the ageing BTS-4 armored recovery vehicles. The BREM-1 has been exported to a number of countries alongside the T-72 MBT. In some cases it is used to supports other tanks when the operator has no dedicated recovery vehicle.

Notes:

The Chinese Type 73 ARV (Armored Recovery Vehicle) is built on a Type 59 hull and was the first ARV the Chinese ever built for their Type 59 in the 1970’s. The recovery equipment includes a recovery winch, which can provide a pulling capacity of 25 tons, or 50 tons when used in conjunction with two pulleys, and a manually operated hoist boom with a max lifting capacity of 1,000 kg. A spade can provide a maximum of 54 tones of support. This means that the vehicle can winch to safety, tow, and replace the engine of a damaged or stuck tank in the field. Armament on the Type 73 includes a roof-mounted Type 59 12.7mm antiaircraft machine gun (AAMG) with 500 rounds.

Fording, Prepared: 1.52 m

Tires: Super singles with CTIS

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1089 Wrecker is designed to recover vehicles in the 5 ton or less weight class. The M1089 Wrecker features front or rear disabled vehicle lift and tow capability. The M1089 is equipped with two, 30,000 pound main winch assemblies, with 300 feet of cable each. The M1089 also equipped with a MHE rated at 11,000 pounds with the boom extended at 14 feet. Both MHE and main winches feature remote control capabilities.

M984A1 HEMTT American 8x8 Heavy Expanded Mobility Tactical Truck (HEMTT) Wrecker

Tiers:

Variants:

- **M977:** The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis.
- **M978:** The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant.
- **M983 Tractor:** The M983 is a tractor unit for use with the trailer-mounted MIM-104 Patriot missile system. It can also be used with the Interim Stryker Recovery System, or other trailers. An earlier variant fitted with a 30 kW generator and crane mounted behind the cab was used to tow the Pershing II Erector Launcher in CONUS (a M1001 MAN tractor was used in West Germany). The M983A2/A4 Light Equipment Transporter (LET) tractor is mainly used to transport construction and engineer equipment. It has a 45,000 lb (20,000 kg)) 2 speed hydraulic winch mounted behind the cab used to load the trailer. It does not have a self-recovery winch.
- **M984A1 Wrecker:** The M984 wrecker is the only HEMTT variant to have been produced in the A1 configuration, and this resulting in the change of recovery crane and retrieval system between A0 and A1 configurations. The current model is the M984A4. Standard equipment includes a 27,240 kg (60,050 lb) capacity two-speed recovery winch, a rear-mounted 11,340 kg capacity vehicle retrieval system, and a 6,350 kg (14,000 lb) at 2.74 m (9.0 ft) capacity Grove materials handling crane. A 9,072 kg (20,000 lb) bare drum capacity self-recovery winch is fitted as standard on the M984.
- **M985 Cargo:** The M985 is available in two variants. The current models are A4; there were no A1 models. The M985 cargo variant is similar to the M977 cargo truck but was developed to support the M270 Multiple Launch Rocket System (MLRS) with a M989A1 HEMAT trailer. It may also used to transport Patriot missiles. The M985 Guided Missile Transporter (GMT) was developed specifically for use with the Patriot system and it can be distinguished easily from other cargo models by its rear-mounted Hiab 8108/2 materials handling crane
- **Taiwanese RT-2000 Multiple Rocket Launcher:** The RT-2000 [Lit; Ray-Ting-2000 or Thunder -2000] rocket launcher mounted on an M977 chassis. In service about 1997. Can mount any one of three launchers: Mk 15 117-mm, 60 rounds; Mk 30, 30 rounds with HE; AP/AM cluster warhead - >18-mile range; Mk 45 12 rounds, > 27-mile range, GPS targeting. See separate record for details.
- **M1120 HEMTT Load Handling System (LHS):** The M1120 Load Handling System (LHS) variant was initially introduced as part of the HEMTT overhaul/rebuild program, during which returned M977 cargo trucks have their cargo bodies and materials handling cranes removed, to be replaced by a Multilift Mark 5 (now designated MPH165-LHS) LHS, as fitted to the Oshkosh PLS truck.
- **M1977 HEMTT Common Bridge Transporter (CBT):** The M1977 HEMTT Common Bridge Transporter (CBT) is a further development of the M1120 LHS, and in common with the M1120 LHS was initially introduced as part of the HEMTT overhaul/rebuild program. It is used for loading, transporting, and unloading Ribbon Bridge components and bridge erection boats.
- **M1142:** The M1142 is a Tactical Fire Fighting Truck (TFFT) capable of extinguishing aircraft, petroleum, brush, and structural fires at isolated military installations. The TFFT is based on a HEMTT M977A2 chassis with the heavier duty M1120 LHS HEMTT variant rear suspension. The TFFT contract was awarded to Pierce Manufacturing with Oshkosh Corporation as a subcontractor to Pierce.
- **M977 A2 Cargo Truck:** Basic version.

- **M977 A2 EPP:** Electrical power plant.
- **M977 A2 LRPT:** Large repair parts transporter.
- **M978 A2:** Fuel servicing transporter truck tanker.
- **HEMTT M983 A2 LET:** Light equipment transporter.
- **HEMTT M983 A2:** Patriot missile tractor.
- **M984 A2:** Recovery truck.
- **M985 A2:** Cargo and MRLS resupply.
- **M985 A2 GMT:** Guided missile transporter.
- **M1120 A2 HEMTT-LHS:** Heavy expanded mobility tactical truck.
- **M1977 A2 CBT:** Common bridge transporter.

Distance Between Axles, 1st to 2nd: 1.52 m

Distance Between Axles, 2nd to 3rd: 3.81 m

Distance Between Axles, 3rd to 4th: 3.30 m

Weight: 23,088 kg

Automotive

Engine Name: 1 x Detroit Diesel 8V-92TA

Engine Type: 736-cu in(12.06-liter) liquid-cooled, 2-stroke, V-8 diesel

Engine Power: 445 hp at 2,100 rpm

Power-to-Weight Ratio: 16.18 hp/metric ton

Transmission: Allison HT740D automatic transmission with torque converter 4 forward/1 reverse gears

Suspension: 8 x 8 (8 wheels driving, 4-wheel steering); Hendrickson leaf spring w/steel saddle, equalizing beams, and 10-in (254-mm) vertical travel on front and rear; RT340 model rear springs on all but M985 (RT380) and M984A1 (RT500)

Maximum Speed: 88 km/h

Range: 483 km; w/full load at 54 km/h

Fuel Capacity: 589 liters

Tire Size: 16.00R20

Gradient: 60 percent

Side Slope: 30 percent

Fording Depth: 1.23 m

Payload Capacity: 9,979 kg

Protection

Armor: A-kit/B-kit; U.S. Army Long Term Armor Strategy (LTAS) compliant

Applique Armor: Available

Active Protection System: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

M984A1 Wrecker The M94A1 is a recovery vehicle version. The automatic, two-speed, 60,000-lb (27,216-kg) capacity recovery winch has 185 ft (56.4 m) of cable. The winch can recover vehicles 32 degrees to the left or right of the wrecker or 23 degrees below the wrecker. It is also fitted with 20,000-lb (9,072-kg) bare-drum capacity self-recovery winch. The towing system is a crossbar floating on a four-inch (102-mm) ball. The ball is supported by three hydraulic cylinders. The wrecker is equipped with a 141,600-ft lb (19,577-kg m) capacity crane that can lift the power packs of a range of vehicles including both the M1A1 Abrams and the M60 main battle tanks. The M984A1 can also be equipped with oxy-acetylene welding equipment as well as a variety of other recovery equipment. The Heavy Expanded Mobility Tactical Truck (HEMTT) is an eight-wheel drive, diesel-powered, 10-short-ton (9,100 kg), tactical truck used by the US military and others. In evolving configurations, it has been in continuous production since 1982. The M977 HEMTT entered service with the U.S. Army as a replacement for the M520 Goer. By mid 2019, around 35,000 HEMTTs in various configurations had been produced by Oshkosh Defense through new-build contracts and around 13,000 of these had been re-manufactured. Current variants have the A4 suffix. The 10×10 Oshkosh Logistic Vehicle System Replacement (LVSR) is the U.S. Marines' equivalent to the U.S. Army's Oshkosh 8×8 HEMTT and Oshkosh 10×10 Palletized Load System (PLS). The Marines do not use the HEMTT or PLS, and the Army does not use the LVSR, but both services use a common trailer (M1076) with all three truck types. The HEMTT's objective is to provide heavy transport capabilities for supply and re-supply of combat vehicles and weapons systems. Compared to earlier generation 5-ton trucks in U.S. Army service it offers increased payload and mobility. The HEMTT is available in a variety of configurations, including cargo, tanker, tractor and wrecker. The HEMTT was developed from the outset as a tactical truck, but to minimize procurement and life cycle costs included militarized commercial automotive components where possible, these including the engine and transmission. Some components used in early HEMTTs are common with the Oshkosh Logistics Vehicle System (LVS) vehicles which were supplied to the U.S. Marine Corps. With the exception of the M984 wrecker variant (254 × 89 × 9.5 mm, front; 356 × 89 × 9.5 mm, rear), on all HEMTT variants the chassis is formed of 257 × 89 × 9.5 mm heat-treated carbon manganese steel with a yield strength of 758 MPa. Bolted construction with Grade 8 bolts is used throughout. A centrally mounted self-recovery winch is an option and this is fitted to around 20% of production. The HEMTT's two-door forward control cab seats two. It is of heavy-duty welded steel construction with corrosion-resistant sheet metal skins. Simula Inc. (acquired by Armor Holdings in 2003 and now BAE Systems) supplied 186 add-on cab armoring kits for use in the former Yugoslavia. These were not issued, but from 2004 were used in Iraq. BAE systems supplied a next-generation armor kit for the HEMTT and by late-2006 had supplied the U.S. Army with around 3600 kits for the Oshkosh HEMTT and PLS. The HEMTT A4 is fitted with the slightly larger from the Oshkosh PLS A1. This cab complies with the U.S. Army's Long Term Armor Strategy (LTAS) requirements of an A- and B-kit armoring philosophy. It also comes as standard with integrated floor armor, an integrated mount for a machine gun and gunner protection kit, and air-conditioning. A Detroit Diesel 8V92TA V-8 two-stroke diesel developing 445 hp (332 kW) is fitted in HEMTT A0 and A1 models, with the DDECIV version of this engine fitted to A2 HEMTTs. An EPA 2004 compliant Caterpillar (CAT) C-15 six-cylinder, 15.2-liter diesel developing a peak of 515 hp (384 kW) is fitted to HEMTT A4 models. HEMTT A0 and A1 models are fitted with an Allison HT 740D 4F/1R automatic transmission, torque converter, and Oshkosh 55,000-pound (25,000 kg) two-speed transfer case. HEMTT A2 models have the Allison HD 4560P 6F/1R automatic transmission. HEMTT A4 models are fitted with an Allison 4500SP 5F/1R automatic transmission and an uprated version of Oshkosh's 55,000-pound (25,000 kg) two-speed transfer case. The front axles on all HEMTTs are single-reduction Oshkosh 46K, the rear are Dana single-reduction which vary according to configuration. Drive to the front axles is selectable and all axles have differential locks. Suspension on A0/A1/A3 models is by Hendrickson leaf springs with equalizing beams. Suspension on A4 models is Holland air suspension, load rating on the rear axles varying by configuration. Tire size is 1600 R20 on all models, and standard tire fit is Michelin XZL. All models are capable of fording water crossings up to 48 in (120 cm) deep, and can climb a gradient of at least 60%. All original variants are air transportable in the C-130. All variants are air-transportable in the C-17. Original HEMTT models now have the suffix A0. Only the M984 wrecker was produced in A1 configuration. All models were produced in A2 configuration.

The A3 suffix is applied to HEMTT technology demonstrators with a diesel-electric drive system. Current HEMTT production models have the suffix A4.

LVSR MKR15 American 10x10 Logistics Vehicle System Replacement (LVSR) Heavy Wrecker

Tiers:

Variants:

- **LSVR MKR15 Wrecker:** This version is equipped with a crane, winches and hydraulic spade. It can flat tow 110,000 lb (49,900 kg) on the highway. The truck has a lift and tow capacity of 97,000 lb (44,000 kg) gross vehicle weight with 24,000 lb (10,890 kg) lift capacity. The articulated crane has a lift capacity of 18,00 0 lb (8,170 kg) at 11 ft (3.35 m); and 10,000 lb (4,540 kg) at a maximum reach of 20 ft (6.1 m).
- **LSVR MKR16 Tractor:** This is the tractor variant of the LVSR. It is equipped with a recovery winch with a 60,000-lb (27,220-kg) capacity and 10,000-lb (4,540-kg) side-pull capacity.
- **MKR18 Cargo:** This is the cargo version of the LVSR. It is equipped with the Multilift Mk 18A1 load handling system. Towed trailers add 16.5 tons of payload.

System

Alternative Designation: LVSR MKR15

Type: Logistics Vehicle System Replacement (LVSR) Heavy Wrecker

Configuration: 10x10

Manufacturer: Oshkosh Defense, Oshkosh, Wis.

Crew: ea1

Cab Seating: 1x1

Airlift Capability: Vehicle can be airlifted by C-17 Globemaster III or C-5A Galaxy aircraft. Height of the vehicle can be reduced by 50 cm for easier transportation. With additional preparation it can be airlifted by the C-141 Starlifter.

Crane: Yes, The articulated crane has a lift capacity of 8,170 kg at 3.35 m; and 14,540 kg at a maximum reach of 6.1 m

Winches: Yes, There are two rear-mounted 17,690 kg dual-drum-style, constant-pull-design winches with 98 m of 19-mm cable. The self-recovery winch is front-mounted with 9,070 kg capacity and 61 m of 16-mm cable.

Hydraulic Spade: Yes, The hydraulic spade has 35,380 kg of pull in 60 RCI soil. The 2.44-m cargo deck has Sixcon ISO lock provisions and tie-down provisions for bulk cargo weighing up to 4,540 kg.

Flat Toe: 49,900 kg on the highway.

Lift and Tow Capacity: The truck has a lift and tow capacity of 44,000 kg gross vehicle weight with 10,890 kg lift capacity

Dimensions

Length: 11.46 m

Width: 2.49 m

Height: 3.11 m

Wheelbase: 5.42 m

Gross Weight: 48,080 kg

Curb Weight: 30,750 kg

Automotive

Engine Name: 1 x CAT C15

Engine Type: Diesel

Engine Power: hp600

Fuel Capacity: m628 liter

Maximum Speed: 105 km/h

Range: 480 km

Gradient: 60%

Side Slope: 30%

Vertical Step: 0.6 m

Trench: 2.5 m

Fording: 1.52 m

Note: The front two and the back two axles are steered.

Protection

Armor: It is fitted with an integrated armored cab and energy-absorbing seats.

Applique Armor: Yes, The add-on armor kit for LVSR was developed and supplied by Plasan of Israel. Plasan was awarded a contract in mid-2006 for 12 LVSR armor kits for testing. The November 2011-stated AAO for LVSR add-on armor B-kits quotes 651. The armor system for LVSR follows the A-kit/B-kit principle, with vehicles designed 'fitted for, but not with', protection. In the case of LVSR, 'fitted for' includes an armored cab floor as standard. Cargo and wrecker variants require an upgrade of the front springs. Protection kits can be installed and uninstalled from vehicles in the field using only basic tools. The A-kit is fitted on the production line and is the combination of a limited amount of armoring (in difficult-to-access areas of the vehicle), together with a significant amount of armour installation attachments and required support structures. The bulk of the armor, the B-kit, is installed in the field on an 'as required' basis. The benefits of the A-kit/B-kit principle are that armor is only fitted when required, this reducing vehicle wear and tear, and by default whole life cycle costs. Improvements and/or upgrades to armor are also far easier to integrate into an appliqué solution. The A-kit/B-kit principle is currently applied to all current production US tactical 'soft skin' vehicles.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The Oshkosh LVSR MKR15 is a wrecker variant of the LVSR heavy high mobility truck. In 2011 US Marine Corps ordered nearly 70 of these heavy wreckers. First production vehicles were delivered in 2012. It replaces the Oshkosh Mk.48/15. The Logistic Vehicle System Replacement (LVSR) is a family of vehicles, based on a common 5-axle ten-wheel drive (10x10) chassis, that vary in individual configuration by mission requirements. The LVSR was designed and is manufactured by Oshkosh Defense. LVSR is a purpose-designed military vehicle and there are currently three variants in service, a cargo, a wrecker and a tractor truck. The first LVSRs were ordered in 2006. The LVSR is the U.S. Marines' equivalent of the U.S. Army's Oshkosh Heavy Expanded Mobility Tactical Truck (HEMTT) and Oshkosh Palletized Load System (PLS). The Marines do not use the HEMTT or PLS and the Army does not use the LVSR, but both services use a common trailer (M1076) with all three truck types. The predecessor of the LVSR, the MK48 Logistics Vehicle System (LVS), had entered service with the US Marine Corps (USMC) from

1985 and in the late 1990s a project to replace the LVS was started. As a precursor to a formal LVS replacement programme a number of manufacturers co-operated with the USMC to build and evaluate an Advanced Technology Demonstrator (ATD). The ATD was built during 1998 at the Nevada Automotive Test Centre (NATC). LVS Modification Demonstrators (LVS-MDs) were also built, these integrating commercially proven automotive components and technologies. In April 2001, Logistics Management Institute (LMI) completed their final report for the 'Analysis of Alternatives (AoA) for the USMC Logistics Vehicle System Replacement (LVSR), concluding the best option was to rebuy a vehicle similar to the technology demonstrator. Five alternative options had been considered, these were: Inspect and Replace Only As Necessary (IROAN) for the LVS; rebuild the LVS; re-manufacture the LVS to a higher standard; rebuy a vehicle similar to the technology demonstrator; research and develop an entirely new vehicle. Around this time it was suggested that 2,000-3,000 vehicles might be required, although throughout the program numbers would fluctuate. An LVSR industry day was held in late 2001, and a formal solicitation to industry was released in early 2003. This had been delayed from an expected April 2002. The LVSR Request for Information (RfI) had originally been expected in May 2000. In March 2004 Oshkosh Truck Corporation (now Oshkosh Defense) announced that the US Marine Corps had awarded the company a Phase I System Development and Demonstration Contract to supply three LVSR trucks. These were to be delivered to the Marines for extensive endurance and performance testing within 12 months. This award was the first phase of a two-phase acquisition competition valued in March 2004 at $783 million for up to 1,581 vehicles. Competition for the Phase II production award (scheduled for March 2006) was limited to those companies that successfully completed Phase I evaluation. The other company selected for the Phase I evaluation was the American Truck Company (ATC) with a TATRA-based design. Phase 1 testing was completed in 2005 and in late-May 2006, the USMC awarded the LVSR Phase II contract to Oshkosh Truck Corporation. An initial LVSR order issued on 31 May 2006 was valued at $28 million and ordered 22 cargo, two wrecker (recovery), and tractor truck LVSR variants, plus vehicle kits, training (operator/maintainer-cargo), test support-production verification testing cargo, meetings, and contract data requirements. The first LVSR cargo variant began testing at the Aberdeen Proving Ground in June 2007. Tractor and wrecker prototype vehicles began testing in November 2007 and April 2008 respectively. An additional 123 cargo variants, which completed low rate initial production (LRIP) quantities, were subsequently ordered under option year two of the production contract. In January 2009, Oshkosh announced an LVSR delivery order valued at $176 million. This called for more than 425 LVSRs and transitioned LVSR from LRIP into full-rate production (FRP). LVSR fielding began in April 2009 for user trials and testing and the first vehicle was fielded to Afghanistan in September 2009. LVSR deliveries were completed in September 2013. Orders totalled 2,022, with the total order value around $965.78 million. Deliveries included 1,505 MKR18 cargo variants, 355 MKR16 tractor trucks, and 162 MKR15 wreckers. The requirement for an LVSR companion trailer for the USMC has also been provided by Oshkosh. The M1076, which is already in service with the US Army, is the selected trailer. In May 2009, it was announced that the Marine Corps would receive an initial 30 M1076 PLST for use with the LVSR. By early 2016 the USMC had purchased a total of 687 PLST through a separate contract with the US Army.

Type 654 Chinese Armored Recovery Vehicle

Tiers:

1 2 3 4

System

Alternative Designation: Type 90-II ARRV

Manufacturer: China North Industries Corp. (NORINCO), Beijing, China Heavy Defense Industries (HDI), Taxila, Pakistan

Crew: ea5

Passenger Capacity: NA

Chassis: Type 90

Blade Characteristics: Hydraulic

Crane Characteristics: Hydraulic (On right side of the hull and forward)

Crane Capacity: kg25,000

Addition Equipment: Auxiliary winch, tools, tow bars, and cables

Winch Capabilities: Maximum pulling force of 82 tons with pulley. 41 tons without the pulley.

Dimensions

Length: m8.83

Width: m3.4

Height: m2.4

Weight, Combat: kg47,500

Automotive

Engine Name: 6TD-2

Engine Type: Water-cooled, turbocharged, after cooled, 4-stroke, 8-cyl diesel

Engine Power: hp1,200

Cruising Range: km500

Speed, Maximum Road: km/h70

Speed, Off Road: km/h50

Gradient: %60

Side Slope: INA

Vertical Step: .85m

Trench: 3m

Fording Depth: 5m with snorkel

Protection

Armor, Hull Rear: INA

Armor, Hull Top: INA

Armor, Glacis: INA

Mine Clearing: Limited with blade

Self-Entrenching Blade: Yes, It can clear a maximum of 120 cu m of soil per hour

NBC Protection: Over-pressure system, anti-neutron inner liner

Smoke Equipment: 8, 76mm, electronically operated smoke grenade launchers IVO the driver's position

Add on Armor: Panel of composite armor can be fitted to the glacis and turret front

Notes:

Based on the Type 90 MBT, the Type 654 Armored Recovery Vehicle was developed as a support vehicle to the Type 90s sold to Pakistan. The Type 654 is similar to the Type 90 tank, but has a new all-welded superstructure designed for the repair and recovery role. The stabilizer blade is hydraulically operated and is mounted at the front of the vehicle and operated by the driver from his position in the vehicle. The dozer blade can be used to remove battlefield obstacles and prepare firing positions though it is most often used to stabilize the vehicle while the crane or winch are being used. The blade can clear a maximum of 4,240 cu ft (120 cu m) of soil per hour. Also hydraulic, the crane is mounted on the right side of the chassis with a maximum lifting capacity of 25,000 kg. The crane is pivoted at the front of the chassis and is traversed to the rear when not in use. The crane is very helpful in conducting battlefield damage repair but, can be used for routine maintenance as well.. The primary hydraulic winch is at the front of the vehicle and has a maximum pulling force of 82 tons. This allows it to recover all current Chinese-produced armored vehicles.

M88A1 American Armored Recovery Vehicle

Tiers:

Variants:

- **M88:** Original production model with Continental AVSI-1790-6A 980-hp V-12 gasoline engine. No NBC protection system. There were 1,075 M88s built from 1961 to 1964 by Bowen-McLaughlin-York (BMY) of York, Pa. All U.S. Army vehicles converted to diesel power.
- **M88A1:** BMY began development of the diesel-powered M88A1 in 1972, eventually converting 875 M88s and building more than 2,100 new M88A1s
- **M88A2 Hercules Improved Recovery Vehicle (IRV):** This is an improved version capable of hoisting and towing twice weight of an M88A1, including M1 tanks. Production on the M88A2 began in 1994. Key upgrades include improved power-assisted braking, steering, winching, hoisting and increased horsepower, according to BAE Systems.

System

Alternative Designation: M88A1
Type: Armored Recovery Vehicle
Crew: ea4
Left Capability: 22.7 tons
Winch Capability: 40.8 tons, It is used for recovery of damaged, stuck, sunken and overturned vehicles. There is also an auxiliary winch. It is used for delivery of the main winch rope and other cargo handling operations.
Towed Load: 55 tons
Dozer Blade: The front-mounted dozer blade is used to stabilize the vehicle during craning and winching operations. It can be also used for clearing obstacles and light earth-mowing works, such as covering up of ditches and so on.
Welding Equipment: Vehicle has a welding outfit for welding and cutting works in the field. These are carried by one of the crew member. The M88 also has a set of tools for field repairs.

Dimensions

Length: 8.27 m
Width: 3.43 m
Height: 3.13 m
Weight: 50.8 tons

Automotive

Engine Name: Continental AVSI-1790-6A

Engine Type: turbocharged diesel engine

Engine Power: 750 hp

Transmission: Allison XT-1400-2 transmission

Maximum Speed: 40 km/h

Range: 300 km

Gradient: %60

Side Slope: %30

Vertical Step: m1.1

Trench: m2.6

Fording without Preparation: m1.4

Fording with Preparation: m2.6

Note: This recovery vehicle was also fitted with auxiliary power unit which powers all systems and add-on equipment when the main engine is turned off.

Main Weapon System

↳*System*

Name: M2 Browning

Type: Heavy Machine Gun

Caliber: 12.7mm

Length: 1,654 mm

Barrel Length: 1,143 mm

Weight: 38 kg (83.78 lb) 58 kg (127.87 lb) with tripod and T&E (Traverse and Elevation Mechanism)

Action: Short recoil-operated

Rate of Fire: 450–600 rounds/min

Muzzle Velocity: 890 m/s

Maximum Firing Range: 7,400 m

Effective Firing Range: 1,800 m

Feed System: Belt-fed (M2 or M9 links)

↳*Ammunition*

Type: Rifle

Caliber: 12.7mm

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 1,300 rounds

Protection

Hull Armor: The superstructure of this armored recovery vehicle is composed of a single large armor casting. It provides protection against machine gun fire and artillery shell splinters. Hull bottom armor is similar to that of medium tanks and

withstands anti-tank mine blast. The original M88 lacks NBC protection system, which later models are equipped with.

Applique Armor: Available

Mine Clearing: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

M88A1 improved version, developed in 1973. The petrol engine was replaced by a diesel unit. It is powered by Continental AVSI-1790-6A turbocharged diesel engine, developing 750 hp. Engine is coupled with Allison XT-1400-2 transmission. This recovery vehicle was also fitted with auxiliary power unit which powers all systems and add-on equipment when the main engine is turned off. Unlike it's predecessor it is equipped with NBC protection system. Production of the M88A1 commenced in 1977 and ceased in 1985 with a total of 1427 vehicles produced. Additionally 876 original M88 ARVs were upgraded to the A1 standard. The M88 armored recovery vehicle was designed for medium and heavy recovery operations. Typical tasks of this support vehicle include recovery of damaged, stuck, swamped or overturned armored vehicles on the battlefield. It also provides maintenance service or tows them to maintenance units. The M88 was accepted to service with the US Army in 1959. Deliveries commenced in 1961 and over 1 000 of these armored recovery vehicles were produced until 1964. This ARV saw action during a number of wars, noticeably in Vietnam and both Iraq wars. The upgraded M88 armored recovery vehicles are still in service with the US military. This vehicle was also exported to a number of countries. The M88 armored recovery vehicle is based on the suspension and running gear of the M48A2 and M60 tanks. Vehicle is fitted with "A" frame-type hoisting boom, winch and a front-mounted dozer. It was designed to support the Patton series tanks. The crane has a 22.3 t capacity. It is used to lift disabled vehicles, turrets, powerpacks, or other loads. If repairs are required to a vehicle's suspension, the crane raises the front of back of the vehicle to allow access to the damaged system. When not required the crane lays on top of the roof. The main winch has a 40.8 t capacity. It is used for recovery of damaged, stuck, sunken and overturned vehicles. There is also an auxiliary winch. It is used for delivery of the main winch rope and other cargo handling operations. The front-mounted dozer blade is used to stabilize the vehicle during craning and winching operations. It can be also used for clearing obstacles and light earth-mowing works, such as covering up of ditches and so on. Vehicle has a welding outfit for welding and cutting works in the field. These are carried by one of the crew member. The M88 also has a set of tools for field repairs. The M88 ARV tows damaged, faulty or uncontrolled tanks or armored vehicles using rigid or non-rigid hitches. Damaged vehicles are towed to the nearest shelters, assembly points of repair depots. The superstructure of this armored recovery vehicle is composed of a single large armor casting. It provides protection against machine gun fire and artillery shell splinters. Hull bottom armor is similar to that of medium tanks and withstands anti-tank mine blast. The original M88 lacks NBC protection system, which later models are equipped with. The M88 is armed with a single roof-mounted 12.7 mm machine gun for self-defense. This weapon is operated by the vehicle commander. A total of 1 300 rounds are carried. This support vehicle has as crew of four, including commander, driver, mechanic and rigger. All crew members have their separate hatches in the roof of the superstructure. There is also a door in each side. The original M88 was powered by a petrol engine. With the introduction of the M1 Abrams two M88 recovery vehicles were required to tow this MBT, due to it's weight. To address this shortcoming a more powerful version of the M88 was introduced in the early 1990s. In case of emergency this recovery vehicle can refuel main battle tanks from it's own fuel tank. The M88 can be fitted with a deep wading kit. After preparation it can ford water obstacles up to 2.6 m deep.

M816 American 6x6 5-Ton Medium Wrecker

Tiers:

System

Alternative Designation: M816

Type: Medium Wrecker

Manufacturer: AM General

In Service: INA

Crew: ea1

Revolving Hydraulic Crane: Yes

Boom Extension: 10-18 feet

Maximum Lift Capacity: maximum lift capacity of 20,000 lb with outriggers and boom jacks to the ground. The boom capacity depends on boom extension and placements of truck outriggers and boom jacks. With boom full out and no outriggers, the capacity is only 3000 lb. The boom elevates to 45 degrees, swings 270.

Dimensions

Length: 9.04 m

Width: 2.49 m

Height: 2.84 m

Weight, Combat: 15,900 kg

Automotive

Engine Name: Cummins NHC-250

Engine Type: Diesel

Protection

Armor: None

Applique Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The M816 Medium Wrecker is part of the M809 series of 5-ton 6x6 military trucks. It was made by AM General starting in 1970. It has a revolving hydraulic crane with an extending boom that can extend from 10–18 ft with a maximum lift capacity of 20,000 lb with outriggers and boom jacks to the ground. The boom capacity depends on boom extension and placements of truck outriggers and boom jacks. With boom full out and no outriggers, the capacity is only 3000 lb. The boom elevates to 45 degrees, swings 270. The fuel consumption rate is 5 mpg. The towing capacity is 14 tons on road or 10 tons cross country (or off-road). The front winch has a 20Klb capacity and the rear winch is 45klb capacity. These trucks were specially built for the United States Army to pull medium duty equipment through non-incorporated terrain.

Winch Capability: 40.8 tons, It is used for recovery of damaged, stuck, sunken and overturned vehicles. There is also an auxiliary winch. It is used for delivery of the main winch rope and other cargo handling operations.
Towed Load: 55 tons
Dozer Blade: The front-mounted dozer blade is used to stabilize the vehicle during craning and winching operations. It can be also used for clearing obstacles and light earth-mowing works, such as covering up of ditches and so on.
Welding Equipment: Vehicle has a welding outfit for welding and cutting works in the field. These are carried by one of the crew member. The M88 also has a set of tools for field repairs.

Cartridge: .50 BMG (12.7×99mm NATO)

Basic Load: 1,300 rounds

Protection

Hull Armor: The superstructure of this armored recovery vehicle is composed of a single large armor casting. It provides protection against machine gun fire and artillery shell splinters. Hull bottom armor is similar to that of medium tanks and withstands anti-tank mine blast. The original M88 lacks NBC protection system, which later models are equipped with.

Applique Armor: Available

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M88 armored recovery vehicle was designed for medium and heavy recovery operations. Typical tasks of this support vehicle include recovery of damaged, stuck, swamped or overturned armored vehicles on the battlefield. It also provides maintenance service or tows them to maintenance units. The M88 was accepted to service with the US Army in 1959. Deliveries commenced in 1961 and over 1 000 of these armored recovery vehicles were produced until 1964. This ARV saw action during a number of wars, noticeably in Vietnam and both Iraq wars. The upgraded M88 armored recovery vehicles are still in service with the US military. This vehicle was also exported to a number of countries. The M88 armored recovery vehicle is based on the suspension and running gear of the M48A2 and M60 tanks. Vehicle is fitted with "A" frame-type hoisting boom, winch and a front-mounted dozer. It was designed to support the Patton series tanks. The crane has a 22.3 t capacity. It is used to lift disabled vehicles, turrets, powerpacks, or other loads. If repairs are required to a vehicle's suspension, the crane raises the front of back of the vehicle to allow access to the damaged system. When not required the crane lays on top of the roof. The main winch has a 40.8 t capacity. It is used for recovery of damaged, stuck, sunken and overturned vehicles. There is also an auxiliary winch. It is used for delivery of the main winch rope and other cargo handling operations. The front-mounted dozer blade is used to stabilize the vehicle during craning and winching operations. It can be also used for clearing obstacles and light earth-mowing works, such as covering up of ditches and so on. Vehicle has a welding outfit for welding and cutting works in the field. These are carried by one of the crew member. The M88 also has a set of tools for field repairs. The M88 ARV tows damaged, faulty or uncontrolled tanks or armored vehicles using rigid or non-rigid hitches. Damaged vehicles are towed to the nearest shelters, assembly points of repair depots. The superstructure of this armored recovery vehicle is composed of a single large armor casting. It provides protection against machine gun fire and artillery shell splinters. Hull bottom armor is similar to that of medium tanks and withstands anti-tank mine blast. The original M88 lacks NBC protection system, which later models are equipped with. The M88 is armed with a single roof-mounted 12.7 mm machine gun for self-defense. This weapon is operated by the vehicle commander. A total of 1 300 rounds are carried. This support vehicle has as crew of four, including commander, driver, mechanic and rigger. All crew members have their separate hatches in the roof of the superstructure. There is also a door in each side. The original M88 was powered by a petrol engine. With the introduction of the M1 Abrams two M88 recovery vehicles were required to tow this MBT, due to it's weight. To address this shortcoming a more powerful version of the M88 was introduced in the early 1990s. In case of emergency this recovery vehicle can refuel main battle tanks from it's own fuel tank. The M88 can be fitted with a deep wading kit. After preparation it can ford water obstacles up to 2.6 m deep.

M88A2 Hercules American Armored Recovery Vehicle

Tiers:

1 2 3 4

Variants:

- **M88:** Original production model with Continental AVSI-1790-6A 980-hp V-12 gasoline engine. No NBC protection system. There were 1,075 M88s built from 1961 to 1964 by Bowen-McLaughlin-York (BMY) of York, Pa. All U.S. Army vehicles converted to diesel power.
- **M88A1:** BMY began development of the diesel-powered M88A1 in 1972, eventually converting 875 M88s and building more than 2,100 new M88A1s
- **M88A2 Hercules Improved Recovery Vehicle (IRV):** This is an improved version capable of hoisting and towing twice weight of an M88A1, including M1 tanks. Production on the M88A2 began in 1994. Key upgrades include improved power-assisted braking, steering, winching, hoisting and increased horsepower, according to BAE Systems.

System

Alternative Designation: M88A2
Type: Armored Recovery Vehicle
Manufacturer: BMY (1961–1994) United Defense and Anniston Army Depot (1994–2005) BAE Systems Land and Armaments (since 2005)
Crew: ea3
Left Capability: 31.8 tons
Winch Capability: 63.5 tons
Towed Load: 63 tons
Dozer Blade: The front-mounted dozer blade is used to stabilize the vehicle during craning and winching operations. It can be also used for clearing obstacles and light earth-mowing works, such as covering up of ditches and so on.
Welding Equipment: Vehicle has a welding outfit for welding and cutting works in the field. These are carried by one of the crew member. The M88 also has a set of tools for field repairs.
Note: With the lowest acquisition, operational and maintenance cost of any 70-ton capable recovery system, HERCULES answers the need for cost-effective, self-supporting heavy recovery performance. The HERCULES was the primary 70-ton recovery system during Operation Iraqi Freedom. And, U.S. troops found a few other creative uses for its capabilities when

they used it to pull down the Saddam Hussein statue in Baghdad on April 9, 2003. HERCULES utilizes a hull designed for the recovery mission and thoroughly proven by U.S. Army testing. Stability and performance are unmatched by any alternate tank-based design. HERCULES offers operational and logistics commonality with the existing M88A1 fleet, simplifying training and parts availability. Key upgrades include improved power-assisted braking, improved steering, improved electrical system and increased engine horsepower. HERCULES features overlay armor protection, ballistic skirts, a longer 35-ton boom, a 140,000-pound (63,504 kg) constant pull main winch with 280 feet of cable, and an auxiliary three-ton winch to aid main winch cable deployment. The M88A2 HERCULES is built and equipped to be the world's recovery champion.

Protection

Hull Armor: This armored recovery vehicle has improved armored protection over it's predecessor. Armor of the M88A2 and withstands hits from 30 mm projectiles. It also withstands and anti-tank mine blast under the hull. Vehicle is additionally fitted with side skirts.

Applique Armor: Available

Mine Clearing: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The M88A2 HERCULES Hercules [Heavy Equipment Recovery Combat Utility Lift and Evacuation System], formerly the M88A1E1 Improved Recovery Vehicle, addresses a long-standing US Army need to upgrade its recovery vehicles to safely tow and recover battle-damaged, mired or inoperative Abrams tanks. The HERCULES, using M88A1 hulls, modified to specification by Anniston Army Depot, upgrades the basic M88 chassis to meet the increased demands of towing, winching, and lifting the M1, M1A1, and M1A2 tank. Among the most significant upgrades is its on-board recovery systems. The winch and hoist capacities are greatly increased to enable the vehicle to lift 40% heavier loads and winch 55% higher capacities. HERCULES features a longer 35-ton hoist capability boom, a 140,000 pound (63,504 kg) constant pull main winch with 280 feet (85.3 m) of cable and an auxiliary 3-ton winch to aid main winch cable deployment. The Hercules also incorporates improved hydraulics, enhanced propulsion system, and heavier suspension, along with overlay armor protection and ballistic skirts. The vehicle's enhanced survivability with added armor which brings its weight to more of a match for the Abrams tanks it predominantly supports. The HERCULES upgraded power train which enables it to tow a 25% larger load, with better braking capacity and higher speeds to better enable it to accompany maneuver forces. The crew has been reduced from four to three soldiers. This action results from some of the on-board innovations such as an auxiliary winch to deploy the main winch, chain/davit hoists for heavy equipment/machinery and a grease operated track adjuster. The HERCULES manufacturer is United Defense, Ground Systems Division located in York, PA. The Low Rate Initial Production (LRIP) awarded 9 Sep 94 with a follow-on award 2 Dec 94. The Hercules M88A1 to M88A2 conversion is a PM Hercules directed program where work is divided between UD and Anniston Army Depot (ANAD) to accomplish the conversion to the M88A2 Hercules Improved Recovery Vehicle. The M88A2 Hercules Heavy Recovery Vehicle (HRV) is a full-tracked armored vehicle used to perform battlefield recovery missions including towing, hoisting, and winching. It is fully capable of recovery support for Abrams series tanks and future heavy combat vehicles. The M88A2 provides the Force XXI maintainer a recovery platform capable of performing a single vehicle tow for M1 series tanks. HERCULES allows maintenance teams to get to the fight and gives them needed capability to perform their mission. The HERCULES is the answer to the current recovery deficiency for M1 series tanks and future heavy combat vehicles. HERCULES is a key enabler for the success of the Force XXI concept of operations and has a separate chapter in the Forward Force Modernization Plan. The Force XXI structure, where manpower and armor quantities are reduced, intensifies the need in an extended battlespace for a single system recovery capability that precludes the use of two vehicle and/or like-combat systems recovery. HERCULES provides this recovery capability, preserving resources and combat power/maneuverability. Within Force XXI, HERCULES will operate as part of the Forward Support Company (FSC) Combat Repair Team (CRT) that provides combined organizational and direct support maintenance to each maneuver company. The CRT is the maneuver battalion’s first level of maintenance support. Deployment of the HERCULES is the CRT’s first step towards restoring combat power to maneuver units. HERCULES is the enabling technology which allows the CRT to reach and retrieve disabled combat vehicles, deliver it to a

location, based on METT-T, where repair can be performed, either by the Forward Repair System or in the Task Force Support Area (TFSA) Unit Maintenance Collection Point. HERCULES in concert with the FRS optimizes CRT maintenance capability. The US Army received its first M88A2 on 11 Jul 97 as the first eight vehicles were handed off to units in the 1st Cavalry Division at Ft. Hood, TX. A total of 46 vehicles were fielded to 1CD by 4QFY99. The first units receiving the 70-ton armored recovery vehicles included the 3rd Squadron, 8th Cavalry and the 215th Forward Support Battalion (FSB) receiving seven and one each respectively. Successfully achieving First Unit Equipped (FUE) represents a critical milestone for any materiel development. For the HERCULES, FUE was accomplished on 31 Jul 97 after the units completed a two and a half week operator and maintenance New Equipment Training (NET) course conducted by the Ordnance Center and School (OC&S) from 14-30 Jul 97. Starting in early April 1999, PM HERCULES initiated total package fielding of 27 vehicles to 4 ID(M), which is receiving HERCULES vehicles over 7 years prior to original fielding plans. HERCULES will be fielded in Armor Bns (7ea), Regimental Cav Sqdn (7ea), Div Cav Sqdn (5ea), Engineer Bns with Grizzly/Wolverine (2ea), and FSB/MSB (1ea). This requires a total of 629 systems. The Force XXI basis of issue is 6 per Forward Support Company (FSC)/Armor Battalion; 4 per Base Support Company (BSC); 1 per Division Support Battalion, 1 per Division Aviation Support Battalion, 7 per Regimental Cavalry Squadron, and 5 per Division Cavalry Squadron. The total Force XXI requirement is 605. The M88A2 is being fielded after years of research, development and testing to ensure the system is safe, operable, maintainable and meets user requirements. Admittedly, not all technical concerns had been fully addressed at the time of initial fielding. However, those that had only been partially met placed no high risk to the user. Of particular concern was the loss of traction when towing an Abrams vehicle on slopes under wet and muddy conditions. Towing was restricted to the use of a braking vehicle, while the PMO assessed various tracks to enhance system performance, with improvements to be addressed as a vehicle retrofit. The M88A2 Traction Enhancement Test teamed engineers from the HERCULES Program Managers office, ATC, and United Defense-Limited Partnership (UDLP). The team was tasked to evaluate proposed changes to the vehicle hardware/suspension that could possibly improve traction of the M88A2 HERCULES and to provide data for input into the modeling effort spearheaded by UDLP. The proposed changes included suspension lockout blocks, re-indexing torsion bars and repositioning of the tow pintle. These changes were designed to enhance the track-to-ground contact and also minimize the squatting effect of the rear of the vehicle during uphill towing. Also, selected track and cleat configurations were evaluated to measure their performance while towing on slopes. The traction enhancement demonstration was conducted at ATC’s Churchville Test Area (CTA), which is located approximately 12 miles north of Aberdeen Proving Ground near the town of Churchville, MD. This facility is APG’s hilly cross-country endurance test area and is used to evaluate the durability of power trains, suspensions, and braking systems of test vehicles as they negotiate (ascending and descending) the various steep hills, with grades up to 29 percent. Testing at CTA consisted of operating on various dirt-surfaced longitudinal grades ranging from 20 to 25 percent. The majority of the demonstrations were conducted on the 24 and 25 percent grades. Effective 10 August 1998, the HERCULES was officially approved for single vehicle tow of the Abrams tank and other 70 ton combat vehicles. As with any new system, there are unforeseen problems, because the M88A2 Heavy Recovery Vehicle System is not the M88A1 Medium Recovery Vehicle System. The HERCULES new main winch has the capabilities of recovering a stuck M1A2, in most cases, using a single line pull. The operating procedures for the main winch are not the same as the M88A1 main winch. Built into the HERCULES main winch are five micro-switches that are designed to protect the main winch from damage. These micro-switches protect the main winch by shutting down the hydraulic system and stopping the winch operations. The PMO was alarmed by a rash of expensive winch failures shortly after fielding at both Ft. Hood and Kuwait. A team of government and contractor experts was assembled to investigate the situation and make recommendations to correct the problem. The root cause of the damage was continued operation of the main winch after the cable mis-wrapped on the drum. The most frequent cause of cable mis-wrap was over-speeding the drum during cable pay out. The variable speed main winch can unwrap the cable faster than the auxiliary winch can pull it out of the vehicle. The team selected four design paths to address the problem. The most promising concept would be to reduce the winch power while in the over-ride mode. It would be better to stall the winch when the cable gets jammed than allow the winch to break itself. The M88A2 road wheel arm hub, bearing and idler arm spindles are built to a closer tolerance than that of the M88A1; therefore, requiring different procedures. As of late 1999 reports from the field indicated that soldiers were ignoring repeated warnings and continue to burn up hub bearings by not following proper procedures.

T-54T Russian Armored Recovery Vehicle

Tiers:

Variants:

- **T-54 (A):** Former East German manufacture. Push/pull bar at front, 1 mt crane, NBC equipment, no winches or spades
- **T-54 (B):** Former East German manufacture. Similar to T-54 (A). Tow cable brackets at hull rear, hull front protective plate, snorkel. No winch or spade.
- **T-54 (C):** Former East German manufacture. Heavy-duty crane, snorkel

System

Alternative Designations: BTS-2 (Medium Tank Towing Vehicle-2)

Recovery

Towing Capacity: mt40

Crane Capacity: mt1

Notes:

The T-54-T armored recovery vehicles are based on modified chassis of the T-54 medium tank. The recovery vehicle variants have a crane able to lift up to 3 MT, a loading platform, and a spade on the rear of the vehicle. They can mount a snorkel for deep fording. Performance figures are the same for the T-54 (and T-55) tanks. They replaced older tank recovery vehicles based on the T-34 chassis.

Wisent 2 German Armored Recovery Vehicle

Tiers:

Variants:

- **Wisent 1:** The Wisent 1 or Bergepanzer Wisent was developed by a German FFG company as a private venture. It is intended mainly for export. It is worth noting that FFG company has considerable experience in the upgrade and overhaul of various armored vehicles. The Wisent 1 evolved from a vehicle, known as the Armored Recovery Vehicle 2000 or ARV 2000.

System

Alternative Designation: Wisent 2
Type: Armored Recovery Vehicle
Manufacturer: German FFG company as a private venture
Crew: ea3
Bucket Capacity: 1.3 m³
Dig Depth: 4.4 m
Lifting Capacity: 32 t
Winch Capacity: 40 t
Towed Load: 62 t
Earth Working Capacity (Dozer): 400 m³/h
Earth Working Capacity (Excavator Arm): 260-300 m³/h
Note: The Wisent 2 is an unusual multi-purpose vehicle. It can be reconfigured from Armored Engineer Vehicle (AEV) to Armored Recovery Vehicle (ARV) in less than 5 hours. The whole concept behind this vehicle is a modular platform, that can be fitted with various add-on and interchangeable equipment.

Dimensions

Length: 10.5 m

Width: 3.54 m

Height: 3.1 m

Weight: 57 t

Automotive

Engine Name: MTU MB 873 Ka501

Engine Type: Diesel

Engine Power: 1 500

Vertical Step: 1.15 m

Trench: 3 m

Fording: 1 m

Main Weapon System

Note: This multi-purpose vehicle can be fitted with remotely-controlled weapon station, armed with a 12.7 mm machine gun for self-defense. This weapon station is optional.

Protection

Hull Armor: The Wisent 2 is based on the Leopard 2 main battle tank. This combat vehicle also has a high level of protection against landmines and improvised explosive devices. It withstands blasts equivalent to 10 kg of TNT under any track location or anywhere under the hull. Interior is lined with a spall liner.

Applique Armor: Available

Mine Clearing: Yes, Add-on passive, or reactive explosive armor can be fitted for even higher level of protection.

NBC Protection: Yes

Smoke Equipment: No

Notes:

WISENT 2 is one of the world’s most advanced multi-functional armored support vehicle, which can be used as an armoured recovery vehicle (ARV) or an armored engineer vehicle (AEV). Developed by Flensburger Fahrzeugbau Gesellschaft (FFG), the vehicle is based on the combat-proven Leopard 2 main battle tank (MBT).

MCRS HEMTT American 8x8 Modular Catastrophic Recovery System (MCRS)

Tiers:

Variants:

- **M977:** The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis.
- **M978:** The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant.
- **M983 Tractor:** The M983 is a tractor unit for use with the trailer-mounted MIM-104 Patriot missile system. It can also be used with the Interim Stryker Recovery System, or other trailers. An earlier variant fitted with a 30 kW generator and crane mounted behind the cab was used to tow the Pershing II Erector Launcher in CONUS (a M1001 MAN tractor was used in West Germany). The M983A2/A4 Light Equipment Transporter (LET) tractor is mainly used to transport construction and engineer equipment. It has a 45,000 lb (20,000 kg)) 2 speed hydraulic winch mounted behind the cab used to load the trailer. It does not have a self-recovery winch.
- **M984A1 Wrecker:** The M984 wrecker is the only HEMTT variant to have been produced in the A1 configuration, and this resulting in the change of recovery crane and retrieval system between A0 and A1 configurations. The current model is the M984A4. Standard equipment includes a 27,240 kg (60,050 lb) capacity two-speed recovery winch, a rear-mounted 11,340 kg capacity vehicle retrieval system, and a 6,350 kg (14,000 lb) at 2.74 m (9.0 ft) capacity Grove materials handling crane. A 9,072 kg (20,000 lb) bare drum capacity self-recovery winch is fitted as standard on the M984.
- **M985 Cargo:** The M985 is available in two variants. The current models are A4; there were no A1 models. The M985 cargo variant is similar to the M977 cargo truck but was developed to support the M270 Multiple Launch Rocket System (MLRS) with a M989A1 HEMAT trailer. It may also used to transport Patriot missiles. The M985 Guided Missile Transporter (GMT) was developed specifically for use with the Patriot system and it can be distinguished easily from

other cargo models by its rear-mounted Hiab 8108/2 materials handling crane

- **Taiwanese RT-2000 Multiple Rocket Launcher:** The RT-2000 [Lit; Ray-Ting-2000 or Thunder -2000] rocket launcher mounted on an M977 chassis. In service about 1997. Can mount any one of three launchers: Mk 15 117-mm, 60 rounds; Mk 30, 30 rounds with HE; AP/AM cluster warhead - >18-mile range; Mk 45 12 rounds, > 27-mile range, GPS targeting. See separate record for details.
- **M1120 HEMTT Load Handling System (LHS):** The M1120 Load Handling System (LHS) variant was initially introduced as part of the HEMTT overhaul/rebuild program, during which returned M977 cargo trucks have their cargo bodies and materials handling cranes removed, to be replaced by a Multilift Mark 5 (now designated MPH165-LHS) LHS, as fitted to the Oshkosh PLS truck.
- **M1977 HEMTT Common Bridge Transporter (CBT):** The M1977 HEMTT Common Bridge Transporter (CBT) is a further development of the M1120 LHS, and in common with the M1120 LHS was initially introduced as part of the HEMTT overhaul/rebuild program. It is used for loading, transporting, and unloading Ribbon Bridge components and bridge erection boats.
- **M1142:** The M1142 is a Tactical Fire Fighting Truck (TFFT) capable of extinguishing aircraft, petroleum, brush, and structural fires at isolated military installations. The TFFT is based on a HEMTT M977A2 chassis with the heavier duty M1120 LHS HEMTT variant rear suspension. The TFFT contract was awarded to Pierce Manufacturing with Oshkosh Corporation as a subcontractor to Pierce.
- **M977 A2 Cargo Truck:** Basic version.
- **M977 A2 EPP:** Electrical power plant.
- **M977 A2 LRPT:** Large repair parts transporter.
- **M978 A2:** Fuel servicing transporter truck tanker.
- **HEMTT M983 A2 LET:** Light equipment transporter.
- **HEMTT M983 A2:** Patriot missile tractor.
- **M984 A2:** Recovery truck.
- **M985 A2:** Cargo and MRLS resupply.
- **M985 A2 GMT:** Guided missile transporter.
- **M1120 A2 HEMTT-LHS:** Heavy expanded mobility tactical truck.
- **M1977 A2 CBT:** Common bridge transporter.

System

Alternative Designation: MCRS

Type: Modular Catastrophic Recovery System

Manufacturer: Oshkosh Corporation

Configuration: 8x8

Family: Heavy Expanded Mobility Tactical Truck (HEMTT)

Crew: ea2

Payload Capacity: This is a multi-component recovery system in U.S. Army service that consists of a M983A4 light equipment tractor; fifth-wheel towing and recovery device; and tilt deck recovery trailer. It can recover and tow a variety of wheeled vehicles in a number of situations. It is a complement to the Army's M984 and M1089 wreckers. The vehicle was initially developed as a Stryker recovery vehicle. The trailer can hold 35 tons, permitting it to handle many of the Army's mine-resistant ambush protected (MRAP) vehicles as well.

Notes:

Modular Catastrophic Recovery System (MCRS) The US Army, with Tru-Hitch Inc., has fielded the Modular Catastrophic Recovery System (MCRS). This system incorporates the Fifth Wheel Towing and Recovery Device (FWTRD), which engages into the Tilt Deck Recovery Trailer (TDRT). This system provides a full range of recovery capability. The Fifth Wheel Towing and Recovery Device (FWTRD) is equipped with a dedicated 35K winch and boom spade caps to provide a stable platform for recovery winching. The prime mover’s heavy duty 45K winch can also be utilized with the FWTRD for winch recovery . The Fifth Wheel Towing and Recovery Device (FWTRD) can lift 32,000 lbs and tow up to 150,000 lb. GCW with optimal weight distribution. The Tilt Deck Recovery Trailer (TDRT) is capable of transporting up to 35 tons and offers high ground clearance and yet low center of gravity. What makes the Tru-Hitch FWTRD unique is that it imposes a downward load on the prime mover at the fifth wheel rather than from behind the prime mover. Thus, towed weight is evenly distributed on all axles of the prime mover. The operator maintains safe steering and braking of the prime mover and the vehicle in tow. Because the load pivots at the fifth wheel, turning ability and off-road mobility are significantly better than that of other recovery systems. The FWTRD can be utilized independently of the Tilt Deck Recovery Trailer (TDRT) to lift tow a full compliment of wheeled vehicles, including MRAP and STRYKER. For recovery, the FWTRD booms with boom caps, are set as spades. The winch cable is fed through a sheave mounted at the top of the FWTRD mast. This high vantage point and extremely stable platform maximize the winches capability. The prime mover’s heavy duty 45K winch, the FWTRD 35K, or a combination of both winches can be utilized for straight pulls. The FWTRD engages into the Tilt Deck Recovery Trailer (TDRT). The axles of the TDRT slide forward allowing the bed to tilt to the rear for loading. Deck width is expandable from 102” to 114” to accommodate wider vehicles. Disabled vehicles are winched onto the TDRT deck. The TDRT deck is specifically designed for severe service. With the TDRT axles slid to transport position, the load is safely moved. Recover, Lift-Tow, Transport. The Modular Catastrophic Recovery System (MCRS)

performs the full range of recovery functions.

Wisent 1 (Bergpanzer Wisent) German Armored Recovery Vehicle

Tiers:

Variants:

- **Wisent 2:** The Wisent 2 armored engineer vehicle was developed by FFG of Germany. This vehicle was aimed to meet requirements of current operations and deployment scenarios in hotspot areas such as Afghanistan and Iraq. The FFG company has considerable experience in the upgrade and overhaul of various armored vehicles. The Wisent 2 is based on the Leopard 2 main battle tank. Development was completed somewhere in 2009.

System

Alternative Designation: Wisent 1; Bergepanzer Wisent
Type: Armored Recovery Vehicle
Manufacturer: German FFG company as a private venture
Crew: ea3
Bucket Capacity: 1.3 m³
Dig Depth: 4.4 m
Lifting Capacity: 30 t
Winch Capacity: 35 t
Towed Load: 50 t
Earth Working Capacity (Dozer): 300 m³/h
Earth Working Capacity (Excavator Arm): 300 m³/h
Front Mounted Dozer Blade: It can be used to clear obstacles and for earthmowing operations. It is also used as an earth anchor to stabilize the vehicle during craning, winching and excavating operations.
ARV: In the ARV role the Wisent 1 can recover damaged, stuck, swamped or overturned combat vehicles on the battlefield. It also tows them to the nearest shelter, or maintenance unit. Vehicle can also provide maintenance service in the field. Crew of the Wisent 1 operate from under armor protection.

Dimensions

Length: 8.2 m
Width: 3.5 m
Height: 3 m
Weight: 47 t

Automotive

Engine Name: MTU MB 838 Ca M500

Engine Type: Diesel

Engine Power: 960

Transmission: INA

Maximum Speed: 65 km/h

Range: 600 km

Gradient: 60%

Side Slope: 30%

Vertical Step: 0.7 m

Trench: 2.5 m

Fording: 1.2 m

Main Weapon System

Note: 1 x 12.7 mm (optional)

Protection

Hull Armor: This multi-purpose combat vehicle has a level of protection, similar to that of the Leopard 1 main battle tank. Vehicle withstands blasts equivalent to 8 kg of TNT anywhere under the hull or under any track location. Interior is lined with a spall liner.

Applique Armor: Available

Mine Clearing: Yes, The Wisent 1 can be also reconfigured for mine clearing role. It can clear pathways through minefields, allowing assault units to pass, before enemy establishes defenses. For this role it can be fitted with a full-width mine plough and a safe lane marking system.

NBC Protection: Yes

Smoke Equipment: No

Notes:

The Wisent is an 8x8 armored logistics vehicle built by Rheinmetall. It is designed to be airlift able by the Airbus A400M. It can be fitted with various modules, for cargo carrying, medical use, troop transport, and so on. The Wisent can also be fitted with various weapons, including an RCWS.

FV106 Samson British Armored Recovery Vehicle

Tiers:

Variants:

- **Scorpion (FV101):** Original variant with 3-man crew
- **Spartan (FV103):** Artillery & engineer vehicle with 3-man crew & 4 dismountable troops; 80 k/hr; 483 km range; 1 7.62-mm MG
- **Striker (FV102):** AT vehicle with 5 Swingfire CLOS ATGMS (5 reloads) & 1 7.62-mm L37A1 MG
- **Scorpion 90:** 3-man crew; 73 k/hr; Cockerill Mk IIIK 90-mm gun & 1 7.62-mm MG
- **Samaritan (FV104):** Ambulance for 4 litter patients, 5 seated patients, or 2 litter/3 seated patients; 2-man crew; 483 km range
- **Sultan (FV105):** Command vehicle with at least 2 radios; total 5-6 personnel; 483 km range
- **Samson (FV106):** 483 km range, ARV with internal main winch, tow bars, & tow cables
- **Scimitar (FV107):** Scorpion with 1 30-mm Rarden L21 rifled gun (165 rounds) & 1 7.62-mm coax MG; 80 k/hr; 644 km range;
- **Scorpion 2:** Description of late production Scorpions with Perkins engine & other upgrades with 2-man turret with 30-mm, 76-mm, or 90-mm main armament options
- **Saber:** Reconditioned recon vehicle with 30-mm Rarden cannon & Hughes 7.62-mm coaxial chain gun
- **Scorpion (Jordan):** Upgraded original Scorpion with Perkins engine & other upgrades
- **Spartan with MILAN ATGM:** 2-round turret must be reloaded from outside the vehicle (11 reloads)
- **Scorpion 90 (Venzeula):** Scorpion 90 with Belgain CMI Defence 90-mm Mk II gun & Perkins engine
- **Sturgeon:** OPFOR vehicle used in Suffield, Canada based on the Spartan
- **Salamander:** OPFOR vehicle used in Suffield, Canada based on the 76-mm Scorpion
- **Scorpion (Malaysia):** Scorpion 90 with 76-mm AGL & Perkins engine
- **Omani Scorpion:** Increased protection package & some received a Cummins diesel engine
- **Scorpion vehicle-mounted automatic mortar FCS:** Fires Denel's 60-mm or BAE Systems' 81-mm L16 mortars
- **CVR(T) Life-Extension Program (LEP):** LEP with diesel engine, better optics & communication

System

Alternative Designations: FV106 Samson
Type: Armored Recovery vehicle
Manufacturer: Alvis Vehicles, Coventry, England
Family: e Combat Vehicle Reconnaissance (Tracked), CVR(T), family

In Service: 1979-? (Great Britain) 1979-Present (see proliferation)

Crew: ea3

Note: The Samson armored recovery vehicle was designed to recover damaged or overturned vehicles on the battlefield. It also provides maintenance service or tows damaged vehicles to maintenance units.

Dimensions

Length: m4.79

Width: m2.36

Height: m2.25

Weight: tons8.7

Ground Pressure: 0.36 kg/cm sq

Track: m1.71

Track Width: m0.43

Ground Clearance: m0.36

Automotive

Engine Name: Cummins BTA 5.9-litre (Diesel)

Type: Diesel

Engine Power: hp195 hp

Cruising Range: 640

Speed, Maximum Road: km/h87

Speed, Average Cross: INA

Speed Maximum Swim: km/h6.4

Gradient: deg60

Side Slope: deg35

Vertical Step: m0.5

Trench: m2

Fording Depth: m1

Fording with Preperation Depth: mAmphibious

Transmission: Self Change Gears TN15X

Suspension: torsion bar, 5 road wheels, front drive, rear idler, 2 hydraulic shock absorbers

Fuel Capacity: 423 liters

Winch: Yes, the winch which is operated at the rear of the vehicle. A hinged spade anchor was designed in two halves to preserve access to the rear door. To winch any heavy vehicles or lighter ones from difficult slopes, it is necessary to lay out several pulleys to get the maximum effect from a fairly low-capacity winch.

Main Weapon System

↳*System*

Name: L43A1 FN MAG, 7.62 mm General-Purpose Machine Gun

Type: 7.62mm General Purpose Machine Gun

Manufacturer: Fabrique Nationale (FNH / FNH UK) and U.S. Ordnance

Proliferation: + 1 Million

Max Rate of Fire: rds/min650-1,000

Length, Total: mm1,263

Length, Barrel: mm630

Width: mm118.7

Height: mm263

Weight: 11.8 kg

Action: Gas-operated long-stroke piston, open bolt

Effective Firing Range (Bipod): 800 m

Effective Firing Range (Tripod): 1,800 m

Maximum firing range: 3,500 m

Feed System: Non-disintegrating DM1 or disintegrating M13 linked belt

Sights: Folding leaf sight with aperture and notch, front blade

NBC Protection System: Yes

Smoke Equipment: 8 Smoke dischargers

Notes:

Based on the Spartan hull, the FV106 is the heaviest Scorpion variant. FV106 Samson is a British Army armoured recovery vehicle, one of the CVR(T) family. The main role of this vehicle is to recover the CVR(T) family of vehicles, but can recover other light tracked vehicles such as the FV430 series. The Samson was conceived in the early 1970s with the final design entering production in 1978. The hull is an all-welded aluminium construction. It usually carries a crew of three operating a 3.5T capstan winch that can also be utilised in a lifting configuration. It carries suitable equipment to enable a 4:1 mechanical advantage with 228m of winch rope. This winch is capable of recovering up to 12 Tonnes of vehicle. A manually operated earth anchor is situated at the rear to anchor the vehicle while operations are carried out. The Samson can be fitted with a flotation screen so it can be operated amphibiously using its own tracks at 6.5 km/h or at 9.6 km/h if also fitted with a propeller kit. The Samson can also be fitted with a full NBC protection unit.

→→Maintenance Support Vehicles

ASLAV-F Australian 8x8 Amphibious Armored Maintenance Support Vehicle

Tiers:

Variants:

- **ASLAV Type I:** The ASLAV Type I is the most numerous type; it is a turreted vehicle derived from the LAV-25 and comes in only one variant.[
- **ASLAV-25 (Reconnaissance):** ASLAV-25 (Reconnaissance) – is an Armoured Car with a crew of three (commander, gunner & driver). The two man turret has day, thermal and infrared imaging weapon systems, a stabilised M242 25mm dual-feed chain gun and two FN MAG 58 7.62 mm machine guns. The ASLAV-25 conducts troop-level tactical reconnaissance and can carry up to six dismounts in the rear.
- **ASLAV Type II:** The ASLAV Type II has no turret and greater internal capacity and is derived from the Canadian Bison Armoured Personnel Carrier. The ASLAV Type II has a crew of two (commander and driver) and is armed with a pintle mounted M2 12.7 mm machine gun. In a number of vehicles, the standard machine gun pintle mount was replaced by a Kongsberg Protector remote weapon station (RWS), which can accommodate either a 12.7 mm machine gun or a Mk 19 40mm automatic grenade launcher. Using a common hull design installed with interchangeable Mission Role Installation Kits (MRIKs), it can be converted into any one of four variants.
- **ASLAV-PC (Personnel Carrier):** is an Armoured Personnel Carrier capable of carrying seven fully equipped troops in support of troop level tactical reconnaissance
- **ASLAV-C (Command):** is an Armoured Command Vehicle, it is equipped with an enhanced radio installation and radio masts, map boards, stowage compartments, specialised seating and an stowable annex. In addition to the crew, the ASLAV-C can accommodate three staff officers and provides command and control at the Squadron and Regimental Headquarter level.
- **ASLAV-S (Surveillance):** is a specialised surveillance vehicle equipped with a hydraulically raised mast mounted thermal imager, laser range finder, day television camera and battlefield surveillance radar RASIT or AMSTAR. The ASLAV-S supports tactical reconnaissance with ground surveillance and observation and can carry four crew and two occasional troops.
- **ASLAV-A (Ambulance):** is an Armoured Ambulance and is fitted with specialist medical equipment and in addition to the crew can accommodate a medic and three lying patients or six sitting patients.
- **ASLAV Type III:** The ASLAV Type III has no turret and is used by members of the Royal Australian Electrical and Mechanical Engineers for repair and recovery. The ASLAV Type III has a crew of two (commander and driver) and usually carries a third mechanic, it is armed with a pintle mounted FN MAG 58 7.62 mm machine gun, although some have been fitted with the Kongsberg Protector RWS. The ASLAV Type III comes in two variants utilising two specialist MRIKs.
- **ASLAV-F (Fitter):** is a maintenance support vehicle that provides a protected mobile workshop for field repair personnel, including vehicle parts and tools, and is fitted with a HIAB 650 crane.
- **ASLAV-R (Recovery):** is an Armoured Recovery Vehicle that is equipped with a heavy winch to recover disabled vehicles to a more accessible location or tow them to a repair facility

System

Alternative Designation: ASLAV-F
Type: Armored Reconnaissance Vehicle
Family: ASLAV

In Service: In the Australian Army, the ASLAV equips the Cavalry Squadrons of the Royal Australian Armoured Corps. A Cavalry Squadron comprises a headquarters element, an echelon and three sabre troops of six ASLAVs, each troop is further broken down into two patrols each comprising two ASLAV-25s and one ASLAV-PC. The ASLAV equips two squadrons from each of the Australian Army's Armoured Cavalry Regiments, the 1st Armoured Regiment in Adelaide, the 2nd Cavalry Regiment in Townsville, and the 2nd/14th Light Horse Regiment (Queensland Mounted Infantry) in Brisbane, as well as the School of Armour at Puckapunyal.

Crew: ea3

Passenger Capacity: ea6

Crane Name: HIAB 650 Special hydraulic crane

Crane Capacity: The Fitters MRIK provides a HIAB 650 Special hydraulic crane with a lift capacity of some 4000kg and which slews approximately 260º.

Maintenance Support Equipment: The Fitters vehicle carries an oxy-acetylene kit, toolboxes, a multi-purpose lifting device for the crane as well as spare parts, enabling power pack and other major assemblies to be changed or repaired in the field.

Dimensions

Length: m6.53.

Weight, Combat: 13.2 t

Automotive

Engine Name: 6V53T

Engine Type: Detriot Diesel

Engine Power: hp275

Range: km660

Speed, Maximum Road: km/h100

Speed, Average Cross: INA

Speed Maximum Swim: km/h10

Gradient: 60

Side Slope: %30

Vertical Step: m0.5

Trench: m2

Fording Depth: mAmphibious

Note: The ASLAV-F is fully amphibious with 3 minute preparation. It is propelled on water by two water jets mounted at the rear of the hull.

Main Gun

↳*System*

Name: M242 25mm Bushranger Chain Gun

Type: 25mm Chain Gun

Caliber: 25mm

Manufacturer: Hughes Helicopters (1981–1985) McDonnell Douglas Helicopters (1985–2002) Alliant Techsystems (2002–2015) Orbital ATK (2015–2018) Northrop Grumman Innovation Systems (2018–present)

In Service: 1981-Present

Proliferation: >11,000

Length: 2,672mm

Barrel Length: 2,175mm

Width: 318mm

Height: 373mm

Weight: 119 kg

Barrels: Single barrel (progressive RH parabolic twist)

Action: Open bolt

Rate of Fire: • Cyclic: 200rpm with 1hp or 500rpm with 8hp

Muzzle Velocity: 1,100 metres per second (3,600 ft/s)

Maximum Firing Range: 6,800 m

Effective Firing Range: 3,000 m

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm25

Shell: 25×137 mm

Basic Load: 720

Notes: A wide range of ammunition has been developed for this weapon, providing it with the capability to defeat the majority of armored vehicles it is likely to encounter, up to and including some light tanks. The ammunition used in the M242 may also be used in a variety of weapons such as the GAU-12 Equalizer, the French Giat M811, or the Swiss Oerlikon KBA weapon system. It has the capability to fire U.S. manufactured ammunition as well as the NATO equivalents thereof. Primarily though, it fires six types of rounds: the M791, M792, M793, M910, MK210, and M919.

Auxiliary Weapon System

↳*System*

Name: Mk 48 Machine Gun

Alternative Designation: Mark 48, or Mk 48, or Maximi

Thermal Sight Gunner: INA

Main Gun Stabilization: INA

Automatic Fire Suppression: Yes

Protection

Hull Armor: Armor of the ASLAV-F provides protection against small-arms fire, mine-blasts and artillery fragments.

Turret Armor: INA. The ASLAV-F is fitted with a two-man turret, similar to that of the LAV-25.

Applique Armor: Protection of this reconnaissance vehicle can be increased by fitting add-on ceramic armor tiles. Vehicle can be also fitted with slat armor, which improves protection against RPG rounds.

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Fitters MRIK provides a HIAB 650 Special hydraulic crane with a lift capacity of some 4000kg and which slews approximately 260º. Two hydraulically operated outriggers are located between the second and third roadwheel stations, and

these provide support during lifting operations. On the right of the hull top, adjacent the crane, is located a stowage box carrying additional stabilisers and stabiliser plates, which can be attached to the rear towing lugs to provide further support during heavy lifting. The Fitters vehicle carries an oxy-acetylene kit, toolboxes, a multi-purpose lifting device for the crane as well as spare parts, enabling power pack and other major assemblies to be changed or repaired in the field. The Australian Light Armoured Vehicle (ASLAV) is an eight-wheeled amphibious armoured reconnaissance vehicle used by the Australian Army. It was built by General Dynamics Land Systems Canada, and developed from the Canadian Army's LAV-25 and Bison armoured fighting vehicles. The ASLAV is a highly mobile, eight-wheel drive, amphibious armoured fighting vehicle that can be deployed by land, sea or air (in Royal Australian Air Force C-130s or C-17s). It is fitted with GPS, an intra-vehicular navigation system and a radio harness capable of supporting HF, VHF, UHF and digital radios. The ASLAV is capable of speeds of 100 km/h (62 mph) and has a maximum range in excess of 660 km (410 mi). The eight-wheel drive provides excellent cross-country mobility and redundancy, the vehicle is capable of operation with only four working wheels, and can continue to operate with eight punctured tyres through the use of solid-core run-flat tyres. It is fully amphibious and is driven in the water by permanent shrouded propellers located at the rear of the hull at speeds of up to 10 km/h (6.2 mph)

M113AS4 AF Australian Armored Personnel Carrier (APC) with Hiab Crane

Tiers:

Variants:

- **M113AS4 AF:** armored fitted, fitted with a Hiab crane. A total of 38 of these vehicles will be delivered.
- **M113AS4 ARVL:** armored recovery vehicle, fitted with a 13 t capacity winch. A total of 12 of these vehicles will be delivered.
- **M113AS4 AA:** armored ambulance. A total of 15 of these vehicles will be delivered.
- **M113AS4 ACV:** armored command vehicle. A total of 43 of these vehicles will be delivered.
- **M113AS4 ALV:** armored logistics vehicle. It can take all types of combat supplies and carry them under armor. A total of 50 of these vehicles will be delivered.

Protection

Hull Armor: Vehicle's hull provides protection against up to 14.5 mm rounds.

Turret Armor: INA

Applique Armor: Protection of the upgraded APC was enhanced by add-on ceramic armor tiles. Hull was reinforced for additional protection against landmines and IED blasts. Interior was fitted with spall liner.

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

M113AS4 AF armored fitted, fitted with a Hiab crane. A total of 38 of these vehicles will be delivered. The M113AS4 is an Australian-made upgrade of the old M113AS1 and M113AS3 which are based on the American M113A1 tracked armoured personnel carrier (APC), one of the most popular light tracked APC in the world. The project of Australian M113 upgrade was leaded by BAE Systems. The decade long project to upgrade 433 M113 vehicles began in 2002, with the first completed vehicle delivered to the customer in January 2007. While the upgraded Australian M113s look similar to how they would have in the 1970’s, they are ‘a generational leap ahead’ with improved firepower, protection and habitability from the original M113 A1 vehicle. The finished vehicles are also more reliable and faster following the upgrade. The Australian Army operates a fleet of some 800 members of the M113 series of full-tracked armoured personnel carriers in different variants including ambulance, fire support, command post, mortar carrier, recovery and load carrier vehicles. The M113AS4 is currently the standard tracked APC of Australian armed forces. The M113 Armoured Personnel Carrier (APC) is an all-terrain vehicle designed to protect and transport its crew and up to ten Infantry personnel. In September 1996, the Australian Department of Defence selected the now Tenix Defence Systems Pty Ltd, Australia to upgrade 364 of the Australian Army's fleet of M113A1 series of full-tracked Armoured Personnel Carriers (APCs) to extend their operational life through to the year 2010.

GCZ-110 Chinese Tracked Multi-Purpose Engineer Vehicle (TMPEV)

Side Slope: 30 percent

Fording, Unprepared: 0.91 m

Fording, Prepared: 1.52 m

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1079 Van is designed to be used as a mobile shop by Direct Support Unit Maintenance contact teams. The M1079 van body is constructed of aluminum and is equipped with 3 double paned windows, blackout shields, double rear doors, removable steps, and an AC/DC electrical junction box and multiple outlets. The van body can be equipped with heater and/or air conditioner. The M1079 can be equipped with a self-recovery winch kit capable of fore and aft vehicle recovery operations. The winch has 308 feet of line capacity and 10,000 pounds bare drum line pull at 110% overload.

ASLAV-A Australian 8x8 Amphibious Armored Ambulance

Tiers:

Variants:

- **ASLAV Type I:** The ASLAV Type I is the most numerous type; it is a turreted vehicle derived from the LAV-25 and comes in only one variant.[
- **ASLAV-25 (Reconnaissance):** ASLAV-25 (Reconnaissance) – is an Armoured Car with a crew of three (commander, gunner & driver). The two man turret has day, thermal and infrared imaging weapon systems, a stabilised M242 25mm dual-feed chain gun and two FN MAG 58 7.62 mm machine guns. The ASLAV-25 conducts troop-level tactical reconnaissance and can carry up to six dismounts in the rear.
- **ASLAV Type II:** The ASLAV Type II has no turret and greater internal capacity and is derived from the Canadian Bison Armoured Personnel Carrier. The ASLAV Type II has a crew of two (commander and driver) and is armed with a pintle mounted M2 12.7 mm machine gun. In a number of vehicles, the standard machine gun pintle mount was replaced by a Kongsberg Protector remote weapon station (RWS), which can accommodate either a 12.7 mm machine gun or a Mk 19 40mm automatic grenade launcher. Using a common hull design installed with interchangeable Mission Role Installation Kits (MRIKs), it can be converted into any one of four variants.
- **ASLAV-PC (Personnel Carrier):** is an Armoured Personnel Carrier capable of carrying seven fully equipped troops in support of troop level tactical reconnaissance
- **ASLAV-C (Command):** is an Armoured Command Vehicle, it is equipped with an enhanced radio installation and radio masts, map boards, stowage compartments, specialised seating and an stowable annex. In addition to the crew, the ASLAV-C can accommodate three staff officers and provides command and control at the Squadron and Regimental Headquarter level.
- **ASLAV-S (Surveillance):** is a specialised surveillance vehicle equipped with a hydraulically raised mast mounted thermal imager, laser range finder, day television camera and battlefield surveillance radar RASIT or AMSTAR. The ASLAV-S supports tactical reconnaissance with ground surveillance and observation and can carry four crew and two occasional troops.
- **ASLAV-A (Ambulance):** is an Armoured Ambulance and is fitted with specialist medical equipment and in addition to the crew can accommodate a medic and three lying patients or six sitting patients.
- **ASLAV Type III:** The ASLAV Type III has no turret and is used by members of the Royal Australian Electrical and Mechanical Engineers for repair and recovery. The ASLAV Type III has a crew of two (commander and driver) and usually carries a third mechanic, it is armed with a pintle mounted FN MAG 58 7.62 mm machine gun, although some have been fitted with the Kongsberg Protector RWS. The ASLAV Type III comes in two variants utilising two specialist MRIKs.
- **ASLAV-F (Fitter):** is a maintenance support vehicle that provides a protected mobile workshop for field repair personnel, including vehicle parts and tools, and is fitted with a HIAB 650 crane.
- **ASLAV-R (Recovery):** is an Armoured Recovery Vehicle that is equipped with a heavy winch to recover disabled vehicles to a more accessible location or tow them to a repair facility

System

Alternative Designation: ASLAV-S

Type: Armored Ambulance

Family: ASLAV

In Service: In the Australian Army, the ASLAV equips the Cavalry Squadrons of the Royal Australian Armoured Corps. A Cavalry Squadron comprises a headquarters element, an echelon and three sabre troops of six ASLAVs, each troop is further broken down into two patrols each comprising two ASLAV-25s and one ASLAV-PC. The ASLAV equips two squadrons from each of the Australian Army's Armoured Cavalry Regiments, the 1st Armoured Regiment in Adelaide, the 2nd Cavalry Regiment in Townsville, and the 2nd/14th Light Horse Regiment (Queensland Mounted Infantry) in Brisbane, as well as the School of Armour at Puckapunyal.

Crew: ea3

Passenger Capacity: ASLAV-A (Ambulance) – is an Armoured Ambulance and is fitted with specialist medical equipment and in addition to the crew can accommodate a medic and three lying patients or six sitting patients.

Name: M242 25mm Bushranger Chain Gun

Type: 25mm Chain Gun

Caliber: 25mm

Manufacturer: Hughes Helicopters (1981–1985) McDonnell Douglas Helicopters (1985–2002) Alliant Techsystems (2002–2015) Orbital ATK (2015–2018) Northrop Grumman Innovation Systems (2018–present)

In Service: 1981-Present

Proliferation: >11,000

Length: 2,672mm

Barrel Length: 2,175mm

Width: 318mm

Height: 373mm

Weight: 119 kg

Barrels: Single barrel (progressive RH parabolic twist)

Action: Open bolt

Rate of Fire: • Cyclic: 200rpm with 1hp or 500rpm with 8hp

Muzzle Velocity: 1,100 metres per second (3,600 ft/s)

Maximum Firing Range: 6,800 m

Effective Firing Range: 3,000 m

Sights: INA

↳*Ammunition*

Type: Rifle

Caliber: mm25

Shell: 25×137 mm

Basic Load: 720

Notes: A wide range of ammunition has been developed for this weapon, providing it with the capability to defeat the majority of armored vehicles it is likely to encounter, up to and including some light tanks. The ammunition used in the M242 may also be used in a variety of weapons such as the GAU-12 Equalizer, the French Giat M811, or the Swiss Oerlikon KBA weapon system. It has the capability to fire U.S. manufactured ammunition as well as the NATO equivalents thereof. Primarily though, it fires six types of rounds: the M791, M792, M793, M910, MK210, and M919.

Smoke Equipment: INA

Notes:

ASLAV-A (Ambulance) – is an Armoured Ambulance and is fitted with specialist medical equipment and in addition to the crew can accommodate a medic and three lying patients or six sitting patients. The Australian Light Armoured Vehicle (ASLAV) is an eight-wheeled amphibious armoured reconnaissance vehicle used by the Australian Army. It was built by General Dynamics Land Systems Canada, and developed from the Canadian Army's LAV-25 and Bison armoured fighting vehicles. The ASLAV is a

highly mobile, eight-wheel drive, amphibious armoured fighting vehicle that can be deployed by land, sea or air (in Royal Australian Air Force C-130s or C-17s). It is fitted with GPS, an intra-vehicular navigation system and a radio harness capable of supporting HF, VHF, UHF and digital radios. The ASLAV is capable of speeds of 100 km/h (62 mph) and has a maximum range in excess of 660 km (410 mi). The eight-wheel drive provides excellent cross-country mobility and redundancy, the vehicle is capable of operation with only four working wheels, and can continue to operate with eight punctured tyres through the use of solid-core run-flat tyres. It is fully amphibious and is driven in the water by permanent shrouded propellers located at the rear of the hull at speeds of up to 10 km/h (6.2 mph)

FV104 Samaritan British Armored Ambulance

Tiers:

Variants:

- **Scorpion (FV101):** Original variant with 3-man crew
- **Spartan (FV103):** Artillery & engineer vehicle with 3-man crew & 4 dismountable troops; 80 k/hr; 483 km range; 1 7.62-mm MG
- **Striker (FV102):** AT vehicle with 5 Swingfire CLOS ATGMS (5 reloads) & 1 7.62-mm L37A1 MG
- **Scorpion 90:** 3-man crew; 73 k/hr; Cockerill Mk IIIK 90-mm gun & 1 7.62-mm MG
- **Samaritan (FV104):** Ambulance for 4 litter patients, 5 seated patients, or 2 litter/3 seated patients; 2-man crew; 483 km range
- **Sultan (FV105):** Command vehicle with at least 2 radios; total 5-6 personnel; 483 km range
- **Samson (FV106):** 483 km range, ARV with internal main winch, tow bars, & tow cables
- **Scimitar (FV107):** Scorpion with 1 30-mm Rarden L21 rifled gun (165 rounds) & 1 7.62-mm coax MG; 80 k/hr; 644 km range;
- **Scorpion 2:** Description of late production Scorpions with Perkins engine & other upgrades with 2-man turret with 30-mm, 76-mm, or 90-mm main armament options
- **Saber:** Reconditioned recon vehicle with 30-mm Rarden cannon & Hughes 7.62-mm coaxial chain gun
- **Scorpion (Jordan):** Upgraded original Scorpion with Perkins engine & other upgrades
- **Spartan with MILAN ATGM:** 2-round turret must be reloaded from outside the vehicle (11 reloads)
- **Scorpion 90 (Venzeula):** Scorpion 90 with Belgain CMI Defence 90-mm Mk II gun & Perkins engine
- **Sturgeon:** OPFOR vehicle used in Suffield, Canada based on the Spartan
- **Salamander:** OPFOR vehicle used in Suffield, Canada based on the 76-mm Scorpion
- **Scorpion (Malaysia):** Scorpion 90 with 76-mm AGL & Perkins engine
- **Omani Scorpion:** Increased protection package & some received a Cummins diesel engine
- **Scorpion vehicle-mounted automatic mortar FCS:** Fires Denel's 60-mm or BAE Systems' 81-mm L16 mortars
- **CVR(T) Life-Extension Program (LEP):** LEP with diesel engine, better optics & communication

NBC Protection: INA

Smoke Equipment: INA

Notes:

Rugged and resilient, the M997A3 is an ambulance configuration of the Humvee family. Equipped with advanced armor protection, these combat ambulances were built to reliably transport causalities from the battlefield to medical aid stations. Capable of transporting up to four litter patients, eight ambulatory patients—or a combination of both—as well as medical personnel, equipment and a driver, the M997A3 is dependable in the face of danger. The ambulance can be heated, ventilated or air conditioned, depending on environmental conditions. For operation in a nuclear, biological or chemical (NBC) environment, the M977A3 can be equipped with a Gas-Particulate Filter Unit (GPFU) with heaters capable of supporting up to seven personnel equipped with either M25 series protective masks or M13 series patient-protective masks. The GPFU sends temperature-controlled, filtered air to individual face masks, increasing protection, making breathing easier and reducing stress and heat fatigue during extended periods of NBC operation.

Bv206A Swedish Amphibious Tracked Armored Ambulance

Tiers:

Variants:

- **Bv 206A:** Ambulance version, which is capable of carrying stretchers in the rear compartment.
- **Bv 206F:** Firefighting vehicle
- **RaBv 2061:** Swedish Army communications/command version, fitted with radio equipment and workplaces for staff members.
- **PvBv 2062:** Swedish Army anti-tank vehicle, an open top version of the Bv 206 armed with a 90 mm Pvpj 1110 recoilless anti-tank gun.
- **PvBv 2063:** Swedish Army anti-tank vehicle, similar to PvBv 2062, but fitted with the launch system for an ATGM, either the TOW (Rbs 55) or the Bofors BILL (Rbs 56).
- **Bv 206S:** The Bv206S is an armored personnel carrier variant of the Bv 206, which provides protection from small arms fire for the occupants. It is in service with the armed forces of France, Germany (379 Bv 206D/S ordered), Spain, Netherlands, Italy (189 units), Sweden (50 units), Greece (Bv 208) and Singapore (300 units), which has replaced it with the Bronco All Terrain Tracked Carrier. Using a Steyr M1-"Monoblock" engine (6-cylinder, 130 kW), the vehicle can carry the driver and 12 combat-equipped troops — four in the front compartment and eight in the rear. The Bv 206S can be slingloaded by Boeing CH-47 Chinook and Sikorsky CH-53E Super Stallion helicopters or carried in the C130 Hercules.

System

Alternative Designation: Small Unit Support Vehicle (SUSV)

Description: Amphibious Armored Ambulance

Bodies: Fiberglass reinforced with PVC foam insulation

Crew: ea1

Passengers: ea11

Forward Car: The forward car accommodates the driver and three combat troops.

Rear Car: The rear car carries eight fully equipped troops or up to 6 stretchers

Airlift Capable: Yes, The unladen Bv206S can be underslung and air lifted by a Boeing Chinook CH-47 and a Sikorsky Super Stallion CH-53 helicopters. The vehicle is air transportable in the C-5A Galaxy (ten vehicles), C-17A Globemaster (six vehicles), C-130 Hercules (one or two vehicles), C-160 Transall (one vehicle), A400M (two vehicles), CH-47 helicopter (one vehicle) and CH-53 helicopter (one vehicle).

Note: The vehicle provides high mobility and ballistic protection and is available as an armoured personnel carrier, cargo carrier, battlefield ambulance, mortar carrier, command post vehicle and recovery vehicle.

Engine Type: Steyr M16 six-cylinder in-line, 3,200cc, direct injection diesel engine provides 130kW power at 4,000rpm and 350Nm torque at 2,300rpm. The power to weight ratio is 19.42hp/t.

Engine Power: hp115

Transmission: Mercedes Benz W5A-580 automatic transmission has five forward and one reverse gear.

Range, Cruising: km300

Speed, Maximum Road: km/h52

Speed, Maximum Swim: km/h4.7

Fording Depth: mAmphibious

Temperature Range: degreesThe vehicle operates in temperatures from -32°C to +46°C, from Arctic to desert and jungle conditions.

Grade, hard surface: %60

Grade, Deep Snow: %30

Turning Radius: m8

Main Weapon System

Note: The Bv206S can be equipped with a ring mount for a 7.62mm or a 12.7mm machine gun. Missiles and other weapon systems can be carried in the vehicle. A mortar carrier variant of the vehicle is available.

Protection

Armor: The vehicle is fitted with all-welded steel armour and the windows of the vehicle provide the same level of protection against direct fire 7.62mm ball ammunition and artillery shrapnel.

Armor, Applique: mmAvailable

Armor, Explosive Reactive: mmNo

Active Protection System: No

NBC Protection: Yes

Smoke Equipment: Yes

Automated Fire Detection and Extinguishing System.: Yes

Notes:

he Bv206A is an ambulance version of the Bv 206 and is capable of carrying stretchers in the rear compartment. Bandvagn 206 (Bv 206) is a tracked articulated, all-terrain carrier developed by Hägglunds (now part of BAE Systems Global Combat Systems) for the Swedish Army. It consists of two units, with all four tracks powered. It can carry up to 17 people (6 in the front compartment, 11 in the rear), and the trailer unit can be adapted for different uses (see Variants section).

YPR-765 PRGWT Danish Armored Medical Evacuation Vehicle (AMEV)

Tiers:

Variants:

- **EIFV:** Holds only 6 soldiers that can dismount; M242 Bushmaster 25-mm gun with 900 rounds of ammo; BGM-71 TOW AT weapon with 6 rounds; M240 Machine Gun with 4400 rounds
- **Mortar Prime Move (Netherlands: YPR 765 PRMR):** Tows the 120-mm Thomson-Brandt mortar with crew of 7
- **Cargo Carrier (Netherlands: YPR 765 PRVR-A/B):** Crew of 2 can carry cargo into the combat zone
- **TOW Missile Carrier (Netherlands: YPR 765 PRAT):** Similar to the US M901 ITOW variant of the M113 with an Emerson TOW AT system
- **Ambulance (Netherlands: YPR 765 PRGWT):** Unarmed variant with a crew of 4
- **Bn Command (Netherlands: YPR 765 PRCO-C1):** Specialized for infantry battalion commanders
- **Bn Gunnery Center (Netherlands PRCO-C2):** Specialized for use by artillery battalions
- **Mortar Fire-Control Vehicle (Netherlands PRCO-C3):** Specialty vehicle to control indirect mortar fire
- **Anti-Aircraft Control Vehicle (Netherlands PRCO-C4):** Specially designed for air defense command & control
- **YPR 765 PRCO-C5 (Netherlands):** Observation vehicle with only a 4-man crew
- **YPR 765 PRRDR (Netherlands):** Operated the British ZB 298 battlefield surveillance radar
- **YPR PRRDR-C (Netherlands):** Radar/Command Vehicle
- **YPR 765 PRI/I (Netherlands):** Squad vehicle with M113 cupola, M2 HB MG, 9 soldiers, & driver
- **YPR 806 PRBRG (Netherlands):** Recovery vehicle with HIAB crane, crew of 4, & 8 smoke grenade launchers
- **YPR-2000 (Netherlands):** Upgrade included more storage containers
- **Command Vehicle:** Room for 9-man crew with additional communication equipment
- **AIFV-B (Belgium):** 40-caliber MG, NBC protection, & Halon fire-extinguishing system
- **AIFV-B-CP (Belgium):** Pintle-mounted 12.7-mm MG, crew of 7, NBC protection, & Halon fire-extinguishing system
- **Philippine Variant:** Converted to accept 50-caliber MG ILO 25-mm cannon
- **YPR-765 KMAR Military Police Vehicle:** YPR-765 PRI/I modified for use by military police
- **Turkish ACV:** See separate vehicle for the FNSS IFV

System

Notes:

YPR-765 prgwt (pantser-rups-gewondentransport) — armored medical evacuation vehicle (AMEV); unarmed; crew of three plus five passengers; rear compartment has two forward-facing seats on the left, bins for the personal equipment of the wounded on either side, and can hold two stretchers on either side, suspended from chains. The vehicle is equipped with a diesel-heater. The AIFV (Armored Infantry Fighting Vehicle) is a tracked light armored vehicle that serves as an infantry fighting vehicle (IFV) in the armies of several countries. It is a development of the M113A1 armored personnel carrier. The hull of the vehicle is made of welded aluminum, with spaced steel laminate armor bolted onto the side and front. The voids of the armor are filled with polyurethane foam, which gives the vehicle extra buoyancy when travelling in the water. Original production AIFV's can swim without deploying flotation curtains, using only a large front-mounted trim vane; they are propelled in the water by their tracks. The engine sits on the front right of the hull, behind a hatch that can be used to remove the complete powerpack. The powerpack is similar to the M113A1, except for a larger radiator capacity and turbocharger. The transmission is also fitted with heavy duty components from the M548 tracked cargo carrier. Immediately to the left of the engine is the driver, above whom is a hatch that opens to the right. The driver has four M27 day periscopes. The driver's center periscope can be replaced by a passive infra-red periscope for night driving. The commander sits immediately behind the driver, and has a cupola that can be completely traversed. The cupola has five periscopes, four of which are M17 day periscopes, the fifth has 1x to 6x variable magnification. The turret is fitted on the right side of the hull behind the engine. The turret, which has electro-hydraulic traverse, can elevate from -10 to +50° and can traverse and elevate at a speed of 60°/sec. The turret mounts an Oerlikon Contraves 25 mm KBA-B02 cannon with a dual ammunition feed and 180 rounds of ready use ammo, with another 144 rounds stored in the hull. Mounted to the left of this gun is a 7.62 mm FN MAG machine gun, which has 230 rounds of ready ammo, with a further 1,610 in the hull. There is a six-barrel smoke discharger mounted at the front, just above the large trim vane. The troop compartment is at the rear of the hull; a large power operated ramp allows access through the rear of the vehicle, a door is also provided in the ramp. Additionally a single piece hatch covers the top of the troop compartment. The compartment contains seven troops in the Dutch variant, with six sitting back to back facing outwards and a single passenger sitting between

the command and the turret facing backwards. There are two firing ports in each side of the hull and a single firing port in the rear. The side firing ports are provided with M17 periscopes, the rear one is fitted with an M27 periscope.

Type 85 (Type WZ751) Chinese Amphibious Armoured Ambulance

Tiers:

1 2 **3** 4

Variants:

- **Type 85/YW 531H:** Domestic/export base model
- **YW703H:** Command variant
- **Type 85 Armored Command Vehicle:** 2-man crew, 6 staff, additional communications equipment, & fewer ammunition rounds; used at regimental or division level
- **Type 85 Recovery Vehicle:** 1000 KG crane with 5-man crew
- **Type 85 Maintenance Engineering Vehicle:** Similar to the WZ 751 (ambulance), but for support
- **Type 85 Mortar Carriers:** 82-mm & 120-mm variants similar to the YW 531
- **WZ 751 Armored Ambulance:** 2-man crew with space for 4 litter or 8 seat patients; 12.7-mm MG
- **Type 85 SP Howitzer (Type 70-1/YW 302):** Type 54-1 122-mm howitzer on Type 85 chassis
- **Type 85 ATGM Launcher Vehicle:** Railed hull with 4-rail Red Arrow-8 SACLOS wire-guided ATGM
- **YW 307 IFV:** Type 89 with a 25-mm cannon similar to the Bushmaster & the 7.62-mm coaxial MG
- **YW 309 Infantry Combat Vehicle (ICV):** 3-man crew, 73-mm low pressure main gun, 7.62-mm coaxial MG & Red Arrow 3 ATGM
- **HJ-8 Anti-Tank Vehicle:** AT traversable launcher with 4 HJ-8 ATGMs & 4 loads in storage in the hull
- **NVH-1:** Joint Chinese/British variant with 25-mm gun
- **Type 90:** Updated design with reduced height, improved hull shape, & better transmission
- **Thai versions:** Similar to the Chinese variants, but armed with a M-2HB MG
- **Artillery Command Post Vehicle:** YW 531H modified with a raised rear superstructure
- **YW 306:** 130-mm MRL platform
- **Type 89 (YW 534/WZ 534):** Improved power pack & night vision equipment for domestic use & export with longer & wider chassis, improved engine, & mobility

Notes:

Type 85 Tracked Armoured Ambulance or Type WZ751 - Unarmed ambulance with a higher roofline. This is also based on the YW 531 H but has a new and raised hull rear and a new larger commander's cupola to the rear of the driver which is fitted with an externally mounted 12.7 mm anti-aircraft machine gun. This has a crew of two and also carries two medical personnel plus four stretcher patients, eight seated patients or two stretcher patients and four seated patients. In addition to the stretchers, a medical kit, a splint box and an oxygen supply are carried and standard equipment includes an air conditioning system. Loaded weight is 13,800 kg. This is now called the Tracked Armoured Ambulance Type 85. The YW531H Type 85 Chinese Armored Personnel Carrier s a tracked armoured fighting vehicle produced by Chinese company Norinco (industrial index: Type YW531H). It is an improved version of the Type 63 armoured personnel carrier. The vehicle is bigger, has additional firing ports and periscopes, a longer chassis with an additional road wheel on each side, and is equipped with an NBC protection system. The Type 85 series was developed in 1985, exclusively for the export market; for the PLA, the very similar Type 89 AFV was designed. The main user of the Type 85 series are the Royal Thai Armed Forces who received their first vehicles in 1987. The hull is made of welded steel, and provides protection against small arms fire. The vehicle carries a maximum of 15 including crew. The driver sits in the front left of the hull, and has a single piece hatch, which opens to the left. The driver is provided with two day periscopes which cover the front and right of the vehicle. One of the drivers periscopes can be replaced by a night vision device. The commander sits behind the driver and has a single piece hatch. The air-cooled, turbocharged diesel engine sits to the right rear of the driver. It has a large intake located in the top of the hull, with an exhaust on the right hand side. The engine feeds a manual transmission with five forward gears and one reverse gear. Track is driven at the front by a drive sprocket, and passes over five dual rubber-typed road wheels and track-return rollers, then loops over an idler at the rear, before returning to the front again. A 12.7 millimetre calibre machine gun with armoured shields is located in an open mount at the front of a small hatch in the center of the hull which opens into the troop compartment. The gun can traverse through 360 degrees and can be elevated to an angle of 90 degrees. A total of 1,120 rounds is carried on board. Two oblong roof hatches

and a large rear door provide access to the troop compartment. On either side of the forward hull, a cluster of four 76 mm smoke grenade dischargers is mounted. The vehicle is amphibious, a folding trim board stowed at the front of the hull needs to be raised, and the vehicle can then propel itself in the water using its tracks. Standard equipment includes an NBC system, a Type 889 or VRC-83 radio, and a Type 803 intercom system.

BMM-3 Russian 8x8 Amphibious Armored Mobile Dressing Station

Tiers:

Variants:

- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)

System

Alternative Designation: BMM-3

Description: 8 X 8 wheeled Mobile Dressing Station

Chassis: BTR-80

Crew: ea3

Note: The equipment and medicine set ensures the delivery of first aid at stationary position and on the move. The vehicle has a folding tent to be attached to the vehicle at any side door. Up to 12 casualties can be accommodated in the tent.

Thermal Sight Gunner: INA

Main Gun Stabilization: No

Protection

Hull Armor: The vehicle protects the occupants from 14.5mm-calibre ammunition, armour-piercing rounds and incendiary rounds. It can withstand the impact of 8kg TNT explosion under the floor and 10kg TNT explosion under the wheels. The vehicle offers STANAG 4569 level III protection against anti-personnel and anti-tank mines, as well as improvised explosive devices (IEDs). The V-shaped hull reduces the blast impact by deflecting the kinetic objects away from the hull in the event of TNT device explosion anywhere under the bottom of the vehicle. The hull is hinged with sandwich armour, comprising conventional internal steel armour and new-generation external ceramic armour.

Applique Armor: INA

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: INA

Notes:

The Med-Evac version using the K-53949 chassis is named Linza. Linza can transport up to 10 wounded soldiers. Kamaz-53949 Typhoon-K is a 4×4 mine-protected armored vehicle manufactured by Remdiesel, a subsidiary of KAMAZ, to meet the requirements of armed forces and special units worldwide. The vehicle was recently displayed at the International Military-Technical Forum ARMY-2017 held in Moscow, Russia, in August. Russian state-owned arms exporter Rosoboronexport and Remdiesel signed an agreement to promote the vehicle in export markets across the North Africa, Middle East, Central and South East Asia, Latin America and Commonwealth of Independent States (CIS) regions. The Typhoon-K is primarily used to safely transport troops and military cargoes in mine-inflated zones. It can also be configured as a command post vehicle, ambulance and logistics support vehicle. Kamaz-53949 design The Typhoon-K is based on the common chassis utilized by the Kamaz family of all-wheel drive medium and heavy-duty vehicles. The vehicle also shares most of the components and assemblies with the other platforms in the family. The vehicle accommodates two crew members and eight fully equipped troops. The hull features four side doors and a rear door. The roof is fitted with two hatches for observation, firing and emergency exit purposes. The Kamaz-53949 vehicle measures 6.7m-long, 2.5m-wide and 2.8m-high. It has a curb weight of 13,700kg and can carry a payload of 2,000kg. The vehicle also features a signature reduction package, an all-around video surveillance system and an automatic fire-extinguishing unit. Armament of Kamaz-53949 Typhoon-K The Kamaz-53949 is fitted with a stabilized remotely controlled weapon station (RCWS). The RCWS can be armed with medium-to-heavy machine guns, including a 7.62mm medium machine gun (MMG) or a 12.7mm / 14.5mm heavy machine gun (HMG).

Computerized FCS: No

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Main Gun Stabilization: INA

Protection

Hull Armor: Vehicle's hull provides protection against up to 14.5 mm rounds.

Turret Armor: INA

Applique Armor: Protection of the upgraded APC was enhanced by add-on ceramic armor tiles. Hull was reinforced for additional protection against landmines and IED blasts. Interior was fitted with spall liner.

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

M113AS4 AA armored ambulance. The M113AS4 is an Australian-made upgrade of the old M113AS1 and M113AS3 which are based on the American M113A1 tracked armoured personnel carrier (APC), one of the most popular light tracked APC in the world. The project of Australian M113 upgrade was leaded by BAE Systems. The decade long project to upgrade 433 M113 vehicles began in 2002, with the first completed vehicle delivered to the customer in January 2007. While the upgraded Australian M113s look similar to how they would have in the 1970’s, they are ‘a generational leap ahead’ with improved firepower, protection and habitability from the original M113 A1 vehicle. The finished vehicles are also more reliable and faster following the upgrade. The Australian Army operates a fleet of some 800 members of the M113 series of full-tracked armoured personnel carriers in different variants including ambulance, fire support, command post, mortar carrier, recovery and load carrier vehicles. The M113AS4 is currently the standard tracked APC of Australian armed forces. The M113 Armoured Personnel Carrier (APC) is an all-terrain vehicle designed to protect and transport its crew and up to ten Infantry personnel. In September 1996, the Australian Department of Defence selected the now Tenix Defence Systems Pty Ltd, Australia to upgrade 364 of the Australian Army's fleet of M113A1 series of full-tracked Armoured Personnel Carriers (APCs) to extend their operational life through to the year 2010.

Bushmaster Australian 4x4 Armored Ambulance

Tiers:

Variants:

- **Planned Variants:** ADI (now Thales Australia) planned at least six variants. These included an armored ambulance; command vehicle; mortar carrier with internally mounted 81-mm or 120-mm weapon; fire support vehicle with 12.7-mm machine gun and 40-mm automatic grenade launcher; engineering vehicle; and firefighting vehicle.
- **Bushmaster ambulance:** This variant can transport two stretchered patients, or one stretchered and four seated patients at one time. They are equipped with the latest medical equipment and provide protection against blasts and ballistic threats.
- **Bushmaster EOD:** The Bushmaster explosive ordinance disposal (EOD) variant is fitted with a 27 ft 11 in (8.5 m) interrogator arm with a 225-degree arc of operation around the front of the vehicle. The arm can be installed onto any existing Bushmaster vehicle to modify it into an EOD variant. The two-piece articulated arm can include the following attachments: interrogation tool with clasp claw; work light; camera; detection equipment; and proximity detector. The vehicle can also be fitted with a roller clearance system that is hydraulically operated, steerable and easily attached and released. An EOD robot can also be stored internally .
- **Bushmaster combat support vehicle:** Thales Australia privately developed a prototype Bushmaster combat support vehicle in 2005. It was previously known as the Copperhead . This 4 x 4 vehicle features the Bushmaster cab at the front, with a flat-bed cargo area at the rear, which can carry up to 11,000 lb (5,000 kg) of cargo. The cargo area measures 101 sq ft (9.4 sq m). Upgradeable ballistic protection options are available for the crew cabin. The vehicle has a top speed of 60 mph (100 km/h) and a maximum range of 500 mi (800 km). It also offers high clearance for obstacles, tight turning circle and the ability to travel off-road in all conditions, according to the manufacturer. A dual-cab variant, offered for the British operational utility vehicle system (OUVS) program, featured a larger interior cabin with room for two crew and up to six passengers with four side-opening passenger doors and a flatbed area of 54 sq ft (5 sq m) and a 6,600-lb (3,000-kg) payload.
- **Bushmaster 6 x 6:** Thales Australia has conducted studies of a 6 x 6 version of the Bushmaster, which would have a gross vehicle weight of up to 25.6 tons.

System

Alternative Designation: Bushmaster Armored Ambulance

Type: Protected Mobility Vehicle

Crew: ea2 (commander, driver)

Passenger Capacity: This variant can transport two stretchered patients, or one stretchered and four seated patients at one time.

Dimensions

Length, Overall: 6.60 m

Length, Hull: 7.09 m

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: 8 x grenade launchers (bank of 4 on each side of vehicle hull)

Notes:

Bushmaster ambulance This variant can transport two stretchered patients, or one stretchered and four seated patients at one time. They are equipped with the latest medical equipment and provide protection against blasts and ballistic threats. The Bushmaster Protected Mobility Vehicle or Infantry Mobility Vehicle is an Australian-built four-wheel drive armoured vehicle. The Bushmaster was primarily designed by the then government-owned Australian Defence Industries (ADI), and is currently produced by Thales Australia with a support contract provided by Oshkosh Truck following the acquisition of ADI. The Bushmaster is currently in service with the Australian Army, Royal Australian Air Force, Royal Netherlands Army, British Army, Japan Ground Self Defense Force, Fiji Infantry Regiment, Jamaica Defence Force and the New Zealand Army. The role of the Bushmaster is to provide protected mobility transport (or protected troop lift capability), with infantry dismounting from the vehicle before going into action. As the Bushmaster is only lightly armoured, the term Infantry Mobility Vehicle (IMV) was initially adopted to distinguish it from a heavier wheeled or tracked armoured personnel carrier, such as the ASLAV and M113 also in Australian service. Later the Bushmaster's designation was changed to Protected Mobility Vehicle (PMV). The Bushmaster is optimised for operations in northern Australia, and is capable of carrying up to 9 soldiers and their equipment, fuel and supplies for 3 days, depending on the type of variant. The vehicle is fitted with air conditioning and was once planned to have a cool water drinking system, but was omitted upon production due to cost constraints. After operational complaints the drinking water cooling system is being reconsidered for installation. It has a road cruise speed of 100 km/h and an operational range of 800 km. The Bushmaster is a mine protected vehicle and provides a high degree of protection against land mines, using its v-hull monocoque to deflect the blast away from the vehicle and its occupants. The vehicle's armour provides protection against small arms of up to 7.62 mm ball ammunition, 81mm mortar fragments, Claymore mines, and with additional applique armour, protection for armour-piercing ammunition of up to 7.62mm. The fuel and hydraulic tanks of the vehicle are located outside the crew compartment, while it also has an automatic fire suppression system. The troop carrier variant of the Bushmaster is fitted with one gun ring. The forward gun ring can be fitted with a 5.56 mm or 7.62 mm machine gun. The two rear hatches each have a mounting boss to allow the attachment of a swing mount capable of holding a 7.62 mm machine gun. The Bushmaster is air transportable by C-130 Hercules, C-17 Globemaster III and Mil Mi-26 aircraft. It is the first armoured vehicle to be designed and completely manufactured in Australia since the Sentinel tank during World War II.

Nimr Hafeet Emirati 6x6 Armored Ambulance

Tiers:

1 2 3 4

Variants:

- **HAFEET 620:**
- **HAFEET 620A:** Logistics and Utility Vehicle
- **HAFEET 640A:** Artillery Support Vehicle (Observation and Command & Control configurations)

Protection

Armor: The Hafeet Class features variants with a high degree of protection to enhance survivability of the crew to attack from roadside IEDs, under-vehicle mines and ballistic threats. The Hafeet Class vehicles can be armored with different level of ballistic and blast protection depending on the variant and customer needs. The vehicles can receive standard ballistic protection up to STANAG level IV and standard blast protection up to STANAG level III (a,b).
Applique Armor: Available, There are numerous versions of the Nimr Hafeet. Due to its modular nature the vehicle can be configured to suit various battlefield roles.
Explosive Reactive Armor: No
Active Protection System: INA
NBC Protection: Optional
Smoke Equipment: Available, smoke grenade dischargers
Fire Suppression System: Yes
Protective Net: Protective net against anti-tank rocket launchers
Battle Field Management System: Available

Notes:

The Nimr Hafeet 6x6 Armored Ambulance is the medical version of the Nimr Hafeet 620. The HAFEET Class of 6x6 vehicles provides a multipurpose platform for all military requirements at 13,000 kg capacity from utility vehicles to fully protected patrol vehicles. A universal 6x6 chassis is utilised for a common logistic basis. All vehicles in the HAFEET Class can be protected, and specific protected models are included for crew survivability with fully tested and certified cabins. The main role of the Hafeet is to provide troops with logistical and utility support. Also there are some specialized versions of this vehicle. It is a purpose-designed military vehicle, which can operate in demanding conditions. It has good cross-country mobility and can travel over difficult terrain. The Hafeet has a payload capacity and size of a light truck. However due to its military nature the Hafeet can withstand heavy use or even abuse, far exceeding that of militarized commercial vehicles, or those based on commercial drivelines. Most versions of the Hafeet can carry loads with a maximum weight of 2 400-5 000 kg. This military vehicle can also tow trailers and light artillery pieces. There are 2-, 3- or 4-door versions of the Hafeet. All versions can be armored. The armored cab provides protection for the passengers against small arms fire and artillery shell splinters, mines and improvised explosive devices.

UAZ-452A Russian 4x4 Ambulance

Tiers:

System

Alternative Designation: UAZ-452A

Type: Ambulance

Manufacturer: Ulyanovsk Automobile Plant

Family: UAZ

Crew: ea1

Passenger Capacity: The van could seat up to 4 stretchers or 6 on the benches and one accompanying both. The vehicle was not comfortable for people on the move, as suspension in the submodel remained that of the standard model, but this van was, and in many places is still the only ambulance vehicle that can reach some of the most remote places.

Note #1: Vehicles produced between 1965–1979 were equipped with old-style lights: turn signal lights were colorless (white), rear lights were round, and the back of the body was rounder. Subsequent post-1979 models got amber (yellow) signal lights, and rear lights were slightly bigger and rectangular.

Dimensions

Length: 4360 mm

Applique Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

UAZ-452A – ambulance, aka "санитарка" (Sanitarka - the medic lady), popularly nicknamed the "таблетка" (tabletka - "tablet" or "pill"). The van could seat up to 4 stretchers or 6 on the benches and one accompanying both. The vehicle was not comfortable for people on the move, as suspension in the submodel remained that of the standard model, but this van was, and in many places is still the only ambulance vehicle that can reach some of the most remote places. The UAZ-452 is a family of off-road vans produced at the Ulyanovsk Automobile Plant (UAZ) since 1965. Its predecessor model UAZ-450 (produced between 1958-1966) was based on the chassis and engine of the four-wheel drive light truck GAZ-69, and was the first "forward control" vehicle of this type to be built in the Soviet Union and Russia. Vehicles produced between 1965–1979 were equipped with old-style lights: turn signal lights were colorless (white), rear lights were round, and the back of the body was rounder. Subsequent post-1979 models got amber (yellow) signal lights, and rear lights were slightly bigger and rectangular. In 1985 the van was upgraded and spun off into separate submodels: 39625, 3962, 3303, 3909 and 2206. The upgrade consisted of lighting fixtures that met modern international requirements, alarms, a new instrument panel, and a new speedometer. The brakes were redesigned. The engine was also upgraded, and its power output increased to 99 hp against the previous 78 hp. In the early 2000s, the model was given new plastic side mirrors taken from the GAZ GAZelle van, headrests on front seats; and new passenger seats for a minibus version (2206) were also given headrests. The pickup truck (version 3303) was fitted with a metal body instead of a wooden one.

XA-185 Finish 6x6 Amphibious Armored Ambulance

Tiers:

Variants:

- **XA-180:** Original six wheeler, carries crew of 2 and 16 troops. Empty weight ca 12 tonnes.
- **XA-185:** Upgraded version, carries crew of 2 and 18 troops. Has a more powerful engine and improved power transmission. Used as an ambulance in the Norwegian Army.
- **XA-186:** Upgraded armour. Armoured and equipped with machine-assisted gun turret (.50 BMG). Cannot swim because of the heavy armour. Empty weight ca 19 tonnes. Engine and transmission same as XA-185.
- **XA-188:** Used by the Netherlands Army.
- **XA-200:** The 200 series looks a little different from older variants due to increased armour. It lacks amphibious capabilities but can wade through water that is up to 1.5 m deep. The improved armour protects the passengers against up to 14.5 mm small arms fire. It is also equipped with modern optical aids like periscopes and night vision. The armor upgrade was initiated after the realisation that the previous armor was inadequate, even modern armor-piercing 7.62 mm ammunition could pierce the older XA-180 and XA-185 models in certain areas. The XA-202 was originally developed for Communications and Command. The XA-203 was made as a temporary replacement for XA-185, and is intended to be replaced by Patria AMVs in Finnish service. The Patria AMV (Armored Modular Vehicle) is an 8×8 multi-role military vehicle produced by the Finnish defence company Patria.

System

Alternative Designation: XA-185 Ambulance
Type: 6x6 Amphibious Armored Ambulance
Manufacturer: Patria Vehicles Oy, Hameenlinna, Finland
Family: XA Series
Crew: 2 (commander, driver)
Passenger Capacity: 10 Troops

Dimensions

Length: 7.35 m
Width: 2.90 m
Height: 2.30 m
Distance between a Axles, 1st to 2nd: 1.90 m
Distance between a Axles, 2nd to 3rd: 1.90 m
Tire Size: 356 x 508 mm
Ground Clearance: 0.40 m

Combat Weight: 15,000 kg

Unloaded Weight: 12,000 kg

Payload Weight, Road: 6,500 kg

Payload Weight, Cross-Country or Swimming: 3,000 kg

Automotive

Engine Name: 1 x Valmet 612 DWI

Engine Type: 451-cu in (7.4-l) liquid-cooled, turbocharged, 4-stroke, 6-cyl inline diesel

Engine Power: 271 hp (202 kW) at 2,500 rpm

Power-to-Weight Ratio: 16.0 hp/metric ton

Transmission: Allison automatic MD 3560P

Suspension: 6 x 6 (6 wheels driving, 4 wheels steering); beam axles, leaf springs and shock absorbers on each wheel station

Maximum Road Speed: 100 kph

Maximum Swim Speed: 10 kph w/2 shrouded propellers

Range: 800 km

Fording: Amphibious

Main Gun

Note: Basic vehicle is unarmed except for 3 firing ports and vision blocks in each hull side

Protection

Hull Armor: All-welded steel hull provides splinter protection

Applique Armor: Available

Explosive Reactive Armor: No

Active Protection System: No

Mine Clearing: No

NBC Protection: Yes

Smoke Equipment: INA

Fire Suppression System: Yes

Notes:

XA-185 Amphibious Armored Ambulance. This is an improved version of the XA-180 fitted with a more powerful diesel engine and stronger axles. The Patria Pasi (earlier known as the Sisu Pasi) is a Finnish-made six-wheeled armoured personnel carrier (APC) originally designed for Finnish Defence Forces. The first version was produced in 1983 and serial production began in 1984. It was designed to operate with ease of use, simple structure and low-cost maintenance. The basic appearance and configuration of Patria Pasi is similar to most wheeled APCs. The XA-180 and XA-185 versions are fully amphibious while the XA-203 is not. In 1980, Sisu produced an XA-180 prototype for Finnish Army tests. It competed against two other prototypes, but was declared the winner of the trials in 1983. On 22 December 1983 the Finnish Army ordered a first batch of fifty XA-180s, of which nine were reserved for UN duties. The vehicle proved quite successful and more orders were soon to follow. The XA-180 was originally manufactured and marketed by the Finnish company Sisu Auto but later variants were marketed by the Finnish defence company Patria and are known as Patria XA series.[1] The Vehicle's widely known nickname "Pasi" (also a common given name of Finnish men) stems from the Finnish name "panssari-Sisu" (English: armoured Sisu). The main

superstructure is mainly manufactured from 6 to 12 mm of armour steel and the bottom is mine-strengthened, and the front windows are bullet-resistant and equipped with protective hatches. The vehicle has continuous six wheel drive and good capabilities for off-road driving. It can take inclines up to a maximum of 60°. The XA series has no standard armament, but is equipped with a rotating turret structure for installation of light/heavy machine guns or autocannons. It also has 8 BMP style firing ports on the sides and rear. Therefore, passengers, usually a squad of infantry, can fire their weapons from the cover of the armor. The XA series is popular in peacekeeping missions due to its mobility, non-aggressive appearance, and good protection against mines and improvised explosive devices (IED). The vehicle also offers a good combination of armament, comfort, mine protection, protection against shrapnel and small calibre fire, road speed, short time of learning how to drive, and an acceptable terrain mobility. It also offers more internal space compared to other similar vehicles like the Fuchs or BTR-80.

→Firefighting Vehicles

M1142 HEMTT American 8x8 Tactical Fire Fighting Truck (TFFT)

Tiers:

Variants:

- **M977:** The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis.
- **M978:** The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant.
- **M983 Tractor:** The M983 is a tractor unit for use with the trailer-mounted MIM-104 Patriot missile system. It can also be used with the Interim Stryker Recovery System, or other trailers. An earlier variant fitted with a 30 kW generator and crane mounted behind the cab was used to tow the Pershing II Erector Launcher in CONUS (a M1001 MAN tractor was used in West Germany). The M983A2/A4 Light Equipment Transporter (LET) tractor is mainly used to transport construction and engineer equipment. It has a 45,000 lb (20,000 kg)) 2 speed hydraulic winch mounted behind the cab used to load the trailer. It does not have a self-recovery winch.
- **M984A1 Wrecker:** The M984 wrecker is the only HEMTT variant to have been produced in the A1 configuration, and this resulting in the change of recovery crane and retrieval system between A0 and A1 configurations. The current model is the M984A4. Standard equipment includes a 27,240 kg (60,050 lb) capacity two-speed recovery winch, a rear-mounted 11,340 kg capacity vehicle retrieval system, and a 6,350 kg (14,000 lb) at 2.74 m (9.0 ft) capacity Grove materials handling crane. A 9,072 kg (20,000 lb) bare drum capacity self-recovery winch is fitted as standard on the M984.
- **M985 Cargo:** The M985 is available in two variants. The current models are A4; there were no A1 models. The M985 cargo variant is similar to the M977 cargo truck but was developed to support the M270 Multiple Launch Rocket System (MLRS) with a M989A1 HEMAT trailer. It may also used to transport Patriot missiles. The M985 Guided Missile Transporter (GMT) was developed specifically for use with the Patriot system and it can be distinguished easily from other cargo models by its rear-mounted Hiab 8108/2 materials handling crane
- **Taiwanese RT-2000 Multiple Rocket Launcher:** The RT-2000 [Lit; Ray-Ting-2000 or Thunder -2000] rocket launcher mounted on an M977 chassis. In service about 1997. Can mount any one of three launchers: Mk 15 117-mm, 60 rounds; Mk 30, 30 rounds with HE; AP/AM cluster warhead - >18-mile range; Mk 45 12 rounds, > 27-mile range, GPS targeting. See separate record for details.
- **M1120 HEMTT Load Handling System (LHS):** The M1120 Load Handling System (LHS) variant was initially

introduced as part of the HEMTT overhaul/rebuild program, during which returned M977 cargo trucks have their cargo bodies and materials handling cranes removed, to be replaced by a Multilift Mark 5 (now designated MPH165-LHS) LHS, as fitted to the Oshkosh PLS truck.
- **M1977 HEMTT Common Bridge Transporter (CBT):** The M1977 HEMTT Common Bridge Transporter (CBT) is a further development of the M1120 LHS, and in common with the M1120 LHS was initially introduced as part of the HEMTT overhaul/rebuild program. It is used for loading, transporting, and unloading Ribbon Bridge components and bridge erection boats.
- **M1142:** The M1142 is a Tactical Fire Fighting Truck (TFFT) capable of extinguishing aircraft, petroleum, brush, and structural fires at isolated military installations. The TFFT is based on a HEMTT M977A2 chassis with the heavier duty M1120 LHS HEMTT variant rear suspension. The TFFT contract was awarded to Pierce Manufacturing with Oshkosh Corporation as a subcontractor to Pierce.
- **M977 A2 Cargo Truck:** Basic version.
- **M977 A2 EPP:** Electrical power plant.
- **M977 A2 LRPT:** Large repair parts transporter.
- **M978 A2:** Fuel servicing transporter truck tanker.
- **HEMTT M983 A2 LET:** Light equipment transporter.
- **HEMTT M983 A2:** Patriot missile tractor.
- **M984 A2:** Recovery truck.
- **M985 A2:** Cargo and MRLS resupply.
- **M985 A2 GMT:** Guided missile transporter.
- **M1120 A2 HEMTT-LHS:** Heavy expanded mobility tactical truck.
- **M1977 A2 CBT:** Common bridge transporter.

System

Alternative Designation: M1142

Type: Tactical Fire Fighting Truck (TFFT)

Manufacturer: Oshkosh Corporation

Configuration: 8x8

Family: Heavy Expanded Mobility Tactical Truck (HEMTT)

Crew: ea2

Water Tank: The M1142 is served by the XM1158 HEMTT-based Water Tender (HEWATT) to support Army requirement for a water tender capability for Army Engineer Firefighting detachments and Ordnance Ammunition Companies. HEWATT carries a 2,500 gallon polypropylene water tank

Water Pump: a Darley 500 gpm pump (hydraulic drive), a booster reel with capacity for 200 feet of 1.0 inch booster hose (electric rewind), 400 feet of 3.0 inch inlet and fill valving identical to the TFFT.

Dimensions

Length: 10.17 m

Width: 2.44 m

Height: 2.57 m

Distance Between Equalizer Pivots: 5.33 m

Distance Between Axles, 1st to 2nd: 1.52 m

Distance Between Axles, 2nd to 3rd: 3.81 m

Distance Between Axles, 3rd to 4th: 1.52 m

Weight: 17,191 kg

Automotive

Engine Name: 1 x Detroit Diesel 8V-92TA

Engine Type: 736-cu in(12.06-liter) liquid-cooled, 2-stroke, V-8 diesel

Engine Power: 445 hp at 2,100 rpm

Power-to-Weight Ratio: 16.18 hp/metric ton

Transmission: Allison HT740D automatic transmission with torque converter 4 forward/1 reverse gears

Suspension: 8 x 8 (8 wheels driving, 4-wheel steering); Hendrickson leaf spring w/steel saddle, equalizing beams, and 10-in (254-mm) vertical travel on front and rear; RT340 model rear springs on all but M985 (RT380) and M984A1 (RT500)

Maximum Speed: 88 km/h

Range: 483 km; w/full load at 54 km/h

Fuel Capacity: 589 liters

Tire Size: 16.00R20

Gradient: 60 percent

Side Slope: 30 percent

Fording Depth: 1.23 m

Payload Capacity: 9,979 kg

Protection

Armor: A-kit/B-kit; U.S. Army Long Term Armor Strategy (LTAS) compliant

Applique Armor: Available

Active Protection System: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

M1142 Tactical Fire Fighting Truck (TFFT) The M1142 Tactical Fire Fighting Truck (TFFT) is an integration of an Oshkosh HEMTT chassis mated with a commercial Pierce fire fighting package. M1142 was delivered for testing in 2005 and first fielded in 2007. Pierce Manufacturing division of Oshkosh is the integration contractor. The M1142 Tactical Fire Fighting Truck (TFFT) is a multifunctional vehicle, ready to deploy in almost any terrain to combat five types of fires/hazards: wildland; structural (limited to two stories or less); petroleum, oils, and lubricants (POL) and hazardous materials (HAZMAT); tactical vehicle; and aircraft crashes. The M1142 Tactical Firefighting Truck (TFFT) is a standard M977A2 HEMTT chassis carrying an add-on commercial firefighting package. The M1142 is served by the XM1158 HEMTT-based Water Tender (HEWATT) to support Army requirement for a water tender capability for Army Engineer Firefighting detachments and Ordnance Ammunition Companies. HEWATT carries a 2,500 gallon polypropylene water tank, a Darley 500 gpm pump (hydraulic drive), a booster reel with capacity for 200 feet of 1.0 inch booster hose (electric rewind), 400 feet of 3.0 inch inlet and fill valving identical to the TFFT. HEWATT procurement is planned for FY 2008-2009, replacing the M916 LET tractor combined with a water tank semitrailer.

Striker 3000 American 6x6 Aircraft Rescue and Firefighting (ARFF) Vehicle

Tiers:

Variants:

- **Striker 1500 (4x4):** The Striker 1500, a.k.a. Striker 4x4, is the 2 axle model. It features 1,500-US-gallon (5,700 l) water tank 210-US-gallon (790 l) foam tank 450 pounds (200 kg) of dry chemical 460 pounds (210 kg) of Halotron 1 Oshkosh unveiled a new modernized Striker at FDIC-Indianapolis, April 2010. It is 2,000 pounds lighter so it is faster and more maneuverable. The new Striker was designed with extensive feedback from firefighters and fire chiefs. It has a 700 HP Deutz TCD 16.0L V8 Diesel engine with over 2,000 pound-feet of torque. This new edition has 84 sq. ft. of glass in the front windscreen, and for the first time has crosslays. Engine maintenance is facilitated by a walk-in, step-up platform incorporated into the rear of the unit, making major systems easily serviced.
- **Striker 3000 (6x6):** The Striker 3000, a.k.a. Striker 6x6, is the 3 axle model. It features: 3,000-US-gallon (11,000 l) water tank 420-US-gallon (1,600 l) foam tank 500 pounds (230 kg) of dry chemical 460 pounds (210 kg) of Halotron 1
- **Striker 4500 (8x8):** The Striker 4500, a.k.a. Striker 8x8, is the 4 axle model. It features: 4,500-US-gallon (17,000 l) water tank 630-US-gallon (2,400 l) foam tank 500 pounds (230 kg) of dry chemical 460 pounds (210 kg) of Halotron 1

System

Alternative Designation: Striker 3000

Type: Aircraft Rescue and Firefighting (AAFF) Vehicle

Manufacturer: Oshkosh

Configuration: 6x6

In Service: 2015-Present

Crew: INA

Cab: 5-person seating max; aluminum frame construction with center steering position; wrap-around, cockpit style instrument panel; easy-read backlit gauges and controls

Dimensions

Length: 475 in. (12 m)

Width: 120 in. (305 cm)

Height without HRET: Less than or equal to 140 in. (356 cm) (with full water tank)

Wheelbase: 267 in. (678 cm) from Axle 1 to Axle 3

Automotive

Engine Name: Scania DC16, Deutz TCD16.0, Emission Rating Available; US Tier 4f/EU Stage IV, US Tier 4i/EU Stage IIIB/Euro 5 Compliant; US Tier 3/EU Stage IIIA/ Euro 3

Engine Type: INA

Transmission: Allison 4800 EVS transmission; electronic/7-speed/automatic

Anti-Lock Braking System (ABS): Yes

Transfer Case: Oshkosh; independently mounted; torque proportioning differential and driver selected locking mechanism

Front Axle: 31,000 lb. (14061 kg); Oshkosh double reduction with bevel gear differential; driver operated differential lock (transverse and separate front to back)

Front Brakes: Drum brakes standard (Rockwell Dual Actuator Air); optional disc brakes available (17” Rotor Bendix SN7 sliding caliper)

Rear Axle: 31,000 lb. (14,061 kg); Oshkosh double reduction with bevel gear differential; driver operated differential lock

Rear Brakes:: S-cam type; air/drum brake standard; disc brake available

Suspension: Oshkosh TAK-4 independent system with dual control arms and single coil spring; up to 16 in. (40.6 cm) of wheel end travel with superior all-terrain mobility, ride quality and handling

Tires: 24R21 all-terrain radial

Fire Fighting System

Roof Turret: Non-aspirating and aspirating options available, electric joystick control; 625/1,250 gpm (2366/4732 lpm), options available up to 1,585 gpm (6000 lpm)

Bumper Turret: 3000 gallon (11356.2 l) capacity; corrosion and UV resistant polypropylene

Water Tank: 3000 gallon (11356.2 l) capacity; corrosion and UV resistant polypropylene

Foam Tank: 420 gallon (1590 l) capacity; corrosion and UV resistant polypropylene

Fire Pump: Power divider driven Waterous CRQB; single stage centrifugal; cast iron body; brass impeller; stainless steel shaft; pump and-roll capable; 2,000 gpm (7570 lpm)

Ultra High Pressure Water: Yes

Quad Agen: Yes, Water, Foam, Dry Chemical, Clean Agent

Compressed Air Foam System: Yes

Fixed Hose Reels: 100 ft. (30 m) hose length bundled with water/foam or 150 ft. (46 m) hose with dry chemical

Foam Proportioning System: Around the-pump

Protection

Armor: No

Applique Armor: No

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The Oshkosh Striker is a specialized aircraft rescue and firefighting (ARFF) vehicle built by Oshkosh Corporation at the Pierce Mfg. facilities Appleton, Wisconsin. There are three models of the Striker: 1500, 3000, 4500. All models are available with a snozzle capable of piercing an aircraft fuselage to dispense fire retardant material within a cabin or cargo area. On April 17, 2015 Oshkosh announced they will debut a new twin engine Striker 8 X 8 at Interschutz 2015. The Striker 3000, a.k.a. Striker 6x6, is the 3 axle model. It features: *3,000-US-gallon (11,000 l) water tank *420-US-gallon (1,600 l) foam tank *500 pounds (230 kg) of dry chemical *460 pounds (210 kg) of Halotron 1 Innovative Fire Suppression CROSSLAYS –With the optional twin crosslays on the Striker, you can have up to 600 feet (183 m) of 1¾" (45mm) hose at your disposal– accessible from either side of the vehicle. LARGE PUMP OPTION – Larger planes mean greater challenges. Oshkosh offers an optional 2650 gpm (10,000 lpm) pump to provide all of the water and/or foam you will need to meet these challenges. BRONZE PUMP – Long ago, you asked for a corrosion resistant pump body. In response, Oshkosh made it available on the Striker. That tradition of excellence carries forward on the Striker. ELECTRONIC FOAM PROPORTIONING –With this all new pressure governed system, the water pump knows what is required to meet your fire suppression needs and runs the engine just enough to meet those needs. This allows your vehicle to use less fuel – reducing overall wear and tear – yet still perform as only a Striker can. ADVANCED FIRE SUPPRESSION TECHNOLOGIES – Firefighters face new challenges every day. The Striker is designed to be ready for the latest technologies still under development, including ultra high-pressure water, compressed air foam systems (CAFS), and clean agent delivery systems. Unmatched Chassis Performance The Striker provides fast acceleration – a full second faster to 50 miles per hour – and delivers increased fuel economy from the 697 hp Tier 4i/Euro 5 emission compliant engine. It also delivers a lower center of gravity, tighter turning radius and, with the help of TAK-4® all-wheel independent suspension, the Striker delivers a confident and controlled ride. LIGHTER WEIGHT – The Striker is designed to be lighter by 5%. What does that mean to you? Faster acceleration, for one thing. Also, better stopping distance. Best of all, it still possesses that quality and toughness that Oshkosh is known for. Advanced Safety Systems Safety is built into all aspects of the Striker – from the cab design to the certified testing for static side slope stability and structural integrity. IMPROVED BRAKE TORQUE – With our new disc brake option we have improved brake torque by 11%. So, when you need to stop, you stop. NITROGEN BOTTLE STORAGE – The Striker provides excellent access to the vertically stored nitrogen bottles for easy and safe removal and reloading. Unsurpassed Reliability And Durability Oshkosh vehicles are renowned for their reliability and durability–and the Striker continues the tradition. ACCESS – Service technicians told us that easy access to the engine compartment is critical. Open up the rear door on the Striker and you will find an exclusive walk-in service port with easy access. And, if necessary, the entire powertrain can be removed for maintenance – without involving the water tank. FILTER AND FLUID CHECK –The Striker has a single, easy to access area with all filters AND fluid checks including: engine oil, transmission fluid, and power divider fluid. One location means you can know, with confidence and in no time at all, that your Striker is ready for action. SERVICEABILITY – Well thought out and well designed electrical, hydraulic, and pneumatic line routing means unsurpassed access to wires, oil, and air lines for faster diagnostic time. 24/7/365 SERVICE – Our worldwide service dealer network is ready when you need us. Smart Design VISIBILITY – With 84 square feet of glass and a 238-degree horizontal viewing radius at eye level, the Striker offers unparalleled visibility. Utilizing the Oshkosh center steer driving position, you will feel like you are in the cockpit of a fighter jet. FORWARD VISIBILITY - We have improved your ability see the ground below you. NFPA requires you to see 20 feet out from the front bumper. The Striker allows you to see 12.3 feet. You will have to sit in this cab to believe it. ERGONOMICS – Completely redesigned cab instrumentation is logical and purpose built. Through extensive ergonomic research with users around the world, we observed how you used the vehicle and designed each control, switch, and instrument to be intuitive and ready when you are. LOGICAL CONTROLS – Color-coded controls to clearly identify what function and/or what agent you are utilizing, allows you, quickly and with confidence, focus on the task at hand. IMPROVED STORAGE – You said you needed more dedicated storage. We listened. With over 63 cubic feet (1.8 m3), the Striker has plenty of room for everything you could possibly need.

On April 17, 2015 Oshkosh announced they will debut a new twin engine Striker 8 X 8 at Interschutz 2015. The Striker 4500, a.k.a. Striker 8x8, is the 4 axle model. It features: 4,500-US-gallon (17,000 l) water tank 630-US-gallon (2,400 l) foam tank 500 pounds (230 kg) of dry chemical 460 pounds (210 kg) of Halotron 1 Innovative Fire Suppression Snozzle HRET in multiple lengths with below-grade discharge Optional crosslays to access hand lines from either side of the truck. Extreme Mobility & Maneuverability Oshkosh patented TAK-4 all-wheel independent suspension Decreased weight for faster acceleration Dual engines for faster response time Wide track and low center of gravity for side slope stability of at least 30° Available central tire inflation increases stability Center steer for advanced visibility and control Firefighter-Inspired Design Panoramic forward view for unmatched visibility Best-in-class space seats up to five - 275 cubic ft. (7.8 cubic m) Exceptional comfort and ride quality New cab and firefighter options Indicator lighting clearly identifies water, foam, and clean agent controls, which are grouped by function Advanced electronics for easier troubleshooting and better user interface Exceeds NFPA, ICAO, and EU standards Easy Maintenance Single point access for lubrication fills, air tank drains, and electrical connections including circuit breaker box

→Fuel Tankers

M978 HEMTT American 8x8 Heavy Expanded Mobility Tactical Truck (HEMTT) Fuel Tanker

Tiers:

Variants:

- **M977:** The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis.
- **M978:** The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant.
- **M983 Tractor:** The M983 is a tractor unit for use with the trailer-mounted MIM-104 Patriot missile system. It can also be used with the Interim Stryker Recovery System, or other trailers. An earlier variant fitted with a 30 kW generator and crane mounted behind the cab was used to tow the Pershing II Erector Launcher in CONUS (a M1001 MAN tractor was used in West Germany). The M983A2/A4 Light Equipment Transporter (LET) tractor is mainly used to transport construction and engineer equipment. It has a 45,000 lb (20,000 kg)) 2 speed hydraulic winch mounted behind the cab used to load the trailer. It does not have a self-recovery winch.
- **M984A1 Wrecker:** The M984 wrecker is the only HEMTT variant to have been produced in the A1 configuration, and this resulting in the change of recovery crane and retrieval system between A0 and A1 configurations. The current model is the M984A4. Standard equipment includes a 27,240 kg (60,050 lb) capacity two-speed recovery winch, a rear-mounted 11,340 kg capacity vehicle retrieval system, and a 6,350 kg (14,000 lb) at 2.74 m (9.0 ft) capacity Grove materials handling crane. A 9,072 kg (20,000 lb) bare drum capacity self-recovery winch is fitted as standard on the M984.
- **M985 Cargo:** The M985 is available in two variants. The current models are A4; there were no A1 models. The M985 cargo variant is similar to the M977 cargo truck but was developed to support the M270 Multiple Launch Rocket System (MLRS) with a M989A1 HEMAT trailer. It may also used to transport Patriot missiles. The M985 Guided Missile Transporter (GMT) was developed specifically for use with the Patriot system and it can be distinguished easily from other cargo models by its rear-mounted Hiab 8108/2 materials handling crane
- **Taiwanese RT-2000 Multiple Rocket Launcher:** The RT-2000 [Lit; Ray-Ting-2000 or Thunder -2000] rocket launcher mounted on an M977 chassis. In service about 1997. Can mount any one of three launchers: Mk 15 117-mm, 60 rounds; Mk 30, 30 rounds with HE; AP/AM cluster warhead - >18-mile range; Mk 45 12 rounds, > 27-mile range, GPS targeting. See separate record for details.
- **M1120 HEMTT Load Handling System (LHS):** The M1120 Load Handling System (LHS) variant was initially introduced as part of the HEMTT overhaul/rebuild program, during which returned M977 cargo trucks have their cargo bodies and materials handling cranes removed, to be replaced by a Multilift Mark 5 (now designated MPH165-LHS) LHS, as fitted to the Oshkosh PLS truck.
- **M1977 HEMTT Common Bridge Transporter (CBT):** The M1977 HEMTT Common Bridge Transporter (CBT) is a further development of the M1120 LHS, and in common with the M1120 LHS was initially introduced as part of the HEMTT overhaul/rebuild program. It is used for loading, transporting, and unloading Ribbon Bridge components and bridge erection boats.
- **M1142:** The M1142 is a Tactical Fire Fighting Truck (TFFT) capable of extinguishing aircraft, petroleum, brush, and structural fires at isolated military installations. The TFFT is based on a HEMTT M977A2 chassis with the heavier duty

M1120 LHS HEMTT variant rear suspension. The TFFT contract was awarded to Pierce Manufacturing with Oshkosh Corporation as a subcontractor to Pierce.

- **M977 A2 Cargo Truck:** Basic version.
- **M977 A2 EPP:** Electrical power plant.
- **M977 A2 LRPT:** Large repair parts transporter.
- **M978 A2:** Fuel servicing transporter truck tanker.
- **HEMTT M983 A2 LET:** Light equipment transporter.
- **HEMTT M983 A2:** Patriot missile tractor.
- **M984 A2:** Recovery truck.
- **M985 A2:** Cargo and MRLS resupply.
- **M985 A2 GMT:** Guided missile transporter.
- **M1120 A2 HEMTT-LHS:** Heavy expanded mobility tactical truck.
- **M1977 A2 CBT:** Common bridge transporter.

System

Alternative Designation: M978 HEMTT Fuel Tanker

Type: Heavy Expanded Mobility Tactical Truck (HEMTT) Fuel Tanker

Manufacturer: Oshkosh Corporation

Configuration: 8x8

Family: Heavy Expanded Mobility Tactical Truck (HEMTT)

Crew: ea2

Payload Capacity: 9,979 kg

Dimensions

Length: 10.17 m

Width: 2.44 m

Height: 2.57 m

Distance Between Equalizer Pivots: 5.33 m

Distance Between Axles, 1st to 2nd: 1.52 m

Distance Between Axles, 2nd to 3rd: 3.81 m

Distance Between Axles, 3rd to 4th: 1.52 m

Weight: 17,191 kg

Automotive

Engine Name: 1 x Detroit Diesel 8V-92TA

Engine Type: 736-cu in(12.06-liter) liquid-cooled, 2-stroke, V-8 diesel

Engine Power: 445 hp at 2,100 rpm

Power-to-Weight Ratio: 16.18 hp/metric ton

Transmission: Allison HT740D automatic transmission with torque converter 4 forward/1 reverse gears

Suspension: 8 x 8 (8 wheels driving, 4-wheel steering); Hendrickson leaf spring w/steel saddle, equalizing beams, and 10-in (254-mm) vertical travel on front and rear; RT340 model rear springs on all but M985 (RT380) and M984A1 (RT500)

Maximum Speed: 88 km/h

Range: 483 km; w/full load at 54 km/h

Fuel Capacity: 589 liters

Tire Size: 16.00R20

Gradient: 60 percent

Side Slope: 30 percent

Fording Depth: 1.23 m

Payload Capacity: 9,979 kg

Protection

Armor: A-kit/B-kit; U.S. Army Long Term Armor Strategy (LTAS) compliant

Applique Armor: Available

Active Protection System: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant. The Heavy Expanded Mobility Tactical Truck (HEMTT) is an eight-wheel drive, diesel-powered, 10-short-ton (9,100 kg), tactical truck used by the US military and others. In evolving configurations, it has been in continuous production since 1982. The M977 HEMTT entered service with the U.S. Army as a replacement for the M520 Goer. By mid 2019, around 35,000 HEMTTs in various configurations had been produced by Oshkosh Defense through new-build contracts and around 13,000 of these had been re-manufactured. Current variants have the A4 suffix. The 10×10 Oshkosh Logistic Vehicle System Replacement (LVSR) is the U.S. Marines' equivalent to the U.S. Army's Oshkosh 8×8 HEMTT and Oshkosh 10×10 Palletized Load System (PLS). The Marines do not use the HEMTT or PLS, and the Army does not use the LVSR, but both services use a common trailer (M1076) with all three truck types. The HEMTT's objective is to provide heavy transport capabilities for supply and re-supply of combat vehicles and weapons systems. Compared to earlier generation 5-ton trucks in U.S. Army service it offers increased payload and mobility. The HEMTT is available in a variety of configurations, including cargo, tanker, tractor and wrecker. The HEMTT was developed from the outset as a tactical truck, but to minimize procurement and life cycle costs included militarized commercial automotive components where possible, these including the engine and transmission. Some components used in early HEMTTs are common with the Oshkosh Logistics Vehicle System (LVS) vehicles which were supplied to the U.S. Marine Corps. With the exception of the M984 wrecker variant (254 × 89 × 9.5 mm, front; 356 × 89 × 9.5 mm, rear), on all HEMTT variants the chassis is formed of 257 × 89 × 9.5 mm heat-treated carbon manganese steel with a yield strength of 758 MPa. Bolted construction with Grade 8 bolts is used throughout. A centrally mounted self-recovery winch is an option and this is fitted to around 20% of production. The HEMTT's two-door forward control cab seats two. It is of heavy-duty welded steel construction with corrosion-resistant sheet metal skins. Simula Inc. (acquired by Armor Holdings in 2003 and now BAE Systems) supplied 186 add-on cab armoring kits for use in the former Yugoslavia. These were not issued, but from 2004 were used in Iraq. BAE systems supplied a next-generation armor kit for the HEMTT and by late-2006 had supplied the U.S. Army with around 3600 kits for the Oshkosh HEMTT and PLS. The HEMTT A4 is fitted with the slightly larger from the Oshkosh PLS A1. This cab complies with the U.S. Army's Long Term Armor Strategy (LTAS) requirements of an A- and B-kit armoring philosophy. It also comes as standard with integrated floor armor, an integrated mount for a machine gun and gunner protection kit, and air-conditioning. A Detroit Diesel 8V92TA V-8 two-stroke diesel developing 445 hp (332 kW) is fitted in HEMTT A0 and A1 models, with the DDECIV version of this engine fitted to A2 HEMTTs. An EPA 2004 compliant Caterpillar (CAT) C-15 six-cylinder, 15.2-liter diesel developing a peak of 515 hp (384 kW) is fitted to HEMTT A4 models. HEMTT A0 and A1 models are fitted with an Allison HT 740D 4F/1R automatic transmission, torque converter, and Oshkosh 55,000-pound (25,000 kg) two-speed transfer case. HEMTT A2 models have the Allison HD 4560P 6F/1R automatic transmission. HEMTT A4 models are fitted with an Allison 4500SP 5F/1R automatic transmission and an uprated version of Oshkosh's 55,000-pound (25,000 kg) two-speed transfer case. The front axles on all HEMTTs are single-reduction Oshkosh 46K, the rear are Dana single-reduction which vary according to configuration. Drive to the front axles is selectable and all axles have differential locks. Suspension on A0/A1/A3 models is by Hendrickson leaf springs with equalizing beams. Suspension on A4 models is Holland air suspension, load rating on the rear axles varying by configuration. Tire size is 1600 R20 on all models, and standard tire fit is Michelin XZL. All models are capable of fording water crossings up to 48 in (120 cm) deep, and can climb a gradient of at least 60%. All original variants are air transportable in the C-130. All variants are air-transportable in the C-17. Original HEMTT models now have the suffix A0. Only the M984 wrecker was produced in A1 configuration. All models were produced in A2 configuration. The A3 suffix is applied to HEMTT technology demonstrators with a diesel-electric drive system. Current HEMTT production

models have the suffix A4.

System

Alternative Designation: M1091
Type: Medium Tactical Vehicle (MTV) Fuel/Water Tanker
Family: FMTV Series
Configuration: 6x6
Crew: ea1
Cab Seating: 3-Man
Tank Assembly: Constructed with 304 stainless steel with internal baffles according to DOT. Top/bottom loading
Fuel Servicing: All U.S. Army aircraft and helicopters, and tracked and wheeled vehicles
System Capability: Reloading from all U.S. Army fuel-dispensing systems including bottom loading @ 600 GPM. Self-loading capability @ 200 GPM
Pumping: FMTV standard is automatic, operator preset flow rate in 10-GPM increments (20-100 GPM) per hose with deadman controller Fuel flow is metered, filtered or unfiltered with a flow control valve from a PTO-driven 200-GPM pump Alternate (backup) pumping is from a 24 VDC, motor-driven, 25 GPM pump
Hoses and Reels: 2 each, 1 1/2" dia., 50-foot long fuel-dispensing hoses on air-powered self-rewinding reels Hose ends are 2", self-sealing, quick disconnect Static ground reels with 40-foot grounding cables and a 10-foot "Y" branch at the end with alligator end connections electrically bonded to the vehicle chassis frame
Metering: A meter is provided for each fuel-servicing hose to indicate fuel dispensed, with one indicating through each hose. A total fuel dispensing meter is also included. Meters provide 1-gallon increment fuel measurement
Pump and Control Module: Rear-mounted pump controls are readily accessible/visible under all operating conditions. Includes both an automatic control shut-off valve when control door is closed and an emergency control cable, which melts and automatically closes in case of fire. An emergency fuel shut-off control is positioned near the cab on both the driver's and second passenger's side
Filter Separator: Per MIL-F-8901, readily accessible and includes automatic/manual drain, water sight glass, and color-coded differential pressure gauge
Fuel Nozzles: New, improved 1-inch automotive-type (OPW) with female quick disconnects
Fuel Level Indicator: Easy reading (float-type), liquid-filled gauge

Dimensions

Length: 8.05 m
Width: 2.44 m
Height, Top of Cab: 2.76 m
Height, Air Transport: 2.59 m
Height, Air Drop: 2.18 m
Wheelbase: 4.50 m
Ground Clearance: 559 mm
Payload Capacity: 4,536 kg
Curb Weight: 10,974 kg

Automotive

Engine Name: 1 x Caterpillar 3116 ATAAC

Engine Type: 403-cu in (6.6-liter) liquid-cooled, turbocharged, aftercooled, in-line 6-cylinder diesel

Engine Power: 290 hp (216 kW) at 2,600 rpm

Transmission: Allison MD 3070 PT automatic/select electronically controlled; 7 forward/1 reverse gears

Power-to-Weight Ration: 19.52-34.47 hp/metric ton

Maximum Speed: 88 km/h

Range: 483 km

Approach Angle: 40 deg

Departure Angle: 63 deg

Gradient: 60 percent

Side Slope: 30 percent

Fording, Unprepared: 0.91 m

Fording, Prepared: 1.52 m

Tires: Super singles with CTIS

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1091 Fuel/Water Tanker is designed to transport fuel or water to support the soldiers on the battlefield. The M1091 is constructed of stainless steel with internal baffles and can transport 1500 gallons. It is a self contained unit, housing the pump and control module, hoses, reels and dispensing nozzles, metering instruments, fuel level indicator, filters, and a sampling

probe used with the aqua-glow water sampling kit. The pump can dispense 20 -100 gallons per minute with deadman controller that halts dispensing to prevent accidental spillage. The vehicle is still in the developmental phase.

RKhM-6 Povozka Russian CBRN Reconnaissance Vehicle

Tiers:

Variants:

- **BTR-80 (GAZ-5903):** Original w/ 3 firing ports on each side & smoke grenade launchers
- **BTR-80A (GAZ-59034:** Stabilized turret w/ 2A72 gun, 7.62-mm coax MG, & new right side firing port
- **BTR-80AK:** BTR-80A CP variant with 1 firing port on right side and 2 whip antennas at rear corners
- **BTR-80K (GAZ-59031):** Command Post for 6; different turret w/ MGs & 3 radios (R-173, R-173P & R-159)
- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment
- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle

- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun
- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control
- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RPM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle

System

Alternative Designation: RKhM-6 CBRN Reconnaissance Vehicle

Manufacturer: Arzamas Machinery Plant of Military Industrial Company (VPK)

Description: The vehicle is based on the hull of BTR-80 armoured personnel carrier (APC). The conventional layout accommodates the driver’s compartment at forward hull, NBC laboratory in the middle and engine at the rear.

Crew: ea3

Personnel: eaThe vehicle lacks special suits for dismounting troops in a radiation environment, but carries three sets of MOPP suits and filters.

CBRN Detection Equipment and Systems: The RKhM-6 is equipped with more advanced NBC laboratory. The fully automated system is controlled by single personnel and enables the automatic detection of chemical and radioactive substances, with alarms ringing inside the vehicle if any such contamination is found. The sensors aboard the vehicle can detect any type of radioactive contamination from inside the vehicle, and the crew can test the samples from within the vehicle. The vehicle lacks special suits for dismounting troops in a radiation environment, but carries three sets of MOPP suits and filters. The biological sensors on the vehicle can detect biological molecules such as viruses, while the chemical detection optical devices use the onboard computer for analysis. The vehicle can detect vapours and aerosols of toxic and hazardous substances in a contaminated environment of 10m² a minute. The vehicle runs at a speed of 20km/h-50km/h in accordance with the level and complexity of contamination. The RKhM-6 is equipped with the battlefield management systems (BMS), and Perunit-V satellite navigation system based on GLONASS. The advanced meteorological suite provides coverage across 4km² of area or accurate direction up to 6km. It measures wind speed and direction, air samples, weather

conditions, rain and snow.

Meteorological Suite: Yes, Provides coverage across 4km² of area or accurate direction up to 6km. It measures wind speed and direction, air samples, weather conditions, rain and snow.

Protection

Hull Armor: Front armor of the BTR-80 APC protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters. It features spaced and heavier armour at the forward hull, while the sides and turret are

hinged with aluminium and steel plates.
Turret Armor: Protection against 12.7mm and shrapnel
Applique Armor: Available
Explosive Reactive Armor: INA
Active Protection System: INA
Mine Clearing: INA
Mine Protection: The vehicle also integrates a reinforced roof and blast-resistant floor for protection against mine explosions.
Self-Entrenching Blade: INA
NBC Protection: Yes, Collective & a advanced NBC laboratory
Smoke Equipment: 6 x 81-mm smoke grenade launchers
Note: The vehicle also integrates a reinforced roof and blast-resistant floor for protection against mine explosions.

Notes:

RKhM-6 "Povozka" – latest version with state-of-the-art detection systems, including the PRKhDD-2B with a detection range of about 3 km. Furthermore, the RKhM-6 is equipped with an SN-RKhM inertial navigation system and a 14Ts834 satellite navigation system. In service since 2011. Deployed to Syria in November 2018. It is an advanced variant of the RKhM-4-01 CBRN vehicle.The 8×8 CBRN vehicle is designed to conduct chemical, radiological, biological and nuclear reconnaissance missions for CBRN reconnaissance elements of the Russian Armed Forces. It can transmit reconnaissance data to reconnaissance devices and command control centres. The Russian Army RKhM-6 is an advanced Nuclear, Bacteriological and Chemical (NBC) reconnaissance vehicle derived from the BTR-80 armored vehicle. The vehicle is provided with satellite navigation system and can cover an area of four square miles. The crew can transmit the result of their analysis to remote command and control centers without leaving the vehicle. The RKhM-6 vehicle is expected to enter service with the Russian Army in early 2016.

Engine Name: VK-1A modified gas turbine

Fuel Type: INA

Fuel Capacity (l): INA

Operating Time (min): 60

Time to Initiate Smokescreen (min): 10

Generator Efficiency (%): 96

Smoke Screening System: Yes

Emplacement Time: 10-12 minutes

Displacement Time: 10-12 minutes

Notes:

The TMS-65m is primarily used for the decontamination of vehicles and equipment whether stationary or on the move. Additionally, the system can be used to decontaminate ground and hard surface roads as well as produce protective smokescreens. The vk-1 turbine engine (a modified MIG-17 engine) along with a sealed control cab is mounted on an Ural 4320, 6x6 truck chassis. The turbine engine can be moved vertically or horizontally by controls located in the operator’s control cab. The operator’s control cab is fixed to the left side of the turbine engine and is equipped with floodlights for limited visibility operations. Two 1500-liter tanks are mounted across the front of the truck bed between the driver’s cab and the turbine engine. One tank is used for obscurant, decontaminates, or water and the other tank is used for the fuel to power the turbine engine. The obscurant, decontamination, or water is fed through pipes into the turbine engine exhaust stream. Depending upon the size and level of contamination the TMS-65m is capable decontaminating equipment at a rate of 30 seconds to 3 minutes per item.

Slovakian Decontamination/Smoke Generator Vehicle TZ-74

System

Alternative Designations: None

Date Of Introduction: INA

Crew: 2

Troop Capacity: INA

Chassis: Tatra 148 PPR 15, 6x6

Combat Weight (Mt): 21.9

Max Road: 71

Max Off-Road: INA

Traverse: 120

Elevation: 30

Depression: 20

Operating RPM's of Turbine Engine: 13,000 rpm (equals 84%)

Idle Speed (rpm): 5400

Ability to Generate on the Move:: 1400

Ability to Generate on the Move: No

Performance Characteristics:

Engine Name: Type M701 C-500

Fuel Type: Diesel

Fuel Capacity (l): 2,000

Operating Time (min): 22

Time to Initiate Smokescreen (min): 1

Generator Efficiency (%): 98

Smoke Screening System: INA

Emplacement Time: approximately 10-12 minutes

Displacement Time: approximately 10-12 minutes

Notes:

THE TZ-74 IS PRIMARILY USED FOR THE DECONTAMINATION OF VEHICLES AND EQUIPMENT WHETHER STATIONARY OR ON THE MOVE. ADDITIONALLY, THE SYSTEM CAN BE USED TO DECONTAMINATE GROUND AND HARD SURFACE ROADS AS WELL AS PRODUCE PROTECTIVE SMOKESCREENS. THE TZ-74 IS BASED ON THE CHASSIS OF THE TATRA 148 PPR 15, 6X6 TRUCKS. THE SYSTEM USES A GAS TURBINE ENGINE TO GENERATE A SMOKE SCREEN OVER A LARGE AREA. THE GAS TURBINE IS MOUNTED ON THE REAR OF THE VEHICLE WITH THE OPERATOR'S CABIN ON THE LEFT-HAND SIDE, AND AN OBSCURANT TANK ON THE RIGHT-HAND SIDE. THE REMAINDER OF THE REAR OF THE VEHICLE CONSISTS OF STORAGE TANKS FOR LIQUIDS AND FUEL FOR THE TURBINE ENGINE. A SMOKESCREEN IS CREATED AS A RESULT OF THE INTRODUCTION OF OIL, DIESEL FUEL, OR A COMBINATION OF BOTH INTO THE EXHAUST NOZZLE OF THE TURBINE ENGINE. THE INTRODUCTION OF THE MIXTURE INTO THE TURBINE ENGINES EXHAUST CAUSES AN IMMEDIATE DISPERSION AND EVAPORATION OF THE MIXTURE THAT CONDENSES IN THE COOLER PART OF THE STREAM AFTER EXPULSION FROM THE MOTOR. THE TZ-74 CAN PRODUCE SMOKE IN ABOUT A MINUTE AFTER THE TURBINE ENGINE IS TURNED ON. ALTHOUGH THE JET ENGINE HAS ENOUGH FUEL TO OPERATE FOR 3 HOURS, ITS MISSION TIME IS SEVERELY LIMITED BY THE CAPACITY OF THE INTERNAL LIQUID SOURCES AVAILABLE. HOWEVER, IF EXTERNAL SOURCES ARE USED, THE MISSION TIMES ARE DRAMATICALLY INCREASED. THE MAIN DECONTAMINANT TANK HAS A 5,000-LITER CAPACITY. THE FOG OIL TANK HAS A 200-LITER CAPACITY. THE FUEL TANK FOR THE GAS TURBINE HAS A 2,000-LITER CAPACITY.

ARS-14KM Russian 6x6 Decontamination Truck

Tiers:

System

Alternative Designation: ARS-14KM

Type: Decontamination Truck

Chassis: Kamaz 43114

Crew: ea1

Cab Seating: 2

Cargo Capacity: 6,000 kg

Towed Load: 12,000 kg

Note: The ARS-14KM decontamination vehicle is designed for decontaminating military hardware and terrain, setting smokescreens and heating process solutions.

Dimensions

Length: 5.20 m

Width: 2.32 m

Wheelbase: 3.34 m

Height: INA

Cargo Capacity: 6,000 kg

Max Gross Train Weight: 27,350 kg

Max Weight: 15,350 kg

Towed Load: 12,000 kg

Automotive

Engine Name: Kamaz 740.31 Euro 2

Engine Type: Turbocharged Diesel

Engine Power: hp225

Max Torque: 912 Nm (6,599 ft-lb)

Ditch Crossing Ability: 0.60 m

Fording Depth: 1.75 m

Step Climbing Ability: 0.55 m

Protection

Armor: The trucks have the option of an armored cab including hidden armoring of the cab.

Applique Armor: Available

Active Protection System: No

NBC Protection: INA

Notes:

The Eastern Military District’s NBC protection regiment based in the Amur Region in Russia’s Far East has received a batch of advanced ARS-14KM versatile decontamination trucks based on the KAMAZ-43114 cross-country vehicle, the district’s press office said. "The truck is designed to disinfect and decontaminate military hardware and separate terrain and road sections. The truck is versatile and can be also used to extinguish fire, generate aerosol screens, make special solutions, heat water, wash servicemen, etc.," the press office said. The ARS-14KM decontamination vehicle is designed for decontaminating military hardware and terrain, setting smokescreens and heating process solutions. According to the press office, the regiment will start learning to operate the advanced military hardware at the beginning of the new training period that will start on December 1. Now, the crews are undergoing preliminary training.

RKhM-2 Russian CBRN Reconnaissance Vehicle

Tiers:

Variants:

- **BTR-80 (GAZ-5903):** Original w/ 3 firing ports on each side & smoke grenade launchers
- **BTR-80A (GAZ-59034:** Stabilized turret w/ 2A72 gun, 7.62-mm coax MG, & new right side firing port
- **BTR-80AK:** BTR-80A CP variant with 1 firing port on right side and 2 whip antennas at rear corners
- **BTR-80K (GAZ-59031):** Command Post for 6; different turret w/ MGs & 3 radios (R-173, R-173P & R-159)
- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment
- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle
- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun
- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control

- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RKhM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle
- **R-439-BK (Legenda 2BK):** Satellite communications vehicle
- **R-165B:** Short-wave signal/ communications vehicle
- **R-149BM4A:** Command and Signal Vehicle
- **R-149BMR:** Signal/Communications vehicle
- **PU-12M7 (9S482MU):** Improved PU-12M6 FA battery command vehicle
- **PU-12M6 (9S482M6):** Field Artillery (FA) battery command vehicle
- **P-240BTZ:** Switchboard platform
- **K1Sh1 (GAZ-59032) (UNSH):** Command Post with enlarged hull w/o turret armament
- **E-351BrM:** Mobile power station with diesel/electric generator
- **BREM-K (GAZ-59033) ARV:** Armored recovery vehicle with A-frame, tow bars, & stabilizers
- **BMM-80 (GAZ-59039 or Simfoniya):** Battlefield ambulance for 9 sitting or 2 litter patients
- **BMM-3:** Battlefield ambulance used as a mobile field hospital
- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)
- **2S23 (Nona-SVK) SP GunMortar System (Fire Support Vehicle):** Breach-loaded 2A60 120-mm rifled mortar/gun system similar to the 2S9
- **BTR-80 R-975:** Forward air control vehicle
- **BTR-80 1V152:** Artillery C2 & forward observation vehicle w/ range finding, navigation & new optics

- **BTR-80 Kushetka-B (M1989/1):** Command vehicle with additional communications gear & gun removed
- **BTR-80 PBKM (KM-80):** Command vehicle with increased radio communications equipment
- **BTR-805:** Modular turret armaments system (14.5-mm KPVT MG) & better fire control/sights
- **BTR-80 with Cummins Diesel:** Western Cummins 6CTA 8.3-C250 diesel engine test model; road speed to 100 km/h and range to 600 km
- **BTR-82/BTR-82A (Russia & Kazakhstan):** Latest version; see separate WEG sheet
- **BTR-80UP (Ukraine):** BTR-80 with 300hp engine improved armor protection & air conditioning
- **BTR-80UP-KB (Ukraine):** Battalion level command vehicle
- **BTR-80UP-KR (Ukraine):** Company level command vehicle
- **BTR-80UP-S (Ukraine):** Staff Vehicle
- **BTR-80UP-M (Ukraine):** Battlefield Ambulance
- **BTR-80UP-BREM (Ukraine):** ARV
- **BTR-80UP-R (Ukraine):** Dedicated reconnaissance vehicle
- **BTR-80UP-T (Ukraine):** Dedicated cargo transport variant
- **KShM Kushetka-B (Ukraine):** Command vehicle based upon the K1Sh1
- **BTR-94 (Ukraine):** Amphibious armored car with twin 23-mm 2A7M guns (same guns as the ZSU-23-4)
- **BTR-3U/Okhotnik (Guardian) (Ukraine):** 2001 BTR-94 upgrade w/ Shkval 1man turret w/ 30-mm gun, twin AT-5 ATGM launchers, 30-mm AGL, & a 7.62-mm MG. Jordanian version uses twin 23-mm gun & donated to the new Iraqi armed forces
- **BTR-3E1 (Ukraine):** Export BTR-3U with the Shturm turret; 30-mm ZTM cannon, a 40mm AGL, & a 7.62-mm MG & a twin Barrier ATGM system.
- **BTR-4 (Ukraine):** Soldiers enter & leave the vehicle through rear doors; Grom overhead weapons station with 30-mm automatic cannon, 7.62mm coax MG, & up to 4 9P135M Konkurs or Baryer ATGM missiles, & 1 30-mm AGL
- **BTR-80 GKKO (Hungary):** Proposed vehicle with additional observation equipment, but no turret
- **BTR-80M (Hungary):** 1993 Improvement with 240-hp DMZ-238M2 series engine
- **BTR-80 MPAEJ (Hungary):** Battlefield engineer variant without turret
- **BTR-80 MPFJ (Hungary):** Obstacle clearance vehicle without armament
- **BTR-80 MVJ (Hungary):** ARV
- **BTR-80 SKJ (Hungary):** Battlefield ambulance variant with enlarged passenger compartment
- **BTR-80 VSV (Hungary):** NBC reconnaissance vehicle
- **TAB Zimbru (B33)(Romania):** BTR-80 w/268hp Model 1240 V8-DTS engine, Romanian radios, & more 12.7-mm ammo storage space
- **Zimbru 2000 (Romania):** Proposed improved TAB Zimbru with enlarged hull & 285-hp engine
- **Saur 1 (Romania):** 2006 prototype with 275hp Cummins engine, rear entry/exit doors & new turret
- **Saur 2 (Romania):** Improved Saur 1 prototype
- **BTR-80 "Caribe" (Columbia):** Colombian designation for BTR-80 with 12.7mm machine gun
- **Kliver Turret System:** Prototype with the Kliver turret (see separate entry)
- **ZS-96:** PSYOP variant w/ loudspeakers
- **ZS-88:** Loudspeakers for PSYOP operations and riot control

- **“Tajfun”:** Prototype proposed for base security forces with a 7.62mm MG & the Kredo-1 radar
- **UNSh:** Standardized name for expanded chassis, but called Kusheta-B, ACRV, & BM
- **SPR-2 Wide Band Jamming System:** Turretless w/ large telescopic antenna to neutralize artillery shells with proximity fuses
- **RKhM-4-02:** Upgraded RKhM-4 NBC reconnaissance vehicle
- **RKhM-4-01:** Improved/modernized RKhM4 NBC vehicle
- **RKhM-4 NBC Reconnaissance Vehicle:** Outfitted with NBC equipment
- **RPM-2 (NKR):** Radiological Reconnaissance Vehicle that first appeared in 2000
- **R-439-MD2:** Satellite communications vehicle
- **R-439-BK1:** Improved R-439-BK satellite communications vehicle
- **R-439-BK (Legenda 2BK):** Satellite communications vehicle
- **R-165B:** Short-wave signal/ communications vehicle
- **R-149BM4A:** Command and Signal Vehicle
- **R-149BMR:** Signal/Communications vehicle
- **PU-12M7 (9S482MU):** Improved PU-12M6 FA battery command vehicle
- **PU-12M6 (9S482M6):** Field Artillery (FA) battery command vehicle
- **P-240BTZ:** Switchboard platform
- **K1Sh1 (GAZ-59032) (UNSH):** Command Post with enlarged hull w/o turret armament
- **E-351BrM:** Mobile power station with diesel/electric generator
- **BREM-K (GAZ-59033) ARV:** Armored recovery vehicle with A-frame, tow bars, & stabilizers
- **BMM-80 (GAZ-59039 or Simfoniya):** Battlefield ambulance for 9 sitting or 2 litter patients
- **BMM-3:** Battlefield ambulance used as a mobile field hospital
- **BMM-2:** Battlefield ambulance for use at the battalion level for field treatment
- **BMM-1:** Battlefield ambulance for first aid & MEDVAC operations
- **BMM:** Medical series; BMM-1 (ambulance), BMM-2 (Bn Aid Stn), & BMM-3 (Bde Aid Stn)
- **2S23 (Nona-SVK) SP GunMortar System (Fire Support Vehicle):** Breach-loaded 2A60 120-mm rifled mortar/gun system similar to the 2S9
- **BTR-80 R-975:** Forward air control vehicle
- **BTR-80 1V152:** Artillery C2 & forward observation vehicle w/ range finding, navigation & new optics

System

Alternative Designation: RKhM-4

Description: The RKhM-4-01 is designed for radiation and chemical agent reconnaissance day and night, under adverse meteorological conditions, in rough terrain when negotiating natural and artificial ground or water obstacles.

Proliferation: INA

Crew: ea3

Personnel: ea7

CBRN Equipment

Dose Rate Meter: IMD-21B (IMD-1r) & DP-5V dose rate meter

Gas Detector: GSA-13 automatic gas detector

Chemical Alert System: SKhT chemical alert flare launcher with control panel

Gas Identifier: PGO-11 semiautomatic gas identifier

Sampling Equipment Kit: KPO-1 sampling equipment kit

Chemical Agent Detector: VPKhR chemical agent detector kit

Meteorology Kit: MK-3M meteorology kit

Warning Sign Kit: KZO-2 warning sign kit

Thermal Sight Vehicle Commander: INA

Thermal Sight Gunner: INA

Gunner Day Sights: 1P3-6, 1.2x/4x

Main Gun Stabilization: No

Infrared Searchlight: OU-3GA2M

Protection

Hull Armor: Front armor of the RkhM-4 protects against 12.7 mm rounds. All-round protection is against 7.62 mm rounds and artillery shell splinters.

Turret Armor: Protection against 12.7mm and shrapnel

Applique Armor: Available

Explosive Reactive Armor: INA

Active Protection System: INA

Mine Clearing: INA

Self-Entrenching Blade: INA

NBC Protection: Yes, Collective

Smoke Equipment: 6 x 81-mm smoke grenade launchers

Notes:

The RKhM-4 is designed for radiation and chemical agent reconnaissance day and night, under adverse meteorological conditions, in rough terrain when negotiating natural and artificial ground or water obstacles. The vehicle design is based on the BTR-80 APC. The RKhM-4-01 vehicle: carries out field radiation level metering conducts radioactivity testing of objects and samples; detects radiation (outside vehicle); carries out automatic atmosphere testing for contaminants; conducts periodic tests for air contamination and contamination of objects and samples; conducts sampling for radioactivity tests and contaminating substance tests; flags contaminated areas; advises of contamination in the area of patrolling; conducts terrain orientation in adverse terrain and weather conditions, day and night; conducts weather observations.

Methods of Dissemination

Indoor air: Yes

Water: Yes

Food: Yes

Outdoor air: Yes

Agricultural: Yes

Historic usage*: Yes

Notes:

Ricin (/ˈraɪsɪn/ RY-sin), a lectin (a carbohydrate-binding protein) produced in the seeds of the castor oil plant, Ricinus communis, is a highly potent toxin. A dose of purified ricin powder the size of a few grains of table salt can kill an adult human. The median lethal dose (LD50) of ricin for mice is around 22 micrograms per kilogram of body weight via intraperitoneal injection. Oral exposure to ricin is far less toxic. An estimated lethal oral dose in humans is approximately 1 milligram per kilogram. Ricin is very toxic if inhaled, injected, or ingested. It can also be toxic if dust contacts the eyes or if it is absorbed through damaged skin. It acts as a toxin by inhibiting protein synthesis. It prevents cells from assembling various amino acids into proteins according to the messages it receives from messenger RNA in a process conducted by the cell's ribosome (the protein-making machinery) – that is, the most basic level of cell metabolism, essential to all living cells and thus to life itself. Ricin is resistant, but not impervious, to digestion by peptidases. By ingestion, the pathology of ricin is largely restricted to the gastrointestinal tract, where it may cause mucosal injuries. With appropriate treatment, most patients will make a decent recovery. Because the symptoms are caused by failure to make protein, they may take anywhere from hours to days to appear, depending on the route of exposure and the dose. When ingested, gastrointestinal symptoms can manifest within six hours; these symptoms do not always become apparent. Within two to five days of exposure to ricin, effects of ricin on the central nervous system, adrenal glands, kidneys, and liver appear. Ingestion of ricin causes pain, inflammation, and hemorrhage in the mucosal membranes of the gastrointestinal system. Gastrointestinal symptoms quickly progress to severe nausea, vomiting, diarrhea, and difficulty swallowing (dysphagia). Haemorrhage causes bloody feces (melena) and vomiting blood (hematemesis). The low blood volume (hypovolemia) caused by gastrointestinal fluid loss can lead to organ failure in the pancreas, kidney, liver, and GI tract and progress to shock. Shock and organ failure are indicated by disorientation, stupor, weakness, drowsiness, excessive thirst (polydipsia), low urine production (oliguria), and bloody urine (hematuria). Symptoms of ricin inhalation are different from those caused by ingestion. Early symptoms include a cough and fever. When skin or inhalation exposure occur, ricin can cause an allergy to develop. This is indicated by edema of the eyes and lips; asthma; bronchial irritation; dry, sore throat; congestion; skin redness (erythema); skin blisters (vesication); wheezing; itchy, watery eyes; chest tightness; and skin irritation. An antidote has been developed by the UK military, although it has not yet been tested on humans. Another antidote developed by the US military has been shown to be safe and effective in lab mice injected with antibody-rich blood mixed with ricin, and has had some human testing. Symptomatic and supportive treatments are available for ricin poisoning. Existing treatments emphasize minimizing the effects of the poison. Possible treatments include intravenous fluids or electrolytes, airway management, assisted ventilation, or giving medications to remedy seizures and low blood pressure. If the ricin has been ingested recently, the stomach can be flushed by ingesting activated charcoal or by performing gastric lavage. Survivors often develop long-term organ damage. Ricin causes severe diarrhea and vomiting, and victims can die of circulatory shock or organ failure; inhaled ricin can cause fatal pulmonary edema or respiratory failure. Death typically occurs within 3–5 days of exposure. Vaccination is possible by injecting an inactive form of protein chain A. This vaccination is effective for several months due to the body's production of antibodies to the foreign protein. In 1978 Bulgarian defector Vladimir Kostov survived a ricin attack similar to the one on Georgi Markov, probably due to his body's production of antibodies. When a ricin-laced pellet was removed from the small of his back it was found that some of the original wax coating was still attached. For this reason only small amounts of ricin had leaked out of the pellet, producing some symptoms but allowing his body to develop immunity to further poisoning. The seeds of Ricinus communis are commonly crushed to extract castor oil. As ricin is not oil-soluble, little is found in the extracted castor oil.The extracted oil is also heated to more than 80 °C to denature any ricin that may be present.The remaining spent crushed seeds, called variously the “cake”, “oil cake”, and “press cake”, can contain up to 5% ricin. While the oil cake from coconut, peanuts, and sometimes cotton seeds can be used as either cattle feed and/or fertilizer, the toxic nature of castor beans precludes their oil cake from being used as feed unless the ricin is first deactivated by autoclaving. Accidental ingestion of Ricinus communis cake intended for fertilizer has been reported to be responsible for fatal ricin poisoning in animals. Deaths from ingesting castor plant seeds are rare, partly because of their indigestible seed coat, and because some of the ricin is deactivated in the stomach. The pulp from eight beans is considered dangerous to an adult. Rauber and Heard have written that close examination of early 20th century case reports indicates that public and professional perceptions of ricin toxicity "do not accurately reflect the capabilities of modern medical management". Most acute poisoning episodes in humans are the result of oral ingestion of castor beans, 5–20 of which could prove fatal to an adult. Swallowing castor beans rarely proves to be fatal unless the bean is thoroughly chewed. The survival rate of castor bean ingestion is 98%. In 2013 a 37-year-old woman in the United States survived after ingesting 30 beans. Victims often manifest nausea, diarrhea, fast heart rate, low blood pressure, and seizures persisting for up to a week. Blood, plasma, or urine ricin or ricinine concentrations may be measured to confirm diagnosis. The laboratory testing usually involves immunoassay or liquid chromatography-mass spectrometry.

VX: Nerve Agent

System

Alternative Designations: Methylphosphonothioic acid, O-ethyl S-(2-diisopropylaminoethyl) methylphosphonothiolate

Military designation:

Chemical abstracts service number: 50782-69-9

UN Number: 2810

Chemical Formula: C11H26NO2PS

Appearance:

Color: Clear, Amber

Description type agent: Nerve

Description: One of the most toxic tasteless and odorless human-made chemical warfare agents

Lethality: Yes

Nonpersistent: No

Flammability*: 1

Health*: 4

Instability/reactivity*: 0

Flashpoint° (F): 318.2

Boiling Point ° (F): 568.4

Routes of Exposure

Inhalation: Yes

Ingestion: Yes

Skin/eye: Yes

Methods of Dissemination

Indoor air: Yes

Water: Yes

Outdoor air: Yes

Agricultural: Possible

Historic usage*:

Notes:

VX is an extremely toxic synthetic chemical compound in the organophosphorus class, specifically, a thiophosphonate. In the class of nerve agents, it was developed for military use in chemical warfare after translation of earlier discoveries of

organophosphate toxicity in pesticide research. In its pure form, VX is an oily, relatively non-volatile, liquid that is amber-like in color] Because of its low volatility, VX persists in environments where it is dispersed. VX, short for "venomous agent X".]is one of the best known of the V nerve agents and was first discovered at Porton Down in England during the early 1950s based on research first done by Gerhard Schrader, a chemist working for IG Farben in Germany during the 1930s. Now one of a broader V-series of agents, they are classified as nerve agents and have been used as a chemical weapon in various recorded deadly attacks. VX fatalities occur with exposure to tens of milligram quantities via inhalation or absorption through skin; VX is thus more potent than sarin, another nerve agent with a similar mechanism of action. On such exposure, these agents severely disrupt the body's signaling between the nervous and muscular systems, leading to a prolonged neuromuscular blockade, flaccid paralysis of all the muscles in the body including the diaphragm, and death by asphyxiation. The danger of VX, in particular, lies in direct exposure to the chemical agent persisting where it was dispersed, and not through its evaporating and being distributed as a vapor (i.e. it is not a "vapor hazard"). VX is considered an area denial weapon due to these physical and biochemical characteristics. As a chemical weapon, it is categorized as a weapon of mass destruction and is banned by the Chemical Weapons Convention of 1993, where production and stockpiling of VX exceeding 100 grams (3.53 oz) per year is outlawed. The only exception is for "research, medical or pharmaceutical purposes outside a single small-scale facility in aggregate quantities not exceeding 10 kg (22 lb) per year per facility".

Sarin: Chemical Nerve Agent

System

Alternative Designations: Trilone, Zarin

Military designation: GB

Chemical abstracts service number: 107-44-8

UN Number: 2810

Chemical Formula: C4H10FO2P

Appearance: Liquid

Color: Clear

Description type agent: Nerve

Description: Chemically similar to Organophospate

Lethality: Yes

Nonpersistent: Yes

Flammability*: 1

Health*: 4

Boiling Point ° (F): 297

Routes of Exposure

Inhalation: Yes

Ingestion: Possible

Skin/eye: Yes

Methods of Dissemination

Indoor air: Yes

Water: Yes

Food: Yes

Outdoor air: Yes

Agricultural: Yes

Historic usage*: Yes

Notes:

Sarin (NATO designation GB [short for G-series, "B"]) is an extremely toxic synthetic organophosphorus compound. A colourless, odorless liquid, it is used as a chemical weapon due to its extreme potency as a nerve agent. Exposure is lethal even at very low concentrations, where death can occur within one-to-ten minutes after direct inhalation of a lethal dose,[5][6] due to suffocation from lung muscle paralysis, unless antidotes are quickly administered. People who absorb a non-lethal dose, but do not receive immediate medical treatment, may suffer permanent neurological damage. Sarin is generally considered a weapon of mass destruction. Production and stockpiling of sarin was outlawed as of April 1997 by the Chemical Weapons Convention of 1993, and it is classified as a Schedule 1 substance. Like some other nerve agents that affect the neurotransmitter acetylcholine, sarin attacks the nervous system by interfering with the degradation of the neurotransmitter acetylcholine at neuromuscular junctions. Death will usually occur as a result of asphyxia due to the inability to control the muscles involved in breathing. Initial symptoms following exposure to sarin are a runny nose, tightness in the chest, and constriction of the pupils. Soon after, the person will have difficulty breathing and they will experience nausea and drooling. As they continue to lose control of bodily functions, they may vomit, defecate, and urinate. This phase is followed by twitching and jerking. Ultimately, the person becomes comatose and suffocates in a series of convulsive spasms. Moreover, common mnemonics for the symptomatology of organophosphate poisoning, including sarin gas, are the "killer Bs" of bronchorrhea and bronchospasm because they are the leading cause of death, and SLUDGE – salivation, lacrimation, urination, defecation, gastrointestinal distress, and emesis (vomiting). Death may follow in one to ten minutes after direct inhalation. Sarin has a high volatility (ease with which a liquid can turn into vapour) relative to similar nerve agents, therefore inhalation is very easy and even vapor may immediately penetrate the skin. A person's clothing can release sarin for about 30 minutes after it has come in contact with sarin gas, which can lead to exposure of other people. Treatment measures have been described. Treatment is typically with the antidotes atropine and pralidoxime. Atropine, an antagonist to muscarinic acetylcholine receptors, is given to treat the physiological symptoms of poisoning. Since muscular response to acetylcholine is mediated through nicotinic acetylcholine receptors, atropine does not counteract the muscular symptoms. Pralidoxime can regenerate cholinesterases if administered within approximately five hours. Biperiden, a synthetic acetylcholine antagonist, has been suggested as an alternative to atropine due to its better blood–brain barrier penetration and higher efficacy.

Hydrogen Cyanide: Systemic Agent

System

Alternative Designations: Formonitrile, Hydrocyanic acid, Prussic acid

Military designation: AC

Chemical abstracts service number: 74-90-8

UN Number: 1051

Chemical Formula: HCN

Appearance:

Color: Colorless or pale blue

Description type agent: systemic chemical asphyxiant

Description: interferes with the normal use of oxygen by nearly every organ of the body

Lethality: Yes

Nonpersistent: No

Outdoor air: Yes

Agricultural: Possible

Historic usage*: Yes

Notes:

Hydrogen cyanide (HCN), sometimes called prussic acid, is a chemical compound[11] with the chemical formula HCN. It is a colorless, extremely poisonous and flammable liquid that boils slightly above room temperature, at 25.6 °C (78.1 °F).[12] HCN is produced on an industrial scale and is a highly valuable precursor to many chemical compounds ranging from polymers to pharmaceuticals.

Chloroacetophenone: Riot Control / Tear Agent

System

Alternative Designations: 2-Chloro-1-phenylethanone, 2-Chloroacetophenone, alpha-Chloroacetophenone, Chemical mace, Chloromethyl phenyl ketone, Phenyl chloromethylketone, Tear gas

Military designation: CN

Chemical abstracts service number: 532-27-4

UN Number: 1697

Chemical Formula: C8H7ClO

Appearance: Gas

Color: Gray, white, or colorless

Description type agent: Riot Control/Tear Agent

Description: Military and law enforcement use CN for riot control.

Lethality: Yes

Nonpersistent: Yes

Flammability*: 1

Health*: 2

Instability/reactivity*: 0

Flashpoint° (F): 244

Boiling Point ° (F): 472-473

Routes of Exposure

Inhalation: Yes

Ingestion: Yes

Methods of Dissemination

Indoor air: Yes

Water: Yes

Outdoor air: Yes

Agricultural: Possible

Historic usage*: Yes

Notes:

Phenacyl chloride, also commonly known as chloroacetophenone, is a substituted acetophenone. It is a useful building block in

organic chemistry. Apart from that, it has been historically used as a riot control agent, where it is designated CN. It should not be confused with cyanide, another agent used in chemical warfare. Because of its significantly greater toxicity, it has largely been supplanted by CS gas. Even though CN is still supplied to paramilitary and police forces in a small pressurized aerosol known as “Mace” or tear gas, its use is falling as pepper spray both works and disperses more quickly than CN and is less toxic than CN. The term "Mace" came into being because it was the brand-name invented by one of the first American manufacturers of CN aerosol sprays. Subsequently, in the United States, Mace became synonymous with tear-gas sprays in the same way that Kleenex has become strongly associated with facial tissues (a phenomenon known as a genericized trademark). Like CS gas, this compound irritates the mucous membranes (oral, nasal, conjunctival and tracheobronchial). Sometimes it can give rise to more generalized reactions such as syncope, temporary loss of balance and orientation.[6] More rarely, cutaneous irritating outbreaks have been observed and allergic contact permanent dermatitis. At high concentrations, CN may cause corneal epithelial damage and chemosis. It has also accounted for at least five deaths, which have resulted from pulmonary injury and/or asphyxia.

Berkut-2 Russian Tactical Heated-Cab Snowmobile

Tiers:

1 2 3 4

System

Alternative Designation: Berkut-2; TTM-1901-40
Type: Tactical Heated-Cab Snowmobile
Manufacturer: Russian firm NPO Transport
In Service: 2016-Present
Crew: ea1
Passenger Capacity: ea2
Operating Temperature: The snowmobiles have a car-type heated cab and are designed for use in the Arctic, given their ability to operate at ambient temperature of -50°C.
Cab Heating System: The cab's effective heating system maintains a temperature of +18°C even if it is -50°C outside.
Aircraft Transport Capable: Many of Russia's military transport aircraft, such as the Il-76, could easily carry them internally and An-32 or An-76 tactical airlifters may be able to as well. Helicopters such as the Mi-8/17 could carry them sling-loaded or even possibly inside their cabin. This could also make the Berkuts an attractive way to provide additional mobility for airborne or special operations forces inserted in remote Arctic areas for short-duration missions.

Active Protection System: No
Mine Clearing: No
Self-Entrenching Blade: No
NBC Protection: INA
Smoke Equipment: No

Notes:

The Berkut-2, or TTM-1901-40, is an extremely simple vehicle consisting of a small heated 2-man cab built atop a set of forward articulated sleds and tracks in the rear. A PKP GPMG can be mounted just behind the cab but there is no armour to protect the gunner or cab. The Berkut's small size and light weight, just 900kg or just under 2,000 lbs, make it ideal for rapid transport aboard trucks or transport aircraft. Highly versatile, the snowmobiles can tow up to 650 lb or 295 kg – either equipment or troops on skis/sleds pulled by tether. The cabs are heated and can support operations in temperatures as low as -55F or -50C. The vehicles are ideal for patrolling or transporting troops to difficult, heavily wooded areas, when insertion on foot or by air are impractical. The snowmobiles are a part of Russia's renewed interest in the Arctic region with the refurbishment and reactivation of former bases in the Russian Arctic Circle. The importance of this small, simple vehicle is marked by its first appearance at this year's Victory Parade.

PTS-M (Ob'yekt 65) (Export) North Korean Tracked Amphibious Transport Vehicle

Tiers:

Variants:

- **PTS-2:** INA
- **PTS-3:** INA
- **PTS-4:** In 2014, the Russian Defense Ministry intends to purchase an undetermined number of PTS-4s, which underwent acceptance trials in 2011. The vehicle will be fitted with a remotely operated 12.7 mm (0.50 in) machine gun and a multi-fuel engine. The PTS-4 weighs 33 tons, with a payload of 12 tons on land (18 tons on water). Projected maximum road speed is 60 km/h (37 mph), with an expected maximum speed in water of 15 km/h (9.3 mph). Unlike its predecessors, it uses T-80 suspension components. The fully enclosed cab offers protection against small arms fire and splinter. Production began in 2014.

System

Alternative Designation: PTS-M (Ob'yekt 65)
Type: Tracked Amphibious Transport Vehicle
Manufacturer: Soviet State Factories

Smoke Equipment: INA

Notes:

The PTS is a Soviet tracked amphibious transport. PTS stands for Plavayushchij Transportyer - Sryednyj or medium amphibious transport vehicle. Its industrial index was Ob'yekt 65. Introduced in 1965, it is large, with a substantial payload of 10 tons, two to four times the capacity of the BAV 485, and better cross-country performance, at the cost of greater somewhat higher purchase costs because it is tracked. The most common model is the improved PTS-M that is powered by a 350 hp diesel engine. The PTS has a boxy, open watertight hull, with six road wheels per side, front drive sprocket, rear idler sprocket, and no return rollers. Like the BAV 485, and unlike the DUKW, it has a rear loading ramp. The crew is seated at the front, leaving the rear of the vehicle open for a vehicle, which can be driven (or backed) in, rather than lifted over the side. To aid in facilitating this, the engine is under the floor. Propulsion in water is by means of twin propellers, in tunnels to protect them from damage during land operations. The PTS-M also has a companion vehicle, the PKP, a boat-like amphibious two-wheeled trailer, with fold-out sponsons providing stability on water; the combination allows the PTS-M to accommodate an artillery tractor, field gun (up to medium caliber), its crew, and a quantity of ammunition, all in one load.

MZKT-74295 Belarusian Tank Transporter

Tiers:

Variants:

- **MZKT-7401:** MZKT-7401 is essentially a similar vehicle. It is powered by a Russian YaMZ engine, developing 400 hp. It has a payload capacity of 50 000 kg. The prime mover is fitted with a MAZ 2-seat cab. It was first publicly revealed in 2007. This tank transporter is used in Belarus and, reportedly, Russia.
- **MZKT-742952:** has a payload capacity of 50 000 kg. The prime mover is powered by a Deutz diesel engine, developing 544 hp. First prototype was completed in 1998.
- **MZKT-742953:** Payload of 70,000kg. Mercedes-Benz (DaimlerChrysler) engine, 680hp. Introduced in 2000. The prime mover has a new metal-frame crew cab, which accommodates driver and 6 passengers.
- **MZKT-74296:** Payload of 59,000kg. Deutz diesel engine, 544hp. 1 driver + 6 passengers. Introduced in 2001
- **MZKT-742960:** 1 driver + 6 passengers; can carry two BMP-2 infantry fighting vehicles simultaneously. Introduced in 2015. It has a new metal-frame crew cab, which accommodates driver and 6 passengers. This prime mover is used in conjunction with a 2-axle semi-trailer and can transport loads with a maximum weight of 56 000 kg. It is powered by a Deutz diesel engine, developing 544 hp.
- **MZKT-74291:** Payload of 90,000kg; 600hp engine

Notes:

This tank transporter is fitted with a MAZ forward control cab, which is produced by a Belarusian truck maker. The cab provides seating for the driver and co-driver. There are two sleeping berths for the crew. However, the cab has no space to accommodate crew of the vehicle that it transports. Vehicle has an 8x8 configuration. Both front axles are steerable. It has two winches that assist loading of immobile or disabled vehicles. The Turkish MZKT-74295 is used in conjunction with a two-axle semi-trailer. It can carry loads with a maximum weight of 50,000 kg, including main battle tanks, heavy armored vehicles, self-propelled artillery systems, construction equipment and other military loads. This vehicle is also marketed under the Volat brand.

Trench: m0.7
Fording: m1.2

Notes:

The Ural-375 is a general purpose 4.5 ton 6×6 truck, produced at the Ural Automotive Plant in the Russian SFSR since 1961. The Ural 375 replaced the ZIL-157 as the standard Soviet Army truck in 1979. It was itself replaced by the Ural-4320. The Soviets found the trucks an ideal platform for the BM-21 Grad rocket launcher. Other modes for the Ural-375D included troop carrier, supply carrier, etc. Since 1973 the main production model was powered by a ZiL-375 V8 diesel engine, developing 180 hp. The diesel-powered unit was introduced in order to increase the range on fuel, as well as to reduce risks of catching fire. Vehicle has an engine pre-heater and is well suited for operation in winter. Despite that the petrol-engined version was produced in small number until 1991. There are numerous variants of this military truck. They vary from multiple rocket launcher carriers to missile resupply vehicles and fuel servicing trucks. The specialized TMS-65 is a special NBC decontamination vehicle carrying a jet engine to remove NBC agents from other vehicles. Other variants include recovery vehicle and fuel tanker.

Renault Kerax French 8x8 Truck

Tiers:

1 **2** 3 4

Variants:

- **Armored version:** Protection from small arms fire (7.62), artillery shell fragmentation, landmines and IEDs. Engine: 520hp turbodiesel Length: 10.2m Width: 2.5m
- **8X8 recovery vehicle:** Equipped with a specific recovery system.
- **8X8 "Heavy Duty" (tractor):** Heavy equipment / tank transporter with a gross combined vehicle weight of 120 tons

System

Utility

Transport: Air-transportable by A400m, C-130, and C-160

Notes:

The Renault Kerax is designed for heavy transport missions, and has eight driven wheels on multiple axles (two steering axles in the front and two drive axles in the rear). It is used to carry cargo, troops, weapons, containers and other equipment. They can be configured also as dump trucks, water/fuel tankers, load handling systems (LHS), shelters, recovery truck, or weapon systems carriers. This vehicle will cold-start down to -32C. The Kerax trucks are available with standard or armored cabs. The cab is air-transportable by A400m, C-130, and C-160.

MAZ-7910 Russian 8x8 Air Defense Missile System Carrier

Tiers:

Variants:

- **MAZ-543P:** The MAZ-543P (carrying capacity - 19600 kg) was used for 9K76 Temp-S system.
- **MAZ-543M:** The MAZ-543M version was designed to carry the BM-30 Smerch Multiple rocket launcher.
- **MAZ-543:** Designed in the 1960s, the MAZ-543 was presented on 7 November 1965 during the Moscow Red Square military parade as part of SS-1c Scud B (9K72 Elbrus) system. The vehicle is powered by a 38.9 litre D12A-525 tank diesel engine producing around 525 horsepower, and gives a maximum road speed of 37 mph (60 km/h). There have been a number of variants
- **MAZ-543A:** he 1967 MAZ-543A, arrived (with extra carrying capacity up to 22000 kg). It served as the basis for several civilian vehicles, including the AA-60(543)-160 aerodrome fire-fighting vehicle (1973), the AA-70(543)-172 experimental emergency vehicle, and the KS-5571 crane. In 1974 at the Exhibition of Achievements of the National Economy, a new prototype modification (MAZ-7310) was presented. It has been in production since 1976.
- **MAZ-547:** The MAZ-547 version is a six-axle version, used as Transporter erector launcher for the SS-20 Saber.
- **MAZ-7910:** This variant is used to carry the air defense missile complex S-300PMU-2.
- **MAZ-74106:** This variant is used mainly to transport the air search radar 64N6 BIG BIRD for the S-300PM.
- **WS2400:** In 1986, People's Republic of China fielded its version of MAZ-543. Initially designated WS580 but later renamed WS2400, this Chinese version is one of the Wanshan series trucks manufactured by Wanshan Special Vehicle, a wholly owned subsidiary of China Aerospace Sanjiang Space Co. Ltd., which is in turn a subsidiary of China Aerospace Science and Industry Corporation (CASIC).

System

Alternative Designations: MAZ 7910

Manufacturer: MAZ

Crew: ea2

Automotive

Engine Name: D12A-525

Engine Type: V-12 water-cooled diesel

Engine Power: 525 hp at 2,100 rpm

Power-to-Weight Ratio: 26.25 hp/metric ton

Maximum Speed, Road: km/h60

Maximum Speed, Off-Road: km/h30

Maximum Range: km800

Cargo Capacity Example: take three 800 mm pipes with a total weight of 18 tonnes

Dimensions (Chassis: MAZ-7910 8 x 8 Truck)

Length: m9.40

Width: m3.10

Height: m3.70

Curb Weight: kg23,300

Payload: tons18

Communications

VHF Radio: R-168 Akveduk

HF Radio: R-161 Poisk

Protection

Note: There is not information on the protection available to the MAZ 7910

Notes:

In 1974, MAZ made the prototype of a pipe hauler MAZ 7910. According to the information the only prototype was made, the other information says that mass production in small quantities started in 1976. This version has a single cabin. It could take three 800 mm pipes with a total weight of 18 tonnes. Overall dimensions — 11,450x3050x3550 mm. Curb weight — 23,300 kg. Payload — 18 tonnes. Top speed — 60 kph.

M983 HEMTT American 8x8 Heavy Expanded Mobility Tactical Truck (HEMTT) Tractor Truck

Tiers:

Variants:

- **M977:** The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis.
- **M978:** The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant.
- **M983 Tractor:** The M983 is a tractor unit for use with the trailer-mounted MIM-104 Patriot missile system. It can also be used with the Interim Stryker Recovery System, or other trailers. An earlier variant fitted with a 30 kW generator and crane mounted behind the cab was used to tow the Pershing II Erector Launcher in CONUS (a M1001 MAN tractor was used in West Germany). The M983A2/A4 Light Equipment Transporter (LET) tractor is mainly used to transport construction and engineer equipment. It has a 45,000 lb (20,000 kg)) 2 speed hydraulic winch mounted behind the cab used to load the trailer. It does not have a self-recovery winch.
- **M984A1 Wrecker:** The M984 wrecker is the only HEMTT variant to have been produced in the A1 configuration, and this resulting in the change of recovery crane and retrieval system between A0 and A1 configurations. The current model is the M984A4. Standard equipment includes a 27,240 kg (60,050 lb) capacity two-speed recovery winch, a rear-mounted 11,340 kg capacity vehicle retrieval system, and a 6,350 kg (14,000 lb) at 2.74 m (9.0 ft) capacity Grove materials handling crane. A 9,072 kg (20,000 lb) bare drum capacity self-recovery winch is fitted as standard on the M984.
- **M985 Cargo:** The M985 is available in two variants. The current models are A4; there were no A1 models. The M985 cargo variant is similar to the M977 cargo truck but was developed to support the M270 Multiple Launch Rocket System (MLRS) with a M989A1 HEMAT trailer. It may also used to transport Patriot missiles. The M985 Guided Missile Transporter (GMT) was developed specifically for use with the Patriot system and it can be distinguished easily from other cargo models by its rear-mounted Hiab 8108/2 materials handling crane
- **Taiwanese RT-2000 Multiple Rocket Launcher:** The RT-2000 [Lit; Ray-Ting-2000 or Thunder -2000] rocket launcher mounted on an M977 chassis. In service about 1997. Can mount any one of three launchers: Mk 15 117-mm, 60 rounds; Mk 30, 30 rounds with HE; AP/AM cluster warhead - >18-mile range; Mk 45 12 rounds, > 27-mile range, GPS targeting. See separate record for details.
- **M1120 HEMTT Load Handling System (LHS):** The M1120 Load Handling System (LHS) variant was initially introduced as part of the HEMTT overhaul/rebuild program, during which returned M977 cargo trucks have their cargo bodies and materials handling cranes removed, to be replaced by a Multilift Mark 5 (now designated MPH165-LHS) LHS,

as fitted to the Oshkosh PLS truck.

- **M1977 HEMTT Common Bridge Transporter (CBT):** The M1977 HEMTT Common Bridge Transporter (CBT) is a further development of the M1120 LHS, and in common with the M1120 LHS was initially introduced as part of the HEMTT overhaul/rebuild program. It is used for loading, transporting, and unloading Ribbon Bridge components and bridge erection boats.
- **M1142:** The M1142 is a Tactical Fire Fighting Truck (TFFT) capable of extinguishing aircraft, petroleum, brush, and structural fires at isolated military installations. The TFFT is based on a HEMTT M977A2 chassis with the heavier duty M1120 LHS HEMTT variant rear suspension. The TFFT contract was awarded to Pierce Manufacturing with Oshkosh Corporation as a subcontractor to Pierce.
- **M977 A2 Cargo Truck:** Basic version.
- **M977 A2 EPP:** Electrical power plant.
- **M977 A2 LRPT:** Large repair parts transporter.
- **M978 A2:** Fuel servicing transporter truck tanker.
- **HEMTT M983 A2 LET:** Light equipment transporter.
- **HEMTT M983 A2:** Patriot missile tractor.
- **M984 A2:** Recovery truck.
- **M985 A2:** Cargo and MRLS resupply.
- **M985 A2 GMT:** Guided missile transporter.
- **M1120 A2 HEMTT-LHS:** Heavy expanded mobility tactical truck.
- **M1977 A2 CBT:** Common bridge transporter.

System

Alternative Designation: M983 HEMTT

Engine Power: 445 hp at 2,100 rpm
Power-to-Weight Ratio: 16.18 hp/metric ton

Transmission: Allison HT740D automatic transmission with torque converter 4 forward/1 reverse gears

Suspension: 8 x 8 (8 wheels driving, 4-wheel steering); Hendrickson leaf spring w/steel saddle, equalizing beams, and 10-in (254-mm) vertical travel on front and rear; RT340 model rear springs on all but M985 (RT380) and M984A1 (RT500)

Maximum Speed: 88 km/h

Range: 483 km; w/full load at 54 km/h

Fuel Capacity: 589 liters

Tire Size: 16.00R20

Gradient: 60 percent

Side Slope: 30 percent

Fording Depth: 1.23 m

Payload Capacity: 9,979 kg

Protection

Armor: A-kit/B-kit; U.S. Army Long Term Armor Strategy (LTAS) compliant

Applique Armor: Available

Active Protection System: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant. The Heavy Expanded Mobility Tactical Truck (HEMTT) is an eight-wheel drive, diesel-powered, 10-short-ton (9,100 kg), tactical truck used by the US military and others. In evolving configurations, it has been in continuous production since 1982. The M977 HEMTT entered service with the U.S. Army as a replacement for the M520 Goer. By mid 2019, around 35,000 HEMTTs in various configurations had been produced by Oshkosh Defense through new-build contracts and around 13,000 of these had been re-manufactured. Current variants have the A4 suffix. The 10×10 Oshkosh Logistic Vehicle System Replacement (LVSR) is the U.S. Marines' equivalent to the U.S. Army's Oshkosh 8×8 HEMTT and Oshkosh 10×10 Palletized Load System (PLS). The Marines do not use the HEMTT or PLS, and the Army does not use the LVSR, but both services use a common trailer (M1076) with all three truck types. The HEMTT's objective is to provide heavy transport capabilities for supply and re-supply of combat vehicles and weapons systems. Compared to earlier generation 5-ton trucks in U.S. Army service it offers increased payload and mobility. The HEMTT is available in a variety of configurations, including cargo, tanker, tractor and wrecker. The HEMTT was developed from the outset as a tactical truck, but to minimize procurement and life cycle costs included militarized commercial automotive components where possible, these including the engine and transmission. Some components used in early HEMTTs are common with the Oshkosh Logistics Vehicle System (LVS) vehicles which were supplied to the U.S. Marine Corps. With the exception of the M984 wrecker variant (254 × 89 × 9.5 mm, front; 356 × 89 × 9.5 mm, rear), on all HEMTT variants the chassis is formed of 257 × 89 × 9.5 mm heat-treated carbon manganese steel with a yield strength of 758 MPa. Bolted construction with Grade 8 bolts is used throughout. A centrally mounted self-recovery winch is an option and this is fitted to around 20% of production. The HEMTT's two-door forward control cab seats two. It is of heavy-duty welded steel construction with corrosion-resistant sheet metal skins. Simula Inc. (acquired by Armor Holdings in 2003 and now BAE Systems) supplied 186 add-on cab armoring kits for use in the former Yugoslavia. These were not issued, but from 2004 were used in Iraq. BAE systems supplied a next-generation armor kit for the HEMTT and by late-2006 had supplied the U.S. Army with around 3600 kits for the Oshkosh HEMTT and PLS. The HEMTT A4 is fitted with the slightly larger from the Oshkosh PLS A1. This cab complies with the U.S. Army's Long Term Armor Strategy (LTAS) requirements of an A- and B-kit armoring philosophy. It also comes as standard with integrated floor armor, an integrated mount for a machine gun and gunner protection kit, and air-conditioning. A Detroit Diesel 8V92TA V-8 two-stroke diesel developing 445 hp (332 kW) is fitted in HEMTT A0 and A1 models, with the DDECIV version of this engine fitted to A2 HEMTTs. An EPA 2004 compliant Caterpillar (CAT) C-15 six-cylinder, 15.2-liter diesel developing a peak of 515 hp (384 kW) is fitted to HEMTT A4 models. HEMTT A0 and A1 models are fitted with an Allison HT 740D 4F/1R automatic transmission, torque converter, and Oshkosh 55,000-pound (25,000 kg) two-speed transfer case. HEMTT A2 models have the Allison HD 4560P 6F/1R automatic transmission. HEMTT A4 models are fitted with an Allison 4500SP 5F/1R automatic transmission and an uprated version of Oshkosh's 55,000-pound (25,000 kg) two-

speed transfer case. The front axles on all HEMTTs are single-reduction Oshkosh 46K, the rear are Dana single-reduction which vary according to configuration. Drive to the front axles is selectable and all axles have differential locks. Suspension on A0/A1/A3 models is by Hendrickson leaf springs with equalizing beams. Suspension on A4 models is Holland air suspension, load rating on the rear axles varying by configuration. Tire size is 1600 R20 on all models, and standard tire fit is Michelin XZL. All models are capable of fording water crossings up to 48 in (120 cm) deep, and can climb a gradient of at least 60%. All original variants are air transportable in the C-130. All variants are air-transportable in the C-17. Original HEMTT models now have the suffix A0. Only the M984 wrecker was produced in A1 configuration. All models were produced in A2 configuration. The A3 suffix is applied to HEMTT technology demonstrators with a diesel-electric drive system. Current HEMTT production models have the suffix A4.

Notes:

The Ural-63708 is a new Russian tractor truck with 8x8 configuration. It is a version of the Ural-63704-0010 military truck with an added axle at the rear and fitted with a more powerful engine. It was first publicly revealed in 2016. This tractor truck is a member of Tornado-U family of military vehicles. In this case letter "U" in the designation stands for "Ural", as there is also a similar KamAZ-U family, developed by another Russian truck manufacturer KamAZ.

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1092 or M1092A1 Truck, Chassis 5 ton is a member of the Family of Medium Tactical Vehicles (FMTV), providing tactical unit mobility and logistics for the U.S. Army and the other military services.

Notes:

The M1084 Standard Cargo Truck with MHE is designed to transport cargo and soldiers. The M1084 has a payload capacity of 10,000 pounds and lift capacity of 2,500 to 5,000 pounds using the on board MHE. The cargo bed side rails are hinged for the ease of loading and unloading cargo. The cargo bed can be equipped with an optional bench seat kit for transport of soldiers. The bench seats are constructed of a non-wood material and attach to the cargo bed side rails. The seats can be folded down and stowed when not in use. Soldiers are assisted climbing in and out of the cargo bed area with the aid of a ladder stowed on the vehicle when not in use. A canvas and bows kit is provided to keep soldiers and cargo protected from the elements. The M1084 can be equipped with a self-recovery winch capable of fore/aft vehicle recovery operations. The winch has 280 feet of line capacity and 15,500 pounds bare drum line pull at 110% overload.

LVSR MKR18 American 10x10 Logistics Vehicle System Replacement (LVSR) Heavy Mobility Cargo Truck

Tiers:

Variants:

- **LSVR MKR15 Wrecker:** This version is equipped with a crane, winches and hydraulic spade. It can flat tow 110,000 lb (49,900 kg) on the highway. The truck has a lift and tow capacity of 97,000 lb (44,000 kg) gross vehicle weight with 24,000 lb (10,890 kg) lift capacity. The articulated crane has a lift capacity of 18,00 0 lb (8,170 kg) at 11 ft (3.35 m); and 10,000 lb (4,540 kg) at a maximum reach of 20 ft (6.1 m).
- **LSVR MKR16 Tractor:** This is the tractor variant of the LVSR. It is equipped with a recovery winch with a 60,000-lb (27,220-kg) capacity and 10,000-lb (4,540-kg) side-pull capacity.
- **MKR18 Cargo:** This is the cargo version of the LVSR. It is equipped with the Multilift Mk 18A1 load handling system. Towed trailers add 16.5 tons of payload.

System

Alternative Designation: LVSR MKR18
Type: Logistics Vehicle System Replacement (LVSR) Heavy Mobility Cargo Truck
Configuration: 10x10
Manufacturer: Oshkosh Defense, Oshkosh, Wis.
Crew: ea1
Cab Seating: 1x1
Airlift Capability: This heavy truck can be airlifted by the C-5A Galaxy and C-17 Globemaster III military transport aircraft. Height of the vehicle can be reduced by 50 cm for easier transportation.
Note #1: The MKR18 cargo carrier version of the LVSR is equipped with a Multilift load handling system and can load and unload flatracks or containers both on the prime mover and trailer without external material handling equipment. All adapters and lift hardware are carried on the vehicle. It uses standard NATO flatracks.

Dimensions

Length: 10.83 m
Width: 2.49 m
Height: 3.52 m
Wheelbase: 5.67 m
Gross Weight: 48,080 kg
Curb Weight: 24,360 kg

Road Payload Capacity: 22,500 kg

Off-Road Payload Capacity: 16,500 kg

Automotive

Engine Name: 1 x CAT C15

Engine Type: Diesel

Engine Power: hp600

Fuel Capacity: m628 liter

Maximum Speed: 105 km/h

Range: 480 km

Gradient: 60%

Side Slope: 30%

Vertical Step: 0.6 m

Trench: 2.5 m

Fording: 1.52 m

Note: The front two and the back two axles are steered.

Protection

Armor: It is fitted with an integrated armored cab and energy-absorbing seats.

Applique Armor: Yes, The add-on armor kit for LVSR was developed and supplied by Plasan of Israel. Plasan was awarded a contract in mid-2006 for 12 LVSR armor kits for testing. The November 2011-stated AAO for LVSR add-on armor B-kits quotes 651. The armor system for LVSR follows the A-kit/B-kit principle, with vehicles designed 'fitted for, but not with', protection. In the case of LVSR, 'fitted for' includes an armored cab floor as standard. Cargo and wrecker variants require an upgrade of the front springs. Protection kits can be installed and uninstalled from vehicles in the field using only basic tools. The A-kit is fitted on the production line and is the combination of a limited amount of armoring (in difficult-to-access areas of the vehicle), together with a significant amount of armour installation attachments and required support structures. The bulk of the armor, the B-kit, is installed in the field on an 'as required' basis. The benefits of the A-kit/B-kit principle are that armor is only fitted when required, this reducing vehicle wear and tear, and by default whole life cycle costs. Improvements and/or upgrades to armor are also far easier to integrate into an appliqué solution. The A-kit/B-kit principle is currently applied to all current production US tactical 'soft skin' vehicles.

Notes:

MKR18 Cargo This is the cargo version of the LVSR. It is equipped with the Multilift Mk 18A1 load handling system. Towed trailers add 16.5 tons of payload. The Logistic Vehicle System Replacement (LVSR) is a family of vehicles, based on a common 5-axle ten-wheel drive (10x10) chassis, that vary in individual configuration by mission requirements. The LVSR was designed and is manufactured by Oshkosh Defense. LVSR is a purpose-designed military vehicle and there are currently three variants in service, a cargo, a wrecker and a tractor truck. The first LVSRs were ordered in 2006. The LVSR is the U.S. Marines' equivalent of the U.S. Army's Oshkosh Heavy Expanded Mobility Tactical Truck (HEMTT) and Oshkosh Palletized Load System (PLS). The Marines do not use the HEMTT or PLS and the Army does not use the LVSR, but both services use a common trailer (M1076) with all three truck types. The predecessor of the LVSR, the MK48 Logistics Vehicle System (LVS), had entered service with the US Marine Corps (USMC) from 1985 and in the late 1990s a project to replace the LVS was started. As a precursor to a formal LVS replacement programme a number of manufacturers co-operated with the USMC to build and evaluate an Advanced Technology Demonstrator (ATD). The ATD was built during 1998 at the Nevada Automotive Test Centre (NATC). LVS Modification Demonstrators (LVS-MDs) were also built, these integrating commercially proven automotive components and

technologies. In April 2001, Logistics Management Institute (LMI) completed their final report for the 'Analysis of Alternatives (AoA) for the USMC Logistics Vehicle System Replacement (LVSR), concluding the best option was to rebuy a vehicle similar to the technology demonstrator. Five alternative options had been considered, these were: Inspect and Replace Only As Necessary (IROAN) for the LVS; rebuild the LVS; re-manufacture the LVS to a higher standard; rebuy a vehicle similar to the technology demonstrator; research and develop an entirely new vehicle. Around this time it was suggested that 2,000-3,000 vehicles might be required, although throughout the program numbers would fluctuate. An LVSR industry day was held in late 2001, and a formal solicitation to industry was released in early 2003. This had been delayed from an expected April 2002. The LVSR Request for Information (RfI) had originally been expected in May 2000. In March 2004 Oshkosh Truck Corporation (now Oshkosh Defense) announced that the US Marine Corps had awarded the company a Phase I System Development and Demonstration Contract to supply three LVSR trucks. These were to be delivered to the Marines for extensive endurance and performance testing within 12 months. This award was the first phase of a two-phase acquisition competition valued in March 2004 at $783 million for up to 1,581 vehicles. Competition for the Phase II production award (scheduled for March 2006) was limited to those companies that successfully completed Phase I evaluation. The other company selected for the Phase I evaluation was the American Truck Company (ATC) with a TATRA-based design. Phase 1 testing was completed in 2005 and in late-May 2006, the USMC awarded the LVSR Phase II contract to Oshkosh Truck Corporation. An initial LVSR order issued on 31 May 2006 was valued at $28 million and ordered 22 cargo, two wrecker (recovery), and tractor truck LVSR variants, plus vehicle kits, training (operator/maintainer-cargo), test support-production verification testing cargo, meetings, and contract data requirements. The first LVSR cargo variant began testing at the Aberdeen Proving Ground in June 2007. Tractor and wrecker prototype vehicles began testing in November 2007 and April 2008 respectively. An additional 123 cargo variants, which completed low rate initial production (LRIP) quantities, were subsequently ordered under option year two of the production contract. In January 2009, Oshkosh announced an LVSR delivery order valued at $176 million. This called for more than 425 LVSRs and transitioned LVSR from LRIP into full-rate production (FRP). LVSR fielding began in April 2009 for user trials and testing and the first vehicle was fielded to Afghanistan in September 2009. LVSR deliveries were completed in September 2013. Orders totalled 2,022, with the total order value around $965.78 million. Deliveries included 1,505 MKR18 cargo variants, 355 MKR16 tractor trucks, and 162 MKR15 wreckers. The requirement for an LVSR companion trailer for the USMC has also been provided by Oshkosh. The M1076, which is already in service with the US Army, is the selected trailer. In May 2009, it was announced that the Marine Corps would receive an initial 30 M1076 PLST for use with the LVSR. By early 2016 the USMC had purchased a total of 687 PLST through a separate contract with the US Army.

14X12 heavy duty off-road vehicle. On a MAZ chassis, the radiators are between the cabs. This vehicle can operate on road, off road, and as a transporter erector launcher (TEL).

MAZ-543 Russian 8x8 Special Wheeled Chassis

Tiers:

Variants:

- **MAZ-543P:** MAZ-543P a baseline chassis with a payload capacity of 19 600 kg. It was used to carry the SS-12 Scaleboard medium range ballistic missile.
- **MAZ-543A:** MAZ-543A appeared in 1967. It is a more capable version, with a payload capacity of 22 000 kg. Layout of the engine compartment was revised. Though it retained two forward control cabs on each side of the engine. This vehicle was used as a chassis to carry Elbrus (Western reporting name Scud) and Temp-S (SS-12 Scaleboard) short-range ballistic missiles. Also here a number of other vehicles, based on this chassis. There were experimental emergency vehicle and crane, based on the MAZ-543A, that did not reached production.
- **MAZ-543M:** MAZ-543M improved version, which appeared in the early 70s. It had some improvements over its predecessor. Passenger cabin on the right was removed and the engine compartment was revised. It allowed to free some space at the rear for weapons and special equipment. The MAZ-543M was used as a base for the Smerch MLRS, Rubezh coastal defense missile system, Bereg self-propelled artillery system and a whole host of other specialized military vehicles.
- **MAZ-7310:** MAZ-7310 cargo truck intended for civilian application. It is a variant of the basic series. This vehicle was revealed in 1974 and entered production in 1976. Other variants of this vehicle are the MAZ-7510 dump truck, and the MAZ-7910 pipeline carrier. An aircraft crash tender, the AA-60 (7310)-160.1, has also been produced. At least one experimental variant powered by a 1 100 hp gas turbine has been developed for trials.
- **MAZ-7410:** MAZ-7410 is a prime mover with a shorter wheelbase, which entered production in the mid-70s
- **Wanshan WS580:** Wanshan WS580 is a Chinese heavy high mobility chassis with 8x8 configuration, which was based on the MAZ-543. Technology was transferred to China from Belarus. This Chinese vehicle evolved into a whole host of indigenous special wheeled chassis, such as Wanshan WS2400, that were carrying ballistic missiles and other military equipment. Later production models were based on Belarusian MZKT designs, but benefit from German technology transfer. These are fitted with German engines and transmissions.

Notes:

In the early 1960s, MAZ started development of an all-wheel drive chassis MAZ 543. These are the 4th generation of this family of vehicles. Its design was similar to MAZ 537G, but was fitted with new units, cabins and longer frame. The new chassis was equipped with a 525 hp D12A-525A V12 diesel, automatic transmission with an updated torque converter and a 3-speed gearbox. MAZ 543 range included chassis MAZ 543, MAZ 543A and MAZ 543M with fiberglass side cabins. There was a place for

radiator and the front part of a missile rocket between cabins. All variant had wheelbase of 7.7 meters, top speed - 60 kph and fuel consumption - 80 liters per 100 km. The first version of the new range was a light chassis MAZ 543 with a payload of 19.1 tonnes. The first 6 prototypes were made in the spring of 1962. Mass production started in 1965. They got 2 twin-door cabins (the left and right). 1631 copies were made. They become the base chassis for a missile complex 9K71 'Temp' and missile launcher 9P117. In 1963, MAZ 543A with a payload of 19.4 tonnes was presented. It was developed for a missile complex 9P120 'Temp-S'. Mass production started in 1966. The main difference from MAZ 543 is slightly shifted to the front both cabins. Till the middle of 2000s, more than 2600 chassis were made.

Shaanxi SX250 Chinese 6x6 General Utility Truck

Tiers:

Variants:

- **SX2150:** Shaanxi SX2150K is a an improved second-generation version. It entered service with the mid 1990s and was produced in large numbers. This truck is fitted with an Austrian Steyr WD615.71 turbocharged diesel engine as well as 9-speed transmission. The engine develops 256 hp. This truck is significantly faster and has a top speed of 87 km/h, opposed to 70 km/h of the original SX250 and SX2150. It is 60 kg lighter than the baseline SX2150, but otherwise has similar dimensions and payload capacity. This truck can be recognized by headlights relocated to the front bumper.
- **SX2190:** The SX2190 is a 7.5 ton 6x6 special heavy duty truck developed and built by Shaanxi Automobile Group and used by the People's Liberation Army of the People's Republic of China. It is the licensed production version of the Steyr-Daimler-Puch (now part of General Dynamics European Land Combat Systems) Steyr 91 and replacing the older JN252, CQ261 and SX250 heavy duty trucks in the 1990s. It is one of the most popular military trucks in China.
- **SX161:** The Shaanxi SX161 was a 6x4 version of the SX250.

Notes:

The MAZ- 537 is a 12-cylinder diesel engine-powered military truck artillery tractor, originally designed for loads up to 50 tons

(using semitrailers such as the ChMZAP-9990 or ChMZAP-5247G, for example) with later versions providing a maximum load of 65 tons. It was manufactured by the Minsk Automobile Plant (from 1959 to 1965) and the Kurgan Wheel Tractor Plant from 1963 until halt of production in 1990. The metal cab of the MAZ-537 provides space for the driver and 3 passengers for a total of four occupants, has two access doors on the side and a roof hatch, and is equipped with additional engine-independent heating. The 537G modification version is characterized by the addition of a winch to facilitate loading and unloading, as well as enabling self-extraction when stalled in adverse terrain (like mud). The working cable length of the winch is 100 meters, and the winch is able to provide 15 tons of traction. The vehicle is powered by a 12-cylinder D-12A-525A diesel engine located directly behind the cab. This engine provides preheating as well. The drivetrain of the MAZ-537 consists of a hydrodynamic transmission transferring power to the two front axles over a torque converter and a planetary three-stage gearbox with assisted steering (power steering) gear. The MAZ-537 has been widely used in both military roles (as, for example, artillery tractor trailer (pulling rocket or (ballistic) missile launchers), tank transporter, and airfield tractor) and in the civilian sphere as heavy tractor trailers, tractor ballast (or secondary unit) for carrying extra heavy loads, and in oil and gas fields.

Kraz-6322 Ukrainian 6x6 Truck

Tiers:

Variants:

- **KrAZ-63221:** Longer wheelbase Length: 10m Curb weight: 11.6mt Payload: 11.4mt Intended for carrying of production equipment and emergency-maintenance teams (attending personnel); can be used on all kinds of roads.
- **KrAZ-63221REB-01 “Sentry”:** Kolchuga passive sensor on KrAZ-63221 chassis
- **KrAZ-63221 RW-02 “Radist:** Outfitted with communications systems, such as radio relay, troposphere, outer space and radio communications serving for arrangement of various communications in the field.
- **C-12-63221 tanker truck:** Used for carrying fuel over roads Temp range: - 40°C to + 45°C Capacity: 12 m3 Two independent tanks to carry gasoline and diesel simultaneously. Introduced: 2016
- **KrAZ-6322-056:** Intended for recovery work and is equipped with a variety of equipment, including 8kW generator, air compressor, cutting torches, tool set, and a behind-the-cab materials handling crane. Supplied to Iraq.

Notes:

LARC-V (Lighter, Amphibious Resupply, Cargo, 5 ton), is an aluminium-hulled amphibious cargo vehicle capable of transporting 5 tons. It was developed in the United States during the 1950s, and is used in a variety of auxiliary roles to this day. In addition to the United States, LARC-Vs have been used by military forces in Australia, Argentina, Portugal, Philippines, Singapore and Iceland. Approximately 968 were made. About 500 were destroyed, most by scuttling during the American withdrawal from South Vietnam. About 200 have been retained in U.S. military service. Roughly 100 are privately owned and mostly used for tourism. The LARC-V was fielded in 1963 and were used extensively by the U.S. Army for over the beach supply during the Vietnam War. They supported the logistical and manpower build up at the start of and during the Vietnam war. Two units arrived from Ft. Story, VA. in June 1965. The 344th Transportation Company (Light Amphibious) setup harbor operations in Qui Nhon and the 347th Transportation Company in Camh Ranh Bay. The companies had two platoons of 17 LARCVs each and a separate 3rd echelon maintenance detachment. About December 1965, one of the 344th's platoons moved to Da Nang and was attached to the Air Force wing. There it ran 24-hour/day operations hauling bombs from ships in the harbor to the flight line. Their operation was so crucial to the USAF that if at least 15 LARCS were not operational, any needed parts were flown in by Nonoperational Ready Supply Grounded (NORSG) aircraft from St Louis. 458th Transportation, LARC-V Company, arrived in Cam Ranh Bay Oct 1967. For 458th Sea Tigers details see our on line site "458th Sea Tigers", or book Serving with the 458th by Ted Faurbo. 101st Airborne Division in 1967 and later the 1st Cavalry Division in 1968. LARC-Vs were used by the Argentine Marines during the 1982 invasion of the Falkland Islands. In January 2011, during the 2010–11 Queensland floods in Australia, it was reported that C-17 aircraft of the Royal Australian Air Force were to carry two LARC-V vehicles for use in Operation Flood Assist. The vehicles were deployed from Townsville to RAAF Base Amberley. The United States Naval Facilities Engineering Command (NAVFAC) has directed the Sealift Support Program Office (SSPO) to supervise a Service Life Extension Program (SLEP) on the LARC Vs used by the Navy. This SLEP involved changing from a mechanical to a hydraulic transmission, updating the electrical system, and improving other on-board systems. These reworked LARCs began delivery in June 2006 for use by U.S. Navy Beach Master Units, Underwater Construction Teams and the Maritime Prepositioned Force ships. A total of 42 LARCs are currently funded to transition through the SLEP process. Towing capacity on land was improved to approximately 29,000 lb and bollard pull in water was doubled to 7,600 lb. The vehicle operates in all-wheel drive while in land or tow modes. The craft is powered by a 375-horsepower John Deere turbo-charged Diesel engine that is Tier 2 certified. Engine speed is constant, with a hydraulic transmission modifying speed. Design and manufacture of the SLEP LARC-Vs was carried out by Power Dynamics, LLC of Stennis Space Center, Mississippi.

Kamaz-6560 Russian 8x8 Truck

Tiers:

1 2 3 4

Variants:

- **Air defense carrier:** Carries Pantsyr SM missiles and acquisition radar.

System

Alternative Designation: KAMAZ-53958 Tornado
Cooling: Water
Curb Weight: kg12
Number of Axles: ea4
Number of Tires: ea8
Payload: mt24
Trailer Payload On: 15
Troop Capacity: 1+2 in cab
Weight, Gross Vehicle: mt36
Wheels Central Tire Pressure Regulation System: Yes
Wheels Size: in425/85.R21
Run flat tires: Yes

↳*Dimensions*

Height, Overall: m3
Length, Overall: m10
Width, Overall: m2.5

Wheelbase: m3.6

Automotive

Engine Type: YaMZ-5367 diesel, 450hp

Fording Depth: m1.8

Ground Clearance: mm400

Range, Cruising: km1000

Speed: km/h90

Side slope: 40%

Vertical step: mm600

Angel of approach: 31 degrees

Armament

Armament: None

Notes:

The main role of this high mobility vehicle is to carry troops and cargo. It can also carry various bodies and specialized equipment. The KamAZ-6560M can be customized as fuel tanker, recovery vehicle, prime mover, palletized load carrying system, mobile crane, multiple launch rocket system, mobile howitzer, mobile crane and can suit many other roles. Vehicle can also tow trailers or artillery pieces with a maximum weight of 15 t. Armored cab is armored at the Russian GOST 6a level (STANAG 4569 Level 3). The cabin protects from B-32 7.62x54mm armor-piercing bullet fired from Dragunov SVD sniper rifle at 25 m distance. It is likely that the cab can be fitted with add-on composite armor. The cab was also designed to withstand mine blasts. Cab of the vehicle withstands mine blasts equivalent to 6 kg of TNT. An NBC filtration system for the cab is proposed as an option.

System

Alternative Designation: M1088

Type: Medium Tactical Vehicle (MTV) Tractor Truck

Family: FMTV Series

Configuration: 6x6

Crew: ea1

Cab Seating: 3-Man

Winch: The M1088 can be equipped with a self-recovery winch capable of fore vehicle recovery operations. The winch is equipped with 280 feet line capacity and 15,500 pounds bare drum line pull at 110% overload.

Dimensions

Length: 7.15 m

Width: 2.44 m

Height, Top of Cab: 2.76 m

Height, Air Transport: 2.59 m

Height, Air Drop: 2.18 m

Wheelbase: 4.10 m

Ground Clearance: 559 mm

Payload Capacity: 4,536 kg

Curb Weight: 8,455 kg

Automotive

Engine Name: 1 x Caterpillar 3116 ATAAC

Engine Type: 403-cu in (6.6-liter) liquid-cooled, turbocharged, aftercooled, in-line 6-cylinder diesel

Engine Power: 290 hp (216 kW) at 2,600 rpm

Transmission: Allison MD 3070 PT automatic/select electronically controlled; 7 forward/1 reverse gears

Power-to-Weight Ration: 19.52-34.47 hp/metric ton

Maximum Speed: 88 km/h

Range: 483 km

Approach Angle: 40 deg

Departure Angle: 63 deg

Gradient: 60 percent

Side Slope: 30 percent

Fording, Unprepared: 0.91 m

Fording, Prepared: 1.52 m

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution

for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1088 Tractor Truck is designed for line haul operations. The M1088 is the prime mover for the M871 Semi-Trailer and can tow the M871 fully loaded on and off road. In addition, the M1088 can tow the existing medium trailer fleet. The M1088 can be equipped with a self-recovery winch capable of fore vehicle recovery operations. The winch is equipped with 280 feet line capacity and 15,500 pounds bare drum line pull at 110% overload.

Engine Power: hp225

Max Torque: 912 Nm (6,599 ft-lb)

Ditch Crossing Ability: 0.60 m

Fording Depth: 1.75 m

Step Climbing Ability: 0.55 m

Protection

Armor: The trucks have the option of an armored cab including hidden armoring of the cab.

Applique Armor: Available

Active Protection System: No

NBC Protection: INA

Notes:

Description: The Kamaz-43114 is a 15-ton class, 6x6 flexible and mobile multipurpose truck system intended to carry personnel and cargo as part of the logistics support for military and peacekeeping missions. It is also suitable for other applications such as water/fuel tank bodies carrier, loading cranes, special purpose vans, and various weapon systems platform. This truck can tow trailers and keep on moving through desert sands and along stony tracks, over scree and mud, snow and ice thanks to its all-wheel drive climbing the most extreme gradients, ford rivers and chase across any terrain. It is powered by a Kamaz 740.31 Euro 2 turbocharged diesel V8 engine developing 225-hp of power or alternatively a Kamaz 740.11 Euro 1 turbocharged diesel V8 engine developing 230-hp of power. Kamaz created three classes of multipurpose vehicles with 6-ton, 8-ton and 10-ton axial load developing a full range of 4x4, 6x6, 8x8 military trucks sharing 85 percent of components and designed to meet military requirements. The trucks have the option of an armored cab including hidden armoring of the cab. The Kamaz-43114 truck is able to carry up to 6-ton payload and towing a trailer of 12-ton. Kamaz has produced this truck system for the Russian Ministry of Defense and export customers across the world.

M977 HEMTT American 8x8 Heavy Expanded Mobility Tactical Truck (HEMTT) Cargo Truck

Tiers:

Variants:

- **M977:** The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis.
- **M978:** The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant.
- **M983 Tractor:** The M983 is a tractor unit for use with the trailer-mounted MIM-104 Patriot missile system. It can also be used with the Interim Stryker Recovery System, or other trailers. An earlier variant fitted with a 30 kW generator and crane mounted behind the cab was used to tow the Pershing II Erector Launcher in CONUS (a M1001 MAN tractor was used in West Germany). The M983A2/A4 Light Equipment Transporter (LET) tractor is mainly used to transport construction and engineer equipment. It has a 45,000 lb (20,000 kg)) 2 speed hydraulic winch mounted behind the cab used to load the trailer. It does not have a self-recovery winch.
- **M984A1 Wrecker:** The M984 wrecker is the only HEMTT variant to have been produced in the A1 configuration, and this resulting in the change of recovery crane and retrieval system between A0 and A1 configurations. The current model is the M984A4. Standard equipment includes a 27,240 kg (60,050 lb) capacity two-speed recovery winch, a rear-mounted 11,340 kg capacity vehicle retrieval system, and a 6,350 kg (14,000 lb) at 2.74 m (9.0 ft) capacity Grove materials handling crane. A 9,072 kg (20,000 lb) bare drum capacity self-recovery winch is fitted as standard on the M984.
- **M985 Cargo:** The M985 is available in two variants. The current models are A4; there were no A1 models. The M985 cargo variant is similar to the M977 cargo truck but was developed to support the M270 Multiple Launch Rocket System (MLRS) with a M989A1 HEMAT trailer. It may also used to transport Patriot missiles. The M985 Guided Missile Transporter (GMT) was developed specifically for use with the Patriot system and it can be distinguished easily from other cargo models by its rear-mounted Hiab 8108/2 materials handling crane
- **Taiwanese RT-2000 Multiple Rocket Launcher:** The RT-2000 [Lit; Ray-Ting-2000 or Thunder -2000] rocket launcher mounted on an M977 chassis. In service about 1997. Can mount any one of three launchers: Mk 15 117-mm, 60 rounds; Mk 30, 30 rounds with HE; AP/AM cluster warhead - >18-mile range; Mk 45 12 rounds, > 27-mile range, GPS targeting. See separate record for details.
- **M1120 HEMTT Load Handling System (LHS):** The M1120 Load Handling System (LHS) variant was initially introduced as part of the HEMTT overhaul/rebuild program, during which returned M977 cargo trucks have their cargo bodies and materials handling cranes removed, to be replaced by a Multilift Mark 5 (now designated MPH165-LHS) LHS, as fitted to the Oshkosh PLS truck.
- **M1977 HEMTT Common Bridge Transporter (CBT):** The M1977 HEMTT Common Bridge Transporter (CBT) is a further development of the M1120 LHS, and in common with the M1120 LHS was initially introduced as part of the HEMTT overhaul/rebuild program. It is used for loading, transporting, and unloading Ribbon Bridge components and bridge erection boats.
- **M1142:** The M1142 is a Tactical Fire Fighting Truck (TFFT) capable of extinguishing aircraft, petroleum, brush, and structural fires at isolated military installations. The TFFT is based on a HEMTT M977A2 chassis with the heavier duty M1120 LHS HEMTT variant rear suspension. The TFFT contract was awarded to Pierce Manufacturing with Oshkosh Corporation as a subcontractor to Pierce.
- **M977 A2 Cargo Truck:** Basic version.

- **M977 A2 EPP:** Electrical power plant.
- **M977 A2 LRPT:** Large repair parts transporter.
- **M978 A2:** Fuel servicing transporter truck tanker.
- **HEMTT M983 A2 LET:** Light equipment transporter.
- **HEMTT M983 A2:** Patriot missile tractor.
- **M984 A2:** Recovery truck.
- **M985 A2:** Cargo and MRLS resupply.
- **M985 A2 GMT:** Guided missile transporter.
- **M1120 A2 HEMTT-LHS:** Heavy expanded mobility tactical truck.
- **M1977 A2 CBT:** Common bridge transporter.

System

Alternative Designation: M977 HEMTT

Type: Heavy Expanded Mobility Tactical Truck (HEMTT) Cargo Truck

Manufacturer: Oshkosh Corporation

Configuration: 8x8

Automotive

Engine Name: 1 x Detroit Diesel 8V-92TA

Engine Type: 736-cu in(12.06-liter) liquid-cooled, 2-stroke, V-8 diesel

Engine Power: 445 hp at 2,100 rpm

Power-to-Weight Ratio: 16.18 hp/metric ton

Transmission: Allison HT740D automatic transmission with torque converter 4 forward/1 reverse gears

Suspension: 8 x 8 (8 wheels driving, 4-wheel steering); Hendrickson leaf spring w/steel saddle, equalizing beams, and 10-in (254-mm) vertical travel on front and rear; RT340 model rear springs on all but M985 (RT380) and M984A1 (RT500)

Maximum Speed: 88 km/h

Range: 483 km; w/full load at 54 km/h

Fuel Capacity: 589 liters

Tire Size: 16.00R20

Gradient: 60 percent

Side Slope: 30 percent

Fording Depth: 1.23 m

Payload Capacity: 9,979 kg

Protection

Armor: A-kit/B-kit; U.S. Army Long Term Armor Strategy (LTAS) compliant

Applique Armor: Available

Active Protection System: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis. The Heavy Expanded Mobility Tactical Truck (HEMTT) is an eight-wheel drive, diesel-powered, 10-short-ton (9,100 kg), tactical truck used by the US military and others. In evolving configurations, it has been in continuous production since 1982. The M977 HEMTT entered service with the U.S. Army as a replacement for the M520 Goer. By mid 2019, around 35,000 HEMTTs in various configurations had been produced by Oshkosh Defense through new-build contracts and around 13,000 of these had been re-manufactured. Current variants have the A4 suffix. The 10×10 Oshkosh Logistic Vehicle System Replacement (LVSR) is the U.S. Marines' equivalent to the U.S. Army's Oshkosh 8×8 HEMTT and Oshkosh 10×10 Palletized Load System (PLS). The Marines do not use the HEMTT or PLS, and the Army does not use the LVSR, but both services use a common trailer (M1076) with all three truck types. The HEMTT's objective is to provide heavy transport capabilities for supply and re-supply of combat vehicles and weapons systems. Compared to earlier generation 5-ton trucks in U.S. Army service it offers increased payload and mobility. The HEMTT is available in a variety of configurations, including cargo, tanker, tractor and wrecker. The HEMTT was developed from the outset as a tactical truck, but to minimize procurement and life cycle costs included militarized commercial automotive components where possible, these including the engine and transmission. Some components used in early HEMTTs are common with the Oshkosh Logistics Vehicle System (LVS) vehicles which were supplied to the U.S. Marine Corps. With the exception of the M984 wrecker variant (254 × 89 × 9.5 mm, front; 356 × 89 × 9.5 mm, rear), on all HEMTT variants the chassis is formed of 257 × 89 × 9.5 mm heat-treated carbon manganese steel with a yield strength of 758 MPa. Bolted construction with Grade 8 bolts is used throughout. A centrally mounted self-recovery winch is an option and this is fitted to around 20% of production. The HEMTT's two-door forward control cab seats two. It is of heavy-duty welded steel construction with corrosion-resistant sheet metal skins. Simula Inc. (acquired by Armor Holdings in 2003 and now BAE Systems) supplied 186 add-on cab armoring kits for use in the former Yugoslavia. These were not issued, but from 2004 were used in Iraq. BAE systems supplied a next-generation armor kit for the HEMTT and by late-2006 had supplied the U.S. Army with around 3600 kits for the Oshkosh HEMTT and PLS. The HEMTT A4 is fitted with the slightly larger from the Oshkosh PLS A1. This cab complies with the U.S. Army's Long Term Armor Strategy (LTAS) requirements of an A- and B-kit armoring philosophy. It also comes as standard with integrated floor armor, an integrated mount for a machine gun and gunner protection kit, and air-conditioning. A Detroit Diesel 8V92TA V-8 two-stroke diesel developing 445 hp (332 kW) is fitted in HEMTT A0 and A1 models, with the DDECIV version of this engine fitted to A2 HEMTTs. An EPA 2004 compliant Caterpillar (CAT) C-15 six-cylinder, 15.2-liter diesel developing a peak of 515 hp (384 kW) is fitted to HEMTT A4 models. HEMTT A0 and A1 models are fitted with an Allison HT 740D 4F/1R automatic transmission, torque converter, and Oshkosh 55,000-pound (25,000 kg) two-speed transfer case. HEMTT A2 models have the Allison HD 4560P 6F/1R automatic transmission. HEMTT A4 models are fitted with an Allison 4500SP 5F/1R automatic transmission and an uprated version of Oshkosh's 55,000-pound (25,000 kg) two-speed transfer case. The front axles on all HEMTTs are single-reduction Oshkosh 46K, the rear are Dana single-reduction which vary according to configuration. Drive to the front axles is selectable and all axles have differential locks. Suspension on A0/A1/A3 models is by Hendrickson leaf springs with equalizing beams. Suspension on A4 models is Holland air suspension, load rating on the rear axles varying by configuration. Tire size is 1600 R20 on all models, and standard tire fit is Michelin XZL. All models are capable of fording water crossings up to 48 in (120 cm) deep, and can climb a gradient of at least 60%. All original variants are air transportable in the C-130. All variants are air-transportable in the C-17. Original HEMTT models now have the suffix A0. Only the M984 wrecker was produced in A1 configuration. All models were produced in A2 configuration.

The A3 suffix is applied to HEMTT technology demonstrators with a diesel-electric drive system. Current HEMTT production models have the suffix A4.

System

Alternative Designation: M1086

Type: Medium Tactical Vehicle (MTV) Long Wheel Base (LWB) Truck

Family: FMTV Series

Configuration: 6x6

Crew: ea1

Cab Seating: 3-Man

Winch: The M1086 can be equipped with a self-recovery winch capable of fore/aft vehicle recovery operations. The winch has 280 feet of line capacity and 15,500 pounds bare drum line pull at 110% overload.

Material Handling Equipmen: Loads/unloads cargo bed and trailer, hydraulic operation, 2,500 lb (1,134 kg) lift at 14 ft (4.3 m), 5,000 lb (2,268 kg) at 7 ft (2.1 m), includes stabilizers and local and remote controls

Dimensions

Length: 9.67 m

Width: 2.44 m

Height, Top of Cab: 2.76 m

Height, Air Transport: 2.59 m

Height, Air Drop: 2.18 m

Wheelbase: 5.50 m

Ground Clearance: 559 mm

Payload Capacity: 4,536 kg

Curb Weight: 11,198 kg

Cargo Bed Length: 6,096 mm

Cargo Bed Width: 2,413 mm

Automotive

Engine Name: 1 x Caterpillar 3116 ATAAC

Engine Type: 403-cu in (6.6-liter) liquid-cooled, turbocharged, aftercooled, in-line 6-cylinder diesel

Engine Power: 330 hp (246 kW) at 2,400 rpmm

Transmission: Allison MD 3070 PT automatic/select electronically controlled; 7 forward/1 reverse gears

Power-to-Weight Ration: 19.52-34.47 hp/metric ton

Maximum Speed: 88 km/h

Range: 483 km

Approach Angle: 40 deg

Departure Angle: 63 deg

Gradient: 60 percent

Side Slope: 30 percent

Fording, Unprepared: 0.91 m

Fording, Prepared: 1.52 m

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1086 LWB Truck with MHE is designed to transport soldiers and cargo in International Standardized Operations Containers. The M1086 has a payload capacity of 10,000 pounds and lift capacity of 2,500 to 5,000 pounds using the on board MHE. The cargo bed side rails are hinged for the ease of loading and unloading cargo. The cargo bed can be equipped with an optional bench seat kit for transport of soldiers. The bench seats are constructed of a non-wood material and attach to the cargo bed side rails. The seats can be folded down and stowed when not in use. Soldiers are assisted climbing in and out of the cargo bed area with the aid of a ladder stowed on the vehicle when not in use. A canvas and bows kit is provided to keep soldiers and cargo protected from the elements. The M1086 can be equipped with a self-recovery winch capable of fore/aft vehicle recovery operations. The winch has 280 feet of line capacity and 15,500 pounds bare drum line pull at 110% overload.

MT-T Russian Heavy Tracked Cargo Carrier

Tiers:

Variants:

- **BAT-2:** BAT-2: The BAT-2 is an armored tracklayer designed to supplement the older BAT-M that is based on the AT-T chassis. The role of the BAT-2 is road grading and clearing existing roads of debree. The BAT-2 is fitted with a variable geometry dozer blade, 2 t light crane, 25 t winch and a ripper. Unlike the MT-T and MDK-3 the BAT-2 has the automotive components fitted at the rear. A smaller cab is fitted in order to make room for the hydraulic equipment of the dozer blade.
- **MDK-3:** MDK-3: The MDK-3 is a trench digger based on the MT-T chassis. I twas produced from 1976 - 1991. The MDK-3 is fitted with a dozer blade on the front and trench digging system at the rear. When digging trenches the MDK-3 moves in reverse. In a single pass the MDK-3 can dig a trench up to 1.75 m deep. By moving 500 to 600 cubic meters of earth per hour the MDK-3 has roughly twice the performance over the older MDK-2 that is based on the AT-T chassis.

Notes:

The MT-T is a tracked prime mover of Soviet origin. It was developed in the late 1970's as a follow up to the AT-T tracked prime mover. Whereas the AT-T was based on the T-55 tank chassis the MT-T is based on the T-64. The MT-T mainly served as a chassis for specialist vehicles. Since many heavy towed guns were replaced by self-propelled guns many AT-T became available for general purpose towing duties. The MT-T is based on the T-64 running gear and transmission but uses the V-64-4 diesel engine from the T-72. Unlike the T-64 the MT-T has the automotive components and drive sprocket located at the front. A large forward control cab is fitted. A load area with tarpaulin cover makes up the rear of the vehicle.

Notes:

The Dongfeng EQ2102 is a 3.5 tonne capacity troop/cargo carrier truck developed and built by Dongfeng Motor Corporation and used by the People's Liberation Army of the People's Republic of China for transport. The truck is a copied version of the Nissan Diesel Condor CM series. When in civilian use, this series of trucks uses a variety of different names (from EQ1101 to EQ5108 depending on the version) but is usually referred to as the Dongfeng 145. A facelifted version is called the "160". It entered service in the 1990s to replace the aging CA-30 and the EQ245/EQ2100.

Brakes: Air

Electrical System: Volts24

Notes:

The DT-10PM articulated tracked vehicle's function is to carry munitions, military equipment, and personnel through difficult terrain and weather conditions. It has excellent offroad capabilities in any season, including swamps, virgin snow, unimproved dirt roads and water obstacles throughout Russia’s Siberia and far east districts. These are two unit transport vehicles with all four tracks driving. Because of low ground pressure, the vehicle is theoretically immune to certain types of at mines. ATVs are indispensable as recovery vehicles, since they have a high pull ratio and can approach a stuck or damaged vehicle from any direction in bad road conditions. The DT-10PM transporters are very efficient as part of search and rescue teams operating in extreme conditions (bad roads, floods, snow-drifts, land and snow slides and large-scale destruction) when it is necessary to evacuate people, animals, and various cargoes up to 30 ton by weight, or transport rescue teams, medical personnel, various equipment and food to the affected area. The DT-10PM has a fully enclosed forward control cab, which provides seating for driver and four passengers. Engine compartment is located behind the cab. The rear unit can accommodate a variety of bodies. In some cases the rear unit can vary considerably from the front. This all-terrain tracked transporter is fully amphibious. On water it is propelled by its tracks. Owing to their unique design, the Vityaz family of ATVs are capable of operating in conditions impossible for other all-terrain vehicles, for example: • Amphibious return to a mother ship • Off-road movement with one unit disabled or without one, or even without both tracks of one of the units • Negotiating ditches and clefts up to 4.0 m wide • Unloading of a ship offshore if it cannot come close to waterfront (i.e. in the Arctic and Antarctic regions, or in flooded regions, etc.); negotiating waterways in severe ice conditions • Operation in mountains up to an altitude of 4,000 m

Coder GM-2E-1750 French 17-Ton Semi-Trailer

Tiers:

System

Alternative Designation: Semi-remorque 17-tonne GM-2E-1750

Brake system (rear): Air

Number of Axles: ea2

Number of Tires: ea8

Trailer Type: Low-bed semi-trailer

Payload: mt17-19

Wheels Central Tire Pressure Regulation System: No

Variants:

- **DT-30PMNE1:** Outfitted with a hydraulic excavator. To facilitate work of the excavator the carrier features three hydraulically-operated outriggers, in an amphibious version the second section is equipped with quick-detachable drop sides. Moreover the front section has enclosed sealed body intended for transportation of up to 12 tons of equipment.
- **DT-30PK8-1:** Universal drilling system was built designated for drilling and construction-and-assembly works on scattered sites on soils with low bearing capacity. The system is fitted with universal drilling equipment suitable for boring wells in soils of I-IV categories (including permafrost soils, as well as soils highly saturated and those containing quick sands and lenses).
- **DT-30PMN:** Fitted with articulated carrier with crane equipment. The crane system is designated KS-5771. The three-unit telescopic boom made of high-resistance steel provides vast crane operations envelope (engaged zone is 960 sq .m) and great hoisting height (up to 25 m).
- **Weapons Carrier:** The rear compartment can be configured to mount surface-to-air missiles, multiple launch rocket systems, heavy mortars, and tube artillery. In 2017, photographs were taken of DT-30PM's outfitted with the Pantsir weapon station and Tor-M2 air defense missile systems.

Angle of Approach: degrees30
Side Slope: degrees15
Temperature Range: degrees-45C to +40C

Notes:

The 30PM series of articulated tracked vehicles function is to carry munitions, military equipment, and personnel through difficult terrain and weather conditions. It has excellent offroad capabilities in any season, including swamps, virgin snow, unimproved dirt roads and water obstacles throughout Russia’s Siberia and far east districts. These are two unit transport vehicles with all four tracks driving. Because of low ground pressure, vehicle is theoretically immune to certain types of at mines. ATVs are indispensable as recovery vehicles, since they have a high pull ratio (approximately 500 kn for the DT-30PM) and can approach a stuck or damaged vehicle from any direction in bad road conditions. The DT-30PM transporters are very efficient as part of search and rescue teams operating in extreme conditions (bad roads, floods, snow-drifts, land and snow slides and large-scale destruction) when it is necessary to evacuate people, animals, and various cargoes up to 30 ton by weight, or transport rescue teams, medical personnel, various equipment and food to the affected area. The DT-30PM has a fully enclosed forward control cab, which provides seating for driver and four passengers. Engine compartment is located behind the cab. The rear unit can accommodate a variety of bodies. In some cases the rear unit can vary considerably from the front. This all-terrain tracked transporter is fully amphibious. On water it is propelled by its tracks. Owing to their unique design, the Vityaz family of ATVs are capable of operating in conditions impossible for other all-terrain vehicles, for example: • Amphibious return to a mother ship • Off-road movement with one unit disabled or without one, or even without both tracks of one of the units • Negotiating ditches and clefts up to 4.0 m wide • Unloading of a ship offshore if it cannot come close to waterfront (i.e. in the Arctic and Antarctic regions, or in flooded regions, etc.); negotiating waterways in severe ice conditions • Operation in mountains up to an altitude of 4,000 m

Victory-58 North Korean 4x4 Utility Truck

Notes:

Sungri-58 (□□ 58□ - 'Victory 58') - A clone of the Soviet GAZ-51 (ГАЗ-51) Truck, however with weaker springs. The Sungri-58 also suffers from unusually high fuel consumption due to its crudely copied GAZ-51 carburetor which has been used since 1961. It was first built in 1958. Later Sungri-58KA and Sungri-58NA (4x4) modifications with new cabin are appeared in the 1970s. Made from 1958- 1979. Based on Russian GAZ 51. Name Sungri (Synri, Sungli, Sungni) translated as Victory. Made by the Sungri General Auto Works, Tokchon. 4x2 truck, 2 ton payload, 3.5-litre 6-cylinder petrol engine. Exists as cargo truck, bus conversion, fire truck, and truck tractor. Often seen powered by gas generator (wood convertor). Most important North Korean truck for years. The GAZ-51 (nickname Gazon) was a Soviet truck manufactured by GAZ. Its first prototypes were produced before the end of World War II, and mass production started in 1946. A 2.5 ton 4×2 standard variant was joined in 1947 by almost identical 2 ton 4×4 GAZ-63. Both variants were powered by 70 hp (52 kW) 6-cylinder 3485 cc engine. GAZ-63s was manufactured with some changes until 1968 and production of GAZ-51 continued until 2 April 1975. The trucks were also manufactured under the Soviet license in Poland (as the Lublin-51), North Korea (as the Sungri-58) and China (as the Yuejin NJ-130).

ZIL-157 Russian 6x6 General Purpose Truck

Notes:

The ZIL-157 is a general purpose 2 1⁄2-ton 6x6 truck, produced post-World War II in the Soviet Union by ZiL. The ZIL-157 was the standard truck used by the army until it was replaced by the ZIL-131 and Ural-375 series that became the standard Soviet army trucks alongside the GAZ-66. The People's Liberation Army also operated the CA-30, a copy of the ZIL-157.

PTS-M (Ob'yekt 65) Russian Tracked Amphibious Transport Vehicle

Tiers:

1 2 3 4

Variants:

- **PTS-2:** INA
- **PTS-3:** INA
- **PTS-4:** In 2014, the Russian Defense Ministry intends to purchase an undetermined number of PTS-4s, which underwent acceptance trials in 2011. The vehicle will be fitted with a remotely operated 12.7 mm (0.50 in) machine gun and a multi-fuel engine. The PTS-4 weighs 33 tons, with a payload of 12 tons on land (18 tons on water). Projected maximum road speed is 60 km/h (37 mph), with an expected maximum speed in water of 15 km/h (9.3 mph). Unlike its predecessors, it uses T-80 suspension components. The fully enclosed cab offers protection against small arms fire and splinter. Production began in 2014.

System

Alternative Designation: PTS-M (Ob'yekt 65)

Notes:

The PTS is a Soviet tracked amphibious transport. PTS stands for Plavayushchij Transportyer - Sryednyj or medium amphibious transport vehicle. Its industrial index was Ob'yekt 65. Introduced in 1965, it is large, with a substantial payload of 10 tons, two to four times the capacity of the BAV 485, and better cross-country performance, at the cost of greater somewhat higher purchase costs because it is tracked. The most common model is the improved PTS-M that is powered by a 350 hp diesel engine. The PTS has a boxy, open watertight hull, with six road wheels per side, front drive sprocket, rear idler sprocket, and no return rollers. Like the BAV 485, and unlike the DUKW, it has a rear loading ramp. The crew is seated at the front, leaving the rear of the vehicle open for a vehicle, which can be driven (or backed) in, rather than lifted over the side. To aid in facilitating this, the engine is under the floor. Propulsion in water is by means of twin propellers, in tunnels to protect them from damage during land operations. The PTS-M also has a companion vehicle, the PKP, a boat-like amphibious two-wheeled trailer, with fold-out sponsons providing stability on water; the combination allows the PTS-M to accommodate an artillery tractor, field gun (up to medium caliber), its crew, and a quantity of ammunition, all in one load.

MZKT-7930 Astrolog Russian 8x8 Special Wheeled Chassis

Tiers:

System

Alternative Designation: MZKT-7930

Type: Special wheeled chassis

Crew : ea1 + 2 men

Troop Capacity : eaINA

Mission: It is mainly used to mount various weapon systems. This high mobility vehicle is used as a chassis for the Iskander short range ballistic missile system and Bal costal defense missile system, TMM-6 heavy mechanized bridge and other applications. It also carries radar of the S-400 missile system.

Airlift Capable: Yes, The special wheeled chassis can be airlifted by military transport aircraft, however these have to be as large as An-124 or An-22.

↳*Dimensions*

Length, Overall : m12.7

Width, Overall : m3

Height, Overall : m3.29

Weight, Empty: tons20.5

Mobility

Mobility: Can be deployed from landing ships

Notes:

The Ruslan TTM-4902PS-10 carrier is a two-section tracked amphibious all-terrain vehicle. It has a 300 horsepower engine which is capable of transporting up to 22 people and provide overnight bed space for five. Manufactured by the CJSC Transport Company, the Ruslan was designed to transport cargo, repair teams and equipment (up to 4000 kg) in off-road conditions. The first section is a power module (load-carrying capacity 500 kg). It is able to carry 6 people and has 2 full beds. The second section is a passenger module (16 people, 6 beds). The vehicle was tested in harsh conditions in the Murmansk region north of the Arctic Circle before entering into service. These vehicles are currently in use by Russian units in the Arctic.

Side Slope: 30 percent

Fording, Unprepared: 0.91 m

Fording, Prepared: 1.52 m

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

The M1083 Standard Cargo Truck is designed to transport cargo and soldiers. The M1083 has a payload capacity of 10,000 pounds and to facilitate loading/unloading, the bed side rails are mounted on hinges. The cargo bed can be equipped with an optional bench seat kit for transport of soldiers. The bench seats are constructed of a non-wood material and attach to the cargo bed side rails. The seats can be folded down and stowed when not in use. Soldiers are assisted climbing in and out of the cargo bed area with the aid of a ladder stowed on the vehicle when not in use. A canvas and bows kit is provided to keep soldiers and cargo protected from the elements. The M1083 can be equipped with a self-recovery winch capable of fore/aft vehicle recovery operations. The winch has 280 feet of line capacity and 15,500 pounds bare drum line pull at 110% overload.

Notes:

The ZIL-135 is a large, eight-wheeled military transport and self-propelled artillery truck produced in the Cold War by the Soviet Union starting in 1959. Its purpose was to carry and launch an artillery missile, specifically a FROG-7, from surface-to-surface. The ZIL-135 was widely exported to other communist countries, most notably North Korea, where it is a common sight in films and military marches. It also served as the TEL for the BM-27 Uragan artillery rocket system. This vehicle has two gasoline engines that power its 20 tonnes to a maximum speed of 65 kilometers per hour. One engine drives the four wheels on the left of the truck, while the other engine drives the four wheels on the right. The ZIL-135 has eight wheel drive, but only the front and rear axles are used for steering. It has a maximum cruising range of 500 kilometers. The cab of the ZIL-135 is NBC protected, allowing the rockets to be fired without exposing the crew to possible contaminants. The six-man crew can emplace or displace the system in three minutes.

System

Alternative Designation: M1078

Type: Light Medium Tactical Vehicle (LMTV)

Family: FMTV Series

Configuration: 4x4

Crew: ea3

Troop Compartment Capacity: The cargo bed can be equipped with an optional bench seat kit for the transport of soldiers. The bench seats are constructed of a non-wood material and attach to the cargo bed side rails, and can be folded down and stowed when not in use. Soldiers are assisted when climbing in and out of the cargo bed area with the aid of a ladder, which is stowed on a vehicle when not in use.

Winch: The M1078 can be equipped with optional electrically operated self-recovery winch kit capable of fore and aft vehicle recovery operations.

Dimensions

Length: 6.43 m

Width: 2.44 m

Height, Top of Cab: 2.76 m

Height, Air Transport: 2.59 m

Height, Air Drop: 2.18 m

Weheeelbase: 3.90 m

Ground Clearance: 559 mm

Payload Capacity: 2,268 kg

Curb Weight: 7,484 kg

Automotive

Engine Name: 1 x Caterpillar 3116 ATAAC

Engine Type: 403-cu in (6.6-liter) liquid-cooled, turbocharged, aftercooled, in-line 6-cylinder diesel

Engine Power: 225 hp (168 kW) at 2,600 rpm

Transmission: Allison MD-D7 automatic transmission; 7 forward/1 reverse gears

Power-to-Weight Ration: 18.9-32.62 hp/metric ton

Maximum Speed: 88 km/h

Range: 483 km

Approach Angle: 40 deg

Departure Angle: 40 deg

Gradient: 60 percent

Side Slope: 30 percent

Fording, Unprepared: 0.91 m

Fording, Prepared: 1.52 m

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the

FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: INA

Note: A canvas and bows kit are available to keep both soldiers and cargo protected from the elements.

Notes:

M1078 Standard Cargo Truck The M1078 Standard Cargo Truck is designed to transport cargo and soldiers. The M1078 has a payload capacity of 5,000 pounds and to facilitate loading/unloading, the bed side rails are mounted on hinges and can be lowered. The cargo bed can be equipped with an optional bench seat kit for transport of soldiers. The bench seats are constructed of a non-wood material and attach to the cargo bed side rails. The seats can be folded down and stowed when not in use. Soldiers are assisted climbing in and out of the cargo bed area with the aid of a ladder stowed on the vehicle when not in use. A canvas and bows kit is available to keep soldiers and cargo protected from the elements. The M1078 can be equipped with an optional electrically operated MHE and self-recovery winch kit capable of fore and aft vehicle recovery operations. The MHE has a lift capacity of 1,500 pounds. The winch has 308 feet of line capacity and 10,000 pounds bare drum line pull at 110% overload.

UAZ-452 Russian 4x4 Off-Road Van

Tiers:

1 2 3 4

System

Alternative Designation: UAZ-452

Type: Off-Road Van

Manufacturer: Ulyanovsk Automobile Plant

Family: UAZ

Crew: ea1

Passenger Capacity: INA

Note #1: Vehicles produced between 1965–1979 were equipped with old-style lights: turn signal lights were colorless (white), rear lights were round, and the back of the body was rounder. Subsequent post-1979 models got amber (yellow) signal lights, and rear lights were slightly bigger and rectangular.

Note #2: The body of the van is normally equipped with two front doors, a single-wing door on the right side and a double-wing door at the rear, although the exact configuration can vary depending on the specific modification. Notable in the van are the fuel ports on the left and the right side of the van, leading to two separate fuel tanks.

Notes:

The UAZ-452 is a family of off-road vans produced at the Ulyanovsk Automobile Plant (UAZ) since 1965. Its predecessor model UAZ-450 (produced between 1958-1966) was based on the chassis and engine of the four-wheel drive light truck GAZ-69, and was the first "forward control" vehicle of this type to be built in the Soviet Union and Russia. Vehicles produced between 1965–1979 were equipped with old-style lights: turn signal lights were colorless (white), rear lights were round, and the back of the body was rounder. Subsequent post-1979 models got amber (yellow) signal lights, and rear lights were slightly bigger and rectangular. In 1985 the van was upgraded and spun off into separate submodels: 39625, 3962, 3303, 3909 and 2206. The upgrade consisted of lighting fixtures that met modern international requirements, alarms, a new instrument panel, and a new speedometer. The brakes were redesigned. The engine was also upgraded, and its power output increased to 99 hp against the previous 78 hp. In the early 2000s, the model was given new plastic side mirrors taken from the GAZ GAZelle van, headrests on front seats; and new passenger seats for a minibus version (2206) were also given headrests. The pickup truck (version 3303) was fitted with a metal body instead of a wooden one.

Notes:

The MZKT-741351 is powered by an 812 hp Caterpillar C18 turbocharged engine associated to an Allison electronically-controlled automatic gearbox. The vehicle has a full-time 8x8 drive. Maximum road speed is electronically limited to 70 km/h. The prime mover is fitted with a central tire inflation system. The unique feature of the MZKT-741351 prime mover is that it is used in conjunction with two trailers. These are MZKT-999421 6-axle semi-trailer which weighs 26,000 kg and has a payload capacity of 76 tons and MZKT-837211 6-axle trailer, which weighs 18 tons and has a payload capacity of 60 tons. Combined hauled load capacity for this road train is 136 tons. This vehicle can transport other loads, such as heavy armored vehicles, self-propelled artillery systems, three standard 20" containers, or various construction materials and equipment. Both the semi-trailer and the trailer have an adjustable width from 3.65 to 4.65 m. This feature allows to adjust the platform in order to carry various loads. Another feature of this road train is that the vehicles can drive onto the semi-trailer directly via the trailer. So there is no need for the crew to disconnect the trailers for the loading and unloading operations. The prime mover is fitted with a double winch for loading immobile vehicles. Each winch has a pulling capacity of 25 tons. The rear trailer has two front steerable axles. Double cab of the prime mover can accommodate the driver and 7 passengers. The vehicle can transport some crew members of the vehicles that it carries. Alternatively the rear seats can be folded to form two sleeping bunks. The cab has a provision for a roof hatch with a mount for general purpose machine gun. Also the cab can be fitted with add-on armor kit. The engine of the MZKT-741351 is located behind and under the cab. The cooling system is also located behind the cab. This feature allowed to reduce height of the vehicle. Also such design protects damage of the radiator or blockage with mud.

Protection

Hull Armor: The MAN SX45 is also available with an integrated armored cab, which provides protection against 7.62x51 mm armor-piercing rounds, artillery shell splinters and withstands 8 kg anti-tank mine blast. An integrated cab can be equipped with remotely controlled weapon stations, fitted with a 12.7 mm heavy machine gun or 40 mm automatic grenade launcher.
Applique Armor: The MAX SX family has a modular cab, which can be fitted with add-on armor protection kit. This kit was jointly developed by MAN and Krauss-Maffei Wegmann. It provides protection against 7.62x39 mm rounds, artillery shell splinters, grenades, small anti-personnel mines. Armored modules are attached to the outside of the cab. Armored kit can be installed within 10 hours in field conditions.

Notes:

UAZ-452D – A truck with double cab and wooden body The UAZ-452 is a family of off-road vans produced at the Ulyanovsk Automobile Plant (UAZ) since 1965. Its predecessor model UAZ-450 (produced between 1958-1966) was based on the chassis and engine of the four-wheel drive light truck GAZ-69, and was the first "forward control" vehicle of this type to be built in the Soviet Union and Russia. Vehicles produced between 1965–1979 were equipped with old-style lights: turn signal lights were colorless (white), rear lights were round, and the back of the body was rounder. Subsequent post-1979 models got amber (yellow) signal lights, and rear lights were slightly bigger and rectangular. In 1985 the van was upgraded and spun off into separate submodels: 39625, 3962, 3303, 3909 and 2206. The upgrade consisted of lighting fixtures that met modern international requirements, alarms, a new instrument panel, and a new speedometer. The brakes were redesigned. The engine was also upgraded, and its power output increased to 99 hp against the previous 78 hp. In the early 2000s, the model was given new plastic side mirrors taken from the GAZ GAZelle van, headrests on front seats; and new passenger seats for a minibus version (2206) were also given headrests. The pickup truck (version 3303) was fitted with a metal body instead of a wooden one.

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Notes:

The M1085 Long Wheel Base (LWB) Truck is designed to transport soldiers and cargo in International Standardized Operations Containers . The M1085 has a payload capacity of 10,000 pounds and to facilitate loading/unloading, the bed side rails are mounted on hinges. The cargo bed can be equipped with an optional bench seat kit for transport of soldiers. The bench seats are constructed of a non-wood material and attach to the cargo bed side rails. The seats can be folded down and stowed when not in use. Soldiers are assisted climbing in and out of the cargo bed area with the aid of a ladder stowed on the vehicle when not in use. A canvas and bows kit is provided to keep soldiers and cargo protected from the elements. The M1085 can be equipped with a self-recovery winch capable of fore/aft vehicle recovery operations. The winch has 280 feet of line capacity and 15,500 pounds bare drum line pull at 110% overload.

Notes:

The KamAZ-6350 (Russian КамАЗ-6350), also called "Mustang" (Russian Мустанг), is a heavy four-wheel drive truck from the production of KAMAZ plant in Naberezhnye Chelny . The vehicle has been built since 1998 and is also designed for military applications. The Ural 5323 is a very similar vehicle, which also comes from Russian production. The 6350 model is one of the largest trucks in KamAZ range. Its development began in 1987. First prototypes were completed in the early 1990s, however, this truck was officially accepted to service with the Russian Army only in 2002, as well as other trucks of the Mustang range. A low-rate production commenced in 2003

Taian TA5380 Chinese 8x8 Special Wheeled Chassis

Tiers:

Standard equipment includes an engine preheating device for cold weather operations. Options include an automatic brake gap adjustment arm; engine exhaust brake; ABS; air suspension; and automatic fire extinguishers within the engine compartment.

LVSR MKR16 American 10x10 Logistics Vehicle System Replacement (LVSR) Tractor Truck

Tiers:

Variants:

- **LSVR MKR15 Wrecker:** This version is equipped with a crane, winches and hydraulic spade. It can flat tow 110,000 lb (49,900 kg) on the highway. The truck has a lift and tow capacity of 97,000 lb (44,000 kg) gross vehicle weight with 24,000 lb (10,890 kg) lift capacity. The articulated crane has a lift capacity of 18,00 0 lb (8,170 kg) at 11 ft (3.35 m); and 10,000 lb (4,540 kg) at a maximum reach of 20 ft (6.1 m).
- **LSVR MKR16 Tractor:** This is the tractor variant of the LVSR. It is equipped with a recovery winch with a 60,000-lb (27,220-kg) capacity and 10,000-lb (4,540-kg) side-pull capacity.
- **MKR18 Cargo:** This is the cargo version of the LVSR. It is equipped with the Multilift Mk 18A1 load handling system. Towed trailers add 16.5 tons of payload.

System

Alternative Designation: LVSR MKR16

Type: Logistics Vehicle System Replacement (LVSR) Tractor Truck

Configuration: 10x10

Manufacturer: Oshkosh Defense, Oshkosh, Wis.

Crew: ea1

Cab Seating: 1x1

Airlift Capability: Vehicle can be airlifted by C-17 Globemaster III or C-5A Galaxy aircraft. Height of the vehicle can be reduced by 50 cm for easier transportation. With additional preparation it can be airlifted by the C-141 Starlifter.

Side Slope: 30%

Vertical Step: 0.6 m

Trench: 2.5 m

Fording: 1.52 m

Note: The front two and the back two axles are steered.

Protection

Armor: It is fitted with an integrated armored cab and energy-absorbing seats.

Applique Armor: Yes, The add-on armor kit for LVSR was developed and supplied by Plasan of Israel. Plasan was awarded a contract in mid-2006 for 12 LVSR armor kits for testing. The November 2011-stated AAO for LVSR add-on armor B-kits quotes 651. The armor system for LVSR follows the A-kit/B-kit principle, with vehicles designed 'fitted for, but not with', protection. In the case of LVSR, 'fitted for' includes an armored cab floor as standard. Cargo and wrecker variants require an upgrade of the front springs. Protection kits can be installed and uninstalled from vehicles in the field using only basic tools. The A-kit is fitted on the production line and is the combination of a limited amount of armoring (in difficult-to-access areas of the vehicle), together with a significant amount of armour installation attachments and required support structures. The bulk of the armor, the B-kit, is installed in the field on an 'as required' basis. The benefits of the A-kit/B-kit principle are that armor is only fitted when required, this reducing vehicle wear and tear, and by default whole life cycle costs. Improvements and/or upgrades to armor are also far easier to integrate into an appliqué solution. The A-kit/B-kit principle is currently applied to all current production US tactical 'soft skin' vehicles.

Active Protection System: No

NBC Protection: INA

Smoke Equipment: No

Notes:

MKR16 Tractor This is the tractor variant of the LVSR. It is equipped with a recovery winch with a 60,000-lb (27,220-kg) capacity and 10,000-lb (4,540-kg) side-pull capacity. The Logistic Vehicle System Replacement (LVSR) is a family of vehicles, based on a common 5-axle ten-wheel drive (10x10) chassis, that vary in individual configuration by mission requirements. The LVSR was designed and is manufactured by Oshkosh Defense. LVSR is a purpose-designed military vehicle and there are currently three variants in service, a cargo, a wrecker and a tractor truck. The first LVSRs were ordered in 2006. The LVSR is the U.S. Marines' equivalent of the U.S. Army's Oshkosh Heavy Expanded Mobility Tactical Truck (HEMTT) and Oshkosh Palletized Load System (PLS). The Marines do not use the HEMTT or PLS and the Army does not use the LVSR, but both services use a common trailer (M1076) with all three truck types. The predecessor of the LVSR, the MK48 Logistics Vehicle System (LVS), had entered service with the US Marine Corps (USMC) from 1985 and in the late 1990s a project to replace the LVS was started. As a precursor to a

formal LVS replacement programme a number of manufacturers co-operated with the USMC to build and evaluate an Advanced Technology Demonstrator (ATD). The ATD was built during 1998 at the Nevada Automotive Test Centre (NATC). LVS Modification Demonstrators (LVS-MDs) were also built, these integrating commercially proven automotive components and technologies. In April 2001, Logistics Management Institute (LMI) completed their final report for the 'Analysis of Alternatives (AoA) for the USMC Logistics Vehicle System Replacement (LVSR), concluding the best option was to rebuy a vehicle similar to the technology demonstrator. Five alternative options had been considered, these were: Inspect and Replace Only As Necessary (IROAN) for the LVS; rebuild the LVS; re-manufacture the LVS to a higher standard; rebuy a vehicle similar to the technology demonstrator; research and develop an entirely new vehicle. Around this time it was suggested that 2,000-3,000 vehicles might be required, although throughout the program numbers would fluctuate. An LVSR industry day was held in late 2001, and a formal solicitation to industry was released in early 2003. This had been delayed from an expected April 2002. The LVSR Request for Information (RfI) had originally been expected in May 2000. In March 2004 Oshkosh Truck Corporation (now Oshkosh Defense) announced that the US Marine Corps had awarded the company a Phase I System Development and Demonstration Contract to supply three LVSR trucks. These were to be delivered to the Marines for extensive endurance and performance testing within 12 months. This award was the first phase of a two-phase acquisition competition valued in March 2004 at $783 million for up to 1,581 vehicles. Competition for the Phase II production award (scheduled for March 2006) was limited to those companies that successfully completed Phase I evaluation. The other company selected for the Phase I evaluation was the American Truck Company (ATC) with a TATRA-based design. Phase 1 testing was completed in 2005 and in late-May 2006, the USMC awarded the LVSR Phase II contract to Oshkosh Truck Corporation. An initial LVSR order issued on 31 May 2006 was valued at $28 million and ordered 22 cargo, two wrecker (recovery), and tractor truck LVSR variants, plus vehicle kits, training (operator/maintainer-cargo), test support-production verification testing cargo, meetings, and contract data requirements. The first LVSR cargo variant began testing at the Aberdeen Proving Ground in June 2007. Tractor and wrecker prototype vehicles began testing in November 2007 and April 2008 respectively. An additional 123 cargo variants, which completed low rate initial production (LRIP) quantities, were subsequently ordered under option year two of the production contract. In January 2009, Oshkosh announced an LVSR delivery order valued at $176 million. This called for more than 425 LVSRs and transitioned LVSR from LRIP into full-rate production (FRP). LVSR fielding began in April 2009 for user trials and testing and the first vehicle was fielded to Afghanistan in September 2009. LVSR deliveries were completed in September 2013. Orders totalled 2,022, with the total order value around $965.78 million. Deliveries included 1,505 MKR18 cargo variants, 355 MKR16 tractor trucks, and 162 MKR15 wreckers. The requirement for an LVSR companion trailer for the USMC has also been provided by Oshkosh. The M1076, which is already in service with the US Army, is the selected trailer. In May 2009, it was announced that the Marine Corps would receive an initial 30 M1076 PLST for use with the LVSR. By early 2016 the USMC had purchased a total of 687 PLST through a separate contract with the US Army.

Wanshan WS2600 Chinese 10x8 Special Wheeled Chassis

Tiers:

Armor: Protection from small arms and shell splinters

Applique Armor: INA

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The WS2600 is a 22.5 ton 10x8 and 10x10 transporter erector launcher used by the People's Liberation Army Rocket Force of the People's Republic of China. It is, along with the smaller WS2500, one of the principle mobility platforms in mounting China's medium-range ballistic missiles. It is a general purpose heavy duty missile transporter developed from the original WS2500 and is built by Wanshan Special Vehicle. Its other contemporary is the larger HTF5680A1. The WS2600 is a heavy duty TEL co-developed by a joint Chinese and Belarusian venture. The WS2600 is slightly bigger than the WS2500 and a larger version of the original WS2400 with an additional axle to support the increased payload. Due to its larger size, the WS2600 is able to carry much heftier missiles, of which its most common payload is the DF-21C medium-range ballistic missile and the DF-21D anti-ship ballistic missile. Both the WS2500 and WS2600 form one of the main TEL carriers of China's MRBM and ASBM stockpiles. Like the WS2500, the TEL has a 4-door cab, which allows the WS2600 to easily accommodates the driver and 7 additional passengers.

NBC Protection: INA

Smoke Equipment: INA

Notes:

Each BM 9P140 launcher is normally accompanied by at least one and sometimes two,9T452 transloader vehicles based on the same ZIL-135LM 8 × 8 chassis. The transloader vehicle carries 16 reload rounds arranged in two stacks positioned one either side of the vehicle. Mounted to the immediate rear of the cab is a hydraulic crane operated by one person, which is used to resupply the rocket launcher. This crane has a maximum lifting weight of 300 kg with the operator being seated to the rear. For reloading, the launcher has to be in the horizontal position and traversed to one side. The new rocket is then loaded into the tube via the crane and rammed home by the rammer. It is estimated that the reload time is 20 to 30 minutes, a long time when compared to the 227 mm US Lockheed Martin Missiles and Fire Control Multiple Launch Rocket System (MLRS).

Approach Angle: 40 deg

Departure Angle: 63 deg

Gradient: 60 percent

Side Slope: 30 percent

Fording, Unprepared: 0.91 m

Fording, Prepared: 1.52 m

Tires: Super singles with CTIS

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

Notes:

M1094 Dump Truck, LVAD The M1094 Dump Truck, LVAD is designed to be loaded on and dropped from C130 aircraft into remote areas where landing strips are not available. The vehicle can transport dirt, rock, gravel, etc., in support of road construction missions. The M1094 is capable of transporting a 5 cubic yard, 10,000 pound payload. The cargo bed can be equipped with an optional bench seat kit for transport of soldiers. The bench seats are constructed of a non-wood material and attach to the cargo bed side rails. The seats can be folded down and stowed when not in use. Soldiers are assisted climbing in and out of the cargo bed area with the aid of a ladder stowed on the vehicle when not in use. A canvas and bows kit is provided to keep soldiers and cargo protected from the elements. The M1094 can be equipped with a self-recovery winch capable of fore/aft vehicle recovery operations. The winch is equipped with 280 feet line capacity and 15,500 pounds bare drum line pull at 110% overload.

M113AS4 ALV Australian Armored Logistics Vehicle

Tiers:

Variants:

- **M113AS4 AF:** Armored fitted, fitted with a Hiab crane. A total of 38 of these vehicles will be delivered.
- **M113AS4 ARVL:** Armored recovery vehicle, fitted with a 13 t capacity winch. A total of 12 of these vehicles will be delivered.
- **M113AS4 AA:** Armored ambulance. A total of 15 of these vehicles will be delivered.
- **M113AS4 ACV:** Armored command vehicle. A total of 43 of these vehicles will be delivered.
- **M113AS4 ALV:** Armored logistics vehicle. It can take all types of combat supplies and carry them under armor. A total of 50 of these vehicles will be delivered.

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: INA

Notes:

M113AS4 ALV armored logistics vehicle. It can take all types of combat supplies and carry them under armor. A total of 50 of these vehicles will be delivered. The M113AS4 is an Australian-made upgrade of the old M113AS1 and M113AS3 which are based on the American M113A1 tracked armoured personnel carrier (APC), one of the most popular light tracked APC in the world. The project of Australian M113 upgrade was leaded by BAE Systems. The decade long project to upgrade 433 M113 vehicles began in 2002, with the first completed vehicle delivered to the customer in January 2007. While the upgraded Australian M113s look similar to how they would have in the 1970’s, they are ‘a generational leap ahead’ with improved firepower, protection and habitability from the original M113 A1 vehicle. The finished vehicles are also more reliable and faster following the upgrade. The Australian Army operates a fleet of some 800 members of the M113 series of full-tracked armoured personnel carriers in different variants including ambulance, fire support, command post, mortar carrier, recovery and load carrier vehicles. The M113AS4 is currently the standard tracked APC of Australian armed forces. The M113 Armoured Personnel Carrier (APC) is an all-terrain vehicle designed to protect and transport its crew and up to ten Infantry personnel. In September 1996, the Australian Department of Defence selected the now Tenix Defence Systems Pty Ltd, Australia to upgrade 364 of the Australian Army's fleet of M113A1 series of full-tracked Armoured Personnel Carriers (APCs) to extend their operational life through to the year 2010.

Bushmaster Australian 4x4 Armored Combat Support Vehicle

Tiers:

Variants:

- **Planned Variants:** ADI (now Thales Australia) planned at least six variants. These included an armored ambulance; command vehicle; mortar carrier with internally mounted 81-mm or 120-mm weapon; fire support vehicle with 12.7-mm machine gun and 40-mm automatic grenade launcher; engineering vehicle; and firefighting vehicle.
- **Bushmaster ambulance:** This variant can transport two stretchered patients, or one stretchered and four seated patients at one time. They are equipped with the latest medical equipment and provide protection against blasts and ballistic threats.
- **Bushmaster EOD:** The Bushmaster explosive ordinance disposal (EOD) variant is fitted with a 27 ft 11 in (8.5 m) interrogator arm with a 225-degree arc of operation around the front of the vehicle. The arm can be installed onto any existing Bushmaster vehicle to modify it into an EOD variant. The two-piece articulated arm can include the following attachments: interrogation tool with clasp claw; work light; camera; detection equipment; and proximity detector. The vehicle can also be fitted with a roller clearance system that is hydraulically operated, steerable and easily attached and released. An EOD robot can also be stored internally .
- **Bushmaster combat support vehicle:** Thales Australia privately developed a prototype Bushmaster combat support vehicle in 2005. It was previously known as the Copperhead . This 4 x 4 vehicle features the Bushmaster cab at the front, with a flat-bed cargo area at the rear, which can carry up to 11,000 lb (5,000 kg) of cargo. The cargo area measures 101 sq ft (9.4 sq m). Upgradeable ballistic protection options are available for the crew cabin. The vehicle has a top speed of 60 mph (100 km/h) and a maximum range of 500 mi (800 km). It also offers high clearance for obstacles, tight turning circle and the ability to travel off-road in all conditions, according to the manufacturer. A dual-cab variant, offered for the British operational utility vehicle system (OUVS) program, featured a larger interior cabin with room for two crew and up to six passengers with four side-opening passenger doors and a flatbed area of 54 sq ft (5 sq m) and a 6,600-lb (3,000-kg) payload.
- **Bushmaster 6 x 6:** Thales Australia has conducted studies of a 6 x 6 version of the Bushmaster, which would have a gross vehicle weight of up to 25.6 tons.

System

Alternative Designation: Bushmaster Combat Support Vehicle; Copperhead
Type: Protected Mobility Vehicle
Crew: ea2 (commander, driver)
Passenger Capacity: 8 troops

Dimensions

Length, Overall: 6.60 m
Length, Hull: 7.09 m
Height: 2.65 m
Width: 2.50 m

Cabin Volume: 11.2 cubic m

Ground Clearance, Hull: 0.43 m

Ground Clearance, Axle Housings: 0.40 m

Wheel Track: 2.10 m

Wheel Base: 3.90 m

Weight, Unloaded: 12,500 kg

Weight, Combat: 15,000 kg

Weight, Payload: 2,500 kg

Flat-Bed Cargo Area: This 4 x 4 vehicle features the Bushmaster cab at the front, with a flat-bed cargo area at the rear, which can carry up to 11,000 lb (5,000 kg) of cargo. The cargo area measures 101 sq ft (9.4 sq m).

Automotive

Engine Name: 1 x Caterpillar 3126 ATAAC

Engine Type: 6-cylinder turbocharged air-to-air after-cooled diesel

Engine Power: 300 hp at 2,400 rpm with 25 percent torque rise

Transmission: ZF 7HP502 full automatic with front-end retarder for controlled slope descent

Tires: 395/85 R20 with bead locks or optional run-flat inserts

Inflation System: optional dual-channel with dash-mounted push button control, providing 4 settings highway, sand, mud/snow and emergency

Brakes: dual circuit Meritor air-operated disc brakes assisted by a hydraulic retarder

Suspension: AxleTech 4000 series coil spring with short-long-arm wishbone and double-acting hydraulic shock-absorbers, bump-stop rubbers

Axles: Arvin Meritor/Timoney 4000 series independent suspension axle system, 7,700-kg capacity with diff locks front, center and rear

Speed, Road: 100 km/h

Range: 800 km

Vertical Obstacle: 0.50 m

Fording: 1.20 m w/out preparation

Gradient: %60

Side Slope: %40

Approach Angle: deg40

Departure Angle: deg38

Turning Circle: 18.6 m

Fuel Capacity: 319 Liters

Main Gun

Explosive Reactive Armor: No
Active Protection System: INA
Mine Clearing: No
Self-Entrenching Blade: No

NBC Protection: INA

Smoke Equipment: 8 x grenade launchers (bank of 4 on each side of vehicle hull)

Notes:

Bushmaster combat support vehicle Thales Australia privately developed a prototype Bushmaster combat support vehicle in 2005. It was previously known as the Copperhead . This 4 x 4 vehicle features the Bushmaster cab at the front, with a flat-bed cargo area at the rear, which can carry up to 11,000 lb (5,000 kg) of cargo. The cargo area measures 101 sq ft (9.4 sq m). Upgradeable ballistic protection options are available for the crew cabin. The vehicle has a top speed of 60 mph (100 km/h) and a maximum range of 500 mi (800 km). It also offers high clearance for obstacles, tight turning circle and the ability to travel off-road in all conditions, according to the manufacturer. A dual-cab variant, offered for the British operational utility vehicle system (OUVS) program, featured a larger interior cabin with room for two crew and up to six passengers with four side-opening passenger doors and a flatbed area of 54 sq ft (5 sq m) and a 6,600-lb (3,000-kg) payload. The Bushmaster Protected Mobility Vehicle or Infantry Mobility Vehicle is an Australian-built four-wheel drive armoured vehicle. The Bushmaster was primarily designed by the then government-owned Australian Defence Industries (ADI), and is currently produced by Thales Australia with a support contract provided by Oshkosh Truck following the acquisition of ADI. The Bushmaster is currently in service with the Australian Army, Royal Australian Air Force, Royal Netherlands Army, British Army, Japan Ground Self Defense Force, Fiji Infantry Regiment, Jamaica Defence Force and the New Zealand Army. The role of the Bushmaster is to provide protected mobility transport (or protected troop lift capability), with infantry dismounting from the vehicle before going into action. As the Bushmaster is only lightly armoured, the term Infantry Mobility Vehicle (IMV) was initially adopted to distinguish it from a heavier wheeled or tracked armoured personnel carrier, such as the ASLAV and M113 also in Australian service. Later the Bushmaster's designation was changed to Protected Mobility Vehicle (PMV). The Bushmaster is optimised for operations in northern Australia, and is capable of carrying up to 9 soldiers and their equipment, fuel and supplies for 3 days, depending on the type of variant. The vehicle is fitted with air conditioning and was once planned to have a cool water drinking system, but was omitted upon production due to cost constraints. After operational complaints the drinking water cooling system is being reconsidered for installation. It has a road cruise speed of 100 km/h and an operational range of 800 km. The Bushmaster is a mine protected vehicle and provides a high degree of protection against land mines, using its v-hull monocoque to deflect the blast away from the vehicle and its occupants. The vehicle's armour provides protection against small arms of up to 7.62 mm ball ammunition, 81mm mortar fragments, Claymore mines, and with additional applique armour, protection for armour-piercing ammunition of up to 7.62mm. The fuel and hydraulic tanks of the vehicle are located outside the crew compartment, while it also has an automatic fire suppression system. The troop carrier variant of the Bushmaster is fitted with one gun ring. The forward gun ring can be fitted with a 5.56 mm or 7.62 mm machine gun. The two rear hatches each have a mounting boss to allow the attachment of a swing mount capable of holding a 7.62 mm machine gun. The Bushmaster is air transportable by C-130 Hercules, C-17 Globemaster III and Mil Mi-26 aircraft. It is the first armoured vehicle to be designed and completely manufactured in Australia since the Sentinel tank during World War II.

Kamaz-5350 Russian 6x6 General Utility Truck

Tiers:

1 2 3 4

Variants:

- **KamAZ-4350 (4x4):** 4x4 Version
- **KamAZ-6350 (8x8):** 8x8 Version

System

Alternative Designation: KamAZ-5350
Type: General Utility Truck
Manufacturer: Kamaz
Family: Mustang Family
In Service: 2003-Present
Cab Seating: 1+2 Men
Passenger Capacity: INA
Configuration: 6x6
Liter/Stretcher Capacity: INA

Dimensions

Length: m7.85
Width: m2.5
Height: m3.29
Weight, Combat: tons9.2
Maximum Load: tons6

Automotive

Engine Name: KamAZ-740.13-260 Diesel
Engine Type: Diesel
Engine Power: hp260
Cruising Range: km1,000

Speed, Maximum Road: km/h100

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: %60

Side Slope: %40

Vertical Step: m0.6

Trench: m0.6

Fording Depth: m1.75

Maximum Load: tons6

Note #1: Engine is also equipped with cold weather starting device and can be started at temperatures down to -50°C

Note #2: Vehicle has a full-time all-wheel drive and is fitted with a central tyre inflation system

Communications

Radio: R-168-5UN(1)E Russian VHF Manpack-Vehicular Radio Station

Protection

Armor: INA, It is also proposed with concealed built-in internal armor

Applique Armor: Available

Active Protection System: No

Mine Clearing: No

Self-Entrenching Blade: No

NBC Protection: Yes

Smoke Equipment: No

Notes:

The KamAZ-5350 general utility truck is a member of Mustang family. This family of military trucks includes the KamAZ-4350 (4x4) and KamAZ-6350 (8x8) with numerous variants. This general utility truck is a further development of the KamAZ-4310, which was launched in the early 1980s. It was officially accepted to service with the Russian Army in 2002 and a small-scale production commenced in 2003.

Kamaz 4310 Russian 6 Metric Ton 6x6 General Utility Vehicle

Height: m.89
Length: m3.33

Notes:

The GAZ-66 is a Soviet and later Russian 4x4 all-road (off-road) military truck produced by GAZ. It was one of the main cargo vehicles for motorized infantry of the Soviet Army and is still employed in former Soviet Union countries. It is nicknamed shishiga (шишига) shehsherik (шешерик) trueman (in Siberia). Almost one million vehicles of this type were built for both military and civil use. The GAZ-66 has gained legendary status in many countries around the world due to its reliability, simplicity and off-road capability. Thanks to standard features, such as a front-mounted winch, Central Tire Inflation System (CTIS) and self-locking differentials, the GAZ-66 is extremely popular worldwide with armed forces and off-road enthusiasts. Production ceased in 1999, with the GAZ-3308 being produced instead. Besides functioning as a general cargo carrier, the GAZ-66 is used as a prime mover for 120mm mortars. The DDA-66 variant is an NBC decontamination truck.

M1120 HEMTT American 8x8 Heavy Expanded Mobility Tactical Truck (HEMTT) Load Handling System (LHS)

Tiers:

Variants:

- **M977:** The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis.
- **M978:** The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant.
- **M983 Tractor:** The M983 is a tractor unit for use with the trailer-mounted MIM-104 Patriot missile system. It can also be used with the Interim Stryker Recovery System, or other trailers. An earlier variant fitted with a 30 kW generator and crane mounted behind the cab was used to tow the Pershing II Erector Launcher in CONUS (a M1001 MAN tractor was used in West Germany). The M983A2/A4 Light Equipment Transporter (LET) tractor is mainly used to transport construction and engineer equipment. It has a 45,000 lb (20,000 kg)) 2 speed hydraulic winch mounted behind the cab used to load the trailer. It does not have a self-recovery winch.
- **M984A1 Wrecker:** The M984 wrecker is the only HEMTT variant to have been produced in the A1 configuration, and this resulting in the change of recovery crane and retrieval system between A0 and A1 configurations. The current model is the M984A4. Standard equipment includes a 27,240 kg (60,050 lb) capacity two-speed recovery winch, a rear-mounted 11,340 kg capacity vehicle retrieval system, and a 6,350 kg (14,000 lb) at 2.74 m (9.0 ft) capacity Grove materials handling crane. A 9,072 kg (20,000 lb) bare drum capacity self-recovery winch is fitted as standard on the M984.
- **M985 Cargo:** The M985 is available in two variants. The current models are A4; there were no A1 models. The M985 cargo variant is similar to the M977 cargo truck but was developed to support the M270 Multiple Launch Rocket System (MLRS) with a M989A1 HEMAT trailer. It may also used to transport Patriot missiles. The M985 Guided Missile Transporter (GMT) was developed specifically for use with the Patriot system and it can be distinguished easily from other cargo models by its rear-mounted Hiab 8108/2 materials handling crane
- **Taiwanese RT-2000 Multiple Rocket Launcher:** The RT-2000 [Lit; Ray-Ting-2000 or Thunder -2000] rocket launcher mounted on an M977 chassis. In service about 1997. Can mount any one of three launchers: Mk 15 117-mm, 60 rounds; Mk 30, 30 rounds with HE; AP/AM cluster warhead - >18-mile range; Mk 45 12 rounds, > 27-mile range, GPS targeting. See separate record for details.
- **M1120 HEMTT Load Handling System (LHS):** The M1120 Load Handling System (LHS) variant was initially introduced as part of the HEMTT overhaul/rebuild program, during which returned M977 cargo trucks have their cargo

bodies and materials handling cranes removed, to be replaced by a Multilift Mark 5 (now designated MPH165-LHS) LHS, as fitted to the Oshkosh PLS truck.

- **M1977 HEMTT Common Bridge Transporter (CBT):** The M1977 HEMTT Common Bridge Transporter (CBT) is a further development of the M1120 LHS, and in common with the M1120 LHS was initially introduced as part of the HEMTT overhaul/rebuild program. It is used for loading, transporting, and unloading Ribbon Bridge components and bridge erection boats.
- **M1142:** The M1142 is a Tactical Fire Fighting Truck (TFFT) capable of extinguishing aircraft, petroleum, brush, and structural fires at isolated military installations. The TFFT is based on a HEMTT M977A2 chassis with the heavier duty M1120 LHS HEMTT variant rear suspension. The TFFT contract was awarded to Pierce Manufacturing with Oshkosh Corporation as a subcontractor to Pierce.
- **M977 A2 Cargo Truck:** Basic version.
- **M977 A2 EPP:** Electrical power plant.
- **M977 A2 LRPT:** Large repair parts transporter.
- **M978 A2:** Fuel servicing transporter truck tanker.
- **HEMTT M983 A2 LET:** Light equipment transporter.
- **HEMTT M983 A2:** Patriot missile tractor.
- **M984 A2:** Recovery truck.
- **M985 A2:** Cargo and MRLS resupply.
- **M985 A2 GMT:** Guided missile transporter.
- **M1120 A2 HEMTT-LHS:** Heavy expanded mobility tactical truck.
- **M1977 A2 CBT:** Common bridge transporter.

System

Alternative Designation: M1120 HEMTT Load Handling System (LHS)
Type: Heavy Expanded Mobility Tactical Truck (HEMTT) Load Handling System (LHS)
Manufacturer: Oshkosh Corporation
Configuration: 8x8
Family: Heavy Expanded Mobility Tactical Truck (HEMTT)
Crew: ea2
Payload Capacity: 9,979 kg
Crane: A large arm-like crane grabs pre-loaded cargo flatracks, shelters and containers, and then hoists them on to the rear of the vehicle.
Trailer: A trailer can also be added to double the payload. It is designed for rapid transport of all classes of supply with a payload capacity of 22,000 lbs (9,979 kg).
Airdrop Capability: The HEMTT LHS is interoperable with NATO standard flatracks and air transportable in the C-130 aircraft.

Dimensions

Length: 10.17 m
Width: 2.44 m
Height: 2.57 m
Distance Between Equalizer Pivots: 5.33 m
Distance Between Axles, 1st to 2nd: 1.52 m
Distance Between Axles, 2nd to 3rd: 3.81 m
Distance Between Axles, 3rd to 4th: 1.52 m
Weight: 17,191 kg

Automotive

Engine Name: 1 x Detroit Diesel 8V-92TA

Engine Type: 736-cu in(12.06-liter) liquid-cooled, 2-stroke, V-8 diesel

Engine Power: 445 hp at 2,100 rpm

Power-to-Weight Ratio: 16.18 hp/metric ton

Transmission: Allison HT740D automatic transmission with torque converter 4 forward/1 reverse gears

Suspension: 8 x 8 (8 wheels driving, 4-wheel steering); Hendrickson leaf spring w/steel saddle, equalizing beams, and 10-in (254-mm) vertical travel on front and rear; RT340 model rear springs on all but M985 (RT380) and M984A1 (RT500)

Maximum Speed: 88 km/h

Range: 483 km; w/full load at 54 km/h

Fuel Capacity: 589 liters

Tire Size: 16.00R20

Gradient: 60 percent

Side Slope: 30 percent

Fording Depth: 1.23 m

Payload Capacity: 9,979 kg

Protection

Armor: A-kit/B-kit; U.S. Army Long Term Armor Strategy (LTAS) compliant

Applique Armor: Available

Active Protection System: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

M1120 HEMTT Load Handling System (LHS) This modified HEMTT M977 Cargo Truck was redesigned to incorporate the LHS used on the Palletized Loading System (PLS), allowing the truck to be loaded and unloaded with cargo without additional material handling equipment. A large arm-like crane grabs pre-loaded cargo flatracks, shelters and containers, and then hoists them on to the rear of the vehicle. A trailer can also be added to double the payload. It is designed for rapid transport of all classes of supply with a payload capacity of 22,000 lbs (9,979 kg). The HEMTT LHS is interoperable with NATO standard flatracks and air transportable in the C-130 aircraft. FUE First Digitized Division (4th Infantry Division), Fort Hood, in November 2000. A variant -- HEMTT-LHS THAAD -- has been modified for use as launch platforms for the Theater High Altitude Area Defense (THAAD) weapon system. The first two vehicles were delivered in October 2002. The Heavy Expanded Mobility Tactical Truck (HEMTT) is an eight-wheel drive, diesel-powered, 10-short-ton (9,100 kg), tactical truck used by the US military and others. In evolving configurations, it has been in continuous production since 1982. The M977 HEMTT entered service with the U.S. Army as a replacement for the M520 Goer. By mid 2019, around 35,000 HEMTTs in various configurations had been produced by Oshkosh Defense through new-build contracts and around 13,000 of these had been re-manufactured. Current variants have the A4 suffix. The 10×10 Oshkosh Logistic Vehicle System Replacement (LVSR) is the U.S. Marines' equivalent to the U.S. Army's Oshkosh 8×8 HEMTT and Oshkosh 10×10 Palletized Load System (PLS). The Marines do not use the HEMTT or PLS, and the Army does not use the LVSR, but both services use a common trailer (M1076) with all three truck types. The HEMTT's objective is to provide heavy transport capabilities for supply and re-supply of combat vehicles and weapons systems. Compared to earlier generation 5-ton trucks in U.S. Army service it offers increased payload and mobility. The HEMTT is available in a variety of configurations, including cargo, tanker, tractor and wrecker. The HEMTT was developed from the outset as a tactical truck, but to minimize procurement and life cycle costs included militarized commercial automotive components where possible, these including the engine and transmission. Some components used in early HEMTTs are common with the Oshkosh Logistics Vehicle System (LVS) vehicles which were supplied to the U.S. Marine Corps. With the exception of the M984 wrecker variant (254 × 89 × 9.5 mm, front; 356 × 89 × 9.5 mm, rear), on all HEMTT variants the chassis is formed of 257 × 89

× 9.5 mm heat-treated carbon manganese steel with a yield strength of 758 MPa. Bolted construction with Grade 8 bolts is used throughout. A centrally mounted self-recovery winch is an option and this is fitted to around 20% of production. The HEMTT's two-door forward control cab seats two. It is of heavy-duty welded steel construction with corrosion-resistant sheet metal skins. Simula Inc. (acquired by Armor Holdings in 2003 and now BAE Systems) supplied 186 add-on cab armoring kits for use in the former Yugoslavia. These were not issued, but from 2004 were used in Iraq. BAE systems supplied a next-generation armor kit for the HEMTT and by late-2006 had supplied the U.S. Army with around 3600 kits for the Oshkosh HEMTT and PLS. The HEMTT A4 is fitted with the slightly larger from the Oshkosh PLS A1. This cab complies with the U.S. Army's Long Term Armor Strategy (LTAS) requirements of an A- and B-kit armoring philosophy. It also comes as standard with integrated floor armor, an integrated mount for a machine gun and gunner protection kit, and air-conditioning. A Detroit Diesel 8V92TA V-8 two-stroke diesel developing 445 hp (332 kW) is fitted in HEMTT A0 and A1 models, with the DDECIV version of this engine fitted to A2 HEMTTs. An EPA 2004 compliant Caterpillar (CAT) C-15 six-cylinder, 15.2-liter diesel developing a peak of 515 hp (384 kW) is fitted to HEMTT A4 models. HEMTT A0 and A1 models are fitted with an Allison HT 740D 4F/1R automatic transmission, torque converter, and Oshkosh 55,000-pound (25,000 kg) two-speed transfer case. HEMTT A2 models have the Allison HD 4560P 6F/1R automatic transmission. HEMTT A4 models are fitted with an Allison 4500SP 5F/1R automatic transmission and an uprated version of Oshkosh's 55,000-pound (25,000 kg) two-speed transfer case. The front axles on all HEMTTs are single-reduction Oshkosh 46K, the rear are Dana single-reduction which vary according to configuration. Drive to the front axles is selectable and all axles have differential locks. Suspension on A0/A1/A3 models is by Hendrickson leaf springs with equalizing beams. Suspension on A4 models is Holland air suspension, load rating on the rear axles varying by configuration. Tire size is 1600 R20 on all models, and standard tire fit is Michelin XZL. All models are capable of fording water crossings up to 48 in (120 cm) deep, and can climb a gradient of at least 60%. All original variants are air transportable in the C-130. All variants are air-transportable in the C-17. Original HEMTT models now have the suffix A0. Only the M984 wrecker was produced in A1 configuration. All models were produced in A2 configuration. The A3 suffix is applied to HEMTT technology demonstrators with a diesel-electric drive system. Current HEMTT production models have the suffix A4.

Ural-43203 Russian 6x6 General Utility Truck

Tiers:

1 2 3 4

Variants:

- **Ural-4320VV:** Originally built for the Internal Troops
- **Ural-4420:** tractor truck.
- **Ural-4320-0911-30:** is a long wheelbase model. It has a payload capacity of up to 10 t. This version can carry more cargo, 39 troops or various specialized bodies
- **Ural-43206:** a 4x4 version. It has a payload capacity of up to 4.2 t. It can carry up to 24 troops at the rear. This truck is capable of towing trailers with a maximum weight of 7 t. The 4x4 version is powered by a diesel engine, developing 180 hp. It was adopted by the Russian Army in 1996 and production commenced during the same year.
- **Ural-4320-70,:** also known as Ural Next is new version of the Ural-4320. It is fitted with a new cab of steel and polymer construction. Production of the commercial Ural Next commenced in 2015, though militarizes model was also proposed for the Russian military. Initially the new Ural Next was produced alongside the older Ural-4320 trucks.

System

Alternative Designation: Ural-43203
Type: General Utility Truck
Manufacturer: Ural Automotive Plant

Notes:

The Ural-43203 - chassis with reinforced front suspension The Ural-4320 is a general purpose off-road 6x6 vehicle, produced at the Ural Automotive Plant in Miass, Russia for use in the Russian army. Introduced in 1976, it is still in production today. The wheel arrangement for the Ural-4320 was designed for transporting cargo, people and trailers on all types of roads and terrain. It also serves as a launching platform for the BM-21 "Grad" rocket launcher. The Ural-4320 is a diesel-powered development of the Ural-375D. The Ural-4320 chassis has good ground clearance, so it is preferred in regions where roads are difficult to traverse due to sand or big rocks. In the proverbial Russian tradition, the Ural-4320 is reliable and easy to repair and maintain. It has civilian uses as a fire truck, a garbage truck, or a logging truck. It is also used for water, oil and gas drilling using the 1BA15 and URB-3A3 drilling rigs, which are mounted on the chassis.

MZKT-7930 Belarusian 8x8 Special Wheeled Chassis

Tiers:

1 2 3 4

Variants:

- **MZKT-79306:** MZKT-79306 is a proposed export version. A prototype was completed in 2000. It is fitted with a Deutz BF8M diesel engine, developing 544 hp. Engine is mated to an Allison automatic transmission. This vehicle has a payload capacity of 25 000 kg.
- **MZKT-7930-300:** MZKT-7930-300 is an improved version, fitted with a Belarusian 6-speed automatic transmission. It was adopted by Belarus, as a chassis for Polonez artillery rocket system.
- **MZKT-7415:** MZKT-7415 is a prime mover with a shorter wheelbase. It was originally intended to replace the MAZ-7410.
- **MZKT-79292:** MZKT-79292 is a larger 10x10 version, that can carry 35 t of payload. Maximum speed is limited to 45 km/h. This vehicle was designed to compete with a Russian BAZ-69096 special wheeled chassis with 10x10 configuration, which is planned to be used as a transporter erector launcher for a new Russian S-500 long-range air defense and anti-ballistic missile system.
- **MZKT-7909:** MZKT-7909 is a newer 8x8 version. It is powered by a TMZ-84631.10 turbocharged diesel engine, developing 525 hp. This vehicle has a payload capacity of 22 700 kg and is fitted with a new cab. It is used to carry a Turkish Khan short-range ballistic missiles.

System

Alternative Designation: MZKT-7930

Notes:

The ZIL-131 is a general purpose 3.5 tons 6x6 army truck designed in the Soviet Union by ZIL. The basic model being a general cargo truck. Variants include a tractor-trailer truck, a dump truck, a fuel truck, and a 6x6 for towing a 4-wheeled powered trailer. The ZIL-131 also serves as a platform for the 9P138 rocket launcher, a 30-tube variant of the BM-21 "Grad". The ZIL-131 was introduced in 1966; it is a military version of the ZIL-130, that was introduced in 1962, and a family of two trucks is sharing identical components. The ZIL-131 6x6 has the same equipment as the GAZ-66 and Ural-375D. The ZIL-130/131 was in production at the "AMUR" truck plant (as the AMUR 531340), with both gasoline and diesel engines, until 2012 when AMUR shut down and filed for bankruptcy.

Ural-375 Russian 6x6 General-Purpose Cargo Truck

Tiers:

Variants:

- **Ural-375:** Ural-375 has an open cab roof that could be covered by a canvas - i.e.: a softtop cab rather than a hardtop.
- **Ural-375A:** Ural-375A has a fully enclosed all-steel cab, was a chassis for wagon-style body, payload 12,787 lb (5,800 kg), framework shortened to 13.2'
- **Ural-375D:** Ural-375D Most produced 375.
- **Ural-375E KET-L:** Ural-375E KET-L was a recovery vehicle equipped a front-mounted and a rear-mounted winch along with a jib crane.
- **Ural-375S:** Ural-375S was a tractor-trailer truck with framework shortened to 5.3'.
- **Ural-377:** Ural-377-civilian 6×4 truck
- **Ural-377S:** Ural-377S was a civilian 6×4 tractor-trailer.

System

Alternative Designation: NA
Type: 6x6 General-Purpose Cargo Truck
Manufacturer: Ural Automobile Plant, Miass
Cab Capacity: 1 driver, 1 passenger
Passenger Capacity: INA
Payload Capacity: 4500 kg (plus trailer: 22,050 lb, 10,002 kg)

Dimensions

Length: m7.35
Width: m2.96
Height: m2.98
Weight, Empty: t8
Payload Capacity: t5
Ford: m1.5
Ground Clearance: INA

Automotive

Engine Name: 7.0L ZIL-375YA V8

Engine Type: Petrol

Engine Power: hp180

Cruising Range: km750

Speed, Maximum Road: km/h76

Speed, Average Cross: INA

Speed Maximum Swim: Not Amphibious

Gradient: 65%

Side Slope: 40%

Vertical Step: m0.8

Trench: m0.7

Fording Depth: m1.2

Suspension: Solid axles, leaf springs, rear wheels at balance-cart.

Fuel Capacity: 79 gallon tank and 16 gallon tank

Fuel Economy: 4.9 mpg (19-25 mph), 2.94 mpg (city)

Protection

Armor: Protection from small arms fire and shell splinters

Applique Armor: INA

Active Protection System: No

Mine Clearing: No

NBC Protection: INA

Smoke Equipment: No

Notes:

The Ural-375 is a general purpose 4.5 ton 6×6 truck, produced at the Ural Automotive Plant in the Russian SFSR since 1961. The Ural 375 replaced the ZIL-157 as the standard Soviet Army truck in 1979. It was itself replaced by the Ural-4320. The Soviets found the trucks an ideal platform for the BM-21 Grad rocket launcher. Other modes for the Ural-375D included troop carrier, supply carrier, etc.

Ural-43206 Russian 4x4 General Utility Truck

Tiers:

Parent:

Ural-4320 Russian General Utility Truck

Variants:

- **Ural-4320VV:** Originally built for the Internal Troops
- **Ural-4420:** Tractor truck.
- **Ural-4320-0911-30:** Is a long wheelbase model. It has a payload capacity of up to 10 t. This version can carry more cargo, 39 troops or various specialized bodies
- **Ural-43206:** A 4x4 version. It has a payload capacity of up to 4.2 t. It can carry up to 24 troops at the rear. This truck is capable of towing trailers with a maximum weight of 7 t. The 4x4 version is powered by a diesel engine, developing 180 hp. It was adopted by the Russian Army in 1996 and production commenced during the same year.
- **Ural-4320-70,:** Also known as Ural Next is new version of the Ural-4320. It is fitted with a new cab of steel and polymer construction. Production of the commercial Ural Next commenced in 2015, though militarizes model was also proposed for the Russian military. Initially the new Ural Next was produced alongside the older Ural-4320 trucks.

System

Alternative Designation: Ural-43206
Type: General Utility Truck

IR Signature: No

Notes:

The Ural-43206 is a 4x4 version, developed from the larger Ural-4320, which has a 6x6 configuration. It was developed both for internal market, as well as the export customers. It is worth mentioning that the 4x4 version is less expensive than the larger 6x6. The Ural-43206 was adopted by the Russian Army in 1996. Its production commenced the same year. This high mobility truck is used in large numbers as a troop or cargo transport.

Notes:

The Ural-4320 is a general purpose off-road 6x6 vehicle, produced at the Ural Automotive Plant in Miass, Russia for use in the Russian army. Introduced in 1976, it is still in production today. The wheel arrangement for the Ural-4320 was designed for transporting cargo, people and trailers on all types of roads and terrain. It also serves as a launching platform for the BM-21 "Grad" rocket launcher. The Ural-4320 is a diesel-powered development of the Ural-375D. The Ural-4320 chassis has good ground clearance, so it is preferred in regions where roads are difficult to traverse due to sand or big rocks. In the proverbial Russian tradition, the Ural-4320 is reliable and easy to repair and maintain. It has civilian uses as a fire truck, a garbage truck, or a logging truck. It is also used for water, oil and gas drilling using the 1BA15 and URB-3A3 drilling rigs, which are mounted on the chassis.

M985 HEMTT American 8x8 Heavy Expanded Mobility Tactical Truck (HEMTT) Cargo Truck

Tiers:

Variants:

- **M977:** The M977 cargo truck variant is the base member of the HEMTT family. The current model is the M977A4; there was no M977A1. In addition to the basic M977A0/A2/A4 cargo truck, two other variants are available. The M977A0/A2/A4 Electrical Power Plant (EPP) has an extended cargo body (6.041 m (19.82 ft) inside length) and is used to hold and transport generators for the Patriot air-defence missile system. There is no material handling crane on the EPP. The M977A0/A2/A4 Large Repair Parts Transporter (LRPT) and the basic M977 cargo truck are fitted with a light-duty Grove materials handling crane mounted at the rear of the chassis.
- **M978:** The M978 is a 9,500 liter capacity tanker. The current model is the M978A4; there was no M978A1. The M978A0 was produced in both potable water (approximately 18) and fuel servicing truck variants, the A2 and A4 models have only been produced in the fuel servicing truck variant.
- **M983 Tractor:** The M983 is a tractor unit for use with the trailer-mounted MIM-104 Patriot missile system. It can also be used with the Interim Stryker Recovery System, or other trailers. An earlier variant fitted with a 30 kW generator and crane mounted behind the cab was used to tow the Pershing II Erector Launcher in CONUS (a M1001 MAN tractor was used in West Germany). The M983A2/A4 Light Equipment Transporter (LET) tractor is mainly used to transport construction and engineer equipment. It has a 45,000 lb (20,000 kg)) 2 speed hydraulic winch mounted behind the cab used to load the trailer. It does not have a self-recovery winch.
- **M984A1 Wrecker:** The M984 wrecker is the only HEMTT variant to have been produced in the A1 configuration, and this resulting in the change of recovery crane and retrieval system between A0 and A1 configurations. The current model is the M984A4. Standard equipment includes a 27,240 kg (60,050 lb) capacity two-speed recovery winch, a rear-mounted 11,340 kg capacity vehicle retrieval system, and a 6,350 kg (14,000 lb) at 2.74 m (9.0 ft) capacity Grove materials handling crane. A 9,072 kg (20,000 lb) bare drum capacity self-recovery winch is fitted as standard on the M984.
- **M985 Cargo:** The M985 is available in two variants. The current models are A4; there were no A1 models. The M985 cargo variant is similar to the M977 cargo truck but was developed to support the M270 Multiple Launch Rocket System (MLRS) with a M989A1 HEMAT trailer. It may also used to transport Patriot missiles. The M985 Guided Missile Transporter (GMT) was developed specifically for use with the Patriot system and it can be distinguished easily from other cargo models by its rear-mounted Hiab 8108/2 materials handling crane
- **Taiwanese RT-2000 Multiple Rocket Launcher:** The RT-2000 [Lit; Ray-Ting-2000 or Thunder -2000] rocket launcher mounted on an M977 chassis. In service about 1997. Can mount any one of three launchers: Mk 15 117-mm, 60 rounds; Mk 30, 30 rounds with HE; AP/AM cluster warhead - >18-mile range; Mk 45 12 rounds, > 27-mile range, GPS targeting. See separate record for details.
- **M1120 HEMTT Load Handling System (LHS):** The M1120 Load Handling System (LHS) variant was initially introduced as part of the HEMTT overhaul/rebuild program, during which returned M977 cargo trucks have their cargo bodies and materials handling cranes removed, to be replaced by a Multilift Mark 5 (now designated MPH165-LHS) LHS,

as fitted to the Oshkosh PLS truck.

- **M1977 HEMTT Common Bridge Transporter (CBT):** The M1977 HEMTT Common Bridge Transporter (CBT) is a further development of the M1120 LHS, and in common with the M1120 LHS was initially introduced as part of the HEMTT overhaul/rebuild program. It is used for loading, transporting, and unloading Ribbon Bridge components and bridge erection boats.
- **M1142:** The M1142 is a Tactical Fire Fighting Truck (TFFT) capable of extinguishing aircraft, petroleum, brush, and structural fires at isolated military installations. The TFFT is based on a HEMTT M977A2 chassis with the heavier duty M1120 LHS HEMTT variant rear suspension. The TFFT contract was awarded to Pierce Manufacturing with Oshkosh Corporation as a subcontractor to Pierce.
- **M977 A2 Cargo Truck:** Basic version.
- **M977 A2 EPP:** Electrical power plant.
- **M977 A2 LRPT:** Large repair parts transporter.
- **M978 A2:** Fuel servicing transporter truck tanker.
- **HEMTT M983 A2 LET:** Light equipment transporter.
- **HEMTT M983 A2:** Patriot missile tractor.
- **M984 A2:** Recovery truck.
- **M985 A2:** Cargo and MRLS resupply.
- **M985 A2 GMT:** Guided missile transporter.
- **M1120 A2 HEMTT-LHS:** Heavy expanded mobility tactical truck.
- **M1977 A2 CBT:** Common bridge transporter.

System

Alternative Designation: M985 HEMTT

Type: Heavy Expanded Mobility Tactical Truck (HEMTT) Cargo Truck

Manufacturer: Oshkosh Corporation

Configuration: 8x8

Family: Heavy Expanded Mobility Tactical Truck (HEMTT)

Crew: ea2

Payload Capacity: 9,979 kg

Material Handling Crane Maximum Capacity: 2,449 kg at 5 m boom length

Dimensions

Length: 10.17 m

Width: 2.44 m

Height: 2.57 m

Distance Between Equalizer Pivots: 5.33 m

Distance Between Axles, 1st to 2nd: 1.52 m

Distance Between Axles, 2nd to 3rd: 3.81 m

Distance Between Axles, 3rd to 4th: 1.52 m

Weight: 17,191 kg

Automotive

Engine Name: 1 x Detroit Diesel 8V-92TA

Engine Type: 736-cu in(12.06-liter) liquid-cooled, 2-stroke, V-8 diesel

Engine Power: 445 hp at 2,100 rpm

Power-to-Weight Ratio: 16.18 hp/metric ton

Transmission: Allison HT740D automatic transmission with torque converter 4 forward/1 reverse gears

Suspension: 8 x 8 (8 wheels driving, 4-wheel steering); Hendrickson leaf spring w/steel saddle, equalizing beams, and 10-in (254-mm) vertical travel on front and rear; RT340 model rear springs on all but M985 (RT380) and M984A1 (RT500)

Maximum Speed: 88 km/h

Range: 483 km; w/full load at 54 km/h

Fuel Capacity: 589 liters

Tire Size: 16.00R20

Gradient: 60 percent

Side Slope: 30 percent

Fording Depth: 1.23 m

Payload Capacity: 9,979 kg

Protection

Armor: A-kit/B-kit; U.S. Army Long Term Armor Strategy (LTAS) compliant

Applique Armor: Available

Active Protection System: INA

NBC Protection: Yes

Smoke Equipment: No

Notes:

M985 Cargo This variant is the same as the 977 except that it is equipped with an 89,100-ft lb (12,319-kg m) heavy-duty crane. It is used to carry Multiple Launched Rocket System (MLRS) ammunition. The Heavy Expanded Mobility Tactical Truck (HEMTT) is an eight-wheel drive, diesel-powered, 10-short-ton (9,100 kg), tactical truck used by the US military and others. In evolving configurations, it has been in continuous production since 1982. The M977 HEMTT entered service with the U.S. Army as a replacement for the M520 Goer. By mid 2019, around 35,000 HEMTTs in various configurations had been produced by Oshkosh Defense through new-build contracts and around 13,000 of these had been re-manufactured. Current variants have the A4 suffix. The 10×10 Oshkosh Logistic Vehicle System Replacement (LVSR) is the U.S. Marines' equivalent to the U.S. Army's Oshkosh 8×8 HEMTT and Oshkosh 10×10 Palletized Load System (PLS). The Marines do not use the HEMTT or PLS, and the Army does not use the LVSR, but both services use a common trailer (M1076) with all three truck types. The HEMTT's objective is to provide heavy transport capabilities for supply and re-supply of combat vehicles and weapons systems. Compared to earlier generation 5-ton trucks in U.S. Army service it offers increased payload and mobility. The HEMTT is available in a variety of configurations, including cargo, tanker, tractor and wrecker. The HEMTT was developed from the outset as a tactical truck, but to minimize procurement and life cycle costs included militarized commercial automotive components where possible, these including the engine and transmission. Some components used in early HEMTTs are common with the Oshkosh Logistics Vehicle System (LVS) vehicles which were supplied to the U.S. Marine Corps. With the exception of the M984 wrecker variant (254 × 89 × 9.5 mm, front; 356 × 89 × 9.5 mm, rear), on all HEMTT variants the chassis is formed of 257 × 89 × 9.5 mm heat-treated carbon manganese steel with a yield strength of 758 MPa. Bolted construction with Grade 8 bolts is used throughout. A centrally mounted self-recovery winch is an option and this is fitted to around 20% of production. The HEMTT's two-door forward control cab seats two. It is of heavy-duty welded steel construction with corrosion-resistant sheet metal skins. Simula Inc. (acquired by Armor Holdings in 2003 and now BAE Systems) supplied 186 add-on cab armoring kits for use in the former Yugoslavia. These were not issued, but from 2004 were used in Iraq. BAE systems supplied a next-generation armor kit for the HEMTT and by late-2006 had supplied the U.S. Army with around 3600 kits for the Oshkosh HEMTT and PLS. The HEMTT A4 is fitted with the slightly larger from the Oshkosh PLS A1. This cab complies with the U.S. Army's Long Term Armor Strategy (LTAS) requirements of an A- and B-kit armoring philosophy. It also comes as standard with integrated floor armor, an integrated mount for a machine gun and gunner protection kit, and air-conditioning. A Detroit Diesel 8V92TA V-8 two-stroke diesel developing 445 hp (332 kW) is fitted in HEMTT A0 and A1 models, with the DDECIV version of this engine fitted to A2 HEMTTs. An EPA 2004 compliant Caterpillar (CAT) C-15 six-cylinder, 15.2-liter diesel developing a peak of 515 hp (384 kW) is fitted to HEMTT A4 models. HEMTT A0 and A1 models are fitted with an Allison HT 740D 4F/1R automatic transmission, torque converter, and Oshkosh 55,000-pound (25,000 kg) two-speed transfer case. HEMTT A2 models have the Allison HD 4560P 6F/1R automatic transmission. HEMTT A4 models are fitted with an Allison 4500SP 5F/1R automatic transmission and an uprated version of Oshkosh's 55,000-pound (25,000 kg) two-speed transfer case. The front axles on all HEMTTs are single-reduction

Oshkosh 46K, the rear are Dana single-reduction which vary according to configuration. Drive to the front axles is selectable and all axles have differential locks. Suspension on A0/A1/A3 models is by Hendrickson leaf springs with equalizing beams. Suspension on A4 models is Holland air suspension, load rating on the rear axles varying by configuration. Tire size is 1600 R20 on all models, and standard tire fit is Michelin XZL. All models are capable of fording water crossings up to 48 in (120 cm) deep, and can climb a gradient of at least 60%. All original variants are air transportable in the C-130. All variants are air-transportable in the C-17. Original HEMTT models now have the suffix A0. Only the M984 wrecker was produced in A1 configuration. All models were produced in A2 configuration. The A3 suffix is applied to HEMTT technology demonstrators with a diesel-electric drive system. Current HEMTT production models have the suffix A4.

Fording, Prepared: 1.52 m

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Smoke Equipment: INA

Notes:

The M1087 Expandable Van is envisioned to be a mobile office used at various echelons in a field environment. The M1087 van sides pull out from the main body to form the office complex. It is equipped with 110V AC to operate computer, radio and air condition systems. A 24 VDC electrical system is provided to operate the electrical components (radios and blackout lights, etc.) until the office complex can be set up. The vehicle is still in the developmental phase.

System

Alternative Designation: M1090

Type: Medium Tactical Vehicle (MTV) Dump Truck

Family: FMTV Series

Configuration: 6x6

Crew: ea1

Cab Seating: 3-Man

Winch: The M1090 can be equipped with a self-recovery winch capable of fore/aft vehicle recovery operations. The winch is equipped with 280 feet line capacity and 15,500 pounds bare drum line pull at 110% overload.

Dump Body Construction: Welded steel, 5 cu yd (4 m3), 10,000 lb (4,536 kg) capacity Provisions for troop seats and cover kit

Dimensions

Length: 7.19 m

Width: 2.44 m

Height, Top of Cab: 2.76 m

Height, Air Transport: 2.59 m

Height, Air Drop: 2.18 m

Wheelbase: 5.30 m

Ground Clearance: 559 mm

Payload Capacity: 4,536 kg

Curb Weight: 9,969 kg

Automotive

Engine Name: 1 x Caterpillar 3116 ATAAC

Engine Type: 403-cu in (6.6-liter) liquid-cooled, turbocharged, aftercooled, in-line 6-cylinder diesel

Engine Power: 290 hp (216 kW) at 2,600 rpm

Transmission: Allison MD 3070 PT automatic/select electronically controlled; 7 forward/1 reverse gears

Power-to-Weight Ration: 19.52-34.47 hp/metric ton

Maximum Speed: 88 km/h

Range: 483 km

Approach Angle: 40 deg

Departure Angle: 63 deg

Gradient: 60 percent

Side Slope: 30 percent

Fording, Unprepared: 0.91 m

Fording, Prepared: 1.52 m

Tires: Super singles with CTIS

Main Weapon System

Note: 1 x 12.7-mm machine gun mount over cab

Protection

Armor: Current and recent operational scenarios now call for logistic trucks of the FMTV type to at least have the option of cab armoring. When it entered production, armoring was not considered an option for the FMTV. The first protection solution for the FMTV was not in answer to such scenarios, but was developed by Stewart & Stevenson and O'Gara-Hess & Eisenhardt Armoring Company (OHE). Called the Crew Protected Cab, it was specifically for the HIMARS variant and offered flash and Foreign Object Debris (FOD) protection during launch. Designs followed for an Enhanced Crew Protected Cab, and later an Armor Protected Cab, each adding more ballistic capability against direct fire, artillery burst and mines.

Applique Armor: To meet emerging threats on deployed operations, in March 2004 DRS Technical Services was awarded a $16.3 million contract to provide 272 armor protection kits for the FMTV. A total of 1,862 kits are understood to have been produced in total. These kits were based around ballistic-protection panels installed on standard FMTV cabs. In answer to demands for greater crew protection, BAE Systems developed the Low Signature Armored Cab (LSAC) for all variants of the FMTV. The LSAC replaced the standard FMTV cab (with which it shares internals) in a remove and replace operation. To meet the US Army's current Long Term Armor Strategy (LTAS) for armored cabs, BAE Systems developed the LTAS cab for the FMTV. BAE Systems states that it produced over 9,000 LTAS cabs for the FMTV A1P2 variant. All Oshkosh FMTV vehicles include the company's own LTAS-compliant armor solution. LTAS is based around the A and B kit principles, this allowing for vehicles to be armored as required, and with the add-on applique package adaptable to prevailing threats and upgradeable as new armoring technologies emerge. The A-Kit, which includes a new cab, modifies the FMTV to allow the addition of armour; the B-Kit being the bulk of the armor itself.

Active Protection System: No

NBC Protection: INA

Notes:

The M1090 Dump Truck is designed to transport construction material in support of combat engineer road and bridge projects. The M1090 has a 5 cubic yard, 10,000 pound payload capacity. The cargo bed can be equipped with an optional bench seat kit for transport of soldiers. The bench seats are constructed of a non-wood material and attach to the cargo bed side rails. The seats can be folded down and stowed when not in use. Soldiers are assisted climbing in and out of the cargo bed area with the aid of a ladder stowed on the vehicle when not in use. A canvas and bows kit is provided to keep soldiers and cargo protected from the elements. The M1090 can be equipped with a self-recovery winch capable of fore/aft vehicle recovery operations. The winch is equipped with 280 feet line capacity and 15,500 pounds bare drum line pull at 110% overload.

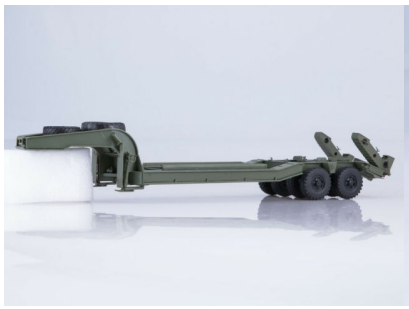
ChMZAP-5247 G Russian 50 Tons Trailer



Tiers:

1 2 **3** 4

Variants:

- **ChMZAP-5247B:** The ChMZAP-5247B is a simple flatbed transporter with two axles in the rear of the trailer and a total of eight tires, each with airbrakes. The ChMZAP-5247B has adjustable track guides, guide bars, and the standard selection of tools and materials for the securing of vehicles or cargo. Two spare tires are also provided.

System

Alternative Designation: ChMZAP-5247G
Type: Trailer
Manufacturer: INA
Load: 50 tons

Dimensions

Length: 9.33 m
Width: 3.2 m
Height: INA
Weight, Combat: 18 ton

Protection

Armor: W(2)/HF1 HS1 HR1
Applique Armor: INA
Active Protection System: No

Notes:

The ChMZAP-5247G is a more advanced form of this trailer; the load deck is within a "well" of sorts, with an incline behind the load area and the gooseneck in front of it. It is a little over half a meter longer than its predecessor and almost three-quarters of a meter wider. It can carry more weight, and has powered folding loading ramps at the rear (the ChMZAP-5247B has only removable loading ramps).

Notes:

The CHMZAP-9990 semitrailer is an excellent, rugged tank transporter and general bulk cargo carrier design capable of operations on paved roads, natural roads, trails and selected off-road terrain. The CHMZAP-9990 has three equally spaced axles and 12 tires (wheels). The 12 tires are arranged in pairs on half-axles, with each pair independent of the pair across the vehicle from it. There is no axle across the vehicle. Each half-axle and wheel pair is mounted on a center pivot which allows 15 degrees of roll freedom in each direction. All three axle pairs on each side of the vehicle are connected to a walking beam or rocker arm type. This beam is 8 feet long, tapered towards the ends and a massive weldment in structure. The extreme wheel pairs (axles 1 and 3) are connected at the ends of the beam, while the middle axle is co-located with the walking beam pivot in the center of the beam and connected through an auxiliary walking beam of somewhat unknown design. Loads are transferred from the semitrailer through the walking beam pivot to the walking beam. The first and third axles receive their loads at the ends of the walking beam while load to the center axle is through the auxiliary walking beam. The CHMZAP-9990 semitrailer has stakebody sides and a cargo floor bed. When carrying general cargo it provides tremendous capability. The gooseneck section includes two spare tires, landing legs, and a tire-handling boom. A very useful feature of this semitrailer is the low-tire-inflation-pressure warning system. The system is designed to warn the operator of a fall in tire pressure below 4.4 kg/cm2 in any of the 12 tires on the trailer (5.5 kg/cm2 is normal). Sensors in each wheel of the trailer make an electrical connection when tire pressure falls below the designated pressure. This activates a horn or buzzer in the operator's cab, warning only that one or more tires is low. The operator must then stop the truck and go to a terminal panel box on the trailer. This panel box contains a series of press-to-test buttons, arranged in a pattern to represent wheel placement. By pressing each button or a series of them, the operator can determine the low tire; the buzzer will stop sounding when the button (or buttons) for the low-pressure wheel (or wheels) is pressed. Components on the trailer are connected by means of a detachable shielded conduit to the buzzer and a 24-v electrical power source in the tractor.

Notes:

The Panha 2091 "Toufan" is an Iranian overhaul and upgrade of the Bell AH-1J International (export version of the SeaCobra) attack helicopter purchased before the 1979 Islamic Revolution. The overhaul and upgrade program is known as project number 2091 of the Iranian Helicopter Support and Renewal Company (also known as Panha). Reported upgrades include: new cockpit armored panels new, Iranian-designed canopy new avionics nose-mounted camera new cockpit design The upgraded attack helicopter has a narrower airframe for greater flexibility and is armed with an M197 three-barreled 20-mm Gatling-type cannon in the A/A49E turret. Its wing-stub stations carry a pair of 19-tube 70-mm rocket launchers. Bulletproof glass protects the pilot's cockpit and weapons officer station, internal avionics have been revamped with the addition of a GPS and receiver in the nose, and a warning radar attached to the rear, with four antennae providing 360 degrees coverage and all electronics systems integrated.

Eurocopter Tiger German Attack Helicopter

Tiers:

Variants:

- **Tiger ARH (armed reconnaissance helicopter):** The Tiger ARH is a modified Tiger HAP with upgraded MTR390 engines and a laser designator incorporated in the Strix sight for the firing of Hellfire II missiles. Australian Aerospace is to set up a production assembly in Australia for assembly and parts for the duration of the program.
- **Tiger HAC (anti-tank helicopter, Helicoptere Anti-Char):** Carries an Osiris mast-mounted sight equipped with infrared charge coupled device (IRCCD) camera and laser rangefinder. The nose-mounted forward looking infrared (FLIR) has a 40 degree x 30 degree field of view. The Tiger HAC can be equipped with four Mistral or Stinger air-to-air missiles for air defense missions. For ground-attack missions, the Tiger is designed to carry both the HOT -3 and Trigat -LR anti-tank missiles. The pilots have helmet-mounted display sites. This variant was ultimately cancelled in favor of the HAD version.
- **Tiger HAP (fire support helicopter, Helicoptere d'Appui et de Protection):** A lighter Tiger used for ground fire support and engaging airborne threats. Equipped with a turreted Giat 30-mm AM-30781 automatic cannon, gun and either four Mistral missiles, 44 rockets plus four Mistral missiles, or 68-mm rockets. Only one weapon can be activated at a time. The helicopter typically carries four Mistral missiles and two pods, each carrying 22 68-mm rockets. The Tiger HAP also has a Strix roof-mounted sight with gyro-stabilized platform, laser rangefinder, direct optical sight, infrared camera and charge-coupled device television camera (CCDTV). French Tiger HAPs will be capable of deployment from MISTRAL- and FOUDRE-class amphibious ships and the aircraft carrier CHARLES DE GAULLE. Initial operational capability in the maritime role was scheduled for late 2008.
- **Tiger UHT (anti-tank helicopter, Unterstuzungs Hubschrauber):** Similar to the HAC version, although it does not have helmet-mounted display sites. Instead, the UHT uses integrated day and night helmets. The Osiris mast-mounted sight features second-generation infrared charge-coupled device (IRCCD) and television cameras for the gunner and a nose-mounted IRCCD camera with a 40-deg x 30-deg field of view for the pilot. German armament includes 12.7-mm machine gun pods, 70-mm rockets, FIM-92 Stinger anti-air missiles, HOT and Trigat anti-tank missiles and the Osiris mast-mounted sight. Electronic warfare equipment includes missile approach warning receivers and decoy launchers.
- **Tiger HAD (support destruction helicopter, Helicoptère d'Appui Destruction):** This version is very similar to the HAP variant, but features upgraded Enhanced MTR 390E engines, providing 14 percent more power; improved ballistic protection; identification friend or foe (IFF) interrogation system; new optronic sight; and enhanced electronic warfare systems. It is fitted with the Strix roof-mounted sight and can be equipped with TRIGAT-LR, Hellfire or Spike anti-tank missiles. The Safran Strix is a gyrostabilized elector-optical system featuring a thermal imager, daylight camera and laser rangefinder. It supports day/night operations for all weapons the Tiger carries, including Hellfire laser-guided missiles, rockets and Spike anti-tank missiles. This version was selected by the Spanish army. The French army also decided to upgrade all of its HAP helicopters to the HAD standard, leading to the cancellation of the HAC version. French versions are armed with eight Hellfire II anti-tank missiles, a 30-mm cannon, 70-mm rockets and four Mistral air-to-air missiles. Spanish variants are equipped with Spike-ER missiles. The Tiger HAD Block 2 configuration features new

software with man-machine interface improvements; improved firing capability; high-frequency data link; naval capabilities; an enlarged firing envelope for the Spike missile; and a new engine control monitoring unit (ECMU-B).
- **Afghanistan Stabilization German Army Rapid Deployment (ASGARD):** This is an upgrade program for German army Tiger helicopters that are to be deployed to Afghanistan. The modifications include a sand filter, additional defensive weapons and ballistic protection, mission data recorder and enhanced communications equipment. The engines are up-rated for improved hot-and-high performance.

System

Alternative Designation: Eurocopter Tiger
Type: Attack Helicopter
Crew: ea2
Blades, Main Rotor: 4
Blades, Tail Rotor: ea3
Number of Engines: ea2
Payload Capacity: 3,968 lb (1,800 kg) max
Number of Hard Points: two inner hardpoints and outer hardpoints
Inner Hardpoints Capacity: *1x 20 mm (0.787 in) autocannon pods, or *22x 68 mm (2.68 in) SNEB unguided rockets in a pod, or *19x 70 mm (2.75 in) Hydra 70 unguided rockets in a pod or *4x AGM-114 Hellfire missiles (Australia/France) or *4x Spike-ER missiles (Spain) or *4x PARS 3 LR missiles (Germany) or *4x HOT3 missiles (Germany)
Outer Hardpoints Capacity: *2x Mistral air-to-air missiles, or *2x FIM-92 Stinger air-to-air missiles (Germany), or 12x 68 mm (2.68 in) SNEB unguided rockets in a pod or *7x 70 mm (2.75 in) Hydra 70 unguided rockets in a pod

Dimensions

Length, Fuselage: 51 ft 10 in (15.80 m)
Length, Rotors Turning: 45 ft 11 in (14.00 m)
Wingspan: 15 ft 1 in (4.60 m)
Height: 14 ft 2 in (4.32 m) to top of tail rotor
Rotor Diameter: 42 ft 8 in (13.00 m)
Dsic Area: 1,428.2 sq ft (132.7 m sq)
Weight, Empty: 7,275 lb (3,300 kg)
Weight Mission: 11,905 lb (5,400 kg)
Weight, Takeoff: 13,230 lb (6,000 kg) max

Automotive

Engine Name: 2 x MTR390 turboshaft; 1,290 shaft hp each; or 2 x MTR390-E (Tiger HAD); 1,470 shaft hp each
Engine Type: INA
Engine Power: hp1,290 through 1,470
Fuel: 2,250 lb (1,020 kg) internal 3,472 lb (1,575 kg) max internal and external
Mission Range: 430 nm (500 mi, 800 km) on internal fuel 691 nm (800 mi, 1,280 km) with external fuel
Maximum Endurance: 3 hr 25 min on internal fuel
Mission Maximum: 2 hr 50 min

Maximum Speed: 145 knots (167 mph, 267 km/h)

Never Exceed Speed: 161 knots (185 mph, 298 km/h)

Cruise Speed: 123 knots (142 mph, 228 km/h)

Vertical Rate of Climb: 17.1 ft/sec (5.2 m/sec)

Maximum Rate of Climb: 35.1 ft/sec (10.7 m/sec)

Hover Ceiling: 10,663 ft (3,250 m)

Chin Mounted Gun

↳*System*

Name: 1× 30 mm (1.18 in) GIAT 30 cannon in chin turret.

Type: Revolver Cannon

Caliber: 30mm

Length: 2.4 m

Weight: 120 kg

Barrels: 1

Action: Seven-chamber revolver

Rate of Fire: 2,500 rounds/min

Muzzle Velocity: 1,025 m/s

↳*Ammunition*

Type: Rifle

Caliber: 30mm

Shell: 30 × 113mm B (M 781), 30 x 150mm B (M 791)

Basic Load: 450 rounds

Wing Mounted Weapons

↳*Inner Hardpoints*

Note: *1x 20 mm (0.787 in) autocannon pods, or 22x 68 mm (2.68 in) SNEB unguided rockets in a pod, or *19x 70 mm (2.75 in) Hydra 70 unguided rockets in a pod or *4x AGM-114 Hellfire missiles (Australia/France) or *4x Spike-ER missiles (Spain) or *4x PARS 3 LR missiles (Germany) or *4x HOT3 missiles (Germany)

↳*Outer Hardpoints*

Note: *2x Mistral air-to-air missiles, or *2x FIM-92 Stinger air-to-air missiles (Germany), or *12x 68 mm (2.68 in) SNEB unguided rockets in a pod or *7x 70 mm (2.75 in) Hydra 70 unguided rockets in a pod

Avionics

Note: Amongst the key avionics features of the aircraft are the EUROGRID battlefield management and map display systems, integrated communications (HF/VHF/FM radio and satellite) and data transfer links, a high-authority digital automatic flight control system, and redundant MIL 1553 data buses. Two redundant mission computers control the

weapons, sensors, and targeting functions. The Tiger's navigational suite includes GPS, dual redundant inertial referencing, Doppler radar, separated air data units, radio altimeter and distributed air speed sensors. A dedicated nose-mounted forward-looking infrared (FLIR) sensor is used by the pilot for night time flying. Each crew member has a pair of multifunction liquid crystal data displays at their control station, typically used to display internal systems information and sensory data, and to interact with the aircraft's higher systems. An additional display system is available to both crew in the form of the helmet-mounted display (HMD). The HMD is used by the flying pilot to display basic flight data with digitally enhanced optics, such as night vision or infrared imagery from the sensors, superimposed against; the gunner can use the HMD to interact with and control onboard weapon systems and view targeting data. Perhaps the most significant single avionics system fitted upon the Tiger is the mast-mounted Osiris sight/sensor; this incorporates optical TV and thermal cameras, a laser range finder/tracker/designator, and multiple gyroscopes for stabilisation. Osiris performs as the main sensor for target observation and acquisition, providing firing and targeting data via the weapons computer; Osiris also enables entirely passive target acquisition to be undertaken and was developed to maximise the capabilities of the Trigat anti-tank missile developed in parallel to the Tiger itself. An alternative optical system to Osiris is mounted on the aircraft's roof upon some variants. The Tiger can be fitted with various armaments including rockets, cannons, and a range of air-to-air and air-to-surface missiles, controlled via a dedicated weapons control computer. Munitions for anti-ground warfare include the nose-mounted 30mm Nexter turret; an assortment of external gun pods, anti-tank missiles, and up to four launchers for 70mm and 68mm rockets can be mounted on the Tiger's stub wings. When deploying missiles such as the Mistral, the Tiger is capable of taking advantage of the munition's off-boresight capabilities. A guided 70mm rocket will be developed for the Tiger based on the Roketsan Cirit.

Protection

Note: The protection systems employed on the Tiger includes stealth; aspects such as the visual, radar, infra red and acoustic signatures have been minimised to better evade threats that may be present upon the battlefield. According to Andrew Warner, the Tiger's survivability "relies on stealth and agility". The use of composite materials on the airframe has resulted in reductions in radar cross-section (RCS), infra red and acoustic signatures to improve battlefield survivability. The fuselage is armoured and was developed to withstand small arms fire and 23 mm (0.91 in) cannon rounds. The helicopter has various radar/laser warning and missile approach detection systems, including EADS's AN/AAR-60 MILDS (Missile Launch Detection System), as well as flares and chaff dispensers. The Tiger is the first all-composite helicopter developed in Europe.[53] The fuselage of the Tiger is made from 80% carbon fibre reinforced polymer and kevlar, 11% aluminium, and 6% titanium. The entire tail section is made of composites, including the single section tail boom.The rotors are composed of a fibre plastic composite material able to withstand combat damage and bird strikes. The structure of the Tiger also incorporates protection against lightning strikes and electromagnetic pulses via an embedded copper/bronze grid and copper bonding foil. The design of the Tiger includes a high degree of crash worthiness; many of the onboard systems have redundancies and are segregated to minimise the effect of damage. Components of the propulsion system, such as the rotors and drive shaft, were deliberately designed for greater ballistic tolerance than traditional designs; the gearbox is rated for a 60-minute dry run capability if lubrication is lost. Fuel is contained in two main internal fuel tanks, and an additional two smaller tanks are housed inside the stub wings. Fuel tanks have self-sealing capability to decrease the vulnerability. In the inhospitable conditions of the Afghanistan theatre, the Tiger had a reported operational availability of 90%.

Notes:

The Eurocopter (now Airbus Helicopters) Tiger is a four-bladed, twin-engined attack helicopter which first entered service in 2003. It is manufactured by Eurocopter (now Airbus Helicopters), the successor company to Aérospatiale's and DASA's respective helicopter divisions, which designate it as the EC665. Following their languages, in Germany it is known as the Tiger; in France and Spain it is called the Tigre. Development of the Tiger started during the Cold War, and it was initially intended as an anti-tank helicopter platform to be used against a Soviet ground invasion of Western Europe. During its prolonged development period the Soviet Union collapsed, but France and Germany chose to proceed with the Tiger, developing it instead as a multirole attack helicopter. It achieved operational readiness in 2008. The Tiger has the distinction of being the first all-composite helicopter developed in Europe; even the earliest models also incorporate other advanced features such as a glass cockpit, stealth technology, and high agility to increase its survivability. Improved variants have since entered service, outfitted with more powerful engines and compatible with a wider range of weapons. Since the type's introduction to service, Tigers have been used in combat in Afghanistan, Libya, and Mali. The Tiger is capable of undertaking a wide range of combat missions, including armed reconnaissance and surveillance, anti-tank and close air support, escort and protection of friendly assets; and can operate during day or night in all-weather conditions, and has been designed to include operations in the aftermath of nuclear, biological, or chemical warfare. The Tiger can also be used in the maritime environment, able to operate from the decks of ships including frigates and during extreme weather conditions. Amongst the Tiger's notable qualities, it possesses very high levels of agility, much of which is attributed to the design of its 13-meter four-bladed hingeless main rotor; the Tiger can perform full loops and negative g manoeuvres. Power is provided by a pair of FADEC-controlled MTU Turbomeca Rolls-Royce MTR390 turboshaft engines. he Tiger has a tandem-seat 'glass cockpit' and is operated by a two-man crew; the pilot is placed in the forward position, with the gunner seated behind. Either of the crew members can manage the weapon systems or the primary flight controls, switching roles if necessitated; in addition to flying the aircraft, the Tiger's pilot would typically be in control of the self-defence systems and communications, as well as some secondary weapons functions. While

some of the weapons use dedicated control interfaces, such as the anti-tank Trigat missile, air-to-air weapons can be managed via controls on both sets of collective and cyclic sticks. Crew new to the Tiger have to undergo substantial retraining due to the differences from older platforms, particularly in higher workload management and the additional capabilities afforded by the type; one major change from preceding attack helicopters is a far greater degree of operational autonomy. According to Andrew Warner, chief test pilot during the Tiger's development, it is "the easiest-handling aircraft I have ever flown". The system cost (helicopter, armament, support) and unit cost varies between variants; Australia's Tiger ARH has a price per unit of A$68 million, the latest Tiger HAD variant is estimated to cost US$44–48 million

Z-10 (WZ-10) Chinese Attack Helicopter

Tiers:

Variants:

- **Z-10ME:** Upgraded variant first unveiled in 2018 with active and passive countermeasures, missile approach warning system, radar warning receiver, new engine exhaust nozzle pointed upwards to reduce infrared signature, new intake filtration systems and armor panels, more powerful 1200 kW engine, larger ammunition magazine, appliqué graphene-based armor panels, infrared jammer, and a new IFF interrogator.
- **Z-10H:** Pre-production series powered by Pratt & Whitney Canada PT6C-76 turboshaft engine
- **Z-10K:** Simplified Z-10H powered with domestic Chinese WZ-9 engine of 930 - 950 kW range. Due to the drastic reduction of power by nearly a third, MASWS, IRCM and some other subsystems removed armor is also greatly reduced to save weight.
- **Z-10M:** 3 samples built for Pakistan with equipment missing in Z-10K added back, powered by WZ-9C engine with maximum power around 1000 - 1100 kW. Was not selected by Pakistan after evaluation, but the design was used to upgrade Z-10 built earlier when more powerful engine became available
- **Z-10 Millimeter Wave Radar:** Equipped with Z-19's millimeter wave radar for ground testing.

System

Alternative Designation: CAIC Z-10, WZ-10, Fierce Thunderbolt
Function: Attack, Anti-Tank, Air-to-Air
Crew: ea2
Blades, Main Rotor: 5
Blades, Tail Rotor: 4
Number of Engines: 2
Night/Weather Capabilities: All weather capable within the commander's risk assessment
Takeoff Limitations: INA
Vertical Clime Rate: iNA
Number of Hard Points: ea4
YH Millimetre-Wave Fire-Control Radar: Yes
Helmet mounted sight with night vision goggles: Yes

Dimensions

Length: m14.2
Width: m4.3

Height: m3.8

Main Rotor Diameter: m12

Weight, Combat: kg5,500

Weight, Payload (Max): kg1,500

Weight, Empty: kg5,100

Weight, Maximum Take Off: kg7,257

Automotive

Engine Type: 2 x Pratt & Whitney Canada PT6C-67C turboshaft

Engine Power: hp1,531 (1,142 kW) each

Cruising Range: km800

Speed, Maximum: km/h300

Speed, Average: km/h250

Service Ceiling: m6,400

Climb Rate: m/s>10

Communications

Radio: INA

Armament

Notes: Due to its modular design concept, Z-10 can be armed with a wide variety of weaponry. The adaptation of Chinese GJV289A standard, the Chinese equivalent of the MIL-STD-1553B databus architecture, enables weaponry of both Soviet and western origin to be adopted by Z-10. Offensive weaponry consists of machine guns, cannons, rockets and missiles. The stub wings have two hardpoints each for a total of four, each hardpoint being able to carry up to 4 missiles for a total of up to 16.

↳*23mm Automatic Chain Gun (Chin Mounted-Option 1)*

Name: Gryazev-Shipunov GSh-23

Location: Chin Mounted

Cailber/Length: 23mm x 115

Barrels: 2

Number of Rounds: ea2,000

Armor Penetration: Yes

Muzzle Velocity: m/s715

Muzzle Break: Yes

Maximum Effective Range: m200-1,800

Rate of Fire: rds/m3,400-3,600

↳*25mm M242 Bushmaster (Chin Mounted-Option 2)*

Location: Chin Mounted

Type: Similar to the 25mm chain gun found in the US Bradley Fighting Vehicle

Caliber / Length: 25mm x 137

Number of Rounds: 2,000

Maximum Effective Range: m3,000

Muzzle Velocity: m/s1,100

Armor Penetration: Yes

Barrels: Single Barrel (Progressive RH parabolic Twist)

Rate of Fire: Cyclic: 200rpm with 1hp or 500rpm with 8hp

Notes:: A wide range of ammunition has been developed for this weapon, providing it with the capability to defeat the majority of armored vehicles it is likely to encounter, up to and including some light tanks. Primarily though, it fires six types of rounds: the M791, M792, M793, M910, MK210, and M919.

↳*14.5 mm Gatling Gun (Chin Mounted-Option 3)*

Location: Chin Mounted

Caliber / Length: 14.5 mm

Number of Rounds: 40- Round Belt

Maximum Effective Range: m3,000

Muzzle Velocity: m/s1,000

Armor Penetration: Yes

Rate of Fire: rpm600

Notes:: BS: Armor-piercing incendiary; B-32: Armor-piercing incendiary full metal jacket round with a hardened steel core; BZT: Armor-piercing incendiary tracer full metal jacket round with a steel core; MDZ: High-explosive incendiary bullet of instant action; ZP: Incendiary tracer round

↳*HJ-9 Anti-Tank Missile (Wing Mounted-Option 1)*

Location: Wing Mounted

Length: mm1200

Diameter: mm152

Weight: kg37

Engine: Rocket Motor

Warhead: Tandem HEAT warhead, 1100-1200 mm penetration RHAe

Detonation Mechanism: Contact Fuse

Guidance System: Laser-beam-riding & MMW Radar

Operational Range: m100-5,500

Combat Load: INA

Notes: Additional Guided and Unguided Missisles include: HJ-8, HJ-9, PL-9, AIM-9 Sidewinder

↳*HJ-10 Anti-Tank Missile (Wing Mounted-Option 2)*

Location: Wing Mounted

Length: INA

Weight: kg50

Warhead: Heat and others

Engine Propellant: Solid Fuel

Operational Range: km3-10

Speed: Supersonic

Guidance System: Fiber-optic wire-guided missile (AFT-10) semi-active laser homing and millimeter wave radar seeker (AKD-10) Infrared homing

Aircraft Capible to Carry: ea16

↳***TY-90 Air-to-Air Missiles (Wing Mounted-Option 2)***

Location: Wing Mounted

Length: m1.9

Diameter: mm90

Weight, Warhead: kg3

Aircraft Capible to Carry: ea16

Detonation Mechansim: Impact/Proximity

Engine Propllant: Soldi Fuel

Operational Range: km0.5-6

Flight Ceiling: km6

Flight Alitude: km0-6

Speed: Mach2

Guidance System: ImiR IR

Protection

Fuselage: INA

Cockpit Glass: Glass is rated to protect against 7.62mm rounds

Stealth Properties: Yes, fuselage is designed to reduce radar cross section

Heat Signature Reduction: INA

Armor: Cockpit and fuselage have armor plating, providing protection against 12.7mm rounds.

Add on Armor: On Oct 10th, 2018, the Global Times reported that additional graphene (strong and lightweight material) had been added to the fuselage to protect key components, fuel cells, and the cockpit.

NBC Protection: Yes

EW Counter Measures/CCM: Radar receiving warning, laser receiving warning, infrared jammer, missile approach warning sensors (MAWS) and dispensers for chaff and flares.

Engine Exhaust: Directed slightly up into rotor wash to reduce heat signature

Counter Measures (Chaf/Flares): Yes

Forward-Looking Infrared (FLIR) Systems: Yes

Laser Designator and Rangefinder: Yes

Missile Approach Warning Sensors (MAWS): Yes, located behind the nose

Fire Control

Fire Control System Type: Fly-by-wire (fully automatic)

Fire Control Radar: YH millimeter-wave fire control radar

Cockpit: "Glass" cockpit (fully automated) with digital multi-function displays

Digitial or Analog Cockpit: Digital

Direct Fire Control: Yes

Laser Disignator: Yes

Automated Helmet: Yes, helmet mounted cueing system with heads up display and weapons control. NVG capable.

Sensor Suites(s) Available: Fitted to the nose and includes a TV camera, FLIR, laser designator, and range finder.

Position Location System: Yes

Notes:

The Z-10 is an attack helicopter under development in China. It is designed primarily for anti-tank and battlefield interdiction operations, with a secondary air-to-air capability. It is said to be in the same class as the AgustaWestland A129 Mangusta, Denel Rooivalk and Eurocopter Tiger. The Z-10 has a conventional attack helicopter layout with the pilot and weapon system operator sitting in tandem, stepped cockpits. The helicopter has a five-blade main rotor and a four-blade tail rotor. It has two engines, each in a pod aft of the cockpit. The fuselage has sloped sides in a diamond configuration to reduce the aircraft's radar cross-section. Nicknames of characters in the Chinese classic novel Water Margin have been used to name Z-10 and its smaller counterpart Harbin Z-19: Z-10 is called Fierce Thunderbolt (Pi Li Huo, □□□), the nickname of Qin Ming, while Z-19 is called Black Whirlwind (Hei Xuan Feng, □□□), the nickname of Li Kui.[8][9] In September 2016, the PLA announced that all of its ground force aviation units had been equipped with the WZ-10. The Kamov design bureau was contracted to perform the development work under a secret contract. Kamov worked with the Chinese to establish base specifications, such as weight, speed and payload capacity after which they had full freedom to design the helicopter. Kamov designed, tested and verified the helicopter design, after which it was provided to the Chinese team. Although designed in Russia, the prototype construction, flight testing and further development was performed by the Chinese.[1][2][3][4] Wu Ximing (□□□) of the 602nd Research Institute, one of the Chinese top scientists involved in the 863 Program was publicly credited with being the chief designer of the Z-10, in an attempt to preserve the secrecy of the Kamov contract. Wu had earlier participated in the designs of the armed version of transport helicopters Z-8A and WZ-9. In order to complete the necessary development, the 602nd Research Institute and CAIC had jointly built a new engineering design center, industrial simulator, aircraft engine ground test center, fatigue laboratory, and rotary test platform (nicknamed as Iron Bird Platform, □□□). In the end of 2001, the final test was completed on the full-scale rotary test platform, paving the way for test flights. Composite material is widely used in the Z-10 but China faced difficulties in this field, particularly in the area of survivability during crashes. Huge efforts were spent to domestically develop composite materials able to provide comparable levels of survivability to Western counterparts. This achievement earned a second place in the Commission for Science, Technology and Industry for National Defense (COSTIND) progress reward. The main contractor of the avionics of Z-10 is the 613th Research Institute, which was responsible for integrating all of the avionics subsystems provided by subcontractors. Although foreign technologies are utilized (particularly French and Israeli, as rumored), this is limited to hardware only. All software applicable to Z-10 are completely indigenously developed by China on its own. Reportedly, the most time consuming part of the software engineering for Z-10 was to develop all of the mathematic models needed for Z-10. Instead of using French standard DIGIBUS, Z-10 is built to Chinese GJV289A standard, the Chinese equivalent of MIL-STD-1553B. The adaptation of western military standard means that western weaponry can be readily deployed on Z-10, and the developer claims that all it needed was to add a module or interface to accomplish this. The ease of being compatible with multiple weaponry would also help to expand the export market of Z-10 in the future.

Z-19 Harbin (Black Whirlwind) Chinese Attack Helicopter

Tiers:

FLIR: Yes

Helmit Mounted Sights (HMS): Yes

Notes:

The Z-19 is a Chinese light scout and observation helicopter. It was locally developed by Harbin. It was a China's attempt to develop a modern and capable helicopter. The whole development programme was kept in high secrecy. The Z-19 is esentially a tandem-seat version of the Z-9W, which in turn is a license-built version of the Eurocopter AS365 Dauphin. However this helicopter also shares some resemblance with the Japanese OH-1. The Z-19 made its first flight in 2011 and was publicly revealed in 2012. This helicopter is in service with Chinese army aviation regiment. It operates alongside the dedicated Z-10 attack helicopter. The Z-19 is lightly armored. Both pilots are seated on crash-resistant seats. This scout and observation helicopter is equipped with a nose-mounted FLIR, TV and laser rangefinder. The Z-19 is an updated modified version of the Harbin Z-9W (similar to the development of the Bell AH-1 Cobra from the UH-1). It is a twin-seat tandem helicopter using mechanical components derived from the Eurocopter AS365 Dauphin series, as the Z-9 series are licence-built versions of the Dauphin. The Z-19 features a fenestron tail, reducing the noise level and therefore allowing it to achieve some level of acoustic stealthiness. The exhausts have also been designed to reduce the infrared signature. The helicopter is equipped with a millimeter wave fire control radar. Unlike most other attack helicopters, it lacks a nose-mounted machine gun or autocannon. The Z-19 also features armor plating, crash-resistant seats, and a turret with FLIR, TV, and laser rangefinder. It is also equipped with advanced helmet mounted sight (HMS), which looks different from that of the CAIC WZ-10. The general designer of the WZ-19 was Wu Ximing (□□□) of the 602nd Research Institute, one of the Chinese top scientists involved in the 863 Program, after graduating from Nanjing University of Aeronautics and Astronautics in 1984. Wu had earlier participated in the designs of the armed version of the transport helicopters Z-8A, Z-11 and WZ-9. He also participated in the development and flight testing of another Chinese attack helicopter, the CAIC WZ-10. At the 9th Zhuhai Airshow held in November 2012, Aviation Industry Corporation of China formally announced the official names of the WZ-10 and WZ-19 at a televised news release conference, with both attack helicopters named after fictional characters in the Water Margin, one of the Four Great Classical Novels of Chinese literature. WZ-10 is named as Lighting fire (Pili Huo, □□□), the nickname of Qin Ming, while WZ-19 is named as Black Whirlwind (Hei Xuanfeng, □□□), the nickname of Li Kui. Harbin is developing the Z-19, which is expected to function and support with a heavier attack helicopter, the CAIC WZ-10, in the near future. Export variants will be designated WZ-19 (Wǔzhuāng Zhíshēngjī, □□□□□ - attack helicopter), but aircraft used in China will be designated Z-19 as WZ is used by the PLAAF for UAVs (WZ - Wúrén Zhēnchá, □□□□ (Unmanned Reconnaissance)).

Mi-28 (Havoc) Russian Attack Helicopter

Tiers:

Variants:

- **Mi-28N/MMW Havoc:** All weather day-night version adopted by Russian military in 2009. Equipped with a top-mounted millimeter wave radar, thermographic camera-TV, and a laser rangefinder. Powered by two Russian Klimov TV3-117VMA-SB3 engines (2,500 hp each), produced by the Ukrainian Motor-Sich and replaced by Russian-made VK-2500 engines as of 2016. Max takeoff weight: 11,500 kg, max payload: 2,350 kg.
- **Mi-28NE:** Export version of the Mi-28N. In service with the Iraqi and Algerian Air Force. In August 2018, the Russian Helicopters unveiled an upgraded Mi-28NE variant, with improvements made in the main rotor system and engine unit and new on-board radio-electronic equipment.
- **Mi-28NM:** An upgraded version of the Mi-28N under development since 2009. The helicopter has redesigned nose hull due to removal of its nose antenna, new H025 radar station for all-round visibility, more powerful Klimov VK-2500 engines instead of the previous Klimov TV3-117VMA engines and improved rotor blades to increase its maximum speed by 13% and cruise speed by 10%.
- **Mi-28D:** Simplified daylight operation version. Similar to Mi-28N, but without top-mounted radar and FLIR
- **Mi-28NAe:** Export version offered to North Korea
- **Mi-40:** Proposed armed transport version. Never reached prototype stage.
- **Mi-28UB:** (Učebno-Bojevoj – training-and-combat) version, designed for training for Mi-28N. Has dual hydromechanical flight controls that can be operated from tandem cockpits, a more spacious lower cockpit to house a flight instructor, a wider pilot canopy, and new energy-absorbing crew seats. Serves as a trainer but can perform attack helicopter tasks.
- **Mi-40:** The Mil Mi-40 was a projected utility version of the Mi-28, first initiated in 1983, announced in 1992 and shown at the Moscow Airshow in 1993. It was primarily intended for the "Aerial Infantry Fighting Vehicle" category as a successor to the Mil Mi-24 and Mi-8 assault helicopters.

System

Alternative Designation: Mil Mi-28
Manufacturer: Mil
In Service: 1982-Present
Type: Attack Helicopter
Function: new-generation attack helicopter that functions as an air-to-air and air-to-ground partner for the Mi-24 Hind and Ka-50 Hokum.

Crew: ea2 1 pilot, 1 WSO)

Passenger Capacity: ea3

Blades, Main Rotor: 5

Blades, Tail Rotor: ea4

Number of Main Engines: ea2

Day/Night Capable: Yes

All Weather Capable: Yes

Number of Hard Points: Two pylons under each stub wing to mount bombs, rockets, missiles, and gun pods.

Radar Type: Arbalet millimeter-wave radar

Pilot HUD: Yes

Cockpit Type: Tandem, stepped-up cockpits

Note #1: The Mil Mi-28 is capable of auto-hover and hover/heading lock-in attack mode

Note #2: For anti-armor missions the Mi-28 can be equipped with Ataka, Shturm-V or Vikhr anti-tank guided missiles.

Dimensions

Length: m16.85

Length, with rotors revolving: m21.16

Width: m4.81

Height: m3.82

Rotor Diameter: m17.20

Weight, Full Load: kg11,500

Weight, Normal: kg10,400

Weight, Empty: kg7,890

Weight, Combat Load: kg638

Weight, Maximum Combat Load: kg1,605

Automotive

Engine Name: Two(2) x Klimov TV3-117

Engine Type: Turboshaft engines

Engine Power: hp2,200 hp each

Speed, Maximum: km/h282

Speed, Cruise: km/h260

Ceiling, Hovering: m3,450

Ceiling, Service: m5,750

Range, Normal Takeoff Weight: km460

Range, Ferry with Drop Tanks: km1,105

Endurance: hours2

G Limits: G+3 -0.5

Fuel Capacity, Internal: kg1,337

Drop Tanks: ea4

Drop Tanks Total Fuel Capacity: kg445

Landing Gear: non-retractable tricycle tail-wheel type landing gear.

Communications

UHF Radio: Yes

VHF Radio: Yes

IFF Capabile: Yes

Chin Mounted Gun

Note: The Mi-28 is equipped with a chin-mounted NPPU-28 turret with 30 mm automatic Shipunov 2A42 autocannon.

↳*System*

Name: Shipunov 2A42, 30mm Autocannon

Caliber: mm30

Manufacturer: Tulamashzavod

Proliferation: Widely Proliferated

Total Length: mm3,027

Number of Barrel: ea1

Barrel Length: 2,416

Weight: kg115

Max Rate of Fire (Low): 200-300 rds/min

Max Rate of Fire (High): 550-800 rds/min

Maximum Firing Range: m4,000

Effective Firing Range: m2,000

Action: Gas-operated

Feed System: Twin Feed

↳*Ammunition (Option 1)*

Name: M929

Type: APFSDS-T

Caliber: mm30

Cartridge: 30mm × 165mm

Muzzle Velocity: m/s1,260

Basic Load: ea300

Note #1: A sub-caliber fin-stabilized discarding sabot round with tracer from Belgian Mecar, with tungsten alloy

penetrator. Penetration: 50 mm RHA steel at 60 degree impact at 1,000 m range

Note #2: Rounds from High Explosive Incendiary (HEI) to Armour-Piercing Discarding Sabot (APDS) can be used.

Wing Mounted Weapons

↳*Rocket System*

Name: B-13L Rocket Pod

Type: Rocket Pod

Basic Load: 2 x Rocket Pods

Length: mm3560

Diameter: mm410

Unloaded Weight: kg160

Number of Rockets per Rocket Pod: ea5

Firing Interval: sec0.15

↳*Rocket System Ammunition*

Name: S-13

Type: 122 mm calibre unguided rocket weapon

Proliferation: The S-13 is a 122 mm calibre unguided rocket weapon developed by the Soviet Air Force for use by military aircraft. It remains in service with the Russian Air Force and some other countries.

Length: m2.54

Diameter: mmINA

Muzzle Velocity: m/sINA

Basic Load: ea5 Rockets per B-13L

Launch Weight: kg57

Warhead Weight: kg21

Effective Range: km1.1-3

Penetration: Penetrates 3 m of earth and 1 m of reinforced concrete. On runways it produces a demolition area of 20 m². Velocity 650 m/s.

Note: In total the Mi-28 carries 10 S-13 Rockets (5 Rockets in each B-13L Rocket Pod).

↳*Anti-Tank Guided Missile System (Option 2)*

Name: Shturm

Type: ATGM

In Service: 1976-Present

Basic Load: ea8

Missile Length: mm1,630

Missile Diameter: mm130

Fin Span: mm360

Missile Weight: kg31.4

Warhead Type: HEAT

Warhead Weight: kg5.3

Guidance System: Radio Guided

Range of Fire: km5

↳***Anti-Tank Guided Missile System (Option 2)***

Name: Ataka (AT-9 Spiral-2)

Type: ATGM

In Service: 1990-Present

Basic Load: ea8

Missile Length: m1.83

Missile Diameter: m0.13

Fin Span: m0.36

Missile Weight: kg42.5

Warhead Type: tandem HEAT, fuel-air explosive, expanding rod

Warhead Weight: kg7.4

Range of Fire: km6

Guidance System: Radio-Guided & Semi-Automatic Command to Line of Sight (SACLOS) guidance

Speed: supersonic

Fire Control

Fire Control System Type: integrated surveillance and fire control system

Fire Control Radar: Yes

Digital or Analog Cockpit: Digital

Direct Fire Control: Yes

Laser Designator: Yes

Laser Rangfinder: Yes

Automated Helmet: Yes, target designation and indication system

Sights: TV Channel, Thermal, EO

GPS: Yes

Navigation: Integrated Inertial Navigation

Night Vision Compatible Cockpit: Yes

Protection

Crew Compartment Armor: It withstands hits from 12.7 mm armor-piercing rounds and 20 mm HE-FRAG rounds. It is claimed that this helicopter can not be defeated by a single short-range anti-aircraft missile.

Windsheild: Protection from 7.62 and 12.7 mm armor piercing bullets and 20 mm shell fragments.

Warning System: Mak IR Warnign System

NBC Protection: Yes

EW: INA

Counter Measures (Chaff/Flares): Yes, UV-26 flares

IR Sensors: Yes, 2 x fixed IR sensors

IR Suppressors: Yes

Jammer System: Platan Jammer

Radar Warning System: Yes

Laser Warning System: Yes

Energy Absorbing Seats: Yes

Parachute Escape System: Yes, in a hatch on the port side to the rear of the wing

Notes:

Mi-28 Havoc attack aircraft interdictor technical data sheet specifications intelligence description information identification pictures photos images video Mil Russia Russian Air Force aviation air defence industry military technology Description. The Mil Mi-28A/N (NATO reporting name "Havoc") is a Russian all-weather, day-night, military tandem, two-seat anti-armor attack helicopter designed and produced by Mil Moscow Helicopter Plant. It is a dedicated attack helicopter with no intended secondary transport capability, better optimized than the Mil Mi-24 gunship for the role. Design work on the Mi-28 began under Marat Tishchenko in 1981, and the first prototype was flown on 10 November 1982. The Mi-28 program was cancelled in 1993 because it was deemed uncompetitive with the Ka-50, and in particular, it was not all-weather capable. The Mi-28 is a new-generation attack helicopter that functions as an air-to-air and air-to-ground partner for the Mi-24 Hind and Ka-50 Hokum. The five-blade main rotor is mounted above the body midsection, short, wide, tapered, weapon-carrying wings are mounted to the rear of the body midsection. Two turboshaft engines in pods are mounted alongside the top of the fuselage with downturned exhausts. The fuselage is slender and tapers to the tail boom and nose. It features tandem, stepped-up cockpits, a cannon mounted beneath the belly, and a non-retractable tricycle tail-wheel type landing gear. Due to the energy-absorbing landing gear and seats the crew can survive a vertical fall of up to 12 m/s. The Mi-28 has a fully armoured cabin, including the windshield, which withstands 7.62 and 12.7 mm armor piercing bullets and 20 mm shell fragments. The helicopter design is based on the conventional pod and boom configuration, with a tail rotor. The main rotor head has elastomeric bearings and the main rotor blades are made from composite materials. The tail rotor is designed on a biplane configuration, with independently controlled X-shaped blades. A new design of all-plastic rotor blades, which can sustain 30 mm shells, is installed on the Mi-28N night attack variant. It is equipped with two heavily armored cockpits, a windshield able to withstand 12.7–14.5 mm caliber bullets, in-nose electronics, and a narrow-X tail rotor (55 deg), with reduced noise characteristics. It is powered by two 2,200 hp Isotov TV-3-117VM (t/n 014) turboshaft engines. While the Mi-28 is not intended for use as a transport, it does have a small passenger compartment capable of carrying three people. The planned purpose of this is the rescue of downed helicopter crews. The Mi-28N features a helmet mounted display for the pilot. The pilot designates targets for the navigator/weapons officer, who proceeds to fire the weapons required to fulfill that particular task. The integrated surveillance and fire control system has two optical channels providing wide and narrow fields of view, a narrow-field-of-view optical television channel, and laser rangefinder. The system can move within 110 degrees in azimuth and from +13 to −40 degrees in elevation. The night attack variant helicopter retains most of the structural design of the original Mi-28. The main difference is the installation of an integrated electronic combat system. Other modifications include: new main gearbox for transmitting higher power to the rotor, new high-efficiency blades with swept-shaped tips, and an engine fuel injection control. The pilot uses a helmet-mounted target designator, which allocates the target to the navigator's surveillance and fire control system. The navigator/weapons officer is then able to employ guided weapons or guns against the target. The targeting system follows the direction of the pilot's eyes. Russia's military rotary-wing aircraft fleet has been fully refitted with new night vision goggles (NVG). Mil Mi-28N attack helicopters of the Russian Aerospace Forces (VKS) received GEO-ONV1-family NVGs.

Ka-50 Black Shark (Hokum A) Russian Attack Helicopter

Tiers:

Variants:

- **Kamov V-80:** Prototype version for Ka-50.
- **Kamov Ka-50:** Single-seat version.
- **Kamov Ka-50N:** Ka-50 with night attack capability.
- **Kamov Ka-50Sh:** Ka-50 with improved night attack capability.
- **Kamov Ka-50-2 "Erdogan":** Version with a two-seat tandem cockpit.
- **Kamov Ka-52 "Alligator":** Highly upgraded version with a two-seat side-by-side cockpit for the Russian Air Force.
- **Kamov Ka-52K "Katran":** Naval version with folding blade and reinforced landing gear, wing shortened for basing on ships and the possibility of using Kh-35 anti-ship missile.

System

Alternative Designation: Kamov Ka-50 "Black Shark", Hokum A
Type: single-seat attack helicopter
Manufacturer: Kamov
In Service: 1995-Present
Crew: ea1
Blades, Main Rotor: Each rotor has three blades with swept tips
Blades, Tail Rotor: No tail rotor necessary in this configuration
Number of Engines: ea2
Day/Night Capable: The Ka-50N Night Shark was developed to overcome the challenges of operating at night that the ka-50 has.
All Weather Capable: Yes
Takeoff or Landing Limitations: INA
Number of Hard Points: 4 (6 on Ka-52) under-wing hardpoints, plus 2 on wingtips for countermeasures or air-to-air

missiles with a capacity of 2,000 kg

Digital Autopilot: Yes

Maximum Pylons Capacity: 2,300 kg

Landing Gear: Two-wheel nose landing gear retracts to the rear under the cockpit

Note #1: The lack of a tail rotor enables the aircraft to perform flat turns within the entire flight speed range

Note #2: If the Ka-50 is to operate at night, it must be equipped with a Saturn night targeting pod. This pod takes up one of the underwing pylons

Dimensions

Length with Rotors: m16

Rotor Diameter: m14.50

Wingspan: m7.30

Height: m4.90

Weight, Empty: kg7,692

Weight, Takeoff Normal: kg9,800

Weight, Takeoff Maximum: kg10,800

Disc Area: 330.4 m sq

Automotive

Engine Name: 2 x turboshaft Klimov TV3-117VMA

Engine Type: Turboshaft

Engine Power: 2,200 shaft hp each

Speed, Maximum Level: km/h315

Speed, Maximum Dive: km/h350

Speed, Cruise: km/h270

Speed, Backwards: km/h90

Speed, Sideways: km/h70

Range, Combat Radius: km250

Range, Normal Radius: km460

Range, Ferry: km1,160

Climb Rate: 600 m/min

Ceiling Hover: m4,000

Ceiling Service: m5,500

Load Factor: 3.5 g (max vertical)

Endurance: 3 Hours

Communications

Radio: INA

Chin Mounted Gun

↳*System*

Name: Shipunov 2A42,

Type: 30mm Autocannon

Manufacturer: Tulamashzavod

In Service: 1980-Present

Length: m3.027

Barrel Length: mm2,416

Barrels: ea1

Action: Gas-operated

Rate of Fire, Low: 200 to 300 rds/min

Rate of Fire, High: 550-800 rds/min (high)

Effective Firing Range (AP-t): m2,000

Maximum Firing Range (HEI): m4,000

Feed System: Twin Feed

↳*Ammunition*

Name: 3UOF8

Type: HEI

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s960

Basic Load: ea2,000

Armor Penetration: INA

Projectile Weight: grams389

Bursting Charge: grams49

Note: A high-explosive incendiary round with A-670M nose fuze.[10] The fuze produces a 0.15 millisecond delay on impact, and a self-destruct mechanism detonating the projectile after 7.5 to 14.5 seconds of flight (3900–5300 m distance from muzzle).

Wing Mounted Weapons

Note: The Ka-50 can also be outfitted with the Kh-25MP (AS-12 Kegler) Missile and FAB 500 or tactical dispensers

↳*Rocket System*

Name: S-8 Rocket

Type: Rocket

Rocket Pod Type: B series of rocket pods, carrying either seven or 20 rockets.

Number of Rocket Pods: ea4

Rocket Length: m1.56

Rocket Diameter: mm80

Launch Weight: kg11.5

Warhead Type: HEAT

Warhead Weight: kg3.6

Basic Load: ea80 separate S-80 Rockets in four B-8 Series Rocket Pods

Maximum Effective Range: km4

Minimum Effective Range: km1.3

Speed: m/s692

Armor Penetration: 350 mm versus RHA

Fuze Type: N-26A fuze

Motor: BIK-2D motor powder

↳*Missile System*

Name: R-60 Missile (AA-8 Aphid")

Type: Short-range lightweight infrared homing air-to-air missile

In Service: 1974-Present

Manufacturer: Vympel

Length: mm2,090

Diameter: mm120

Wingspan: mm390

Basic Load: INA

Warhead Type: kg3

Detonation mechanism: Proximity

Engine: Solid-fuel rocket engine

Operational Range: km8

Flight Altitude: m20,000

Speed: Mach 2.7

Guidance System: Infrared Homing

Note: The Ka-50 can also carry the R-73 (AA-11 Archer) Missile

↳*Anti-Tank Guided Missile System*

Name: 9K121 Vikhr (AT-16 Scallion)

Type: Laser-Guided ATGM Missile

In Service: 1985-Present

Length: m2.80

Diameter: mm130

Wingspan: mm380

Missile Weight: kg45

Warhead Type: Tandem HEAT charge

Warhead Weight: kg8-12

Armor Penetration (ERA): mm1,000

Basic Load: ea12

Detonation Mechanism: Proximity and Impact

Engine: Solid-fuel rocket

Propellant: Sold Fuel

Operational Range: km10-12

Speed: m/s600

Guidance System: Laser beam riding

Note: The KA-50 can also carry 9M120 Ataka (Spiral-2) ATGMs.

Fire Control

Fire Control System Type: INA

Fire Control Radar: Millimetre wave radar

Digital or Analog Cockpit: Digital

Direct Fire Control: Yes

Laser Designator: Yes

Laser Rangefinder: Yes

Night Vision: electro-optical sight; takes one pylon slot

Position Location System: Yes

IFF: Yes, Slap Shot System

Heads Up Display (HUD): Yes

Helmet-Mounted Display: Yes

Data Link: Yes, with ground units

Protection

Armor: protection against 12.7-mm armor-piercing bullets and 23-mm projectile fragments

Cockpit Glass: INA

Stealth Properties: No

Heat Signature Reduction: Yes, Exhaust infrared (IR) suppressors

Add on Armor: INA

NBC Protection: Yes

EW Counter System: Yes

Counter Measures (Chaff/Flares): Yes, launchers in wingtip pods

Ejection System: K-37-800 rocket-assisted

Automatic Fire Suppression System: Yes

Note #1: Extensive provision of steel armor adds 770 lb (350 kg) to aircraft weight.

Note #2: Armored, self-sealing composite fuel cells are buried in the fuselage.

Notes:

The Ka-50, also nicknamed the Chernaya Akula (Black Shark) was a Soviet attack helicopter. Its NATO reporting name was Hokum. The Ka-50 was planned as a rival to the Mi-28 in a competition to provide the Soviet armed forces with a new battlefield attack helicopter. Kamov opted for a single-crew layout to save weight for more armor, more powerful armament, and a greater number of advanced sensors. The first of three V-80 prototypes made its maiden flight on 17 June 1982. In October 1986 the Ka-50 was selected for production. With the collapse of the Soviet Union, Russia faced military budget cuts. Production of the original Ka-50 was stopped with only around 10 of these helicopters ever built. In 2000 a pair of production Ka-50 helicopters was used during the Second Chechen War, where these gunships were basically tested by the Russian military to evaluate the type. However the original Ka-50 never reached full operational capability. If the Ka-50 is to operate at night, it must be equipped with a Saturn night targeting pod. This pod takes up one of the underwing pylons.

AH-1W Super Cobra American Attack Helicopter

Tiers:

Variants:

- **AH-1J SeaCobra:** Original twin engine version.
- **AH-1J International:** Export version of the AH-1J SeaCobra.
- **AH-1T Improved SeaCobra:** Improved version with extended tail boom and fuselage and an upgraded transmission and engines.
- **AH-1(4B)W Viper:** "Four-Bladed Whiskey" test version with a four-bladed bearingless composite main rotor based on Bell 680 rotor. A prototype was converted from AH-1T 161022.
- **AH-1Z Viper:** A new variant nicknamed "Zulu Cobra", and developed in conjunction with the UH-1Y Venom for the H-1 upgrade program. The variant includes an upgraded four-blade main rotor and adds the Target Sight System (TSS).
- **Bell 309 KingCobra:** Experimental all-weather version based on the AH-1G single-engine and AH-1J twin-engine designs.[36] Two Bell 309s were produced; the first was powered by a PW&C T400-CP-400 Twin-Pac engine set and the second was powered by a Lycoming T-55-L-7C engine.
- **CobraVenom:** Proposed version for the United Kingdom.
- **AH-1RO Dracula:** Proposed version for Romania.
- **AH-1Z King Cobra:** AH-1Z offered for Turkey's ATAK program; selected for production in 2000, but later canceled when Bell and Turkey could not reach an agreement on production.
- **Panha 2091:** Unlicensed Iranian upgrade of AH-1J International.
- **IAIO Toufan:** Iranian copy / re-manufactured AH-1J International by Iran Aviation Industries Organization, with locally sourced avionics, and weapons.

Chin Mounted Gun

↳*System*

Name: M61 Vulcan

Type: Hydraulically, electrically or pneumatically driven, six-barrel, air-cooled, electrically fired Gatling-style rotary cannon

Caliber: mm20

Manufacturer: General Dynamics

In Service: 1946-Present

Length: m1.827

Weight, With Feed System: kg112

Weight, Without Feed System: kg92

Barrels: 6-barrel (progressive RH parabolic twist, 9 grooves)

Action: Hydraulically operated, electrically fired, rotary cannon

Rate of Fire, M61A1: rds/min6,000

Rate of Fire, M61A2: rds/min6,600

Feed System: Belt or linkless feed system

Note #1: The turret can pivot to both sides of the helicopter, as well as up and down.

Note #2: The Super Cobra can carry additional pods with miniguns on stub wings.

↳*Ammunition*

Name: M53

Type: HEI

Caliber: mm20

Cartridge: 20×102 mm

Muzzle Velocity: m/s1,050

Basic Load: round750

Armor Penetration: 6.4 mm (0.25 in) RHA penetration at 0 degree impact angle and 1,000 m (3,300 ft) range

Note: The M61 Vulcan can also fire M56A3/A4 and PGU-28A/B 20mm rounds

Wing Mounted Weapons

Additional Weapons the AH-1H can carry: 8 x AGM-71 TOW anti-tank missiles; or 2 x AGM-122 Sidearm anti-radar missiles; or 8 x AGM-114 Hellfire anti-tank missiles; or 4 x CMU-55B fuel-air explosive weapons; or 16 x 5-in (127-mm) Zuni rockets; or 4 x 78 gal (295-liter) auxiliary fuel tanks; or 2 x 100 gal (378-liter) auxiliary fuel tanks

Anti-Tank Guided Missile System

Name: AGM-114 Hellfire

Type: Anti-Tank Guided Missile (ATGM)

Manufacturer: Lockheed Martin, Boeing (previous second source), and Northrop Grumman (seeker only for AGM-114L Longbow Hellfire)

In Service: 1984-Present

Length: m1.6

Wingspan: mm330

Diameter: mm180

Weight: kg45-49

Warhead Type: High-explosive anti-tank (HEAT)

Engine: Solid-fuel rocket

Operational Range: 0.499–11.008 km

Speed: Mach 1.3

Guidance system: Semi-active laser homing millimeter wave radar seeker

Launch Platform: Rotary- and fixed-wing platforms, unmanned combat air vehicles, tripods, ships, and ground vehicles

Basic Load: ea4 ea, one on each hardpoint

Note: The Super Cobra is also armed with Hellfire or TOW anti-tank guided missiles. It can actually carry both types of missiles on the same mission.

↳*Air-to-Air Missile*

Name: AIM-9 Sidewinder

Type: short-range air-to-air missile

Length: m3.02

Diameter: mm127

Wingspan: mm279.4

Manufacturer: Raytheon Company[1] Ford Aerospace Loral Corp.

In Service: 1956-Present

Weight: kg85.3

Warhead Type: WDU-17/B annular blast-frag

Warhead Weight: kg9.4

Detonation Mechanism: IR proximity fuze

Engine: Hercules/Bermite Mk. 36 Solid-fuel rocket

Operational Range: 1.0 to 35.4 km

Speed: Mach 2.5

Guidance system: Infrared homing (most models) semi-active radar homing (AIM-9C

↳Launch platform: Aircraft, naval vessels, fixed launchers, and ground vehicles

Basic Load: 4 ea, one on each hardpoint

Note: The Super Cobra can also carry AIM-92 Stinger short-range air-to-air missiles, and AGM-122 Sidearm anti-radiation missiles. This gunship also has provision for AGM-65 Maverick air-to-ground missiles.

↳*Rockets and Bombs*

Note: The SuperCobra can also carry various pods with unguided rockets, cluster munitions, napalm bombs

Fire Control

Fire Control System: Yes

Fire Control Radar: Yes, type INA

Digital or Analog Cockpit: INA

Direct Fire Control: Yes

Laser Designator: Yes

Laser Rangefinder: Yes

Sensor Suite(s) Available: Yes, low speed air data sensor

Position Location System: Yes

Forward-Looking Infra-Red (FLIR): Yes

TV Camera: Low-light TV camera

Autotrack System: Yes

Night Targeting System (NTS): Yes

Thermal Sights: thermal sights and a FLIR to allow for acquisition, launch, and tracking of all types of TOW missiles in all weather conditions

Digital Ballistic Computer: Yes

Heads Up Display: Yes

Navigation: Doppler navigation

In Flight Boresighting: Yes

Protection

Fuselage Type: The Super Cobra has a slim fuselage with a fighter-type cockpit

Cockpit Protection: The cockpit is surrounded by armor protection. Armored cockpit can withstand small arms fire.

Tailboom Protection: Tail boom are able withstand damage from 23-mm cannon hits.small arms fire, and composite blades and tailboom able to withstand damage from 23-mm cannon hits.

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW: INA

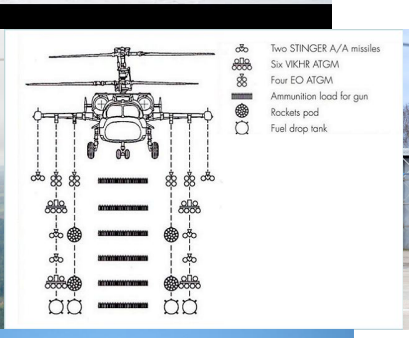
EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): AN/ALE-39 Chaff system and SUU-4/1 Flare dispensers

Notes:

The Bell AH-1 Super Cobra is a twin-engine attack helicopter based on the United States Army's single-engine AH-1 Cobra. The twin Cobra family, itself part of the larger Huey family, includes the AH-1J Sea Cobra, the AH-1T Improved Sea Cobra, and the AH-1W Super Cobra. The AH-1W, the backbone of the United States Marine Corps's attack helicopter fleet for decades, is being replaced by the next generation Bell AH-1Z Viper. The Super Cobra was the first attack helicopter to qualify both the Sidewinder air-to-air missile and the Sidearm anti-radiation missile. Both missiles can use the same LAU-7 rail launcher. Sidearm has a range of more than 15km. AIM-9L Sidewinder is an all-aspect, short-range, air-to-air missile produced by Lockheed Martin and Raytheon. The missile has a range of 15km. A major upgrade of the Bell Super Cobra known as the H-1 program is underway. The program calls for the re-manufacture of the US Marine Corps fleet of 180 AH-1W Super Cobra and 100 UH-1N utility helicopters to an advanced four-bladed configuration, which will operate to beyond 2020.

Ka-52 Alligator (Hokum B) Russian Attack Helicopter



Tiers:

Variants:

- **Kamov V-80:** Prototype version for Ka-50.
- **Kamov Ka-50:** Single-seat version.
- **Kamov Ka-50N:** Ka-50 with night attack capability.
- **Kamov Ka-50Sh:** Ka-50 with improved night attack capability.
- **Kamov Ka-50-2 "Erdogan":** Version with a two-seat tandem cockpit.
- **Kamov Ka-52 "Alligator":** Highly upgraded version with a two-seat side-by-side cockpit for the Russian Air Force.
- **Kamov Ka-52K "Katran":** Naval version with folding blade and reinforced landing gear, wing shortened for basing on ships and the possibility of using Kh-35 anti-ship missile.

System

Alternative Designation: Ka-52 Alligator; Kamov Ka-52 Alligator ; Hokum B
Type: Two-seat version of the Ka-50
Mission: Reconnaissance, target designation and assignment, ground communications and combat support
Manufacturer: Kamov
In Service: 2008-Present
Crew: ea2 (pilot, weapons officer)
Blades, Main Rotor: Each rotor has three blades with swept tips

Blades, Tail Rotor: No tail rotor necessary in this configuration

Number of Engines: ea2

Day/Night Capable: Yes, unlike the Ka-50 which is very restricted when operating at night

All Weather Capable: Yes

Takeoff or Landing Limitations: INA

Number of Hard Points: 6 total (1 inner, 1 middle, 1 tip on each wing)

Digital Autopilot: Yes

Maximum Pylons Capacity: 2,300 kg

Landing Gear: Two-wheel nose landing gear retracts to the rear under the cockpit

Autonomous Mode Capable: Yes

Note #1: The lack of a tail rotor enables the aircraft to perform flat turns within the entire flight speed range

Dimensions

Length, with Rotors: m16

Length, without Rotors: m13.53

Rotor Diameter: m14.50

Wingspan: m7.34

Height: m4.95

Weight, Empty: kg8,550

Weight, Takeoff Normal: kg10,400

Weight, Takeoff Maximum: kg12,500

Disc Area: 330.4 m sq

Payload Capacity: kg2,800

Rotor Payload: 37.80 kg/sq m

Power Payload: 2.84 kg/hp

Pylons: 6 total (1 inner, 1 middle, 1 tip on each wing)

Pylons Maximum Load: kg2,000

Automotive

Engine Name: 2 x turboshaft Klimov TV3-117VMA-SB3

Engine Type: Turboshaft

Engine Power: 2,400 shaft hp each

Speed, Maximum Level: km/h310

Speed, Maximum Dive: km/h350

Speed, Cruise: km/h270

Speed, Backwards: km/h90

Speed, Sideways: km/h80

Range, Combat Radius: km250

Range, Normal Radius: km520

Range, Ferry: km1,200

Climb Rate: 480 m/min

Ceiling Hover: m3,600

Ceiling Service: m5,500

Load Factor: 3.5 g (max vertical)

Endurance: INA

Communications

Radio: INA

Chin Mounted Gun

↳*System*

Name: Shipunov 2A42,

Type: 30mm Autocannon

Manufacturer: Tulamashzavod

In Service: 1980-Present

Length: m3.027

Barrel Length: mm2,416

Barrels: ea1

Action: Gas-operated

Rate of Fire, Low: 200 to 300 rds/min

Rate of Fire, High: 550-800 rds/min (high)

Effective Firing Range (AP-t): m2,000

Maximum Firing Range (HEI): m4,000

Azimuth: -2 deg 30 min to 9 deg

Elevation: -37 deg to 3 deg 30 min

Feed System: Twin Feed

↳*Ammunition*

Name: 3UOF8

Type: HEI

Caliber: mm30

Cartridge: 30 × 165

Muzzle Velocity: m/s960

Basic Load: ea460

Armor Penetration: INA

Projectile Weight: grams389

Bursting Charge: grams49

Note: armor-piercing and high-fragmentation incendiary, pilot/gunner selectable

Wing Mounted Weapons

Note: The ka-52 can also equip: INNER PYLON Rockets: B-8 V-20 80-mm rocket pod carrying 20 S-80 rockets Bombs: UPK-23-250 250-kg FAB-250 bomb 500-kg FAB-500 bomb 500-kg KAB-500Kr bomb KMGU cluster bomb Anti-Radar: Kh-25MP (AS-10 Kegler) missile MIDDLE PYLON: Anti-Tank: 6 x Vikhir-M (AT-9 Whirlwind) laser-guided missiles Rockets: B-8 V-20 80-mm rocket pod carrying 20 S-80 rockets B-13 122-mm rocket pod carrying 5 S-13 rockets Bombs: 250-kg FAB-250 bomb 500-kg FAB-500 bomb 500-kg KAB-500Kr bomb KMGU cluster bomb Other: ECM/aiming containers fuel tank aiming stations for Ka-50 TIP PYLON: Anti-Air: 2 or 4 Igla-V (SA-16 Gimlet)

↳*Rocket System*

Name: S-8 Rocket

Type: Rocket

Rocket Pod Type: B series of rocket pods, carrying either seven or 20 rockets.

Number of Rocket Pods: ea4

Rocket Length: m1.56

Rocket Diameter: mm80

Launch Weight: kg11.5

Warhead Type: HEAT

Warhead Weight: kg3.6

Basic Load: ea80 separate S-80 Rockets in four B-8 Series Rocket Pods

Maximum Effective Range: km4

Minimum Effective Range: km1.3

Speed: m/s692

Armor Penetration: 350 mm versus RHA

Fuze Type: N-26A fuze

Motor: BIK-2D motor powder

↳*Missile System*

Name: R-60 Missile (AA-8 Aphid")

Type: Short-range lightweight infrared homing air-to-air missile

In Service: 1974-Present

Manufacturer: Vympel

Length: mm2,090

Diameter: mm120

Wingspan: mm390

Basic Load: INA

Warhead Type: kg3

Detonation mechanism: Proximity

Engine: Solid-fuel rocket engine

Operational Range: km8

Flight Altitude: m20,000

Speed: Mach 2.7

Guidance System: Infrared Homing

Note: The Ka-52 can also equip R-73 X-25ML (AA-11 Archer) missiles

↳ ***Anti-Tank Guided Missile System***

Name: 9K121 Vikhr (AT-16 Scallion)

Type: Laser-Guided ATGM Missile

In Service: 1985-Present

Length: m2.80

Diameter: mm130

Wingspan: mm380

Missile Weight: kg45

Warhead Type: Tandem HEAT charge

Warhead Weight: kg8-12

Armor Penetration (ERA): mm1,000

Basic Load: ea12

Detonation Mechanism: Proximity and Impact

Engine: Solid-fuel rocket

Propellant: Sold Fuel

Operational Range: km10-12

Speed: m/s600

Guidance System: Laser beam riding

Note:

Fire Control and Electronics

Fire Control System Type: Samshit-E system

Fire Control Radar: Arbalet Radar

Sighting System: Shkval electro-optical sighting system

Digital or Analog Cockpit: Digital

Direct Fire Control: Yes

Laser Designator: Yes

Laser Rangefinder: Yes

Night Vision: Samshit-E optics

Position Location System: Yes

IFF: Yes, Slap Shot System

Heads Up Display (HUD): Yes

Helmet-Mounted Display: Yes, TopOwl helmet-mounted sight display

Data Link: Yes, with ground units

Infrared Camera: Yes

Flight Computer: Multi-level digital flight computer

Navigation System: Nadir-10 navigation system

Autonomous Mode Capable: Yes

Radar Warning Receiver: Pastel (L-150) radar warning receiver

Laser Warning System: Mak (L-136) infrared and Otklik (L-140) laser warning systems

Turett Sensor: GOES-451 sensor

Protection

Armor: protection against 12.7-mm armor-piercing bullets and 23-mm projectile fragments

Cockpit Glass: INA

Stealth Properties: No

Heat Signature Reduction: Yes, Exhaust infrared (IR) suppressors

Add on Armor: INA

NBC Protection: Yes

EW Counter System: Yes, passive and active electronic warfare systems

Counter Measures (Chaff/Flares): Yes, can be loaded on pylons as required

Decoys: 23-mm rejector pods loaded on tip pylons as required, 32 decoys per pod

Ejection System: K-37-800 rocket-assisted

Automatic Fire Suppression System: Yes, autonomous fire-extinguishing system

Blast Proof Fuel Tanks: Yes

Note #2: Armored, self-sealing composite fuel cells are buried in the fuselage.

Notes:

The Kamov Ka-52 "Alligator" (Hokum-B) is an upgraded form of the original Ka-50 "Hokum" attack helicopter line. While the Ka-50 utilized a single-seat cockpit, the most notable difference in the new mark is the twin-seat, side-by-side cockpit. Development of this attack helicopter began in 1994 leading to a first flight recorded on June 25th, 1997. While the Ka-52 includes a radar suite, additional crew member, and all-new designation it more or less retains the same form and function as well as armament capabilities of the original. Additionally, the platform supports all-weather, day/night attack environments due to its various upgrades that include FLIR, TV sighting, helmet-mounted sighting, laser rangefinder, and mast-mounted radar antenna. The Ka-52 is billed as an armed reconnaissance and combat platform able to take on the roles of assault, Close-Air Support (CAS), convoy protection, and armed patrolling. The helicopter maintains its weaponry under its short wingstub assemblies which allow for four underwing hardpoints. Onboard countermeasures, including signature reduction features, chaff/flare dispensers, and crew/critical systems armoring enhances battlefield survivability. Each pilot is also afforded K-37-800M shock-absorbing ejection seats. The twin-seat arrangement sports control redundancy meaning either pilot can

manage the flight control aspects of the helicopter. The avionics suite is all-modern (complete with a high level of automation for reduced crew workloads) and the weapons suite flexible to support a broad range of weaponry. Attention has also been given to reduced maintenance and repair times by providing for better accessibility of key systems and components. The Alligator features the Kamov helicopter trademark coaxial main rotors arrangement (2 x three-bladed systems) which eliminate the need for a countering tail rotor unit (this also increased battlefield survivability to an extent). These main rotors are driven by 2 x Klimov VK-2500 series turboshaft engines which support "hot-and-high" operations as well as cold weather service. Performance includes a maximum speed of 300 kmh with a cruising speed nearing 260 kmh. Ferry range is 1,100 kilometers with a combat radius of about 460 kilometers. Its operational service ceiling reaches 5,500 meters. The Ka-52 carries a 30mm 2A42-1 cannon along the starboard side of its fuselage. There is limited traversal given which requires the pilots to position the entire aircraft in the direction of fire but overall accuracy is said to be better than that of a turreted chin gun seen in other modern attack helicopters. Beyond this standard installation, the wingstubs of the helicopter support Anti-Tank Guided Missiles (ATGMs), rockets, rocket pods, gun pods, and cannon pods as required. To date, the Ka-52 has only been adopted by the Russian Air Force with possible plans to feature it in the Russian Navy as well dependent upon successful procurement of a new amphibious warship / helicopter carrier. The Air Force is planning on a Ka-52 stock of 140 helicopters with the Navy adding a possible 40 more units.

Mi-24 (Hind) Russian Attack Helicopter

Tiers:

Variants:

- **V-24:** The first version, twelve prototypes and development aircraft. The first V-24 mockup resembled the Bell UH-1A Huey. Later models resembled the future Hind-A, one of which was modified in 1975 as A-10 for speed record attempts with wings removed and faired over and with inertia-type dampers on the main rotor head. The A-10 reached a speed of 368 km/h. It was armed with GSh-23 and could carry up to six missiles or rockets.
- **Mi-24:** (Hind-A) Other early versions were the armed assault helicopter, which could carry eight combat troops and three crew members. It could also carry four 57mm rocket pods on four underwing pylons, four MCLOS 9M17 Fleyta (AT-2 Swatter) anti-tank missiles on two underwing rails, free-fall bombs, plus one Afanasev A-12.7 12.7mm machine-gun in the nose. The Mi-24 was the first production model.
- **Mi-24F:** (Hind-A) Modified Hind-A with seven reinforcing ribs on the port fuselage aft of the wing and the SRO-2M Khrom ("Odd Rods") IFF antenna relocated from the canopy to the oil cooler. The APU exhaust was also extended and angled downwards. The designation may be unofficial.
- **Mi-24A:** (Hind-B) The Mi-24A was the second production model. Both the Mi-24 and Mi-24A entered the Soviet Air Forces service in 1972. They Lacked the four-barrel Yak-B 12.7mm machine gun under the nose.
- **Mi-24U:** (Hind-C) Training version without nose gun and wingtip stations.
- **Mi-24BMT:** Small number of Mi-24s converted into minesweepers.
- **Mi-24D (Hind-D):** The Mi-24D was a purer gunship than the earlier variants. It entered production in 1973. The Mi-24D has a redesigned forward fuselage, with two separate cockpits for the pilot and gunner. It is armed with a single 12.7mm four-barrel Yak-B machine-gun under the nose. It can carry four 57mm rocket pods, four SACLOS 9M17 Phalanga anti-tank missiles (a significant enhancement compared to the MCLOS system found on the Mi-24A), plus bombs and other weapons. One Mi-24D was sold to Poland in January 1996 and was used by the WTD 61 in Manching during 1994 for tests with the head of a MIM-23 Hawk missile in place of the chin-mounted gun. This version also had an unidentified modification in the rear cabin window on the starboard side.
- **Mi-24PTRK:** This version was the Mi-24D modification that was used for testing the Shturm V missile system for the Mi-24V.
- **Mi-24DU:** Small numbers of Mi-24Ds were built as training helicopters with doubled controls.
- **Mi-24V:** (Hind-E) Later development which entered production in 1976 and was first seen by the west in the early 1980s. It was armed with the more advanced 9M114 Shturm (AT-6 Spiral). Eight of those missile are mounted on four outer wing pylons. It was the most widely produced version with more than 1,500 made. In Polish service this aircraft is designated Mi-24W. One Mi-24V was referred to as Mi-24T for unknown reasons.
- **Arsenal Mi-24V upgrade:** Ukrainian upgrade for Mi-24V.
- **Mi-24P:** (Hind-F) The gunship version, which replaced the 12.7mm machine-gun with a fixed side-mounted 30mm GSh-30-2K twin-barrel autocannon.
- **Mi-24TECh-24:** Experimental Mi-24P to test abilities for recovery of downed aircraft.

- **Mi-24VP:** (Hind-E Mod) Development of Mi-24V made in 1985 which replaced the machine-gun with twin 23mm autocannons in a movable turret. Entered service in 1989, but only 25 were made before production ended the same year.[2] One Mi-24VP flew with the Delta-H tail rotor of the Mil Mi-28.
- **Mi-24RKhR:** (Hind-G1) NBC reconnaissance model, which is designed to collect radiation, biological and chemical samples. It was first seen during the 1986 Chernobyl disaster. Also known as the Mi-24R, Mi-24RK and Mi-24RKh (Rch).
- **Mi-24RR:** Radiation reconnaissance model derived from the Mi-24R.
- **Mi-24K:** (Hind-G2) Army reconnaissance, artillery observation helicopter.
- **Mi-24VM:** Upgraded Mi-24V with updated avionics to improve night-time operation, new communications gear, shorter and lighter wings, and updated weapon systems to include support for the 9M120 Ataka, Shturm and 9K38 Igla ATGM missiles and a 23mm main gun. Other internal changes have been made to increase the aircraft life-cycle and ease maintenance.
- **Mi-24VN:** (Hind-E) A night-attack version based on an Mi-24V in Mi-24VM Stage 1 configuration.
- **Mi-24PM:** Upgraded Mi-24P using same technologies as in Mi-24VM.
- **Mi-24PN:** PN version has a TV and a FLIR camera located in a dome on the front of the aircraft, and is armed with GSh-23L. The Russian Air Force received 14 Mi-24PNs in 2004
- **Mi-24PS:** Civil police or paramilitary version, equipped with a FLIR, searchlight, loudspeaker PA system and attachments for rappelling ropes.
- **Mi-24V Ecological Survey Version:** Environmental research modification developed by the Polyot Industrial Research Organisation.
- **Mi-24 SuperHind Mk.II:** Modern western avionics upgrade produced by South African company Advanced Technologies and Engineering (ATE)
- **Mi-24 SuperHind Mk.III:** Extensive operational upgrade of the original Mi-24 including weapons, avionics and counter measures.
- **Mi-PSV:** Experimental high-speed helicopter based on the Mi-24. PSV stands for Perspektivny skorostnoi vertolet (Перспективный скоростной вертолёт) – Prospective high speed helicopter). Single-seat streamlined cockpit, unarmed, fitted with experimental main rotors for research into high-speed flight, with a target of increasing the speed of the Mi-28N by 10% and the Mi-35M by 13%
- **Mi-35P:** Russian Helicopters holding has developed a common standard for Mi-24 modernization designated as Mi-35P. The Mi-35P has received the OPS-24N-1L observation-sight system with a third generation long-wave matrix thermal imager, TV camera, and laser rangefinder.
- **Mi-35MV:** Modernized version of Mi-35M with an additional armour and upgraded propulsion and optical systems. It is equipped with a opto-electronic OPS-24N1 surveillance and targeting system
- **Mi-35O:** Export version of the Mi-24VN using a Mexican FLIR camera and a glass cockpit with upgraded avionics. Operated by Mexico only.
- **Mi-35M4:** (AH-2 Sabre) Updated version of the Mi-35M with Israeli avionics for the Brazilian Air Force.
- **Mi-35M2:** Updated version of the Mi-35M for the Venezuelan Army.
- **Mi-35MS:** Flying Command Post variant of the Mi-35M. Operated by the Russian Federal Protective Service (FSO).

System

Alternative Designation: Mil Mi-24 Hind; Mil Mi-35 Hind
Manufacturer: Mil

Chin Mounted Gun

Note: The original Mi-24/Mi-25 was equipped with 1 x 4 barrel 12.7mm gun, which was later replaced with a 23mm twin-barrel cannon

↳*System*

Name: Gryazev-Shipunov GSh-23

Type: twin-barreled 23mm autocannon d

Caliber: 23mm

Manufacturer: KBP Instrument Design Bureau

In Service: 1960-Present

Weight: kg49.2

Length: mm1,387

Barrel Length: mm1,000

Barrels: ea2

Action: Gas Principle

Rate of Fire: rds/min3,400-3,600

↳*Ammunition*

Type: Autocannon Rifle Round

Caliber: mm23

Cartridge: 23x115mm

Muzzle Velocity: m/s715

Basic Load: 450

Armor Penetration: INA

Ammo Types: HEFI, HEI, APT, APE, CC

Wing Mounted Weapons

↳*Rocket System #1 Launcher*

Name: UB-32

Type: 57mm, reusable, 32-salvo rocket pod

Basic Load (UB-32 Rocket Pod): ea2-4

Launcher Length: mm2,080

Launcher Diameter: mm464

Weight, Empty: kg103

Weight, Loaded: kg264

↳*Rocket System #1 Projectile*

Name: S-5M (ARS-57) Rocket

Type: Unguided HE-FRAG

Caliber: mm55

Length: m1.4

Diameter: mmINA

Weight: kg5

Basic Load (S-5 Rockets): ea32

Operational Range: km3-4

Engine: Solid Rocket Motor

Speed: 300 meters in 1.1 seconds

Note #1: Produces 75 Splinters

Note #2: The S-5 is carried in rocket pods, with 4–32 rockets.

↳*Rocket System #2*

Name: S-24 Rocket

Type: Unguided high-velocity airborne rocket

Diameter: mm240

Length: m2.33

Launch Weight: kg235

Warhead Type: blast-fragmentation warhead

Warhead Weight: kg123

Operational Range: km2-3

Basic Load: ea2-4

Proximity Fuze: R-24

Fragmentation Casualty Zone Radius: m300-400

Number of Fragments: 4,000

Penetration: 30mm of armor

Note: The S-24 Warhead detones 3 meters above the ground

↳*Anti-Tank Guided Missile System*

Name: AT-2 Swatter (3M11/9M17)

Type: Anti-Tank Guided Missile (ATGM)

In Service: 1964-Present

Manufacturer: Nudelman OKB-16

Weight: kg27

Length: cm116

Diamter: mm148

Warhead Type: HEAT

Warhead Weight: kg5.4

Engine: Solid fuel rocket

Wingspan: cm68

Operational Range: km0.5-2.5

Speed: 160 m/s (360 mph)

Guidance System: Radio command

Steering System: MCLOS

Launch Platform: Mi-4, Mi-8, Mi-24, Mi-25, BRDM-1, BRDM-2

Missile Guidance Transmitter: Yes

Protection

Stealth Properties: None

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW: No

EW Counter Measures/CCM: No

Counter Measures (Chaff/Flares): ASO-2V flare dispensers

Notes:

Mil Mi-24 is a twin-engined Combat helicopter intended for close support of ground forces, destruction of armored targets and transportation of persons or cargo. The Mi-24 is not a direct counterpart to the American AH-64 Apache, since unlike this and other Western attack helicopters it is also capable of transporting up to eight troops. As a combination gunship and troop transport, the Hind combat helicopter has no direct NATO counterpart. The combat helicopter is a flying infantry fighting vehicle, which blends features of both transport and attack helicopters. Soviet pilots called the aircraft 'letayushiy tank' or flying tank. Another common nickname is 'Krokodil' (Crocodile) - due to the helicopter's camouflage and fuselage shape and "Drinking Glass", (Stakan) because of the flat glass plates that surround the Mi-24's cockpit. The core of the aircraft was derived from the Mil Mi-8 (NATO reporting name "Hip") with two top-mounted turboshaft engines driving a mid-mounted 17.3 m five-blade main rotor and a three-blade tail rotor. The engine configuration gave the aircraft its distinctive double air intake. Original versions have an angular greenhouse-style cockpit; Model D and later have a characteristic tandem cockpit with a "double bubble" canopy. Other airframe components came from the Mi-14 "Haze". Two mid-mounted stub wings provide weapon hardpoints, each offering three stations, in addition to providing lift. The loadout mix is mission dependent; Mi-24s can be tasked with close air support, anti-tank operations, or aerial combat. The Mi-24 fuselage is armored and can resist impacts from 12.7 mm (0.50 in) rounds from all angles. The titanium rotor blades are resistant to 12.7 mm rounds. The cockpit is protected by ballistic-resistant windscreens and a titanium-armored tub. The cockpit and crew compartment are over pressurized to protect the crew in NBC conditions. Considerable attention was given to making the Mi-24 fast. The airframe was streamlined, and fitted with retractable tricycle undercarriage landing gear to reduce drag. At high speed, the wings provide considerable lift (up to a quarter of total lift). The main rotor was tilted 2.5° to the right from the fuselage to compensate for translating tendency at a hover. The landing gear was also tilted to the left so that the rotor would still be level when the aircraft was on the ground, making the rest of the airframe tilt to the left. The tail was also asymmetrical to give a side force at speed, thus unloading the tail rotor. Comparison to Western helicopters As a combination of armoured gunship and troop transport, the Mi-24 has no direct NATO counterpart. While the UH-1 ("Huey") helicopters were used in the Vietnam War either to ferry troops, or as gunships, they were not able to do both at the same time. Converting a UH-1 into a gunship meant stripping the entire passenger area to accommodate extra fuel and ammunition, and removing its troop transport capability. The Mi-24 was designed to do both, and this was greatly exploited by airborne units of the Soviet Army during the 1980–89 Soviet–Afghan War. The closest Western equivalent was the Sikorsky S-67 Blackhawk, which used many of the same design principles and was also built as a high-speed, high-agility attack helicopter with limited troop transport capability using many components from the existing Sikorsky S-61. The S-67, however, was never adopted for service. Other Western equivalents are the Romanian Army's IAR 330, which is a licence-built armed version of the Aérospatiale SA 330 Puma, and the MH-60 Direct Action Penetrator, a special purpose armed variant of the Sikorsky UH-60 Black Hawk. The Hind has been called the world's only "assault helicopter" due to its combination of firepower and troop-carrying capability A modified Mi-24B, named A-10, was used in several speed and time-to-climb world record attempts. The helicopter had been modified to reduce weight as much as possible—one measure was the removal of the stub wings. The previous official speed record was set on 13 August 1975 over a closed 1000 km course of 332.65 km/h (206.7 mph); many of the female-specific records were set by the all-female crew of Galina Rastorguyeva and Lyudmila Polyanskaya. On 21 September 1978, the A-10 set the absolute speed record for helicopters with 368.4 km/h (228.9 mph) over a 15/25 km course. The record stood until 1986, when it was broken by the current official record holder, a modified British Westland Lynx.

AH-64 Apache American Guardian Attack Helicopter

Tiers:

Variants:

- **AH-64A:** The AH-64A is the original production attack helicopter. The crew sit in tandem in an armored compartment. It is powered by two GE T700 turboshaft engines. The A-model was equipped with the −701 engine version until 1990 when the engines were switched to the more powerful −701C version. U.S. Army AH-64As are being converted to AH-64Ds. The service's last AH-64A was taken out of service in July 2012 before conversion at Boeing's facility in Mesa, Arizona. On 25 September 2012, Boeing received a $136.8M contract to remanufacture the last 16 AH-64As into the AH-64D Block II version and this was forecast to be completed by December 2013.
- **AH-64B:** In 1991, after Operation Desert Storm, the AH-64B was a proposed upgrade to 254 AH-64As. The upgrade would have included new rotor blades, a Global Positioning System (GPS), improved navigation systems and new radios. U.S. Congress approved $82M to begin the Apache B upgrade. The B program was canceled in 1992. The radio, navigation, and GPS modifications were later installed on most A-model Apaches through other upgrades.
- **AH-64C:** Additional funding from Congress in late 1991 resulted in a program to upgrade AH-64As to an AH-64B+ version. More funding changed the plan to upgrade to AH-64C. The C upgrade would include all changes to be included in the Longbow except for mast-mounted radar and newer −700C engine versions. However, the C designation was dropped after 1993. With AH-64As receiving the newer engine from 1990, the only difference between the C model and the radar-equipped D model was the radar, which could be moved from one aircraft to another; thus the decision was made to simply designate both versions "AH-64D".
- **AH-64D:** The AH-64D Apache Longbow is equipped with a glass cockpit and advanced sensors, the most noticeable of which being the AN/APG-78 Longbow millimeter-wave fire-control radar (FCR) target acquisition system and the Radar Frequency Interferometer (RFI), housed in a dome located above the main rotor. The radome's raised position enables target detection while the helicopter is behind obstacles (e.g. terrain, trees or buildings). The AN/APG-78 is capable of simultaneously tracking up to 128 targets and engaging up to 16 at once; an attack can be initiated within 30 seconds. A radio modem integrated with the sensor suite allows data to be shared with ground units and other Apaches, allowing them to fire on targets detected by a single helicopter. The aircraft is powered by a pair of uprated T700-GE-701C engines. The forward fuselage was expanded to accommodate new systems to improve survivability, navigation, and 'tactical internet' communications capabilities. In February 2003, the first Block II Apache was delivered to the U.S. Army, featuring digital communications upgrades. The Japanese Apache AH-64DJP variant is based on the AH-64D; it can be equipped with the AIM-92 Stinger air-to-air missiles for self-defense.
- **AH-64E:** Formerly known as AH-64D Block III, in 2012, it was redesignated as AH-64E Guardian to represent its increased capabilities. The AH-64E features improved digital connectivity, the Joint Tactical Information Distribution System, more powerful T700-GE-701D engines with upgraded face gear transmission to accommodate more power, capability to control unmanned aerial vehicles (UAVs), full IFR capability, and improved landing gear. New composite rotor blades, which successfully completed testing in 2004, increase cruise speed, climb rate, and payload capacity. Deliveries began in November 2011. Full-rate production was approved on 24 October 2012,[318] with 634 AH-64Ds to be upgraded to AH-64E standard and production of 56 new-build AH-64Es to start in 2019/20. Changes in production lots 4 through 6 shall include a cognitive decision aiding system and new self-diagnostic abilities. The updated Longbow radar has an oversea capacity, potentially enabling naval strikes; an AESA radar is under consideration. The E model is to be fit for maritime operations. The Army has expressed a desire to add extended-range fuel tanks to the AH-64E to further increase range and endurance. AH-64Es are to have the L-3 Communications MUM-TX datalink installed in place of two previous counterparts, communicating on C, D, L, and Ku frequency bands to transmit and receive data and video with all Army UAVs. Lots 5 and 6 will be equipped with Link 16 data-links.[323] As of April 2020, 500 AH-64E have been delivered.
- **AH-64F:** In 2014, Boeing conceptualized an Apache upgrade prior to the introduction of the U.S. Army's anticipated attack version of the Future Vertical Lift (FVL) aircraft, forecast to replace the Apache by 2040. The conceptual AH-64F

would have greater speed via a new 3,000 shp turboshaft engine from the Improved Turbine Engine Program, retractable landing gear, stub wings to offload lift from the main rotor during cruise, and a tail rotor that can articulate 90 degrees to provide forward thrust. In October 2016, the Army revealed they would not pursue another Apache upgrade to focus on funding FVL; the Army will continue buying the Apache through the 2020s until Boeing's production line ends in 2026, then FVL is slated to come online in 2030.

- **Compound Apache:** In October 2018, Boeing began testing the AH-64E Block 2 Compound, a compound helicopter design which added a larger fixed wing and a pusher propeller to the Apache airframe to provide additional lift and thrust, respectively. In addition, the engine exhaust was redirected downwards. Collectively, the modifications were anticipated to improve speed to 185 kn (343 km/h; 213 mph), range to 460 nmi (850 km; 530 mi), payload to 5,900 lb (2,700 kg), and fuel economy. A 30% scale model completed wind tunnel testing in January 2019. The Compound Apache has been pitched as an interim replacement for the Apache before its replacement under the Future Vertical Lift program.
- **Sea Apache:** During the 1980s naval versions of the AH-64A for the United States Marine Corps and Navy were examined. Multiple concepts were studied with altered landing gear arrangements, improved avionics and weapons. The USMC was very interested and conducted a two-week evaluation of the Apache in September 1981, including shipboard operation tests. Funding for a naval version was not provided; the Marine Corps continued to use the AH-1. The Canadian Forces Maritime Command also examined a naval Apache. In 2004, British Army AgustaWestland Apaches were deployed upon the Royal Navy's HMS Ocean, a Landing Platform Helicopter, for suitability testing; there was U.S. interest in the trials. During the 2011 military intervention in Libya, the British Army extensively used Apaches from HMS Ocean. In 2013, U.S. 36th Combat Aviation Brigade AH-64Ds were tested on a variety of U.S. Navy ships.
- **Export Apaches:** Several models have been derived from both AH-64A and AH-64D for export. The British-built AgustaWestland Apache (assembled from kits purchased from Boeing) is based on the AH-64D Block I with several different systems, including more powerful engines, folding rotor blades, and other modifications for operation from Royal Navy vessels.

Notes:

The Boeing AH-64 Apache is an American twin-turboshaft attack helicopter with a tailwheel-type landing gear arrangement and a tandem cockpit for a crew of two. It features a nose-mounted sensor suite for target acquisition and night vision systems. It is armed with a 30 mm (1.18 in) M230 chain gun carried between the main landing gear, under the aircraft's forward fuselage, and four hardpoints mounted on stub-wing pylons for carrying armament and stores, typically a mixture of AGM-114 Hellfire missiles and Hydra 70 rocket pods. The AH-64 has significant systems redundancy to improve combat survivability. The Apache began as the Model 77 developed by Hughes Helicopters for the United States Army's Advanced Attack Helicopter program to replace the AH-1 Cobra. The prototype YAH-64 was first flown on 30 September 1975. The U.S. Army selected the YAH-64 over the Bell YAH-63 in 1976, and later approved full production in 1982. After purchasing Hughes Helicopters in 1984, McDonnell Douglas continued AH-64 production and development. The helicopter was introduced to U.S. Army service in April 1986. The advanced AH-64D Apache Longbow was delivered to the Army in March 1997. Production has been continued by Boeing Defense, Space & Security, with over 2,400 AH-64s being produced by 2020. The U.S. Army is the primary operator of the AH-64. It has also become the primary attack helicopter of multiple nations, including Greece, Japan, Israel, the Netherlands, Singapore, and the United Arab Emirates. It has been built under license in the United Kingdom as the AgustaWestland Apache. American AH-64s have served in conflicts in Panama, the Persian Gulf, Kosovo, Afghanistan, and Iraq. Israel used the Apache in its military conflicts in Lebanon and the Gaza Strip. British and Dutch Apaches have seen deployments in wars in Afghanistan and Iraq.

Mi-35M (Hind E) Russian Attack Helicopter

Tiers:

Variants:

- **V-24:** The first version, twelve prototypes and development aircraft. The first V-24 mockup resembled the Bell UH-1A Huey. Later models resembled the future Hind-A, one of which was modified in 1975 as A-10 for speed record attempts with wings removed and faired over and with inertia-type dampers on the main rotor head. The A-10 reached a speed of 368 km/h. It was armed with GSh-23 and could carry up to six missiles or rockets.
- **Mi-24:** (Hind-A) Other early versions were the armed assault helicopter, which could carry eight combat troops and three crew members. It could also carry four 57mm rocket pods on four underwing pylons, four MCLOS 9M17 Fleyta (AT-2 Swatter) anti-tank missiles on two underwing rails, free-fall bombs, plus one Afanasev A-12.7 12.7mm machine-gun in the nose. The Mi-24 was the first production model.
- **Mi-24F:** (Hind-A) Modified Hind-A with seven reinforcing ribs on the port fuselage aft of the wing and the SRO-2M Khrom ("Odd Rods") IFF antenna relocated from the canopy to the oil cooler. The APU exhaust was also extended and angled downwards. The designation may be unofficial.
- **Mi-24A:** (Hind-B) The Mi-24A was the second production model. Both the Mi-24 and Mi-24A entered the Soviet Air Forces service in 1972. They Lacked the four-barrel Yak-B 12.7mm machine gun under the nose.
- **Mi-24U:** (Hind-C) Training version without nose gun and wingtip stations.
- **Mi-24BMT:** Small number of Mi-24s converted into minesweepers.
- **Mi-24D (Hind-D):** The Mi-24D was a purer gunship than the earlier variants. It entered production in 1973. The Mi-24D has a redesigned forward fuselage, with two separate cockpits for the pilot and gunner. It is armed with a single 12.7mm four-barrel Yak-B machine-gun under the nose. It can carry four 57mm rocket pods, four SACLOS 9M17 Phalanga anti-tank missiles (a significant enhancement compared to the MCLOS system found on the Mi-24A), plus bombs and other weapons. One Mi-24D was sold to Poland in January 1996 and was used by the WTD 61 in Manching during 1994 for tests with the head of a MIM-23 Hawk missile in place of the chin-mounted gun. This version also had an unidentified modification in the rear cabin window on the starboard side.
- **Mi-24PTRK:** This version was the Mi-24D modification that was used for testing the Shturm V missile system for the Mi-24V.
- **Mi-24DU:** Small numbers of Mi-24Ds were built as training helicopters with doubled controls.
- **Mi-24V:** (Hind-E) Later development which entered production in 1976 and was first seen by the west in the early 1980s. It was armed with the more advanced 9M114 Shturm (AT-6 Spiral). Eight of those missile are mounted on four outer wing pylons. It was the most widely produced version with more than 1,500 made. In Polish service this aircraft is designated Mi-24W. One Mi-24V was referred to as Mi-24T for unknown reasons.
- **Arsenal Mi-24V upgrade:** Ukrainian upgrade for Mi-24V.
- **Mi-24P:** (Hind-F) The gunship version, which replaced the 12.7mm machine-gun with a fixed side-mounted 30mm GSh-30-2K twin-barrel autocannon.
- **Mi-24TECh-24:** Experimental Mi-24P to test abilities for recovery of downed aircraft.
- **Mi-24VP:** (Hind-E Mod) Development of Mi-24V made in 1985 which replaced the machine-gun with twin 23mm autocannons in a movable turret. Entered service in 1989, but only 25 were made before production ended the same year.[2] One Mi-24VP flew with the Delta-H tail rotor of the Mil Mi-28.
- **Mi-24RKhR:** (Hind-G1) NBC reconnaissance model, which is designed to collect radiation, biological and chemical samples. It was first seen during the 1986 Chernobyl disaster. Also known as the Mi-24R, Mi-24RK and Mi-24RKh (Rch).
- **Mi-24RR:** Radiation reconnaissance model derived from the Mi-24R.
- **Mi-24K:** (Hind-G2) Army reconnaissance, artillery observation helicopter.
- **Mi-24VM:** Upgraded Mi-24V with updated avionics to improve night-time operation, new communications gear, shorter and lighter wings, and updated weapon systems to include support for the 9M120 Ataka, Shturm and 9K38 Igla ATGM missiles and a 23mm main gun. Other internal changes have been made to increase the aircraft life-cycle and ease

maintenance.

- **Mi-24VN:** (Hind-E) A night-attack version based on an Mi-24V in Mi-24VM Stage 1 configuration.
- **Mi-24PM:** Upgraded Mi-24P using same technologies as in Mi-24VM.
- **Mi-24PN:** PN version has a TV and a FLIR camera located in a dome on the front of the aircraft, and is armed with GSh-23L. The Russian Air Force received 14 Mi-24PNs in 2004
- **Mi-24PS:** Civil police or paramilitary version, equipped with a FLIR, searchlight, loudspeaker PA system and attachments for rappelling ropes.
- **Mi-24V Ecological Survey Version:** Environmental research modification developed by the Polyot Industrial Research Organisation.
- **Mi-24 SuperHind Mk.II:** Modern western avionics upgrade produced by South African company Advanced Technologies and Engineering (ATE)
- **Mi-24 SuperHind Mk.III:** Extensive operational upgrade of the original Mi-24 including weapons, avionics and counter measures.
- **Mi-PSV:** Experimental high-speed helicopter based on the Mi-24. PSV stands for Perspektivny skorostnoi vertolet (Перспективный скоростной вертолёт) – Prospective high speed helicopter). Single-seat streamlined cockpit, unarmed, fitted with experimental main rotors for research into high-speed flight, with a target of increasing the speed of the Mi-28N by 10% and the Mi-35M by 13%
- **Mi-35P:** Russian Helicopters holding has developed a common standard for Mi-24 modernization designated as Mi-35P. The Mi-35P has received the OPS-24N-1L observation-sight system with a third generation long-wave matrix thermal imager, TV camera, and laser rangefinder.
- **Mi-35MV:** Modernized version of Mi-35M with an additional armour and upgraded propulsion and optical systems. It is equipped with a opto-electronic OPS-24N1 surveillance and targeting system
- **Mi-35O:** Export version of the Mi-24VN using a Mexican FLIR camera and a glass cockpit with upgraded avionics. Operated by Mexico only.
- **Mi-35M4:** (AH-2 Sabre) Updated version of the Mi-35M with Israeli avionics for the Brazilian Air Force.
- **Mi-35M2:** Updated version of the Mi-35M for the Venezuelan Army.
- **Mi-35MS:** Flying Command Post variant of the Mi-35M. Operated by the Russian Federal Protective Service (FSO).

System

Alternative Designation: Mil Mi-30M

Manufacturer: Mil

In Service: 2010-Present

Type: Attack Helicopter

Crew: ea2

Troop Capacity: ea8

Litter Capacity: ea4

Blades, Main Rotor: 5

Blades, Tail Rotor: ea3

Chin Mounted Gun

↳*System*

Name: Gryazev-Shipunov GSh-23

Type: twin-barreled 23mm autocannon d

Caliber: 23mm

Manufacturer: KBP Instrument Design Bureau

In Service: 1960-Present

Weight: kg49.2

Length: mm1,387

Barrel Length: mm1,000

Barrels: ea2

Action: Gas Principle

Rate of Fire: rds/min3,400-3,600

↳*Ammunition*

Type: Autocannon Rifle Round

Caliber: mm23

Cartridge: 23x115mm

Muzzle Velocity: m/s715

Basic Load: 450

Armor Penetration: INA

Ammo Types: HEFI, HEI, APT, APE, CC

Wing Mounted Weapons

Note: This attack helicopter can carry different weapons, including podded guns, 8 older Shturm-V or newer Ataka-V anti-tank missiles, Igla-V air-to-air missiles, unguided rockets or bombs. Armament depends on customer requirements.

↳*Rocket System #1 Launcher*

Name: UB-32

Type: 57mm, reusable, 32-salvo rocket pod

Basic Load (UB-32 Rocket Pod): ea2-4

Launcher Length: mm2,080

Launcher Diameter: mm464

Weight, Empty: kg103

Weight, Loaded: kg264

↳*Rocket System #1 Projectile*

Name: S-5M (ARS-57) Rocket

Type: Unguided HE-FRAG

Caliber: mm55

Length: m1.4

Diameter: mmINA

Weight: kg5

Basic Load (S-5 Rockets): ea32

Operational Range: km3-4

Engine: Solid Rocket Motor

Speed: 300 meters in 1.1 seconds

Note #1: Produces 75 Splinters

Note #2: The S-5 is carried in rocket pods, with 4–32 rockets.

↳*Rocket System #2*

Name: S-24 Rocket

Type: Unguided high-velocity airborne rocket

Diameter: mm240

Length: m2.33

Launch Weight: kg235

Warhead Type: blast-fragmentation warhead

Warhead Weight: kg123

Operational Range: km2-3

Basic Load: ea2-4

Proximity Fuze: R-24

Fragmentation Casualty Zone Radius: m300-400

Number of Fragments: 4,000

Penetration: 30mm of armor

Note: The S-24 Warhead detones 3 meters above the ground

↳*Anti-Tank Guided Missile System*

Name: AT-2 Swatter (3M11/9M17)

Type: Anti-Tank Guided Missile (ATGM)

In Service: 1964-Present

Manufacturer: Nudelman OKB-16

Weight: kg27

Length: cm116

Diamter: mm148

Warhead Type: HEAT

Warhead Weight: kg5.4

Engine: Solid fuel rocket

Wingspan: cm68

Operational Range: km0.5-2.5

Speed: 160 m/s (360 mph)

Guidance System: Radio command

Steering System: MCLOS

Launch Platform: Mi-4, Mi-8, Mi-24, Mi-25, BRDM-1, BRDM-2

Fire Control

Fire Control System Type: INA

Fire Control Radar: Yes

Digital or Analog Cockpit: Digital

Direct Fire Control: Yes

Laser Designator: Yes

Automated Helmet: INA

Sensor Suite(s) Available: electro-optical sensor systems

Position Location System: Yes

Radar Warning System: Sirena-3M radar warning system

IR Jammer: HO Brick IR Jammer

FLIR Equipped: Yes

RWR Equipped: Yes

Air Data Sensor: Yes

Missile Guidance Transmitter: Yes

Note: Electronic core of the helicopter underwent fundamental modifications. A whole spectrum of new electronic systems were adopted in the cockpit. The Mi-35M is fitted with upgraded avionics and improved sensor package, including night vision system. Helicopter is also fitted with electro-optical rangefinder/targeting system with thermal imaging guidance channel, satellite positioning and navigation system, electronic multifunction displays, onboard computer and new generation jam-proof communications equipment.

Protection

Stealth Properties: None

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW: No

EW Counter Measures/CCM: No

Counter Measures (Chaff/Flares): ASO-2V flare dispensers

Notes:

Mi-35M is a multi-role combat helicopter manufactured by Rostvertol, a subsidiary of Russian Helicopters. It is an export variant of Mi-24 Hind attack helicopter. Primarily designed for attack and military transport missions, the helicopter offers a more superior flight performance and manoeuvrability compared to its predecessor. The production of Mi-35M started in 2005. The aircraft integrates modern, high-precision weaponry for destroying ground-based armoured targets and providing air support for ground missions. It can be modified as an attack, ground assault, medical evacuation (MEDEVAC) or transport platform. Mi-35M is one of the modern combat helicopters in the Russian Air Force inventory. It is also operated by the armed forces of Venezuela, Brazil, Azerbaijan, Nigeria, Kazakhstan and Mali.

Name: AGM-114 Hellfire

Type: Air-to-Surface Missile

Basic Load: 8 x AGM-114 Hellfire Missiles

Length: 1.6 m

Diameter: 180 mm

Wingspan: 0.33 m

Weight: 45–49 kg

Warhead Type: High-explosive anti-tank Shaped charge Tandem anti-armor Metal augmented charge Blast fragmentation

Engine: Solid-fuel rocket

Operational Range: 546 yd (0.499 km) to 6.84 mi (11.01 km)

Maximum Speed: Mach 1.3

Guidance System: Semi-active laser homing millimeter wave radar seeker

↳*Missile System (Option 2)*

Name: AIM-92 Stinger
Type: Air-to-Surface Missile
Basic Load: 4-8 x AIM-92 Stinger Missiles
Length: 1.52 m
Diameter: 70 mm
Wingspan: 140 mm
Weight: 16 kg
Guidance System: Fire-and-forget passive infrared seeker for Block I and Fire-and-forget passive IR focal plane array seeker in Block II version
Warhead: 3 kg HE blast fragmentation
Speed: Mach 2.2
Range: 8 km

Fire Control and Radar System

Fire Control System Type: INA
Fire Control Radar: Elettronica ELT-156 radar warning receiver
Direct Fire Control: INA
Laser Designator: INA
Automated Helmet: kmINA

Protection

Stealth Properties: No
Heat Signature Reduction: INA
Add on Armor: INA
NBC Protection: INA
EW: INA
Jammer: BAE Systems IEWS AN/ALQ-144A infrared jammer
Counter Measures (Chaff/Flares): Yes

Notes:

The Agusta A129 Mangusta (English: Mongoose) is an attack helicopter originally designed and produced by Italian company Agusta. It is the first attack helicopter to be designed and produced wholly in Europe. It has continued to be developed by AgustaWestland, the successor company to Agusta. The A129 has undergone several combat deployments since entering service with the Italian Army in the 1990s. A derivative of the A129, the TAI/AgustaWestland T129 ATAK, is being developed by Turkish Aerospace Industries (TAI) in cooperation with AgustaWestland. TAI will produce the T129 for the Turkish Army and potentially export customers. The A129 Mangusta is the first European attack helicopter; as such it has several original aspects to its design, such as being the first helicopter to make use of a fully computerised integrated management system to reduce crew workload. It was decided that much of the helicopter's functionality was to be automated; as such, parts of the flight and armament systems are monitored and directly controlled by onboard computers. The A129 shares considerable design similarities to Agusta's earlier A109 utility helicopter; the rear section of the A129 was derived from the A109 and incorporated to an entirely new forward section. The A129's fuselage is highly angular and armoured for ballistic protection; the composite

rotor blades are also able to withstand hits from 23mm cannon fire. The two man crew, comprising a pilot and gunner, sit in a conventional tandem cockpit. The A129 can be used in the anti-armour, armed reconnaissance, ground attack, escort, fire support and anti-aircraft roles. For the anti-ground mission the helicopter can employ various armaments, such as up to eight Hellfire missiles. In the air-to-air role, the FIM-92 Stinger missile was certified for use in 2003. The A129 can also be equipped with 81 mm or 70 mm (2.75 in) unguided rockets; a M197 three-barrel 20 mm cannon is also installed onto a nose-mounted Oto Melara TM-197B turret. By 2014, the Spike-ER, a fourth-generation anti-tank missile, had been added to the A129's arsenal. Power is provided by a pair of Rolls-Royce Gem 2-1004D turboshaft engines, the engines have been designed to incorporate infrared heat signature reduction measures. One of the key protective measures incorporated onto the A129 include the electronic warfare and SIAP (Single Integrated Air Picture) self-protection suite. Elements of the mission interface systems and the onboard software integrated onto later aircraft were produced by Selex Galileo. The A129 is equipped with infrared night vision systems and is capable of operating at day or night in all-weather conditions. Laser systems are fitted onto newer aircraft for range-finding and target designation purposes, the A129 can laser-designate targets for other friendly aircraft to attack. On the AW129D, Rafael Advanced Defense Systems's Toplite III sight is used as the primary targeting system; it is able to act as a FLIR and has both manual and automatic target tracking modes, Toplite also provides a greater detection and identification range than the 1970s era HeliTOW sensor it replaced. In 1998, Israel Aircraft Industries (IAI) formally partnered with Agusta to offer various avionics and weapons upgrades to potential A129 operators; various IAI technologies have since been proposed and implemented on Italian A129s.

Rooivalk (Ah-2) South African Attack Helicopter

Tiers:

Variants:

- **Rooivalk Mk 1 Block 1F:** The Mk 1 Block 1F introduced modifications to improve the Rooivalk's safety and reliability and accuracy of weapon systems. The work included a significant remanufacturing of some gearbox mounting components. Old electronics were replaced and reliability issues with the 20-mm F2 cannon were resolved. The upgraded helicopter also features new Denel Saab Aerostructures external fuel tanks that increase self-deployment range by 50 percent and provides integration with the Denel Mokopa air-to-ground missile.

System

Alternative Designation: AH-2 Rooivalk Attack Helicopter
Primary Function: Anti-Tank Attack Helicopter
Type: Attack Helicopter
Crew: ea2
Blades, Main Rotor: 4
Blades, Tail Rotor: ea1
Number of Engines: ea2
Day/Night Capable: Yes
All Weather Capable: INA
Takeoff or Landing Limitations: 8,750 kg
Vertical Climb Rate Two Engines: m/s799
Vertical Climb Rate One Engine: 390
Hover Ceiling IGE: 5,852 m
Hover Ceiling OGE: 5,456 m
Number of Hard Points: 6
Maximum Forward Speed: km/h278
Maximum Sideway Speed: km/h93
Cruise Speed: kts150
Cruising Range Internal Fuel: km700

Cruising Range External Fuel: km1200

Note:: AH-2 Rooivalk Attack Helicopter is 130 deployable

Dimensions

Length: m18.73

Height: m5.19

Main Rotor Diameter: m15.58

Empty Weight:: kg5,730

Combat Weight: kg8,750

Automotive

Engine Name: Makila

Engine Type: 2 x 1K2

Engine Power: hp3,008 hp (2,243 kW)

Communications

Radio: 2 x VHF/UHF (AM and FM) transceivers, 1 High Frequency radio and an IFF (Identify Friend or Foe) Transponder

Chin Mounted Gun

Name: 1 x 20-mm F2 dual-feed gas-operated chin mounted

Type: Single Barrel Cannon

Caliber: 20mm

Manufacturer: GIAT France

OA Length: 2.600m

Recoil Stroke: 60mm

Weight: 71kg

Rate of Fire: 900rds/min

Barrel Length: 100calibers

Basic Load: 900rds

↳*Ammunition. Chin Mounted Gun*

Name: 20mm F2 cannon, high velocityF2

Type Munitions/Muzzle Velocity: HE: 3,440 fps: APDS: 4,100 fps

Ammunition Stowage: 300rds/magazine

Approximate Barrel Life: 16,000rds

Wing Mounted Weapons

Rocket System #1

Name: 70-mm (2.75in) Zeebrugge

Type: FFAR (Folding Fin Aerial Rocket)

Basic Load: up to 76 Rockets (19 70mm rockets/pod)

↳*Air-to-Air Missile System*

Name: Mistral

Type: Air-to-air

Manufacturer: MBDA France

Proliferation: Widely proliferated over 30 countries.

Basic Load: 4

Length: m1.86

Diameter: mm90

Range: km6

Guidance: Infrared Homing

Warhead: High Explosive with High density tungsten balls

Warhead Weight: 2.95kg

Detonation Mechanism: Laser proximity or impact trigger

Engine: Solid Rocket Motor

Speed: 800 m/s, approx. Mach 2.6 (high supersonic)

↳*Anti-Tank Guided Missile System #1*

Name: ZT-6 Mokopa

Type: Air-to-surface

Manufacturer: Denel Dynamics, South Africa

Length: 1.995mm

Diameter: 178mm

Missile Weight: 49.8kg

Min Range: kmINA

Maximum Range: km10

Missile Velocity: m/sVaries by type of munition

Armor Penetration: 1350mm

Warhead Type: Tandem High Explosive Anti-Tank (HEAT) and Blast Fragmentation

Guidance: Semi-active laser homing millimeter wave radar seeker

Anti-Tank Guided Missile System #2

↳

Name: HOT-3 (French: Haut subsonique Optiquement Téléguidé Tiré d'un Tube)

Type: Anti-tank

Manufacturer: MBDA

Length: 1.3m

Diameter: .15m

Missile Weight: 24.5kg

Minimum Range: 75m

Maximum Range: 4,300m

Missile Velocity: 864 km/h

Armor Penetration: 1250mm

Warhead Type: Tandem charge HEAT

Guidance: Semi-automatic command to line of sight (SACLOS)

Engine: Two-stage solid fuel rocket

Anti-Tank Guided Missile System #3

Name: AGM-114 Hellfire

Type: Air-to-Surface

Manufacturer: Northrop Grumman, Lockheed Martin, Boeing, United States of America

Length: 1.6m

Diameter: 180mm

Missile Weight: 45-49kg

Minimum Range: 499m

Maximum Range: 11,008m

Missile Velocity: 1601 km/h

Armor Penetration: INA

Warhead Type: High-explosive anti-tank (HEAT); 9.1 kg tandem anti-armor. Metal augmented charge (MAC); 8.2 kg shaped charge Blast fragmentation

Guidance: Semi-active laser homing millimeter wave radar seeker

Enginie: Solid-fuel rocket

Fire Control

Fire Control Target Detection System: Auto-tracking FLIR (Forward Looking Infrared Radar)

Direct Fire Control: Target detection, acquisition and tracking system (TDATS). TDATS has an auto-tracker, forward-looking infrared (FLIR) sensor with three fields of view, laser designator, laser rangefinder and low-level television sensor.

Laser Designator: Yes

Automated Helmet: kmTop Owl helmet mounted sight

Position Location System: GPS

Note:: The pilot flies the Rooivalk with hands-on-collective-and-stick (HOCAS) controls, assisted by a Thales Avionics Top Owl helmet-mounted sight display (HMSD). The HMSD gives both crewmembers a head-up display (HUD) for nap-of-the-earth (NOE) flight and low-level target engagement.

Protection

Cockpit Protection: Protected cockpit

Heat Signature Reduction: INA

NBC Protection: INA

EW Protection: Rooivalk also carries a full electronic warfare suite to increase survivability on the battlefield. The fully integrated helicopter electronic warfare self-protection suite (HEWSPS) can be reprogrammed using threat libraries matching the potential hazards of the area of operations.

EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): Manual, semi-automatic or automatic chaff and flares

Waring Systems: Laser and radar warning systems

Notes:

The Denel Rooivalk (previously designated AH-2 and CSH-2) is an attack helicopter manufactured by Denel Aviation of South Africa. Rooivalk is Afrikaans for "Red Falcon". Development of the type began in 1984 by the Atlas Aircraft Corporation, its development is closely connected to the Atlas Oryx transport helicopter, both aircraft being based on the Aérospatiale SA 330 Puma and having started development at the same time. Development of the Rooivalk was protracted due to the impact of limited budgets during the 1990s, and a desire to produce a highly advanced attack helicopter. The South African Air Force (SAAF) ordered 12 Rooivalk, designated the Rooivalk Mk 1 in SAAF service, the first of was officially handed over in April 2011. The helicopters are flown by 16 Squadron, based at AFB Bloemspruit near Bloemfontein. Due to the SAAF's decades of helicopter experience in the harsh African environment, the Rooivalk has been designed to operate for prolonged periods without sophisticated support. All that is needed to keep the Rooivalk flying is a medium transport helicopter equipped with a basic spares supply plus four ground crew. The Rooivalk carries a range of weapons depending on the mission profile. It is generally fitted with a nose-mounted 20 mm cannon and can also carry air-to-air missiles, anti-armour missiles and unguided rockets. The Rooivalk has a fire control system for target acquisition and tracking as well as an advanced navigation system using Doppler radar and GPS. Also incorporated is an electronic countermeasures suite coupled with chaff and flare dispensers. Notable features include a tandem cockpit, starboard tail rotor with a port tailplane, a fixed wheeled undercarriage as well as wire cutters above and below the cockpit and on the undercarriage. The Rooivalk is capable of doing a loop and thus momentarily "flying upside down". The first manned helicopter to do a loop was the Sikorsky S-52 flown by Harold E. Thompson on May 9th, 1949. The following types of missions are foreseen for the Rooivalk: reconnaissance, heliborne escort, close air support, deep penetration, and anti-armour. In 2016, Denel was reportedly proceeding with a Mk 1.1 upgrade program for the existing Rooivalk fleet; prospective improvements include the addition of a missile approach warning system and enhancements to the rotorcraft avionics. On 15 September 2016, it was announced that Airbus Helicopters and Denel had signed a memorandum of understanding to cooperate on the SAAF modernisation program; further details on the changes included reliability and survivability improvements, an increased payload, and the replacement of obsolete targeting systems and armaments. In September 2014, Denel Group chief executive Riaz Saloojee stated that the firm were currently studying the feasibility of reopening the Rooivalk production line, which had been mothballed in 2007 after the production of the initial 12 SAAF aircraft. Saloojee stated that talks were under way; it was mooted that new production aircraft conforming to an entirely new platform that used Rooivalk technology could be produced. In September 2016, the South African government authorised government-to-government negotiations on the topic of restarting production of the Rooivalk. According to Victor Xaba, deputy chief executive of Denel Aerostructures, the company would need commitments for at least 70 rotorcraft for the re-establishment of the assembly line to be viable.[8] The production of a prospective Rooivalk Mk 2 has been periodically mooted.[5] In July 2015, Saloojee spoke on the company's efforts to gain support for a Rooivalk Mk 2 programme which would involve a large proportion of new systems and for which the firm had already produced a roadmap. In late 2016, Denel stated that it was conducting a series of talks with various nations on the Rooivalk Mk 2, including Egypt, Brazil, Nigeria, Poland, and India.

AH-1F Cobra American Attack Helicopter

Tiers:

Variants:

- **AH-1J:** AH-1 variant with upgraded engines and powertrain for improved performance. This minimally expanded rotor system and overall dimensions of the AH-1J. Most older AH-1J Seacobra and AH-1Ts are still in operation, having been upgraded to the AH-1W standard.
- **AH-1T:** Construction of a variant, possibly called “Dracula”, may occur in the near future
- **AH-1RO (Romania)::** Four-bladed variant called the “King Cobra” or “Viper”, with better flight performance. It contains an integrated digital tandem cockpit and digital map display. Improved FCS includes helmet-mount sight system.
- **AH-1Z/AH-1(4B)W:** Four-bladed variant called the “King Cobra” or “Viper”, with better flight performance. It contains an integrated digital tandem cockpit and digital map display. Improved FCS includes helmet-mount sight system.

System

Alternative Designation : AH-1F Cobra; Bell 209
Date of Introduction: 1986
Proliferation: Total: +1,116 At least 10 countries
Manufacturer: Bell Helicopter
Crew : two: one pilot, one co-pilot/gunner (CPG)
In Service: Retired from US Army in 2001, but this helicopter is still used in other parts of the world
Main Blades: ea2
Tail Blades: ea2
Hardpoints: ea4

↳*Dimensions*

Height : m4.2
Length, Fuselage : m13.6

Length, rotors turning : m16.1

Rotor Diameter: m13.6

Height: m4.12

Empty Weight: 2,993 kg

Max. Takeoff Weight:: 4,500 kg

Stub Wing Span: 3.15 m

Automotive

Engine Name: 1 × Lycoming T53-L-703

Engine Type: Turboshaft,

Engine Power: hp1,800

Ceiling, Hover (in ground effect) : m4270.0

Ceiling, Hover (out of ground effect) : m915.0

Ceiling, Service : m5703.0

Range, Normal Load : km590.0

Range, with aux fuel : kmINA

Speed , Cruising : km/h270.0

Speed , Maximum : km/h277

Speed, Maximum "G" Force : g+2.5 to -0.5 g

Vertical Climb Rate : m/s4.0

Fuel Capacity: liters1,150

Standard Payload: kg1740.0

Rate of Climb: m/s8.2

Chin Mounted Gun

Note: Armament consists of the three-barrel M197 20mm automatic gun mounted on the M97A4 armament subsystem

↳*System*

Name: M197 electric cannon

Type: 20mm three-barreled electric Gatling-type rotary cannon

In Service: 1967-Present

Manufactuer: General Dynamics Armament Systems

Barrels: 3-barrel (progressive RH parabolic twist, 9 grooves)

Rate of Fire: Up to 1500 rpm

Maximum Effective Range: INA

↳*Ammunition*

Name: M53

Type: API

Caliber: mm20

Cartridge: 20 × 102 mm

Muzzle Velocity: 1,030 m/s

Basic Load: 2,000 ea

Bursting Charge: 4.2 g incendiary

Penetration: Penetration 20mm at 25-degree impact and 100 meter range, 6.3mm RHA at 0-degree impact and 1000-m range.

Wing Mounted Weapons

Note #1: Hydra 70 2.75 in (70 mm) rockets – 7 rockets mounted in the M260 launcher or 19 rockets in the M261 launcher

Note #2: The AH-1F can also be equipped with TOW Missiles – 4 or 8 missiles mounted in two-missile launchers on each hardpoint

↳***System***

Name: Hydra 70

Type: 70mm Fin-stabilized unguided rocket

In Service: 1980s-Present

Manufacturer: United States of America

Length: 1,060 mm

Diameter: 70 mm

Muzzle Velocity: 700 m/s

Effective Firing Range: 8,000 m

Maximum Firing Range: 10,500 m

Speed: 739 m/s

Guidance System: Unguided

Basic Load: 7 or 19

Fire Control

Fire Control System Type: INA

Fire Control Radar: INA

Digital or Analog Cockpit: Analog

Heads Up Display (HUD): Yes

Laser Rangefinder: Yes

Data System: M143 Air Data Subsystem (ADS)

ASE: Yes, Allied Signal Engines (ASE)

Protection

Armor Type: carbon fiber side panels and seats, with composite commonly called “chicken plates
Jammer: infrared jammer mounted above the engine exhaust
EW Capable: INA
Engine Exhaust Suppression System: Yes, infrared suppressing engine exhaust system
Note: There is very little written about the protection of the AH-1F

Notes:

Bell AH-1F Cobra Developed from the Huey transport helicopter, the Cobra was the first purpose-built helicopter gunship to enter military service. It was the mainstay of U.S. Army attack aviation from its combat debut in South Vietnam during 1967 until replaced by the AH-64 Apache in the 1980s and ‘90s. Versions of the Cobra continue to serve in the U.S. Marine Corps and the armed forces of many nations. Avionics/sensor/optics: the missile targeting system uses a telescopic sight unit (traverse 110º, elevation – 60º/+30º) with two magnifications/fields of view, a laser augmented tracking capability, TV, and video. Additional missions include: direct air support, escort, target designation, security, reconnaissance, air to air combat, and anti-ship. This aircraft costs approximately $10.7 million, inexpensive compared to other modern attack helicopters; but its performance is similar. Thus many nations consider this aircraft as a good candidate for fielding in attack helicopter squadrons. This is the Hybrid Threat tier 1 representative helicopter system.

AH-1J SeaCobra American Attack Helicopter

Tiers:

Variants:

- **AH-1J International:** Export version of the AH-1J SeaCobra.
- **AH-1T Improved SeaCobra:** Improved version with extended tail boom and fuselage and an upgraded transmission and engines.
- **AH-1W SuperCobra:** ("Whiskey Cobra"), day/night version with more powerful engines and advanced weapons capability.
- **AH-1(4B)W Viper:** "Four-Bladed Whiskey" test version with a four-bladed bearingless composite main rotor based on Bell 680 rotor. A prototype was converted from AH-1T 161022
- **AH-1Z Viper:** A new variant nicknamed "Zulu Cobra", and developed in conjunction with the UH-1Y Venom for the H-1 upgrade program. The variant includes an upgraded four-blade main rotor and adds the Target Sight System (TSS).
- **Bell 309 KingCobra:** Experimental all-weather version based on the AH-1G single-engine and AH-1J twin-engine designs.[36] Two Bell 309s were produced; the first was powered by a PW&C T400-CP-400 Twin-Pac engine set and the second was powered by a Lycoming T-55-L-7C engine.
- **CobraVenom:** Proposed version for the United Kingdom.
- **AH-1RO Dracula:** Proposed version for Romania.[
- **AH-1Z King Cobra:** AH-1Z offered for Turkey's ATAK program; selected for production in 2000, but later canceled when Bell and Turkey could not reach an agreement on production.
- **Panha 2091:** Unlicensed Iranian upgrade of AH-1J International.
- **IAIO Toufan:** Iranian copy / re-manufactured AH-1J International by Iran Aviation Industries Organization, with locally sourced avionics, and weapons.

System

Alternative Designation: PANHA 2091 (Toufan), IAIO Toufan or Toophan
Type: Attack Helicopter
In Service: 1970-Present
Manufacturer: Bell Helicopter
Capabilities: Ground Attack; Close-Air Support; Navy/Maritime
Crew: ea2
Blades, Main Rotor: 2
Blades, Tail Rotor: ea2
Number of Engines: ea1
Day/Night Capable: Yes

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW: INA

EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): Yes

Notes:

The USMC desired a twin engine AH-1G, based on a desire for improved safety and redundancy for over-water operation, which would become a hallmark of all subsequent USMC AH-1 types. The AH-1J "Sea Cobra" was developed and the USMC ordered this version of the Cobra in May 1968. Featuring the Pratt and Whitney Twinpac T400 engine (two 900-hp turboshaft engines coupled together) giving an overall increase in installed power, the AH-1J Sea Cobra included a new nose turret gun, with the three barrel XM197 20mm cannon, as well as other improvements. While development and production of the first 49 ordered were under way, the Marines obtained 38 AH-1Gs from the Army. The Marines depended on attack helicopters to provide close-in fire support coordination in serial and ground escort operations. Such support was required during amphibious ship-to-shore movements and subsequent shore operations within the objective area. As a result the AH-1 was designed for the following tasks: Armed escort for helicopters carrying personnel and cargo Landing zone fire suppression support Visual armed reconnaissance Target marking and direction for high-performance attack aircraft and naval gunfire Convoy escort and fire suppression for ground units Operations from air capable ships Point target attack of threatening armor Self-defense and protection of helicopters carrying personnel and cargo from threatening air-to-air weapon-equipped helicopters

→→Medium Multi-role Helicopter

Z-9 Harbin (WZ-9) Gun Ship Chinese Medium Multi-Role

Tiers:

Variants:

- **Z-9A:** Military production version with some upgrades, such as Arriel 1C2 engine, upgrade instrument panel, and 150-kg payload increase.
- **Z-9A 100:** Prototypes for domestic market versions with WZ8A engines. First flight 16 January 1992, approved 30 December 1992
- **Z-9B:** Current production version for multi-role use, based on Dauphin 2 designs. Changes include 11-blade tail rotor.
- **Z-9C:** Naval version for ASW and SSM, with Sinatra HS-12 dipping sonar and torpedo. It has a datalink to support targeting for YJ-82 SSM. An expected near-term upgrade is the C-701 TV guided air-to-surface missile.
- **WZ-9:** Light attack version of Z-9B (see ARMAMENT, left). Poss aka Z-9W. Export version is Z-9G.
- **Z-9Z:** Reconnaissance prototype.
- **Z-9EC:** ASW variant produced for the Pakistan Naval Air Arm. Configured with pulse-compression radar, low frequency dipping sonar, radar warning receiver and doppler navigation system, it is also armed with torpedoes for use aboard Pakistan Navy's Zulfiquar-class frigates
- **Z-9EH:** Transport, emergency and/or passenger variant
- **Z-9W (WZ-9):** Armed version with optional pylon-mounted armament, gyro stabilization and roof-mounted optical sight. Export designation Z-9G, roof-mounted sight optional. First flown in 1987, with the first weapons tests in 1989
- **Z-9WA:** A newer night-capable version has been built with nose-mounted FLIR. July 2011, Xinhua News Agency released a photo of Z-9WA firing ADK10 air-to-ground missile. Incorporates a domestic Chinese helmet mounted sight that is compatible with anti-tank missiles such as HJ-8/9/10, as well as light anti-ship missiles such as C-701/703 and TL-1/10 when they are used as air-to-surface missiles, air-to-air missiles such as TY-90 and other MANPAD missiles for self-defense
- **H410A:** Version with 635 kW WZ8C turbo-shaft engines. First flight September 2001, CAAC certification 10 July 2002. One is currently being fitted with a new Mast-Mounted Sighting (MMS) system.
- **H425:** Newest VIP version of the H410A, that has upgraded 635 kW WZ8C turbo-shaft engines and a new Mast-Mounted Sighting (MMS) system.
- **H450:** Projected development
- **WZ-19:** Attack helicopter development with tandem seats. The WZ-19 shares the same power plant as the WZ-9WA.

System

Alternative Designations: Z-9 Harbin; WZ-9

Crew: ea1 for Z-9, 2 for WZ-9. Transports 9-12 troops, 4-8 litters or cargo.

Passengers: ea10 (4,189 lb)

Primary Function: Medium Multi-role Helicopter

Blades – Main Rotor: ea4

Blades Tail Rotor: ea11

Tail rotor: 13 Z-9A, 11 Z-9B/WZ-9

All Weather Capable: Yes

Day/Night Capable: Yes

Vertical Clime Rate: m/s246

Cruise: kkm/h260

Hover (out of ground effect): 1,020 Z-9A 1,600 Z-9B

Service: 4,500 Z-9A, 6,000 Z-9B/WZ-9

Hover (in ground effect): m1,950 Z-9A 2,600 Z-9B

Speed: Max: km/h305

Ferry Range: km1,000

Under-Nose Low-Light TV: Yes

Infrared Observing and Tracking: Yes

Roof Mounted Optical Sight: Yes

EW Counter Measures/CCM: Yes

Notes:

Despite statements from some sources, WZ-9 is too lightly protected to be an "Attack helicopter". The Z-9 was designed to be adaptable for a variety of roles, including transport, direct air support, escort, security, reconnaissance, ambulance, anti-submarine warfare, IW, airborne C2, search and rescue, antiship, and anti-submarine warfare. Each fuselage side has one pylon allowing for a single pod or missile rack. An expected upgrade for WZ-9/Z-9g is the red arrow 9 laser-beam rider/MMW guided ATGM, with 1,200 mm penetration and 5 km range. The first Z-9 flew in 1981, and was built in China from components supplied by Aérospatiale as part of a production patent bought on 15 October 1980. On 16 January 1992, the indigenous variant Z-9B, constructed with 70% Chinese-made parts, flew successfully. The flight test was completed in November 1992 and the design was finalized a month later. Z-9B production began in 1993 and entered PLA service in 1994. The Z-9B features an 11-blade Fenestron faired-in tail rotor with wider-chord, all-composite blades replacing the 13-blade used in the original AS365N. As a light tactical troop transport, the Z-9 has the capacity to transport 10 fully armed soldiers. Generally the Z-9 is identical to the AS365N Dauphin, though later variants of the Z-9 incorporate more composite materials to increase structural strength and lower radar signature. The helicopter has a four-blade main rotor, with two turboshaft engines mounted side by side on top of the cabin with engine layout identical to the AS365N. The Z-9 teardrop-shaped body features a tapered boom to the tail fin, with rounded nose and stepped-up cockpit, retractable gear, and all flat bottom. In 2002, Harbin obtained Chinese certification for the new H410A variant of the Z-9, which features more powerful Turbomeca Arriel 2C turboshaft engines; Eurocopter issued official objections to Harbin's decision to continue production in spite of the license-production agreement having expired, leading to a period of highly sensitive international negotiations to resolve the dispute.

Z-8 (Zhishengji-8) Chinese Multi-Role Helicopter

Tiers:

Variants:

- **Z-8A:** The Z-8A is a military version of the original model Z-8 and is used for transportation.
- **Z-8F:** The Z-8F is an advance utility variant. The variant is used for search and rescue, general utility and logistics support missions. The Z-8F is installed with three Pratt & Whitney Canada PT6A-67B turboshaft engines.
- **Z-8K/KA:** The Z-8K is an enhanced version of Z-8F, built primarily to execute search and rescue missions. This variant is also fitted with forward looking infra-red (FLIR) sensors and a search light underneath the cockpit.
- **Z-8JA:** The Z-8JA is a ship-borne variant of Z-8. It is able to land on water. Z-8JA and Z-8JH are currently in service with PLANAF, executing transport and medical evacuation operations respectively.

System

Alternative Designation: Z-8; Zhishengji-8
Capabilities: Anti-Submarine Warfare; Anti-ship; Commercial Market; Search and Rescue; Reconnaissance; Special Forces
Type: Chinese Multi-Role Helicopter
Manufacturer: Sud Aviation Aérospatiale
In Service: 1976-Present
Crew: ea3
Passenger Capacity: It can accommodate 27 fully armed troops or 15 medical stretchers.
Blades, Main Rotor: 6
Blades, Tail Rotor: ea5
Number of Engines: ea3
Day/Night Capable: Yes
All Weather Capable: Yes
Hoist and Basket for SAR: Available
Hoist and Winch: Available, 275kg hoist and winch
Number of Hard Points: ea2

Dimensions

Fuselage Length: m20.27
Fuselage Width (with pontoon): m5.2

Width of Cargo bay (at the floor): m1.90

Height of Cargo Bay: m1.83

Weight,Empty: kg6,865

Weight, MTOW: kg13,000

Main Rotor Diameter: m18.9

Tail Rotor Diameter: m4

Whole Cabin Volume: 28.9m3

Main Rotor Disc: 280.48m2

Tail Rotor Disc: 12.57m2

Maximum Payload Capacity: 4,000kg

Maximum Payload Capacity with Sling Loads: 5,000kg

Automotive

Engine Name: 3 x Turbomeca Turmu IIIC Turboshaft Engines

Number of Engines: ea3

Engine Type: Turboshaft

Engine Power: 1,570 hr each engine

Maximum Range: km1,020

Speed, Maximum: km/h275

Ceiling: m3,150

Rate of Climb: 401 meters per min

Vertical Climb Rate: 6.66 m/s

Main Rotor Blade: Six-Bladed

Tail Rotor Blade: Five-Bladed

Fuel Capacity: 3,900 liters

Fuel Capacity, Internal Aux: 1,900 liters

Endurance: 4 hours

Landing Gear: non-retractable tricycle type landing gear comprising two wheels and low air pressure shock absorbers.

Communications

Radio: INA

Wing Mounted Weapons

Note: The helicopter can accommodate rockets and gun pods on the external pylons for anti-piracy missions.

↳*Missile System (Option 1)*

Name: YJ-8/C-802 (NATO: CSS-N-4 Sardine)

Type: Anti-Ship & Air-to-Surface Missiles

Manufactuer: China Aerospace Science and Industry Corporation

In Service: 1980s-Present

Length: m5.81

Width: INA

Weight: kg815

Warhead Type: High-explosive fragmentation

Warhead Weight: kg165

Engine: Rocket

Propellant: Solid Rocket

Operational Range: km42

Flight Altitude: m5-7

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Basic Load: ea2

↳*Missile System (Option 2)*

Name: YJ-83 (CSS-N-8 Saccade)

Type: Subsonic anti-ship cruise missile

Manufacturer: China Aerospace Science and Industry Corporation

In Service: 1998-Present

Length: INA

Diameter: INA

Warhead Type: High-explosive fragmentation

Warhead Weight: kg190

Operational Range: km180

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Basic Load: ea2

↳*Torpedo*

Name: A244S Torpedo

Type: Fire and Forget Torpedo

Length: m2.75

Diameter: mm324

Muzzle Velocity: INA

Effective Firing Range: km13.5

Maximum Firing Range: 6 km for Mod. 1, 13.5 km for Mod. 3

Filling: high explosive STANAG 4439 and MURAT-2 compliant

Detonation Mechanism: Various

Note: The Torpedo can be launched from surface vessels or from aircraft, and locates the target by means of an acoustic seeker.

Counter Measures (Chaff/Flares): Yes

Notes:

The Changhe Z-8 (Zhishengji-8) is a triple engine, multi-role helicopter designed and manufactured by the Changhe Aircraft Industry Group (CAIG) of China. It is derived from SA 321 Super Frelon Helicopter built by Aerospatiale. The Z-8 is designed to execute both civil and military missions. The civil operations capable of being performed by the aircraft include geological survey, aerial mapping, construction, forest fire protection, power line erection and communication. The military uses of the Z-8 include liaison, search and rescue, fire fighting, frontier patrol, troop transport, anti-submarine warfare (ASW) and emergency medical service (EMS). Z-8 helicopter design The design of Changhe Z-8 began in 1976. The final design was approved in November 1994. The helicopter is designed to manoeuvre even in bad weather conditions. A six-bladed main rotor system is mounted on the centre of the upper fuselage section. The helicopter has a five-blade tail rotor. The fuselage section is designed in a robust semi-monocoque shape with boat-hull inside its bottom. The Z-8 is designed to execute both civil and military missions. The civil operations capable of being performed by the aircraft include geological survey, aerial mapping, construction, forest fire protection, power line erection and communication. The military uses of the Z-8 include liaison, search and rescue, fire fighting, frontier patrol, troop transport, anti-submarine warfare (ASW) and emergency medical service (EMS).

Development The development of the Z-8 began in 1976 at the Jingdezhen-based Changhe Aircraft Factory. The development programme was delayed in 1979 due to technical difficulties and financial crisis. CAIG resumed the programme in 1985 with its own funding. The maiden flight of the first Z-8 prototype took place in December 1985. The second prototype took its first flight in October 1987. The domestic type approval was granted in April 1989. The Z-8 entered service with the PLANAF in August 1989. Features The Z-8 features a flight control system, gear boxes, a horizontal stabiliser, boat hull fuselage and bar-shape array radar. It is also equipped with a 275kg hoist and winch as well as a scoop fitted atop starboard side cabin door for rescue missions. It is fitted with a standard fuel tank of 3,900l capacity. An auxiliary fuel tank installed in the cabin offers extended-range, increasing the total capacity to 5,800l. Cockpit The glass-cockpit seats a pilot and a co-pilot. It is fitted with two cockpit doors and broad side sliding windows for providing clear visibility to the cockpit crew. The cabin provides plenty of space for passengers on-board. The cabin is incorporated with ventilators, heaters, a hydraulic actuated rear loading door, soundproof and vibration proof systems.It can accommodate 27 fully armed troops or 15 medical stretchers. Armaments The Z-8 is fitted with a HS-12 dipping sonar, sonobuoys and an A244S torpedo under the fuselage section. It is also equipped with YJ-81 or YJ-83K air-to-surface missiles (ASM) for anti-ship operations. The helicopter can accommodate rockets and gunpods on the external pylons for anti-piracy missions. Engines The Z-8 is powered by three Changzhou WZ-6 turboshaft engines, each of which can produce 1,128kW of output power. Two engines are fitted adjacent to each other on the forward fuselage of the main rotor, while the third is integrated behind the main rotor system. It is a Chinese copy of the French-developed Turbomeca Turmo engine. The Z-8F is installed with three Pratt & Whitney Canada PT6A-67B turboshaft engines. Landing gear The helicopter is fitted with a non-retractable tricycle type landing gear comprising two wheels and low air pressure shock absorbers. The hull shaped landing gear allows the helicopter to take-off or land on water during emergencies. Performance The Z-8 can climb at the rate of 690m/min. Its maximum and cruise speeds are 315km/h and 266km/h respectively. The economical cruise speed is 255km/h. The range of the helicopter is 700km and the service ceiling is 3,100m. Its maximum endurance is four hours.

Ka-28 Russian Anti-Submarine Helicopter

Tiers:

Variants:

- **Ka-27PL (Helix-A):** baseline anti-submarine warfare helicopter.
- **Ka-27PS (Helix-D):** is a search and rescue helicopter.
- **Ka-27M:** s a recent improved version. It is being tested and evaluated by the Russian Navy. This helicopter has got new radar and some other improvements.
- **Ka-28 (Helix-A):** is an export version of the Ka-27PL ordered by China, India, Vietnam and Yugoslavia. This version has a revised avionics suite.
- **Ka-29 (Helix-B):** is a naval assault transport helicopter. This helicopter is intended especially for the support of Russian Navy's amphibious operations and featuring a substantially changed airframe. The type entered service in 1985. About 59 of these helicopters were produced. These are in service with Russia and Ukraine.
- **Ka-31:** is an airborne early warning helicopter, based on the basic Ka-29. Its main mission is a long-range detection of airborne and naval threats.
- **Ka-32 (Helix-C):** is a simplified civilian version. It is used in Russia and has been exported to a number of countries. It is even used by some Western countries.
- **Ka-32K:** is a civilian flying crane.
- **Ka-32S:** is a specialized version, designed to operate from icebreakers. It can be used for ice patrolling, search and rescue, oil rig support, and other tasks. This version is fitted with a radar.
- **Ka-32T:** is a civilian transport helicopter. It lacks radar and has simplified avionics. It can carry passengers or freight. It has a payload capacity of 4 000 kg internally or 5 000 kg externally.

System

Alternative Designation: Kamov Ka-28;
Primary Function: Anti-submarine warfare helicopter
Manufacturer: Kamov
In Service: 1982-Present
Crew: ea2 (pilot, navigator) + 1-3 sensor operators
Passenger: The main cabin holds ASW gear or up to 16 passengers
Blades, Main Rotor: 6
Blades, Tail Rotor: No Rail Rotor
Number of Engines: ea2
Day/Night Capable: Yes, due to the Automatic Flight Control System
Takeoff or Landing Limitations: INA
All Weather Capable: Yes, due to the Automatic Flight Control System

Number of Hard Points: INA

Stabilizer: horizontal stabilizer (with elevators) fitted with endplate fins and full-height rudders

Auto-hovering: Yes

Automatic Flight Control System: Yes

Landing Gear: Fixed, quadricycle landing gear

Note: One fully articulated, three-blade assembly is carried close to the roof, rotating counter-clockwise when seen from above. The other three-blade hub is fitted to the upper end of the mast and rotates clockwise. Each assembly has its own pitch change mechanism and each has folding blades. The blades are of all-composite construction and the main rotor hub is made of titanium and steel.

Dimensions

Length: m11.30

Width: m5.65

Height: m5.40

Main Rotor Diameter: m15.90

Weight, Empty: kg6,400

Weight, Normal Takeoff: kg10,700

Weight, Maximum Takeoff: kg11,000

Weight, Internal Payload: kg4,000

Cabin Length: m4.52

Cabin Width: m1.30

Cabin Height: m1.32

Disc Area: 199 m sq

Automotive

Engine Name: 2 x Isotov TV3-117KM turboshaft

Engine Power: hp2,200 shaft hp each

Cruising Range: km800

Speed, Maximum: km/h250

Speed, Cruise: km/h230

Internal Fuel Capacity: 4,720 liters

Ceiling: m6,000

Hovering Ceiling: m3,500

Communications

Radio: Various depending on country and mission

Wing Mounted Weapons

Note: The Ka-28 can be equipment with 1 × torpedoes (AT-1M, VTT-1, UMGT-1 Orlan, APR-2 Yastreb) or 36 RGB-NM & RGB-NM-1 sonobuoys

↳*Torpedoe System*

Name: Torped 45

Type: lightweight torpedo intended for ASW and surface targets, providing multiple-target active/passive homing combined with wire guidance.

Manufacturer: Saab Dynamics (Sweden)

In Service: 1995-Present

Length: mm2,850

Diameter: mm400

Weight: kg320

Engine: Electric DC motor with gearbox

Basic Load: ea3

Guidance System: Hydro-acoustic homing combined with wire guidance and on-board computer

↳*Bomb System*

Note: Additionally, the Ka-27 can carry 10 x PLAB 250-120 anti-submarine bombs

Fire Control and Avionics

Fire Control System Type: INA

Fire Control Radar: INA

Digital or Analog Cockpit: INA

Direct Fire Control: INA

Laser Designator: INA

Submarine Search Radar: Osminog in undernose radome

Doppler Radar: DISS-15 Doppler navigational

Position Location System: Yes

Navigation System: NKV-252 navigation system

Gyroscope: MGV-1V gyroscopic system

Radio Compass: A-031 radio compass

Flight System: PKV-252 flight system

Protection

Fuselage: The fuselage resembles that of the Hormone and has a similar semi-monocoque pod and boom type that has been stretched approximately 5 ft (1.5 m).

Cockpit Glass: unstepped windshield

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW: INA

EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): INA

Notes:

KA-28 The Ka-28 helicopter is an export version of the Ka-27 anti-sub and rescue helicopter of the Russian Navy. Aircraft of the type were mass-produced in Kumertau, with a total of 267 built. By 2000, 33 Ka-28s were assembled. They were sold to China, India, Vietnam, Syria, Yugoslavia and Cuba. Under the 1998 contract, five Ka-28 anti-sub helicopters and three Ka-27PS search and rescue ones were delivered to China, three in 1999 and five in 2000. The ship-based anti-submarine helicopter KA-28 is intended to be used to search, to track and to destroy submarines in under-water and above-water positions, day and night, in simple and complicated weather conditions at the depth of their immersion up to 500 m and travel speeds up to 75 km/h, in the regions being remote from the point of the helicopter basing at the distance up to 200 km. These tasks are fulfilled at the flights from the land aerodromes and from the deck a ship at the sea disturbance up to 5 number. The helicopter is equipped with the inflatable ballonnets system allowing to carry out an emergent landing of the helicopter on the water surface, and also with the blade folding mechanism what makes it possible to considerably diminish the overall dimensions at its storage in the hangars of ships and aerodromes. Coaxial Ka-28 helicopter has two rotors of 15.9-m diameter each. The polymeric composite blades are equipped with electrical thermal de-icing system and blade folding system allowing to keep the helicopter in the ship hangars. Compact airframe with the empennage of a fixed-wing A/C type has four-leg non-retractable landing gear for operating the helicopter from ship decks in the sea state conditions of up to ±10 degrees. The export version of Ka-28 is developed on the basis of Ka-27 and differs from it by some on-board equipment units, "friend-or-foe" identification system and larger fuel system capacity - 4,470 l. The operating ratings of TV3-117VMA engines, developed by the company, headed by Mr. A. Sarkisov, Designer General, were supplemented by higher-power emergency rating in case one of the engines fails. Due to the unique qualities of a coaxial rotor layout the helicopter features high power-to-weight ratio, small dimensions, maneuverability, simplicity of control and safety of flight operations from ship decks in stringent sea conditions and turbulent atmosphere. Simplicity of piloting techniques and perfect flight-navigational package make it possible for one pilot to fly prolonged combat missions above reference-free water surface in any time of the year, day-and-night, and in IFR conditions. After the target is detected the on-board avionics suite in combination with the automatic control system of the helicopter solve the task of bringing the helicopter to the designated point and automatic firing of the weapons selected by the pilot. The flight tests of the upgraded Ka-28 helicopter with new avionics have started to be over in mid-2007. The upgraded version features the Kopyo-A airborne radar developed by the Fazotron-NIIR corporation. The flight tests were expected to be over in the middle of 2008. Several foreign countries have initiated talks with the "Rosoboronexport" over modernization of Ka-28 helicopters supplied to them by the Soviet Union earlier. The "Kopyo-A" new long-range airborne radar has surveillance radius of 250 km. It is a pulse-Doppler X-band multimode radar with high resolution. Kopyo-A ensures all-weather 360-deg surveillance in maritime border patrols. In addition to its main functions, the radar allows making high-resolution maps, as well as identifying and tracking up to ten water objects, searching and detecting aerial targets. It can also be used for navigation, and missile guidance. He added that modernized Ka-28s would be able to launch X-35 air-to-surface and air-to-ship guided missiles. Chinese helicopters have most advanced "Izumrud" (Emerald) search radar system installed.

AW139M Italian Multi-Role Helicopter

Tiers:

Variants:

- **AB139:** Original Italian-built production aircraft, 54 built.
- **AW139M:** Militarized variant, capable of carrying various weapons payloads.
- **HH-139A:** Italian Air Force designation for ten search-and rescue configured AW139Ms.
- **VH-139A:** Italian Air Force designation for two VIP configured AW139s.
- **US139:** Military variant, was the AgustaWestland proposed entry for the US Army Light Utility Helicopter programm in partnership with L-3 Communications.
- **MH-139 Grey Wolf:** This is a militarized variant selected by the U.S. Air Force. It can carry nine fully equipped troops; has a top cruise speed of 135 knots and can fly at least three hours, and a minimum distance of 225 nm, without needing refueling. The helicopter is equipped with an electro-optical/infrared sensor turret under the nose and provisions for machine gun mounts on either side. For some operations, it may be fitted with hoists for search-and rescue or other mission-specific gear.
- **AW139 (long nose configuration):** Long nose variant with increased room for avionics built in Italy and the United States.

System

Primary Function: Utility Helicopter
Crew: 2
Blades, Main Rotor: ea5
Blades, Tail Rotor: ea4
Number of Engines: ea2
Day/Night Capable: Yes
All Weather Capable: Yes
Vertical Climb Rate: INA
Number of Hard Points: INA
Cockpit Options: A Honeywell Primus Epic core avionics system comes in either the basic visual flight rules (VFR),

instrument flight rules (IFR) three-axis automatic flight control system (AFCS), IFR four-axis digital AFCS or SAR versions

Passengers: 15, less if fully equipped, not to exceed 2,500kgs

Litters: ILO passengers, 6 liters with 4 medical personnel

FLIR: Yes

Dimensions

Length, Overall: m16.6

Length, Fuselage: m13.5

Width, Across Cabin: m2.3

Width, Across Sponsons: m3.2

Height: m4.9

Weight, Max Takeoff: kg6,000

Main Rotor Diameter: m13.8

Load, Useful: kg2,500

Load, External: kg2,700

Cabin, Interior Volume: m38

Automotive

Engine Name: Pratt and Whitney Canada PT6C-67C

Engine Type: Turboshafts with FADEC (full-authority digital engine control)

Engine Power: Maximum continuous power of 1,531hp (1,142 kW)

Cruising Range: 750km, 3 hours and 54 minutes without reserves

Speed, Maximum: km/h309

Speed, Average: km/h290

Armament

Note: The AW139M can be armed with Internal and external weapons such as general purpose machine guns, sniper rifles, heavy machine gun pods and 70mm rocket pods, forward firing rockets and machine guns, pintle mounted machine gun and Air-to-Surface Missile (ASM) system. The firing of weapons is controlled by a weapon management system equipped with head up display.

Protection

Note: The low thermal and acoustic signature improves the survivability of the AW139M helicopter. The cockpit and cabin can be equipped with ballistic protection. The crew protection is further improved with armored seats. The helicopter also includes ballistic-tolerant, self-sealing fuel tanks. The onboard missile approach warning system provides threat information to the pilot for actuating the helicopter’s countermeasures. The Counter Measures Dispensing System (CMDS) deceives incoming missiles.

Cockpit Glass: Yes

Stealth Properties: No

Heat Signature Reduction: Yes

Add on Armor: No

NBC Protection: INA

EW: INA

EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): Yes

IR: Low acoustic and infrared (IR) emissions

Notes:

The AW139 is a 15-seat medium-sized twin-engined helicopter developed and built by AgustaWestland, now called Leonardo. It is marketed at several different roles, including military (AW139M), VIP/corporate transport, offshore transport, fire fighting, law enforcement, search and rescue, emergency medical service, disaster relief, and maritime patrol. In addition to AgustaWestland's manufacturing facilities in Italy and the United States, the AW139 is produced in Russia by HeliVert, a joint venture between AgustaWestland and Russian Helicopters. The AW139 was originally designed and developed jointly by Agusta and Bell Helicopters and marketed as the Agusta-Bell AB139, being redesignated AW139 when Bell withdrew from the project. Since entering service in 2003, the AW139 has become one of AgustaWestland's most influential products; it has been subsequently developed into two enlarged medium-lift helicopters, the military-orientated AW149 and the AW189 for the civil market. The AW139 is a conventional twin-engine multi-role helicopter. It has a five-bladed fully articulated main rotor with a titanium hub and composite blades and a four-bladed articulated tail rotor. It is fitted with retractable tricycle landing gear, the two aft wheels retracting into external sponsons which are also used to house emergency equipment. It is flown by a crew of two pilots, with up to 15 passengers accommodated in three rows of five. The AW139 had been aimed at a vacant niche in the market, sitting below larger types such as the Eurocopter AS332 Super Puma and Sikorsky S-92, and above smaller ones like the Bell 412 and Eurocopter EC155. "Rotor & Wing" has described the AW139's flying attitude as 'docile and predictable'. The AW139 is powered by two FADEC-controlled Pratt & Whitney Canada PT6C turboshaft engines; the FADEC system seamlessly adjusts the engines for pilot convenience and passenger comfort, and can automatically handle a single-engine failure without noticeable deviation. It was constructed with maintenance requirements in mind; critical systems can be readily accessed, where possible the number of parts has been reduced, and many components have been designed for an extended lifecycle; a Health and Usage Monitoring System (HUMS) is also equipped. More than a thousand customizable items of equipment can be configured per customer demand, including auxiliary fuel tanks, rescue hoists, cargo hooks, search and weather radar, ice protection systems, external cameras and searchlights, and seating arrangements. The AW139 features a modular glass cockpit, a commonly-installed feature being the four-axis autopilot, which enables functions such as auto-hover capability. The cockpit has been designed to enable single-pilot flight operations under instrument flight rules conditions, and it is also compatible with the use of night vision goggles. Pilot training for the type is available via advanced Level D Full Flight Simulators. According to "Shipping & Marine", the AW139 has "the largest cabin in its class"; containing up to 15 passengers or four litters and accompanying medics, an additional baggage compartment is used to stow equipment to keep the main cabin clear for use. Large sections of the AW139 have been developed and produced by a range of different companies. Airframes are typically produced by PZL-Świdnik, who delivered their 200th airframe in April 2014. Pratt & Whitney Canada produce the type's PT6C turboshaft engines, while the primary and secondary transmissions were developed by Westland GKN and Kawasaki Heavy Industries respectively. A significant portion of the avionics are sourced from Honeywell. Turkish Aerospace Industries has been subcontracted to manufacture various elements of the AW139, including the fuselage, canopy, and radome. Final assembly of most AW139s is performed at AgustaWestland's facilities in Philadelphia, United States, and Vergiate, Italy; those destined for customers within the Commonwealth of Independent States are typically assembled by a third final manufacturing plant in Tomilino, Moscow operated by HeliVert.

H215 Super Puma French Multi-Role Helicopter

Tiers:

1 2 3 4

System

Alternative Designation: H215
Type: Multi-Role Helicopter
Primary Function: The H215 is a 9-ton class twin-engine helicopter in the famous COUGAR / SUPER PUMA family. They combine the rugged experience of the AS532 / AS332 dynamic and basic assemblies with the most advanced avionics of the H225M. They also include full glass cockpit avionics and the latest generation autopilot. These aircraft are reliable, fast helicopters and have outstanding all weather capabilities: a great power reserve and high maneuverability. The powerful MAKILA 1A1 engines give them the ability to fly almost any mission, no matter the temperature and altitude. They ensure maximum operational safety, even in the most difficult situations (discretion, low vulnerability, crash survivability and icing conditions).
Crew: 2 (pilot, co-pilot)
Passengers: 21-25
Number of Engines: ea2
Number of Hard Points: INA

Dimensions

Length: 15.53 m
Height: 4.92 m
Main Rotor Diameter: 15.60 m
Disc Area: 191.1 sq m
Cabin Length: 6.05 m
Cabin Width: 1.80 m
Cabin Height: 1.55 m

Cabin Volume: 11.4 cu m

Empty Weight: 4,265 kg

Maximum Takeoff Weight, with Internal Load: 9,000 kg

Maximum Takeoff Weight, With Sling Load: 9,350 kg

Internal Load Weight: 3,000 kg

Automotive

Engine Name: 2 x Turbomeca Makila 1A

Engine Type: Turboshaft

Engine Power: 1,780 shaft hp each

Cruise Speed: 251 kph

Climb Rate: 426 m/min

Hovering Ceiling, in Ground Effect: 2,800 m

Hovering Ceiling, Out of Ground Effect: 1,650 m

Range, with Internal Tanks: 871 km

Range, with External Tanks: 1,260 km

Main Gun System

Note: mix of air-to-surface missiles, 20-mm; or 7.62-mm gun pods, 7.62-mm door guns, and rocket pods; - or -2 x ASW torpedoes; or 2 x AM 39 Exocet missiles; or up to 6 AS15TT anti-ship missiles

Notes:

The Airbus Helicopters H215 is an evolution of the twin-engine AS332 C1e/L1e aircraft intended for business and industrial operators. The H215 is a versatile, economic and robust helicopter that combines advanced avionics and a reliable platform for rugged multi-mission capabilities. It offers long range capabilities, power, speed, a large useful payload and very good lifting performance in hot and high environments. Both EASA and FAA certified, the aircraft is equipped with the latest, most modern technologies meeting the latest safety requirements of the market. This includes a glass cockpit and the renowned 4-axis autopilot used on the H225. The H215 helicopter was launched in November 2015 and the first production aircraft is scheduled to roll off the assembly line in Romania by 2017.

AS 332 Super Puma (AS 532UC Cougar) French Multi-Role Helicopter

Tiers:

Variants:

- **AS 332 Super Puma/AS 532UC Cougar:** Initial production short fuselage transport version. Seats two crew and 21 passengers. The military version has a reinforced floor.
- **AS 332L1 Super Puma/AS 532UL Cougar:** Long fuselage version. Civil version can carry 20 passengers in an airline interior. Military version can carry up to 25 troops and is equipped with IR suppressors, radar warning receiver, chaff dispensers, flare launchers and armored protection for the crew and passengers.
- **AS 532AC/AL Cougars:** Armed versions of short and long fuselage army Cougars. For tactical transport operations, the AS 532AL can carry 24 troops or 18 troops in crashworthy seats. It has space for six stretchers and 10 seats in casualty evacuation configuration. It can carry 9,900 lb (4,500 kg) of cargo in an external sling. The helicopter can also be equipped with external weapons, including rocket pods and machine guns.
- **AS 532SC Cougar:** Naval version with ASW equipment, anti-corrosion treatment, larger landing gear sponsons, and modifications for shipboard operation including a folding tail-rotor pylon and haul-down system. It is equipped with a full glass cockpit, including active matrix liquid crystal displays (AMLCDs).
- **AS 532U2 Cougar Mk 2/AS 332L2 Super Puma Mk 2:** Fitted with improved Spheriflex rotor head and longer blades (53 ft 1 3/4 in/16.2 m rotor diameter) with parabolic tips, fully articulated four-blade anti-torque rotor, rear fuselage lengthened by 1 ft 5 3/4 in (0.45 m). Cockpit considerably reworked and fitted with Sextant Avionique Electronic Flight Instrumentation System (EFIS) with four multi-function displays (MFD). Uprated Makila engines with better hot and high performance.
- **H215 (AS 332 L1e/C1e):** This is the latest variant of the Super Puma, which was unveiled in November 2012. It features new avionics, including a four-axis autopilot, from the EC 225 helicopter. Certification was scheduled for 2013.
- **AS 332L2 Super Puma Mk 2 VIP:** Variant equipped with an eight to 15 seat interior, full galley and toilet.
- **Horizon:** Helicopter-borne battlefield surveillance radar fitted in an AS 532UL airframe that can detect ground vehicles, slow moving aircraft and ships. It is a flat-plate radar on retractable mount; extends well below the helicopter in flight to provide 360-deg scan. It is linked to a ground station, which provides information to ground commanders.
- **AS 532A2 Combat Search-and-Rescue (CSAR) Cougar:** Specially equipped Cougar Mk II, deployed by French and Saudi air forces. This version is designed to rescue downed pilots behind enemy lines. Specialized equipment that is deployed on this aircraft includes: rescue hoist, FLIR, GPS , searchlight, night-vision-compatible cockpit, infrared and radar jammers, countermeasure launchers, radar warning receiver, missile approach warner and an encrypted position locator system. Armament includes 20-mm cannon and door-mounted .50 caliber machine guns.
- **Growth Super Puma:** In July of 1998, Eurocopter announced the development of a growth version of its Super Puma transport helicopter, called the Mk III, which was designed to compete with such helicopters as Sikorsky's S-92 . A military version was also planned. It was ultimately scrapped in favor of the EC 225/EC 725 , due to high development costs.
- **H225M Caracal/EC 725:** The H225M completed its first flight in November 2000. The H225M is based on the proven fuselage and structural design of the Cougar Mk 2 with a new five-bladed main rotor and reinforced main gearbox. The helicopter also has a suite of integrated displays and piloting system. The H225M can carry a much higher military payload (24,692 lb), at a faster speed (150-170 kts) and a longer distance (800 nm) than its predecessors. Based on the 1990 nomenclature adjustment, the H225 Puma is the civil version of this latest variant. See separate record for more details.

Notes:

The Eurocopter AS332 Super Puma is a four-bladed, twin-engine, medium-size utility helicopter marketed for both civil and military use. Originally designed and built by Aérospatiale, it is an enlarged and re-engined version of the original Aérospatiale SA 330 Puma. First flying in 1978, the Super Puma succeeded the SA 330 Puma as the main production model of the type in 1980; since 1990 Super Pumas in military service have been marketed under the AS532 Cougar designation. In civilian service a next generation successor to the AS 332 was introduced in 2004, the further-enlarged Eurocopter EC225 Super Puma.

Ka-27 Helix Russian Anti-Submarine Helicopter

Tiers:

Variants:

- **Ka-27PL (Helix-A):** baseline anti-submarine warfare helicopter.
- **Ka-27PS (Helix-D):** is a search and rescue helicopter.
- **Ka-27M:** s a recent improved version. It is being tested and evaluated by the Russian Navy. This helicopter has got new radar and some other improvements.
- **Ka-28 (Helix-A):** is an export version of the Ka-27PL ordered by China, India, Vietnam and Yugoslavia. This version has a revised avionics suite.
- **Ka-29 (Helix-B):** is a naval assault transport helicopter. This helicopter is intended especially for the support of Russian Navy's amphibious operations and featuring a substantially changed airframe. The type entered service in 1985. About 59 of these helicopters were produced. These are in service with Russia and Ukraine.
- **Ka-31:** is an airborne early warning helicopter, based on the basic Ka-29. Its main mission is a long-range detection of airborne and naval threats.
- **Ka-32 (Helix-C):** is a simplified civilian version. It is used in Russia and has been exported to a number of countries. It is even used by some Western countries.
- **Ka-32K:** is a civilian flying crane.
- **Ka-32S:** is a specialized version, designed to operate from icebreakers. It can be used for ice patrolling, search and rescue, oil rig support, and other tasks. This version is fitted with a radar.
- **Ka-32T:** is a civilian transport helicopter. It lacks radar and has simplified avionics. It can carry passengers or freight. It has a payload capacity of 4 000 kg internally or 5 000 kg externally.

System

Alternative Designation: Kamov Ka-27; Helix
Primary Function: Anti-submarine warfare helicopter
Manufacturer: Kamov
In Service: 1982-Present
Crew: ea2 (pilot, navigator) + 1-3 sensor operators
Passenger: The main cabin holds ASW gear or up to 16 passengers
Blades, Main Rotor: 6

Blades, Tail Rotor: No Rail Rotor

Number of Engines: ea2

Day/Night Capable: Yes, due to the Automatic Flight Control System

Takeoff or Landing Limitations: INA

All Weather Capable: Yes, due to the Automatic Flight Control System

Number of Hard Points: INA

Stabilizer: horizontal stabilizer (with elevators) fitted with endplate fins and full-height rudders

Auto-hovering: Yes

Automatic Flight Control System: Yes

Landing Gear: Fixed, quadricycle landing gear

Note: One fully articulated, three-blade assembly is carried close to the roof, rotating counter-clockwise when seen from above. The other three-blade hub is fitted to the upper end of the mast and rotates clockwise. Each assembly has its own pitch change mechanism and each has folding blades. The blades are of all-composite construction and the main rotor hub is made of titanium and steel.

Add on Armor: INA
NBC Protection: Yes
EW: INA
EW Counter Measures/CCM: INA
Counter Measures (Chaff/Flares): INA

Notes:

KA-27 Helix A Ka-27, Kamov 'Helix-A is an improved version of the Ka-25. The fuselage was redesigned to give a large increase in cabin room, with only a small increasse in external dimensions. This allows the Ka-27 to operate from the same ships as the Ka-25. As the 1960s drew to a close, the need arose for a new shipboard anti-submarine warfare helicopter to replace the Soviet Navy's main ASW chopper, the Kamov Ka-25 which was becoming obsolescent. The objective was to greatly increase the payload, internal volume and engine power while still allowing the helicopter to use the same deck helipads and shipboard hangars. The design bureau led by Nikolay Il'yich Kamov started work on the new ASW helicopter in 1969. Given the size requirements, the engineers logically chose to retain the preceding model's contra-rotating rotor layout - a feature which had been a Kamov "trademark" from the start. Initially designated Ka-252 (though the designation was later changed to Ka-27), the prototype made its first hover on 8th August 1973 and the first free flight on 24th December 1973 [1974?]. After a period of rigorous testing the helicopter officially entered service with the Soviet Navy in 1981. The KA-27 helicopter is intended to be used for search-rescue provision of aircraft flights over the sea and the land, and also for provision of emergency-rescue operations at the disasters of ships and vessels, at day and night time, in simple and complicated weather conditions at the sea roughness up to 5 number, alone and in combination with ships. To carry out rescue operations, the helicopter is equipped with the winch with lifting capacity 300 kg. The flight-navigation complex of the helicopter allows to conduct an automatically controlled flight of the helicopter according to the pre-set route, a landing of the helicopter on deck a ship and an unloading of the ship without the stoppage of the latter, an autonomous hovering of the helicopter over the pre-determined point, and together with the radar "Osminog", leading out of the helicopter into the point of the flight pre-set by the pilot. An inflatable ballonnet system ensures the floatage of the helicopter in case of its emergency landing on the water surface. The blade folding mechanism allows to considerably diminish the overall dimensions of the helicopter at its storage in the hangars of the ships and aerodromes. The KA-27PS is intended for fulfilling of search and rescue operations and transport transportation at sea and on dry land. High flight-performance data of helicopter and the perfect equipment ensure the fulfillment of the endurance flight above aqueous the surface without reference points and the search for above-water objects at the significant removal from the ship of basing. Onboard radio-electronic complex provides automatic control of helicopter in flight according to route and precise output of helicopter into the calculation point. The KA-27PS helicopter is equipped with all necessary means of the group and individual rescuing of victims. For lifting the victim onboard the helicopter is established the controlled by hydraulics lifting boom with the electric hoist by load capacity 300 kg. for the transport of large-dimension loads on the helicopter KA-27PS additionally it is established the system of external suspension. Helicopter is equipped with the system of the storing of blades for the arrangement in the deck and bilge hangars. For guaranteeing the buoyancy in the case of emergency landing on the aqueous surface the helicopter is supplied [bystronapolnyaemymi] with air by ballonets. Helicopter is capable to accomplish takeoff and landing on the limited ship area with the tossing + -10 The design turned out to be extremely versatile, and specialised versions began appearing before long. The original Ka-27PL ASW chopper was supplemented by the Ka-27PS search and rescue version, the Ka-28 export variant supplied to friendly nations, the civil Ka-32, the armoured Ka-29 assault helicopter for the Soviet Marines and the Ka-31 airborne early warning version with its unusual rotating radar antenna stowed under the belly when not in use. The civil version found use in such varied roles as long line operations and heli-logging, ice patrol and ship support, firefighting, law enforcement and flying crane operations, with specialised sub-variants appearing accordingly. The considerable capabilities of the Ka-32 quickly earned it recognition in the West, attracting orders from such nations as Canada, Switzerland and South Korea, which were certainly not among the usual buyers of Russian hardware.

AS532 Cougar (H215M) French Multipurpose Helicopter

Tiers:

Variants:

- **SA 330 Puma:** Developed in the late 1960s by Aerospatiale in France. Others were built in the UK, Indonesia, Romania.
- **AS 532 Cougar Mk I UC/AC:** is a military version with a short fuselage capable of carrying 21 commandos, which can be fitted with equipment for maximum efficiency in all theaters of operation: radar or missile detector, decoy-launcher. Moreover, its optional equipment make it truly multi-purpose: winch, projector, specific equipment for SAR missions, or, for instance, crashworthy seats, IR camera, NVG compatible cockpit for special missions. The AC version is the armed version and can be equipped with side-mounted machine-guns and axial pods fitted with either 20-mm guns or 68-mm rocket-launchers
- **AS 332 Super Puma:** Differs from the SA 330 Puma through an improved rotor system, upgraded engines, stretched fuselage, and a modified nose shape.
- **AS-532 Cougar Mk I UE:** is the basic version with long fuselage of the military Cougar MK1 range. The aircraft can transport 25 commandos in addition to the crew (1 chief of stick + 24 troop seats). For tactical transport and logistical support missions the Cougar UE is offered "ready for use". Its standard configuration includes a minimum of radio (2 VHF/AM,TRANSPONDER, ICS...) and navigation
- **AS 532 Cougar Mk I UL/AL:** s the "long" version which can carry up to 25 commandos or 6 injured passengers lying down and 10 other people. Like the other versions, it is capable of lifting 4.5 tons on a sling. The Horizon battlefield ground surveillance system can be installed on the AS 532 UL.
- **AS 532 Cougar Mk I SC:** s the naval version of the Cougar, and its main missions are the following: anti-surface unit warface (ASUW) fitted with AM 39 missiles, anti-submarine warfare (ASW) with a variable-depth sonar and torpedoes, and search and rescue and sea patrols.
- **AS 532 Cougar Mk II U2 A2:** helicopter has the biggest cabin volume in its category : 29 commandos or 12 stretchers with medical equipment, and is capable of carrying 5 tons on the sling. This 1992 version is the longest variant of the Cougar line. It has an improved Spheriflex rotor system with only 4x tail rotor blades, and 2x 2,100-shp Turbomeca Makila 1A2 turboshaft engines that allow an increased cargo carrying capability. It can transport 29 troops or 12 litters, or an external load of 5,000 kg. Primarily used for combat search and rescue, and as an armed version. It may be armed additionally with a 20-mm cannon or pintle-mounted .50 caliber machine guns. Its basic design with screens in the cockpit and a 4-axis autopilot with built-in coupler makes it possible to reduce the crew workload and increase its safety for tactical flight by the same degree.
- **AS 535 Cougar Mk II A2 RESCO:** he main mission of the A2 RESCO is to recover aircrews downed in combat areasplant (RESCO is the French acronym for Combat Search and Rescue or CSAR). For very long range operations, the CSAR Cougar Mk 2 can operate at a higher alternate gross weight of 11,200 kg compared to its normal maximum mission weight of 9,750 kg. With this enhanced capability, the Cougar can rescue two crew members 400 nautical miles away.

System

Notes:

The Eurocopter AS532 Cougar (now Airbus Helicopters H215M) is a twin-engine, medium-weight, multipurpose helicopter developed by France. The AS532 is a development and upgrade of the Aérospatiale SA 330 Puma in its militarized form. Its civilian counterpart is the Eurocopter AS332 Super Puma. The AS532 has been further developed as the Eurocopter EC725. The Cougar name was adopted for all military variants, and in 1990, all Super Puma designations were changed from AS 332 to AS 532 to distinguish between civil and military variants. The Cougar was designed to provide high performance, ease of deployment, low operating cost, comfort, plus high mission readiness. For military use and adapting to modern battlefield conditions, it features survivability, suitability for tactical flight thanks to exceptional manoeuvrability, low observability, low vulnerability to projectiles, crashworthiness. A multirole helicopter, the Cougar can be armed with machine-guns and pod-mounted cannons, with rockets, or with antisubmarine or antisurface weapon systems to suit different mission requirements. Additional missions include: VIP transport, electronic warfare, and anti-submarine warfare.

Mi-8AMT Russian Multi-Role Helicopter

Tiers:

Variants:

- **List of Variants - See Below:** Mi-8 Hip-A Mi-8 Hip-B Mi-8T Hip-C (Transportny, transport) Mi-8TM Mi-8TV Mi-8S Hip-C (Salon) Mi-8 VIP Mi-8VZPU Hip-D Mi-8TB Hip-E Mi-8TBK Hip-F (Kommercheskiy, commercial) Mi-9 Hip-G Mi-8MPS Mi-8SMV Hip-J Mi-8P/PPA Hip-K Mi-8AMTSh/Mi-171Sh Mi-8AMTSh-V Mi-8AMTSh-VA Mi-8TG Mi-8 Rana Mi-8MTPR-1 Mi-17/Mi-8MT/Mi-8MTV/Mi-17V Hip-H Mi-17P Mi-17PI Mi-17PG Mi-17Z-II Mi-17MD Mi-17KF Mi-171 Mi-171M/Mi-171A2 Mi-17M/Mi-171V Mi-172 Mi-8MTV (Visotnii, high altitude) Mi-17 Pratap Mi-17-1VA Mi-17V5 Mi-171E Mi-171E2

System

Alternative Designation: Mi-8AMT
Type: Medium twin-turbine Multi-Role helicopter
Manufactuer: Ulan-Ude Aviation Plant
Mission: The helicopter can carry out multiple missions including search and rescue (SAR), surveillance, patrolling, fire-fighting, medical evacuation (MEDEVAC), and observation missions. It can also be deployed for transportation of cargo and personnel.
Crew: ea3 (2x pilots, 1x flight engineer)
Blades, Main Rotor: 5
Blades, Tail Rotor: ea3
Day/Night Capable: The Mi-8AMT is equipped with instruments and avionics allowing operation in day, night, and instrument meteorological conditions.
All Weather Capable: The Mi-8AMT is equipped with instruments and avionics allowing operation in day, night, and instrument meteorological conditions.
Takeoff or Landing Limitations: INA
Vertical Climb Rate: m/s9
Number of Hard Points: ea4

Cargo Capacity: 4,000 kg

Seat Capacity: 37 troop seats or 26 passenger chairs.

Landing Gear: Fixed main gear struts run down and out from attachment points on the upper, rear fuselage. A second strut holds the wheel well away from the lower fuselage. The two-wheel nose gear is fitted under the fuselage just behind the cockpit

Winch: The helicopter is fitted with LPG-150M winch and SLG-300 hoist systems for lifting people during search and rescue tasks.

External Sling: An external sling hydraulic weighing system is attached to carry up to 4,000kg of payload. The helicopter can perform lifting, loading and unloading of freight in-flight.

Note: Additional equipment onboard the Mi-8AMT includes an anti-icing system, fluorescent lighting, a spotlight with IR filter, information and emergency lighting panels, and winches.

Dimensions

Length, with Rotors Turning: m25.2

Length, Fuelage: m18.2

Width: m2.5

Height: m5.65

Main Rotor Diameter: m21.3

Tail Rotor Diameter: m3.9

Cargo Compartment, Length: m5.3

Cargo Compartment, Width: m2.3

Cargo Compartment, Height: m1.8

Weight, Maximum Gross: kg12,000

Weight, Normal Takeoff: kg11,100

Weight, Empty: kg6,350

Automotive

Engine Name: 2 x TV3-117VM

Engine Type: Medium twin-turbine

Engine Power: Each engine develops a take-off power of 2,200 hp and a contingency power of 2,200 hp.

Speed, Maximum: km/h250

Speed, Average: km/h230

Service Ceiling: m4,500

Range, Maximum Load: km350

Range, Normal Load: km460

Range, with Auxilery Fuel: km950

Fuel, Internal: 445 liters

Fuel, Internal Aux Tank: 915 liters ea

Fuel, External Fuel Tank: 45 liters in port tank, 680 liters in starboard tank

Service Ceiling, Service: m4,500

Service Ceiling,Hover (out of ground effect): m800

Service Ceiling,Hover (in ground effect): m1,900

Vertical Climb Rate: m/s9

Note: Maximum operational height is 6,000m, and the helicopter can operate in temperatures ranging between +50°C and -50°C. It can also withstand high winds.

Communications

Radio: INA

Door Mounted Gun

Note: Loaded combat troops can fire personal weapons through windows from inside cabin.

Wing Mounted Weapons

Additional Armament that can be equipped on the Mi-8T: 2 x 7.62-mm or 1 x 12.7-mm MG 4-6 - AT-2C Swatter or AT-3 Sagger ATGMs 4-6 - 57-mm rocket pods (16 each) 2 - 80-mm rocket pods (20 each) 4 - 250-kg bombs 2 - 500-kg bombs 2 - 12.7-mm MG pod 2 - Twin 23-mm gun pods 1,830 liters Additional fuel tanks

↳*Rocket System*

Name: UB-32 (rocket pod)

Type: 57 mm, reusable, 32-salvo rocket pod

Length, Launcher: mm2,080

Diameter, Launcher: mm464

Basic Load for the UB-32 Rocket Pod: ea4, one on each hardpoint

Number of Rockets in each UB-32 Rocket Pod: ea32

↳*Rocket*

Name: S-5 Rockets

Type: Rocket

Length, Rocket: mm2,080

Diameter, Rocket: mm481

Weight Empty: kg103

Weight Loaded: kg264

Warhead Types: produced in a variety of sub-types with different warheads, including HEAT anti-armour (S-5K), high-explosive fragmentation (S-5M/MO), smoke, and incendiary rounds

Maximum Effective Range: 3-4 km depending on the warhead and fuze

Basic Load: 32 S-5 Rockets per UB-32 Rocket Pod

Fire Control

Fire Control System Type: INA

Fire Control Radar: INA

Digital or Analog Cockpit: INA

Direct Fire Control: Yes

Laser Designator: INA

Automated Helmet: INA

Position Location System: Yes

Weather Radar: Type 8A-813

Navigation: DISS-32-90 Doppler navigation under tailboom

Note: Mi-8AMT multi-role helicopter is equipped with advanced navigation and radio communications equipment for improved situational awareness. The latest in-cockpit piloting equipment ensures flight safety. The helicopter also features multifunctional global positioning system (GPS) / global satellite navigation system (GLONASS), a forward looking infrared (FLIR) system and an early ground proximity warning system.

Protection

Armor Type: Bolt-on

Fuselage: semi-monocoque pod and boom fuselage has a nearly stepless front

Cockpit Glass: large, five-section windshield and lower nose windows

Stealth Properties: No

Heat Signature Reduction: IR over engine exhausts

Add on Armor: Available

NBC Protection: Yes

EW: INA

EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): Yes,

Jammer: Hot Brick IR

Notes:

Mi-8AMT is designed to solve a wide range of tasks: transporting passengers and cargo, transporting bulky cargo on an external load, conducting search and rescue operations, evacuating the injured. When developing the Mi-8AMT helicopter, the vast experience of operating more than 12,000 helicopters of the Mi-8 family in all climatic and natural zones was taken into account. “Comfort and safety!” Is the motto under which this passenger helicopter was created. To ensure the safety of passengers, the Mi-8AMT helicopter is equipped with three Class III emergency hatches that meet the requirements of FAR-29, as well as several additional emergency exits. For flights above the water surface, the helicopter is equipped with an emergency landing system, equipped with life jackets. The transport modification upon the customer’s request can be equipped with an additional right extended door, a ladder in the rear part of the cab.

AS 332L1 Super Puma (AS 532UL Cougar) French Multi-Role Helicopter

Tiers:

Variants:

- **AS 332 Super Puma/AS 532UC Cougar:** Initial production short fuselage transport version. Seats two crew and 21 passengers. The military version has a reinforced floor.
- **AS 332L1 Super Puma/AS 532UL Cougar:** Long fuselage version. Civil version can carry 20 passengers in an airline interior. Military version can carry up to 25 troops and is equipped with IR suppressors, radar warning receiver, chaff dispensers, flare launchers and armored protection for the crew and passengers.
- **AS 532AC/AL Cougars:** Armed versions of short and long fuselage army Cougars. For tactical transport operations, the AS 532AL can carry 24 troops or 18 troops in crashworthy seats. It has space for six stretchers and 10 seats in casualty evacuation configuration. It can carry 9,900 lb (4,500 kg) of cargo in an external sling. The helicopter can also be equipped with external weapons, including rocket pods and machine guns.
- **AS 532SC Cougar:** Naval version with ASW equipment, anti-corrosion treatment, larger landing gear sponsons, and modifications for shipboard operation including a folding tail-rotor pylon and haul-down system. It is equipped with a full glass cockpit, including active matrix liquid crystal displays (AMLCDs).
- **AS 532U2 Cougar Mk 2/AS 332L2 Super Puma Mk 2:** Fitted with improved Spheriflex rotor head and longer blades (53 ft 1 3/4 in/16.2 m rotor diameter) with parabolic tips, fully articulated four-blade anti-torque rotor, rear fuselage lengthened by 1 ft 5 3/4 in (0.45 m). Cockpit considerably reworked and fitted with Sextant Avionique Electronic Flight Instrumentation System (EFIS) with four multi-function displays (MFD). Uprated Makila engines with better hot and high performance.
- **H215 (AS 332 L1e/C1e):** This is the latest variant of the Super Puma, which was unveiled in November 2012. It features new avionics, including a four-axis autopilot, from the EC 225 helicopter. Certification was scheduled for 2013.
- **AS 332L2 Super Puma Mk 2 VIP:** Variant equipped with an eight to 15 seat interior, full galley and toilet.
- **Horizon:** Helicopter-borne battlefield surveillance radar fitted in an AS 532UL airframe that can detect ground vehicles, slow moving aircraft and ships. It is a flat-plate radar on retractable mount; extends well below the helicopter in flight to provide 360-deg scan. It is linked to a ground station, which provides information to ground commanders.
- **AS 532A2 Combat Search-and-Rescue (CSAR) Cougar:** Specially equipped Cougar Mk II, deployed by French and Saudi air forces. This version is designed to rescue downed pilots behind enemy lines. Specialized equipment that is deployed on this aircraft includes: rescue hoist, FLIR, GPS , searchlight, night-vision-compatible cockpit, infrared and radar jammers, countermeasure launchers, radar warning receiver, missile approach warner and an encrypted position locator system. Armament includes 20-mm cannon and door-mounted .50 caliber machine guns.
- **Growth Super Puma:** In July of 1998, Eurocopter announced the development of a growth version of its Super Puma transport helicopter, called the Mk III, which was designed to compete with such helicopters as Sikorsky's S-92 . A military version was also planned. It was ultimately scrapped in favor of the EC 225/EC 725 , due to high development costs.
- **H225M Caracal/EC 725:** The H225M completed its first flight in November 2000. The H225M is based on the proven

fuselage and structural design of the Cougar Mk 2 with a new five-bladed main rotor and reinforced main gearbox. The helicopter also has a suite of integrated displays and piloting system. The H225M can carry a much higher military payload (24,692 lb), at a faster speed (150-170 kts) and a longer distance (800 nm) than its predecessors. Based on the 1990 nomenclature adjustment, the H225 Puma is the civil version of this latest variant. See separate record for more details.

AS 332L1 Super Puma/AS 532UL Cougar Long fuselage version of the AS 332 Super Puma. Civil version can carry 20 passengers in an airline interior. Military version can carry up to 25 troops and is equipped with IR suppressors, radar warning receiver, chaff dispensers, flare launchers and armored protection for the crew and passengers. It can also be equipped for VIP missions and search-and-rescue operations.

SA-321 Super Frelon (Super Hornet) French Multi-Role Helicopter

Tiers:

Variants:

- **SA 321G:** Anti-submarine warfare version for the French Navy, it was powered by three Turbomeca IIIC-6 turboshaft engines; 26 built.
- **SA 321Ga:** Utility and assault transport helicopter for the French Navy.
- **SA 321GM:** Export version for Libya, fitted with Omera ORB-32WAS radar.
- **SA 321H:** Export version for Iraq, it was powered by three Turbomeca Turmo IIIE turboshaft engines, fitted with Omera ORB-31D search radar, and armed with Exocet anti-ship missiles.
- **SA 321F:** Commercial airline helicopter, powered by three Turbomeca IIIC-3 turboshaft engines, with accommodation for 34 to 37 passengers.
- **SA 321J:** Commercial transport helicopter and accommodation for 27 passengers.
- **SA 321Ja:** Improved version of the SA 321J.
- **SA 321K:** Military transport version for Israel.
- **SA 321L:** Military transport version for South Africa, fitted with air inlet filters.
- **SA 321M:** Search and rescue, utility transport helicopter for Libya.
- **Changhe Z-8:** Chinese built version with three Changzhou Lan Xiang WZ6 turboshaft engines.
- **Changhe Z-8A:** Army transport.
- **Changhe Z-8F:** Chinese built version with Pratt & Whitney Canada PT6B-67A turboshaft engines.
- **Changhe Z-8AEW:** Chinese AEW helicopter with retractable radar antenna, AESA radar, 360 degree coverage, redesigned nose similar to the AC313, and FLIR.
- **Changhe Z-8L:** Chinese variant with enlarged fuel sponsons, first spotted in January 2019

System

Alternative Designation: SA 321 Super Frelon; Super Hornet
Capabilities: Anti-Submarine Warfare; Anti-ship; Commercial Market; Search and Rescue; Reconnaissance; Special Forces
Type: Chinese Multi-Role Helicopter
Manufacturer: Sud Aviation Aérospatiale
In Service: 1966-Present
Crew: ea3
Passenger Capacity: It can accommodate 27 fully armed troops or 15 medical stretchers.
Blades, Main Rotor: 6
Blades, Tail Rotor: ea5
Number of Engines: ea3
Day/Night Capable: Yes

All Weather Capable: Yes

Hoist and Basket for SAR: Available

Hoist and Winch: Available, 275kg hoist and winch

Number of Hard Points: ea2

Dimensions

Fuselage Length: m20.27

Weight, MTOW: kg13,000

Main Rotor Diameter: m18.9

Tail Rotor Diameter: m4

Whole Cabin Volume: 28.9m3

Main Rotor Disc: 280.48m2

Tail Rotor Disc: 12.57m2

Maximum Payload Capacity: 4,000kg

Maximum Payload Capacity with Sling Loads: 5,000kg

Automotive

Engine Name: 3 x Turbomeca Turmu IIIC Turboshaft Engines

Number of Engines: ea3

Engine Type: Turboshaft

Engine Power: 1,570 hr each engine

Maximum Range: km1,020

Speed, Maximum: km/h275

Ceiling: m3,150

Rate of Climb: 401 meters per min

Vertical Climb Rate: 6.66 m/s

Main Rotor Blade: Six-Bladed

Tail Rotor Blade: Five-Bladed

Fuel Capacity: 3,900 liters

Fuel Capacity, Internal Aux: 1,900 liters

Endurance: 4 hours

Landing Gear: non-retractable tricycle type landing gear comprising two wheels and low air pressure shock absorbers.

Communications

Radio: INA

Wing Mounted Weapons

Note: The helicopter can accommodate rockets and gun pods on the external pylons for anti-piracy missions.

↳*Missile System (Option 1)*

Name: YJ-8 (CSS-N-4 Sardine)

Type: Surface-launched subsonic anti-ship cruise missile.

Manufactuer: China Aerospace Science and Industry Corporation

In Service: 1980s-Present

Length: m5.81

Width: INA

Weight: kg815

Warhead Type: High-explosive fragmentation

Warhead Weight: kg165

Engine: Rocket

Propellant: Solid Rocket

Operational Range: km42

Flight Altitude: m5-7

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Basic Load: ea2

↳*Missile System (Option 2)*

Name: YJ-83 (CSS-N-8 Saccade)

Type: Subsonic anti-ship cruise missile

Manufacturer: China Aerospace Science and Industry Corporation

In Service: 1998-Present

Length: INA

Diameter: INA

Warhead Type: High-explosive fragmentation

Warhead Weight: kg190

Operational Range: km180

Speed: Mach 0.9

Guidance System: Inertial navigation/active radar homing terminal guidance

Basic Load: ea2

↳***Torpedo***

Name: A244S Torpedo

Type: Fire and Forget Torpedo

Length: m2.75

Diameter: mm324

Muzzle Velocity: INA

Effective Firing Range: km13.5

Maximum Firing Range: 6 km for Mod. 1, 13.5 km for Mod. 3

Filling: high explosive STANAG 4439 and MURAT-2 compliant

Detonation Mechanism: Various

Note: The Torpedo can be launched from surface vessels or from aircraft, and locates the target by means of an acoustic seeker.

Cockpit Glass: Ballistic

Stealth Properties: No

Add on Armor: INA

NBC Protection: Yes

EW: INA

EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): Yes

Notes:

The Aérospatiale (formerly Sud Aviation) SA 321 Super Frelon ("Super Hornet") is a three-engined heavy transport helicopter produced by aerospace manufacturer Sud Aviation (later Aérospatiale) of France. It held the distinction of being the most powerful helicopter to be built in Europe at one point, as well as being the world's fastest helicopter. The Super Frelon was a more powerful development of the original SE.3200 Frelon, which had failed to enter production. On 7 December 1962, the first prototype conducted the type's maiden flight. On 23 July 1963, a modified Super Frelon flew a record-breaking flight, setting the new FAI absolute helicopter world speed record with a recorded speed of 217.7 mph (350.4 km/h). Both civilian and military versions of the Super Frelon were produced; the type was predominantly sold to military customers. In 1981, Aerospatiale, Sud Aviation's successor company, chose to terminate production due to a lack of orders. The Super Frelon was most heavily used by naval air arms, such as the French Navy and the People's Liberation Army Naval Air Force. On 30 April 2010, the type was retired by the French Navy, having been replaced by a pair of Eurocopter EC225 helicopters as a stopgap measure pending the availability of the NHIndustries NH90 helicopter. The Super Frelon was in use for an extended period within China, where it was manufactured under license and sold by the Harbin Aircraft Industry Group as the Harbin Z-8. A modernised derivative of the Z-8, marketed as the Avicopter AC313, performed its first flight on 18 March 2010. The Aérospatiale SA 321 Super Frelon is a large, heavy-lift single-rotor helicopter, furnished with a relatively atypical three-engine configuration; these are Turboméca Turmo IIIC turboshaft engines set on top of the fuselage, a pair of turbines positioned side by side at the front and one located aft of the main rotor. The naval anti-submarine and anti-ship variants are usually equipped with navigation and search radar (ORB-42), and a 50-metre rescue cable. They are most often fitted with a 20 mm cannon, countermeasures, night vision, a laser designator and a Personal Locator System. The Super Frelon can also be fitted for inflight refueling. The front engines have simple individual ram intakes, while the rear one is fitted with a semi-circular scoop to provide air; all three bifurcated exhausts are near to the rotor head. The three engines and the reduction gearbox are mounted on a horizontal bulkhead and firewall which forms the roof of the cabin and upper structural member of the fuselage. The engines are isolated by multiple firewalls, including transverse firewalls separating front and rear engines from the rotor gearbox, and zonal engine firewalls. Eight sturdy hinged doors provide access to the compact Turmo engines, which have ample space around them to enable ground crew to service them without using external platforms. The fuselage is actually a hull, which makes use of a semi-monocoque light alloy construction; according to aerospace publication Flight International, the hull design was "reminiscent of flying-boat engineering". The main cabin lacks any transverse bracing, except for a single bulkhead between the cockpit and cabin. Substantial built-up frames connect the strengthened roof structure with the floor/planing-bottom of transverse under-floor bulkheads and outer skin. A conventional exterior skin is used, employing longitudinal stiffeners as well as two lines of deep channel members, while the under-floor cross members are reinforced with vertical stiffeners. There is no keel, at the floor level there are horizontal members between frames which are stiffened by transverse shear angles. Flexible fuel cells are stored in four watertight under-floor compartments lying fore and aft of the rotor axis, while the floor itself is fitted with removable panels. A hatch set into the floor, positioned approximately underneath the rotor axis, is used for sling-load operations. At the rear of the cabin is a tapered section of simple semi-monocoque construction, which is closed by a robust hinged rear loading ramp, which serves as the main entrance for bulky loads or equipment. The loading ramp is jettisonable in emergency situations. Additionally, there is a sliding door located on the forward starboard side, while a small hinged emergency door is set on the aft port side. The tail boom uses conventional semi-monocoque construction, supported by closely spaced notched channel-section frames and continuous stringers, absent of any major longitudinal sections or longerons. The cranked section carrying the tail rotor and trim plane is more robust, strengthened by a solid-web spar, frames, and stiffeners. The juncture of the main boom and cranked section is hinged in order to reduce the rotorcraft's folded length to 58 ft. Along the top of the boom, the shaft for the tail rotor is covered by a fairing. The fixed landing gear has twin wheels on each of the three vertical shock absorber-equipped struts. The main leading gear units are mounted on triangulated tubular structures, while the nose gear is bracketed to the cockpit bulkhead via a watertight seal in the planing bottom. The main wheels have hydraulic brakes operated from the pedals, complete with a parking hand brake, while the nose unit is fully castoring. The nose, which is covered by large glazed panels, has a bow chine and planing bottom built as a unit with the flight deck, which is higher than the main cabin floor

OH-1 Japanese Light Scout and Observation Helicopter

Tiers:

Variants:

- **AH-2:** Proposed attack helicopter derivative that would have featured uprated engines and additional anti-tank armaments; rejected in favour of Boeing AH-64 Apache.
- **UH-X utility helicopter:** Technology developed by Kawasaki for the OH-1 is being integrated into a new aircraft design, the UH-X , in order to "reduce technological risks associated with development and appropriately control life cycle costs," according to the company. The new aircraft is expected by 2017, according to a Shephard Media release dated May 29, 2012. Kawasaki has proposed a new cabin, transmission, avionics and engines for the utility version, including a new control system, rotor hub and enhanced rotor-blade transmission protection. In fiscal year 2006, Tokyo began funding development of a more powerful engine (with a goal of 1,300 shp). More than 120 helicopters are needed to meet the JGSDF requirement for a utility helicopter. Fuji Heavy Industries was selected as prime contractor for the UH-X helicopter program in July 2015. The aircraft will be based on the Bell 412 twin-engine utility helicopter.

System

Alternative Designation: Kawasaki OH-1 Japanese Light Scout and Observation Helicopter
Type: Attack Helicopter
Primary Function: Reconnaissance missions, Ground attack and Close-Air Support
Manufacturer: Kawasaki
Crew: ea2
Blades, Main Rotor: ea4
Number of Engines: ea2
Main rotor diameter: m11.6
Main rotor area: ft1138
Tail Rotor, Name: Fenestron (fantail) tail rotor
Blades, Tail Rotor: ea8-18
Number of Hard Points: Hardpoints: 4 × pylons for rockets, gun pods, anti-tank missiles, or Type 91 air-to-air missiles
Note #1:: Each crew member has two LCD colour multi-function displays, and the gunner has a head-up display. The mission avionics include a trainable roof-mounted Kawasaki package (forward of the main rotor) with a Fujitsu thermal imager, NEC colour TV camera and NEC laser rangefinder. Protection is enhanced by the installation of an infra-red jammer on the helicopter's spine to rear of the main gearbox.

Notes:

The Kawasaki OH-1 (nickname: "Ninja") is a military scout/observation helicopter developed and manufactured by the Kawasaki Aerospace Company. The primary operator is the Japan Ground Self-Defense Force (JGSDF), who originally procured the OH-1 as a domestically-produced successor to their existing OH-6D Loach fleet. The OH-1 has the distinction of being the first helicopter to be entirely produced in Japan. In addition to its use an observation helicopter, it can also be armed with various munitions to directly participate in combat; such weapons include a limited quantity of anti-tank missiles or air-to-air missiles for self-defense purposes. Several variants of the OH-1 have been proposed, these have included derivatives of the type to serve as an attack helicopter as well as an aborted project to develop utility helicopter based on OH-1. As of March 2014, a total of 38 OH-1s have entered service with the JGSDF, so far these have complemented the existing OH-6Ds rather than replace them.

BO-105 German Light Utility Helicopter

Tiers:

Variants:

- **Bo 105A:** First production model primarily for civil use and equipped with two Allison 250-C18 turbine engines.
- **Bo 105ATH:** Anti-tank version for the Spanish Army.
- **Bo 105C:** Initial version. Developed in 1972 and equipped with two Allison 250-C20 turbines engines.
- **Bo 105CB:** Light observation, utility transport version. Developed in 1976 and equipped with two Allison 250-C20B turbine engines of which 30 were delivered to The Royal Netherlands Air Force.[
- **Bo 105CBS:** Utility transport version, with the fuselage stretched by 10 inches and an extra window for emergency medical service duties
- **EC-Super Five:** High performance version of the Bo 105CBS.
- **Bo 105CBS-5:** Also known as Superfive, with increased lifting capabilities similar to the LS A3 Superlifter
- **Bo 105D:** UK certified offshore version.
- **Bo 105GSH:** Armed scout version for the Spanish Army.
- **Bo 105HGH:** A high speed research variant wint aerodynamic refinements, such as a rotor head fairing, rear fuselage fairing, small individual skids and 6 m (20 ft) long fixed auxiliary wings.
- **Bo 105 KLH:** license-produced combat version of CBS-5 custom-fitted with Korean mission equipment package including communication, navigation, electronic warfare and target acquisition system, to meet Republic of Korea Army's operational requirements. KLH also has greatly improved rotor blade and transmission system. 12 are in service.
- **Bo 105LOH:** Observation version for the Spanish Army.
- **Bo 105LS A1:** Developed in 1984 with stretched fuselage and two Allison 250-C28C turbine engines.
- **Bo 105LS A3:** Developed in 1986 with maximum take-off weight increased to 2,600 kg.
- **Bo 105LS A3 "Superlifter":** Developed in 1995 with maximum mission weight increased to 2,850 kg.
- **Bo 105M:** With its army designation "VBH" (Verbindungshubschrauber; 'liaison chopper'), is a light transport and surveillance helicopter
- **Bo 105MSS:** Maritime version, fitted a search radar.
- **Bo 105P/BSH:** Proposed escort version for the German Army, armed with Stinger air-to-air missiles.
- **Bo 105P/PAH-1:** With its army designation "PAH-1" and "PAH-1A1" for the upgraded version (PAH=Panzerabwehrhubschrauber; 'Tank-defence helicopter'), is an anti-tank helicopter armed with wire-guided HOT ATGMs (HOT2 for the upgraded A1 version).
- **Bo 105P/PAH-1A1:** Improved anti-tank version for the German Army, fitted with six HOT missile tubes.[
- **Bo 105P/PAH-1 Phase 2:** Proposed night attack version for the German Army
- **Bo 105S:** Search and rescue version.
- **Bo 105/Ophelia:** Test and trials aircraft fitted with a mast-mounted sight.
- **NBO-105:** Were Manufactured by IPTN under license from MBB (now Airbus Helicopters) 1976–2011; only rotors and transmission now supplied by Germany; originally NBO-105 CB, but stretched NBO-105 CBS available from 101st

aircraft onwards. 122 were produced, Dirgantara Indonesia stopped production in 2008.

- **Bo 105 Executaire:** Boeing Vertol and Carson Helicopters manufactured a 24.5 cm stretched version of the Bo 105 under license as the Executaire in an attempt to break into the U.S. light helicopter market, but sales were dismal.
- **Bo 105E-4:** 12 German Army Bo 105P upgraded and overhauled for a 10 million euro contract and donated to Albania first batch delivered in 2006, the helicopters have better performance and avionics. The conversion of other Bo 105 helicopters from the German Armed Forces is also under consideration with a view to future sales.
- **Bo 106:** Widened cabin to seat 7 instead of 5. First flight was on 26 September 1973. A single helicopter of that variant has been made (registration D-HDCI, serial no. 84). The Bo 106 was also equipped with more powerful Allison 250 C 20B engines. In 1981, the German air rescue organization Deutsche Rettungsflugwacht/DRF Luftrettung bought that prototype and had it rebuilt into a 105 CB-2 with a standard cabin. It flew for DRF until November 1993 under the registration D-HCCC, but in 1994 it was put aside to gain spare parts for another DRF helicopter (Bo 105 CBS-S, registration D-HNNN, serial number 662).
- **PADC Hummingbird:** An unlicensed development of the Bo 105C with revised cockpit structure.

System

Alternative Designation: B0-105, MBB BO 105, Messerschmitt-Bölkow-Blohm Bo 105

Primary Function: light, twin-engine, multi-purpose helicopter

Manufacturer: Messerschmitt-Bölkow-Blohm (MBB)

In Service: 1970-Present

Crew: ea1 or 2

Passengers: ea4-5

Blades, Main Rotor: 4

Blades, Tail Rotor: ea2

Number of Engines: ea2

Day/Night Capable: Yes

All Weather Capable: Yes

Takeoff or Landing Limitations: INA

Number of Hard Points: INA

Skids: The main body rests on a pair of skids (with optional flotation skids for seagoing helicopters).

Note: The rotor system is entirely hingeless, the rotor head consisting of a solid titanium block to which the four blades are bolted;

Dimensions

Length: m11.6

Width: m2.53

Height: m3.00

Rotor Diameter: m9.84

Tailrotor Diameter: m1.90

Weight, Empty: kg1,433 kg

Weight, Takeoff: kg2,500 kg

Weight, Sling Load: kg1,200 kg

Automotive

Engine Name: 2 x Allison 250-C 20B Turbine

Engine Type: Turbine

Engine Power: hp400

RPM: 424

Cruising Range: km528

Speed, Maximum: km/h243

Speed, Cruise: km/h204

Ceiling: 5,180 m

Fuel Capacity: 570 liters

Hover Ceiling IGE: 1,829 m

Hover Ceiling OGE: 1,158 m

Climb Rate: 7.4 m/sec

Endurance: 3 hr 30 min (standard fuel, maximum payload)

Airfoil: NACA 23012

Communications

Radio: Various depending on country and mission

Wing Mounted Weapons

↳*Missile System*

Name: HOT (missile)

Type: High Subsonic, Optical, Remote-Guided, Tube-Launched ATGM Missile

Manufacturer: Euromissile (now MBDA)

In Service: 1977-Present

Variants: HOT 1, HOT 2, HOT 3

Length: m1.30

Diameter: m0.15

Weight: kg24.5

Wingspan: m0.31

Basic Load: ea6

Warhead Type: Tandem charge HEAT

Engine: Two-stage solid fuel rocket

Operational Range: m75-4,300

Speed: 864 km/h

Guidance System: SACLOS

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: Available

NBC Protection: Yes

EW: INA

Counter Measures (Chaff/Flares): INA

Notes:

The Messerschmitt-Bölkow-Blohm Bo 105 is a light, twin-engine, multi-purpose helicopter developed by Bölkow of Ottobrunn, West Germany. It was the first light twin-engine helicopter in the world, and the first rotorcraft that could perform aerobatic maneuvers such as inverted loops.[5][6] The Bo 105 features a revolutionary hingeless rotor system, at that time a pioneering innovation in helicopters when it was introduced into service in 1970. Production of the Bo 105 began at the then-recently merged Messerschmitt-Bölkow-Blohm (MBB). The BO105 is considered a rugged, time-proven design. It is easily maintained in the field and is highly maneuverable in flight due to a unique hingeless main rotor system. The compact cabin has a flat floor, rear clamshell doors and provides excellent visibility for the pilot. The main production facilities for producing the Bo 105 were located in Germany and Canada; due to the level of export sales encountered, additional manufacturing lines were set up in Spain, Indonesia, and the Philippines.[7] MBB became a part of Eurocopter in 1991, who continued production of the type until 2001. The Bo 105 was formally replaced in Eurocopter's product range by the newer Eurocopter EC135, which was itself a development of the Bo 105.

SA-341/342 Gazelle French Light Utility Helicopter

Tiers:

Variants:

- **SA 341H:** Can carry 4x AT-3 ATGMs, and 2x SA-7, or 128-mm or 57-mm rockets, and 7.62-mm machinegun in cabin.
- **SA 341H:** Export variant.
- **SA 342L:** Export light attack variant with Astazou XIVM engine.
- **SA 342L:** Export light attack variant with either rocket pods or Machine guns.
- **SA 342K:** Armed antitank version with 4-6x HOT ATGMs and 7.62- mm MG. Missile Weight (kg): 32 (in tube). Warhead: Tandem shaped Charge. Armor Penetration (mm CE): 1250. Maximum Range (m): 75/4,000. Rate of fire (missiles/min): 3-4, depending on range.
- **SA 342M:** Armed version with 4 x HOT ATGMs, 2x Mistral AAM, 7.62-mm MG.
- **SA 341 GAZELLE:** Developed by Aerospatiale in France. Others were built in the UK by Westland, and in Yugoslavia.
- **SA 341F:** Production version for French Army. A GIAT M.621 20-mm cannon is installed on right side of some aircraft. Rate of fire is either 300 or 740 rpm. Upgraded engine to Astazou IIIC.
- **SA 342K:** Armed SA 341F with Upgraded 870-shp Astazou XIVH engine, mostly exported to the Middle East
- **SA 342M:** Improved ground attack variant for French Army, with 4-6 HOT ATGMs, possibly fitted with Mistral air- to-air missiles. Similar to SA 342L, but with improved instrument panel, engine exhaust baffles to reduce IR signature, navigational systems, Doppler radar, and other night flying equipment. Fitted with Viviane FCS with thermal sight for night attack. This the Hybrid Threat Tier 1 baseline light helicopter.
- **SA 341B/C/D/E:** Production versions for British military. Used in communications and training and roles

System

Alternative Designation : SA 341 Gazelle
Crew : ea1 or 2 (pilots)
Type: Light Utility Helicopter
Manufacturer: AEROSPATIALE, WESTLAND
Role: real time air to air defense, overall defense operations against enemy helicopters and slow-moving aircraft.
In Service: 1973-Present
Crew: ea1 or 2

Transports: 3 troops or 1 litter, or cargo.

Main Rotor, Blades : ea3.0

Notes:

The Aérospatiale Gazelle (company designations SA 340, SA 341 and SA 342) is a French five-seat helicopter, commonly used for light transport, scouting and light attack duties. It is powered by a single Turbomeca Astazou turbine engine and was the first helicopter to feature a fenestron tail instead of a conventional tail rotor. It was designed by Sud Aviation, later Aérospatiale, and manufactured in France and the United Kingdom through a joint production agreement with Westland Aircraft. Further manufacturing under license was performed by SOKO in Yugoslavia and the Arab British Helicopter Company (ABHCO) in Egypt. Since being introduced to service in 1973, the Gazelle has been procured and operated by a number of export customers. It has also participated in numerous conflicts around the world, including by Syria during the 1982 Lebanon War, by Rwanda during the Rwandan Civil War in the 1990s, and by numerous participants on both sides of the 1991 Gulf War. In French service, the Gazelle has been supplemented as an attack helicopter by the larger Eurocopter Tiger, but remains in use primarily as a scout helicopter.

Mi-2 (Hoplite) Russian Small Transport Helicopter

Tiers:

Variants:

- **Mi-2B:** Upgrade with improved navigation and electrical systems
- **Mi-2R:** Ambulance version that carries 4x litter patients
- **Mi-2T:** Transport version that carries 8 personnel.
- **Mi-2URN:** Armed reconnaissance variant, employs 57-mm unguided rockets, and mounts a gun sight in the cockpit for aiming all weapons.
- **Mi-2URP:** The antitank variant. Carries 4x AT-3C Sagger ATGMs on external weapons racks, and 4x additional missiles in the cargo compartment.
- **Mi-2US:** The gunship variant, employs an airframe modification that mounts a 23-mm NS-23KM cannon to the portside fuselage. It also employs 2x 7.62-mm gun pods on external racks, and 2x 7.62-mm pintle-mounted machineguns in the cabin.
- **PZL Swidnik:** A Polish-produced variant under license from Russia. It features minor design changes, but same performance, characteristics, and missions. Polish MOD officials will upgrade the gunship version with a new ATGM. Likely choice is between the Israeli 6 km FOG-M Spike-ER missile, and the 4 km HOT-3. The 4-missile launcher will also have a thermal night sight.

↳*SURVIVABILITY/COUNTERMEASURES*

Description: Main and tail rotor blades electrically deiced.

↳*ARMAMENT*

Description: The Lynx employed by ground forces can be equipped with two 20-mm cannons mounted externally to permit 7.62-mm machineguns to be fired from the cabin. Two fuselage pylons allow for external stores.

↳*AVIONICS/SENSOR/OPTICS*

Description: The cannon is pilot sighted, and fire is adjusted by controlling attitude of the aircraft.

↳*NIGHT/WEATHER CAPABILITIES*

Description: The Mi-2 is primarily a daylight only aircraft.

Notes:

The Mil Mi-2 (NATO reporting name Hoplite) is a small, lightly armed turbine-powered transport helicopter that could also provide close air support when armed with 57 mm rockets and a 23 mm cannon. The Mi-2 was produced exclusively in Poland, in the WSK "PZL-Świdnik" factory in Świdnik. The first production helicopter in the Soviet Union was the Mil Mi-1, modelled along the lines of the S-51 and Bristol Sycamore and flown by Mikhail Mil's bureau in September 1948. During the 1950s it became evident, and confirmed by American and French development, that helicopters could be greatly improved with turbine engines. S. P. Isotov developed the GTD-350 engine and Mil used two of these in the far superior Mi-2. The twin shaft-turbine engines used in the Mi-2 develop 40% more power than the Mi-1's piston engines, for barely half the engine weight, with the result that the payload was more than doubled. The Mi-2 fuselage was extensively altered from its predecessor, with the engines mounted overhead. However, the external dimensions remained similar. The Mil-built prototype first flew in the Soviet Union on 22 September 1961, after the initial development the project was transferred to Poland in 1964. The first Świdnik-built example flew on 4 November 1965 (making this the only Soviet-designed helicopter to be built solely outside the Soviet Union). PZL-Świdnik produced a total of 5,497 helicopters, about a third for military users. The factory also developed fiberglass rotor blades, and developed the wide-body Mi-2M seating 10 passengers instead of eight. Most typical role-change kits include four stretchers for air ambulance usage, or aerospraying or cropdusting applications. In Poland, several specialized military variants were also developed for support or reconnaissance roles, with 23 mm autocannon, machine guns and/or two 57 mm rocket pods, four 9K11 Malyutka anti-tank missiles or Strela-2 AA missiles. The Mi-2 was first introduced into the Soviet Air Force in 1965. The Mi-2 is used by mainly former Soviet and Eastern Bloc countries, although it was also purchased by Mexico and Myanmar armed forces. Most of the armed Mi-2 variants were used by Poland. Some were also used by the former East Germany (with machine gun and unguided rocket armament only). North Korea still maintains a large active fleet of Mi-2s.

MD 530F Cayuse Warrior American Scout Attack Helicopter

Tiers:

Parent:

MD 500 Defender American Light Multi-Role Helicopter

Variants:

- **500D Scout Defender:** Armed reconnaissance version
- **500M Defender:** Military export version of the 500 and 500C, built under license by Kawasaki in Japan (as the OH-6J)[7] and Breda Nardi in Italy.
- **500M/ASW Defender:** Export version for the Spanish Navy.
- **NH-500M Defender:** Italian-built version of the 500M Defender. Licensed by Breda Nardi before merge with Agusta.
- **500MD Defender:** Military version of the 500D. Korean Air's aerospace division from 1976 to 1984 with 200 choppers made. 50 were armed with TOW anti-tank missiles and 150 choppers used for transportation and support duties.
- **500MD/ASW Defender:** Maritime version of the 500MD Defender.
- **500MD/TOW Defender:** Anti-tank version of the 500MD Defender, armed with TOW anti-tank missiles.
- **500MD/MMS-TOW Defender:** Anti-tank version, fitted with a mast-mounted sight, armed with TOW anti-tank missiles.
- **500MD Quiet Advanced Scout Defender:** Fitted with noise suppression equipment.
- **500MD Defender II:** Improved version.
- **500MG Defender:** Military version of the 500E.
- **520MG Defender:** Philippine military version. Special Forces version. Modified 500MG Defender that carry .50 caliber machine guns and 7-tube rocket pods and operates as a light attack aircraft.
- **520MK Black Tiger:** South Korean-built military version, built by Korean Air Aerospace Division[
- **530MG Defender:** Military version of the 530F.
- **MD530 Nightfox:** Night attack version.
- **MD530MG Paramilitary Defender:** Police or border patrol version.
- **MD540F:** Upgraded MD530F, incorporating a 6-bladed, fully articulated rotor blade system made of composite material, a more rugged landing skid for heavier take-off and landing weights, a fully integrated digital glass cockpit with multi-function color displays and a pilot Helmet Display and Tracking System (HDTS), which couples together a targeting FLIR and laser designator.
- **MD530G:** Designed based on the MD 530F airframe and is engineered with advanced technology to deliver enhanced combat capabilities.

System

Alternative Designation: MD530 Cayuse Warrior

Type: Light multi-role military helicopter

Manufacturer: Hughes Helicopters McDonnell Douglas Helicopter Systems MD Helicopters

In Service: 2011-Present

Crew: ea2 (pilot, co-pilot)

Passengers: + 6 troops

Blades, Main Rotor: five-blade main rotor, many with four-blade anti-torque rotor

Blades, Tail Rotor: ea2

- **SA 341F:** Production version for French Army. A GIAT M.621 20-mm cannon is installed on right side of some aircraft. Rate of fire is either 300 or 740 rpm. Upgraded engine to Astazou IIIC.
- **SA 342K:** Armed SA 341F with Upgraded 870-shp Astazou XIVH engine, mostly exported to the Middle East
- **SA 342M:** Improved ground attack variant for French Army, with 4-6 HOT ATGMs, possibly fitted with Mistral air- to-air missiles. Similar to SA 342L, but with improved instrument panel, engine exhaust baffles to reduce IR signature, navigational systems, Doppler radar, and other night flying equipment. Fitted with Viviane FCS with thermal sight for night attack. This the Hybrid Threat Tier 1 baseline light helicopter.
- **SA 341B/C/D/E:** Production versions for British military. Used in communications and training and roles

Notes:

The SA-342L is a export light attack variant of the SA-341/342 Gazelle. The Eurocopter/Aerospatiale SA 341/342 Gazelle is a French built light utility helicopter which was first flown in 1967. Military missions include attack, antitank, anti helicopter, reconnaissance, utility, transport, and training. The three-blade main rotor is mounted on top of the fuselage at the rear of the cabin. The single turboshaft engine, mounted on top of the fuselage and to the rear of the rotor shaft, features a prominent, upturned exhaust. The teardrop-shaped fuselage has a round, glassed-in cockpit and landing skids. The tapering tail boom mid-mounted on the fuselage has a swept-back tail fin which is tapered with a square tip and rectangular flats with small fins. The fan rotor housing is built into the lower tail.

MD 500 Defender American Light Multi-Role Helicopter

Tiers:

Variants:

- **500D Scout Defender:** Armed reconnaissance version
- **500M Defender:** Military export version of the 500 and 500C, built under license by Kawasaki in Japan (as the OH-6J)[7] and Breda Nardi in Italy.
- **500M/ASW Defender:** Export version for the Spanish Navy.
- **NH-500M Defender:** Italian-built version of the 500M Defender. Licensed by Breda Nardi before merge with Agusta.
- **500MD Defender:** Military version of the 500D. Korean Air's aerospace division from 1976 to 1984 with 200 choppers made. 50 were armed with TOW anti-tank missiles and 150 choppers used for transportation and support duties.
- **500MD/ASW Defender:** Maritime version of the 500MD Defender.
- **500MD/TOW Defender:** Anti-tank version of the 500MD Defender, armed with TOW anti-tank missiles.
- **500MD/MMS-TOW Defender:** Anti-tank version, fitted with a mast-mounted sight, armed with TOW anti-tank missiles.
- **500MD Quiet Advanced Scout Defender:** Fitted with noise suppression equipment.
- **500MD Defender II:** Improved version.
- **500MG Defender:** Military version of the 500E.
- **520MG Defender:** Philippine military version. Special Forces version. Modified 500MG Defender that carry .50 caliber machine guns and 7-tube rocket pods and operates as a light attack aircraft.
- **520MK Black Tiger:** South Korean-built military version, built by Korean Air Aerospace Division[
- **530MG Defender:** Military version of the 530F.
- **MD530 Nightfox:** Night attack version.
- **MD530MG Paramilitary Defender:** Police or border patrol version.
- **MD540F:** Upgraded MD530F, incorporating a 6-bladed, fully articulated rotor blade system made of composite material, a more rugged landing skid for heavier take-off and landing weights, a fully integrated digital glass cockpit with multi-function color displays and a pilot Helmet Display and Tracking System (HDTS), which couples together a targeting FLIR and laser designator.
- **MD530G:** Designed based on the MD 530F airframe and is engineered with advanced technology to deliver enhanced combat capabilities.

Notes:

The McDonnell Douglas Helicopter Systems MD 500 Defender is a light multi-role military helicopter based on the MD 500 light utility helicopter and OH-6 Cayuse Light Observation Helicopter. The Defender 500 foreign military sales helicopter is offered with either a four- or five-blade main rotor, depending on the model, with a weapons platform mounted on the lower rear body. This light utility commercial helicopter could seat five passengers in comfort, and is used mainly by the military, being very flexible and offering good all round capabilities. Other missions include: direct air support, antitank, reconnaissance, observation, and light utility. A single engine is mounted inside the body with air intakes on top of the cabin and a black hole exhaust. The fuselage is teardrop-shaped a features a round, glassed-in cockpit and landing skids. External stores are mounted on weapons racks on each side of the fuselage. Each rack has one hardpoint. The tail fin is boomerang-shaped, swept-back, and tapered. The tail flats are back-tapered with small fins attached to the tips, with the flats high-mounted on the fin forming a T. The rotor is mounted on the lower left of the tail boom. The successful Hughes 500/MD 500 series began life in response to a U.S. Army requirement for a Light Observation Helicopter (LOH). Hughes' Model 369 won the contest against competition from Bell and Hiller. The subsequent OH-6 Cayuse first flew in February 1963. The 500 series design features shock-absorbing landing skid struts, a turboshaft engine mounted at a 45-degree angle toward the rear of the cabin pod, a fuel tank cell under the floor and the battery in the nose. The engine exhaust port is located at the end of the cabin pod underneath the tailboom. It has a short-diameter main rotor system and a short tail, giving it agile control response and is less susceptible to weather-cocking. Hughes won the U.S. Army's LOH contest with its OH-6 helicopter by submitting a very low and aggressive price per airframe (without an engine). Due to rising prices, the U.S. Army later re-opened the contest, where Hughes offered the machine at a more realistic price, but was undercut by the redesigned Bell OH-58 Kiowa (military JetRanger). OH-6 helicopters were still ordered by the U.S. Army, though at a much reduced number. Prior to the OH-6's first flight, Hughes announced it was developing a civil version, to be marketed as the Hughes 500, available in basic five- and seven-seat configurations.[3] A utility version with a more powerful engine was offered as the 500U (later called the 500C). The improved Hughes 500D became the primary model in 1976, with a more powerful engine, a T-tail, and a new five-blade main rotor; a four-blade tail rotor was optional. The 500D was replaced by the 500E from 1982 with a pointed nose and various interior improvements, such as

greater head- and legroom. The 530F was a more powerful version of the 500E optimized for hot and high work. McDonnell Douglas acquired Hughes Helicopters in January 1984, and from August 1985 the 500E and 530F were built as the MD 500E and MD 530F Lifter. Following the 1997 Boeing-McDonnell Douglas merger, Boeing sold the former MD civil helicopter lines to MD Helicopters in early 1999. Military variants are marketed under the MD 500 Defender name.

AS565 Dauphin French Medium Utility Helicopter

Tiers:

Variants:

- **SA 365 C:** A twin-engined version of the Dauphin, designated as the Dauphin 2, was announced in early 1973. The first prototype's first flight took place on 24 January 1975; production model deliveries began in December 1978. In comparison with the earlier model, the SA 365 C featured twin 470 kW (630 shp) Arriel 1 turboshafts in a new engine fairing, a Starflex main rotor hub and a higher maximum take-off weight (3,400 kg (7,496 lb) or 7,495 lb). Its Fenestron anti-torque device featured 13 metal blades. Production of both the SA 360 and SA 365 C ceased in 1981, by which time approximately 40 SA 360s and 50 SA 365 C/C1s had been built; both were replaced by the SA 365 N.
- **SA 365 C1:** Variant powered by Arriel 1A1 certified in March 1979.
- **SA 365 C2:** Variant powered by Arriel 1A2 certified in February 1980.
- **SA 365 C3:** Variant powered by Arriel 1C certified in January 1982.
- **SA 365 N:** A much improved version of the SA 365 C Dauphin 2, the first prototype flying on 31 March 1979. This version introduced the uprated 492 kW (660 shp) Arriel 1C turboshafts, a retractable tricycle undercarriage, enlarged tail surfaces, and revised transmission, main rotor, rotor mast fairing and engine cowlings. The aircraft's initial M.T.O.W. of 3,850 kg (8,490 lb) was later raised to 4,000 kg (8,800 lb). Deliveries of the production model began in 1982.
- **SA 365 N1:** Incorporating many of the improvements developed for the SA 366 G1 (HH-65 Dolphin), this version introduced upgraded 526 kW (705 shp) Arriel 1C1 turboshafts, an improved 11-blade Fenestron with wider-chord blades (which reduced the AS365 N1's noise signature), movable undercarriage doors replaced by simplified fairings and a higher gross weight of 4,100 kg (9,000 lb).
- **AS 365 N2:** This version – designated AS365 N2 from the outset – introduced the upgraded 549 kW (737 shp) Arriel 1C2 turboshafts, an uprated gearbox, increased maximum take-off weight of 4,250 kg (9,370 lb), redesigned cabin doors and revised interior, enlarged tail fin with all composite Fenestron. Deliveries of this version started in 1990. Licensed versions were assembled in China as the Z-9, Z-19 and AVIC AC312.
- **AS365 N3:** The high-performance AS365 N3 was developed for operations in 'hot and high' climates, and introduced 635 kW (851 shp) Arriel 2C turboshafts equipped with a single channel DECU (Digital Engine Control Unit) with manual reversion, mated to an uprated main transmission for better single engine performance. The AS365 N3 also features a redesigned ten blade composite Fenestron anti-torque device with asymmetric blade distribution, offering a further reduction in noise signature. The AS365 N3's gross weight is 4,300 kg (9,500 lb). Production deliveries began in December 1998.
- **AS365 N3+:** This version was presented at the 2009 Paris Air Show and differs mainly in new avionics including 4-axis auto-pilot This version is currently still in production.
- **AS365 N4:** Produced as the EC155.
- **AS365 X:** Better known as the DGV 200 or Dauphin Grand Vitesse (High Speed Dauphin), the AS365 X was developed

from the X-380 DTP (Developpement Technique Probatoire or Probatory Technical Development) testbed, first flown on 20 March 1989. The aircraft was first flown in the AS365 X configuration two years later in March 1991, and featured a smaller Fenestron, a new main rotor with five high-inertia blades with swept tips, a composite rotor hub/mast and 624 kW (837 shp) Turbomeca Arriel IX turboshafts. On 19 November 1991, this aircraft set a Class E1e (3,000 to 4,500 kg) speed record of 201 knots (372 km/h; 231 mph) over a 3 km (1.9 mi) triangular course.

- **EC155 B/B1:** This version was originally to follow the N3 as the AS365 N4, and was announced at the 1997 Paris Airshow before being redesignated as the EC155 B. As with the N3 version, it has two Arriel 2C/2C2 turboshafts equipped with FADEC as well as a five blade Spheriflex main rotor (derived from the AS365 X DGV). It also features a 30% larger main cabin (achieved with bulged doors and cabin plugs). The first flight of the first prototype took place on 17 June 1997 and this version is currently in production (as the EC155 B1).
- **SA 366 G1 Dauphin:** The SA 366 G1 Dauphin version was selected by the US Coast Guard (USCG) in 1979 as its new air-sea rescue helicopter and given the designation HH-65A Dolphin. In total 99 helicopters, optimized for the USCG's short-range recovery (SRR) search and rescue role, were initially acquired, with additional aircraft later procured.
- **SA 365 N Dauphin:** A much improved version of the SA 365 C Dauphin 2, the first prototype flying on 31 March 1979. This version introduced the upgraded 492 kW (660 shp) Arriel 1C turbo-shafts, a retractable tricycle undercarriage, enlarged tail surfaces, and revised transmission, main rotor, rotor mast fairing and engine cowlings. The aircraft's initial M.T.O.W. of 3,850 kg (8,490 lb) was later raised to 4,000 kg (8,800 lb). Deliveries of the production model began in 1982.
- **SA 365 F Dauphin:** The SA 365 F is a variant of the SA 365 N for the French Navy. It has been used since 1991 for general duties and for backup purposes aboard an aircraft carrier. A helicopter with rescue divers is always in the air during flight operations to be able to assist the pilot in case of an accident. First experiments were successfully carried out in 1990 on board the Clemenceau. The variant 365F is used since 1999 with Flottille 35F called AS365F Dauphin Pedro.
- **AS365 N3 Dauphin:** The high-performance AS365 N3 was developed for operations in 'hot and high' climates, and introduced 635 kW (851 shp) Arriel 2C turbo-shafts equipped with a single channel DECU (Digital Engine Control Unit) with manual reversion, mated to an upgraded main transmission for better single engine performance. The AS365 N3 also features a redesigned ten blade composite Fenestron anti-torque device with asymmetric blade distribution, offering a further reduction in noise signature. The AS365 N3's gross weight is 4,300 kg (9,500 lb). Production deliveries began in December 1998.
- **AS365 N3+:** This version was presented by Eurocopter at the 2009 Paris Air Show and differs mainly in new avionics including 4-axis auto-pilot

Counter Measures (Chaff/Flares): Yes

Notes:

The Eurocopter (now Airbus Helicopters) AS365 Dauphin (Dolphin), also formerly known as the Aérospatiale SA 365 Dauphin 2, is a medium-weight multipurpose twin-engine helicopter produced by Airbus Helicopters. It was originally developed and manufactured by French firm Aérospatiale, which was merged into the multinational Eurocopter company during the 1990s. Since entering production in 1975, the type has been in continuous production for more than 40 years. The intended successor to the Dauphin is the Airbus Helicopters H160, which is yet to enter operational service as of January 2020. The Dauphin 2 shares many similarities with the Aérospatiale SA 360, a commercially unsuccessful single-engine helicopter; however the twin-engine Dauphin 2 did meet with customer demand and has been operated by a wide variety of civil and military operators. Since the type's introduction in the 1970s, several major variations and specialised versions of the Dauphin 2 have been developed and entered production, including the military-oriented Eurocopter Panther, the air-sea rescue HH/MH-65 Dolphin, the Chinese-manufactured Harbin Z-9 and the modernised Eurocopter EC155. The AS365 Dauphin is a twin-engine helicopter

capable of travelling long ranges, and well suited to operating in climates of a high ambient temperature or at locations of significant altitude. The Dauphin is typically powered by a pair of Turbomeca Arriel turboshaft engines; on later variants, these are equipped with FADEC units, which provide additional functionality such as an automated start-up sequence and a training mode. The engines drive the rotorcraft's foldable Starflex main rotor and its Fenestron anti-torque tail rotor via two separate transmissions; these gearboxes are also connected to two separate hydraulic systems as well as a stand-by hydraulic system for emergency use, such as deployment of the landing gear. Electrical power is provided by a pair of starter generators and a cadmium-nickel main battery, an emergency battery is also present. The main fuselage of the rotorcraft comprises the cabin area, a separate luggage compartment, and a retractable tricycle landing gear arrangement; a total of four conventional doors to access the main cabin are typically installed, which can be optionally replaced by a single clamshell air stair entrance instead. Various portions of the rotorcraft are made from composite materials, such as the rotor blades that made of carbon fiber, other materials are used in portions of the fuselage. The fuselage features anti-corrosion protection and is structurally reinforced for an optional hoist or cargo sling to be installed, various other mooring and gripping points are also fitted on the rotocraft's exterior surface. Various types and models of radar can be installed in the Dauphin's nose. The combination of the rotorcraft's Starflex main rotor and Fenestron tail provides a low-noise and low-vibration flight experience for those on board; Airbus Helicopters has claimed the sound emissions of the AS365 N3 to be 3.1 decibels below International Civil Aviation Organization (ICAO) standards, making it the quietest helicopter in its class. The Dauphin can take off under a full load from sea level under Category A conditions. The main cabin area is designed to be reconfigurable, a feature which is promoted to emergency medical service (EMS) and search and rescue (SAR) operators. In a regular passenger transport layout, the cabin can accommodate up to 12 passengers in addition to the two pilots; up to seven passengers can be accommodated in a VIP layout. Access to the cabin is via large sliding doors on either side of the helicopter, built-in boarding steps are typically installed to ease the boarding of passengers. While the cockpit is typically equipped with dual flight controls for two-man operations, the Dauphin can be readily flown by a single pilot while operating under instrument flight rules; this was achieved in part by avionics such as the 4-axis Dual Digital Automatic Flight Control System (older production aircraft use a 3-axis flight control system with integrated autopilot instead) to reduce crew workload. The principal flight control system are connected to a total of 3 dual-chamber primary servo-units for cyclical and collective pitch control, and a single dual-chamber rear servo-unit for tail rotor pitch control.[6] Other major avionics include 10.4-inch multi-mission touch screen displays, weather radar, global positioning system (GPS) receiver, traffic alert and collision avoidance system (TCAS), automatic voice alarm device (AVAD), health and usage monitoring system (HUMS), quick access records for helicopter flight data management, and digital audio communication system (DACS).

Variants:

- **SA 365 C:** A twin-engined version of the Dauphin, designated as the Dauphin 2, was announced in early 1973. The first prototype's first flight took place on 24 January 1975; production model deliveries began in December 1978. In comparison with the earlier model, the SA 365 C featured twin 470 kW (630 shp) Arriel 1 turboshafts in a new engine fairing, a Starflex main rotor hub and a higher maximum take-off weight (3,400 kg (7,496 lb) or 7,495 lb). Its Fenestron anti-torque device featured 13 metal blades. Production of both the SA 360 and SA 365 C ceased in 1981, by which time approximately 40 SA 360s and 50 SA 365 C/C1s had been built; both were replaced by the SA 365 N.
- **SA 365 C1:** Variant powered by Arriel 1A1 certified in March 1979.
- **SA 365 C2:** Variant powered by Arriel 1A2 certified in February 1980.
- **SA 365 C3:** Variant powered by Arriel 1C certified in January 1982.
- **SA 365 N:** A much improved version of the SA 365 C Dauphin 2, the first prototype flying on 31 March 1979. This version introduced the uprated 492 kW (660 shp) Arriel 1C turboshafts, a retractable tricycle undercarriage, enlarged tail surfaces, and revised transmission, main rotor, rotor mast fairing and engine cowlings. The aircraft's initial M.T.O.W. of 3,850 kg (8,490 lb) was later raised to 4,000 kg (8,800 lb). Deliveries of the production model began in 1982.
- **SA 365 N1:** Incorporating many of the improvements developed for the SA 366 G1 (HH-65 Dolphin), this version introduced upgraded 526 kW (705 shp) Arriel 1C1 turboshafts, an improved 11-blade Fenestron with wider-chord blades (which reduced the AS365 N1's noise signature), movable undercarriage doors replaced by simplified fairings and a higher gross weight of 4,100 kg (9,000 lb).
- **AS 365 N2:** This version – designated AS365 N2 from the outset – introduced the upgraded 549 kW (737 shp) Arriel 1C2 turboshafts, an uprated gearbox, increased maximum take-off weight of 4,250 kg (9,370 lb), redesigned cabin doors and revised interior, enlarged tail fin with all composite Fenestron. Deliveries of this version started in 1990. Licensed versions were assembled in China as the Z-9, Z-19 and AVIC AC312.
- **AS365 N3:** The high-performance AS365 N3 was developed for operations in 'hot and high' climates, and introduced 635 kW (851 shp) Arriel 2C turboshafts equipped with a single channel DECU (Digital Engine Control Unit) with manual reversion, mated to an uprated main transmission for better single engine performance. The AS365 N3 also features a redesigned ten blade composite Fenestron anti-torque device with asymmetric blade distribution, offering a further reduction in noise signature. The AS365 N3's gross weight is 4,300 kg (9,500 lb). Production deliveries began in December 1998.
- **AS365 N3+:** This version was presented at the 2009 Paris Air Show and differs mainly in new avionics including 4-axis auto-pilot This version is currently still in production.
- **AS365 N4:** Produced as the EC155.
- **AS365 X:** Better known as the DGV 200 or Dauphin Grand Vitesse (High Speed Dauphin), the AS365 X was developed from the X-380 DTP (Developpement Technique Probatoire or Probatory Technical Development) testbed, first flown on 20 March 1989. The aircraft was first flown in the AS365 X configuration two years later in March 1991, and featured a smaller Fenestron, a new main rotor with five high-inertia blades with swept tips, a composite rotor hub/mast and 624 kW (837 shp) Turbomeca Arriel IX turboshafts. On 19 November 1991, this aircraft set a Class E1e (3,000 to 4,500 kg) speed record of 201 knots (372 km/h; 231 mph) over a 3 km (1.9 mi) triangular course.
- **EC155 B/B1:** This version was originally to follow the N3 as the AS365 N4, and was announced at the 1997 Paris Airshow before being redesignated as the EC155 B. As with the N3 version, it has two Arriel 2C/2C2 turboshafts equipped with FADEC as well as a five blade Spheriflex main rotor (derived from the AS365 X DGV). It also features a 30% larger main cabin (achieved with bulged doors and cabin plugs). The first flight of the first prototype took place on 17 June 1997 and this version is currently in production (as the EC155 B1).
- **SA 366 G1 Dauphin:** The SA 366 G1 Dauphin version was selected by the US Coast Guard (USCG) in 1979 as its new air-sea rescue helicopter and given the designation HH-65A Dolphin. In total 99 helicopters, optimized for the USCG's

short-range recovery (SRR) search and rescue role, were initially acquired, with additional aircraft later procured.

- **SA 365 N Dauphin:** A much improved version of the SA 365 C Dauphin 2, the first prototype flying on 31 March 1979. This version introduced the upgraded 492 kW (660 shp) Arriel 1C turbo-shafts, a retractable tricycle undercarriage, enlarged tail surfaces, and revised transmission, main rotor, rotor mast fairing and engine cowlings. The aircraft's initial M.T.O.W. of 3,850 kg (8,490 lb) was later raised to 4,000 kg (8,800 lb). Deliveries of the production model began in 1982.
- **SA 365 F Dauphin:** The SA 365 F is a variant of the SA 365 N for the French Navy. It has been used since 1991 for general duties and for backup purposes aboard an aircraft carrier. A helicopter with rescue divers is always in the air during flight operations to be able to assist the pilot in case of an accident. First experiments were successfully carried out in 1990 on board the Clemenceau. The variant 365F is used since 1999 with Flottille 35F called AS365F Dauphin Pedro.
- **AS365 N3 Dauphin:** The high-performance AS365 N3 was developed for operations in 'hot and high' climates, and introduced 635 kW (851 shp) Arriel 2C turbo-shafts equipped with a single channel DECU (Digital Engine Control Unit) with manual reversion, mated to an upgraded main transmission for better single engine performance. The AS365 N3 also features a redesigned ten blade composite Fenestron anti-torque device with asymmetric blade distribution, offering a further reduction in noise signature. The AS365 N3's gross weight is 4,300 kg (9,500 lb). Production deliveries began in December 1998.
- **AS365 N3+:** This version was presented by Eurocopter at the 2009 Paris Air Show and differs mainly in new avionics including 4-axis auto-pilot

System

Alternative Designation: AS565 Panther
Type: Medium Utility Helicopter
Manufacturer: Aérospatiale Eurocopter Airbus Helicopters
Crew: 2 (pilot, co-pilot)
Blades, Main Rotor: ea4
Blades, Tail Rotor: INA
Number of Engines: ea2
Number of Hard Points: INA

Dimensions

Length, Rotors Turning: 13.74 m
Fuselage Length: 12.11 m
Rotor Diameter: 11.94 m
Disc Area: 112 sq m
Height: 3.50 m
Empty Weight: 2,249 kg
Sling Load Weight: 1,600 kg
Maximum Takeoff Weight: 4,100 kg

Automotive

Engine Name: 2 x Turbomeca Arriel
Engine Type: Turboshaft
Engine Power: 650 shaft hp each
Internal Fuel Capacity: 1,135 liters

Cruise Speed: 285 kph

Economical Speed: 259 kph

Ceiling: 6,000 m

Hovering Ceiling in Ground Effect: 2,150 m

Hovering Ceiling out of Ground Effect: 1,200 m

Maximum Range with Internal Fuel: 865 km

Maximum Range with Auxiliary Fuel Tanks: 1,067 km

Main Gun System

Note: 20-mm or 7.62-mm General-Purpose Machine Guns.

Missile Weapon Systems

↳***Missile System #1***

Name: AS15TT Anti-Ship Missile

Type: Anti-Ship Missile

Length: 2.30 m

Diameter: 190 mm

Wingspan: 0.56 m

Warhead: 30 kg derived from OP3C APHE

Fuze: impact

Weight: 98 kg

Maximum Range: 15 km

Maximum Speed: 1,007 kph

Guidance System: SACLOS by Thomson-CSF Agrion 15 chin-mounted I/J-band radar

Basic Load: INA

Anti-Tank Guided Missile System

Name: HOT-1

Type: Air-to-Ground Anti-Tank Missile

Length: 1.27 m

Diameter, Launcher: 175 mm

Diameter, Missile: 136 mm

Launcher Weight: 23.5 kg

Launcher and Missile Weight: 32.0 kg

Warhead Weight: 5.0 kg

Warhead: Octol hollow-charge high-explosive anti-tank or multi-purpose penetration of rolled homogeneous armor (RHA). Penetrates up to 47 in (1,200 mm) of armor.

Engine: 1 x two-stage solid-propellant rocket; Bugeat booster with a burn of 0.9 sec; Epictete sustainer, 53 lb (24 kg) static thrust with a burn of 17.4 sec

Maximum Speed: Mach 0.74

Maximum Range: 4,000 m

Minimum Range: 400 m

Flight Time to 2,000 m: 9 sec

Flight Time to 3,000 m: 13 sec

Flight Time to 4,000 m: 17 sec

Guidance System: SACLOS wire-guided

Tracking System: optical or IR tracking of target; IR tracking of missile.

Basic Load: INA

Fire Control and Avionics

Fire Control Radar: INA

Navigation Radar: INA

Protection

Add on Armor: INA

Stealth Properties: None

Heat Signature Reduction: No

NBC Protection: INA

EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): Yes

Notes:

The Eurocopter (now Airbus Helicopters) AS565 Panther is the military version of the Eurocopter AS365 Dauphin medium-weight multi-purpose twin-engine helicopter. The Panther is used for a wide range of military roles, including combat assault, fire support, anti-submarine warfare, anti-surface warfare, search and rescue, and medical evacuation (MEDEVAC). The AS565 Panther is a twin-engine medium-sized multi-mission rotorcraft. It is capable of performing various naval and land-based missions, such as maritime security, search and rescue (SAR), casualty evacuation (CASEVAC), vertical replenishment, surveillance, special forces operations, anti-submarine warfare (ASW) and Anti-surface warfare (ASuW). The Panther is powered by a pair of Turbomeca Arriel turboshaft engines, which drives the rotorcraft's main rotor as well as the fenestron anti-torque tail rotor device. The flight profile of the Panther has been described as being easy to manoeuver, possessing generous g-force limitations and a high level of stability. In the commando-transport configuration, the Panther may carry up to 10 fully armed soldiers on board at a time in addition to the two pilots flying the aircraft. The main cabin can be rapidly reconfigured to conduct various roles, such as troop-transport, SAR, and MEDIVAC missions; optional equipment includes a full medical suite, forward-looking infrared (FLIR) camera, emergency flotation, loudspeaker, variable-speed hoist, cargo sling, search light, and a stretcher-support structure. Various avionics are present upon the Panther; some variants are fitted with the advanced human-machine interface (HMI) glass cockpit. It features the vehicle and engine multifunction display (VEMD), integrated electronic standby instrument (ESI), usage monitoring system (UMS), traffic collision avoidance system (TCAS), terrain awareness and warning system (H-TAWS), and dedicated mission display coupled with a multi-sensor processor, a 4-axis automatic flight control system (AFCS), flight management system (FMS), and an advanced search radar. The design of the cockpit and avionics systems, such as the engine management system, provides a high level of automation as part of an effort to reduce workload upon the pilots. The cockpit was deliberately designed with extra panel space to accommodate future upgrades and additional instrumentation that may be installed. The principle element of ASW-configured Panthers is the Helicopter Long-Range Active Sonar (HELRAS), a dipping sonar equipped with a descending array of seven projection elements and a receiving array equipped with eight extending arms, which is capable of detecting submarines up to 500 meters below the water's surface. According to Airbus Helicopters, the Panther family has been qualified to operate from the flight decks of over 100 classes of

NATO vessels, and complies with NATO standardization agreements. The compact size of the Panther has enabled the type to be operated from smaller ocean-going vessels such as corvettes. To aid in shipboard landings under rough sea conditions and high winds, some variants can be furnished with the hydraulic Harpoon deck-lock securing device. The Panther can be armed with several different sets of munitions and armaments, dependent upon the intended role. Munitions include 20mm pod-mounted cannons, 68mm rocket pods, a maximum of eight Mistral air-to-air missiles, or a maximum of eight HOT anti-tank missiles; all of which can be mounted onto a universal weapon support beam. The weapon systems are integrated with a Crouzet HDH-2A electronic sight and the autopilot, the latter of which provides automatic flight handling assistance during weapons deployment to avoid negative tendencies such as nose droop. For improved survivability, the radar signature is reduced due to the use of composite materials across the airframe and the use of the fenestron tail rather than a conventional tail rotor; low infrared paints are also typically applied to the exterior surfaces and jet exhaust dilution devices are installed on the engines to reduce the Panther's infrared signature. Damage resistance is increased by the adoption of self-sealing fuel tanks and armor-plated crew seating.

MRH90 Australian Utility Helicopter

Tiers:

1 2 3 4

System

Alternative Designation: MRH90
Type: Utility Helicopter
Role: - Anti-Submarine Warfare (ASW) - Anti-Ship - Transport - Medical Evacuation (MEDEVAC) - Search and Rescue (SAR) - Special Forces
Status: 2016-Present
Crew: ea3
Blades, Main Rotor: 4
Blades, Tail Rotor: ea4
Number of Engines: ea2
Day/Night Capable: Yes
All Weather Capable: Yes

Dimensions

Length: m16.15 m
Main Rotor Diameter: 16.3 m
Height: 5.25 m
Weight, Empty: 6,400 kg
Weight, Combat: 10,600 kg

Automotive

Engine Name: 2 x Rolls-Royce Turbomeca RTM322-01/9
Engine Type: turboshaft engines
Engine Power: developing 2,230 horsepower each
Cruising Range: km800
Speed, Maximum: km/h300

Service Ceiling: 6,000 m

Rate-of-Climb: 480 m/min

Fuel Capcity: 1,900 kg

Main Weapon System

Note: The MRH90 typically only has a door-mounted machine gun for local defense.

Protection

Cockpit Glass: INA

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): INA

Notes:

For decades the Australian military relied on the ubiquitous Bell UH-1 "Huey" helicopter line and thought (and funding) was finally given to adopt a more modern product - this became the MRH-90 "Taipan" (MRH = "Multi-Role Helicopter") based on the NHIndustries NH90 series. The NH90 serves in the medium-lift role and can undertake many mission types for military and civilian industries. Nearly 250 have been produced (2015) with service seen through the French, Italian and Finnish armies. The helicopter is an original product from NHIndustries (NHI), the helicopter arm of what was once Eurocopter - now falling under the Airbus Helicopters brand label. For the Australian military the Taipan fulfills a utility role and will serve both its Army and Navy forces. An early-batch order in 2005 called for twelve helicopters to replace UH-1 models and a 2006 follow-on order totaled 34 systems to succeed outgoing Sikorsky UH-60 "Black Hawk" and Westland "Sea King" helicopters. The Australian military plans to procure no more than 47 MRH-90s in all with four to be produced in Europe and the remainder in Australia by Airbus Helicopters subsidiary Australian Aerospace of Brisbane. Forty units are set aside for Army use and six are to be used by the Navy. While the original order was for 46 total aircraft, a renegotiated contract of 2013 yielded the Australian government one extra airframe which will be set aside for training duty. The MRH-90 has had a rocky development, forcing revisions as evaluations were being undertaken. Since 2010 the helicopter was repeatedly showing up on the Australian government's "shame list" for its many problems and delayed service entry. While first deliveries came in 2007, final examples will not be on hand until 2016 or 2017 - over ten years since the initial order was placed. For cost reasons, the Army will still be forced to use their Black Hawks until 2018. Initial Operational Capability (IOC) was finally had in 2014 by the Army with the Navy following a year later. The MRH-90 has experience issues with object ingestion in its turboshaft (Rolls-Royce) engines despite the fact that protective screens were in place (the screens were not suitable for the debris available in the Australian landscape). Additionally, windshield cracking was a constant which resulted in a special film being applied for added strength and a new installation procedure being drawn up. In 2010 a single engine failure occurred to an MRH-90 by Adelaide which caused a fleet grounding during the review process (shaft bowing was blamed). A stronger cabin floor was then ordered when it was found that the original lightweight design suffered under the stress of equipment-laden Australian infantry. Beyond other scheduled additions (rappelling equipment, door guns, etc...) it appears that the darkest days of the MRH-90 program are behind it.

AS-532/Cougar European Multirole Helicopter

Tiers:

1 2 **3** 4

Variants:

- **AS-532 Cougar UL/AL Mk I::** This version has an extended fuselage, which allows it to carry 25 troops and more fuel. It is also capable of carrying an external load of 4,500 kg.
- **AS-532 Cougar U2/A2 Mk II::** This 1992 version is the longest variant of the Cougar line. It has an improved Spheriflex rotor system with only 4x tail rotor blades, and 2x 2,100-shp Turbomeca Makila 1A2 turboshaft engines that allow an increased cargo carrying capability. It can transport 29 troops or 12 litters, or an external load of 5,000 kg. Primarily used for combat search and rescue, and as an armed version. It may be armed additionally with a 20-mm cannon or pintle-mounted .50 caliber machine guns.
- **SA 330 Puma::** Developed in the late 1960s by Aerospatiale in France. Others were built in the UK, Indonesia, and Romania.
- **AS 332 Super Puma::** Differs from the SA 330 Puma through an improved rotor system, upgraded engines, stretched fuselage, and a modified nose shape.
- **AS-532 Cougar UC/AC Mk I::** The basic version with a short fuselage to carry 20 troops.

System

Alternative Designation : AS 332 Super Puma, SA 330 Puma

Blades, Main Rotor: 4.0

Crew : ea2 (pilots). Transports: 20-29 troops or 6- 12 litters (variant dependent), or cargo.

↳*Dimensions*

Width : m1.8

↳*Survivability/Countermeasures*

Survivability/Countermeasures: Main and tail rotor blades electrically deiced. A radar warning receiver is standard, while a laser warning receiver, missile launch detector, missile approach detector, infrared jammer, decoy launcher, and flare/chaff dispensers are optionally available.

Armament

Most Probable Armament: The armed versions have side-mounted 20-mm machineguns and/or axial pods fitted with 68-mm rocket launchers.

Notes: Mission dictates weapons configuration. Not all will be employed at the same time.

Other Loading Options: 20-mm twin gun pods (2), 68-mm rocket pods (22 each), (2), 2.75-in rocket pods (19 each), (2), External fuel tanks (600 liters).

↳***Weapon 1***

Caliber/Length : mm7.62

Type: Machine Gun

Armaments

Armament: The Mk I variants may employ 2x 7.65-mm machine guns on pintle-mounts in the cabin doors when employed in a transport role

Avionics/Sensor/Optics

Avionics/Sensor/Optics: The aircraft is NVG compatible, and through its instruments, avionics, full autopilot, and navcomputer, is capable of operation in day, night, and instrument meteorological conditions

Payload

Standard Payload, External : kg4500, on sling only

Standard Payload, Internal : kg3000.0

Performance

Ceiling : m270.0

Ceiling, Service : m4100.0

Vertical Climb Rate : m/s7.0

Notes:

This helicopter is produced by the Eurocopter company. It was formed as a joint venture between Aerospatiale of France, and Daimler-Benz aerospace of Germany. Additional missions include: VIP transport, electronic warfare, and anti-submarine warfare.

EW: INA

EW Counter Measures/CCM: INA

Counter Measures (Chaff/Flares): Yes,ASO-3 and ASO-2 chaff/flare countermeasures system

Jammer: Hot Brick IR

Notes:

The Mil Mi-17 (NATO reporting name: Hip) is a Soviet/Russian helicopter in production at two factories in Kazan and Ulan-Ude. It is known as the Mi-8M series in Russian service. It is a medium twin-turbine transport helicopter. There are also armed gunship versions. The improved version of the Mi-8 is the Mi-17 Hip multipurpose helicopter, also known as the Mi-8TMB. It is specifically designed for improved capabilities at high altitudes and in hot weather conditions. The Mi-17 is identifiable from the Mi-8 by the additional air filters on the turbine air intakes, as well as left hand side mounted tail rotor, required by the more powerful TB-3-117A turboshaft engines it is fitted with. The Mi-17 can climb at the rate of 8m/s. The maximum and cruise speed of the helicopter are 250km/h and 225 km/h respectively. The range of the helicopter is 465 km and the service ceiling is 6,000m. The aircraft weighs around 7,489 kg and its maximum take-off weight is 13,000kg. The Mi-8/17 have given rise to a bewildering range of versions that fulfil a wide variety of specialized roles. Dedicated combat support variants include airborne reserve command post, electronic counter measures (with onboard jammers), Communications intelligence and command relay. Other versions carry out delivery of fuel to front-line units, photo-reconnaissance, artillery fire-correction, reconnaissance, VIP transport, minelaying and mine clearing.

Mi-2 (Hoplite) Russian Transport Helicopter

Tiers:

Variants:

- **V-2V:** Armament prototype
- **Mi-2 Platan:** Aerial minelayer version.
- **Mi-2B:** Upgraded export version for the Middle East, fitted with improved systems and navigational aids.
- **Mi-2Ch Chekla:** Chemical reconnaissance / smokescreen layer version.
- **Mi-2D Przetacznik:** Aerial command post equipped with R-111 radio.
- **Mi-2FM:** Survey version.
- **Mi-2P:** Passenger / cargo version, with accommodation for 6 passengers.
- **Mi-2R:** Agricultural version.
- **Mi-2RL:** Land rescue/ambulance version.
- **Mi-2RM:** Sea rescue version equipped with electric winch for two people and dropped rafts.
- **Mi-2Ro:** Reconnaissance version equipped with cameras.
- **UMi-2Ro:** Reconnaissance trainer version.
- **Mi-2MSB-V or MSB-2MO:** Modernized by Motor Sich for Ukrainian Air Force., Original engine replaced with AI-450M 465 HP engine, armed with Rocket and machine gun pods, IR-jamming system and flares dispenser for defence against MANPADS.
- **Mi-2MSB or MSB-2 Nadia ('Hope'):** Modernized by Motor Sich to passenger-transport version for the civil aviation.
- **Mi-3:** Planned Mi-2 derivative that lacked suitable engines for the program to continue.
- **Mi-2 Plus:** Upgraded Mi-2 with uprated GTD-350W2 engines, all-composite rotor blades, new avionics and other modifications.
- **Mi-2URP-G Gniewosz ('Smooth snake'):** Mi-2URP with additional 4x AA missiles Strzała-2 (Strela 2) in two Gad rocket launchers.
- **Mi-2URP Salamandra ('Salamander'):** Gunship and anti-tank variant, armed with 23mm NS-23 gun, optional window-mounted 7,62mm PK machine gun, and 4x AT-3 Sagger (9M14M Malutka) wire-guided missiles on external weapons racks and 4x additional missiles in the cargo compartment.
- **Mi-2URN Żmija ('Viper'):** Armed reconnaissance variant armed with a fixed 23mm NS-23 gun and two 16x57mm S-5 unguided rocket pods Mars-2. Optional 7,62mm PK machine gun window-mounted.
- **Mi-2US:** Armed version fitted with a fixed 23mm NS-23 cannon, 4 x 7,62mm PKT machine gun pods and optional cabin PK machine gun.
- **Mi-2U:** Dual-control training version.

System

Alternative Designation: Mil Mi-2 Hoplite
Primary Function: Its military roles include anti-tank, liaison, air ambulance, training and scout. The Hoplite has been one of the most widely produced helicopter designs
Type: Transport Helicopter
Manufacturer: Mil Moscow Helicopter Plant
In Service: 1965-Present

Crew: ea1

Cargo Capacity: 8 passengers / 700 kg internal cargo / 800 kg external cargo

Blades, Main Rotor: 3

Blades, Tail Rotor: ea2

Day/Night Capable: The Mi-2 is primarily a daylight only aircraft

All Weather Capable: INA

Takeoff or Landing Limitations: INA

Number of Hard Points: INA

Landing Gear: fixed tricycle gear has the main wheels extend on a tripod of struts from the lower rear of the cabin

Tail Skid: A fixed tail skid is fitted to the tail boom below the horizontal stabilizer

Note: The cabin can be reconfigured to take cargo, four litters and a medical attendant, or two sitting casualties and two litters

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

EW: No

EW Counter Measures/CCM: No

Counter Measures (Chaff/Flares): INA

Note: Main and tail rotor blades electrically deiced

Notes:

The MI-2 Hoplite provides transport and fire support. The MI-2 can conduct reconnaissance, resupply guerrillas and provide close air support with 57mm rockets. It can also have a smoke generator mounted to provide a wide area smoke screen in front of units, screening their movements. Additional missions include; direct air support, antitank, armed reconnaissance, transport, medevac, airborne command post, minelaying, and training. Although the Mi-2 Hoplite was developed by the Mil bureau in the former Soviet Union, the aircraft was produced exclusively in Poland by the PZL Swidnik aircraft factory. Several thousand of these aircraft were built and it remained in production until 1985. The Hoplite has been one of the most widely produced helicopter designs. The three-blade main rotor is mounted on top of a large hump above the body midsection. Two turboshaft enginess are mounted side-by-side on top of cabin, forming a hump, with round air intakes above the cockpit and oval exhausts on the sides of the engines. The small, bus-like fuselage with fixed landing gear features a stepped-up cockpit and rounded nose, and a tadpole-shaped body when viewed from bottom. The tapered tail boom has small, unequally tapered flats and a

thin, swept-back fin with a rotor on the right.

Mi-26 (Halo) Russian Heavy Transport Helicopter

Tiers:

Variants:

- **Mi-26A:** Upgraded military version with a new flight/navigation system. Flown in 1985 but no production
- **Mi-26M:** Upgraded version of the Mi-26 for better performance.
- **Mi-26S:** Disaster response version developed in response to nuclear accident at Chernobyl
- **Mi-26T:** Basic civil cargo/freight transport version. Production from 1985.[
- **Mi-26TS:** Civil cargo transport version, also marketed as Mi-26TC.
- **Mi-26TM:** Flying crane version with under-nose gondola for pilot/crane operator.
- **Mi-26TP:** Firefighting version with internal 15,000 litres (4,000 US gal; 3,300 imp gal) fire retardant tank.
- **Mi-26MS:** Medical evacuation version of Mi-26T. Up to 60 stretcher cases in field ambulance role, or can be equipped for intensive care or as field hospital.[
- **Mi-26P:** 63 seat passenger version.[
- **Mi-26PK:** Flying crane derivative of Mi-26P
- **Mi-26T2:** Improved version of the Mi-26T equipped with BREO-26 airborne electronic system, allowing it to fly any time, day or night, under good and bad weather conditions. Serial production began on May 22, 2015.[
- **Mi-26T2V:** Newest modernization variant intended for the Russian military, equipped with new NPK90-2V avionics suite allowing it to fly routes in automatic mode, airborne defense complex "Vitebsk", anti-blast seats and new navigation and satellite communication systems. The cockpit is fitted with multifunctional displays with provision for use of night-vision goggles during night ops. The Mi-26T2V made its maiden flight in August 2018
- **Mi-27:** Proposed airborne command post variant; two prototypes bui

Notes:

The Mil Mi-26 (Russian: Миль Ми-26, NATO reporting name: Halo) is a Soviet/Russian heavy transport helicopter. Its product code is izdeliye 90. Operated by both military and civilian operators, it is the largest and most powerful helicopter to have gone into series production. The Mi-26 helicopter, the heaviest and most powerful helicopter in the world, was designed for carrying large-size cargoes weighing up to 20 tons. It is the result of an early 1970s specification for a transport helicopter whose empty weight, without fuel, was not to exceed half of its maximum take-off weight. It can be used for construction projects ranging from bridges to power transmission lines. The combination of high load-carrying capacity and high cruise speed makes the use of the helicopter economically efficient. The helicopter is loaded through the cargo hatch in the tail of the fuselage with lowered ladder and subladders. The cargo cabin is equipped with two electric hoists and lifting and loading devices ensuring loading and carrying along the cabin of cargoes weighing up to 5 tons. Mil Moscow helicopter plant joint stock company is the major designer and producer of military transport, civil transport, heavy-lift,multi-role helicopters. Mil is associated with the Rostov and Kazan production enterprises. Rostov makes the Mi-26 heavy-lift helicopters.

Mi-6 (Hook) Russian Heavy Transport Helicopter

Tiers:

Variants:

- **Mi-6VKP Vozkuzhnyi Komandnii Punkt (Hook-B):** This airborne command post version is equipped with various antennas and communications equipment.
- **Mi-6AYa/Mi-22 (Hook-C):** Advanced airborne command post version.
- **Mi-10 Harke:** This was an airborne crane version of the Mi-6. It is no longer in service. See separate database entry for more information.

System

Alternative Designation: Mil Mi-6; Hook
Primary Function: Heavy Transport Helicopter
Manufacturer: Mil Moscow Helicopter Plant
In Service: 1957-2002 Russia 1957-Present Other Nations
Missions: Missions include heavy-lift cargo operations, medical evacuation, troop transport and civil operations such as fire-fighting.
Crew: ea5 (pilot, co-pilot, navigator, flight engineer, radio operator)
Passengers: + 70 troops; or 41 litters + 2 attendants; or 26,450 lb (12,000) cargo

Notes:

The Mil Mi-6 (NATO reporting name Hook), given the article number izdeliye 50 and company designation V-6, is a Soviet/Russian heavy transport helicopter that was designed by the Mil design bureau. It was built in large numbers for both military and civil roles and used to be the largest helicopter in production until Mil Mi-26 was put in production in 1980. The development of the Mil Mi-6 began in the first half of the ‘50s to meet the needs of the Soviet armed forces and those of the state-owned industries that were looking for a helicopter capable of carrying large payloads over long distances. In those years, a period often known as the Cold War period, there were military and industrial projects scattered throughout the Soviet Union, even in remote areas such as the immense Siberian regions. Having successfully completed the construction of the Mi-4 Mikhail Leontyevich Mil (1909-1979) accepted a new challenge and started designing a rotorcraft with a greater load-carrying capacity. Mil was a brilliant aeronautical engineer at the head of one of the many OKB, acronym for Opytnoe Konstructorskoe Bjuro, thus experimental design bureau.

Mi-4 (Hound) Russian Transport Helicopter

Tiers:

Variants:

- **Variants:** V-12 Prototype. Designation reused for the Mi-12. Mi-4 (NATO – Hound-A) Basic production version. Mi-4A Assault transport helicopter. Mi-4AV Armed versions based on the Mi-4A. V for Vooruzhenniy (Armed). Mi-4A with additional armament. Modification of 1967 had weapons complex K-4V, included four 9M17M ATGM "Phalanga" and 96 57-mm NAR S-5M in six blocks UB-16-57U (or six 100-kg bombs or four 250-kg bombs or tanks with an incendiary substance); 185 helicopters were converted to Mi-4AV. Mi-4GF Factory designation for demilitarised Mi-4 for use in the Civil Air Fleet. Mi-4L Lyukes Six-seat VIP transport version, sometimes converted into an air ambulance helicopter. Mi-4VL Fire-fighting version of Mi-4L. Mi-4M (NATO – Hound-C) Anti-submarine warfare helicopter with searching radar station SPRS-1 ("Kurs-M"), hydroacoustic station "Baku", additional fuel tank and rescue boat with operator in under-fuselage gun turret. Mi-4ME Export modification of Mi-4M. Mi-4VM Slightly modified version of Mi-4M, differed by some avionics system. Mi-4MR Upgraded version of Mi-4VM with the searching radar station "Rubin-V" instead of "Kurs-M". Mi-4P / Mi-4VP Civil transport helicopter, with accommodation for between 8 and 11 passengers, plus eight stretchers and a medical attendant for air ambulance duties. Mi-4PL (NATO – Hound-B) Anti-submarine warfare helicopter. Mi-4PS SAR version. Mi-4S Salon VIP transport helicopter. Mi-4Skh Multi-role agricultural helicopter, with a large chemical container in the main cabin. Also used as a fire-fighting helicopter. Mi-4T Major military production version, equipped with a large diameter main rotor and bulged windows. Mi-4VM (VM-12) Anti-submarine warfare helicopter. Mi-4BT Minesweeper with floats. Mi-4RI Mi-4M equipped with the Rion experimental sonar. Mi-4MT Torpedo-carrying ASW attack (killer) aircraft derived from Mi-4M. Mi-4MU Attack helicopter. Mi-4MO Search helicopter with Oka sonar. Mi-4MS Search helicopter with Soora infra-red sensor. Mi-4FV (Mi-4KV) Photographic and guidance helicopter. Mi-4Schch "Polar version" of Mi-4FV for working at the Soviet Arctic and Antarctic research stations. Mi-4SP Special rescue modification. Mi-4PG Experimental version equipped with an external load sling system. Mi-4SV Mi-4 with improved heat insulation for working in the Far North. Mi-4N "Filin" (Horned owl) Experimental reconnaissance version intended for night-time use. Mi-4KK (Mi-4VKP) Mobile command post. Mi-4KU (Mi-4VPU) Mobile command post for controlling Air Force units. Mi-4U Target-designator version carrying the Oospekh (Success) system. Mi-4GR Mi-4 fitted with Grebeshok-3 (Haircomb-3) wide-range panoramic detection and relay radar. Mi-4TARK TV-equipped artillery reconnaissance and spotting helicopter. Mi-4MK (Mi-4PP) ECM version. Mi-4UM Radio-controlled target drone version. Harbin Z-5 Chinese military transport helicopter. Chinese production version. Harbin Z-6 Prototype turbine powered version of the Z-5, no production undertaken. Xuanfeng Chinese civil transport helicopter. Chinese production version.

Notes:

The Mil Mi-4 (USAF/DoD reporting name "Type 36", NATO reporting name "Hound") is a Soviet transport helicopter that served in both military and civilian roles. The Mi-4 was designed in response to the American H-19 Chickasaw and the deployment of U.S. helicopters during the Korean War. While the Mi-4 strongly resembles the H-19 Chickasaw in general layout, including the

innovative engine position in front of the cockpit, it is a larger helicopter, able to lift more weight and built in larger numbers. The first model entered service in 1953. The helicopter was first displayed to the outside world in 1952 at the Soviet Aviation Day in Tushino Airfield. One Mi-4 was built with a jettisonable rotor. It served as an experimental vehicle for future pilots' means of safety and ejection designs

EC725 Caracal (H225M Super Cougar) French long-Range Tactical Transport Helicopter

Tiers:

Variants:

- **SA 330 Puma:** Developed in the late 1960s by Aerospatiale in France. Others were built in the UK, Indonesia, Romania.
- **AS 532 Cougar Mk I UC/AC:** is a military version with a short fuselage capable of carrying 21 commandos, which can be fitted with equipment for maximum efficiency in all theaters of operation: radar or missile detector, decoy-launcher. Moreover, its optional equipment make it truly multi-purpose: winch, projector, specific equipment for SAR missions, or, for instance, crashworthy seats, IR camera, NVG compatible cockpit for special missions. The AC version is the armed version and can be equipped with side-mounted machine-guns and axial pods fitted with either 20-mm guns or 68-mm rocket-launchers
- **AS 332 Super Puma:** Differs from the SA 330 Puma through an improved rotor system, upgraded engines, stretched fuselage, and a modified nose shape.
- **AS-532 Cougar Mk I UE:** is the basic version with long fuselage of the military Cougar MK1 range. The aircraft can transport 25 commandos in addition to the crew (1 chief of stick + 24 troop seats). For tactical transport and logistical support missions the Cougar UE is offered "ready for use". Its standard configuration includes a minimum of radio (2 VHF/AM,TRANSPONDER, ICS...) and navigation
- **AS 532 Cougar Mk I UL/AL:** s the "long" version which can carry up to 25 commandos or 6 injured passengers lying down and 10 other people. Like the other versions, it is capable of lifting 4.5 tons on a sling. The Horizon battlefield ground surveillance system can be installed on the AS 532 UL.
- **AS 532 Cougar Mk I SC:** s the naval version of the Cougar, and its main missions are the following: anti-surface unit warface (ASUW) fitted with AM 39 missiles, anti-submarine warfare (ASW) with a variable-depth sonar and torpedoes, and search and rescue and sea patrols.
- **AS 532 Cougar Mk II U2 A2:** helicopter has the biggest cabin volume in its category : 29 commandos or 12 stretchers with medical equipment, and is capable of carrying 5 tons on the sling. This 1992 version is the longest variant of the Cougar line. It has an improved Spheriflex rotor system with only 4x tail rotor blades, and 2x 2,100-shp Turbomeca Makila 1A2 turboshaft engines that allow an increased cargo carrying capability. It can transport 29 troops or 12 litters, or an external load of 5,000 kg. Primarily used for combat search and rescue, and as an armed version. It may be armed additionally with a 20-mm cannon or pintle-mounted .50 caliber machine guns. Its basic design with screens in the cockpit and a 4-axis autopilot with built-in coupler makes it possible to reduce the crew workload and increase its safety for tactical flight by the same degree.
- **AS 535 Cougar Mk II A2 RESCO:** he main mission of the A2 RESCO is to recover aircrews downed in combat areasplant (RESCO is the French acronym for Combat Search and Rescue or CSAR). For very long range operations, the CSAR Cougar Mk 2 can operate at a higher alternate gross weight of 11,200 kg compared to its normal maximum mission weight of 9,750 kg. With this enhanced capability, the Cougar can rescue two crew members 400 nautical miles away.

System

Alternative Designation: Eurocopter EC725; EC725 Caracal; Super Cougar H225M
Primary Function: long-Range Tactical Transport Helicopter

Door Mounted Gun

Note #1: The Mk I variants may employ 2x 7.65-mm machine guns on pintle-mounts in the cabin doors when employed in a transport role. The armed versions have side-mounted 20-mm machineguns and/or axial pods fitted with 68-mm rocket launchers.

Wing Mounted Weapons

Note #1: Hydra 70 2.75 in (70 mm) rockets – 7 rockets mounted in the M260 launcher or 19 rockets in the M261 launcher

Note #2: Additional Armament that can be equipped on the AS532 Cougar are: 7.65-mm MG 2 - 20-mm twin gun pods 2 - 68-mm rocket pods (22 each) 2 - 2.75-in rocket pods (19 each) 600 liters External fuel tanks

↳*Gun Pod Weapon System*

Name: M61 Vulcan

Type: hydraulically, electrically or pneumatically driven, six-barrel, air-cooled, electrically fired Gatling-style rotary cannon which fires 20 mm rounds

Manufactuer: General Dynamics

In Servcie: 1946-Present

Length: m1.827

Weight: kg112

Barrels: 6-barrel (progressive RH parabolic twist, 9 grooves)

Action: twist, 9 grooves) Action Hydraulically operated, electrically fired, rotary cannon

Rate of Fire: rds/min6,000

Muzzle Velocity: m/s1,050

Feed System: Belt or linkless feed system

↳*Rocket System*

Name: Hydra 70

Type: 70mm Fin-stabilized unguided rocket

Launcher Name: M261 Launcher

Number of M261 Launchers: ea2

In Service: 1980s-Present

Manufactuer: United States of America

Length: 1,060 mm

Diameter: 70 mm

Muzzle Velocity: 700 m/s

Effective Firing Range: 8,000 m

Maximum Firing Range: 10,500 m

Speed: 739 m/s

Guidance System: Unguaided

Basic Load: 19 each per M261 Launcher

↳*Ammunition*

Name: M53

Type: API

Caliber: mm20

Cartridge: 20×102 mm

Bursting Charge: 4.2 grams of incendiary

Muzzle Velocity: m/s1,050

Armor Penetration: 6.4 mm (0.25 in) RHA penetration at 0 degree impact angle and 1,000 m (3,300 ft) range.

Maximum Effective Range: km1.6

Basic Load: 900

Fire Control and Avionics

Fire Control System Type: INA

Fire Control Radar: INA

Digital or Analog Cockpit: INA

Automated Helmet: INA

Position Location System: Yes

Radar Warning Receiver: Yes

Laser Warning Receiver: Yes

Missile Launch Detector: Yes

Missile Approach Deterctor: Yes

NVG Compatible: Yes

Autopilot: Full autopilot

Navigation Computer: Yes

Protection

Fuselage Protection: Protection Against 7.62 or 12.7 mm

Cockpit Protection: Crew cockpit protection: armoured and energy absorbing crew seats

Armor Plating: Armour plating in the cabin: either collective floor and walls or individual armour plating carpets

Heat Signature Reduction: IR signature divided by 10

Fuel Tank Protection: Self sealing Fuel tanks and crashworthy fuel tanks

Blade Protection: Blades multibox structure Bullet impact resistant

Add on Armor: Yes

NBC Protection: Yes

EW: INA

EW Counter Measures/CCM: Optionally Available

Counter Measures (Chaff/Flares): Optionally Available

Deiced Capable: Main and tail rotor blades electrically deiced

Infrared Jammer: Optionally Available

Decopy Launcher: Yes

PLS (Personal Locator System): Yes

Notes:

The Eurocopter EC725 Caracal, now called Airbus Helicopters H225M, is a long-range tactical transport military helicopter developed from the Eurocopter AS532 Cougar for military use. It is a twin-engined aircraft and can carry up to 28 seated troops along with two crew, depending on customer configuration. The helicopter is marketed for troop transport, casualty evacuation, and combat search and rescue duties, and is similar to the civilian EC225. The new helicopter made its first flight in 2000. First helicopter was delivered to the French Air Force in 2005. Later it has been adopted by the French Army. It has seen combat in with French armed forces in Afghanistan and Mali. The Caracal has been exported to Brazil, Indonesia, Malaysia, Mexico and Thailand. Some other countries ordered this helicopter. There is also an ASW version of this helicopter. It can be fitted with MU90 Impact aerial-launch torpedo.

CH-47 American Medium Transport Helicopter

Tiers:

Variants:

- **HC-1B:** The pre-1962 designation for Model 114 development aircraft that would be redesignated CH-47 Chinook
- **CH-47A:** The all-weather, medium-lift CH-47A Chinook was powered initially by Lycoming T55-L-5 engines rated at 2,200 horsepower (1,640 kW), but then replaced by the T55-L-7 rated at 2,650 hp (1,980 kW) engines or T55-L-7C engines rated at 2,850 hp (2,130 kW). The CH-47A had a maximum gross weight of 33,000 lb (15,000 kg), allowing for a maximum payload around 10,000 lb (4,500 kg)
- **ACH-47A:** The ACH-47A was originally known as the Armed/Armored CH-47A (or A/ACH-47A). It was officially designated ACH-47A as a U.S. Army Attack Cargo Helicopter, and unofficially referred to as Guns A Go-Go. Four CH-47A helicopters were converted to gunships by Boeing Vertol in late 1965. Three were assigned to the 53rd Aviation Detachment in South Vietnam for testing, with the remaining one retained in the U.S. for weapons testing. By 1966, the 53rd was redesignated the 1st Aviation Detachment (Provisional) and attached to the 228th Assault Support Helicopter Battalion of the 1st Cavalry Division (Airmobile). By 1968, only one gunship remained, and logistical concerns prevented more conversions. It was returned to the United States, and the program stopped.
- **CH-47B:** The CH-47B was an interim solution while Boeing worked on a more substantially improved CH-47C. The CH-47B was powered by two Lycoming T55-L-7C 2,850 shp (2,130 kW) engines. It featured a blunted rear rotor pylon, redesigned asymmetrical rotor blades, and strakes along the rear ramp and fuselage to improve flying characteristics. It could be equipped with two door-mounted M60D 7.62 mm NATO machine guns on the M24 armament subsystem and a ramp-mounted M60D using the M41 armament subsystem. Some CH-47 "bombers" were equipped to drop tear gas or napalm from the rear cargo ramp onto Viet Cong bunkers. The CH-47B could be equipped with a hoist and cargo hook. The Chinook proved especially valuable in "Pipe Smoke" aircraft recovery missions. The "Hook" recovered about 12,000 aircraft valued at over $3.6 billion during the war; 108 were built.
- **CH-47C:** The CH-47C principally featured more powerful engines and transmissions.[61] Three sub-versions were built; the first had Lycoming T55-L-7C engines delivering 2,850 shp (2,130 kW). The "Super C" included Lycoming T55-L-11 engines delivering 3,750 shp (2,800 kW), an upgraded maximum gross weight of 46,000 lb (21,000 kg), and a pitch stability augmentation system. The T55-L-11 engines suffered difficulties, as they had been hurriedly introduced to increase payload; thus, they were temporarily replaced by the more reliable Lycoming T55-L-7C. The type was distinguishable from the standard "C" by the uprated maximum gross weight.
- **CH-47D:** The CH-47D shares the same airframe as earlier models, the main difference being the adoption of more powerful engines. Early CH-47Ds were originally powered by two T55-L-712 engines, the most common engine is the later T55-GA-714A. With its triple-hook cargo system, the CH-47D can carry heavy payloads internally and up to 26,000 pounds (12 t) (such as 40-foot or 12-metre containers) externally. It was first introduced into service in 1979. In air assault operations, it often serves as the principal mover of the 155 mm M198 howitzer, accompanying 30 rounds of ammunition, and an 11-man crew. The CH-47D also has advanced avionics, such as the Global Positioning System. Nearly all US Army CH-47D were conversions from previous A, B, and C models, a total of 472 being converted. The last

U.S. Army CH-47D built was delivered to the U.S. Army Reserve, located at Fort Hood, Texas, in 2002.[

- **MH-47D:** The MH-47D variant was developed for special forces operations and has inflight refueling capability, a fast rope-rappelling system, and other upgrades. The MH-47D was used by U.S. Army 160th Special Operations Aviation Regiment. 12 MH-47D helicopters were produced. Six were conversions from CH-47A models and six were conversions from CH-47C models.
- **MH-47E:** The MH-47E has been used by U.S. Army Special Operations. Beginning with the E-model prototype manufactured in 1991, a total of 26 Special Operations Aircraft were produced. All aircraft were assigned to 2–160th SOAR(A) "Nightstalkers", home based at Fort Campbell, Kentucky. E models were conversions from existing CH-47C model airframes. The MH-47E has similar capabilities as the MH-47D, but includes an increased fuel capacity similar to the CH-47SD and terrain following/terrain avoidance radar.
- **CH-47F:** In 2001, the first CH-47F, an upgraded CH-47D, made its maiden flight; the first production model rolled out on 15 June 2006 at Boeing's facility in Ridley Park, Pennsylvania, and first flew on 23 October 2006. Upgrades include 4,868-shaft-horsepower (3,630 kW) Honeywell engines and the airframe featuring greater single-piece construction to lower maintenance requirements. The milled construction reduces vibration, as well as inspection and repair needs, and eliminates flexing points to increase service life. The CH-47F can fly at speeds of over 175 mph (282 km/h) with a payload of more than 21,000 lb (9.5 t). New avionics include a Rockwell Collins Common Avionics Architecture System (CAAS) cockpit, and BAE Systems' Digital Advanced Flight Control System (DAFCS).[75] AgustaWestland assembles the CH-47F under license, known as the Chinook ICH-47F, for several customers.[78] Boeing delivered 48 CH-47Fs to the U.S. Army through August 2008; at that time Boeing announced a $4.8 billion contract with the Army for 191 Chinooks.
- **MH-47G:** The MH-47G Special Operations Aviation (SOA) version is currently being delivered to the U.S. Army. It is similar to the MH-47E, but features more sophisticated avionics including a digital Common Avionics Architecture System (CAAS). The CAAS is a common glass cockpit used by different helicopters such as MH-60K/Ls, CH-53E/Ks, and ARH-70As. The MH-47G also incorporates all of the new sections of the CH-47F.
- **CH-47J:** The CH-47J is a medium-transport helicopter for the Japan Ground Self-Defense Force (JGSDF), and the Japan Air Self-Defense Force (JASDF).[95] The differences between the CH-47J and the CH-47D are the engine, rotor brake and avionics, for use for general transportation, SAR and disaster activity like U.S. forces.The CH-47JA, introduced in 1993, is a long-range version of the CH-47J, fitted with an enlarged fuel tank, an AAQ-16 FLIR in a turret under the nose, and a partial glass cockpit. Both versions are built under license in Japan by Kawasaki Heavy Industries, who produced 61 aircraft by April 2001.
- **HH-47:** On 9 November 2006, the HH-47, a new variant of the Chinook based on the MH-47G, was selected by the U.S. Air Force as the winner of the Combat Search and Rescue (CSAR-X) competition. Four development HH-47s were to be built, with the first of 141 production aircraft planned to enter service in 2012.[
- **Sea Chinook:** For years US Navy has been operating different versions of the CH-53 helicopter. CH-47s regularly conduct ship-based operations for U.S. Special Forces and other international operators. Due to budget issues, technical problems and delays with CH-53K, the director of the Pentagon’s cost assessment office directed US Navy to consider maritime versions of CH-47. Naval versions must be protected against the corrosive seaborne environment and be able to operate from aircraft carriers and amphibious ships
- **Civilian models:** Model 234LR (long range): Commercial transport helicopter. The Model 234LR can be fitted out as an all-passenger, all-cargo, or cargo/passenger transport helicopter. Model 234ER (extended range): Commercial transport version. Model MLR (multi-purpose long range): Commercial transport version. Model 234UT (utility transport): Utility transport helicopter. Model 414: The Model 414 is the international export version of the CH-47D. It is also known as the CH-47D International Chinook.

System

Alternative Designation: CH-47

Primary Function: The CH-47 performs various transport missions. It transports troops, war supplies and battlefield equipment. This helicopter is also deployed in medical evacuation, search and rescue, aircraft recovery, parachute drop and other operations.

In Service: 1962-Present

Type: Medium Transport Helicopter

Crew: ea2-4

Passengers: 44 men

Blades, Main Rotor: 3

Blades, Tail Rotor: ea3

Maximum Payload Capacity: 10.3 t of cargo

Cargo Hooks: The helicopter has three external cargo hooks and can carry various loads, such as light vehicles, artillery pieces or shelters.

Note #1: Between 1982 and 1998 over 480 of the US Army's Chinooks were remanufactured to CH-47D standard with greatly enhanced capability; the RAF has also upgraded 32 of its surviving Chinooks to this standard as Chinook HC.Mk 2s and also received a further eight new-build HC.Mk 2s, as well as nine HC.Mk 3s, which are similar to the US Army's MH-47E special missions helicopter. The MH-47 is fitted with terrain-following radar, additional fuel tanks, in- flight refueling probe and a number of defensive modifications for operation behind enemy lines. Other nations operating Chinook in CH-47D International Chinook and CH-47SD Super D forms for export.

Note #2: Even though the CH-47F is still in production, Boeing is already looking for a future enhancements. It is planned that between 2020 and 2025 helicopters will be fitted with more powerful engines, new rotor blades derived from the cancelled RAH-66 Commanche, will have a strengthened airframe and will be capable to carry more payload. The planned future versions are nominally referred as CH-47G and CH-47H. These helicopters are planned to remain operational with the US Army beyond 2060, or over 100 years after the type first entered service.

Dimensions

Length: 15.54 m

Main Rotor Diameter: 18.29 m

Height: 5.77 m

Weight, Empty: 10.1 t

Weight, Maximum Take Off: 22.6 t

Automotive

Engine Name: 2 x Textron Lycoming T55-L-712

Engine Type: Turboshafts

Engine Power: 2 x 3 750 shp

Maximum Speed: 256 km/h

Cruising Speed: INA

Service Ceiling: INA

Range: 56 - 185 km with maximum internal and external payload

Main Weapon System

Note: This military transport helicopter can be armed with up to three 7.62 mm machine guns or miniguns. Two of them can be mounted in the doors and one on loading ramp.

Protection

Stealth Properties: No

Heat Signature Reduction: INA

Add on Armor: INA

NBC Protection: Yes

Counter Measures (Chaff/Flares): INA

Notes:

The Boeing CH-47 Chinook is an American twin-engined, tandem rotor, heavy-lift helicopter developed by American rotorcraft company Vertol and manufactured by Boeing Vertol (later known as Boeing Rotorcraft Systems). The CH-47 is among the heaviest lifting Western helicopters. Its name, Chinook, is from the Native American Chinook people of modern-day Washington state. The Chinook was originally designed by Vertol, which had begun work in 1957 on a new tandem-rotor helicopter, designated as the Vertol Model 107 or V-107. Around the same time, the United States Department of the Army announced its intention to replace the piston engine-powered Sikorsky CH-37 Mojave with a new, gas turbine-powered helicopter. During June 1958, the U.S. Army ordered a small number of V-107s from Vertol under the YHC-1A designation; following testing, it came to be considered by some Army officials to be too heavy for the assault missions and too light for transport purposes. While the YHC-1A would be improved and adopted by the U.S. Marine Corps as the CH-46 Sea Knight, the Army sought a heavier transport helicopter, and ordered an enlarged derivative of the V-107 with the Vertol designation Model 114. Initially designated as the YCH-1B, on 21 September 1961, the preproduction rotorcraft performed its maiden flight. In 1962, the HC-1B was redesignated CH-47A under the 1962 United States Tri-Service aircraft designation system. The Chinook possesses several means of loading various cargoes, including multiple doors across the fuselage, a wide loading ramp located at the rear of the fuselage and a total of three external ventral cargo hooks to carry underslung loads. Capable of a top speed of 170 knots (196 mph, 315 km/h), upon its introduction to service in 1962, the helicopter was considerably faster than contemporary 1960s utility helicopters and attack helicopters, and is still one of the fastest helicopters in the US inventory. Improved and more powerful versions of the Chinook have also been developed since its introduction; one of the most substantial variants to be produced was the CH-47D, which first entered service in 1982; improvements from the CH-47C standard included upgraded engines, composite rotor blades, a redesigned cockpit to reduce workload, improved and redundant electrical systems and avionics, and the adoption of an advanced flight control system. It remains one of the few aircraft to be developed during the early 1960s – along with the fixed-wing Lockheed C-130 Hercules cargo aircraft – that had remained in both production and frontline service for over 50 years. The military version of the helicopter has been exported to nations across the world; the U.S. Army and the Royal Air Force (see Boeing Chinook (UK variants)) have been its two largest users. The civilian version of the Chinook is the Boeing Vertol 234. It has been used by civil operators not only for passenger and cargo transport, but also for aerial firefighting and to support logging, construction, and oil extraction industries.

Mi-26T2 Russian Heavy Transport Helicopter

Tiers:

Parent:

Mil Mi-26 (Halo) Russian Heavy Transport Helicopter

Variants:

- **Mi-26A:** Upgraded military version with a new flight/navigation system. Flown in 1985 but no production
- **Mi-26M:** Upgraded version of the Mi-26 for better performance.
- **Mi-26S:** Disaster response version developed in response to nuclear accident at Chernobyl
- **Mi-26T:** Basic civil cargo/freight transport version. Production from 1985.[
- **Mi-26TS:** Civil cargo transport version, also marketed as Mi-26TC.
- **Mi-26TM:** Flying crane version with under-nose gondola for pilot/crane operator.
- **Mi-26TP:** Firefighting version with internal 15,000 litres (4,000 US gal; 3,300 imp gal) fire retardant tank.
- **Mi-26MS:** Medical evacuation version of Mi-26T. Up to 60 stretcher cases in field ambulance role, or can be equipped for intensive care or as field hospital.[
- **Mi-26P:** 63 seat passenger version.[
- **Mi-26PK:** Flying crane derivative of Mi-26P
- **Mi-26T2:** Improved version of the Mi-26T equipped with BREO-26 airborne electronic system, allowing it to fly any time, day or night, under good and bad weather conditions. Serial production began on May 22, 2015.[
- **Mi-26T2V:** Newest modernization variant intended for the Russian military, equipped with new NPK90-2V avionics suite allowing it to fly routes in automatic mode, airborne defense complex "Vitebsk", anti-blast seats and new navigation and satellite communication systems. The cockpit is fitted with multifunctional displays with provision for use of night-vision goggles during night ops. The Mi-26T2V made its maiden flight in August 2018
- **Mi-27:** Proposed airborne command post variant; two prototypes bui

System

Alternative Designation: Mil Mi-26; Halo
Primary Function: Heavy Transport Helicopter
In Service: 2015-Present
Manufacturer: Rostvertol

Crew: ea2-3 (pilot, co-pilot and loadmaster when carrying an external load)

Passengers: The modernised helicopter is designed to transport heavy cargo and equipment. It can be used to quickly transport up to 82 troops and their equipment, as well as a wide range of heavy-weight combat vehicles.

Blades, Main Rotor: 8

Blades, Tail Rotor: ea5

Number of Engines: ea2 ea, however the helicopter has the ability to fly with only one engine

Day/Night Capable: Yes

All Weather Capable: Yes, NPK90-2 integrated avionics equipment system (IAES)

Number of Hard Points: INA

Note: Crew requirements are reduced with the elimination of the flight engineer and navigator.
